This contribution aligns with the panel's topic by examining how higher education in astrophysics can explicitly address the epistemic, social, and institutional dimensions of scientific research alongside disciplinary content, with the general objective to build the professional preparation of future scientists, and foster scientific citizenship. In fact, scientific knowledge is not merely a body of concepts, but a negotiated, collective and value-based enterprise. However, the majority of university curricula privilege focus on disciplinary content, leaving implicit the processes by which knowledge is produced, validated, and communicated within the scientific community and in society (see e.g. [1] for a review). To address this gap, we investigate the educational potential of cinematic narratives to re-enact the scientific endeavour. The study centres on the analysis of the documentary "Black Holes: The Edge of All We Know" [2], narrating the realization of the first image of the supermassive black hole in M87. Beyond presenting scientific results, the film portrays the Event Horizon Telescope collaboration as a space of dialogue, negotiation and shared responsibility, where theory, observations, simulations and data analysis interact across diverse groups. In this sense, the movie can be interpreted as an example of democratic interaction within and across scientific communities, from which knowledge emerges. Also, black-and-white animation footages make visible the personal and collective emotions underlying contemporary research. The movie has been analyzed through a framework integrating three complementary conceptual "lenses". First, social semiotics supports the analysis of how disciplinary "modes" (e.g. equations, images, simulations) contribute to meaning-making [3]. Second, the Nature of Science (NOS) allows us to identify epistemic, social and institutional dimensions of research, combined within the FRA Wheel [4]. Finally, epistemic emotions examine how feelings such as curiosity, uncertainty and wonder shape both individual and collective inquiry. Taken together, these lenses show that the movie is able to render the scientific practice as a negotiated and inherently relational process, resonating with democratic forms of knowledge. Our analysis was complemented by an exploratory public screening, followed by a discussion and a questionnaire admin-

istered to the audience. Preliminary findings indicate that the film not only stimulates conceptual interest in black holes, but also foregrounds transversal aspects of research, such as uncertainty and the interaction between communities in large-scale collaborations. Moreover, the majority of participants reported strong emotional engagement with the scientific endeavour. Building on this, our next step is to realize a pilot internship for Astronomy undergraduate students, to be guided in a film analysis with our framework. Overall, we claim that narrative-based re-enactments of research can open reflective spaces in higher education where to confront the complexity of research practices. By making visible the social and emotional nature of inquiry, this approach not only enriches disciplinary understanding, but also equips people with interpretative tools to critically engage with the public production and circulation of scientific knowledge. In this sense, engaging with cinematic narratives of research can support the development of scientifically literate and democratically engaged citizens capable of participating thoughtfully in collective decisions about the future of our communities.

AN EXPERIMENTAL ACTIVITY IN THE CHEMISTRY LABORATORY FOR IN-SERVICE SCIENCE TEACHER TRAINING

Marco Neviani (Università di Bologna, Dipartimento di Chimica Industriale "Toso Montanari", Italy) · **Sergio Zappoli** (Università di Bologna, Dipartimento di Chimica Industriale "Toso Montanari", Italy) · **David Cross** (Université de Montpellier et Université de Montpellier Paul Valéry, LIRDEF, France)

In-service teachers | Nature of Science (NOS) | Epistemic practices

Teachers' continuous professional development is crucial for improving science education, which is often perceived as too theoretical and inaccessible by students, particularly in the case of chemistry. This empirical study presents a laboratory-based training programme, grounded in action-research, designed for a small group of in-service mathematics and science teachers of Italian lower secondary school. The aim is to foster active learning (1,2), enabling teachers—as reflective practitioners—to rethink their teaching practices and prepare students to engage with contemporary socio-scientific challenges, in line with a vision of science as a democratic and situated practice. This is crucial as many science teachers in Italy has not received a specific professional training on science education issues regarding citizenship. The training programme was designed to promote active learning for teachers in a setting analogous to the school environment (1), incorporating moments of critical reflection. It consists of two cooperative work sessions: an initial hands-on laboratory session followed by a reflective classroom session (focus group) (3). The first part takes place in the chemistry laboratory, where participants engage in an experimental inquiry, characterised by a phenomenological approach that does not require submicroscopic modelling of matter (4). This approach draws on an historical and epistemological analisis of acids and bases (5,6), using materials from everyday contexts. The second part focuses on reflecting on the knowledge and epistemic practices activated in the laboratory, with the goal of assessing their transferability to the school context. This case study aims to analyse how a teacher training experience based on investigative—rather than confirmatory—experimental activities in a chemistry laboratory, employing a macroscopic phenomenological approach to chemical phenomena and using materials from daily life, can promote, by homology, active teaching practices. These practices should set students in a context of knowledge production through direct inquiry and collective negotiation. The research methodology involves audio recording of the sessions to analyse the emerging professional knowledge and its links to teaching practices. The analysis of knowledge is based on a threefold perspective: chemical knowledge, Pedagogical Content Knowledge (2,7), and the Nature of Science (8), with particular attention to the role of everyday chemical

knowledge and common sense. The connection of the professional knowledge to teaching practices is evaluated by analysing the reflective focus group, addressing the foundational aspects of the training: laboratory activities, investigative approach, and macroscopic approach to chemical phenomena.

CULTIVATING SCIENTIFIC CITIZENSHIP THROUGH PLAYFULNESS: THE THIRD TIME OF TINKERING IN PRIMARY SCIENCE

Adele Bracci (Istituto Comprensivo di Pianoro, Italy) · **Antonia Carbone** (Istituto Comprensivo n. 11, Bologna, Italy) · **Stefano Rini** (University of Bologna) · **Sara Ricciardi** (INAF Astrophysics and Space Science Observatory Bologna)

Scientific citizenship | Primary education | Tinkering

In contemporary societies marked by uncertainty, complexity, and contested knowledge, science education must engage students not only with established concepts but with the epistemic practices through which scientific knowledge is generated and negotiated. Responding to calls to move beyond deterministic views of science (Levrini, Pietrocola, & Erduran, 2024), this contribution explores how structured problem posing and reflective documentation can foster early forms of scientific citizenship in primary education. The paper presents a design-based research project conducted in fourth-grade classrooms engaged in a sequence of four Light Play tinkering sessions, in which the available materials and tools were progressively expanded across sessions. Overall, the study highlights the pedagogical potential of combining informal constructionist practices (Papert, 1980) with formal curricula and disciplinary knowledge. In fact, the design of the activities was informed by the TIDE Canvas (Rini & Ricciardi, 2025): the tinkering sessions were followed by "cold debriefs", supported by two documentation tools: a collective Question Map and a personal Journal of Light. These moments invited children to revisit their ideas through documentation (Giudici et al 2001), reconnect with emerging questions, and build conceptual bridges between tinkering experiences and disciplinary knowledge of light and shadow. Documentation artefacts functioned as boundary objects (Akkerman & Bakker, 2011), enabling students and teachers to negotiate emerging problems and orient subsequent experimentation. This iterative process resonates with Resnick's learning spiral (2013; 2017) and can be interpreted as an enactment of its principles within tinkering-based learning supporting science learning at primary school, fostering emotional engagement, creativity, and scientific depth. The findings underline the importance of equipping teachers with tools to facilitate this "third moment", ensuring that tinkering does not remain an isolated creative episode but a sustainable pathway toward creativity, identity, critical thinking, and disciplinary understanding. Rather than organising inquiry around pre-framed research questions, the design sustained the articulation, stabilisation, and collective refinement of students' own problem formulations. Documentation rendered epistemic processes visible, supported negotiation of uncertainty, and enabled shared decision-making about which questions deserved further investigation. In this sense, the classroom increasingly functioned as a community of inquiry, modelling forms of epistemic participation relevant to scientific citizenship (Greco et al., 2008). Such conditions resonate

with post-normal understandings of science (Funtowicz & Ravetz, 1993), where uncertainty is intrinsic and deliberation becomes central. The study suggests that NOS-informed, design-based approaches can create early educational experiences that prepare students to engage with science as a situated, negotiated, and socially consequential practice.

REINVENTING FUTURES. ENCOUNTERS AND ENGAGEMENTS IN A FAVELA COMPLEX IN RIO DE JANEIRO, BRAZIL

Agata Mazzeo (Università di Bologna, Italy) · **Cleidiana Antunes da Silva** (Ninho das Águias, Brazil) · **Cláudio Alberto Barbosa Araujo** (PPG astro club, Brazil) · **Arianna Cortesi** (Universidade Federal do Rio de Janeiro, Brazil) · **Carlos Esquivel da Silva** (Ninho das Águias, Brazil) · **Claudia Mignone** (Istituto Nazionale di Astrofisica, Italy)

Public astronomy | Informal science learning | Ethnography

The current multiple and intertwined crises, unfolding worldwide, shape how we imagine the future, and threats of apocalyptic scenarios and dystopian societies appear increasingly concrete nowadays. On the one hand, envisioning an increasingly uncertain and bleak future is negatively impacting the mental health of ever-larger segments of the global population, particularly the most vulnerable, including children, adolescents, and young adults (Cianconi et al. 2023). On the other hand, large segments of the global population, particularly those still experiencing the impact of processes of exploitation and domination rooted in European colonialism, find themselves daily confronting the challenges of a life in which even imagining a future becomes a form of resistance to deprivation. The future is a "cultural fact" (Appadurai 2013): imagining and reinventing it, moving away from already established or imposed trajectories, requires the availability of accessible material and symbolic resources, as well as the ability to use those resources. With these premises in mind, the project Closer to the Sky: Co-creating Astronomical Knowledge in the Favela Complex of Cantagalo Pavão Pavãozinho (PPG) in Rio de Janeiro, Brazil, was launched in 2023 (Cortesi et al. 2023). This project emerged from direct and long-term collaboration among astronomers and educators from the local Observatory of Valongo, the PPG astronomy club and the educational center Ninho das Águias, located in the Pavãozinho section of the favela complex. In Brazil, the everyday routine of favela dwellers, mostly Afro-descendants, is marked by insecurity, violence and "peace-time crimes" (Scheper-Hughes 1997), affecting the population's psychological wellbeing, in particular that of children, with a negative impact on their learning ability (Data Favela 2025). The project, funded by the International Astronomical Union - Office of Astronomy for Development (IAU-OAD), is addressed to children, adolescents, young adults, and adults living in the above-mentioned favela complex and is implemented by co-creating scientific content together with favela residents, artists, educators, and researchers in various disciplines. Its primary objective is using the inspiration and restorative power of astronomy (Mdhluli et al. 2025; Vertue 2022) to co-produce knowledge and promote the right to full and informed citizenship for favela dwellers who face discrimination and whose socioeconomic vulnerability is rooted in the structural racism and violence that still impact wide segments of Brazilian population, such as the Afro-descendants and indigenous communities (Ribeiro Corossacz 2005; Ioris 2023). Through this paper, we share some reflections on: 1) the transdisciplinary dialogue established during the project, particularly among the astronomical, pedagogical, and anthropological perspectives; 2) the actions undertaken aimed at combating school dropout among children and developing professional skills among young adults and adults; and 3) on the co-production of knowledge and practices from a decolonial,

participatory, transdisciplinary, and reflexive approach. The combination of educational practices with the implementation of ethnographic research methodologies aimed at stimulating a reflection on the project experience itself aims at fostering the ability to imagine and design more just and sustainable futures in the global context, from below, by recognizing and enhancing the potential of too often silenced and marginalized voices.

FUTURE TEACHERS IN CONTESTED TIMES: SCIENCE-RELATED POPULISM, EPISTEMIC TRUST, AND SCIENCE EDUCATION

Stefano Pasta (Catholic University of the Sacred Heart, Italy) · **Alessandra Carenzio** (Catholic University of the Sacred Heart, Italy) · **Simona Ferrari** (Catholic University of the Sacred Heart, Italy) · **Federica Pelizzari** (Catholic University of the Sacred Heart, Italy)

Science education | science-related populism | trust in science

In contemporary information ecosystems, critical thinking is increasingly challenged by conspiracy thinking and by what the literature defines as science-related populism (Mede & Schäfer, 2020). This notion refers to discursive and social dynamics that construct an antagonism between ordinary people, assumed to be virtuous, and scientific or academic elites, assumed to be corrupt or self-interested (Bory, Giardullo, Tosoni, & Turrini, 2023). Within this framework, scientific knowledge becomes a contested terrain where the legitimacy of expertise, the authority of institutions, and the boundaries of democratic participation are constantly negotiated (Pasta & Raviolo, 2023). Such tensions are particularly visible in highly mediatized environments, where the social web plays a central role in the circulation of alternative knowledge claims and in the delegitimization of epistemic authorities (Pasta, 2018). In a post-truth regime (McIntyre, 2019), science-related populism mobilizes different "repertoires of contestation" (Ylä-Anttila, 2018), that is, argumentative strategies aimed at questioning established scientific knowledge and at weakening trust in those institutions responsible for its production and validation. These dynamics pose significant challenges for education, especially in relation to STEM disciplines, where the teaching of scientific concepts cannot be separated from the development of epistemic trust, critical inquiry, and responsibility in the public use of knowledge (Carenzio, Ferrari, Pasta, 2024; Pasta, 2025). In postdigital society, characterized by high uncertainty, collective stakes, and the need for inclusive deliberation, fostering scientific citizenship requires educational approaches that make visible the processes, negotiations, and limits through which scientific knowledge is produced. This contribution is situated within the interdisciplinary research project Communicating Science. Mediation and mediators of scientific knowledge in complex societies (Catholic University of the Sacred Heart, 2022–2025), which investigates how individuals construct their understanding of science within contemporary media environments. The paper presents the results of a survey conducted in November 2025 among students enrolled in primary teacher education programmes at the Catholic University of the Sacred Heart (Milan, Brescia, and Piacenza campuses). The survey explored sources of scientific information, media consumption related to science, trust in science, epistemic trust, science-related populism, naïve scientism, and beliefs about gender inequalities in STEM fields. These data are compared with the results of the same survey administered in 2024 to a statistically representative sample of the Italian population. The comparison allows us to analyse how future teachers position themselves within current conflicts around scientific knowledge and to reflect on the educational implications of these attitudes in terms of scientific

citizenship, epistemic responsibility, and democratic participation. The findings suggest that the development of scientific citizenship cannot rely only on the transmission of scientific content, but requires educational practices that engage learners in the reconstruction of knowledge, in the recognition of uncertainty, and in the evaluation of the social consequences of scientific claims. In this perspective, teacher education becomes a crucial space for cultivating reflective and responsible forms of participation in the public life of science, capable of countering conspiracy thinking and science-related populism while preparing future citizens to navigate complex socio-ecological and technoscientific futures Brotherton, 2021).

Beyond the Screen: Educational Mediation, Children's Rights, and Digital Citizenship in Early Childhood

PANEL CONVENORS: Gianna Cappello (University of Palermo, Italy); Maria Ranieri (University of Florence, Italy)

PANEL KEYWORDS: Digital infancy, early childhood education, children's rights

The expansion of digital technologies and algorithmic infrastructures is reshaping children's life, anticipating their entry into the "platform society", influencing early practices of socialization, exploration, and meaning-making. Children's digital biographies now begin before preschool, as touch-responsive interfaces and data-driven platforms lower access barriers and embed algorithmic logics into intimate family routines (Livingstone & Sefton-Green, 2025; Mascheroni & Siibak, 2021). These transformations often produce polarized reactions: prohibitionist approaches that remove digital opportunities to prevent cognitive or socio-emotional risks, and, conversely, an uncritical reliance on the "babysitting screen," which turns devices into passive entertainment tools and delegates care and regulation to technology. Both stances appear reductive when compared with empirical evidence documenting the complex effects of early screen use and with children's rights to participation, expression, and play affirmed in the UN Convention on the Rights of the Child. Educational mediation emerges as an intentional practice that protects children from premature datafication and profiling while nurturing their agency, exploratory attitudes, and symbolic capacities within increasingly complex digital ecosystems (Cappello & Ranieri, 2025). This panel invites sociological, pedagogical, and interdisciplinary contributions that examine the tensions, opportunities, and responsibilities generated by young children's early encounters with digital technologies. We aim to discuss models of educational guidance that foster autonomy, critical awareness, social justice, and equitable digital environments for early childhood. We welcome empirical research proposals investigating young children's digital practices, educators' and families' mediation strategies, governance and datafication dynamics, and theoretical or methodological contributions that advance critical, justice-oriented approaches to early childhood digital environments.

ART AS A GENERATIVE ENCOUNTER: EDUCATIONAL PRACTICES IN EARLY CHILDHOOD AND INFANT EDUCATION AND MEDIA EDUCATION

Angela Daniela Sortino (Università di Palermo, Italy)

Early childhood education | media education | artistic experience

This paper investigates the constitutive role of art in early childhood and childhood education, a role that extends beyond a purely instrumental or recreational dimension. The hypothesis is that artistic experience, as a cognitive and transformative practice, acts as a catalyst for reorganizing educational practices towards a model of circular knowledge, where traditional pedagogical dichotomies dissolve into an ecological and relational paradigm (MIM, 2021). Within this framework, each creative act by the child is reconceived as a unified act of expression and reflection (MIM, 2012). It is not merely a matter of producing an artifact, but of understanding artistic doing as discovery, play, and a cognitive process mediated through a medium (painting, clay, movement, sound, digital), in a process where sensory experience, manipulation, and symbolic elaboration are inseparable (Munari, 1977). The resulting learning is dynamic and integrated, following not a linear but a reticular and regenerative model, co-constructed in the dialogue between the child's action, the shaping of thought, and subsequent critical re-elaboration, both individually and in groups. This approach enables an understanding of the mechanisms and evolution of the hundred communicative and expressive languages (Malaguzzi, 1996) through any mediator, including digital ones, in relation to the characteristics of the developmental stage. Adopting a media-educational perspective, this proposal contributes to the educational project in which the school assumes the responsibility of accompanying children's growth through the implementation and progressive conceptualization of their experience of reality, and the empirical knowledge of the possibilities offered by different technologies. The heuristic experience becomes a multisensory encounter with reality, where the prepared environment, understood as a "third educator", and the relationship with the adult mediator are central. The encounter with art is facilitated by narrative strategies, as demonstrated by the operational examples on artists (Haring, Mirò) conducted in a nursery. The article also integrates a media education perspective, promoting the creative and integrated use of digital technology to enhance expressive languages and document processes. One technique that fosters the development of multiple languages (verbal, visual, sound, and digital) is digital storytelling, which naturally lends itself, even in the preschool context, to an initial form of awareness regarding the creative use of digital media from the perspective of media literacy education (Zini et al., 2018; Ranieri, 2018; Cappello & Ranieri, 2026). From this perspective, media education adopts a logic of integration, aimed at ensuring that digital languages are mastered more effectively by both adults and children (Rivoltella, 2017). Educational

services can initiate a dialogue that fosters mutual enrichment and contributes to providing increasingly meaningful experiences for children, starting from the 0-6 age group (Tisseron, 2013; Di Bari & Mariani, 2018; Cappello & Ranieri, 2026). Teaching through art takes the form of an epistemological paradigm, the aim of which is to educate children in "thinking creativity" and aesthetic sensitivity from the outset. Educational mediation emerges as an intentional practice that protects children from premature datafication and profiling while nurturing their agency, exploratory attitudes, and symbolic capacities within increasingly complex digital ecosystems (Cappello & Ranieri, 2025)

Digital Infancy | Educational Mediation | ECEC services

The expansion of digital technologies is redefining the socialization practices of children under six, anticipating their entry into the "platform society." This contribution presents the findings of an extensive quantitative study conducted within the framework of the PRIN 2022 Di.Co.Each. project. The research involved a robust sample of 2,041 parents and 667 ECEC (Early Childhood Education and Care) professionals across Italy, exploring the tension between adult perceptions, parental, technological and professional self-efficacy, and actual mediation practices. Data reveal almost universal digital accessibility: 93% of families own a smartphone and 73% a tablet. However, a significant "usage paradox" emerges: despite high availability, 65% of children aged 3-6 use these devices for less than 30 minutes daily, reflecting a mediation style often dictated by parental anxiety or restrictive gatekeeping. A key finding concerns the "regulative" use of technology: 33% of parents admit using devices primarily to manage children's behavioral needs - such as during meals or to soothe tantrums - effectively falling into the "babysitting screen" model, where care and regulation are partially delegated to the device. Furthermore, the research highlights a systemic misalignment between home and school. While parents are often skeptical about digital tools in nurseries, fearing they might limit socialization, educators show a cautious openness towards their pedagogical potential. Crucially, the study finds that parental digital self-efficacy (the perception of being a "competent guide") is a stronger predictor of supportive mediation than technical skills alone. For professionals, the lack of specific training remains the primary barrier to integrating digital tools into a structured "critical-agency" framework. Through the lens of the UN Convention on the Rights of the Child, the analysis discusses how these gaps risk exposing children to premature datafication. This contribution concludes by advocating for a "pedagogical alliance" between families and ECEC services to transform digital devices from passive entertainment tools into environments for symbolic exploration, ensuring equitable digital citizenship and protecting young children's agency.

PROMOTING MEDIA EDUCATION IN THE EDUCATIONAL SYSTEM 06

Gabriele Lugaro (CED Centro per l'Educazione al Digitale A.P.S., Italy) · **Jacopo Ferro** (CED Centro per l'Educazione al Digitale A.P.S., Italy)

media education childhood families

Promoting media education is a pressing educational priority today that involves all stakeholders in the education system. Introducing it as early as preschool helps foster and facilitate dialogue among families, children, teachers, and local authorities, promoting informed, critical, and creative approaches to language, environments, and digital media at various levels. Let's explore these levels in greater depth by identifying action plans for promoting media education activities starting in early childhood. Due to space constraints, we will focus primarily on activities to be promoted in preschool: 1) The design and implementation by teachers of educational activities in preschool that promote the use of digital technologies and tools as available resources capable of broadening children's horizons of knowledge and discovery. These activities are designed and tailored to the needs emerging from the classroom groups, with a view to integrating digital languages and tools in dialogue with the school curriculum, aimed at fostering active approaches, reflective practices, and critical thinking in young children. The goal is to reconceptualize digital tools and screens, transforming them from objects of desire into potential tools of knowledge in dialogue with other cognitive and communicative languages. 2) The organization of regular meetings with families to discuss and exchange views on the management and use of digital technology and screens in home and school settings, with the aim of revitalizing the school-family relationship and promoting media education within families. These meetings also facilitate participatory practices that promote mindful parenting; when cultivated from early childhood, these practices can foster the development of educational communities and virtuous, generative educational ecosystems across all school levels and grades. The meetings can also lead to the creation of documents shared among families—such as recommendations, agreements, or digital school-family contracts—designed to foster shared and participatory educational approaches within classroom groups and educational communities. 3) Periodic quantitative monitoring of digital usage habits within family settings through the administration of questionnaires. Data collection enables families and educational services to reflect on the issue and facilitates the implementation of public policies that involve educational, psycho-pedagogical, and social welfare plans and services, promoting integration with local authorities in each area (municipalities, local health authorities, consortia, social-health districts, and service areas). The project proposal outlined here is the result of the work and initiatives carried out over the years by CED Centro Educazione Digitale A.P.S., which have made it possible to identify best practices capable of engaging all stakeholders in educational systems by promoting generative dialogic, pedagogical, and democratic processes.

DIGITAL MEDIA EDUCATION. ANALYSIS AND PROPOSAL OF A GUIDELINE SYSTEM FROM EMPIRICAL EVIDENCE ON FIELD THROUGHOUT ITALIAN SCHOOL

Jacopo Ferro (CED Centro per l'Educazione al Digitale A.P.S., Italy) · **Gabriele Lugaro** (CED Centro per l'Educazione al Digitale A.P.S., Italy)

media education | technology | school

In 1979, Neil Postman observed that American children spent, from 5 to 18 years old, more time in front of the television than in a classroom: about 15'000 hours against 11'500. That's why he considered television as the first curriculum, defining it (not without concern) "the greatest pedagogical enterprise in history." Decades later, with the rise of smartphones, screen time has only increased and evolved in its consumption — raising urgent questions about how digital media actually impacts, and what role schools can play in response. This project presents the evidence and framework of the CED – Centro Educazione Digitale, which has partnered with dozens of school communities across northern Italy, engaging more than 5000 families and students from early childhood through secondary school. Drawing on survey data about communities' digital habits and perceptions along the whole compulsory school course (0-18), the CED developed four interconnected guidelines: involving families through shared "Digital Contracts"; conducting hands-on media education workshops with students; training teachers from nursery level upward in critical digital literacy; and monitoring the phenomenon over time through quali-quantitative questionnaires. We analyse how these guidelines were implemented across the different age groups and schools, examining what worked, where difficulties arose, and what measurable outcomes were achieved. The findings suggest that meaningful digital education requires a whole-community approach, and that integrating digital tools as instruments of knowledge — rather than mere objects of desire — is both possible and necessary.

WHEN TOYS TALK BACK: ANTHROPOMORPHIZATION, DATAFICATION, AND A NEW MEDIA EDUCATION AGENDA FOR EARLY CHILDHOOD

Michele Marangi (Università eCampus, Italy) · **Matteo Adamoli** (Università eCampus, Italy)

Gen AI | Anthropomorphization | Early Childhood

The proliferation of connected, voice-responsive, and algorithmically driven toys is profoundly reshaping children's earliest encounters with digital technologies. The Internet of Toys (IoToys), a subset of the broader Internet of Things, embeds data collection and platform logic into objects traditionally associated with play, care, and imaginative development (Mascheroni & Holloway, 2019). This paper presents a theoretical framework for examining the intersection of anthropomorphization, datafication, and children's digital rights within this emerging landscape (Marangi, 2026). The anthropomorphic design of smart toys, devices engineered to simulate emotional responsiveness, personality, and conversational agency, operates as a structural mechanism that erodes children's critical distance toward data-extractive systems. When toys appear to listen, respond, and remember, the boundaries between play and surveillance dissolve in ways that children, and often their caregivers, are ill-equipped to recognize or contest (Raffaghelli, 2022). Children's digital biographies now begin well before preschool, as algorithmically driven interfaces embed platform logics into intimate family routines, generating asymmetries of power that existing regulatory frameworks have yet to adequately address. Building on the concept of the child data citizen (Barassi, 2021), the framework situates IoToys within the governance gaps that persist despite normative advances represented by the UN Convention on the Rights of the Child,

the GDPR, and the EU Digital Services Act. Legal protection alone, however, remains insufficient. The most urgent intervention lies at the level of educational mediation and specifically in the formation of the adults who share children's earliest digital experiences: parents, early childhood educators, and teachers working in the 0–6 age range (Livingstone & Blum-Ross, 2020). In this perspective, the media education framework, in its most current formulation (Rivoltella, 2020), emerges not as a supplementary skill but as a foundational professional competence for all those who live or work in proximity to early childhood. Such adults must develop an ethical, not merely technical, orientation toward the digital revolution (Adamoli, 2020), and cultivate the capacity to recognize anthropomorphic design strategies, understand datafication dynamics, and engage children in age-appropriate forms of critical reflection on their relationships with connected objects (Mascheroni, 2025). This requires rethinking the very concept of digital competence in light of the transformations brought about by AI, reframing it as an increasingly relational and critical disposition (Ranieri, 2024) that encompasses the ability to decode the affective and ideological dimensions embedded in smart technologies, and to support children in developing genuine agency within, rather than mere exposure to, digital ecosystems (Livingstone & Sefton-Green, 2025). Such a reframing places the quality of adult-child mediation, rather than the device itself, at the center of any meaningful approach to children's digital rights.

Convivial Pedagogies for the Age of AI: Autonomy, Bias Awareness, and Democratic Non-Homogenization

PANEL CONVENORS: Tiziana Catarci (Cnr); Ines Crispini Crispini (University of Calabria); Aldo Pisano (University of Calabria)

PANEL KEYWORDS: AIED, Ethics, Non-directive Education

This panel examines how non-directive education traditions—drawing on Tools for Conviviality by Ivan Illich and Pedagogy of Autonomy by Paulo Freire—offer critical resources for rethinking democratic education in an era increasingly shaped by artificial intelligence. Rather than approaching AI as a neutral instrument, the panel conceptualizes it as an emerging form of agency whose computational logics may foster dependency, epistemic homogenization, and the erosion of human autonomy. Illich's analysis of radical monopolies and his notion of thresholds of mutation illuminate how digital infrastructures may cross a critical point beyond which tools cease to support autonomy and instead reorganize educational experience around efficiency, predictability, and control. In parallel, Freire's emphasis on ethical self-formation and dialogical responsibility frames education as an inherently moral and political practice aimed at cultivating critical agency. The panel argues that the theoretical apparatus of non-directive pedagogy can be translated into concrete educational practices oriented toward the co-construction of knowledge, the critical examination of algorithmic and cognitive biases, and the cultivation of dialectical argumentation as a democratic competence. Against educational models prioritizing prediction and standardization, convivial pedagogies promote reflective judgment, plural reasoning, and participatory learning environments. By integrating insights from philosophy of education, virtue ethics, and critical AI studies, the panel articulates an interdisciplinary framework for empowering learners to engage with AI without relinquishing autonomy or dialogical agency. Ultimately, it explores how educational institutions might reconfigure AI from an apparatus of normalization into a convivial partner sustaining democratic plurality.

BEYOND THE SINGLE ANSWER: CONVIVIAL AI PRACTICES FOR DIALOGIC KNOWLEDGE CO-CONSTRUCTION IN UPPER SECONDARY EDUCATION

Giulia Valentini (SIPEIA, Italy) · **Maurizio Valentini** (SIPEIA, Italy)

Convivial pedagogy | Non-directive education | Artificial intelligence in education

The growing integration of artificial intelligence in educational contexts often promotes efficiency-oriented models of learning based on prediction, standardization, and the delegation of judgment, where AI is approached as an immediate source of answers rather than as an object of inquiry. In this scenario, this contribution reframes AI education through the perspective of convivial and non-directive pedagogies, understood as practices capable of sustaining students' autonomy and the plurality of interpretative processes. This contribution draws on a situated educational experience in upper secondary education (grades 10–12) and is based on participant observation of a cycle of workshops specifically designed to critically explore the role of AI in learning processes. In this context, AI is not introduced as a tool for optimizing performance or providing correct solutions, but as an object of shared exploration and as a device for the dialogic co-construction of knowledge. The activities are designed to suspend the logic of the single correct answer and immediate validation, and to privilege the comparison of different interpretations, collective argumentation, and the negotiation of meaning within the classroom. Within this setting, AI's epistemic authority is deliberately decentered and interaction with generative systems becomes a participatory space in which knowledge is not received but constructed through dialogic practices. From this perspective, AI is framed neither as a neutral device nor as a performance-support tool, but as an element that renders visible the tensions between standardization and autonomy and enables a democratic reconfiguration of the educational environment. The theoretical framework is grounded in the traditions of convivial and non-directive pedagogies. Illich's notion of convivial tools allows AI to be interpreted as a technology that can either sustain or constrain autonomy depending on the educational practices in which it is embedded, while Freire's pedagogy of autonomy informs the design of learning environments based on dialogic responsibility, participation, and the co-construction of knowledge. The observations collected indicate that practices of this kind foster a use of AI that is not oriented toward delegation, but toward the production of spaces for plural reasoning in which students are called to take a position, engage with different perspectives, and actively participate in knowledge construction. In this light, AI education does not coincide with the acquisition of technical skills, but with the design of convivial contexts capable of sustaining autonomy, reflective

judgment, and democratic participation. This contribution engages with the panel by showing how the principles of non-directive pedagogy can be translated into concrete educational practices and how AI can be reconfigured, within such practices, from an apparatus of normalization into a convivial partner for democratic learning.

CONVIVIAL PERSONALISM AS A PHILOSOPHICAL FOUNDATION OF EDUCATION

Bernard Hostić (Institute of Philosophy, Croatia)

autonomy conviviality personalism

The presentation outlines the key philosophical ideas behind Ivan Illich's social criticism, with particular emphasis on the personalist elements within it as a possible paradigm for a renewed educational system. Illich captures the fate of the "new society" – the modern and postmodern age – with the following insight: "Our imaginations have been industrially deformed to conceive only what can be moulded into an engineered system or social habits that fit the logic of large-scale production. We have almost lost the ability to frame in fancy a world in which sound and shared reasoning sets limits to everybody's power to interfere with anybody's equal power to shape the world."1 He argues that we are not merely passing through a historical stage but inhabiting an era in which the ontological understanding of the human being is fundamentally reshaped. Humans increasingly become instruments and consumers of their own inventions rather than agents who use them to realize their creative and human potential. His criticism rests on two core concepts: vernacular values and convivial society. Vernacular values refer to the value systems found in indigenous cultures and small autonomous communities – systems grounded in mutual aid, independence from global institutional-industrial forces, and proportional reciprocity between human beings and their environment. Such a framework enables individuals to actualize their humanity by offering a concrete experience of human existence within a broader reality. The notion of a convivial society builds on these values, translating them into a vision for contemporary post-modernity. It represents a new epistemic and normative orientation toward reality – one that modern societies have largely lost. While the modern legal system grounds many of its principles in the concept of the person, Illich emphasizes another dimension often overlooked: the lived, relational experience of personhood. This dimension cannot be fully articulated in rights or declarations but manifests in direct, lived engagement with others. Here Illich's thought intersects significantly with the personalist tradition. True personal development, he argues, cannot be achieved solely through abstract theories or formal legislation but through a life-giving orientation toward the other: "We can only live these changes: we cannot think our way to humanity."2 The presentation is structured in three parts. The first introduces the philosophical foundations of Illich's social criticism. The second examines these concepts through the lens of personalist philosophy. The final section synthesizes the results and considers whether a convivial-personalist paradigm can serve as a viable framework for renewed understanding of contemporary society and new educational approaches. The central thesis of this presentation is that education and pedagogy must be grounded in the dignity and uniqueness of the human person, and only then expressed through specific educational approaches and methodologies. 1 Ivan Illich, Tools for Conviviality, Fontana (Glasgow: William Collins Sons & Co, 1975), 28. 2 Ivan Illich, Celebration of Awareness: A Call for Institutional Revolution (New York: Doubleday & Company, 1971), 3.

CONVIVIAL FUTURES: EDUCATING TO DEMOCRATIC AGENCY AND SOCIAL JUSTICE IN THE AGE OF AI

Valeria Piras (Istituto per le Tecnologie Didattiche, Consiglio Nazionale delle Ricerche (ITD - CNR), Italy) · **Stefania Bocconi** (Istituto per le Tecnologie Didattiche, Consiglio Nazionale delle Ricerche (ITD - CNR), Italy)

Convivial futures | Critical pedagogy | critical culture of digital innovation

In the age of artificial intelligence, digital innovation is often framed as neutral and efficiency-driven. Such narratives risk fostering passivity, epistemic homogenization, narrowing of imagination, and the erosion of democratic agency in new generations. Education, therefore, cannot be limited to integrate AI as an instructional resource or as a necessary skill to be taught; it must cultivate the individuals' capacity to interrogate, reappropriate, and reshape technologies in light of social justice and democratic values. What is needed is to foster a critical culture of digital innovation. Starting from the definition of a theoretical framework that integrates critical pedagogy, futures studies and sustainable digital innovation, the paper conceptualizes education as a cultural and political space where technologies can be understood through the lenses of social justice and democracy. Innovation processes, particularly those related to AI, need to be examined in relation to the values they embed and reproduce: they may reinforce inequalities, undermine human dignity and environmental sustainability, or alternatively become drivers of justice, cohesion and ecological responsibility. Within this perspective, schools are not merely sites of technological adoption but spaces of democratic imagination where pedagogical practices cultivate students' critical and anticipatory capacities. Drawing on Futures Studies, these approaches encourage learners to question existing technological paths and to imagine more just alternatives. This perspective advances a dual trajectory: supporting both teachers and students in developing critical and anticipatory competences while engaging in educational pathways oriented toward emancipation and the co-construction of more equitable technological futures. Central to this approach is to use "possible futures" as pedagogical spaces. Through anticipatory methodologies, such as speculative design, learners are fostered to imagine desirable futures grounded in democratic values and social justice and to identify pathways towards their realization. This process nurtures students and teachers' ownership and agency over the socio-technical systems that shape their lives, cultivating plural imaginaries and critical reasoning that resist algorithmic standardization. Within this perspective, convivial futures can be understood as both a pedagogical horizon and a methodological tool: collective futures explored through educational practices that enable individuals to question, reinterpret, and reshape technological innovation in light of democratic and socially just values. The paper briefly discusses the InspAIr laboratory as an exploratory application of this conceptual and methodological framework. In this experience, teachers and students collaboratively engage in speculative and critical inquiry around AI systems, highlighting embedded biases, power structures and sustainability implications. This pedagogical practice illustrates how convivial futures pedagogies can translate theoretical principles into concrete educational processes. Ultimately, the contribution argues that cultivating a critical culture of digital innovation among young generation is not simply an educational innovation, but a democratic necessity and urgency. By reconnecting technological development to the foundational values of social justice, plurality and collective responsibility, education can help reconfigure AI towards convivial futures that sustains democratic non-homogenization.

TOWARDS A DIGITAL REALISM. IRIS MURDOCH AND DIGITAL EDUCATION

Viviana Vozzo (Sapienza University of Rome, Italy)

Iris Murdoch | Digital Education | Moral education

This proposal aims to present an approach to Moral Education inspired by Iris Murdoch and apply it to Digital Education, suggesting that building a virtual image, strictly influenced by intersubjectivity and moral vocabulary, is not merely an escape, but rather an attempt to reconnect to the world through imagination, which might be defined as "digital realism". Indeed, Education plays a fundamental role in Iris Murdoch though, placing particular emphasis on the importance of context, in relation to which she focuses on the moral concept of vision, which, alongside imagination and attention, serves as an exploratory tool for engaging with reality. In this framework language plays a fundamental role in Iris Murdoch's thought: every choice is linguistically oriented, as she stated, «words are where we live as human beings and as moral spiritual agents» (Murdoch, 1972). In this view, language functions as a moral medium because each use implies a value judgement and creativity from the agent. From a literary perspective, driven by imagination, writers navigate a network of meanings that directly impact reality. Literature's urge towards completeness compensates philosophical language, by developing its moral vocabulary through a process of perfectionism. As "word-users" (Murdoch, 1978) we are constantly immersed in literature that we use to «make interesting forms out of experience» (Ibidem). Furthermore, language can modify ethical perspective, even before actions are taken. Today, the pervasiveness of digital technologies transforms the way we express ourselves through ordinary language. According to Murdoch, «we are all story-tellers and in this sense we are all literary artists» (Murdoch, 1978). With our "digital stories" we are shaping our identity and defining our "conceptual life" (Diamond, 2006). However, a virtual-based identity necessarily raises the problem of "reality". Similarly, the levels of attention and also learning methods, and language change. With our digital lives, we are exposed in our existential diary, previously relegated to the private sphere, the οἶκος, which now becomes public, becoming πόλις. Ordinary realism, through attention, allows us to essentially go beyond our own story. The use of digital technology, like all discussions on technique allows us to notice the vulnerability of others in a perspective of care and education "about" and "through" the digital. Any contemporary discussion of education as a fundamental aspect of moral realism, from a Murdochian perspective, must necessarily take into account the digital dimension, which provides an opportunity to reflect on the concepts that shape our moral lives.

ALGORITHMIC CONVIVIALITY AGAINST DIGITAL OPPRESSION

Giordana Truscelli (Università degli Studi di Teramo, Italy)

conviviality | digital oppression | education

In contemporary society, characterised by the accelerated and pervasive advancement of artificial intelligence, democratic education confronts a multitude of challenges. Primarily, it is imperative to avert the potential of computational logic to engender epistemic oppression. In this context, the pedagogical traditions of Ivan Illich and Paulo Freire can offer significant food for thought in finding solutions to these transformations. The initial point of departure will be Illich's analysis of radical monopolies1, which posits that the advent of new technologies has the potential to erode the autonomy of the learner, thereby fostering both genuine cognitive dependence and the homogenisation of knowledge. Indeed, the potential of AI to reduce the individual to a mere agent, one that automatically and mechanically follows instructions, is a matter of great concern. This would effectively prevent the individual from playing their own role as the architect of their cognitive activity, thereby stifling their ontological vocation to 'be more'. In the face of the looming spectre of technological determinism, the pedagogy of autonomy proposed by Paulo Freire is poised to emerge as a potential solution. This pedagogy emphasises the necessity of conceptualising education as a praxis of consciousness-raising2 and dialogical responsibility. Education, therefore, would help to foster a spirit of critical inquiry capable of transforming curiosity into a rigorous commitment to transforming reality, rather than a passive adaptation to it. Confronted with a predetermined algorithm, critical education encourages the learner to transcend rote learning and meticulously investigate the underlying rationales behind the information received, the conceptual frameworks employed by the designers of these machines, and the limitations of purely technical expertise. Finally, Illich's reflections on conviviality could offer a tool for rethinking the algorithm: from an instrument of domination and oppression, it becomes convivial, that is, open to user intervention and capable of stimulating doubt and debate through transparency and intellectual provocation. In this sense, the information provided by AI would cease to be considered as absolute truths, but rather as raw data on which the individual can exercise critical judgement by questioning their own biases and verifying sources. This process is instrumental in enabling the realisation of the autonomy of knowledge. 1 The term 'radical monopoly' is employed to denote the phenomenon in which an industrial production process exerts exclusive control over the satisfaction of a pressing need, thereby precluding the possibility of resorting to non-industrial activities. . Illich, Tools for Conviviality, Marion Boyars, 2001. 2 In this regard, Freire emphasises the need for critical thinking that enables us to uncover the causes of social barriers, transforming the notion of a 'predetermined fate' into one of possibility and agency. CONVIVIAL THRESHOLD DESIGN FOR ANCIENT GREEK WITH GENERATIVE AI: AUTONOMY, BIAS, DEMOCRATIC PLURALITY

Bruna Capuzza (Università di Bologna, Italy)

convivial pedagogy | Ancient Greek | democratic argumentation

Generative AI is rapidly entering language classrooms, including Ancient Greek, where its apparent fluency can tempt learners (and institutions) to outsource philological judgment. This paper argues that AI should be treated not as a neutral aid but as sociotechnical agency whose computational logics can reorganize educational life around efficiency, predictability, and the production of "one-best" answers. Drawing on Illich's analysis of "two watersheds" and radical monopoly, we hypothesize that educational AI may cross a threshold beyond which tools cease to support autonomy and instead generate dependency and epistemic homogenization. In parallel, Freire's pedagogy of autonomy frames learning as ethical self-formation through repeated, responsible decisions, precisely the kind of decisions demanded by Ancient Greek parsing and translation. We introduce Convivial Threshold Design for Ancient Greek (CTD-GR), a design-oriented intervention

translating non-directive pedagogy into implementable didactics. CTD-GR operationalizes three methodological aims – co-construction of knowledge, critical examination of algorithmic and cognitive bias, and dialectical argumentation as democratic competence – through a minimal activity architecture: (1) Threshold Mapping: teacher and students identify tasks where AI assistance becomes dependency (e.g., full translations, ready-made commentaries, automated morphology) and set "convivial limits" that preserve core human competences (parsing, reasoning about ambiguity, evidence-based justification). (2) Textual Co-translation Workshops: small groups produce parallel translations of a shared Greek passage, documenting alternative construals (case/tense/aspect, participial scope, particles, word order). AI may be queried only to generate contestable hypotheses ("possible readings"), which are then argued for or rejected through reference to grammars, lexica, and the Greek text itself. (3) Bias Audits on AI Glosses and Explanations: learners test AI-generated glosses, morphological parses, and cultural explanations under prompt variation, explicitly searching for (a) systemic bias (cultural frames and canon formation), (b) computational/statistical bias (patterned errors, confabulations), and (c) human-cognitive bias (over-trust in plausible outputs). Findings are recorded in an "error-and-evidence log" that becomes a shared class resource. CTD-GR culminates in a collectively negotiated "convivial use agreement" for Greek study –transparent, revisable, and aligned with assessment that rewards traceable reasoning over polished output. Expected democratic outcomes include autonomy in tool-use decisions, epistemic plurality in interpretation, reflective judgment (phronesis), and dialogical agency sustained by dialectical argumentation.

HUMAN-CENTERED ARTIFICIAL INTELLIGENCE, EMOTIONAL INTELLIGENCE, AND PEDAGOGIES OF CONVIVIALITY: REFRAMING AI AND EDUCATION FOR DEMOCRATIC LEARNING IN COMPLEX SYSTEMS

Matteo Ciaschi (National Research Council (CNR), Italy) · **Daniel Dan** (School of Applied Data Science, Modul University Vienna, Austria)

Artificial Intelligence | Emotional Intelligence | Human-Centered AI

Emotional intelligence constitutes a key educational and civic competence in contemporary learning environments marked by complexity, uncertainty, and intensified relational interdependence. At the same time, Artificial Intelligence is increasingly embedded in educational systems through learning analytics, adaptive platforms, automated assessment, and decision-support tools, profoundly reshaping pedagogical practices, institutional governance, and conceptions of learning itself. These developments raise critical questions regarding autonomy, agency, and the democratic purposes of education. Drawing on non-directive and critical pedagogical traditions—particularly Ivan Illich's notion of convivial tools and Paulo Freire's pedagogy of autonomy—this contribution examines the intersection of Artificial Intelligence, Emotional Intelligence, and education as a crucial site for rethinking democratic learning in the age of algorithmic mediation. Rather than approaching AI as a neutral educational technology, the paper conceptualizes it as an emerging form of agency whose computational logics may privilege prediction, optimization, and standardization, potentially fostering dependency, epistemic homogenization, and the erosion of ethical self-formation when uncritically adopted in educational contexts. Through a critical review of interdisciplinary literature in AI and Education, philosophy of education, and complexity studies, complemented by illustrative examples of AI-based educational applications, the study explores how Emotional Intelligence can function as a countervailing pedagogical resource. Specifically, it argues that emotional awareness, dialogical responsibility, and relational reflexivity are essential for enabling learners and educators to critically engage with AI-mediated learning environments rather than passively adapting to them. Furthermore, recent theoretical work calls for reconceptualizing AI in education beyond tools—toward hybrid human-AI systems that extend human cognition while foregrounding agency, motivation, and emotion. Particular attention is devoted to Illich's concept of thresholds of

mutation, highlighting the point at which educational technologies cease to support learning autonomy and begin to reorganize educational experience around control, surveillance, and behavioral normalization. From a Freirean perspective, the paper emphasizes that Emotional Intelligence in education should not be reduced to a measurable or optimizable variable within AI-driven systems, but understood as a dialogical, ethical, and political practice cultivated through participatory and critical pedagogical relationships. A concrete and hitherto under-theorized instantiation of this surveillance threshold is examined through an original empirical investigation of eye-tracking technology integrated within Moodle-based assessments delivered via Safe Exam Browser (SEB). Drawing on the convivial and Freirean frameworks developed in this study, the paper critically interrogates how the deployment of eye-tracking in lockdown examination contexts risks crossing Illich's threshold of mutation—transforming assessment from a site of authentic demonstration of learning into a normalized apparatus of biometric surveillance that may induce learner anxiety, self-censorship, and performative compliance rather than genuine cognitive engagement and critical sense-making. The contribution ultimately proposes a convivial framework for AI and Education, in which Artificial Intelligence is reconfigured from an apparatus of pedagogical automation into a reflective partner supporting critical inquiry, collective sense-making, and democratic participation. By aligning human-centered AI with pedagogies of conviviality, the study offers theoretical and practical insights for designing educational environments that resist technocratic reductionism and promote autonomy, plural reasoning, and democratic agency in complex learning systems.

HUMAN-IN-THE-LOOP AI-GENERATED FLASHCARDS: A CONVIVIAL FRAMEWORK FOR ETHICAL INTEGRATION AND PROFESSIONAL AUTONOMY IN EMERGENCY MEDICINE

Antonella Fontana (Department of Life, Health and Environmental Sciences (MESVA), University of L'Aquila, Italy) · **Antonio Cirella** (Department of Life, Health and Environmental Sciences (MESVA), University of L'Aquila, Italy) · **Silvano Junior Santini** (Department of Life, Health and Environmental Sciences (MESVA), University of L'Aquila, Italy) · **Valerio Caputo** (Department of Life, Health and Environmental Sciences (MESVA), University of L'Aquila, Italy) · **Ivan Letteri** (Department of Life, Health and Environmental Sciences (MESVA), University of L'Aquila, Italy) · **Pierpaolo Vittorini** (Department of Life, Health and Environmental Sciences (MESVA), University of L'Aquila, Italy) · **Clara Balsano** (Department of Life, Health and Environmental Sciences (MESVA), University of L'Aquila, Italy; Geriatric Unit, Department of Life, Health and Environmental Sciences, University of L'Aquila, L'Aquila, Italy)

Emergency Medicine · Medical Education · Human-in-the-Loop Artificial Intelligence

In the high-stakes environment of Emergency Medicine (EM), the rapid expansion of clinical knowledge threatens to create a "radical monopoly" where learners may become dependent on non-transparent digital tools. The employment of Artificial Intelligence (AI) in this field raises central ethical questions regarding patient safety, clinical accountability, and the reliability of generated information. International guidelines, such as FUTURE-AI and the WHO guidance, emphasize that AI adoption must remain anchored in the bioethical principles of beneficence, non-maleficence, autonomy, and justice. In this context, explicability plays a crucial role, as AI systems must provide outputs that are understandable, traceable, and open to critical scrutiny by human professionals. Our study strictly adheres to the ethical principles of AI application in medicine, ensuring that technological innovation remains at the service of human responsibility and clinical oversight. This initial version of the app represents a primary validation of purely educational content, aimed at relieving

educators of formatting burdens while maintaining scientific accuracy. The strategic goal of our work was to establish a robust ethical and qualitative foundation to subsequently evolve the tool into a clinical decision support system (CDSS) for real-time use in Emergency Departments. We conducted a two-arm, randomized controlled trial involving 123 evaluations from Italian EM residents and specialists. The study compared a traditional human-driven workflow with an innovative "human-in-the-loop" AI-assisted approach using GPT-4 to generate flashcards validated by external subject matter experts. The adopted methodology directly targeted the risk of AI hallucinations by safeguarding the central role of the human educator as the final authority for clinical validation and responsibility. The results demonstrate that human-revised, AI-assisted flashcards achieved significantly higher mean scores in relevance (3.97 vs. 3.61), correctness (3.83 vs. 3.62), and clarity (3.86 vs. 3.71). Conversely, human-only content scored higher in informativeness (3.74 vs. 3.72), highlighting that human expertise is essential for providing nuances based on real-world experience and critical alerts. Our study highlights that the integration of AI into medical education should be understood as a collaborative and ethically grounded process rather than a substitutive one. Framing AI as an initial support tool, systematically followed by expert clinical review, aligns its use with the fundamental principles of biomedical ethics: it promotes beneficence by enhancing decision quality, safeguards non-maleficence through human validation of outputs, preserves professional and learner autonomy by preventing overreliance on opaque systems, and supports justice by encouraging transparent and accountable use of technological resources. Within this model, AI does not function as a surrogate decision-maker but as a form of ethically supervised cognitive augmentation, strengthening reflective clinical reasoning while ensuring that responsibility, interpretive authority, and patient-centered judgment remain firmly in human hands.

LOGIC-CONSTRAINED PROMPT LEARNING FOR EUCLIDEAN GEOMETRY EDUCATION

Simone Cuconato (Department of Physics, University of Calabria, Rende, Italy) · **Roberto Beneduci** (Department of Physics, University of Calabria, Rende, Italy; National Institute of Nuclear Physics (INFN), Rome, Italy) · **Alberto Saracco** (Department of Mathematical, Physical and Computer Sciences, University of Parma, Parma, Italy)

Human-centered AI | Logic-constrained prompt learning | Mathematics education

This contribution introduces a pedagogical and methodological framework for the integration of LLMs into secondary mathematics education through logic-constrained prompt learning [1], a paradigm of structured interaction in which the prompt is conceived as a logical object and the reasoning generated by AI is explicitly constrained by formal proof procedures [2,3]. Rather than employing AI systems as solution generators, the proposed approach reconfigures them as inference-guided reasoning environments and, simultaneously, as agents of reasoning verification, whose outputs must conform to transparent deductive constraints. The framework is illustrated in the context of high-school-level Euclidean geometry problems, where the primary objective is not merely to obtain the correct result, but to master the procedural structure of mathematical inference. The central idea is to reinterpret the solution of elementary geometric problems as a satisfiability-driven logical task. The proof task is then operationalized by constructing a classical analytic tableau for the set composed of the premises together with the negation of the thesis. Closure of the tableau corresponds to the impossibility of a countermodel and therefore to the logical validity of the geometric conclusion. This transformation enables students to perceive geometric proofs not as narrative arguments, but as structured inferential processes governed by explicit rules. Within this setting, the LLM is queried under stringent procedural constraints: it must expand formulas exclusively via the standard tableau rules, label each inferential step, avoid introducing undeclared theorems, and explicitly indicate branch closures and contradictions. Such constraints reduce the model's tendency to provide heuristic or intuitive explanations and instead impose the production of traceable proof objects. The resulting interaction introduces a form of dialogical agency, in which the AI participates in the inferential process as a regulated interlocutor,

and shifts epistemic authority from the generative system to the formal framework: correctness does not depend on the plausibility of the explanation, but on the verifiability of the derivational structure. Students are thus encouraged to analyze, critique, and reconstruct the tableau, developing metacognitive awareness of proof structure and logical dependencies among statements. From a theoretical perspective, the framework establishes a constructive equivalence between elementary geometric demonstration and formal logical consequence, offering a unified view of mathematical reasoning across different domains. From a pedagogical perspective, it supports three complementary learning outcomes: explicit understanding of deductive chains in geometry, development of formalization skills through controlled propositional encoding of mathematical statements, and critical engagement with AI outputs as objects of validation rather than authoritative answers. The approach is compatible with collaborative classroom practices such as inquiry-based learning and thinking-classroom models, and requires only minimal formal knowledge beyond an introduction to classical propositional logic. The proposed methodology contributes to research on human-centered AI in education by offering a replicable model for integrating LLMs into proof-oriented disciplines without sacrificing rigor or transparency. Through the direct incorporation of formal proof procedures into the prompt structure, logic-constrained prompt learning enables AI to operate simultaneously as an environment and an agent of reasoning verification, thereby fostering reflective judgment, rigorous reasoning, and participatory learning contexts.

USING, NOT BEING USED: TOWARD A CONVIVIAL PEDAGOGY OF AI WITH ADOLESCENTS

Emiliana Murgia (University of Foggia) · **Filippo Bruni** (University of Molise)

AI perceptions and practices | Convivial Pedagogy | Critical AI Literacy

The global AI debate reveals, at the geopolitical level, what Ivan Illich (1973) would recognize as the emergence of a radical monopoly: the control of artificial intelligence is explicitly and directly tied to the struggle for world leadership, among nations with sharply divergent values, visions, and practices (Aresu 2024). When a technology reaches this threshold, it no longer merely supports human activity but begins to reorganize social and educational experience around efficiency, predictability, and control. Against this backdrop, the relationships between Artificial Intelligence (AI), democratic education, and citizenship formation become not merely relevant but urgent. Educational technologies are never neutral. The concept of affordance reminds us that tools push toward specific uses while remaining open to different pedagogical orientations: the same instrument can serve transmission-based or constructivist approaches. In Freirean terms, this distinction maps onto the difference between education that reproduces dependency and education that cultivates critical agency (Freire 2014). This tension becomes particularly acute with AI. Drawing on Ranieri, Biagini and Cuomo's distinction (2023) between educating with and educating about AI - and in dialogue with UNESCO (Miao & Shiohira 2024, Cukurova & Miao 2024) frameworks on AI competencies - we argue that convivial pedagogy requires both dimensions simultaneously: using AI as a dialogical partner while developing the critical literacy to examine its computational logics, biases, and epistemic effects. A critical pedagogy of AI must begin from where learners actually are. AI is not new to users' experience: long before conscious engagement with tools like ChatGPT or Gemini, it has shaped daily life through recommendation systems operating largely below the threshold of awareness. Levels of AI literacy are highly differentiated and mapping them is not merely a diagnostic exercise - it is itself a pedagogical act. Surfacing implicit perceptions reveals what we might call personal philosophies of AI: tacit assumptions about agency, trust, and knowledge that risk fostering exactly the epistemic dependency and homogenization that convivial pedagogy seeks to counter. Empirical investigation of perceptions and practices thus provides both a necessary starting point for educational design and a means of motivating learners toward more conscious, critical engagement (Bruni & Murgia 2024). Recent data reveal both the scale and the stakes of this challenge. According to EU Kids Online (Mascheroni, Rosichini & Cino 2026), 89% of Italian children and adolescents used generative AI in the past month - rising to 98% among 15-16-year-olds - primarily as a learning support tool, with ChatGPT described as «a teacher always available». Yet adolescents themselves

identify dependency as the dominant risk: AI, they fear, will make them «lazier and less capable». This self-awareness is a pedagogical resource. Drawing on a survey conducted with high school students in Milan, the study maps AI perceptions and practices as a first step toward designing convivial educational environments that harness these tools without surrendering critical agency to them. The findings suggest that a Freirean pedagogy for the AI era must begin precisely here - transforming adolescents' tacit concerns into conscious dialectical inquiry, and their habitual use into reflective, autonomous action.

Critical Dialogue with AI in Schools: Metacognition, Agency, and Democratic Learning

PANEL CONVENORS: Nadia Sansone (UnitelmaSapienza University of Rome, Italy)

PANEL KEYWORDS: AI Literacy, Metacognition, Dialogical Pedagogy

Artificial intelligence is entering educational institutions at unprecedented pace. Without deliberate critical practice, we risk automating the very spaces where democracy and human agency should flourish. Yet a crucial question remains: how can we ensure that AI becomes a tool for deepening critical thinking and human agency, rather than a mechanism for automating decisions and outsourcing pedagogical judgment? This panel explores AI integration in education through the lens of foundational sociocultural and metacognitive frameworks. Drawing on Vygotsky's Zone of Proximal Development, we position AI not as a replacement for human mediation but as a potential mediator—one that requires rigorous critical reflection to function ethically. Metacognition (Flavell) and dialogism (Bakhtin) become central: learners and educators must develop awareness of how they interact with AI systems, understanding AI as a dialogical partner rather than an oracular authority. We welcome research addressing two interconnected dimensions. First, the teacher's role: how can educators use AI responsibly for lesson design, content creation, and assessment while maintaining pedagogical agency and ethical judgment? Second, student empowerment: what pedagogical approaches foster critical AI literacy, meaningful participation, and metacognitive self-evaluation rather than passive consumption? This panel invites empirical studies, theoretical frameworks, and case studies examining AI integration across diverse educational contexts—from primary to adult education, formal to informal settings. We seek work that grapples with tensions between innovation and critical caution, automation and agency, efficiency and democratic deliberation. The aim is to generate dialogue among researchers, educators, and practitioners committed to embedding democratic values into educational AI adoption.

CRITICAL DIALOGUE WITH AI IN MATHEMATICS EDUCATION: METACOGNITION, AGENCY, AND TEACHER MEDIATION IN A CLASSICAL HIGH SCHOOL CONTEXT

Manuela Pipitone (Liceo Ginnasio Statale "Francesco Scaduto" - Bagheria, Italia)

Metacognition | Mediation | Mathematics

The rapid diffusion of artificial intelligence in educational contexts is reshaping the epistemic conditions of teaching and learning, particularly in mathematics education, where generative systems provide immediate solutions and procedural explanations. While such tools offer new forms of cognitive support, they also raise critical concerns regarding student agency, pedagogical judgment, and the preservation of democratic learning spaces within increasingly datafied environments (Williamson, 2017). The challenge, therefore, extends beyond technological adoption to the cultivation of critical AI literacy, understood as the capacity to question, interpret, and responsibly engage with algorithmically generated knowledge (Long & Magerko, 2020). This paper presents a classroom-based study conducted in a classical high school in Bagheria (Sicily, Italy), where AI-powered mathematical applications were integrated through structured pedagogical

mediation. Drawing on Vygotsky's sociocultural framework (1978), AI is conceptualized as a mediating artifact operating within the learner's Zone of Proximal Development rather than as an autonomous authority. Metacognition (Flavell, 1979) and dialogism (Bakhtin, 1981) provide the theoretical lens through which student–AI interaction is analyzed. The study adopts a mixed-method case-study design. A structured questionnaire administered to the entire course provided descriptive data on students' patterns of AI use, while qualitative thematic analysis of student narratives examined processes of cognitive support, cognitive delegation, metacognitive engagement, and teacher mediation. Questionnaire findings indicate that most students initially approached AI as a procedural support tool, whereas a smaller group demonstrated explicit metacognitive monitoring and systematic comparison between AI outputs and classroom reasoning. Qualitative analysis further revealed differentiated trajectories of instrumental use and reflective appropriation. Rather than interpreting instrumental engagement as failure, the study frames such variability as part of a process of instrumental genesis (Rabardel, 1995), through which learners progressively appropriate new cognitive tools. Sustained teacher mediation functioned as an epistemic anchor, ensuring that AI outputs remained embedded within disciplinary mathematical reasoning rather than substituting it. The findings suggest that AI integration, when embedded within dialogical pedagogy and supported by metacognitive scaffolding, can strengthen student agency and sustain democratic learning environments. In this perspective, critical dialogue with AI emerges as foundational to preserving mathematics education as a space of reflective judgment, disciplinary rigor, and responsible technological engagement.

WHO CONTROLS WHOM? DEVELOPING METACOGNITIVE AGENCY THROUGH AI-RESISTANT DEBATE IN AN ITALIAN SECONDARY SCHOOL

Giulia Calogero (IISS DON MILANI PERTINI MORANTE - GROTTAGLIE (TA), Italy)

Alliteracy | metacognition | authenticassessment

The rapid integration of generative AI into educational contexts raises a fundamental pedagogical question: how can schools prevent students from delegating thinking to machines and instead cultivate the critical agency that democratic education requires? This contribution presents an empirical case study developed in a secondary vocational school (Servizi Socio-Sanitari, IISS Don Milani Pertini Morante, Grottaglie, Italy), exploring how a deliberately designed pedagogical framework — the AI-Resistant Debate — can transform AI interaction into a site of metacognitive practice. The framework rests on a core assumption aligned with Vygotsky's Zone of Proximal Development: AI does not replace human mediation but can function as a challenging dialogical partner (Bakhtin) whose outputs demand critical scrutiny. In the AI-Resistant Debate, student teams are invited to use generative AI tools (ChatGPT, Gemini) during the preparation phase, but with a crucial constraint: they must keep an AI-Log — a reflective diary documenting every AI suggestion accepted, every one rejected, and the reasoning behind each decision. This protocol becomes a powerful metacognitive mirror (Flavell, 1979): by externalising their decision-making process, students learn to distinguish their own reasoning from automated output, to identify hallucinations, and to exercise what the framework terms "critical prompting" — the capacity to interrogate AI rather than accept it as an oracular authority. Two complementary activities enrich this core design. In the augmented storytelling modules, students used NotebookLM and Gemini to reinterpret canonical literary texts (Dante, D'Annunzio, Verga) and historical sources (Magellan's circumnavigation) in multimodal formats: podcasts, infographics, video scripts, and vision boards. Here, the AI-Log evolved into a production diary tracking creative agency — which ideas originated with the student, which were AI-generated, and how human and machine authorship were negotiated. A complementary Prompt-Book for Authentic Assessment provides teachers with structured prompts for metacognitive evaluation, including a rubric specifically designed to assess the quality of students' AI dialogue — distinguishing passive consumption from critical co-creation. The debriefing session concluding each activity foregrounds the democratic dimension of the framework. Guided by questions such as "Who was controlling whom?" and "Where did your thinking end and the machine's begin?", students reflect collectively on epistemic autonomy, the risks of automation bias, and the

civic responsibilities entailed in using AI-generated content in public discourse. Qualitative data drawn from AI-Logs, self-assessment checklists, and post-activity reflections suggest that the framework effectively nurtures higher-order thinking skills — analysis, evaluation, and creation in the revised Bloom's taxonomy (Krathwohl, 2002) — while developing a practised scepticism toward AI outputs. Students who engaged most rigorously with the AI-Log demonstrated stronger argumentative coherence and greater ownership of their final products. This case study contributes to the panel's inquiry by demonstrating that the critical potential of AI in schools is not inherent in the technology itself, but in the pedagogical scaffolding that surrounds its use. The AI-Resistant Debate and AI-Log offer a replicable framework for ensuring that AI amplifies, rather than erodes, the conditions for democratic learning.

REFRAMING BLOOM'S TAXONOMY FOR THE AI AGE: FROM KNOWLEDGE REPRODUCTION TO DEMOCRATIC AGENCY

Giulia Calogero (IISS DON MILANI PERTINI MORANTE - GROTTAGLIE (TA), Italy)

Bloom'staxonomy AIresistantpedagogy democraticagency

The widespread availability of generative AI poses a structural challenge to educational assessment and curriculum design: when a language model can produce summaries, definitions, lists of causes, and descriptive analyses in seconds, the lower rungs of Bloom's taxonomy risk becoming a "cognitive commodity". If schools continue to certify the reproduction of knowledge that AI generates effortlessly, they risk certifying the machine rather than the student. This paper argues that this crisis demands not a rejection of Bloom's framework, but its reframing for an era of human–AI co-cognition. Drawing on two years of classroom-based curriculum development at IISS Don Milani Pertini Morante (Grottaglie, Italy) — a secondary vocational school in the Servizi Socio-Sanitari track — this contribution presents a practical reframing of Bloom's revised taxonomy adapted to the conditions of generative AI. The proposed framework reorganises the taxonomy's six levels into three pedagogical zones. The AI-Commodity Zone (Curate & Question; Prompt & Explain; Adapt & Apply) acknowledges that AI handles baseline cognitive tasks with statistical precision, and redefines these levels around source verification, critical prompting, and situated judgement rather than mere recall and comprehension. The Human Superiority Zone (Compare & Validate; Challenge & Reflect; Co-Create) foregrounds the specifically human capacities of identifying algorithmic bias, exercising ethical judgement, and driving innovation through strategic human–AI collaboration. At the apex stands the Transform level, inspired by Mezirow's transformative learning theory: the student becomes an agent of change who deploys knowledge to generate real social impact, a capacity that no algorithm can replicate. The paper presents a comparative table of "fragile" vs. "AI-resistant" learning objectives, showing how a simple shift in the action verb transforms a delegable task into one that demands authentic human cognition. For example, "describe the figure of Augustus" becomes "refute an AI-generated analysis of Augustus as 'Saviour', using primary sources" — a task requiring Compare & Validate. Similarly, "summarise the chapter" becomes "argue the validity of thesis X against AI output Y", activating Challenge & Reflect. The framework also introduces Enhancement as a metacognitive bridge level: the strategic capacity to integrate AI outputs with traditional academic sources to produce depth that neither human nor machine achieves alone. The framework has been operationalised through a Prompt-Book for Authentic Assessment — a structured set of rubrics and teacher prompts designed to evaluate not the product of AI interaction, but its quality: did the student interrogate, improve, and contextualise AI output, or merely reproduce it? This assessment instrument embeds the democratic dimension of the framework: by requiring students to take ownership of their cognitive process — to decide what is reliable, relevant, and ethical — it cultivates the epistemic autonomy and civic responsibility that democratic education demands. This contribution offers researchers and practitioners a replicable theoretical

framework and a set of practical design tools for navigating the tension between AI efficiency and democratic agency. The central argument is that Bloom's taxonomy, properly reframed, does not become obsolete in the AI age: it becomes more necessary than ever, as the compass that distinguishes authentic human learning from the automation of thought.

Education | Generative AI | Democracy

Integrating Generative Artificial Intelligence (GenAI) into education requires thoughtful decisions that prioritize human agency. One major concern is cognitive delegation: when students (and sometimes teachers) start relying too much on the system for thinking, their learning can actually weaken instead of getting stronger. That's why we need effective teaching strategies—ones that view AI as a conversational partner that encourages reflection, rather than just a quick fix that takes the place of human judgment. The PAIDEIA project, backed by the Regional Programme of the Marche Region (https://paideia.study/), is built on a theoretical framework that merges learning sciences with computer engineering. Its goal is to promote "human training" that doesn't just adapt to technology but actively influences how we use it. Addressing the concerns raised in the panel "Critical Dialogue with AI in Schools" (M.03), the project investigates how teachers can intentionally design lessons to make AI a facilitator of critical thinking, rather than just a tool that automates decision-making. The key research question is: how can the collaborative design of Learning Units (LUs) using the "Teacher in the Loop" (TiL-AI) model enhance metacognitive engagement and empower students, pushing back against algorithmic passivity? In line with sociocultural perspectives, the project places AI within the Zone of Proximal Development (Vygotsky, 1978), viewing it as adaptive support that can help manage cognitive load (Sweller, 1988) and promote educational success through a transdisciplinary approach. The heart of this project is all about empowering teachers by training 460 of them to collaboratively guide the learning experiences facilitated by the PaolaGen.AI platform (https://paolagen.ai/). A crucial part of this approach is the Teacher in the Loop AI (TiL) strategy (Balaji et al., 2025), which puts educators front and center in the algorithmic process. This ensures that AI enhances teaching methods instead of replacing professional judgment. With PAIDEIA's Learning Units (LUs), we create tools that not only engage students but also boost their intrinsic motivation and sense of competence—key elements of Self-Determination Theory (Ryan & Deci, 2000). In this way, AI becomes a supportive tutor that helps solidify skills-based teaching. For the 5,800 students involved, the project fosters the development of strong metacognitive skills, which are vital for resisting algorithmic conditioning and avoiding passive content consumption. Following Nelson and Narens' (1990) model of monitoring and regulation, the activities we've designed encourage students to critically assess the quality of GenAI outputs, paving the way for genuine Critical AI Literacy (Flavell, 1979). In this self-regulated learning environment (Zimmerman, 2002), AI serves as a "cognitive mirror" (Efklides, 2011), prompting students to plan and adjust their study strategies, thereby enhancing their executive functions (Brown, 1987) and awareness of their cognitive journey. Ultimately, the PAIDEIA project shows that the democratic integration of AI can only thrive through strong teacher collaboration inspired by the TiL model, which emphasizes critical thinking and creativity, ensuring a fair and inclusive learning experience.

FROM SPECTATORS TO AUTHORS: A COLLABORATIVE SCHOOL-WORK MODULE ON AI LITERACY, PODCAST PRODUCTION AND THE CONDITIONS OF CRITICAL AGENCY

Giulia Lorenzoni (Liceo Muratori San Carlo Modena, Italy) · **Arianna Giannone** (Talent srl) · **Lorenzo Cesaretti** (Talent srl) · **Federica Marchesini** (Talent srl)

AI literacy | metacognition | school-to-work

This paper documents an intensive Formazione Scuola Lavoro (FSL) module carried out in January 2026 with a fourth-year class (16 students) at a liceo linguistico in northern Italy. The module was jointly designed and delivered by a secondary school teacher of English language and literature and a pedagogy graduate researcher working as FSL tutor for an educational technology company. Both contributors brought distinct but genuinely pedagogical frameworks to the design: the former rooted in narrative and literary-disciplinary practice, the latter in competency-based education and FSL assessment: producing a collaborative authorship that shaped both the project's architecture and the interpretation of its outcomes. The project work took podcast production as its central device: a format requiring students to move through a complete cycle of competencies (critical analysis of AI systems, collaborative negotiation of topic and format, editorial co-design with an AI tutor, and performative audio production). This cycle was deliberately structured as a progression, with each phase requiring a greater degree of initiative and autonomous decision-making than the previous one. An encounter with professional podcasters mid-process introduced an external standard of communicative quality, shifting students' self-perception from task-completers toward communicative authors accountable to a real audience. Three Black Mirror episodes were used as the analytical entry point, mediated through DOK-structured scaffolding across four cognitive levels. The AI tutor askLea was introduced only after a phase of peer negotiation, designed to function as a critical interlocutor. Conversation logs document patterns of interaction ranging from passive, delegating acceptance of AI output to increasingly directive and evaluative prompting. The conditions that appeared to shift students from one posture to the other constitute the central analytical focus of this contribution. The paper's primary research question is not whether the module "worked", but under what conditions critical agency with AI tools emerged or failed to emerge. To address this question, the paper will draw on triangulation across three data sources (askLea conversation logs, direct observation records from the sessions, and a final Likert-scale questionnaire on perceived competency development, with particular attention to the tensions between self-reported autonomy and observed interaction behaviour. Where these sources diverge, the divergence itself will be treated as pedagogically significant data, pointing to the gap between perceived and enacted competency. The experience is presented with deliberate transparency about its unevenness: fragmented group dynamics, intermittent engagement, and products of variable quality. In an FSL framework, this unevenness maps precisely where transversal competencies require further pedagogical attention, and it is from that mapping that the contribution's practical implications are drawn.

ALGORITHMIC BIAS, STUDENT AGENCY AND CRITICAL DIALOGUE: A TWO-LEVEL ANALYSIS OF TERRITORIAL EVIDENCE AND INTERNATIONAL PEDAGOGICAL CASE STUDIES

Matteo Angeloni (Università degli Studi della Tuscia, Italy)

algorithmic bias | educational equity | AI governance

When an algorithmic system classifies a student as "low risk" without that assessment being open to verification or discussion, it does not merely make a technical error: it forecloses the very possibility of educational dialogue. The teacher cannot open a conversation about what they cannot see, the student cannot regulate their learning on the basis of criteria they are unaware of, and the school cannot exercise its function if its decisions are delegated to an opaque procedure. This contribution argues that the problem is not the use of AI in education, but the conditions under which it is used: conditions which, when absent, make AI incompatible with any serious conception of critical learning. Authentic learning requires that students have access to the criteria by which they are judged, that they can monitor and regulate their own progress, and that dialogue with tools and teachers remains open and contestable (Vygotsky, 1978; Flavell, 1979; Bakhtin, 1981). An AI system that produces predictions without explaining them violates all three conditions at once. The AI Act (EU 2024/1689), Arts. 9, 10 and 14, translates this into normative obligations: human oversight, data quality, and explainability of high-impact decisions, treated here not as bureaucratic constraints but as minimum pedagogical conditions. The contribution adopts a two-level mixed design. At the macro level, an empirical analysis of territorial bias across 190 European NUTS2 regions uses Eurostat data on early school leaving rates and regional GDP per capita (2024) to show which students an algorithm calibrated on the European average renders structurally invisible. At the micro level, four case studies from the Educational Data Mining Conference 2023 are analysed for the centrality they assign to teachers and students. At the macro level, a statistically significant correlation emerges between regional GDP per capita and the algorithm's prediction error ($r = -0.194$, $p = 0.007$): disadvantaged regions are systematically underestimated as "low risk", with a structural gap of 0.68 percentage points (t-test $p = 0.044$). The bias follows economic, not geographic, lines (Kruskal-Wallis $p = 0.32$): 82 false negatives appear because students live in low-income contexts the algorithm does not account for. At the micro level, four recurring conditions emerge. Gabbay and Cohen (2023) show that metacognitive feedback in programming MOOCs produces more autonomous learners than systems providing solutions directly. An Accountable Talk case mediated by GPT-4 (EDM 2023) demonstrates that language models can sustain critical discourse when designed to elicit argumentation, not replace it. Wagner et al. (2023) show that a transparent recommendation system reduces dropout without a self-fulfilling prophecy effect. Karimov et al. (2023) document how an adaptive platform in a disadvantaged context in Azerbaijan improved grades for 68.6% of students, showing that algorithmic equity is a matter of design. Both levels converge: AI is compatible with education only if verifiable — if teachers and students can interrogate it, challenge it, and correct it. Without explainability and human accountability, the school does not produce critical learners: it produces consumers of predictions who do not know they can refuse them.

DELEGATION OR DELIBERATION? AI, METACOGNITION AND DEMOCRATIC AGENCY IN A CLASSICAL HIGH SCHOOL

Daniela Canfarotta (Liceo Ginnasio di Stato "Francesco Scaduto" (Bagheria, Palermo), Italy)

AI Literacy | Metacognition | Student Agency

When students use generative AI to translate Latin and Ancient Greek, are they thinking more—or thinking less? This paper presents findings from an exploratory qualitative case study conducted in an Italian classical high school, examining how AI reshapes interpretative practices in subjects traditionally centred on judgement, ambiguity, and linguistic precision. Data were collected through structured classroom observations, analysis of student translations, and guided reflective discussions during AI-supported activities. Two contrasting patterns emerge. Some students fully delegate the task to AI systems, reproducing translations without engaging in grammatical analysis or interpretative reasoning. In these cases, AI functions as a form of cognitive substitution, weakening agency and displacing responsibility for judgement. Other students, however, use AI as a cognitive scaffold: they compare outputs with their own attempts, question lexical and syntactic choices, and refine their understanding in preparation for oral examinations. Here, AI becomes a mediating tool that can potentially extend the learner's zone of development. These findings suggest that the educational impact of generative AI does not depend on the technology itself but on the pedagogical structure framing its use. As algorithmic systems trained on vast datasets, generative models embed implicit linguistic and cultural assumptions that shape the interpretative options presented to learners. Without explicit critical mediation, such systems risk becoming oracular authorities. In response, the paper proposes a three-step instructional protocol designed to foster metacognitive awareness and dialogical engagement: (1) independent translation attempt; (2) systematic comparison with AI output; and (3) guided reflection on divergences, interpretative criteria, and underlying assumptions. By making algorithmic mediation itself an object of inquiry, students learn to interrogate digital power rather than passively absorb it. Such practices cultivate habits of justification, responsibility, and reflective judgement—capacities essential to democratic learning in an age of datafication.

DESIGNING AI TO AVOID COGNITIVE DELEGATION: A METACOGNITIVE TUTORING MODEL FOR CRITICAL AI LITERACY IN SECONDARY EDUCATION

Luca Addiucci (Sapienza, Italy) · **Marco Temperini** (Sapienza, Italy)

Critical AI literacy | Student agency | Metacognition

The rise of Generative Artificial Intelligence (GenAI) in schools introduces a fundamental pedagogical tension: how can GenAI be integrated into classroom practice without encouraging cognitive delegation or passive reliance on AI-generated outputs? This issue connects to broader debates on the purposes of education and the risks of delegating educational processes to technological systems (Biesta, 2020; Selwyn, 2019). This study presents an intervention conducted in an Italian upper secondary school using a Specialised Conversational Agent (SCA) grounded in a Metacognitive Tutoring Model (MTM), designed to foster critical GenAI literacy, student agency, and reflective judgment. We explore the conditions under which AI can enter classroom practice without replacing educational responsibility or teacher judgment. This perspective aligns with critical analyses warning against technologically deterministic narratives (Williamson & Eynon, 2020) and emphasizing the need to preserve teachers' professional agency in AI-enhanced environments (Lan & Chen, 2024). The MTM underpinning the SCA aims to (1) reject the agent's role as an oracle-like problem solver, (2) enact dialogic coaching and active scaffolding, and (3) create a "cognitive gym" supporting the transition from passive consumer to active inquirer. The model builds on foundational work on metacognition (Flavell, 1979) and on the role of self-efficacy in sustaining learner agency (Bandura, 1997). Through structured feedback, metacognitive prompts, and guided error analysis, the agent ensures that students remain the primary architects of the problem-solving process, learning to

reformulate prompts and critically evaluate responses, including incomplete or misleading outputs. The agent is thus conceived not as a substitute for human intelligence, but as a system designed to augment and extend it (Luckin, 2018). The intervention adopted a waitlist-controlled classroom design. All students received preliminary training in prompting, framed as a cognitive and deliberative practice emphasizing clarity, intentionality, and iterative refinement. In the first phase, one group participated in structured mathematics sessions with the SCA, while a second group followed traditional instruction. In the second phase, the latter received prompting training and used the SCA, ensuring full participation. This design enabled observation of learning trajectories and the development of competence in using GenAI systems. Rather than focusing on disciplinary performance, the study examines empowerment and metacognitive indicators. Data include anonymized student–agent interaction excerpts, the evolution of prompt patterns, and a self-perception questionnaire measuring perceived agency, awareness of GenAI limitations, prompt reformulation ability, and recognition of incomplete or ambiguous responses. The central question concerns students' positioning toward GenAI: do they adopt uncritical cognitive delegation (GenAI as an "epistemic oracle"), or maintain cognitive agency, treating GenAI as a co-cognitive dialogic partner? This inquiry reflects concerns about the future of teaching in AI-mediated contexts (Selwyn, 2019) and the need to design systems that support rather than displace pedagogical judgment (Lan & Chen, 2024). We argue that critical AI literacy cannot be reduced to ethical awareness or technical proficiency. It requires pedagogical devices that preserve deliberation (Biesta, 2020), safeguard teacher judgment, and foster students' responsibility in learning. The proposed model is presented as a replicable instructional framework currently undergoing empirical validation.

DIALOGIC METACOGNITIVE PROTOCOLS FOR ANCIENT GREEK: PRESERVING TEACHER JUDGMENT AND STUDENT AGENCY WITH GENERATIVE AI

Bruna Capuzza (Università di Bologna, Italy)

dialogic pedagogy | Ancient Greek | critical AI literacy

Ancient Greek teaching is an intensive practice of evidence-based interpretation: learners must justify morphological parses, evaluate syntactic ambiguity, and defend translation choices that remain contestable. Generative AI can support this work, but its conversational authority risks automating judgment and encouraging cognitive dependency. Responding to Panel M.03's focus on critical dialogue with AI, this paper connects Freire's pedagogy of autonomy (ethical self-formation through responsible decision-making) with Illich's threshold logic (tools crossing into radical monopoly) and critical AI approaches that treat AI as sociotechnical agency that must be pedagogically mediated, not merely adopted. We propose a Dialogic Metacognitive Protocol for Ancient Greek (DMP-GR), a five-step lesson sequence that treats AI as a dialogical partner rather than an oracle and that preserves teacher agency: (1) Problematize: the teacher frames a "philological problem" in a short Greek passage (e.g., participial scope; discourse particles; aspect and modality) and makes explicit democratic criteria (reasons, evidence, openness to alternative readings). (2) Externalize: students generate multiple AI outputs through prompt-variation (constraints, counterfactuals, "show two parses", "argue against yourself"), documenting outputs and uncertainties. (3) Cross-examine: groups test claims against grammars, lexica, and corpora; they identify where AI is plausible but unsupported, and where it is wrong but persuasive. (4) Metacognitive reflection: students write a short "philological decision log" explaining how they updated their confidence, what evidence mattered, and which biases (AI or human) may have shaped their choice. (5) Dialogic deliberation: students defend a translation and respond to objections; the class co-constructs a justified version plus an "alternative readings" appendix.

DMP-GR shifts evaluation from product to process: the teacher assesses traceable reasoning, responsible tool-use, and dialogical participation. Expected democratic outcomes include autonomy in deciding when and how to use AI, epistemic humility, plural reasoning, and practical wisdom (phronesis) in AI-mediated inquiry.

AI AS AGENTS TO THINK WITH: A CONSTRUCTIONIST FRAMEWORK FOR AI USAGE

Lorenzo Natali (Università di Genova; ITD/CnR)

Agency | A.I for education | Human-A.I interaction

Generative artificial intelligences (GAI), through their rapid development, are profoundly reshaping the educational landscape. Current literature highlights how the use of A.I in education can positively affect several dimensions, including instructional personalization, learning outcomes, collaborative and communicative dynamics, reduction of cognitive load, and overall enhancement of cognitive skills. At the same time significant risks have been identified, such as overreliance and cognitive deskilling. As reported by Tian & Zheng (2025), the effects of A.I on the development of skills such as the 4Cs are also influenced by the role it assumes within the educational process (e.g., tutor, peer, or collaborator). This makes it strategically important to define conditions and interaction models capable of guiding the use of A.I, framing it as a tool for cognitive augmentation rather than as a purely performative and opaque technology. Seymour Papert's constructionist pedagogy offers a potential interpretative key, both due to the centrality of creative activity in the process of knowledge construction and through what he define as "objects to think with": tools enabling students to engage in cognitively meaningful activities. Levin et al. extend this concept to A.I, shifting from objects to "agents to think with." These can function as maieutic tutors and cognitive exoskeletons capable of stimulating reasoning while keeping learners pivotal in their cognitive processes, thus preserving agency and cognitive abilities. This perspective suggests a reversal of the interaction axis between user and A.I where, rather than having a learner passivly searching for an output, we figure an agent guiding him maieutically fostering cognitive processes, divergent thinking, creative and critical skills. Along these lines, this paper aims to present the Tool Engagement × Human Engagement (TExHE) interaction paradigm. Designed to stimulate user agency as defined by Bandura (2001)—intentionality, forethought, self-reactiveness, and self-reflectiveness—within constructionist learning contexts, TExHE supports the configuration of co-constructionist "agents to think with," outlining their characteristics and pedagogical aims. The agent's behaviors (Tool Engagement) should be modeled both according to Levin's definition of "agents to think with" and according to Resnick's (2018) principles of effective educational tools: low floors (accessibility), high ceilings (high potential), and wide walls (flexibility). These features are intended to foster Human Engagement, understood as the degree of cognitive and self-regulatory involvement through which the learner guides, structures, and evaluates their own mental processes. The relationship between Tool Engagement and Human Engagement is therefore asymmetrical and dynamic: the agent's intervention remains subordinated to, and functionally oriented toward, the preservation and enhancement of the learner's agency. A first application of this paradigm, currently under field experimentation, is the Gemini Gem Clair. As a constructionist tutor, Clair supports users in creative processes by integrating the TExHE paradigm, which determines its behavioral logic, with the Creative Problem Solving Framework 6.1, which structures its operational workflow, acting both as a facilitator and as an enhancer of creative performance. Moreover, its implementation through Gemini Gems ensures replicability and accessibility of similar tools within school contexts, offering design possibilities potentially within teachers' reach.

METACOGNITIVE AI LITERACY ACROSS CONTEXTS: EMPIRICAL EVIDENCE FROM THE RAISE FRAMEWORK

Nadia Sansone (UnitelmaSapienza University of Rome, Italy)

Metacognition | prompt reasoning | conversational AI

The widespread adoption of generative AI in educational and professional contexts has outpaced the development of frameworks supporting critical, metacognitive engagement. Most users approach conversational AI as a digital oracle — seeking speed and immediate output — rather than as a dialogical partner for meaning-making. This pattern mirrors a structural problem: the very affordances that make generative AI powerful (fluency, responsiveness, apparent authority) also make it prone to fostering cognitive delegation rather than reflective thinking. This paper presents rAIse (Reflect-Ask-Interpret-Source-Evolve), a five-phase framework for conversational AI literacy developed within the AI4E Laboratory at UnitelmaSapienza, and reports empirical evidence of its effectiveness across multiple learning contexts. rAIse is grounded in five foundational theoretical traditions: Flavell's metacognition, Vygotsky's Zone of Proximal Development, Bakhtin's dialogism, Schön's reflection-in-action, and Freire's generative pedagogy (Evolve). Each phase is operationalized through stimulus questions that slow down and structure human-AI interaction, shifting engagement from mechanical to strategic and from passive to reflective. The framework explicitly repositions AI not as an authoritative source but as a co-constructor of knowledge requiring active critical participation from the user — a dialogical partner rather than an oracular authority. A pre-post single-group design was conducted across multiple professional and educational contexts — university students, in-service teachers, private sector professionals, and public administration officers — through the AI4E Laboratory at UnitelmaSapienza. A total of 657 participants completed the rAIse process module and an accompanying validated questionnaire (24 items; Cronbach's α = 0.826 pre, 0.827 post). Two conditions were compared: facilitated workshops (2–4 hours, with theoretical introduction and guided application) versus fully autonomous self-application without prior training or facilitation. Four AI literacy competencies were measured via five-point Likert scales: use of AI for professional support, use of AI for information research, critical analysis of AI outputs, and ethical awareness. Wilcoxon signed-rank tests revealed large effect sizes across all four competencies (r = 0.619–0.838, $p < .001$). A counterintuitive and theoretically significant finding emerged: participants who applied rAIse autonomously — without any prior facilitated training — showed systematically greater improvement than workshop participants, with the most pronounced difference in ethical awareness (+0.123 effect size). This finding suggests that the framework possesses intrinsic self-scaffolding

properties: learning occurs through structured doing rather than through listening to explanations, positioning the AI conversation itself as the formative environment. Moreover, participants who completed the EVOLVE phase reflective item demonstrated significantly higher gains in critical analysis (U = 47566, p = .044), confirming that metacognitive writing is constitutive to the learning process. Reduced post-intervention standard deviations across all competencies further indicate that rAIse reduces initial variability, functioning as an equalizing scaffold within heterogeneous groups. Three conclusions emerge. First, rAIse is effective transversally across diverse professional and educational profiles, from primary teachers to public sector officers. Second, traditional didactic mediation is not a prerequisite for its effectiveness: the framework's structure is sufficient to generate meaningful learning independently. Third, the challenge of AI literacy is ultimately cultural rather than technical — it requires reclaiming metacognition, slowness, and democratic agency as non-negotiable dimensions of human-AI interaction in educational settings.

ARTIFICIAL INTELLIGENCE AS A SOCIOLOGICAL OBJECT FOR STUDENT REFLEXIVITY: A CLASSROOM LABORATORY ON KNOWLEDGE, BIAS AND DIGITAL MEDIATION

Claudia Jiménez-Rodríguez (Universidad Antonio de Nebrija, Spain; Università di Torino, Italy) · **Simona Tirocchi** (Università di Torino, Italy) · **Federica Cretazzo** (Università degli Studi di Milano-Bicocca, Italy)

Artificial Intelligence in Education | Metacognition | Democratic Learning

Abstract The growing presence of generative artificial intelligence (GenAI) in contemporary societies, and particularly in education, is reshaping how knowledge is produced, accessed and interpreted (Brandao, 2025; Rossi et al., 2025). Within broader processes of digitalization and datafication, algorithmic systems increasingly influence the circulation of knowledge and the ways individuals engage with information. However, whether GenAI represents primarily risks or opportunities for younger generations remains relatively underexplored. While its use may become problematic when it is purely instrumental and oriented toward rapid output production, it may also foster meaningful learning when it promotes reflective and critical engagement with knowledge and supports the development of AI literacy and critical thinking skills (Walter, 2024). These transformations raise important questions regarding whether students possess the tools to critically engage with artificial intelligence and whether these technologies can contribute to the democratic mission of education, particularly in relation to citizenship formation. Within the field of sociology of education, these developments call for renewed reflection on algorithmic authority, digital mediation and the ways students interact with algorithmically generated knowledge. In response to these challenges, this paper presents a classroom laboratory designed as a pedagogical and sociological experiment in which university students engage critically with generative AI systems while exploring sociological concepts such as identity, social roles and inequality. The objective is not merely to employ AI as a technological tool, but to examine how algorithmic responses may reflect, reproduce or reshape existing social narratives. Methodologically, the study develops a classroom laboratory adopting a qualitative and exploratory approach grounded in participatory peer-based research methods. The activity takes place within the university course Sociology of Education in the Digital Age at the University of Turin (academic year 2025–2026) and involves a cohort of 35 students. The study dynamics are implemented through the use of the generative artificial intelligence platform ChatGPT (OpenAI) and structured instruments designed around key sociological concepts such as identity, social roles and inequality. The data generated—including students' prompts, AI responses and collective classroom reflections—are analyzed through a qualitative interpretative approach aimed at identifying patterns of reasoning, emerging narratives and processes of metacognitive reflection on algorithmically mediated knowledge. By encouraging students to interrogate the assumptions embedded in AI-generated discourse, the laboratory promotes metacognitive awareness of how knowledge is constructed within digitally mediated environments and supports the development of student agency in relation to algorithmic systems. The

study argues that such pedagogical practices can strengthen critical engagement with emerging technologies while addressing broader democratic challenges associated with artificial intelligence, including the capacity to recognize algorithmic bias, counter disinformation and foster forms of digital citizenship in contemporary educational contexts.

BEYOND THE ANTINOMY. GENERATIVE ARTIFICIAL INTELLIGENCE IN SCHOOLS BETWEEN SUPPORT AND RELIANCE

Giacomo Astorri (University of Bologna, Italy)

generative artificial intelligence | pedagogical problematicism | agency

This contribution uses the antinomical formula (Bertìn, 1968), the methodological pivot of pedagogical problematicism, to investigate two possible postures regarding the use of generative artificial intelligence devices within the school environment and teaching-learning practices, with the aim to overcome both of them towards a solution both ethically and technologically grounded. On the one hand, we have "reliance" as a posture that does not primarily involve critical and reflective thought, but rather it's focus on automation of the practices and knowledge of both educators and learners when using generative artificial intelligence systems. This pole is well represented by the discipline known as learning analytics (Siemens & Long, 2011). On the other hand, the pole of "support" highlights how it is possible to use devices with a critical and reflective approach, not fully entrusting aspects of teaching-learning practices to algorithmic outputs, but intervening where necessary, negotiating meanings, power, and knowledge. This second pole is represented, for example, by minority studies in critical education and technology (Selwyn, 2014). According to its epistemological framework, pedagogical problematicism posits that the polarities analyzed within the antinomical dialogue possess both positive and negative elements subject to observation and analysis. These elements, therefore, must be taken into consideration with the aim of overcoming the two positions in favor of a synthesis that renounces dogmatic and ideological aspects in favor of greater pedagogical proximity between the positions. The point, therefore, is not to value "support" solely at the expense of "reliance", nor viceversa. This debate runs parallel to the polarized and polarizing positions of the excessively naïve techno-enthusiasts and the neo-Luddites, who would aspire to an almost total return to the analog; it is believed, in this case as well, that both positions have, from a pedagogical perspective, elements to be valued that are useful for the reflection set forth here. Finally, a recent and exploratory perspective will be examined which, thanks to its theoretical framework, overcomes the impasse that these two positions often bring with them. The reference is to the theory of “artificial agency” proposed by Luciano Floridi (Floridi, 2025). This theory, in its originality, does not banish computers nor eminently (all too) human qualities to the disadvantage of synthetic data but, on the contrary, enriches the discussion and represents in nuce a desirable future.

GOVERNING AI INTERACTION: METACOGNITIVE PROFILES, SELF-ASSESSMENT, AND PEER FEEDBACK IN A RAISE-STRUCTURED E-TIVITY

Nadia Sansone (UnitelmaSapienza University of Rome, Italy) · **Ilaria Bortolotti** (UnitelmaSapienza University of Rome, Italy)

conversational AI | formative assessment | rAIse

The integration of generative AI in higher education demands a fundamental shift in focus: from what AI produces to how students interact with it. Without deliberate metacognitive scaffolding, conversational AI risks reinforcing cognitive delegation rather than developing critical judgment. This exploratory mixed-methods study examines whether a structured e-tivity embedding the rAIse framework (Reflect-Ask-Interpret-Source-Evolve) as a procedural scaffold can transform AI conversation into a formative and self-regulatory practice aligned with Assessment as Learning principles (Earl, 2003). Two research questions guided the study: RQ1 — To what extent do metacognitive regulation strategies emerge, particularly in self-assessment and revision phases? RQ2 — What interaction profiles emerge from conversational logs, and how do these associate with the degree of alignment between perceived and enacted competence, as revealed by peer feedback? 17 university students (online degree programme in Psychological Sciences, UnitelmaSapienza) participated in an e-tivity titled "Learning to learn with AI," conducted across three synchronous webinars between October and November 2025. In the first webinar, students were introduced to rAIse through live practice and submitted a baseline evaluative prompt formulated without any structured approach, serving as the analytical reference point for measuring subsequent changes in prompt quality and interaction strategy. In the second webinar, students applied rAIse to co-construct an assessment rubric with AI and use it to evaluate their own work through motivated, iterative revision — directly reformulating their baseline prompt using rAIse phases and introducing explicit criteria, meta-prompting, and regulation practices. In the third webinar, each student analyzed an anonymized peer's conversational log using a rAIse-derived coding grid, providing written feedback on prompt quality, cognitive function attributed to AI, and regulation strategies observed; collective debriefing enabled students to confront the gap between perceived and enacted competence. The dataset comprises 68 chat logs, rAIse pre/post questionnaires (four AI literacy dimensions, Likert 1–5), and structured peer feedback forms. Logs were analyzed using ordinal indicators of prompt quality (0–3), cognitive function attributed to AI (0–3, from substitutive to critical-regulative), transformative iteration level (0–3), and regulation markers including meta-prompting, motivated output critique, and validation requests. Perceived-enacted alignment was estimated by triangulating pre/post questionnaire delta scores with peer feedback evaluations. Addressing RQ1, metacognitive regulation emerged in three recurring strategies: regulation for clarity (contesting vague AI-generated criteria), regulation for control (meta-prompting, inverting the standard dialogic flow), and regulation for refinement (negotiating content through motivated rejection of AI proposals). Addressing RQ2, five interaction profiles emerged along a delegating-to-regulative continuum: Reflective Learner (29%), Strategic Architect (18%), Task-Oriented (18%), Pragmatic (23%), and Surface Learner (12%). Surface profiles systematically overestimated their competence while reflective profiles showed close alignment between questionnaire delta scores and log-observed strategies. The baseline-to-rAIse comparison further confirmed that structured scaffolding produces qualitative shifts in prompt construction and interaction governance. These findings yield three design implications: explicit criteria must be embedded structurally in tasks; verification and triangulation must be required and assessed; peer analysis of conversational logs creates a metacognitive mirror unavailable through individual reflection alone. Epistemic responsibility remains with the learner — and the design must structurally demand it.

CRITICAL DIALOGUE WITH AI IN CIVIC EDUCATION: TEACHER MEDIATION, METACOGNITION AND DEMOCRATIC AGENCY IN LOWER SECONDARY SCHOOL

Lucia Iannucci (I.C. Pescara 8 - Scuola secondaria di primo grado "Tinozzi", Italy)

Critical AI Literacy | Teacher Agency | Metacognitive Pedagogy

This paper presents an empirical case study from an Italian lower secondary school exploring the integration of artificial intelligence (AI) within a civic education pathway grounded in Article 54 of the Italian Constitution, which emphasizes duty, responsibility, and service to the Republic. The study investigates how AI can be incorporated into classroom practice while preserving pedagogical judgment and fostering critical thinking, student agency, and democratic learning. The project developed through structured and progressive phases. Students first engaged in reflective civic inquiry through creative and analytical activities, including acrostics centred on constitutional values (duty, honour, loyalty, discipline, sacrifice, oath), autobiographical writing, and the collective composition of a poem. The pathway also included an encounter with the author of a book dedicated to the journalist Antonio Russo, whose professional commitment provided a framework for discussing ethical responsibility and public service. Additionally, students conducted and examined an interview with a witness connected to the figure of magistrate Emilio Alessandrini, introducing authentic testimonial material into the learning process. AI was introduced gradually and framed as an object of reflection rather than as an authoritative source. Within a sociocultural perspective informed by Vygotsky, AI functioned as a mediating tool whose educational value depended on teacher guidance and critical use. In one phase, a collectively written poem was transformed into a song through an AI-based application while maintaining full student ownership of meaning and content. In another phase, AI-supported transcription and summarisation tools were employed during the guided analysis of the recorded interview. Students were encouraged to distinguish between information, interpretation, and personal elaboration, developing awareness of how AI systems reorganise discourse. The case addresses the two dimensions highlighted in this panel. Regarding the teacher's role, AI integration was based on deliberate instructional design and explicit ethical framing. Decisions about its use were made transparent, ensuring that evaluative and interpretative authority remained human and pedagogically grounded. Regarding student empowerment, the pathway promoted critical AI literacy through dialogical practices inspired by Bakhtin and metacognitive self-evaluation grounded in Flavell's framework. Structured written reflections following the author encounter supported students in examining both content and learning processes. Recently awarded first prize in a national civic education competition focused on constitutional values, the project demonstrates that AI can contribute to democratic education when embedded in reflective pedagogy and intentional mediation. The findings suggest that critical AI literacy emerges through guided dialogue, ethical positioning, and metacognitive practice rather than through technical proficiency alone. By positioning AI as a dialogical partner requiring critical engagement, this study contributes to discussions on balancing technological innovation with democratic responsibility in educational contexts.

QUESTIONING THE MACHINE: A SOCRATIC CHATBOT AND METACOGNITIVE GAINS AMONG PRE-SERVICE TEACHERS

Maria Ranieri (University of Florence, Italy) · **Gabriele Biagini** (University of Florence, Italy) · **Giulia Cuozzo** (University of Florence, Italy)

AI Chatbot | Metacognition | Pre-service Teachers

As generative AI becomes embedded in educational practice, a critical question emerges: does it cultivate or erode the metacognitive capacities that underpin democratic, agentive learning? The dominant model of human-AI interaction — in which students ask and AI answers — mirrors cognitive offloading rather than pedagogical dialogue, externalising problem-framing and bypassing the productive struggle through which deep learning occurs. This contribution presents empirical evidence from a quasi-experimental study examining whether a theoretically grounded alternative can foster

metacognitive awareness among pre-service teachers, rather than merely replacing their cognitive effort. The study deployed MAIEUTIC — a conversational AI explicitly architected around Vygotsky's Zone of Proximal Development and Zimmerman's Self-Regulated Learning framework — in an undergraduate Educational Technology course at an Italian university (N=188). Grounded in Bakhtinian dialogism, MAIEUTIC treats the learner not as a passive recipient of information but as an active voice in a genuine epistemic exchange. Rather than answering student questions, it inverts the typical human-AI dialogue: through Socratic questioning and adaptive scaffolding organised across a tri-phasic structure (planning → producing → revising), the system elicits student elaboration at each stage. Crucially, the system incorporates anti-offloading mechanisms — refusing to generate complete answers and requiring elaboration before offering further support — operationalising the idea that the AI's role is to sustain thinking, not to substitute it. Across 25 analysed sessions, MAIEUTIC averaged 6.5 questions per session against students' 1.6, yielding a 4:1 system-to-student ratio — what we term the Interaction Flip. Metacognitive awareness was measured via the MAI-19 (Metacognitive Awareness Inventory, 19 items, 5-point Likert scale) in a matched pre-post design (N=144: MAIEUTIC n=71, ChatGPT control n=73), with participant-generated anonymous codes ensuring privacy while enabling longitudinal tracking. Results indicate markedly divergent trajectories. MAIEUTIC participants showed substantial growth in self-reported metacognitive awareness ($\Delta M = +0.625$), while the ChatGPT control group showed a slight decline ($\Delta M = -0.068$). A mixed ANOVA confirmed a large Group × Time interaction ($F(1,142) = 146.31$, $p < .001$, $\eta^2p = .507$), which remained robust after adjusting for baseline non-equivalence (ANCOVA, $\eta^2p = .404$). Nearly half of MAIEUTIC participants (49.3%) met the Reliable Change Index threshold for clinically meaningful improvement; none in the control group did. These findings suggest that AI dialogue structure — specifically, who asks the questions — is not a neutral design choice but a deeply political and pedagogical one. In educational spaces where democratic deliberation should flourish, designing AI as an interlocutor that questions rather than answers may be a concrete strategy for preserving learner agency, supporting teacher professional identity, and resisting the automation of judgment. The study contributes empirical grounding to theoretical calls for critical AI literacy, and we conclude with implications for educators, AI developers, and policy frameworks that currently treat all AI tools as equivalent.

PARTNER, NOT CREATOR: EVALUATING PRODUCT CREATIVITY OF AI-SUPPORTED STORYBOARD WRITING IN MARGINALIZED EDUCATIONAL CONTEXTS

Fabrizio Lo Presti (Istituto per le Tecnologie Didattiche - Consiglio Nazionale delle Ricerche, Italy; Università degli Studi di Modena e Reggio Emilia, Italy) · **Giuseppina Rita Jose Mangione** (INDIRE Firenze, Italy) · **Manuel Gentile** (Istituto per le Tecnologie Didattiche - Consiglio Nazionale delle Ricerche, Italy)

Generative Artificial Intelligence | Creativity | Multi-Agent Systems

A major paradigm shift in educational research has rethought the definition of creativity: no longer seen as a fixed individual trait, it is now understood as a complex process stimulable through targeted educational interventions (Runco, 2004). However, opportunities to develop creativity are not equally distributed. Students attending schools in geographically marginalised areas often experience reduced access to cultural institutions, extracurricular activities, and advanced digital resources that can nurture creative development (Mangione, 2024). In these settings, structured educational programs aimed at fostering creativity can play a particularly important compensatory role. While different activities aiming to foster creative practices have been proposed in educational scenarios (Clapham, 2003) , their effectiveness is often hindered by limitations such as conformity and production blocking (Zhou & Luo, 2012) or the prevalence of persistent creativity myths and test-focused environments (Plucker et al., 2011). Current research therefore focuses on finding

new methods for efficiently empowering students' creativity. In this scenario, Generative Artificial Intelligence (AI) systems, when guided by a clear pedagogical direction, have the potential to act as cognitive mediators and facilitators of the creative process, while preserving the centrality of the human individual. This paper presents a study exploring an innovative approach to AI integration for creativity fostering in schools. While much of the literature investigates the impact of AI on the creative Person or Process (Rhodes, 1961), this study shifts the focus to the Product and the Press, the sociocultural context framing the evaluation. Specifically, the research addresses the following question: does the creative artifact produced following the intervention, evaluated by a team of domain experts, reach high levels of quality in terms of creativity? To address this question, the study adopts a quasi-experimental mixed-methods design. The three-week intervention involves students from marginalized areas of Umbria, Italy, tasked with designing a textual storyboard. To support them, the study utilizes a digital platform featuring a Generative AI-enhanced multi-agent system (MAS), designed as a brainstorming chat between the human participant and artificial agents. The pedagogical framework is grounded in Edward De Bono's Six Thinking Hats model (De Bono, 1985). The brainstorming sessions feature distinct phases where both the student and agents wear the same hat, promoting parallel thinking and minimizing cognitive conflict. As recent literature highlights, MAS function as communities that enable collaboration among multiple agents to address complex tasks exceeding the capabilities of any single entity, effectively generating diverse perspectives that enrich the collaborative dialogue (Lo Presti et al., 2025). To evaluate the quality of the final storyboards, a subsample of anonymous artifacts is submitted to independent domain experts using Amabile's (1982) Consensual Assessment Technique (CAT). This allows for a robust measure of Product creativity grounded in expert consensus, which represents the Press. Finally, implementing this intervention in geographically marginalized contexts highlights the potential of pedagogically structured AI to act as a democratic equalizer, providing equitable access to high-level cognitive scaffolding and fostering critical, agentic learning environments.

AI-SUPPORTED SCHOOL VISIONS: MULTI-AGENT SYSTEMS AND TEACHER AGENCY IN SMALL AND RURAL SCHOOLS

Lydia Zampolini (INDIRE Firenze, Italy) · **Giuseppina Rita Jose Mangione** (INDIRE Firenze, Italy) · **Manuel Gentile** (ITD-CNR Palermo, Italy)

Artificial intelligence in education | multi-agent systems | design thinking

The integration of Artificial Intelligence (AI) into educational systems raises significant concerns regarding the automation of pedagogical judgement and its potential impact on educational professionals' agency. This contribution explores the use of language-model-based multi-agent systems (LLM-MAS) (Cheng, Y., et al., 2024) as cognitive mediators supporting collective ideation and the construction of school visions, avoiding passive delegation to technology. Grounded in a sociocultural framework, AI is conceptualised as a mediating artefact capable of expanding human cognition operating within the Zone of Proximal Development (ZPD), providing adaptive support for tasks that would otherwise be difficult to manage independently (Vygotsky, 1978). In this view, AI does not replace professional judgement but can strengthen

agency as the capacity to intervene intentionally in educational processes and act as co-authors of institutional change (Bandura, 2001). The study presents preliminary findings from a project conducted in three small schools located in central Italy, complex contexts where challenges take locally specific forms and require highly contextualised innovation strategies. Teachers, school leaders and key stakeholders participated in imagination workshops supported by an LLM-MAS designed to complement Design Thinking practices (Brown, 2009; Zampolini et al., 2025a). Unlike generalist language models, the system employs multiple intelligent agents organised with distinct roles (Zampolini et al., 2025b) — Challenger, Jester, Gardener and Conceptualiser — enabling proactive interaction and supporting reflective ideation. Equipped with contextual memory, the system functions not as a mere assistant but as a "cognitive teammate", participating in problem-setting processes while maintaining human control. Functional differentiation among agents allows simulation of dialogical and collaborative dynamics, fostering negotiation of meanings and co-construction of knowledge. Such dynamics support professional creativity as a systemic competence emerging from collective problem reformulation and shared solution generation rather than an individual trait (Harris, 2018; Sawyer, 2012). Analysis of the imagination workshops indicates that participants developed increasingly articulated and context-sensitive school visions through iterative cycles of problem reformulation and solution generation. Interaction with LLM-MAS appeared to facilitate dialogue, the exploration of alternative scenarios and the externalisation of tacit assumptions, contributing to the transformation of imagination from an individual activity into a structured collective process. Rather than replacing human thinking, the system functioned as a cognitive and social scaffold that supported reflective deliberation within the workshops (Belland, 2014). By providing a low-risk environment for experimentation, it also helped reduce barriers to creative engagement, such as fear of error and resistance to ambiguity (Zampolini et. al, 2025a). Overall, interaction with LLM-MAS supported deeper and more reflective ideation processes, strengthening professional agency and the development of locally grounded solutions. Rather than replacing human thinking, AI functioned as a cognitive and social scaffold that stimulated dialogue, made design alternatives visible, and transformed imagination from an individual capacity into a structured collective practice (Belland, 2014). By providing a safe, low-risk environment for experimentation, multi-agent systems also reduced psychological barriers to creativity, such as fear of error and resistance to ambiguity (Zampolini et al., 2025a).

Democracy Education and A.I. in the Geopolitical Disorder. A Proposal for a New Democratic Citizenship

PANEL CONVENORS: Alessio Fabiano (Universita' Degli Studi Basilacata, Italy); Claudio De Luca (Universita' Degli Studi Basilacata, Italy); Teodora Pezzano (Universita' Della Calabria, Italy); Giuseppe Spadafora (Universita' Della Calabria, Italy)

PANEL KEYWORDS: Democracy, Education, A.I

In this geopolitical disorder the link between the values of western democracies and the other system of autocracies is determined by an environment saturated with different technological manipulations and the ideology of disinformation. In this perspective the classic relationship between democracy and education, as John Dewey defined it in Democracy and Education of 1916, must be completely reconstructed. The democracy's crisis is developing because the global society is more and more characterized by the power of the economic and financial oligarchies which limit the democratic participation of the people. To recover the authentic meaning of democracy it is necessary to contrast the ideology of disinformation, proposing a new curriculum in the school and university, based on a model of new citizenship in which there is a fertile hybridization between education, didactics and A.I. to reconstruct democracy. The panel will try to analyze the relationship between A.I. and democratic debate to promote in the school and university the empowerment of the critical thinking and the epistemic responsibility for the students and the teachers. The only possibility of salvation and peace in this geopolitical disorder is the reconstruction of the relationship between democracy and education, using the algorithm system to improve the sustainable development in our global society.

POPULISM, AFFECTIVE MEDIATIZATION, AND DIGITAL GOVERNANCE: RECONFIGURING LEADERSHIP AND DEMOCRACY IN EUROPE

Elena Varotto (UCAM UNIVERSITY/SISP MEMBER, Italy)

fandom | digital governance | populism

Panel submission Panels: 5.c. Media: The Challenge in the Digital Age Keywords: fandom, digital governance, populism Populism, Affective Mediatization, and Digital Governance: Reconfiguring Leadership and Democracy in Europe Elena Varotto UCAM UNIVERSITY/SISP MEMBER, Italy; ELE.VAROTTO@GMAIL.COM This panel addresses a central question: How is political leadership reconfigured in a context marked by polarization, citizen disaffection, and affective mediatization? From the consolidation of Vox to the ascent of Fratelli d'Italia, we witness a mutation of political language where emotional appeals, symbolic enemies, and the aestheticization of leadership play a decisive role. Digital platforms are crucial in this transformation: social media amplify populist messages and enable the creation of affective communities around leaders who increasingly operate as celebrities. Concepts such as political fandom, asymmetric intimacy, and parasocial interaction provide analytical tools to understand how legitimacy is constructed today. The hypothesis guiding this panel is that contemporary populism is not merely a discursive strategy or a permanent campaign, but also a form of emotional and symbolic participation deeply mediated by spectacle and digital culture. Case studies such as the "Bimbe di Giuseppe Conte" or Giorgia Meloni's visual narrative on Instagram exemplify this transformation. At the same time, these dynamics intersect with the fragmentation of digital governance in Europe. The EU's Digital Services Act represents an ambitious attempt to regulate platforms, protect rights, and ensure algorithmic transparency, yet its effectiveness is constrained by uneven competences, divergent national models, and epistemic vulnerability. By combining comparative analysis with EU-level governance debates, this panel invites contributions on how populism, affective mediatization, and fragmented regulation converge to challenge democratic quality, public deliberation and social cohesion. EPISTEMIC VULNERABILITY AND AI: A NEW ETHICAL CHALLENGE IN LIFE-LONG EDUCATION

Aldo Pisano (University of Calabria, Italy)

AIED | Ethics | epistemic vulnerability

This article examines epistemic vulnerability as a structural condition affecting all individuals across the lifespan and argues for its recognition as a critical educational object. Epistemic vulnerability refers to susceptibility to distorted or oversimplified representations of reality, arising from both internal cognitive biases and external narrative ecosystems (Bueter, 2022). We define this concept and distinguish it from other forms of vulnerability, then introduce the Large Ethics Model (LEM) as a comprehensive framework for addressing interpretive distortions, particularly in the context of emerging technologies like artificial intelligence (Pisano, Crispni & Rossi, 2025). The LEM integrates the PAIA model of AI risks—Pervasiveness, Autonomy, Invisibility, and Adaptivity—with a multi-stakeholder approach to ethical responsibility, encompassing policymakers, funders, programmers, and users (Pisano, 2025). We propose that ethics education, grounded in philosophical dialogue and critical literacy, offers the most potent response to these challenges. Empirical evidence from a recent AI & Ethics Literacy pilot study demonstrates that targeted educational interventions can improve ethical awareness, bias recognition, and critical thinking across different ages and educational tracks. Building on this analysis, we outline a set of good practices through which the epistemic care-giver—performing what is, in essence, a genuinely philosophical task—can intervene operationally on multiple planes (Tronto, 2013). First, on the plane of social sustainability, through the epistemic-representational process of anthropomorphization, understood here in a constructive sense: this means attributing non-neutral intentions to digital platforms, thereby foregrounding the purposes of those who design and fund them, and recognizing as forms of silent enslavement the labour disguised by gamification mechanisms such as likes, comments, and reposts (Casilli, 2021). Second, on the plane of environmental sustainability, by materializing the virtual—revealing that digital space is not ethereal, but grounded in the exploitation of human labour and raw materials, rendered invisible to the end user (Crawford, 2020). Third, by relocating responsibility onto the human agent, supporting arguments that refuse to treat the machine as an autonomous moral agent and instead frame it as a tool of interaction with human beings (Holmes, 2023). These proposals represent a mode of deploying the virtues of care ethics, triggering a positive paidetic circle in which the moral (epistemic) patient progressively becomes a conscious moral agent, thereby avoiding the perpetuation of disinformation and distorted representations of reality. We conclude that addressing epistemic vulnerability through lifelong education, guided by frameworks like LEM and enacted through the care-based practices outlined above, is essential to preserving democracy and human agency in an era of pervasive information manipulation. The epistemic care-giver, far from being a marginal figure, emerges as a pivotal actor in the cultivation of critical awareness—one who can translate philosophical inquiry into concrete educational interventions capable of confronting the ethical challenges posed by digital technologies and artificial intelligence.

EDUCATIONAL COMMUNICATION AND DEMOCRACY AT SCHOOL: DIDACTIC MEDIATION, DIGITAL ENVIRONMENTS AND EDUCATIONAL RESPONSIBILITY

Antonio Corbo (Ministero dell'Istruzione e del Merito, Italy)

communication democratic responsibility

In the context of socio-cultural transformations driven by the digitalization of communicative processes, schools are increasingly called upon to rethink their role as public spaces for democratic education. Educational communication can no longer be understood as a mere transmission of contents, but rather as a complex pedagogical device that structures educational relationships, participatory processes, and the shared construction of knowledge (Dewey, 1916; Rivoltella, 2012). In everyday classroom practices, this shift often translates into concrete difficulties in sustaining genuinely dialogical and participatory spaces of communication. From this perspective, the quality of communication in school settings becomes a decisive variable for sustaining the educational pact and for enabling the exercise of conscious democratic citizenship (Biesta, 2011). This paper proposes a re-interpretation of educational communication as a practice of didactic and cultural mediation, capable of supporting processes of inclusion, dialogue, and mutual recognition within educational contexts increasingly shaped by digital languages, hybrid environments, and technological platforms (Rivoltella & Rossi, 2019). Communication is interpreted here as the symbolic infrastructure of educational democracy: it shapes power relations in the classroom, students' forms of participation, and the conditions for building genuinely inclusive learning communities (Habermas, 1981). Within this framework, digital environments and emerging technologies – including artificial intelligence systems – redefine modes of interaction, access to knowledge, and the negotiation of meanings, raising new challenges for the educational responsibility of teachers and school institutions (Floridi, 2019; UNESCO, 2023). The risk is that communication may be progressively colonized by algorithmic logics, communicative simplifications, and transmissive models that weaken critical thinking and students' democratic participation (Selwyn, 2019). Drawing on contributions from pedagogy, didactics, and communication studies, the paper analyses the school as a laboratory of communicative democracy, in which the quality of communicative practices becomes a condition for the construction of dialogical, equitable, and participatory learning environments (Biesta, 2011; Rivoltella, 2012). This calls for continuous reflective work on teachers' communicative practices, often taken for granted yet decisive in shaping processes of inclusion and exclusion. Particular attention is paid to how conscious educational communication can counteract phenomena of exclusion, relational fragmentation, and communicative poverty, fostering students' agency and shared educational responsibility (Rivoltella & Rossi, 2019). Finally, the contribution argues for the need to renew education for communication in school contexts, understood as a transversal competence for democratic citizenship, capable of integrating critical, ethical, and participatory dimensions. Only through communicative practices oriented towards dialogue, reflexivity, and shared responsibility can the school's role as a public space for democratic formation be strengthened within the contemporary communicative ecosystem (Dewey, 1916; UNESCO, 2023).

ARTIFICIAL INTELLIGENCE AND SCHOOL: PEDAGOGICAL, ETHICAL, AND DEMOCRATIC CHALLENGES IN CONTEMPORARY EDUCATION

Alessia Notti (University of Salerno, Italy)

Artificial intelligence | education | democracy

The introduction of artificial intelligence (AI) into schools represents one of the most significant transformations in contemporary education, with profound effects on teaching, learning, and assessment processes. AI does not simply provide new teaching tools; it also helps redefine the organization of knowledge, educational practices, and the very role of those involved, within a broader framework of the digitalization of society and education. Intelligent tutoring systems, educational data analytics, and generative applications promise to support the personalization of learning paths and improve inclusion, in line with a conception of education as an active and democratic experience (Dewey, 1916). From this perspective, schools can become spaces for pedagogical experimentation where intelligent technologies support, rather than replace, teaching mediation processes and the educational relationship. However, the introduction of AI into schools also raises critical ethical, social, and political questions. The use of data-driven systems entails risks related to privacy protection, surveillance, and student profiling, as well as the potential reproduction or amplification of inequalities through algorithmic biases (Zuboff, 2019). Furthermore, with automation, some cognitive and evaluative functions can reduce the complexity of learning to mere measurable indicators, weakening the critical and reflective dimension of education. Within this framework, it becomes crucial to recover a pedagogy oriented toward emancipation and awareness, capable of training individuals who are not simply users of technologies, but citizens capable of critically questioning the devices that structure the educational experience (Freire, 1970). Major international organizations have emphasized the need to develop and use AI in a "trustworthy" manner, based on principles of equity, transparency, accountability, and respect for fundamental rights (OECD, 2019; UNESCO, 2021). The European regulatory framework, with the adoption of the Artificial Intelligence Act, also proposes a risk-based approach that has direct implications for education systems, particularly regarding the use of applications with a high impact on student rights and automated decision-making processes (European Union, 2024). These references indicate that the issue of AI in schools cannot be addressed solely in terms of educational innovation but requires educational governance that is attentive to the ethical and democratic dimensions of technology. The paper therefore proposes considering AI in schools as a lever for renewed digital citizenship, in which education in technology is intertwined with education in democracy. From this perspective, schools are called to become laboratories of critical skills, capable of integrating digital literacy, ethical reflection, and informed participation in social life. Training students and teachers to critically use AI means not only improving the effectiveness of educational processes but also contributing to the construction of a democratic culture capable of consciously governing ongoing technological transformations, preventing them from translating into new forms of inequality or cognitive dependence.

RETHINKING DEMOCRATIC BILDUNG: TEACHER EDUCATORS' PERSPECTIVES ON GENERATIVE AI

Synnøve H. Amdam (Volda University College, Norway) · **Ann-Therese Arstorp** (University of South-Eastern Norway) · **Mari-Ann Letnes** (Norwegian University of Science and Technology) · **Ilka Nagel** (Østfold University College, Norway) · **Cathrine E. Tømte** (University of Agder, Norway)

Generative Artificial Intelligence | Bildung | Teacher Education

Bildung has historically been a central educational aim in the Nordic countries (Burman, 2014; Sjöström et al., 2017), grounding education in democratic participation, ethical awareness, and the development of autonomous, socially engaged citizens. In today's post-digital societies, where digital technologies permeate economic, political, and social life, the boundaries between humans and technologies are increasingly blurred (Knox, 2019). We collaborate with digital systems as epistemic partners (Lund & Aagaard, 2020), a dynamic intensified by the rapid diffusion of generative AI (GenAI). These developments challenge democratic education systems to critically reconsider how knowledge is produced, mediated, and valued, and also what it means to be and develop as humans. Bildung entails understanding oneself as a social and civic actor (Hegel & Elster, 1967), cultivating ethical responsibility, and contributing to democratic development (Kant & Zehbe, 1975). Yet recent decades have seen the diminishing status of Bildung in favour of qualifications, labor-market relevance, and measurable learning outcomes in Nordic curricula (Biesta, 2020; Erstad & Voogt, 2018). This shift risks narrowing education's democratic and relational dimensions. GenAI forces a renewed reckoning with these tensions. On the one hand, GenAI destabilizes outcome-focused pedagogies by producing traditional educational artefacts, such as essays, with minimal student engagement. This underscores the need to refocus on learning processes, critical inquiry, and collaborative meaning-making. In doing so, GenAI paradoxically re-opens space for Bildung-oriented educational goals. On the other hand, GenAI also presents substantive risks to democratic Bildung. Its capacity to generate misinformation and authoritative-sounding but inaccurate content challenges students' and citizens' ability to navigate truth, trust, and public discourse. Established models of critical thinking, democratic deliberation, and epistemic agency therefore require re-examination in a technological landscape where information is abundant, ambiguous, and automated. Teacher education becomes crucial in addressing these democratic and pedagogical challenges. Teacher educators must navigate GenAI's opportunities and risks while supporting student teachers in cultivating both their own Bildung and Bildung in their future pupils. Teacher educators' understandings of educational purposes, digital technologies, and democratic responsibility shape how GenAI is integrated, or resisted, within schooling. This paper presents findings from a reflexive thematic analysis (Braun & Clarke, 2021) of semi-structured in-depth interviews (Morris, 2015) with 20 teacher educators across five Norwegian teacher education institutions. We ask: How can teacher educators promote Bildung in a world of generative AI? We explore how these educators understand Bildung today and how they perceive and address the challenges following the rise of GenAI through a discursive approach (Edley, 2001). Our aim is to contribute to a deeper understanding of how to rethink education and democratic responsibility in an AI-driven society.

CIVIC EDUCATION TEACHING IN ITALIAN SCHOOLS: THE CONTRIBUTION OF LAW 92/2019 TO DEMOCRATIC EDUCATION IN CONTEMPORARY SOCIETY

Carolina Leva (Università della Basilicata, Italy)

civic education · democratic education · digital citizenship

In contemporary society, characterized by rapid technological transformations, the expansion of digital environments, and the growing influence of Artificial Intelligence, the relationship between education and democracy has become increasingly central to pedagogical and political debate. Digital technologies have profoundly reshaped access to knowledge, forms of social participation, and democratic processes, generating both new opportunities and significant challenges. In this context, schools play a fundamental role in preparing informed, responsible, and active citizens capable of critically understanding the complexity of contemporary society. From a theoretical perspective, democratic education represents an essential dimension of the educational process. Drawing on John Dewey's pedagogical thought, democracy can be understood not only as a political system but also as a form of associated living grounded in participation, dialogue, and shared responsibility. Education thus becomes the primary means through which democratic values, critical thinking, and civic responsibility are cultivated. Schools are therefore not only institutions for the transmission of knowledge but also environments in which democratic culture is experienced and developed through participation and dialogue. Italian Law no. 92 of 2019, which reintroduced civic education as a compulsory and cross-curricular subject across all school levels, represents a significant pedagogical and normative development. This law constitutes an important educational reform, as it recognizes civic education as a central element in the formation of democratic citizens and assigns schools a key role in promoting constitutional values, social responsibility, and active participation. Particular emphasis is placed on digital citizenship, highlighting the need to develop students' critical, ethical, and participatory competences in order to navigate digital environments increasingly shaped by algorithmic systems and the influence of Artificial Intelligence. The pedagogical value of Law 92/2019 lies in its capacity to position civic education as a structural component of the school curriculum and as a key instrument of democratic education. By integrating civic, social, and digital dimensions, civic education contributes to the development of critical thinking, ethical responsibility, and active participation, which are essential for democratic life in contemporary societies. In a context marked by the growing pervasiveness of digital technologies and Artificial Intelligence, civic education provides students with the cognitive and ethical tools necessary to understand, critically evaluate, and responsibly engage with ongoing technological transformations. This paper offers a theoretical interpretation of civic education teaching in Italian schools, highlighting the contribution of Law 92/2019 to strengthening democratic education. It argues that civic education represents a fundamental pedagogical response to the challenges posed by digital transformation and Artificial Intelligence, contributing to the formation of citizens capable of conscious, critical, and responsible participation in contemporary societies.

DEMOCRATIC CITIZENSHIP AND CULTURAL HERITAGE EDUCATION: SOCIAL IMPACT ASSESSMENT FOR THE AI ERA

Claudio De Luca (University of Basilicata, Italy) · **Vincenzo Nunzio Scalcione** (University of Basilicata, Italy)

UNESCO global citizenship · democratic education · social impact assessment

The contemporary geopolitical context demands renewed attention to the relationship between democracy and education as articulated by John Dewey, rendering timely a critical and updated reading of his thought in light of ongoing social, cultural, and technological transformations. This contribution is situated within the framework of UNESCO's Global Citizenship Education and examines how social pedagogy can contribute to strengthening democratic participation

through the integration of cultural heritage education and rigorous social impact assessment methodologies. Drawing upon the UNESCO framework on global citizenship, which emphasises belonging to a broader community and common humanity, it is argued that cultural heritage education constitutes a strategic resource for promoting active and democratic citizenship. Heritage education, addressed to all individuals throughout the lifespan, not only fosters knowledge and respect for cultural assets but also promotes lifelong formation for active citizenship, requiring synergy between territories and educational institutions. The shift from an expertise-led and object-oriented preservation paradigm to an inclusive and people-centred approach has transformed how cultural institutions engage with communities. This paper critically analyses the principal methodological approaches for measuring social and educational impact in cultural heritage interventions. Cost-Benefit Analysis provides quantitative economic evaluation of cultural investments. Multiplier Analysis examines the indirect economic effects generated by cultural activities within local economies. Contingent Valuation assesses the perceived value of non-market cultural goods through stakeholder surveys. The Social Return on Investment (SROI) methodology, developed by the Roberts Enterprise Development Fund, emerges as the most widely adopted tool globally for strategic planning and social impact communication, quantifying social value through stakeholder engagement, proxy identification, and systematic verification of outcomes. The integration of artificial intelligence systems within this evaluative framework presents both opportunities and challenges for democratic citizenship education. Whilst algorithmic systems can enhance the measurement of intangible impacts generated by cultural institutions, they also require critical epistemic responsibility. Educational curricula must develop the critical thinking capabilities of students and educators to navigate the ideology of disinformation whilst leveraging artificial intelligence for sustainable development. Following the UNESCO 2030 Agenda objectives and the European Recommendation on Key Competences for Lifelong Learning, this contribution advocates for a competency-based approach wherein personal, social, citizenship, entrepreneurial, and cultural awareness competencies become the formative goals of educational pathways. The Service Learning methodology emerges as a particularly effective pedagogical practice enabling students to learn through community service whilst engaging with real problems within their living context, including cultural heritage preservation and valorisation. This paper concludes that reconstructing democracy in the current geopolitical disorder requires evidence-based evaluation of educational and cultural interventions, wherein social impact assessment methodologies serve not merely as accountability tools but as instruments for promoting a new democratic citizenship capable of addressing the challenges of contemporary global society.

THE DELICATE ISSUE OF THE NEW CITIZENSHIP EDUCATION AND OF THE EDUCATION FOR THE NEW CITIZENSHIP SUPPORTED BY DIGITAL TECHNOLOGIES FOR SHARING COMMON VALUES AND RULES IN DEMOCRACY

Alessio Annino (University of Catania, Italy)

education | Artificial Intelligence | active citizenship

The use of new digital technologies and Artificial Intelligence, including generative AI, has been increasingly emerging as an enormous potential with regards to the promotion of active citizenship and participation in a truly democratic perspective, as it can offer numerous possibilities for all citizens to access resources in terms of effective equity. In fact, if we start from the analysis of education as a dependent variable within a complex system of a complex society in which profoundly different languages, religions, sexual orientations, cultures and ways of behaving coexist on a daily basis, the need to see a new perspective emerges for education for multicultural global citizenship which is striving to also become intercultural. A pedagogical reflection in this regard shows how this phase of the educational process is the favorable terrain for developing a conscious adherence to shared values and cooperative and collaborative attitudes that are the prerequisites for practicing civil coexistence. clearly in such a complex and articulated training process, generative AI takes on an essential role, both in the research and improvement of contents, as well as in their structuring and re-structuring to support the greatest possible usability: especially in terms of participatory and inclusive citizenship, it is essential to make continuous references to the specific weight of the values and to the most suitable teaching methodologies and strategies for their easier internalization. Above all, new digital technologies can truly constitute an enormous bridge, not only virtual but also physical, in bringing cultures closer together in sharing cultural instances, ways of behaving and traditions, thus reducing the distances between ethnic groups and thus contributing to smoothing out the edges of the risks of inter-ethnic conflicts that contemporary globalised society can generate in terms of commercial and working efficiency and effectiveness. Clearly, the identification and use of new digital tools and new digital technologies cannot ignore a general consideration of the economic conditions at various latitudes of the globe. And this can undoubtedly invalidate the use of the Internet and the global network. This serves, democratically speaking, as a stimulus for governments to invest more and more in research and to reduce economic and social inequalities that can jeopardize the effective use of the elementary human rights connected to democracy. It is clear that a complex universe such as that of digital technologies, which is always undergoing profound and rapid change, always requires constant updating in terms of skills and knowledge for its real use in terms of equity and democratic effectiveness.

HYBRID TEACHING AND FUNDAMENTAL SKILLS: RETHINKING CURRICULUM IN THE AGE OF ARTIFICIAL INTELLIGENCE

Andrea Cirolia (Università della Basilicata, Italy)

hybrid teaching | artificial intelligence | democratic education

Within the current phase of geopolitical disorder and accelerated digital transformation, the diffusion of artificial intelligence and the datafication of social processes are reshaping learning environments and challenging traditional curricular frameworks in schools and universities. This paper argues that the widespread tendency to oppose technological competencies to the strengthening of basic skills risks producing a false dichotomy, obscuring the interdependence between digital innovation and the formative foundations of democratic education.(Dewey, 1916; Bruner, 1996; OECD, 2019) By framing artificial intelligence within the current geopolitical disorder, the paper highlights how the educational use of AI is entangled with broader processes of disinformation, algorithmic governance, and the reshaping of democratic participation. In contexts increasingly mediated by platforms and intelligent systems, education is called to cultivate critical thinking and epistemic responsibility as core dimensions of a renewed democratic citizenship.(UNESCO, 2023; OECD, 2019) The contribution situates itself within the ongoing debate on the relationship between democracy, education, and artificial intelligence, proposing hybrid teaching as a pedagogical and curricular lens through which fundamental skills and AI-related competencies can be integrated in a coherent and intentional way. Hybrid teaching is here conceptualized not as a merely organizational arrangement or a technical alternation between physical and digital spaces, but as a design framework capable of aligning times, spaces, languages, and tools with essential learning outcomes.(Calvani, 2011; Rivoltella, 2020) From this perspective, the reinforcement of basic skills—such as reading comprehension, argumentative competence, logical reasoning, and linguistic proficiency—emerges as a necessary condition for the meaningful and critical appropriation of intelligent technologies. Without such foundations, the educational integration of artificial intelligence risks amplifying superficial learning practices, cognitive fragmentation, and vulnerability to disinformation and algorithmic manipulation.(Trinchero, 2014; UNESCO, 2023) Drawing on a theoretical framework that brings together curriculum studies, general didactics, and democratic pedagogy, the paper outlines how hybrid teaching can foster a coherent alignmentbetween educational aims, teaching methodologies, and technological tools, avoiding technocratic or solutionist approaches to innovation. In this sense, digital technologies do not replacefoundational skills but may function as environments for their consolidation, transfer, and critical enactment within the digital public sphere.(Bruner, 1996; OECD, 2019; UNESCO, 2023)

AI LITERACY AS DEMOCRATIC EDUCATION: RECONSTRUCTING CITIZENSHIP IN THE AGE OF DISINFORMATION

Giuseppe Nobile (Università degli Studi della Basilicata, Italy)

AI | Literacy | democratic

The current geopolitical disorder is increasingly shaped by the centrality of artificial intelligence, datafication, and algorithmic governance systems that influence public debate, democratic participation, and educational processes. In this context, the classical relationship between democracy and education, as formulated by John Dewey, appears deeply undermined by the power of digital platforms, economic and financial oligarchies, and the systematic spread of disinforma-

tion. These dynamics negatively affect critical thinking, epistemic responsibility, and the conditions for exercising conscious democratic citizenship. (Dewey, 1916; Floridi, 2019) This paper argues that AI Literacy should be conceived as a pedagogical and civic paradigm capable of reconstructing the relationship between democracy and education, recognizing the educational pact of shared responsibility as a strategic device for addressing the complexity of the contemporary digital ecosystem. AI Literacy is not understood as a technical competence, but as an integrated educational framework aimed at fostering critical awareness, ethical reflexivity, and social responsibility through an educational alliance involving schools, universities, families, and local communities. (Rivoltella & Rossi, 2019; UNESCO, 2023) Within this perspective, artificial intelligence is interpreted not only as an object of learning, but as a cultural and political environment that structures access to knowledge, decision-making processes, and forms of participation. The educational pact of shared responsibility therefore assumes a generative pedagogical function, configuring itself as a space of mediation between educational institutions and civil society, oriented toward the construction of democratic, inclusive, and participatory digital citizenship. (Floridi, 2019; Dewey, 1916) Drawing on pedagogy, special education, and didactics, the paper analyzes the role of schools and universities as democratic laboratories in which students and teachers can develop critical competencies to interpret algorithmic systems, recognize the mechanisms of disinformation, and act responsibly within the digital public sphere. Particular attention is devoted to the risks of educational and digital inequality, highlighting how the lack of AI-related competencies may intensify forms of digital educational poverty and social marginalization. (Rivoltella & Rossi, 2019; UNESCO, 2023) The contribution argues that a renewed curriculum for democratic citizenship must be based on a fruitful hybridization of education, didactics, and artificial intelligence, promoting critical thinking, conscious participation, and an ethics of shared responsibility. Only through collectively grounded educational approaches can the ideology of disinformation be countered and algorithmic systems oriented toward social cohesion, sustainability, and peace in a global society marked by increasing instability. CIVIC EDUCATION AND NEW FRONTIERS OF EDUCATION IN THE AGE OF AI

Antonella Tiano (Unibas, Italy)

L.92/2019 Autonomia scolastica Dirigente Scolastico

An inclusive and meritocratic school system represents the core of the autonomous school system, linked to the role and functions of the school principal, where the educational success of each student is the fundamental path to defining themselves as citizens of the Italian Republic, the European Union, and the world. The overall meaning, as well as a cultural and political paradigm, is provided by the teaching of civic education – Law 92/2019 – which can improve both the organization of teaching, in its epistemological and pedagogical foundations, and the governance of the autonomous school system. The pedagogical question is therefore fundamental to clarifying the relationship between the autonomous school system and the school principal and to offering the social community a school that educates for change and inclusive democracy as one of the key aspects for the salvation of humanity, severely tested by the geopolitical transformations underway in global society and by the great challenges that humanity will face in the coming decades, such as the advent of artificial intelligence.

THE EXPERIENCE OF ART AS A CONTRAST TO DISINFORMATION. REFLECTIONS ON KNOWLEDGE, EDUCATION, AND DEMOCRACY IN THE AGE OF EPISTEMIA

Vincenza Costantino (Università degli studi "G. d'Annunzio" Chieti-Pescara, Italy)

Art | Education | A.I

The connection between the values of western democracies and other autocratic systems is conditioned by an environment saturated with technological manipulation and pervaded by the ideology of disinformation. Disinformation today, helped by the still unregulated use of AI, exhibits specific aspects that impact the relationship between knowledge, education, and democracy. Web information, characterized by speed and repeatability, produces an enormous amount of unverifiable and easily falsifiable content and news (fake news). Generative AI, through chatbots, provides its users with effective answers and texts tailored to their needs, resulting in significant linguistic effects: from lexical impoverishment, particularly seen in some experiential fields of knowledge, to epistemia, which is the impression of knowledge based on the uncritical acceptance of AI responses. Large Language Models (LLMs) are increasingly present in various learning contexts and are used to obtain information or access knowledge across all fields. LLMs offer well-articulated answers with such formal accuracy that they lead the user to confuse linguistic form with epistemic reliability. Epistemia is, precisely, the illusion of knowledge that emerges when superficial plausibility replaces source verification, in-depth knowledge, and selection of informations. Delegating judgment to such systems can influence learning processes and negatively impact people's development in the context of democratic citizenship, accentuating systemic effects such as economic and cultural inequalities, social disparities, and political asymmetries. The contemporary crisis is not only technological, socioeconomical, or political; it is, first and foremost, an epistemological crisis. Today, we have free access to a boundless amount of knowledge, but we don’t know how to appropriate it, how to manage it. In the constant flow of web communications, it becomes essential to develop the skills of organization and connection of knowledge. AI can communicate anything without having experience and knowledge of it. Education today must take on the following tasks: rethink the lexicon of knowledge; defend the possibility of experiencing knowledge in a world that replaces it with its linear description; build awareness of the significant losses that are reducing the lexicon linked to experience and cultivate semantic capital (Floridi). To rebuild the relationship between democracy and education it is important to place the individual at the center of the educational process, their corporeity, their unpredictable and nonlinear thinking, the complexity of their understanding of the world through experience. Culture and especially art can be considered pedagogical tools aimed at fostering the values of social cohesion and equity. This perspective opens a reflection about the use of AI in education, placing the experiential value of knowledge at the center, and thus recognizing the individual's active role in a complex relationship of hybridization between culture, pedagogy, and technology. Learning about the role of art and of the experience of art is important to promote the empowerment of critical thinking and the epistemic responsibility of students and teachers to reach a democratic school.

Democracy in the Infosphere: Educational Strategies for Active Citizenship

PANEL CONVENORS: Gabriele Nicotra (La Sapienza Università di Roma, Italy); Alessandro Ralli (La Sapienza Università di Roma, Italy)

PANEL KEYWORDS: Youth Participation, Infosphere, Media Literacy

Promoting citizen participation, particularly among young people, stands as one of the most arduous challenges for consolidating genuine civic activism in a healthy democracy. The health of democracy is threatened by multiple crises, inscribed in a neoliberal political context driven by an individualistic rationality that has eroded trust in formal democratic institutions. Consequently, youth resentment—stemming from a lack of recognition within the traditional political system—has found an outlet in forms of bottom-up citizenship. These instances of youth activism serve as critical "exceptions," offering a profound interrogation of the current democratic system. In countering these atomizing practices, education plays a fundamental role. However, the educational mission faces a monumental challenge within the current technological landscape. The deep mediatization of the infosphere and the extreme polarization of public discourse—rife with misinformation—render it imperative to develop a pedagogy focused on media literacy. The goal is not merely access, but educating new citizens in the conscious, critical use of technology for both informational and formative purposes. The panel welcomes contributions focusing on issues related to the promotion of active participation, particularly among young people, disadvantaged and marginal groups, which are the result of research in issues such as: - Local initiatives to promote and educate active citizenship - Practices of digital citizenship and digital rights claims - Pedagogical strategies for media literacy and critical thinking. - Research on local or national participatory democracy mechanisms - Studies on political participation, with a particular focus on youth forms - Tools and policies for inclusion and co-design

PLAYFUL ACTIVISM IN YOUTH CITIZENSHIP AND NEW FORMS OF POLITICAL PARTICIPATION AMONG PRE-TEENS

Geremia Trinchese (Università La Sapienza, Italy)

democracy | activism | infosphere

In the context of contemporary ongoing polycrisis marked by genocide, democratic backsliding, armed conflicts, and climate emergency, young people on social media platforms face what visual artist Noura Tafeche termed as ‘iniqualgia’: the process of getting sick from injustice, particularly through the constant exposure to images of violence and suffering. In this political atmosphere, promoting youth political participation stands as one of the most arduous challenges for consolidating genuine civic activism in a healthy democracy. Traditional institutional channels suffer from a profound crisis of representation, failing to recognize young people within the political system and generating youth resentment. This lack of recognition has driven youth toward novel forms of bottom-up citizenship, yet these participatory practices remain underexplored, particularly among pre-teen demographics typically excluded from civic engagement research and practice. This contribution examines the concept of ‘playful activism’ (Cervi & Divon, 2023) in the digital ambient, a tool through which youth create meaningful political participation within algorithmically governed digital spaces. Playful activism mobilizes platform affordances (gamification, virality, accessibility) to construct low-cost, inclusive solidarity actions that subvert intended platform purposes. As a case study, this paper analyzes the ongoing practice of teens and preteens pro-Palestine Roblox virtual protests: coordinated demonstrations beginning in October 2023 that have recurred regularly, attracting thousands of users organizing parades with Palestinian flags and political messages within the gaming platform. A case study particularly relevant considering the demographic of the Roblox Platform where over 40% of the users are aged 12 or younger. By appropriating gaming platforms for political expression, participants practice digital citizenship and construct innovative solidarity spaces, asserting agency through creative platform use. Reaching demographics systematically excluded from traditional activism, particularly pre-teens, and generating substantial media coverage, these actions demonstrate tangible impact on public discourse beyond the platform itself. The methodology proposed is based on qualitative content analysis of secondary data, including media coverage of Roblox protests, social media posts and screenshots documenting virtual demonstrations, and available platform data. This approach allows for examination of both the visual and discursive dimensions of playful activism, capturing how protest practices are represented, amplified, and circulated beyond the gaming platform itself. This contribution aims to analyse youth political participation, digital citizenship practices, and inclusion tools essential for strengthening democratic engagement among new generations. Beyond protest, these practices function simultaneously as advocacy and informal media literacy. By

participating in coordinated virtual demonstrations, pre-teens develop critical platform awareness, learning to appropriate digital spaces for civic purposes. Each protest thus generates a new wave of informed participants: young people who, having experienced playful activism firsthand, become advocates capable of mobilizing future collective actions. In this context, youth playful activism serves not merely as a form of political participation but as a form of grassroots peer-to-peer communal, educational and political approach.

INFLU-ACTIVISTS SHAPING POLITICAL PARTICIPATION: PUBLICS' NEGOTIATIONS BETWEEN PERSONALISED FANDOM AND FEMINIST ENGAGEMENT

Sabrina Brignoli (Università degli Studi di Urbino Carlo Bo, Italy)

Influ-activism | Political participation | Political fandom

In the contemporary digital public sphere, influ-activists (Murru et al., 2024) are emerging as new political intermediaries who play an important role in political education and media literacy, fostering political participation particularly among young people (Riedl et al., 2023). Operating at the intersection of digital activism and influence culture, these actors function outside traditional democratic institutions, engaging in strongly partisan political discourses on social media platforms (Rothut, 2025). They aim to raise citizens' awareness, encourage active participation, and "irritate" the public sphere (Boccia Artieri, 2021). They achieve this through the accumulation of influencing capital and the strategic cultivation of their fanbase (Khamis et al., 2016), leveraging their attachment to socio-political causes. Focusing on Italian feminist influ-activism on Instagram, this contribution investigates how publics negotiate the tension between admiration for influ-activists and commitment to feminist values, and how this negotiation shapes their participation. To decode these dynamics, the study applies the framework of political fandom (Sandvoss, 2013; Dean, 2017). This perspective conceptualises political engagement not only as rational adherence, but also as a process driven by identity, affective investment, entertainment, and collective dynamics. This engagement can be directed either towards institutional figures and leaders (Campus & Mazzoni, 2025; "personalised fandom") or towards political or value-based affiliations (Barnes, 2022; "ideological fandom"), providing a useful lens to interpret how publics relate both to influ-activists and to feminist causes. The study adopts a qualitative approach based on 20 semi-structured online interviews with individuals who follow the most visible influencers within the Italian digital feminist landscape (according to criteria of theme, relevance and territory, Polesana & Risi, 2024). Participants were selected through a purposive sampling strategy (Patton, 2015) based on multimodal recruitment, combining: (1) offline interception of subjects during the 25 November demonstrations in Rome and Milan, to include individuals with high levels of participation, (2) direct online recruitment, and (3) the snowball technique to increase the variability of the sample by including individuals with more fluid or mediated forms of participation. Findings reveal a wide spectrum of participation profiles. Some participants exhibit a strong personalised fandom, relying on influ-activists as central sources of information and political learning. In these cases, ideological adherence to feminism and political participation tend to be more individualised and intermittent, struggling to develop into a structured collective sentiment beyond the relationship with the influ-activist. Conversely, individuals with a more solid feminist identity and a stronger attachment to the political cause demonstrate a more detached relationship with influ-activists and a broader consumption of political entertaining content. In these cases, the parasocial relationship with influ-activists is present but mediated by a critical awareness of algorithmic logics and digital labour, which fosters processes of humanisation and deconstruction of celebrity. Overall, the results suggest that personalised fandom can lower barriers to

entry and facilitate mobilisation. However, at the same time the balance between attachment to individuals and commitment to causes shapes the quality of engagement and participation, determining whether it develops into a collective we-sense and sustained mobilisation or remains individualised and episodic engagement.

COMMUNICATING EUROPE IN THE POST-DIGITAL ERA: YOUTH PARTICIPATION, EUROPEANIZATION AND CIVIC AGENCY

Marinella Belluati (University of Turin) · **Marta Fornacini** (University of Turin; University of Genova) · **Sara Pane** (University of Turin)

AI | public communication | citizen engagement

Communicating Europe in the Post-Digital Era: Youth Participation, Europeanization and Civic Agency Promoting active citizen participation—particularly among young people—represents a critical challenge for contemporary democracies confronted with declining institutional trust, deep mediatization of the public sphere and the individualizing dynamics of platform-based communication (Sorice, 2020). The European Union constitutes a privileged arena for examining these transformations: a paradigmatic yet contested case of Europeanization of the public sphere, marked by persistent communicative and democratic deficits across local, national and supranational levels (Belluati, forthcoming; Lovari & Belluati, 2023; Trenz, 2005). These deficits are closely linked to the EU's enduring perception as a technocratic and distant polity, whose governance and communication practices often struggle to foster affective resonance and meaningful civic involvement (Belluati, 2021). Within this framework, youth engagement emerges as a key corrective to structural limitations. Young people have been consistently framed as a strategic priority of EU policies and communication initiatives—not only as beneficiaries, but as agents capable of re-politicizing European integration and counteracting technocratic closure. Civil society organizations and non-formal educational practices also play a pivotal role in fostering active citizenship at the European level, while the EU's multilevel governance architecture provides a distinctive context for examining participatory democracy mechanisms operating across scales (D'Ambrosi & Parito, 2022). Against this backdrop, this study investigates how digital technologies reshape citizen–institution interaction and civic participation within the Europeanized EU public sphere, with a specific focus on youth engagement in an emerging post-digital communicative environment characterized by algorithmic mediation and the growing institutional use of generative artificial intelligence (Pane et al., 2025). The research adopts a multi-phase qualitative design combining three rounds of semi-structured interviews conducted between 2024 and 2026. A first wave (n = 25), conducted ahead of the 2024 European Parliament elections, examines how EU institutional communication is perceived and negotiated in a high-stakes electoral context marked by platformization, polarization and misinformation. A second wave (n = 26) explores how EU institutions and civil society actors experiment with digital tools—from e-participation platforms to generative AI and chatbot interfaces—alongside youth-led appropriations of these technologies in non-formal educational settings. A third wave (n = 26), conducted in the post-electoral period, further probes the routinization of AI-assisted communication within EU institutional workflows and its implications for inclusion, responsiveness and democratic legitimacy (Pane, 2025). Taken together, the findings offer a longitudinal and multi-perspectival analysis of youth participation in the EU's post-digital public sphere , highlighting

persistent tensions between top-down institutional communication logics and bottom-up civic engagement, while identifying spaces of convergence where digital platforms and AI-enabled tools can support media literacy and participatory capacity-building. By situating youth engagement at the intersection of EU public communication, civil society action and multilevel governance, the article contributes to debates on Europeanization, democratic resilience and the future of participatory democracy in Europe (Pane, forthcoming). The research draws on work carried out by the Jean Monnet Chair Com4T.EU – Communicating for Transitions in Europe at the University of Turin (2023–2026) and the Interactif project (Interregional action for France and Italy 2025-2026).

CONTESTING THE PAST IN THE DIGITAL INFOSPHERE: NARRATIVE FRAGMENTATION AND MEDIA LITERACY REGARDING THE NANJING MASSACRE AMONG YOUTH

Haoxuan Diao (Sapienza University of Rome, Italy)

Nanjing Massacre | Collective Memory | Digital Citizenship

The collective memory of the Nanjing Massacre is increasingly being "re-mediated" within the digital infosphere, where digital power structures and algorithmic logic reshape historical consciousness. This study explores the tension between institutional historical education and decentralized digital discourses among youth in the Sinosphere (Mainland China, Hong Kong, and Taiwan). The research first presents a comparative literature review of history textbooks, revealing a fundamental divergence in narrative framing: while Mainland Chinese curricula emphasize a "Victimization and Patriotism" perspective, narratives in Hong Kong and Taiwan lean towards "Universal Human Rights" and "Global War Trauma." This initial divergence creates a "cognitive baseline gap" among youth before they engage in digital interactions. Building on this, the study incorporates a content analysis of contemporary discussions on Reddit. It examines how these pre-existing pedagogical frameworks collide in a decentralized digital environment characterized by polarization. Preliminary findings suggest that the lack of a shared narrative baseline makes young users vulnerable to digital disinformation and nationalist Echo Chambers, where historical trauma is frequently weaponized to fuel ideological division. To address these challenges, this paper proposes a strategic "Narrative Literacy" framework as a practical intervention. Beyond traditional fact-checking, this framework equips digital citizens with the tools to deconstruct how digital platforms amplify conflicting historical frames. Furthermore, the study demonstrates how participatory "co-creation" tools can be utilized to facilitate cross-border dialogue, shifting the focus from defensive nationalism to a critical, multi-perspectival understanding of difficult heritage. By integrating these pedagogical strategies, the research offers a roadmap for fostering resilient and empathetic digital citizenship in an age of AI-driven polarization.

RESISTING GENTRIFICATION AND PRIVATIZATION OF PUBLIC GREEN SPACES THROUGH PARTICIPATIVE DEMOCRATIC PRACTICE: THE CASE OF EX MERCATI GENERALI IN ROME

Mario Monopoli (Sapienza Università di Roma, Italy) · **Andrea Scorsino** (Sapienza Università di Roma, Italy)

Participatory Democracy | Digital Activism | Gentrification

The “Ex Mercati Generali” is a complex of structures established in 1922 in Rome, specifically in the Ostiense district. The area has remained abandoned since 2002; and then followed a long phase - lasting more than twenty years - of proposals, revisions, cancellations, and renegotiations of projects and concessions. In the meantime, nature has taken its course: a spontaneous ecosystem has emerged that today represents a significant example of urban renaturalization in the city center. The turning point for the future of the area came in 2025, when the concessionaire signed a new agreement with Hines, a large real estate investment fund based in Texas. The project involves the demolition of the pavilions and the construction of ten new buildings. Seven of these will be used as a luxury student accommodation. In response to the project, grassroots protests quickly emerged, hybridizing online and offline tools (Treré, 2019). In particular it is worth noting the high level of youth participation, which has resulted in an online communicative style that combines memetic language (Mina, 2019), symbolic artwork elements (Stammen & Meissner, 2024), and participatory storytelling practices oriented toward civic engagement. In the agreement signed between Hines and the Municipality of Rome, the local community was consulted only after the contract had already been finalized, in a form of invitation-based participatory practice (Antonucci et al., 2024) without effective participation, resembling what has been defined as “participationism” (ivi). The analysis therefore focuses on participatory practices and the activation of mobilization and public participation from an environmental risk perspective (Webler & Tuler, 2021), linked to the cementification and privatization of a large public area intended to become a luxury student residence, further exacerbating processes of gentrification (Chatterton, 2010). The participatory process is interpreted as a form of democratic learning for liminal communities (Barbas 2020; Antonucci et al., 2024), which tactically (de Certeau, 1988) uses media affordances (Nagy & Neff, 2015) and platform algorithms (Bonini & Trerè, 2024) to raise awareness within the infosphere, with a focus on the way in which a composite grassroots protest space can become a political laboratory that experiments with horizontal and democratic educational practices for the entire citizenry. Methodologically, the study adopts a multimodal qualitative approach (Bussoletti & Belotti, 2022), which combines multiple data collection sources such as interviews and memos taken by the researchers during the committee meetings and protest demonstrations, along with posts of the @generaliliberi social media pages and whatsapp community. In this way the analysis explores both the frontstage and backstage dimensions of the protest organization (Treré, 2019). Through participatory observation (Kawulich, 2005) along with digital ethnography (Pink et al. 2016) of the instagram page of the committee and semi-structured interviews with campaign organizers and administrators, the analysis focus on the activists’ media literacy and practices (Bussoletti, et al. 2025), proposing that urban conflicts mediated through digital platforms can become spaces of collaborative civic practice.

AI AND MEDIA LITERACY: CRITICAL, CREATIVE AND EMOTIONAL SKILLS FOR DEMOCRATIC PARTICIPATION

Alice Cardinale (University of Rome La Sapienza, Italy)

AI literacy | Civic Education | Democratic Partecipation

Democratic debate is becoming more polarized and fragmented, with the spread of hate speech and forms of incivility (Engesser et al., 2017). These dynamics can be understood as strategies that increase engagement and exploit the attention economy of digital platforms (Shugars and Ha, 2025). This situation raises concerns for democracy, especially because of emotional proximity and informational distortion. Emotional proximity is becoming more important in shaping how people perceive epistemic authority in social networks (Boccia Artieri, 2025), meaning that users often trust information because they feel emotionally connected to it rather than because it is accurate. Informational distortion, in a context often described as post-truth (McIntyre, 2018), becomes a strategic tool used to influence public opinion (Vasist et al., 2024). In such a current global infosphere (Floridi, 2014), Artificial Intelligence plays an increasingly important role in the algorithmic mediation between citizens and democratic participation. Through Machine Learning, an advanced statistical modelling technique, AI can automatically learn from data, make predictions, "create new things" (Tlili et al., 2023), and influence how knowledge is produced and shared in today's post-public sphere (Schlesinger, 2020). As a result, education systems face a structural challenge: they must prepare students for a world where AI is integrated into the ways people learn, access information, and think. In response, this contribution explores how Media Literacy should update to prepare learners to participate in a democratic discourse in which AI plays a central role. The author argues that to respond to this epistemic shift (Bartsch et al., 2025), it's crucial to integrate two main areas in education: AI literacy and human abilities that AI cannot replicate (Quattrociocchi et al., 2025). The first area concerns a technical understanding of how AI systems and algorithms work. Learners should be aware of limitations such as bias (Tao et al., 2024) and hallucinations (Loru et al., 2025). At the same time, students should understand the ethical and social implications of AI (Ricaurte, 2022), including inclusivity, transparency in algorithmic functioning, clarity about how data are used, and the reliability of information generated by AI systems (Holmes et al., 2022; Khosravi et al., 2022). These aspects should also be contextualized to the impact of AI in media environments, especially in relation to multimedia content that may be partly or completely false. The second area includes abilities that remain key characteristics of human intelligence and allow people to interact critically with AI systems, and media. Critical thinking (CT) helps learners navigate, search for, and filter data, information, and multimedia content available on digital platforms (European Commission, 2022). Creativity is essential for active use. Together with CT, Creativity fosters the ability to deal with uncertainty (Baumann, 2000) and strongly influences the digital environments through which we inform ourselves. Emotional intelligence is another key competence. It includes the ability to recognize, understand, regulate, communicate, and use emotions effectively in social interactions (Mollik and Mollik, 2023) so to develop respectful forms of interaction that consider the perspective of others.

Facing AI Challenges in a Democratic and Socio-Constructivist Perspective: Imaginaries, Agency and Explorative Experiences with a Reggio Emilia-Inspired Approach

PANEL CONVENORS: Maria Barbara Donnici (Fondazione Reggio Children-Centro Loris Malaguzzi, Italy); Lorenzo Manera (Università di Modena e Reggio Emilia); Elena Sofia Paoli (Fondazione Reggio Children-Centro Loris Malaguzzi, Italy); Ludovica Brandi (Università di Modena e Reggio Emilia); Chiara Magurno (Università di Modena e Reggio Emilia); Elena Repman (Università degli studi Guglielmo Marconi); Alessia Donini (Università di Modena e Reggio Emilia)

PANEL KEYWORDS: AI Literacy, Children's Agency, Critical AI Awareness

Artificial Intelligence is becoming a pervasive tool in everyday lives, shaping how people learn, communicate, and understand the world. Yet children and young people often encounter AI systems without adequate conceptual, ethical, or critical equipment to recognize their mechanisms, constraints, and socio-political implications. This panel investigates how children and youngsters conceptualize AI and intelligence, how they imagine processes such as machine "learning", and how they understand the human. We also examine the possible trust infrastructure for responsible use of AI, reflecting on ethical issues in education and governance instruments. These early representations are crucial for democratic learning, influencing emerging forms of civic participation, trust, and agency in digital societies. From a REA perspective, drawing on children's narratives, questions, embodied explorations, and emotional responses, the panel examines how imaginaries of AI can become generative spaces for ethical reflection, critical awareness, and informed engagement. Contributions can address pedagogical interventions, AI literacy activities and experimental practices that integrate the body, emotions, arts, and curricular disciplines to foster reflective and responsible interactions with AI. The panel particularly welcomes contributions that articulate how education can cultivate conscious use of AI, ethical discernment, and the creative exploration of the possibilities fostered by AI. Through investigation, reflection, and co-construction of learning, young people can move from passive consumption into an opportunity for agency, creativity, and democratic participation. By bringing together researchers, educators, and practitioners, the panel aims to promote awareness, democratic participation, and resilience and to equip young people with the capacity to navigate AI-mediated worlds.

QUANTUM DIPLOMACY GAMES AS AN EMERGING DIMENSION OF THE DEMOCRATIZATION OF SCIENCE DIPLOMACY

Yixin Zhang (Sapienza university di Roma, Italy)

science diplomacy | quantum diplomacy games | democratic practice

As global competition over quantum technologies intensifies, science diplomacy is becoming increasingly entangled with geopolitical rivalry, raising concerns about its legitimacy and inclusiveness.Science diplomacy has often been recognized as an instrument of high politics rather than a form of participatory governance because of its traditional state-centered negotiation and expert-driven coordination methods.Under the conditions of advanced technological competition, an underexplored question arises: how can democratic forms of deliberation and learning be incorporated into science diplomacy? A theoretical approach to explore the potential democratization of science diplomacy is presented in this paper by exploring quantum diplomacy games as an emerging analytical entry point.A critical focus of the paper is on initiatives

such as the quantum diplomacy game developed by the CERN Open Quantum Institute, which conceptualizes serious games not merely as capacity-building or training tools but as experimental and reflective spaces where alternative governance logics can be simulated and examined.It is through the construction of counterfactual future scenarios characterized by technological scarcity, systemic interdependence, and global risk that these games offer participants the opportunity to engage simultaneously with scientific, political, economic, and societal issues. It is the purpose of quantum diplomacy games to facilitate multi-role participation rather than prioritizing a single state interest or technological rationality. This involves actors navigating their overlap of responsibilities as scientists, policymakers, industry representatives, and civil society organizations.The objective of this design feature is to disrupt the conventional separation between technical expertise and political judgment, encouraging deliberation, negotiation, and compromise as necessary conditions for collective problem-solving.This approach embeds democratic practices such as dialogue, transparency, and mutual learning into the mechanics of decision-making rather than treating them as external ideals. According to the paper, quantum diplomacy games can contribute to rethinking democratic practice in science diplomacy by analyzing publicly available project documentation, game design principles, and current scholarship on science diplomacy, democratic governance, and serious games.As part of these efforts, power is being reconfigured by utilizing non-traditional resources including data access and ethical standards, procedural transparency has been foreemphasized through iterative discussion and reflection, and conceptual space has been created for non-state actors to engage meaningfully in highly technical policy domains through iterative discussion and reflection. There is no claim in the paper that quantum diplomacy games democratize science diplomacy in practice.Instead, it argues that they serve as exploratory tools that facilitate democratic negotiation, make it visible, discussable, and effective within complex technological governance frameworks.As a practice that can be explored and refined rather than as a fixed value that needs to be asserted.

AI IN EARLY CHILDHOOD EDUCATION: ETHICAL GOVERNANCE IN THE AGE OF MORAL ARTIFICIAL AGENTS

Elena Repman (University Niccolò Cusano, Italy)

Early Childhood Education | Philosophical Anthropology | AI Governance

Digital transformation has reshaped every domain of society—including early childhood education (ECE). While digital tools such as microscopes, cameras, and projectors have long been part of preschool pedagogy, the rise of artificial intelligence (AI) presents a new paradigm. Unlike passive tools, AI systems—especially those equipped with large language models (LLMs) or moral reasoning capabilities—act with a degree of autonomy and influence that raises unique ethical, cognitive, and cultural concerns (Floridi, 2018). A child's interaction with AI becomes a meeting of intelligences: one intuitive, flexible, and embodied; the other logical, predictive, and coded. This intersection becomes particularly critical in early education, a period marked by intense neurological, emotional, and relational development. The introduction of AI at this stage—through storytelling robots, personalized books, or emotion recognition systems—requires careful scrutiny not just in terms of safety and efficiency but in light of deeper philosophical and developmental assumptions. From an intentional-anthropological perspective, the child must be understood as a person–body unity structured by intentionality rather than reducible to computational cognition (Basti, 2012). Are these tools supporting or replacing relational bonds? Are they fostering exploration or reinforcing algorithmic conformity? Moreover, AI technologies are not

culturally neutral. Large language models, for instance, are often trained on data that reflect dominant languages and value systems. A striking example: 93% of GPT-3's training data was in English, raising concerns about embedded cultural bias and value conflict (Johnson et al., 2022). Such imbalances risk marginalizing multilingual children or misrepresenting cultural values in non-western contexts. Despite these risks, professional standards for ECE educators rarely include training in AI ethics or digital governance. As a result, there is a growing gap between technological innovation and regulatory readiness. The prospect of Moral Artificial Agents (MAAs)—autonomous systems capable of ethical decision-making—further complicates the picture, requiring a shift in governance from technical oversight to ethical discernment. To respond to these challenges, this contribution proposes a foundational rethinking of educational governance in light of AI. We argue that any integration of AI in early childhood must begin by revisiting the anthropological assumptions that underlie our systems: What is our image of the child? What kind of person do we believe the child is? Drawing from the dual anthropology developed in Italian pedagogical and legal traditions, and from the relational conception of the child articulated in the Reggio Emilia approach (Malaguzzi, 1998), we offer a framework for ethical AI governance grounded in intentionality, relationality, and human dignity. I begin by outlining three major anthropological problems that shape educational models: the mind–body relationship, the role of community, and the ultimate purpose of education. I then explore the ethical and cognitive challenges of AI integration, propose Reggio Emilia as a relational countermodel, and conclude with governance recommendations. This contribution aims to bridge philosophical anthropology, neuroscientific insight, and concrete policy proposals—offering a vision for AI integration that enhances the humanity of the child. In this sense, educational AI governance must aim to safeguard and promote the child's right to flourish, understood as the full realization of human potential.

CHILDREN, BODIES AND ALGORITHMS: DEMOCRATIC EXPLORATIONS OF ARTIFICIAL INTELLIGENCE IN EARLY CHILDHOOD

Andre Peres (Instituto Federal de Educação, Ciência e Tecnologia do Rio Grande do Sul (IFRS - Campus Porto Alegre)) · **Vitor Davi Pompeu de Mattos** (Instituto Federal de Educação, Ciência e Tecnologia do Rio Grande do Sul (IFRS - Campus Porto Alegre)) · **Fabiana Lorenzi** (Invenio Educação) · **Patricia Cavedini** (Colégio Marista Rosário) · **Nicele Cardoso Caceres Cristmann** (Colégio Marista Rosário) · **Chris Rogers** (Tufts CEEO, Tufts University) · **Milan Dahal** (Tufts CEEO, Tufts University)

Body · Artificial Intelligence · Early Childhood Education

This abstract presents a workshop developed with an early childhood education class (children aged 4 and 5) at a private school in Porto Alegre, Rio Grande do Sul, Brazil. The pedagogical proposal integrates research, maker culture, educational robotics, and Artificial Intelligence (AI), drawing on an approach inspired by Creative Learning (Resnick, 2017). The project emerged from the children's investigative question, "What is automatic?" Initially, the group developed hypotheses about what might be automatic in the human body, identifying involuntary actions such as blinking, heartbeats, and hiccups (Rinaldi, 2024). The investigation then shifted to the built environment, culminating in the question: "Is the elevator automatic?" From this problem, the children collaboratively designed and constructed a manual elevator, exploring its mechanisms and modes of operation. The desire to transform it into an automatic one inaugurated a new phase of the process: the introduction of Artificial Intelligence (AI) (Russel & Norvig, 2010) as a concrete possibility for experimentation. We then conducted a workshop to discuss, in accessible language, introductory notions of automation and basic ideas related to AI through hands-on, playful, and embodied activities. Children designed and built personalized toy automata made from laser-cut MDF (Martinez & Stager, 2013), incorporating their own paper-based characters into the mechanisms (Wilkilson et al., 2014). These creative constructions served as the physical interface for subsequent interactions and generated high levels of engagement, requiring careful pedagogical mediation to guide the activity's flow.

With the character ready and inserted into the automaton, the child moved on to the next step of the workshop. Using the micro:bit CreateAI platform, each child trained three distinct movements for their character: fast, regular, and stop, with their gestures. In the technical setup, a micro:bit captured the children's physical gestures and transmitted commands via BLE to an ESP32 microcontroller, which controlled a DC motor in the automata. The experience allowed the children to perceive, in a practical and embodied way, that the automaton's behavior depended on the examples they provided. By testing and adjusting their movements, they developed an initial understanding that automatic does not mean something that happens on its own, but rather something that can be taught, adjusted, and transformed. Instead of formalizing technical concepts, the proposal prioritized the lived experience of cause-and-effect relationships between human action and machine response. The results indicate that the contextualized integration of AI in Early Childhood Education is feasible when anchored in concrete, playful, and embodied experiences. The children formulated hypotheses, revised strategies, and collectively celebrated outcomes, exercising agency and authorship. AI was presented as an explorable language rather than as something magical or inexplicable, fostering an approach in which children actively participated in decision-making, tested hypotheses, negotiated interpretations, and understood technology as something open to human intervention. By engaging with the initial question of what is automatic, the children expanded their understanding through experimentation: the automatic can be constructed, tested, and modified. The experience suggests that, when mediated by investigative practices centered on children's agency, AI can be meaningfully integrated into early childhood experiences.

INTEGRATING AN AI-BASED CONVERSATIONAL AGENT IN DIALOGIC READING PRACTICES: A DIDACTIC INTERVENTION IN PRIMARY SCHOOL

Chiara Magurno (Università di Modena e Reggio Emilia, Italy) · **Chiara Bertolini** (Università di Modena e Reggio Emilia, Italy)

Reading comprehension | Teaching methodology | AI in education

The growing presence of digital technologies in educational contexts raises critical questions about the pedagogical conditions through which they are meaningfully integrated into classroom practices. In particular, the potential introduction of AI-based conversational agents in school settings calls for reflection on how their use can be structured so as to support students' comprehension processes and strategic engagement with text without reducing learning to exclusively individual interactions. This contribution presents an instructional intervention developed across multiple fourth-grade primary school classrooms aimed at supporting students' text comprehension through a structured pedagogical cycle combining individual work on the text, collective discussion, and metacognitive reflection. The intervention draws on research on reading comprehension and on instructional approaches that emphasise guided mediation of students' understanding during reading (Kintsch, 1998; Palincsar & Brown, 1984; Lumbelli, 2009). Within this framework, the pedagogical cycle was implemented across all experimental conditions. In one of the conditions, interaction with an AI-based conversational agent was introduced as a specific modality of mediation during the initial phase of individual work on the text. Through guided prompts, students were supported in making explicit use of comprehension strategies such as prediction, clarification, questioning, inference, and summarisation. The outcomes of individual work were subsequently reexamined in whole-class discussions, in which students' interpretations were treated as shared resources for collective meaning-making. This process was intended to situate individual comprehension within a dialogic learning context, allowing students to compare perspectives and progressively refine their understanding. A further component of the instructional cycle involved structured metacognitive reflection, supported by a self-reflection tool designed to foster awareness of reading strategies and regulation of comprehension processes. The intervention is framed within a quasi-experimental design involving four instructional conditions implemented in parallel classroom contexts, including a control group following regular instructional practices. This contribution explores the pedagogical conditions under which

the integration of AI-based educational tools can be meaningfully situated within instructional practices that sustain the social dimension of learning. In particular, it examines how individual interaction with AI-based tools, when embedded in mediated instructional practices, may be articulated with collective interpretive processes in classroom contexts.

RETHINKING ARTIFICIAL INTELLIGENCE IN EDUCATION: PLAYFUL INQUIRY, AESTHETIC DIMENSION, AND DEMOCRATIC PARTICIPATION

Maria Barbara Donnici (Fondazione Reggio Children-Centro Loris Malaguzzi ETS) · **Elena Sofia Paoli** (Fondazione Reggio Children-Centro Loris Malaguzzi ETS) · **Alessia Donini** (Università di Modena e Reggio Emilia)

children's agency | democratic engagement | playful approach to learning

As artificial intelligence and digital technologies become increasingly embedded in everyday life, educators face the challenge of designing learning environments that support children's critical and participatory engagement with these systems (Resnick, 2024). Artificial intelligence influences how knowledge is produced, while digital platforms shape social and cultural life, making such understanding fundamental for democratic participation in digitally mediated societies (Floridi, 2023). However, public debate often oscillates between fascination and fear, frequently portraying children as passive users at risk when interacting with technology (Gallese et al., 2025). Grounded in a Reggio Emilia-inspired playful approach to learning, this contribution presents a pilot research project developed by Fondazione Reggio Children in collaboration with academic and technical partners. The project is the result of a multidisciplinary collaboration involving researchers, an atelierista, and an educator, whose complementary perspectives contributed to the design, facilitation, and interpretation of the learning experiences. The project emphasizes how children's agency can be nurtured through inquiry-based and participatory experiences, exploring how learning environments can foster awareness of how AI systems operate, support democratic engagement, and develop critical thinking through playful learning. The study adopts a qualitative methodology based on pedagogical documentation, reflective dialogues, observations, and final interviews. It developed through workshop-based activities involving children aged 7 to 12. The research explored how children engage with complex concepts through a discriminative AI tool and how this process supports reflection and dialogue on human and artificial intelligence. Activities were designed to explore technological concepts through multiple expressive languages and embodied experiences, consistent with the Reggio Emilia emphasis on the "hundred languages". Before interacting with AI systems, children and adults explored their knowledge about AI in order to construct new knowledge together, creating space for critical exploration. This was also an opportunity to deconstruct common societal narratives surrounding the relationship between children and digital technologies. The process of selecting datasets, engaging in trial and error, and recognizing that machines require human intervention to reduce errors, made visible the human work embedded in AI systems. Misunderstandings in interactions between humans and machines highlighted the subjective nature of interpretation and how understanding emerges through social exchanges. The experience positioned AI not as a source of answers but as a tool to support questioning and metacognitive reflection. Children were encouraged to recognize how machines reflect human perceptions and intentions, while intergenerational exchanges among children, educators, researchers, and parents supported democratic knowledge construction. Preliminary findings suggest that playful inquiry can foster critical reflection, enhance awareness of how AI operates, and support collaborative meaning-making. The research highlights how AI can become an educational opportunity when it supports, rather than directs, the learning process, preserving the centrality of the child as an active thinker and co-constructor of knowledge. This contribution proposes a pedagogical approach in which AI integration is conceived as a relational and reflective process, capable of fostering children's agency and democratic participation in contemporary digital societies.

Learning for Democracy: Media Education and Civic Agency in Times of Disinformation

PANEL CONVENORS: Gianna Cappello (University of Palermo, Italy); Paola Macaluso (University of Palermo, Italy); Daniela Angela Sortino (University of Palermo, Italy)

PANEL KEYWORDS: disinformation, media education, civic agency

The rapid platformization of society is transforming democratic life, reshaping how citizens access information, participate in public debate, and construct shared meanings. Algorithmic personalization, opaque curation systems, and attention-driven viral dynamics increasingly mediate civic engagement while weakening traditional mechanisms of deliberation and trust. In this context, disinformation operates not only as false or misleading content but as a structural property of digital ecosystems, exploiting cognitive biases, fueling polarization, and undermining collective capacities to evaluate evidence, negotiate disagreements, and sustain democratic imaginaries. These dynamics pose urgent challenges for educators, institutions, and communities seeking to promote epistemic justice and resilient civic cultures. Education - across formal, non-formal, and informal settings - remains a critical space for developing the competencies required to navigate polluted information environments. Media education, dialogic pedagogies, and critical inquiry practices can empower learners to interrogate the infrastructures shaping their informational experiences, understand how algorithmic and economic logics influence visibility and truth claims, and resist manipulative narratives that threaten democracy (Cappello & Rizzuto, 2025; Hobbs, 2020; Buckingham, 2020). This panel invites sociological, pedagogical, political, and interdisciplinary contributions examining how education can strengthen democratic resilience in contexts permeated by disinformation. We welcome empirical studies on citizens' and students' information practices, educators' strategies to counter disinformation, and analyses of platform-governed educational practices, especially in formal education. Theoretical and methodological contributions advancing justice-oriented, participatory, and democracy-enhancing models of educational intervention are also encouraged.

HOW CAN UNIVERSITIES FOSTER STUDENTS' CRITICAL THINKING SKILLS

Guillaume Cuny (Nantes Université, France)

critical thinking | higher education | pedagody

Within the framework of its Academic Freedom in Action project, the Council of Europe has expressed the ambition to "protect and promote the values of academic freedom, ensuring that higher education remains a stronghold of democracy and critical thinking." From this perspective, the mission of universities can no longer be limited to the production and transmission of knowledge. It also includes the development of critical skills among both staff and students. These skills enable them to assess the validity of arguments and information. However, these critical skills do not appear to be evenly distributed across academic disciplines. A survey published by the Jean Jaurès Foundation in 2023 (Kraus & al. 2023) shows that adherence to misinformation varies according to students' field of study: students in Health and Law appear more likely to endorse false information than those enrolled in the Social Sciences and Humanities or in the Arts. Based on this observation, we formulate the general hypothesis that disciplinary affiliations shape differentiated relationships to knowledge, which are more or less conducive to the development of critical thinking skills. This raises the question of which factors are most decisive in fostering critical thinking skills. Do differences arise from students' ways of learning, such as a more instrumental relationship to knowledge or the use of rote learning? Or do they depend more on assessment practices, which may encourage specific relationships to knowledge (Abrami et al., 2015)? Beyond individual learning practices, do disciplinary contexts matter, for instance through the degree of consensus about what counts as legitimate knowledge, the place given to epistemology in curricula, or the historical development of disciplines (Millet, 2003; Bernstein, 1971; Shay, 2016)? Finally, how do major sociological variables such as gender and social background shape these processes (Renisio, 2015) ? Drawing on a questionnaire survey conducted with 2,000 students at the University of Nantes, aimed at measuring their degree of adherence to misinformation and collecting data on their ways of learning and accessing information, as well as twelve collective interviews carried out with students grouped by discipline

focusing on their relationships to their field of study and to the knowledge transmitted within it, this paper analyses the factors most likely to influence adherence to or resistance against misinformation. Based on these findings, it outlines possible avenues for action to strengthen the development of critical thinking skills in the university of tomorrow

SPECTATORSHIP, BODIES AND DIGITAL HATE: OBSERVING ONLINE HATE SPEECH AND ITS IMPLICATIONS FOR MEDIA EDUCATION

Enrica Sgobba (University of Bari) · **Anna Fausta Scardigno** (University of Bari)

hate speech online | realistic evaluation | media education

The abstract was intended for panel M16, but it does not appear in the list of selectable panels, so I selected panel M07 In contemporary onlife environments (Floridi, 2015), where digital and material dimensions of experience are increasingly intertwined, online hate speech has become a pervasive and structural feature of social media communication. This article examines the phenomenon not through the traditional focus on perpetrators or victims, but through the lens of digital spectatorship, a position marked by visibility, emotional exposure and frequent passivity. Drawing on media education theory and a realistic evaluation framework (Pawson & Tilley, 1997; Pawson, 2006), the study investigates how users observe, interpret and respond to discriminatory discourse targeting bodies, identities and subjectivities that deviate from dominant norms. The empirical research, developed within the PRIN 2022 project Theories, Philosophies and Politics of Bodies in Network-Connected Digital Universes, combines an evaluative survey with an expert-based Nominal Group Technique. Findings indicate high exposure to hate speech, but despite this pervasive presence, spectators predominantly adopt non-interventionist attitudes. These behaviours reflect the bystander effect in digital contexts (Latané & Darley, 1970; Markey, 2000) and are reinforced by mechanisms of moral disengagement (Bandura, 1996). The NGT phase highlights the need for multi-level interventions integrating individual, community and educational approaches. Experts emphasise the importance of training users to recognise subtle hostility, fostering collective moderation practices and embedding media education modules within schools and public institutions. The findings underscore that countering online hate speech requires moving beyond regulatory or punitive strategies: it demands an educational paradigm centred on critical media literacy (Kellner & Share, 2007), emotional awareness, responsibility and active digital citizenship (Bornatici, 2017; Perfetti, 2020). Overall, the study argues that spectatorship represents both a vulnerability and a potential resource for democratic participation. Enhancing media competence and socio-emotional skills is essential for transforming passive witnessing into prosocial engagement (Rivoltella & Ardizzone, 2007) and for promoting inclusive digital public spaces capable of resisting normalised patterns of symbolic violence.

FROM MATHEMATICS TO CITIZENSHIP: AN EDUCATIONAL TOOLKIT FOR CRITICAL DATA LITERACY

Sara Vergallo (Università degli Studi di Macerata, Italy) · **Alice Giglia** (Fondazione G. Feltrinelli, Milano, Italy) · **Leonardo Arpino** (CPIA5, Milano, Italy)

Data Literacy | Mathematics Education | Citizenship Education

Accessing information has never been easier than it is nowadays (Wineburg & McGrew, 2016). However, accessing the tools to critically evaluate and analyze information is not as simple. Never before have young students been so exposed to misinformation, fake news, subtle and captivating reporting, and misleading news. Constantly bombarded by rushed and often conflicting news, it is difficult to independently develop the skills needed for informed and critical reading. But schools and education can contrast this phenomenon: subjects such as mathematics and computer science can be used as training to recreate new mental habits (Carrisi et al., 2025) in the democratic citizens of the future. For this reason, we felt it was essential to develop an educational kit for primary and lower secondary schools in data literacy (Wolff et al., 2016). The kit was developed within the broader framework of the Scuola di Cittadinanza Europea, a civic education platform created by the Fondazione Giangiacomo Feltrinelli to support civic education pathways in secondary schools. The project aims to be a large space of knowledge and participatory teaching, as well as a pathway of awareness and reflection on contemporary challenges, grounded in the growing conviction that education is one of the most relevant factors in improving quality of life in contemporary society. The kit offers an 8-hour modular pathway in data literacy structured around five key steps: understanding what data are, distinguishing data from information, collecting data, reading data, and representing data. Through historical case studies (from the Lebombo bone to Florence Nightingale's polar diagram and early computers), hands-on laboratories (building an Inca quipu), real-world data collection tasks, and guided analysis of media articles and graphs, students are progressively trained to question sources, recognise bias, interpret statistical representations and reflect on how data can shape narratives. By combining mathematical tools such as statistics, probability, data classification and graphical representation with activities in history, language and technology, the kit promotes an integrated and inquiry-based approach to learning. Seven years after the launch of the broader project, a research process was conducted to evaluate and update both the data literacy kit and the pedagogical methodologies underpinning the entire Scuola di Cittadinanza Europea initiative, with the aim of providing teachers with more flexible and inclusive materials, suited to an increasingly diverse student population. Through teacher feedback, classroom experimentation, and revision of instructional materials, the project refined its didactic strategies and updated guidance resources in response to evolving media environments and educational transformations. Enabling students to independently assess the information they encounter daily becomes a powerful tool in fostering critical news literacy, with the ultimate goal of training active, informed, and reflective European citizens.

TACKLING MISINFORMATION THROUGH EDUCATION. TEACHERS 4.0 DIGITAL AGE AS A TOOL FOR ADULT LEARNING AND DIGITAL AWARENESS

Giorgia Coppola (University of Palermo, Italy, Italy) · **Maria Vinciguerra** (University of Palermo, Italy, Italy)

adult education | prevention | digital awareness

Of the many educational challenges we face today, the expansion of digitalisation processes is certainly one of the most controversial. It redefines the concept of 'emergency' as both an emerging phenomenon and an event requiring prompt intervention. Upon closer inspection, it becomes clear that the critical issue is not the result of digitalisation itself, but, rather, the absence of adequate media literacy. This is crucial in guiding the conscious use of technologies and mitigating the risk of misinformation among educators and students. According to the AGCOM report Media and Digital Literacy in Italy (2025), over 64.6% of the Italian population has low or insufficient digital and media skills, and around 8 out of 10 Italians are exposed to online risks, including hate speech, misinformation, and fake news. In line with this evidence, UNESCO's Media and Information Literacy: Policy and Strategy Guidelines (2025) recommends formal and non-formal educational interventions aimed at developing critical and practical skills in the use of media and information. Based on this premise, this paper introduces the Teachers 4.0 Digital Age Curriculum as a tool for initial and ongoing training for teachers and educators across Europe. Structured into ten modules, the curriculum offers a wide range of digital literacy activities alongside corresponding assessment tools. Addressing complex phenomena such as filter bubbles, deepfakes and manipulative online campaigns, it provides educators with the practical tools and theoretical frameworks needed to evaluate source reliability and integrate media literacy into everyday school activities. Particular attention is given to creating safe and inclusive learning environments that respect diversity. In this way, the Teachers 4.0 Digital Age Curriculum serves as a training tool for acquiring media literacy skills, as well as a preventive instrument against misinformation. It aims to educate digital citizens who are aware of their responsibilities and capable of navigating an increasingly complex information ecosystem. In doing so, it contributes to the development of resilient and informed school communities.

LITERACIES REIMAGINED: RECONCEPTUALIZING CRITICAL DIGITAL LITERACY THROUGH ART-BASED POSTDIGITAL ENCOUNTERS

Sara Pastore (Università degli Studi di Napoli Federico II, Italy) · **Emiliano Grimaldi** (Università degli Studi di Napoli Federico II, Italy)

Critical digital literacy | art-based research | sociological fiction

This article intervenes in current debates on critical digital literacy, joining concerns about the lack of a solid conceptualization to sustain both scholarly inquiry and educational intervention (Garavaglia & Petti 2025, Pangrazio 2016). While media education and digital literacy seem to be key topics of current educational policy agendas, existing frameworks in

both fields remain rooted in a print-centered understanding of literacy. This view relies on a narrow and anthropocentric logic that suppresses the diversity of resources for meaning-making (Campbell & Olteanu 2024). Within this paradigm, students are reduced either to masters of technological tools or victims of media manipulation (Buckingham 2020), and literacy is flattened into a set of quantifiable and standardized competencies. Building on this, in this article we repurpose the idea of critical digital literacy through the lens of postdigital approaches (Jandric 2019): this combination is aimed to enable a more nuanced, non-dichotomic and non-reductionist understanding of critical digital literacy (or literacies), attentive to the multiple materialities, forces and agencies entangled in sociodigital encounters. To further this discussion, this article engages with our experience in designing, implementing, and reflecting on a series of media education workshops taking place from March to April 2025 and involving six schools. Each workshop, organized as part of a programme for the promotion of pedagogical innovation, brought together a group of students from the third year of a low-secondary school and one from the first year of high-secondary school. The workshops unfolded in two phases: a critical analysis of a social media platform, carried out through guided navigation; a creative, artistic phase of reimagination, in which students were invited to materially reimagine the platform using the collage technique. Methodologically, therefore, our work unpacks into two interrelated stages: the art-based classroom activity, and an experiment in sociological fictional writing, through which we reassembled the data collected in two fictional vignettes (Hrastinski 2025). Our choice to rely on these methods is consistent with our theoretical stance: in a sector increasingly subject to intensive datafication, and where data that count are those that can be easily counted, art-based research introduces generative frictions in data production processes, while fictional writing surfaces latent or overlooked dimensions, enabling the creation of our own ‘data lives’ (Kitchin 2021). After presenting the fictions, we will discuss the workshops as entry points to rethink critical digital literacy from a postdigital perspective, framing them as occasions to enact third spaces of education, which we understand as sites open to multiple forms of negotiation, discovery and play, particularly suited to enable generative forms of engagement with new media and related literacies (McDougall et al. 2018). Drawing on the workshops, we reconceptualize literacy as inevitably intertwined with agency (Code 2025, Jiang et al. 2024), and describe this twofold articulation as: i) a programmatic process of defamiliarization of digital practices, spaces and actants, often internalized and taken for granted; and ii) a strategic act of reimagination and creative speculation, aimed at reclaiming spaces of assertion, refusal and negotiation within technological interfaces, functions, and algorithmic processes.

FAMILY CAPITAL AND DISINFORMATION: RESILIENCE GROUNDED ON TRUST AND COMPARATIVE THINKING. RESULTS FROM THE ERASMUS+ PROJECT DRONE

Alba Francesca Canta (Polytechnic of Turin, Italy) · **Alvise Mattozzi** (Polytechnic of Turin, Italy) · **Linda Tonolli** (Polytechnic of Turin, Italy) · **Viktoria Konidari** (Hellenic Open University)

Family disinformation resilience

As the call for papers reminds us, the rapid platformization of society, algorithmic personalization, and the growth of media-driven information have changed our approach to information. These changes have affectedboth our strategies and traditional teaching systems. Education remains a key place to develop skills needed for navigating complex and epistemic-instable information environments. However, these skills requireconstant revision. Based on data collected through

structured interviews conducted as part of a European Erasmus+ project on digital literacy and disinformation (DRONE Project), this contribution aims to shed light on the waysadolescents address disinformation for the way it results from interviews and the possible factors that influence it. Among these, family capital appears to be one of the most important factors: interviews with adolescents reveal the essential role of parents, particularly mothers, in addressing and managing disinformation. In addition, the interviews show that young people do not trust teachers very much and, on the contrary, trust their parents if they have a problem related to information/disinformation: they seek guidance, even if they often do not turn to their parents because they are aware of their low level of digital literacy. However, despite this, from the interviews with parents another important finding emerges, not in opposition to but rather consistent with the above: the level of education of parents and their adoption of comparative thinkingtend to influence the level of critical thinking of adolescents and, therefore, their approach to disinformation. Although with due caution and considering all the possible factors that may influence this relationship, the positive correlation between family capital and the level of disinformation among adolescents could serve as a good starting point for building educational and informational resilience practices, beginning with the family, which is often overlooked in digital literacy programs. This resilience strategy, which extends from family to children, could also benefit from a reverse educational approach: from adolescents to parents, as the former, in some cases, have more skills that can be combined with those of their parents. This dialogical educational process and the building of a resilient community should necessarily include schools and teachers. As the DRONE project and interviews demonstrate, there is a lack of teaching related to digital literacy and the same skills among teachers, which generates mistrust of teachers and schools among adolescents.

SITE OF RESISTANCE: SANTARCANGELO FESTIVAL BETWEEN MEDIA SCANDAL, CULTURAL POLICY AND DEMOCRATIC NEGOTIATION

Rita Agatina Di Leo (Sapienza University of Rome and University of Bari "Aldo Moro", Italy)

Censorship | Performance studies | Freedom of expression

In cultural ecosystems increasingly shaped by media dynamics, political pressure, and reconfigured funding structures, Italian performing arts festivals often operate as arenas where artistic production, public discourse, and institutional power intersect. Within these environments, festivals can function as spaces in which cultural and political negotiation takes place, and also as spaces of protest — framing them as territories of resistance and artistic contestation. This proposal investigates how a performing arts festival may become a site of resistance within contemporary cultural policy and media ecologies. Focusing on Santarcangelo Festival (Rimini, Italy) — one of the longest-running experimental theatre festivals in Europe — I analyse four key editions: 1985 (directed by Roberto Bacci), 2015 (Silvia Bottiroli), 2018 (Eva Neklyaeva and Lisa Gilardino), and the most recent 2025 edition (Tomasz Kireńczuk). Each of these editions marks a moment in which artistic programming interacts with broader political and media environments. The 1985 edition became emblematic due to a violent media scandal and institutional backlash surrounding the performance Genet a Tangeri by Magazzini Criminali. The editions of 2015 and 2018 were characterised by controversies involving accusations of moral offence and media-driven censorship. Meanwhile, the 2025 edition unfolded in a context of severe cuts to public cultural funding in Italy. During the festival opening, artistic director publicly defended the autonomy of cultural institutions and freedom of artistic programming, transforming the festival into a space of mobilization and resistance in support of artistic labour and freedom of expression. Through this comparative analysis, the paper examines how festival programming negotiates tensions between artistic autonomy, institutional governance, and audience participation. Programming decisions, labour conditions, and funding structures become part of a broader cultural infrastructure that shapes how artistic

knowledge circulates and how artistic practices are legitimised or contested. The paper therefore asks: do different artistic directors and their programmes refrain from imposing meaning on political bodies and artistic practices? What strategies for democratising artistic knowledge emerge through festival curation? By analysing labour production, programming, and funding structures, the research explores what forms of resistance are enacted and what potential escapes exist from the economy of debt, exceptionality, discontinuity, precarity, and inaccessibility of artistic work (Kunst 2024). Drawing on Bataille's reflections on transgression, the paper proposes that cultural programming can operate simultaneously as contestation and transgression — a space where political and aesthetic boundaries are continuously negotiated (Bataille 1986). Rather than abolishing taboos, festivals may suspend or displace them, revealing persistent tensions between artistic autonomy and institutional control. Instead of simply mapping cultural policies, this study interrogates the fractures, contradictions, and unresolved conflicts that shape the relationship between performance, power, and the processes of subjectivation that these dynamics impose (Butler 1997).

ONLINE INFORMATION-SEEKING AND VOTING DECISIONS IN SWISS DIRECT DEMOCRACY: EVIDENCE FROM A SWISS POPULAR VOTE

Andrea Plata (Scuola universitaria professionale della Svizzera italiana (SUPSI), Switzerland) · **Elena Battipede** (Scuola universitaria professionale della Svizzera italiana (SUPSI), Switzerland; Università della Svizzera italiana (USI), Switzerland) · **Petra Mazzoni** (Scuola universitaria professionale della Svizzera italiana (SUPSI), Switzerland) · **Marina Pettignano** (Scuola universitaria professionale della Svizzera italiana (SUPSI), Switzerland) · **Luca Botturi** (Scuola universitaria professionale della Svizzera italiana (SUPSI), Switzerland)

Political Information Literacy | Youth Electoral Participation | Democratic Citizenship Education

Digital transformation of democratic processes has opened new possibilities for political participation, especially among youth (Kersting, 2016). Easy access to information and digital deliberation spaces may reinforce political engagement (Kersting, 2016; van Dijk, 2012). However, digital information contexts may increase exposure to misinformation, disinformation, manipulation or polarization of opinions, and cognitive overload (Garcia et al., 2021; Schwaiger, 2022; Schweiger, 2017) with consequences for political participation. Information Literacy (IL) is a key competence to navigate the complexity of the infosphere and to participate responsibly in democratic life (Koren, 2023; Kurbanoglu, 2013; Smith, 2016). While much research on young people's political attitudes and media use relies on self-reported measures, fewer studies combine such data with online information-seeking behavior; as a result, it remains unclear how these practices relate to turnout and vote choice (González-Bailón & Xenos, 2023). The aim of the present study is to explore how young adults conduct online searches for political information. The study focuses on a Swiss federal popular vote on climate and energy policy held on 8 March 2026. Data collection took place while the voting period was still ongoing, meaning that some participants had already voted while others had not. To address this aim, the following research questions are explored: (1) How do young adults search for political information online when preparing to vote? (2) Are individuals' online information-seeking behaviors associated with stability or change in their voting intentions or vote choice? (3) Which informational and attitudinal factors are associated with voting intentions or vote choice? The study employs the ROSE digital platform (Reflective Online Searching Education; Botturi et al., 2026) and a browser extension that captures

ecological online information-seeking behavior, including search queries, visited websites, and time spent per webpage. The research follows a structured pre–post design. In March 2026, 76 undergraduate students enrolled in pre-primary and primary teacher education in the Canton of Ticino (aged 19-32, M = 22.52) took part in: (1) an initial questionnaire assessing self-reported prior knowledge of the voting issue, voting intentions or vote choice, and IL skills; (2) a self-directed online searching session on the voting topic, monitored through the ROSE platform; and (3) a final questionnaire collecting socio-demographic data, political variables (political interest, internal and external political efficacy, ideological positioning, participatory habits), and repeated measures of knowledge and voting intentions or vote choice. Preliminary analyses show a significant increase in perceived knowledge about the voting issue, a decrease in indecision, and greater willingness to vote. Furthermore, an initial qualitative analysis of the consulted sources indicates a predominant use of the official channels of the Swiss Confederation as sources of information. Further results will be presented during the conference. By integrating behavioral data on online information-seeking with attitudinal and political variables in a real voting context, this study advances empirical research on democratic participation. The findings may also offer practical guidance for integrating IL and digital citizenship into pre-service and in-service teacher education and broader educational initiatives targeting young adults (Kops et al., 2025; van Dijk, 2012).

DIGITAL CITIZENSHIP AT SCHOOL: A DIGITAL CIVIC EDUCATION CURRICULUM FOR UPPER SECONDARY EDUCATION

Angela Daniela Sortino (Università di Palermo, Italy)

digital citizenship | media education | disinformation

The PhD research project, “Digital Citizenship at School: a Digital Civic Education Curriculum for Upper Secondary Education”, aims to develop an evidence-based digital civic education curriculum inspired by Media Literacy Education. The project includes the design of a curriculum prototype to be tested through a research-action approach. The introduction of Civic Education as a cross-curricular subject (Law 92/2019) and the Guidelines (MIM 2024) have raised a clear challenge for schools. Civic Education can serve as a testing ground for transforming knowledge into consistent everyday behavior, and it is essential to develop students' ability to become conscious and active citizens in the digital ecosystem. This means going beyond the mere consumption of information and providing students with the tools to critically analyse the mechanisms that govern contemporary communication. From a media education perspective, students will have the opportunity to decipher hidden processes and learn to recognize how platforms can influence their perception of reality and their opinion on social facts and issues. They will also be equipped to unmask attempts at disinformation and distorted narratives that jeopardize public debate and the very foundations of democratic coexistence. At the same time, students’ everyday lives increasingly take place in an “onlife” context (Floridi, 2019), where digital and offline experiences are deeply intertwined. Yet Civic Education often fails to reflect this reality. More specifically, schools still struggle to meaningfully integrate a Media Education (ME) perspective into Civic Education. Digital issues are often addressed through a mainly technical or instrumental approach, rather than through a critical and reflective one that supports students’ digital well-being. The main research question is how can a Civic Education curriculum informed by Media

Education be designed to respond to students' needs within the complexity of the contemporary, onlife world? The research project aims to design, test and validate a Civic Education curriculum model inspired by a Media Education perspective, conceived as replicable and scalable. The objective is to foster in students an active, aware and responsible digital citizenship, especially regarding the issue of online disinformation. The research is carried out in two highly differentiated school contexts (a classical high school and a technical/vocational institute in Palermo), in order to assess its effectiveness and adaptability of the model. The study analyses the impact of the educational pathway on students by assessing the development of digital citizenship competences, critical thinking, awareness of digital well-being, and the ability to produce responsible media content. The research project also includes an exploratory analysis, conducted through interviews and focus groups with policymakers, of school policies related to Civic Education and digital citizenship, in order to assess their alignment with the needs and realities of educational practice. The project offers an opportunity to adopt a Media Education approach for the construction and development of students' media literacy, particularly with regard to the issue of disinformation (Cappello & Rizzuto, 2025). At the Fourth International Conference of Scuola Democratica, the initial research findings based on the experimentation conducted with students in February and March 2026 will be presented.

MAPPING THE PEDAGOGICAL ECOLOGY OF DEMOCRACY: MEDIA, CIVIC LEARNING, AND CITIZEN AGENCY

Giulia Ferri (IULM University, Italy) · **Elisabetta Risi** (IULM University, Italy) · **Andrea Miconi** (IULM University, Italy)

media literacy · citizen agency · democratic education

Across Europe, democracy is increasingly shaped by platformized media environments in which polarized public discourse and disinformation influence how citizens access information, interpret public issues, and participate in democratic life. Political disaffection and misinformation are often framed as problems of institutional failure or information disorder. Yet these diagnoses risk overlooking a deeper issue: democracy cannot be sustained by institutions and procedures alone. It must also be continuously learned, interpreted, and enacted by citizens in everyday life, as a lived and relational practice of democratic formation (Biesta, 2011). Starting from this premise, the paper explores how citizens themselves understand the educational foundations of democracy, shifting attention from normative and institutional accounts to the meanings, experiences, and expectations expressed by ordinary people. The analysis draws on findings from the Horizon Europe project MeDeMAP – Mapping Media for Future Democracies and is based on a large-scale qualitative study involving more than 400 participants across ten European countries. Through focus groups and in-depth interviews on democracy, media, and participation, the research examines how citizens identify the educational conditions that allow democratic culture to endure and how they understand the formative role of media within increasingly platformized and information-polluted environments. The paper makes an original contribution at both the empirical and conceptual levels. Empirically, it moves beyond formal policy frameworks and normative models of democratic competence to foreground citizens' own accounts of how democracy is learned and experienced. Across highly diverse national and social contexts, participants consistently described democracy not simply as an institutional order, but as a social and interpretive practice shaped by everyday encounters with political information, public debate, mediated narratives, and competing claims to truth. This bottom-up perspective shows that democratic learning is not confined to formal civic education, but is embedded in the ordinary environments in which citizens encounter and make sense of public life (Freire, 1970). Conceptually, the paper reflects on democracy as a pedagogical ecology, stressing that civic formation does not reside in any single institution but emerges across media systems, schools, families, communities, and citizens' interpretive practices (Markham, 2019). In this perspective, media education is not limited to the acquisition of technical competences, but

concerns the development of critical capacities through which citizens learn to evaluate claims, recognise manipulative narratives, and position themselves in relation to democratic life (Buckingham, 2003; Martens & Hobbs, 2015). Participants repeatedly described media not only as sources of information, but as pedagogical environments through which people learn to recognise public issues, negotiate meanings, and exercise civic agency (Giroux, 2011). At the same time, they stressed that these capacities cannot be taken for granted in environments marked by polarization, opacity, and disinformation. Schools, families, and civic institutions therefore remain essential spaces for cultivating critical media literacy and the democratic resilience needed to navigate contemporary public life.

EPISTEMIC CAPTURE AND DEMOCRATIC EDUCATION: RECLAIMING THE UNIVERSITY IN THE AGE OF ALGORITHMIC INFRASTRUCTURES

Raffaella Frascarelli (Sapienza University of Rome, Italy)

Epistemic Capture | Media Education | Algorithmic Governance

Contemporary debates on disinformation often focus on the circulation of false or misleading content within digital environments. Yet the current crisis is not only informational but infrastructural. It concerns the transformation of the epistemic infrastructures through which knowledge becomes visible, credible, and authoritative in the public sphere. Rather than a simple crisis of information, the present moment can therefore be understood as a reconfiguration of the infrastructures that organize the production and validation of knowledge. This paper develops the concept of epistemic capture to describe the process through which infrastructures governing the circulation and validation of knowledge are reorganized according to the logics of platform capitalism and broader techno-industrial complexes where economic interests, state governance, and military or security apparatuses increasingly intersect. Within these configurations, virality, immediacy, and data extraction reshape the visibility and legitimacy of knowledge while weakening the institutional autonomy of educational and scientific systems. In an increasingly platformized global society, information infrastructures no longer operate as neutral communication channels but as socio-technical architectures that shape the circulation and credibility of knowledge claims. Algorithmic curation, recommendation systems, and opaque ranking mechanisms mediate how individuals access information and form judgments about truth and authority. As Bratton (2015) suggests, these computational architectures operate as quasi-sovereign systems capable of reorganizing public discourse beyond traditional institutional accountability, functioning as devices of digital governmentality that orient cognitive practices and regimes of visibility. In this context, can universities—historically central institutions in the validation and transmission of knowledge—still claim epistemic centrality in the public sphere, or is this role progressively migrating toward computational infrastructures governed by extra-academic logics? From a historical perspective, this transformation recalls earlier technological asymmetries in the control of knowledge. Writing itself functioned for centuries as a technology of epistemic authority monopolized by small literate elites. Today, infrastructures of artificial intelligence, algorithmic mediation, and large-scale data extraction risk generating comparable forms of epistemic concentration if their functioning remains opaque to most citizens. One of the central democratic challenges of contemporary education therefore lies in preventing the emergence of a new form of computational epistemic oligarchy. The paper draws on findings from an exploratory sociological study conducted with students at Sapienza University of Rome. Combining interviews and questionnaires, the research investigates how students acquire and evaluate information within contemporary media ecosystems. Preliminary findings reveal a significant epistemic asymmetry: although students inhabit digital environments daily, they rarely possess the conceptual tools required to critically interrogate the algorithmic infrastructures organizing knowledge production and legitimation. The democratic question today concerns not only freedom of access to information but also the capacity to understand and interrogate the epistemic infrastructures that organize knowledge production. Universities

are therefore called upon to reclaim their role as civic institutions capable of guaranteeing a democratic epistemic right: the capacity of citizens to access, understand, and critically interrogate the infrastructures structuring contemporary social life. This requires pedagogical strategies capable of making algorithmic cognition intelligible and democratizing the mathematical and computational foundations that structure the global information ecosystem.

TACKLING DISINFORMATION AND PROMOTING DIGITAL MEDIA LITERACY: THE TEACHERS 4.0 DIGITAL AGE ONLINE TRAINING MODEL FOR IN-SERVICE TEACHERS

Paola Macaluso (University of Palermo, Italy)

Digital Media Literacy | Disinformation | Teacher Training

In a contemporary information ecosystem characterised by data overload and the rapid spread of viral content, the ability to discern reliable information from various forms of information disorder - such as disinformation, misinformation, and malinformation - has become a fundamental competency for democratic citizenship. The Teachers 4.0 Digital Age project (funded by the Erasmus+ program) addresses this critical challenge through a large-scale capacity-building intervention designed for teacher training. The primary objective is to empower educators to integrate media literacy into their daily pedagogical practices across diverse subject areas. This contribution analyses the development and implementation of the project's comprehensive training curriculum, with a specific focus on the online course designed for in-service teachers and educators. The training program, delivered via a dedicated e-learning platform, is structured into 10 modules totalling 60 hours of professional development (comprising 30 hours of asynchronous learning and 30 hours of practical, hands-on activities). The curriculum covers a wide spectrum of crucial topics: from the deconstruction of media messages and the psychological dynamics of "echo chambers" and "filter bubbles" to the technical analysis of emerging threats like deepfakes, phishing, and algorithmic bias. A distinctive element of this course is its methodological approach, which transcends the mere transfer of technical skills. Instead, it fosters a critical and reflective stance toward digital consumption. Teachers are guided through an exploration of their students' "digital realities", gaining insights into how the media practices of children and adolescents shape their perception of reality and socio-political issues. The e-learning platform serves as a collaborative environment where teachers can share best practices, exchange feedback, and co-design Learning Scenarios (LS) aimed at building digital resilience within the classroom. Preliminary results from the project's pilot phases indicate that online training, supported by multilingual educational materials (available in Italian, English, Greek, Bulgarian, Romanian, and Polish), effectively overcomes geographical and temporal barriers. Furthermore, the modular nature of the curriculum allows for a "blended" flexibility that adapts to different national school systems. In this context, the paper will present the initial findings from the questionnaires administered to the teachers and educators who attended and completed the online course.

HATE SPEECH AS AN "AMBIGUOUS BUT USEFUL" CATEGORY: POSTDIGITAL INTERCULTURES AND CIVIC AGENCY IN PLATFORMIZED SOCIETIES

Stefano Pasta (Catholic University of the Sacred Heart, Italy)

Hate speech | Onlife Citizenship | Postdigital intercultures

In the contemporary social web, democratic coexistence and civic agency are increasingly challenged by polarization processes that may evolve into cultural wars (santerini, 2025) and hate speech (Pasta, 2018). The Council of Europe Recommendation CM/Rec(2022)16 calls for particular attention to those forms of hate incitement which, while not reaching the threshold of criminal or civil liability, still threaten social cohesion and democratic stability. In this perspective, hate speech should not be understood only as an individual act of aggression, but as a phenomenon embedded in the communicative structures of platformized environments. This contribution is situated within the research field of Postdigital Intercultures (Pasta & Zoletto, 2023), which investigates the challenges of living together, citizenship education, and social relations in the context of the everyday entanglement between sociocultural complexity and the plurality of languages, media, and environments characteristic of postdigital transformations. In highly mediatized societies, the relationships between individuals, communities, and socio-technical infrastructures become central to understanding how democratic participation and conflict are reshaped. Contemporary forms of what may be defined as "hate speech onlife" are heterogeneous, yet they share common social and psychological dynamics that sustain hostility and antagonism. Investigating these dynamics is necessary in order to avoid naïve or purely moralistic approaches and to develop educational perspectives capable of addressing these phenomena in their cultural, social, and political dimensions. Alongside critical thinking, a cornerstone of media education, the co-authorial nature of the social web calls for an education to responsibility, understood as the ability to evaluate the consequences of one's actions within mediated public spaces. The category of hate speech can be described as "ambiguous but useful" (Pasta, 2025). Its ambiguity derives from the difficulty of defining clear boundaries between legitimate expression, offensive speech, and incitement to hatred, yet it remains a productive analytical lens for investigating the relationship between digital media, democratic life, and what has been defined as "citizenship onlife" (Pasta & Rivoltella, 2022). The analysis develops along three main lines. First, the paper examines some characteristics of digital environments that facilitate processes of targeting, stigmatization, and polarization. Algorithmic personalization, visibility metrics, virality mechanisms, and the persistence of content contribute to the selection of enemies and the formation of antagonistic publics, favoring emotional intensification and identity construction through opposition. Second, the paper considers the transformation of hate discourse in the age of post-truth. In polluted information environments, the distinction between true and false becomes less relevant than the capacity of messages to mobilize emotions and reinforce group belonging. Irony, provocation, denial of responsibility, and claims of not being serious often function as discursive strategies that allow hostile expressions to circulate while avoiding accountability. Third, the contribution outlines some educational directions aimed at countering online hate without reducing the issue to moral regulation or technical control. Strengthening civic agency requires developing awareness of the socio-technical conditions that shape communication, fostering critical reflection on the emotional and relational dimensions of online interaction, and promoting education to responsibility as a key competence for democratic life in postdigital societies.

Media, Arts and Digital Democracy: Negotiating New Cultural Ecologies

PANEL CONVENORS: Alfonso Amendola (Università di Salerno, Italy); Martina Masullo (Università di Salerno, Italy); Camilla Masullo (Università di Napoli Federico Ii, Italy); Pietro Ammaturo (Università e-Campus, Italy); Maria Beatrice Russo (Università di Salerno, Italy); Giovanna Landi (Università di Salerno, Italy)

PANEL KEYWORDS: Digital Cultural Transformation, Creative Media Ecologies, Democratic Negotiation

This panel brings together contributions that examine how digital culture operates as a radical process of transformation affecting the practices, languages, and institutions of contemporary creative expression, with particular attention to educational implications and democratic negotiation processes. In the current media ecosystem—defined by algorithmic platforms, content fragmentation, and participatory forms of cultural production—fields such as television, cinema, visual and interactive arts, performing arts, music, and poetry are undergoing profound metamorphoses. Television is increasingly configured as a public platform, a hybrid space between broadcast and social media, capable of fostering new forms of media literacy and supporting the formation of a critical citizenry. Cinema is experiencing a transition from the photogram to the algorithm, negotiating between photographic regimes, digital codes, and generative models that redefine authorship, spectatorship, and cultural identity. Interactive artistic practices and the performing arts rewrite the relationship between body, technology, and participation, transforming the artwork into a process and reshaping aesthetic experience. Music, embedded within platform logics, becomes an identity-based, relational, and algorithmic language, while poetry expands into transmedia environments that hybridize narration, learning, and experimentation. The structure of this panel gathers contributions that analyze these phenomena in their intersection with educational and democratic issues: how these cultural forms facilitate or hinder critical capacities, informed participation, inclusion, and shared meaning-making practices; and how television, cinema, the arts, performance, music, and poetry have become spaces of transformation and negotiation of collective experience in the digital age.

EXHIBITION SPACES AND MUSEUM EDUCATION: AI SUPPORT FOR THE CREATION OF NEW NARRATIVES WITH AN INCLUSIVE APPROACH

Laura Ceccacci (Università eCampus - MIM, MUR, Italy)

museum education | inclusive practices | transformative learning

In galleries and art museums, creative expressions from the present and past meet a diverse audience in terms of age, socio-cultural background and motivation. As historically educational spaces, they can be formal learning environments for visitors, but also non-formal (such as guided tours or activities led by experts) and informal (with reference to audio guides, information panels and interactive screens). Today's most innovative exhibition spaces are heavily involved in digital transformation, which is capable of attracting an increasingly wider audience that plays an increasingly active role in the visit. New technologies can play a fundamental role in the appearance of art spaces: they can influence the container, i.e. the way in which the works are displayed and presented; the content, i.e. the way in which the work itself is narrated; and the way in which the work and the visitor encounter each other, creating participatory scenarios of enjoyment that are integrated into the architecture of the cultural institution. The opportunities offered by digitalisation promote inclusive experiences, both intergenerational and socio-cultural. Generative Artificial Intelligence tools can be used very effectively. In fact, starting from the observation of collections of works, art spaces can become spaces for the transformation and negotiation of collective experience. They can be privileged places for activating shared practices of meaning creation and for the co-construction of new narratives, through exchange and dialogue that bring into play lived experiences, past experiences, values and ideas. In particular, workshop activities integrated with visits to galleries and art museums can be configured as inclusive and transformative spaces for social practices, oriented towards sharing and generating new meanings for experiential, contextual and situated learning. This contribution offers a reflection on these aspects and documents experiences of museum education workshops, carried out with heterogeneous groups of different age groups, based on innovative teaching methodologies that integrate generative Artificial Intelligence. It also proposes workshop activities based on the theoretical framework of Making Learning and Thinking Visible (MLTV), which is divided into various activities with specific objectives based on shared protocols (Thinking Routines) and on the methodological framework of Augmented Reading.

TELEVISION AS CITIZENSHIP: RAI AND PUBLIC SERVICE IN THE DIGITAL MEDIA ENVIRONMENT

Martina Masullo (University of Salerno) · **Matteo Marinello** (University of Bologna)

TV Citizenship RaiPlay

In a fragmented and convergent media environment (Jenkins, 2006), public service television faces the challenge of hybridizing with digital media in order to compete within an increasingly complex and stratified commercial context. This environment is characterized by the processing of large amounts of data on users' consumption habits, algorithmic processes that shape both production and distribution, and the organization of content through continuous flows and on-demand libraries (Barra, 2022). Furthermore, within the framework of a post-serial culture (Brancato, 2011; Amendola et al., 2019; Masullo, 2025), the circulation of clips, remixes (Lessig, 2009), and micro-narratives on social media redefines the formats of linear television while simultaneously capturing the attention of audiences—especially younger ones—who engage in new practices of sharing and reappropriation through short, modular, and recombinable languages. Rai has sought to respond decisively to these new market challenges and to the evolving ways in which people learn, access information, and interact online by transforming itself into a digital media company. The RaiPlay platform, relaunched in 2019, stands at the forefront of this transformation. This paper therefore takes RaiPlay as a case study, interpreting its distribution strategies (Barra & Rossi, 2026), formats, and original content aimed at younger audiences as components of a system in transformation that proceeds through trial and error, updating the pluralistic and aggregative mission of public service broadcasting to contemporary needs (while inevitably confronting the limitations, setbacks, and socio-political constraints typical of the Italian media context). Several original coming-of-age productions have positioned the platform as complementary to generalist television, while its role in selecting and enhancing linear content has made it a fundamental tool for event television (sports, music competitions, major public events, and civic commemorations), partially re-synchronizing audience consumption within the vast "sea" of digital plenitude (Bolter, 2020). Moreover, projects such as "Qui c'è RaiPlay", developed in collaboration with the Policlinico Gemelli hospital, along with other partnerships with public institutions, demonstrate the platform's potential for social penetration, offering a virtuous example for schools, universities, training institutions, and public administrations. Television can therefore still potentially represent a crucial space for discussion and citizenship (Ortoleva, 2011), capable of promoting media literacy, critical and conscious entertainment, and the ability to navigate saturated communication environments, thereby contributing to the construction of a democratic horizon capable of resisting the polarization fostered by commercial media. Through a structural and content analysis of the platform, also drawing on interviews with industry professionals, this paper reinterprets RaiPlay's practices and potential as a new frontier of public service broadcasting, capable of fostering inclusive participation and informed citizenship within a fragmented and complex media environment.

MUSIC, PLATFORMS AND DEMOCRACY: PERFORMATIVITY, MEDIA LITERACY AND THE COLLECTIVE CONSTRUCTION OF MEANING

Camilla Masullo (Università degli Studi di Napoli Federico II, Italy)

digital music | participatory culture | algorithmic platforms

Over the last ten years, music has undergone a radical metamorphosis, driven by the pervasiveness of the digital as a cultural environment, a space of interaction and an affective infrastructure. Following Pierre Lévy (2023), the digital is not merely technology, but a cultural and social ecosystem that structures thought, emotions and relationships. Henry Jenkins (2014), with his theory of participatory culture, emphasizes how users are no longer passive spectators but prosumers, actively involved in the production and reinterpretation of content. These theoretical approaches allow us to interpret digital music as a performative, educational and identity-forming device, where aesthetic experience intertwines with social practices and dynamics of collective participation. The aim of this contribution is to explore how digital music operates as an arena of cultural democratization, fostering informal learning, the development of digital and aesthetic skills, and the construction of individual and collective identities. In particular, the role of algorithmic platforms (TikTok, Spotify, YouTube) is examined in shaping tastes, behaviors and spaces of social interaction, highlighting the tensions between democratizing potential and the risks of polarization or homogenization. Philip Auslander, as highlighted by Gemini and Brilli (2024), analyzes "mediated performance" as a process in which identity is never fixed, but constantly negotiated and represented in digital public spaces. In this sense, music—integrated with video, images and text—is one of the most effective tools for this negotiation, allowing individuals to construct and communicate their personal stories in an immediate and recognizable way. In the algorithmic context, music takes on the function of the emotional soundtrack of digital life, making visible and amplifying a process of identity construction that in the past manifested itself in more implicit and private ways. The analysis is based on a socio-technical and qualitative approach, integrating a historical analysis of transformations in musical media, from vinyl to digital; an analysis of digital trends and viral phenomena on social platforms; and observation of user behavior as prosumers, through the documentation of mashups, choreographies, challenges and creative reinterpretations. Within the contribution, two emblematic phenomena illustrating these dynamics will be examined: the digital mashup Celebrate the Good Times by DJ Earworm, which combines more than one hundred pop hits, generating a modular and shared musical flow; the viral trend Savage Love on TikTok, which exploded during the lockdown, where choreographies, remixes and videos created collective memory, a sense of community and widespread social participation. Digital music emerges as a space of educational and cultural innovation, with the potential to develop media literacy, creative skills and practices of digital citizenship. Future challenges include the critical analysis of algorithmic influence on musical preferences, the inclusion of micro-scenes and emerging genres, and the construction of resilient online communities capable of transforming music consumption into a democratic, participatory and conscious experience.

‘EX SILENS’ AD ‘SENSORIUM’. DONNARUMMA AND THE DEMOCRATIC NEGOTIATION OF PERCEPTION: TOWARDS ART AS AN EPISTEMOLOGICAL AND PEDAGOGICAL ENVIRONMENT

Giovanna Landi (Università degli Studi di Salerno, Italy) · **Maria Beatrice Russo** (Università degli Studi di Salerno, Italy)

Democratic negotiation of perception | AI and sensory technologies | Shared perception

The advent of digital technology has precipitated a radical transformation in the media ecosystem, which is characterised by the preeminence of algorithmic platforms, the proliferation of content, and the emergence of participatory forms of cultural production and dissemination. In this paradigm, the visual and interactive arts are undergoing profound transformations that impact not only expressive languages but also the very conditions of production and aesthetic enjoyment. The artistic experience is theorised as a situated and participatory process, in accordance with Dewey's conception of art. According to this theory, the work takes shape in the experience generated by the interaction between the individual and the environment (Art as Experience, 1934). From this perspective, the artistic process is embedded within creative media ecologies, in which bodies, technological devices, algorithmic infrastructures and the public contribute to the shared production of experience, giving rise to new dynamic configurations of perception, relationship and the construction of meaning. This paper will analyse the work of artist Marco Donnarumma, with a particular focus on the performance Ex Silens (2024), which forms part of the I Am Your Body project. This project is based on research conducted with a group of deaf people (including the artist himself) on the concept of embodied knowledge, and explores how normative power is imposed through the technological mediation of the senses. In this performance, AI-based cochlear implants are divested of their corrective function for individual use and reconfigured as collective sound prostheses, capable of generating shared perceptual environments in which all participants - whether hearing or with hearing impairments, in an inclusive perspective - can engage in unprecedented sensory experiences. This process of reframing facilitates the transcendence of sensory boundaries, thereby fostering novel forms of co-participation between performers and audience members. The performative act provides a highly intense experience for participants, giving shape to a radically alternative sensorium commune, which opens up new thresholds of shared perception. The theoretical framework draws on the work of authors such as Marshall McLuhan, Donna Haraway, John Dewey and Judith Butler, as well as studies on embodied knowledge. From a methodological perspective, the research adopts a comparative qualitative approach, based on an interpretative analysis of Donnarumma's work, through an analytical examination of the performative structures, the technical devices employed and the modes of participation activated. The present paper aims to demonstrate how contemporary multimedia and performance art, through the integration of digital technologies and AI systems, helps to redefine the notion of liveness as a sensory, interactive and collective experience, transforming the artwork into a processual space in which dynamics of democratic negotiation of perception and shared experience are activated. From this perspective, interactive artistic practices become experimental laboratories in which to explore new forms of relationship between body, technology and the media environment. This suggests the possibility of considering art as a potential epistemological and pedagogical environment in the post-digital society.

AUTHORSHIP AND PARTICIPATION, SIMULATION AND SIGNIFICATION: CINEMA IN THE ALGORITHMIC AGE BETWEEN FRAME, CODE, AND ARTIFICIAL INTELLIGENCE

Pietro Ammaturo (Università eCampus, Italy)

post-digital · authorship · generative AI

In recent years, cinema has undergone a profound transformation affecting its aesthetic forms, models of production and distribution, and modes of spectatorship. This metamorphosis is not merely technological in nature; rather, it is deeply epistemological, insofar as it reconfigures the role of the author/director, the practices of spectatorship, and the operational logics of the cultural industry within an ecosystem increasingly shaped by algorithmic platforms and participatory forms of production. This contribution examines three coexisting paradigms within the contemporary audiovisual landscape: classical cinema, grounded in the photographic indexicality of reality; so-called digital cinema; and cinema generated through Artificial Intelligence. Moving from Bazinian ontological realism to the category of the archive-image, the article aims to conceptualize contemporary cinema not as a form that records the Real, but as a practice that simulates it through generative models. It further interrogates how the competencies of directing, editing, and aesthetic construction are transformed when the image becomes "computed," and what kinds of changes affect practices of spectatorship on on-demand platforms. Adopting a socio-semiotic framework that brings into dialogue media studies, the sociology of culture, and critical theories of the audiovisual industry, the contribution also seeks to investigate the educational and democratic implications raised by this transformation: in what ways does this transition in cinema enable or hinder critical capacities, informed participation, and the collective construction of meaning? The theoretical and socio-cultural re-elaboration advanced here redefines the audiovisual as a fluid, transmedial, and co-evolutionary cultural practice, reflecting on how the transition from the frame to the algorithm anticipates broader transformations in visual culture and collective sensibilities in the age of artificial intelligence.

REDEFINING MUSIC LISTENING PRACTICES IN THE PLATFORM SOCIETY

Ludovica Malknecht (Università Europea di Roma) · **Sara Navarro Lalanda** (Università degli Studi Roma Tre)

Platforms · Music listening · Cultural sustainability

The digital era has radically transformed the paradigms of music production, distribution, and consumption, raising urgent questions about the sustainability of listening practices in the platform society (van Dijck, Poell, and de Waal 2018; Bonini and Magaudda 2024). This contribution analyzes the socio-cultural challenges stemming from contemporary musical homogenization, fragmentation, individualization, and disintermediation (Airoldi 2021; Ocaña Fernández 2014). Streaming platforms and short-form audiovisual social media (such as TikTok) foster fragmented, hyper-individualized (Webster 2023), and decontextualized listening experiences, inhibiting active selection amid an overabundance of supply (Bonini and Magaudda 2024; IFPI 2025). Here, the apparent freedom of direct access masks a new form of invisible, algorithm-

driven intermediation. Without human curation or critical skills to guide users, algorithms and market logics dominate, confining listeners to filter bubbles that limit exploration and depth. Music thus becomes mere functional background or fleeting commodity, stripped of its relational and semantic depth. Moreover, massive overproduction - such as the roughly 150,000 tracks uploaded daily to Deezer, 78% of which go unplayed (Rosenblatt 2025) - drives an inequitable musical economy, privileging standardized cultural hybrids over local productions (Bourreau et al. 2022; Hagen 2022; Navarro Lalanda 2025). In line with the European Parliament's recent resolution (2024) on protecting cultural diversity and ensuring fair remuneration, this study proposes redefining listening culture through a cultural "re-mediation" that reinstates the human element in the musical experience. To counter homogenization, disintermediation, fragmented discourse, and algorithmic isolation, it advocates a renewed approach to listening education as a strategy for cultural sustainability, targeting: 1) critical literacy in consumption technologies and media logics (Altheide and Snow 1979); 2) skills for situated listening attuned to cultural plurality (Blacking 1995); and 3) music's relational potential via dialogic practices, cooperative models, and participatory user interactions. Positioned within a critical perspective on listening education and democratic citizenship (Arditi and Nolan 2024), this contribution advances an audience-education policy aimed at fostering critical awareness of technological mediation and encouraging active participation, with the broader goal of supporting a plural and equitable musical ecosystem that strengthens collective cohesion, repositions musical practice within shared public spaces, and reaffirms music as a common good for multicultural dialogue and recognition.

Navigating Complexity: Game Design, Emotions, and AI for Democratic Citizenship Education

PANEL CONVENORS: Carlo Andrea Pensavalle (University of Sassari, Italy); Maria Giuliana Solinas (University of Sassari, Italy); Salvatore Fadda (University of Sassari, Italy)

PANEL KEYWORDS: COTS Board Games, AI and Emotional Intelligence, Complexity

In a world marked by complexity, instability, and transitoriness, educating for active citizenship requires not only developing the ability to critically analyze technoscientific systems but also providing emotional tools to navigate uncertainty. Emotions are not ancillary to learning, they are its neuropsychological foundation: positive emotional states activate deep learning processes, while anxiety and stress, common when confronting unpredictable complex systems, generate blockage, withdrawal, and cognitive distress. This panel explores how game design, COTS board games, and AI can serve as integrated educational ecosystems that combine complex systems modeling, cognitive and emotional empowerment, critical technoscientific understanding, psychological well-being, and democratic agency. COTS board games function as accessible complex systems incorporating risk, uncertainty, feedback loops, resource conflicts, and ethical dilemmas. Through play, students safely encounter emotionally resonant situations, tension, collaboration, rapid decision-making, failure, and redesign, activating components of emotional intelligence and fostering learning environments where mistakes spark curiosity rather than fear, and complexity cultivates resilience, awareness, and hope instead of toxic stress. Generative AI can act as an emotional cognitive mediator: a dialogic space helping teachers and students reflect on strategies, thoughts, emotional states, and scenarios, reducing performance anxiety while promoting metacognition and self-efficacy. Rather than functioning as a technocratic authority, AI becomes a facilitator of well-being in thinking, supporting decision-making, narrative construction, emotional regulation, and reflective practice. The panel invites contributions on how the convergence of technoscience, play, AI, and emotional intelligence can challenge technocratic reductionism and expand learners' capacity to inhabit contemporary complex systems with greater health, clarity, and responsibility.

COTS BOARD GAMES AND AI AS EMOTIONAL AND COGNITIVE ECOSYSTEMS FOR DEMOCRATIC CITIZENSHIP: A TEACHER'S PROFESSIONAL DEVELOPMENT PROGRAM

Carlo Andrea Pensavalle (University of Sassari, Italy) · **Alberto Pintus** (University of Sassari, Italy) · **Emanuele Petretto** (University of Sassari, Italy) · **Luca Caloi** (University of Sassari, Italy) · **Veronica Venco** (Adam Mickiewicz University, Poland) · **Alan Mattiassi** (Game Science Research Center, Italy) · **Martina Ragusa** (National Research Council of Italy (CNR), Italy) · **Maria Giuliana Solinas** (University of Sassari, Italy)

Teacher Professional Development | Complexity and Cognitive Ecosystems | Game Design and AI for Democratic Citizenship

This paper presents an innovative Teacher Professional Development (TPD) program that integrates Commercial Off-The-Shelf (COTS) board games and generative Artificial Intelligence (AI) to cultivate complexity awareness, emotional intelligence, and democratic agency in secondary STEM education. In a global context marked by democratic backsliding, widening inequalities, and accelerated digital transformation, citizenship education increasingly requires the capacity to interpret technoscientific systems, negotiate uncertainty, and regulate emotions in situations characterized by risk, ambiguity, and competing values. We argue that learning for democracy cannot be reduced to content transmission or abstract civic principles: it must be enacted through participatory practices in which learners experience and reflect upon decision-making, responsibility, and the social consequences of models. Our program was designed within the Italian Accademia Nazionale dei Lincei project and aligned with the Lombardy guidelines L'Arte di Imparare, which emphasize a shift from the teacher as lecturer to the teacher as designer of learning environments. COTS board games are conceptualized as accessible "complex systems" that embody feedback loops, resource conflicts, probabilistic events, and ethical dilemmas—conditions that mirror contemporary civic life shaped by datafication and algorithmic governance. Unlike many instructional games, COTS games generate authentic emotional dynamics (tension, frustration, solidarity, hope, fear of failure) that can be pedagogically leveraged to foster resilience and reflective judgment rather than performance anxiety and withdrawal. The study reports a pilot implementation conducted with a volunteer sample of secondary STEM teachers in Northern Sardinia, Italy, within a 12-week hybrid course combining workshops, online meetings, collaborative game analysis, classroom prototyping, and guided reflection. Teachers engaged in iterative design cycles: selecting games, deconstructing mechanics through the MDA framework, planning learning sequences, and incorporating student co-design to support epistemic agency. A mixed-methods evaluation included the Teachers' Sense of Efficacy Scale (TSES)

and the Game Experience Questionnaire (GEQ), complemented by open-ended reflections. Preliminary results indicate increased teacher confidence in designing engagement-oriented activities, strong immersion and perceived competence during gameplay, and a growing professional identity centered on facilitation, mediation, and ethical responsibility. Two case studies illustrate how the approach operationalizes democratic citizenship education through technoscientific literacy and emotional empowerment. Maxwell's Daemons supports probabilistic reasoning, network thinking, and model-based explanation within playful competition; Forgotten Odyssey: The Damned of Asinara situates resource optimization and risk management within historically grounded ethical choices and collective responsibility. Across both cases, generative AI functioned as an emotional–cognitive mediator: a dialogic partner for scenario expansion, reflective feedback, personalization, and metacognitive prompts that helped teachers (and potentially students) articulate assumptions, monitor emotional states, and evaluate AI outputs critically rather than accept them as authoritative. Overall, the paper contributes a replicable framework showing how the convergence of board game design, emotional intelligence, and AI-supported reflection can counter technocratic reductionism and support democratic learning as a lived, relational practice—preparing educators and students to inhabit complex systems with greater clarity, care, and civic responsibility.

FROM UNCERTAINTY TO AGENCY: AI-SUPPORTED PLAYFUL LEARNING FOR CRITICAL TECHNOSCIENTIFIC CITIZENSHIP

Veronica Venco (Adam Mickiewicz University, Italy) · **Luca Caloi** (Università degli Studi di Sassari) · **Carlo Andrea Pensavalle** (Università degli Studi di Sassari)

Critical AI Literacy | Playful Learning | Emotional Resilience

In a world increasingly shaped by artificial intelligence and rapid technological transformation, education must prepare students not only to use digital tools, but also to critically understand and evaluate the technoscientific systems that structure contemporary life. The ubiquity of AI—especially among younger generations—raises urgent pedagogical questions: how can schools integrate these technologies without reinforcing passive consumption, dependency on automated outputs, or technocratic reductionism? How can AI instead strengthen democratic agency and responsible participation, rather than functioning as an efficiency device that short-circuits critical thinking? Building on its educational proposal, this contribution outlines a co-design framework integrating generative AI, playful learning, and reverse thinking to foster critical AI literacy, creativity, and civic empowerment. Reverse thinking operates as a methodological lever that challenges the expectation that technology should primarily deliver fast, correct answers. In this approach, AI is repositioned as a dialogic partner that supports inquiry, encourages hypothesis-making, and generates productive uncertainty. The aim is to cultivate learners who can question AI outputs, identify assumptions, compare perspectives, and negotiate meaning—competences essential for navigating AI-saturated environments and for engaging in democratic debates about technology and governance. The project translates conventional curricular topics into interactive game-based experiences. Teachers and students collaboratively transform disciplinary content into logic-based challenges, narrative scenarios, or rule-driven problems, while AI supports ideation, iteration, and critical testing. Prompt engineering becomes not merely

technical training but a reflective practice: learners learn to formulate better questions, explore system behavior, test alternative framings, and validate claims. Teachers, in turn, act as designers, facilitators, and "game masters," guiding exploratory pathways where progress depends on reasoning, collaboration, and informed decision-making rather than on receiving immediate solutions. Crucially, the framework situates learning within emotionally meaningful experiences. Complex systems—technological, ecological, economic, or social—are often perceived as unstable and difficult to control, potentially triggering anxiety, stress, and disengagement, particularly in performance-oriented school cultures. AI-mediated playful learning offers protected environments where uncertainty, error, negotiation, and redesign are normalized. Through gameplay, learners experience tension, curiosity, surprise, and satisfaction in manageable forms, gradually developing emotional regulation and resilience. Mistakes become generative moments that spark exploration rather than fear; complexity becomes a space for collective problem-solving rather than a source of toxic stress. Positive emotions thus function as a pedagogical infrastructure supporting deep learning, sustained attention, and persistence in challenging tasks. Play becomes a laboratory for navigating complexity, where technological awareness grows alongside metacognition, ethical reflection, and collective responsibility. By designing and discussing rules, evaluating AI-generated options, and reflecting on consequences, students practice civic reasoning and learn that technoscientific systems are not neutral but shaped by values, trade-offs, and power relations. Used critically, generative AI can help surface these dimensions by offering alternative perspectives, simulating outcomes, and prompting discussion about bias, reliability, and accountability. Overall, the proposal contributes to debates on science, technology, and democracy by showing how AI-supported playful learning can cultivate not only digital competence, but also ethical awareness, epistemic empowerment, and the capacity to inhabit contemporary complex systems with agency and well-being.

INTEGRATED EDUCATIONAL ECOSYSTEMS FOR DEMOCRATIC CITIZENSHIP: TABLETOP ROLE-PLAYING GAMES AND GENERATIVE AI

Martina Ragusa (ITD-CNR, Italy) · **Davide Capobianco** (University of Venice "Ca' Foscari") · **Giancarlo Masi** (ITD-CNR, Italy; University of Modena and Reggio Emilia, Reggio) · **Flavio Manganello** (ITD-CNR, Italy)

Tabletop role-playing games | generative AI | democratic citizenship education

Educating for democratic citizenship has never been a simple matter, and the task grows more pressing in contexts marked by systemic instability, increasing complexity, and the pervasiveness of techno-scientific reasoning. Cognitive skills, while necessary, are not sufficient on their own. Learners also require socio-relational competencies and practical strategies for regulating emotions. Neuropsychological research consistently shows that facilitative emotional conditions support deep cognitive processing, while sustained anxiety and tension tend to foster withdrawal, rigidity, and diminished critical engagement (Deci et al., 2001). A credible approach to citizenship education must therefore address cognitive and affective dimensions in tandem. This contribution explores the educational potential of two instruments that are receiving growing attention in both research and practice: tabletop role-playing games (TTRPGs) and generative artificial intelligence (GenAI). TTRPGs create experiential learning environments built on collaborative narrative and shared decision-making (Zagal & Deterding, 2018). Within a low-stakes fictional frame, participants encounter situations involving uncertainty, competing interests, and ethical tension, allowing space for reflection and revision without the consequences of real-world failure (Barone, 1997). In doing so, gameplay engages components of emotional intelligence that conven-

tional instructional formats seldom reach. Existing literature suggests that these practices can foster competencies aligned with the European LifeComp framework (European Commission, 2020). Shared narrative construction calls for perspective-taking and active regulation of group dynamics. The distribution of agency within the game demands mediation, attentive listening, and the negotiation of collective decisions. Rotating roles across sessions encourages situated leadership and relational coordination. The ADVENTURE framework (Capobianco & Manganello, 2025) gives operational form to these principles through a five-phase methodology that integrates Self-Determination Theory (Deci & Ryan) with LifeComp competencies. At its core lies the Adventurer's Diary, a formative assessment tool structured around the psychological needs for autonomy, competence, and relatedness. GenAI, in turn, can function as a complementary instrument for cognitive and emotional mediation. Following a three-dimensional model (Masi, Boccuzzi & Manganello, 2025; Masi et al., 2026), GenAI may operate as a design partner, supporting educators in developing culturally inclusive scenarios through iterative elaboration; as a critical friend, providing adaptive feedback informed by diverse cultural frameworks and calibrated to individual communicative styles; and as a work participant, moderating cross-cultural exchanges and prompting metacognitive reflection on strategies, emotional responses, and the consequences of in-game choices. Understood in this way, GenAI does not serve as a control mechanism or evaluative authority. It operates instead as a scaffold for cognitive well-being, with the potential to reduce performance-related anxiety and strengthen learners' sense of self-efficacy. This paper argues that combining structured game-based practices with generative artificial intelligence may open space for educational ecosystems that resist reductionist accounts of techno-science and extend learners' capacity to engage critically with complex contemporary systems. Resilience, self-awareness, and democratic agency are not incidental by-products of such approaches but rather what this kind of pedagogy, at least in principle, is meant to cultivate. The paper further discusses conditions for effective implementation across educational levels, questions of equity and agency in the joint use of games and digital tools, and directions for future empirical research.

WHEN INTENTION ISN'T ENOUGH. VALIDATING A RECOGNITION-OF-HARM GAME MECHANIC TO ADDRESS SOCIAL COMPLEXITY IN APPLIED GAME DESIGN.

Alan Mattiassi (Drimlab, Italy; Game Science Research Center, Italy) · **Irene Cirillo** (University of Trieste, Italy) · **Luna Camauli** (University of Trieste, Italy) · **Matteo Cavallo** (Drimlab, Italy)

procedural rethoric · applied games · gender violence

This paper presents the validation of a dialogue-based game mechanic designed to address complex social topics, specifically inclusivity and gender-based violence, through a psychology-informed approach to procedural rhetoric in adolescent game-based learning. Rather than assuming that "good dialogues" and well-intentioned design are sufficient, the proposed mechanic explicitly tests the psychological reality of its procedural message by empirically calibrating how players perceive different dialogue options along a bipolar recognition-of-harm scale (in Italian, from "sminuire" to "aggravare", or Sm.Ag.). The case study is Un giorno come un altro (designed and developed by Drimlab), a narrative videogame for lower and upper secondary school students that uses branching dialogues in which each decision node offers two alternatives differing in how they recognise and frame a problematic situation (e.g., dismissive "What's the big

deal?" versus acknowledging "This is really serious"). Each choice is intended to position the player on a bipolar recognition-of-harm scale, ranging from minimising to exacerbating the perceived seriousness of the issue, thereby shaping both in-game outcomes and the player's sense of agency over how the situation is interpreted. To ground this procedural rhetoric in players' actual perceptions, every dialogue line is independently rated by psychologists and psychology students on a Likert-type recognition-of-harm dimension (minimising vs exacerbating), after reading the dialogue sequence up to that point. The Sm.Ag. value associated with each option corresponds to the mean perceived position on this bipolar scale, and the game's scoring system as well as its three possible endings (Sm-dominated, Ag-dominated, or balanced trajectories) directly reflect these empirically derived evaluations rather than the designers' a priori intentions. The proposed validation procedure is situated at the intersection of work on the psychological reality of procedural rhetoric (Anderson, Karzmark, & Wardrip-Fruin, 2019), philosophical and empirical accounts of agency in games (Nguyen, 2020), and a unifying framework for the psychology of games that conceptualises games as structured psychological systems (Mattiassi, 2026). It also builds on research on games as media for social change and on gender stereotypes and representation in games (Flanagan & Kaufman, 2018). By aligning the micro-structure of branching dialogues with empirically validated recognition-of-harm trajectories, this approach aims to ensure that the game's procedural rhetoric about inclusivity and gender-based violence is both psychologically plausible and educationally meaningful. The contribution is twofold: it offers a concrete method for validating the rhetoric of dialogue-heavy serious games on complex topics related to civic engagement (Rivers & Bertoli, 2024), and it suggests that addressing such topics in democratic citizenship education requires empirically testing not only content and outcomes (Bertolo & Mariani, 2019; Plass, 2015), but also the procedural patterns through which players exercise and experience agency.

BEYOND CIVIC CONTENT: SERIOUS GAMES AS EMOTIONALLY MEDIATED ENVIRONMENTS FOR DEMOCRATIC LEARNING

Anna Sioni (Sapienza Università di Roma, Italy) · **Alan Mattiassi** (Game Science Research Center)

Serious Games | Citizenship Education | Perspective-Taking

Research on serious games for civic and citizenship education has often focused on their potential to convey civic content, simulate political processes, or increase engagement with public issues. Their educational contribution, however, remains contested, partly because games are frequently treated as self-contained interventions and evaluated through short-term, in-game measures (Dishon & Kafai, 2022). This paper argues that what makes serious games educationally significant for democracy might not lie in the civic content they carry but in the quality of the encounters they stage: spaces in which learners not only encounter other viewpoints but are also challenged to move beyond them (Blokland et al., 2024; Gutierrez et al., 2014), and experiment with ways of reasoning and acting within complex civic systems rather than merely learning about them (de la Torre et al., 2021). From this perspective, serious games are read as designed environments for navigating democratic complexity, understood as the interdependence, non-linearity, and uncertainty that characterize civil life, rather than as discrete tools for delivering predefined civic messages. Central to this argument is a relational and emotionally grounded view of perspective-taking. Taking another's standpoint is not simply a cognitive exercise performed at a distance; it is shaped by the affective experience of role-play, by peer interaction, and by the discomfort of inhabiting a position one would not otherwise choose or be able to occupy (Gutierrez et al., 2014; Blokland et al., 2024). Emotion is therefore not incidental but constitutive: it pushes learners into a zone of proximal development for democratic

reasoning, making alternative positions something they must reckon with, not simply register, and opens space to test possible ways of seeing and acting within complex civic situations. This is also why serious games are especially well-suited to democratic education: they can stage ambiguity and conflicting values without prematurely resolving them, holding open the dissonance that civic life requires learners to navigate (Blokland et al., 2024). This potential, however, is conditional. What happens during play matters, but so does what surrounds it. Without structured debriefing sessions, contextual embedding, and facilitated dialogue, gameplay may remain affectively intense but educationally limited (Blokland et al., 2024; Dishon & Kafai, 2022). From this perspective, this paper considers AI-supported systems not as substitutes for facilitation, but as tools for scaffolding reflection after play. It explores whether AI-mediated debriefing might help learners articulate, connect, and reflect on the multiple perspectives encountered in the game, while preserving space for open-ended dialogue and critical interrogation of the norms and assumptions at stake (Wegemer et al., 2025). Rather than asking whether serious games "work" for democratic citizenship education in general, the paper asks under what conditions they may help learners navigate democratic complexity in ways that are emotionally engaged, reflectively informed, and open to genuine civic dialogue. It thus offers a cautious and educationally grounded interpretation of serious games as designed and facilitated environments whose democratic value depends on the quality of the emotional and reflective experiences they make possible, and that may be further supported and augmented by AI-mediated dialogue.

TRANSPARENT GAMES, OPAQUE ALGORITHMS: BOARD GAMES, AI, AND LUDOLITERACY FOR CRITICAL TECHNOSCIENTIFIC EDUCATION

Christian Gardoni (European University of Rome, Italy) · **Carlo Andrea Pensavalle** (University of Sassari, Italy)

Technosocial opacity | Board Games | AI

In the contemporary context, education is undergoing a technoscientific transformation that tends to replace slow, situated, and relational practices with models of educational governance linked to datafication, EdTech, and the pervasive diffusion of AI. In this scenario, the digital ecosystem is increasingly opaque: students and citizens struggle to understand the consequences of their actions, profiling mechanisms, dark patterns, and the logic of an "algorithmic governmentality" that transcends the individual. This acute technosocial opacity is not only a cognitive problem, but also an emotional one: uncertainty and the perception of lack of control can produce anxiety, frustration, and withdrawal, hindering deep learning and critical participation. The paper proposes to view this condition as a central challenge for education for democratic citizenship: inhabiting complex systems requires simultaneously critical technoscientific skills and emotional tools to support exploration, deliberation, and conflict without falling into toxic stress or adaptive docility. Within this framework, COTS board games are considered "accessible complexity simulators" capable of safely and reflectively experiencing systemic dynamics such as risk, resource scarcity, feedback loops, cooperation/competition, ethical dilemmas, and trade-offs. Board games, in their "slow" and situated dimension, can become an educational ecosystem that activates ludoliteracy and complex thinking, as well as components of emotional intelligence (affective state recognition, regulation, tension management, tolerance of uncertainty), transforming errors into opportunities for redesign and complexity into resilience and hope, rather than a cognitive block. Finally, the paper explores the role of generative AI in game-based educational programs within the tensions that characterize current algorithmic ecosystems. In a context marked by technosocial opacity, optimization logics, and persuasive design practices, AI is not considered a neutral tool or a pedagogical solution. In this context, AI can be tested as a problematic conversational space, rather than as an epistemic authority: a tool for

interrogating decision-making processes and emotional states that emerge in contexts of uncertainty. The integration of analog play — understood as a slow practice that makes the dynamics of complex systems observable — and a limited, reflexive use of AI thus opens up an ambivalent pedagogical space, in which technology does not resolve the opacity of algorithmic systems but can contribute to making them the object of technoscientific critical interrogation.

AI, SOCIOGAMES AND GAME DESIGN: LEARNING SOCIAL COMPLEXITY FOR CRITICAL DIGITAL CITIZENSHIP

Simona Tirocchi (University of Turin, Italy) · **Manuela Repetto** (University of Turin, Italy)

Game-Based Learning | Artificial Intelligence | Critical Digital Citizenship

This paper presents some results from the “Sociogamers project”, developed at the University of Turin starting in 2024, which integrates game design into social sciences curricula to foster a critical understanding of sociotechnical systems and promote forms of critical digital citizenship (Barsotti et. al., 2025; Repetto & Tirocchi, 2025). In particular, the paper focuses on the interactions between gamification and recent developments in artificial intelligence, drawing on the perspectives and experiences of the students involved in the project and reflecting on how educational practices can support critical engagement with contemporary digital platforms and data-driven environments. The project adopts a Design Thinking approach and a peer-to-peer learning model in which students from the courses Game Based Learning and Sociology of Education (starting from a learning needs assessment of the “Network Society” course) collaboratively design immersive educational games using the Delightex Edu platform (Gros, 2007; Asad et al., 2021; Alrehaili, & Al Osman, 2022; Di Natale et al., 2020). This approach resonates with research on digital media making that emphasises the importance of enabling young people to become active creators rather than passive consumers of digital content (McGillivray et al., 2016). Within the project students developed a series of educational games, “sociogames”, each focused on specific sociological concepts and social processes including social capital, group segregation, descriptive social norms, among others. By translating theoretical concepts into interactive scenarios students simulate social dynamics dilemmas and decision-making processes typical of complex social systems fostering experiential learning and critical reflection while engaging in practices of digital making and collaborative problem-solving. The study is based on a questionnaire administered to 78 university students who participated in the game design activity. The sample consists of students enrolled in the Game Based Learning course with a smaller group from Sociology of Education. The analysis combines descriptive statistics and qualitative analysis of open-ended responses to explore students’ perceptions of the learning experience and the competencies developed through the co-creation process. Preliminary findings highlight the collaborative and creative dimensions of game design as key drivers of engagement and learning. Students particularly emphasize teamwork brainstorming and the opportunity to translate sociological concepts into interactive scenarios. The competencies most frequently reported include collaboration, problem solving, creativity, digital skills and instructional design abilities (Marin-Zapata et al., 2022; Kopolovich, 2020). A relevant dimension emerging from the analysis concerns the development of digital and AI-related competencies. 31 responses out of 78 include references to artificial intelligence programming or digital tools used for game development while 6 students explicitly mention AI or similar technologies among the competencies acquired. Overall approximately 40% of participants associate the project with the development of digital and AI-related skills including the use of immersive software such as Delightex basic programming logic and the

translation of theoretical concepts into interactive digital models. Future research could further investigate how artificial intelligence might be integrated into gamified learning environments to generate adaptive scenarios, personalised feedback and dynamic game mechanics responding to learners' profiles motivations and interactions within digital platforms (Abbes, Bennani, & Maalel, 2024).

Navigating the Controversial. Media Practices and Educational Challenges in the Digital Age

PANEL CONVENORS: Paolo Bonafede (University of Trento, Italy); Alessandro Soriani (University of Bologna, Italy); Charlot Cassar (Radboud University)

PANEL KEYWORDS: Controversial issues, Media practices, Digital Technology

In the age of algorithms and artificial intelligence, classrooms have become spaces of constant negotiation between access, control, power and critical autonomy. This panel examines how educators address controversial issues related to the use of digital technologies in schools, interrogating the media practices of both teachers and students as well as the school policies that regulate them. The panel's topic focuses on the emergence of controversial issues tied to technology use: from the management of personal devices in the classroom to the implications of online behaviour in the classroom, from gender representations in digital media to affective and sexuality education, to students' growing interactions with AI tools. These issues raise pedagogical, ethical, and political tensions that affect both educators and school leaders. The goal of the panel is to investigate how the education sector responds to such controversies: Which forms of critical media literacy are required by professionals in the field of education and by students? How can school and educational policies support media practices oriented toward democratic participation and civic responsibility? The panel welcomes theoretical and empirical contributions from diverse learning contexts that document experiences, tensions, and innovations in addressing controversial topics brought about by digital technologies in both formal and informal educational settings. Through a comparative and interdisciplinary approach, the aim is to identify practices that strengthen informed, pluralistic democracies and foster resilience against the polarizing and surveillant dynamics of today's digital ecosystem.

WHEN VIOLENCE GOES VIRAL: UPPER SECONDARY TEACHERS AND THE DEMOCRATIC WORK OF CONTROVERSY

Paolo Bonafede (University of Trento, Italy) · **Alessandro Soriani** (Alma Mater University of Bologna, Italy) · **Charlot Cassar** (Radboud University, Nederlands) · **Elena Pacetti** (Alma Mater University of Bologna, Italy)

controversial issues · school violence · teacher agency

Democratic education is not only a matter of transmitting civic knowledge but of cultivating the habits and dispositions that make pluralistic life possible: listening, justifying, disagreeing, and revising one's views in public (Dewey; 1916). Yet, as schooling is increasingly managed through performative logics and risk-avoidance, opportunities for democratic subjec-

tification can shrink, even when "citizenship" remains a curricular label (Biesta; 2006; Biesta; 2013). Classroom discussion of controversial issues (CIs) has long been proposed as a key practice for democratic learning (Stradling, Noctor, & Baines; 1984; Hess; 2009; Hess & McAvoy; 2015), but it is also a site where teachers' vulnerability, neutrality dilemmas, and institutional pressures become visible (Journell; 2017; Cassar et al.; 2021). In the digital age, these tensions are amplified. Episodes of school violence travel quickly through news platforms, messaging apps, and algorithmic feeds, often framed through sensationalism and polarisation. Teachers meet these events "already interpreted" by media and peer talk, and must decide whether they belong to the educational mandate or should be treated as external safety matters. Research on unplanned controversial issues highlights how such moments can throw "the classroom in turmoil," requiring rapid professional judgement shaped by emotions, prior experiences, and task perception (Cassar et al.; 2021; Cassar et al.; 2023). At the same time, recent debate cautions against removing emotions from civic discussion too quickly, arguing that political emotions may be educational resources rather than mere risks (Surina; 2025). This paper presents an ongoing multi-regional Italian study (upper secondary level) that investigates whether – and under which conditions – teachers perceive school violence as a CI that calls for educational intervention, or as a matter to be delegated beyond schooling. The project currently relies on a single-phase data collection built as a mixed-method questionnaire. The instrument combines (1) a short narrative from real media scenario about a violent episode entering school, designed to anchor responses in concrete; (2) an elicitation task where participants formulate a spontaneous question prompted by the situation; and (3) a set of Likert-scale items and open questions aligned with key CI dimensions (epistemic, political, emotional, and professional) (Hand; 2008; Hess; 2009). Analytically, the study integrates quantitative and qualitative strands: Likert data are used to identify response patterns and teacher positioning profiles, while the written component undergoes thematic and discursive coding to capture boundary-work, justificatory repertoires, and silences. This written approach offers some advantages, like privacy, reduced group dynamics, and traceable texts, but also limitations: brevity, self-presentation, and the absence of dialogic probing that can surface implicit assumptions. Survey data will be collected in Spring 2026 and analysed through a convergent mixed-method design to inform future research and teacher education on democratic deliberation in digitally mediated school controversies.

SOCIO-EDUCATIONAL COOPERATIVES AND SCHOOLS IN THE DIGITAL AGE: LOCAL PARTNERSHIPS TO ADDRESS CONTEMPORARY CHALLENGES

Alice Montagnini (Cooperativa Bangherang - Soc. Coop. Sociale, Italy) · **Stefano Resca** (Cooperativa Bangherang - Soc. Coop. Sociale, Italy)

Digital transformations | Controversial issues | Democratic Education

In the contemporary context, marked by technological acceleration, hyperconnectivity, and the transformation of learning environments, the relationship between education and teaching is being profoundly redefined (Castells, 2010; Floridi, 2014). Schools are increasingly called upon to address controversial issues emerging within the digital sphere, where media practices shape identities and relationships. Within this scenario, the contribution proposes a reflection on the role of socio-educational cooperatives as strategic partners in building educational alliances capable of supporting schools in addressing such complexities. The widespread diffusion of digital media and their pervasiveness in young people's daily

lives generate new educational challenges: mediated relational dynamics, conflicts, disinformation, polarization, and vulnerability. These phenomena are not merely matters of "digital education"; rather, they question the educational mission of schools, which are called upon to foster critical and democratic competences within a constantly evolving communicative ecosystem. This contribution takes as its point of observation the experience of Coop. Bangherang, engaged in the implementation of non-formal educational pathways in both school and extracurricular contexts. Through the analysis of selected projects, the paper highlights how the action of socio-educational cooperatives can strengthen the school ecosystem by offering methodologies, languages, and learning settings capable of addressing emerging needs. In line with the Council of Europe's recommendations on teaching controversial issues and fostering democratic culture (Council of Europe, 2016), the contribution focuses on three key functions. The first is educational mediation: cooperatives act as bridging actors between schools, local communities, and families, fostering the creation of spaces for dialogue. The second is methodological innovation: non-formal pathways make it possible to address controversial issues, transforming complexity into opportunities for learning. The third is the promotion of democratic competences: the digital sphere is understood not as a separate domain, but as a space in which practices of citizenship are exercised on a daily basis. The underlying hypothesis is that socio-educational cooperatives can contribute to the development of a school capable of "inhabiting" digital transformations without reducing them to emergencies, but rather recognizing them as central educational terrain. Through the discussion of the cases, the contribution seeks to offer theoretical and methodological reflections on the role of the third sector in constructing shared educational practices in the digital age. Case Studies: Reading the World: A primary school project dedicated to critical information literacy, the development of critical thinking, and the recognition of disinformation. It integrates digital outputs, thematic board games, and the involvement of a youth-oriented editorial team designed for the target group. Generation Online: A lower secondary school pathway addressing gaming and video games. It analyzes common game mechanics, with particular attention to those that influence behavior, and guides students in designing their own video game in order to enhance awareness and critical capacity. Financial Education: A project for upper secondary schools, developed in collaboration with a banking institution. Through thematic board games and dedicated simulations, it explores issues such as debt, risk, and misleading promises of profit conveyed by apps and online influencers.

DIGITAL TRUST. WHAT ABOUT THE OTHERNESS IN DIGITAL AGENCY?

Maria Gabriella Pediconi (Urbino University, Italy) · **Isabella Quadrelli** (Urbino University, Italy) · **Michela Brunori** (Urbino University, Italy)

adolescents' agency | Digital trust | Social media platforms

Some research tends to portray adolescents as inexperienced and vulnerable navigators of the cyberworld. Our research, however, proposes the perspective of agency to understand the factors that cause adolescents to trust others despite having no direct knowledge of them (Krabbendam et al., 2024). We know that early interactions of trust during childhood form the basis for subsequent interactions of trust with peers and strangers (Erikson, 1963; Stolle, 2002): the attachment and trust experienced in parent-child relationships translate and can be modified by subsequent social experience during childhood and adolescence (Rotenberg et al., 2005). What do we trust in friendship? In symmetrical interpersonal relationships, trust is built purely on emotions (Đorđević, 2025); initial trust is the first indicator of the level of trustworthiness confirmed by other people, whether known or unknown, and signals a desire to engage in potentially mutually beneficial interactions (Krabbendam et al., 2024). Not many studies explore the trust building in everyday contexts, which nowadays fully include cyberspace (Brunori & Pediconi, 2025; Pediconi & Brunori, 2019, 2021; Pediconi et al., 2024). The present research sheds light on characteristics in developing trust in adolescents' online social interactions. Our research involved 99 adolescents (24 males and 75 females) attending the second year of high school in two schools in central Italy. Participants were asked to draw an imaginary Instagram profile of a user with which it can be easy to exchange friendship,

to fill a chat conversation with this imaginary user and to describe both the photo-profile and posts included within his/her profile. Qualitative research using visual methods opens up new perspectives on complex phenomena (Agha et al., 2024; LaMarre & Chamberlain, 2022), allows to “materialize bodies, social practices, and interactions between individuals and structures” useful for studying social experience (MacIsaac 2021, p. 1). The results reveal an identikit of the trusted digital other, based on the exploration of otherness through gender, name, biography, profile photo and chat exchanges. Our adolescents showed a willingness to imagine trusted peers of either gender who would have no problem revealing their first and last names, with a personal photo; they reveal their place of residence or school, ready to meet others in person to share common interests and positive qualities. Young people want to know who they are dealing with; this digital friend is described as helpful, outgoing and transparent teenager who is as authentic as a favourite friend in the offline world. This model of digital otherness is based on offline friendships, revealing a certain caution and prudence on the part of adolescents when they encounter the digital world (Kelly & Burkell, 2025). These personal resources should be utilised as an experiential evaluative dimension in the construction of digital policies and pedagogical strategies. Formal and informal educational settings are places where trust and democratic engagement are closely linked and mutually reinforcing. Strategic actions in these settings can strongly support teenagers' sense of agency, fostering resilience against the polarisation of the digital ecosystem.

DIGITALLY MEDIATED UNPLANNED CONTROVERSY IN THE CLASSROOM

Charlot Cassar (Radboud University, The Netherlands) · **Ida Oosterheert** (Radboud University, The Netherlands) · **Paulien C. Meijer** (Radboud University, The Netherlands)

digitally mediated controversy | unplanned controversial issues | teacher decision-making

Contemporary classrooms have become digitally mediated spaces in which digital technologies shape communication practices, structure information flows, and influence the narratives that emerge in everyday classroom interactions (Soriani, 2019). Within this environment, unplanned controversial moments are also frequently mediated by digital technologies, not necessarily as explicit topics of study but as conditions through which classroom polarisation emerges (Just, 2025; Van Alstein, 2019). Although the digital may appear to take centre stage in such situations, the tensions that surface are not reducible to technological questions alone. This paper examines how the digital becomes implicated in

these moments and how teachers interpret and justify their decision to actively engage or distance themselves from it. The analysis draws on a small number of illustrative cases from a wider qualitative study in which teachers reflected on why they chose to address unplanned controversial incidents. The digital dimension was not pre-specified in the original data collection but emerged naturally within teachers' narratives. The focus here is on how these situations surfaced through digital environments, how teachers framed the challenges that followed and how they justified their decisions to act. Across the cases, the digital appeared in distinct ways: as an object of epistemic debate when students questioned whether the internet could replace teachers; as a source and amplifier of cultural content and values in discussions of online influencers; as a contextual trigger surfacing latent prejudice during an online safety lesson; and as a relational medium through which peer conflict travelled across the boundary between online communication and school life. Teachers responded differently. Some treated these situations as pedagogical and moral opportunities for dialogue, critical scrutiny, and boundary setting, while others delegated responsibility to institutional structures. Teachers' justifications drew on concerns including protecting students from harm, setting moral boundaries around discriminatory or exclusionary views, challenging prejudice and stereotyping, fostering critical and democratic engagement, and upholding the legitimacy and limits of professional responsibility. The paper argues that while digital technologies can mediate the way controversial issues arise in classrooms, they do not fundamentally transform the decision teachers must make in the moment: whether to take up the issue directly or to limit their engagement with it. Rather, digitally mediated controversies reconfigure the context, visibility, and perceived jurisdiction of the issue, even as the fundamental decision teachers must make in the moment remains the same. Such a decision extends beyond the digital to include the teacher's past and a desired future, unfolding in a specific context that is often emotionally charged. The teacher's decision is also anchored in fundamental questions related to the purpose of education and who the person in teaching is (Cassar et al., 2023; Kelchtermans, 2009). The cases suggest that teachers' decisions to address or delimit these issues are never neutral (Hess & McAvoy, 2015). They communicate implicit messages to students about what counts as legitimate knowledge, whose dignity is protected, how conflict is handled, and where professional responsibility begins and ends (Cooper Geller, 2020; Dabach, 2015).

MEMETIC HATE SPEECH AND THE CHALLENGES OF CRITICAL MEME EDUCATION

Claudia Gina Hassan (University of Rome Tor Vergata, Italy) · **Francesco Fabbro** (University of Rome Tor Vergata, Italy)

meme · hate speech · meme literacy

Especially since the 2016 US election campaign that culminated in the first election of Donald Trump, memes (Molina, 2020) have increasingly been used by the American alt-right as tools of xenophobic, racist, and misogynist propaganda (Nagel, 2017). Over the past decade, what can be defined as "memetic hate speech" has progressively consolidated as a strategic component of digital political communication, particularly among nationalist and populist movements across different geopolitical contexts. Memes, due to their hybrid nature—simultaneously humorous, ironic, and highly shareable—enable the normalization of extremist discourses through ambiguity, plausible deniability, and participatory remix cultures (Trillò & Shifman, 2021; Schmid et al., 2025). Their algorithmic compatibility with platform logics further

amplifies their circulation, contributing to the mainstreaming of radical narratives (Whittaker et al., 2021). Starting from this scenario, this contribute first examines the processes of transculturation and indigenization of memetic hate speech, tracing how communicative strategies initially developed within the M.A.G.A. movement in the United States have been recontextualized, adapted, and localized by identity-based political movements in various European countries. Particular attention will be paid to the semiotic transformations, narrative reframing, and visual vernaculars that enable such content to resonate within specific national contexts, while maintaining a recognizable transnational ideological matrix. In doing so, the study situates memetic hate speech within broader dynamics of digital populism, affective polarization, and platformed political participation. Secondly, the issue of hateful memeing will be addressed from a media education perspective (Buckingham, 2020), arguing that the pedagogical response to this phenomenon must move beyond simplistic models of content moderation or fact-checking. Instead, it requires the development of critical interpretative competencies capable of unpacking the rhetorical strategies, intertextual references, and affective appeals embedded in memetic communication. In this regard, a set of Memetic Literacy Frameworks (e.g., Harvey & Palese, 2018; Pather & Crovitz, 2023; Rice, 2023) will be presented and comparatively discussed. These frameworks conceptualize memes not merely as humorous artifacts, but as culturally situated, multimodal texts that demand specific analytical skills. This contribution aims to highlight both the pedagogical potentials and the possible limitations of such frameworks in guiding classroom practices aimed at preventing hate speech in contemporary societies. On the one hand, memetic literacy can foster critical awareness of digital rhetoric, participatory culture, and the socio-political implications of remix practices. On the other hand, challenges emerge in terms of teachers' preparedness, institutional constraints, and the risk of inadvertently reproducing harmful content in educational settings. Ultimately, the contribution seeks to position media education as a key arena for democratic resilience, proposing a critical and reflexive approach to memetic culture as an urgent task in the current media ecosystem.

NAVIGATING CONTROVERSIAL TOPICS THROUGH AI: EXPLORING PRE-SERVICE EFL TEACHERS' EXPERIENCES WITH AI-POWERED DISCUSSIONS

Rita Divéki (ELTE Eötvös Loránd University, Hungary)

controversial issues | case study | AI literacy

In this era of global interconnectedness and unpredictability, education must equip students to become engaged, globally competent citizens who can navigate complex controversial problems, e.g., migration, climate change, wars, polarisation, racism and extremism (OECD, 2018) and even the use of AI. EFL teacher education has a unique role to play here: pre-service teachers must not only develop the skills to facilitate difficult discussions themselves, but also be prepared to nurture their students' social-emotional and critical thinking skills in the process. Yet there is a dearth of research on incorporating controversial issues into EFL teacher education and preparing pre-service teachers for such discussions, especially in the Hungarian context (Divéki, 2024). Incorporating controversial topics into the EFL curriculum has numerous benefits; through debates and discussions, students can develop their language, citizenship, and social-emotional skills (Pereszlényi & Divéki, 2024). AI tools have the potential to support this process in meaningful ways. AI chatbots can provide students with opportunities for meaningful interaction, personalised learning, individualised feedback, and a low-pressure environment for practice (Pesovski et al., 2024; Rebolledo Font de la Vall & González Araya,

2023). By providing information and facilitating the generation of arguments and counterarguments, AI can encourage students to engage with complex, controversial topics and develop a deeper understanding of the issues and their own stances. These tools also offer interactive, student-centred activities, such as simulated discussions, debates and role-plays (Shazly, 2020), which allow students to practice expressing their thoughts in a mature, nuanced and confident manner. In teacher education specifically, these affordances can be particularly valuable, offering pre-service teachers unique opportunities to practice challenging discussions in a controlled, low-stakes environment. The aim of this study is to investigate the effectiveness of AI tools in facilitating discussions about controversial issues with pre-service EFL teachers, examining both their pedagogical potential for developing trainees' speaking and social-emotional skills and their perceptions of AI-powered discussions. Using a case study design, a semester-long study was conducted with a group of pre-service EFL teachers (N=16) in a language skills development seminar at a Hungarian university. Each week, the students engaged with different AI tools while addressing controversial topics through interactive student-centred activities (e.g., role-plays, debates, organised discussions). Data was collected through reflective journals, beginning and end-of-semester surveys, class discussion feedback sheets, student reflections, and semi-structured interviews (n=5). The findings indicate that AI-powered discussions enhanced students' confidence in addressing controversial topics. Particularly noteworthy was the role of AI in supporting argument construction for more demanding debates and role-play activities and in developing students' critical thinking and AI-literacy skills. Nonetheless, while students found the tools useful for preparing for discussions, they expressed ambiguous feelings about the use of AI in class, raising questions about perceived authenticity and the role of human interaction in meaningful discussion practice. The implications of this study point to the need for systematic integration of AI tools in teacher education programmes, alongside the development of targeted materials and guidelines for using AI to facilitate difficult discussions in the EFL context.

Opacity, Subjectivity, and Pedagogy in Algorithmic Times

PANEL CONVENORS: Giovanbattista Trebisacce (Unical University Of Calabria, Italy)

PANEL KEYWORDS: Educational Opacity, Critical Pedagogy, Pedagogical Resistance

This panel explores how the pervasive presence of artificial intelligence and algorithmic infrastructures reshapes the conditions of educational experience, subject formation, and pedagogical encounter. Moving beyond the instrumental use of digital technologies, the panel addresses AI as a cognitive and environmental architecture that filters reality, anticipates interpretation, and constrains the epistemic space of freedom. Drawing on philosophy of education, critical pedagogy, and media theory, contributors will investigate how subjectivity, autonomy, and ethical formation are challenged—or potentially reconfigured—by algorithmic environments. Particular attention will be given to the role of opacity, vulnerability, and unpredictability as educational values that resist the logics of optimization and predictive design. The panel aims to foster interdisciplinary dialogue across educational theory, digital ethics, and philosophy, emphasizing the urgency of a pedagogical stance capable of resisting anticipatory control and reclaiming the eventfulness of human experience. Contributions are welcome from scholars exploring theoretical, empirical, or practice-based approaches to the pedagogical consequences of AI.

REASONABLE USES OF ARTIFICIAL INTELLIGENCE IN HIGHER EDUCATION: DEMOCRATIC PROMISES AND SYMBOLIC DISPOSSESSION

Magdalena Kohout- Diaz (Bordeaux University, France)

Artificial intelligence | Higher education | Educational subjectivity

Current debates on artificial intelligence in education are largely framed through instrumental and functional perspectives, emphasising efficiency, personalisation, learning analytics, or pedagogical support. In higher education, these approaches frequently invoke a democratic promise of AI, associated with widened and inclusive access to academic resources, support for student success, and the mitigation of educational inequalities. However, they often leave unexamined the deeper transformations that AI introduces into the constitution of academic subjectivity and into the symbolic foundations of educational democracy. This paper proposes a critical and theoretically grounded analysis of AI in higher education, not as a neutral tool, but as a new grammar of educational power. Drawing on contemporary reflections on post-humanity—particularly those developed by Yuval Noah Harari—the paper engages with diagnoses of the progressive delegation of judgement to non-conscious systems, the fragilisation of the modern autonomous subject, and the growing role of algorithms as mediators of reality, normativity and truth. Rather than adopting these perspectives uncritically, the paper relocates them within educational institutions, asking what they imply when applied to concrete practices of teaching, learning and evaluation. The analysis conceptualises the emergence of a post-human academic subjectivity affecting both university teachers and students, as judgement, evaluation and academic legitimacy become increasingly co-constructed through interactions with AI systems, particularly in assessment contexts. The aim is not to offer a binary axiological assessment of AI use, but to document the emergence of a hybrid form of subjectivity, reshaped in its relation to knowledge, learning and academic norms through algorithmic mediation. The argument is informed by illustrative material drawn from an exploratory qualitative enquiry focusing on students' reported uses of AI in their everyday academic work, especially during evaluative tasks. These accounts highlight recurrent practices of anticipatory adjustment, norm alignment and risk avoidance, through which AI is mobilised to secure conformity to perceived academic expectations rather than to support the assumption of a personal intellectual position. From an educational and clinical perspective, such uses cannot be reduced to gains in efficiency or access. They point to a reconfiguration of the subject's relation to knowledge, judgement and responsibility, and to a displacement of educational injustice: while certain barriers to access may be lowered, new forms of symbolic dispossession emerge, as the capacity to assume uncertainty, disagreement and accountability is partially delegated to algorithmic mediation. The paper advances three main arguments. First, it argues that so-called "reasonable uses of AI" in higher education are not merely a technical or ethical issue, but a symbolic and political one, reshaping how academic subjects relate to judgement and normativity. Second, it contends that educational democracy presupposes subjects capable of assuming judgement and sustaining disagreement—conditions that conform-

ity-oriented uses of AI tend to neutralise. Third, it proposes a situated analytical framework combining democratic theory, critical philosophy and a clinical sensitivity to subjectivity, without collapsing into either technophobia or technosolutionism.

OPACITY AND SUBJECT FORMATION IN AI-MEDIATED ADULT LEARNING

Alessandra Pedone (INAPP, Italy)

Adult learning | AI-mediated learning | Algorithmic management

The increasing integration of Artificial Intelligence (AI) into adult learning environments is reshaping not only pedagogical practices but also the very conditions of subject formation. Algorithmic systems function as cognitive and environmental architectures that anticipate interpretation, personalise content, and structure access to knowledge through opaque processes of prediction and datafication. In this context, adult learning risks being reduced to adaptive optimisation, narrowing the epistemic space in which autonomy and ethical agency can emerge. This paper investigates AI-mediated adult learning through the conceptual lenses of educational opacity, subjectivity, and critical pedagogy. Empirically, it draws on nationally representative survey data produced by INAPP, examining the diffusion of AI-related training and AI-mediated learning practices among adults in Italy. The findings indicate rapid growth in AI-supported learning, particularly through personalised and micro-modular formats. However, access and meaningful engagement remain stratified by education, digital competence, age, and organisational context. While AI promises personalisation and inclusion (Adarkwah, 2024; Cera, 2024), the data reveal a tension between expanded accessibility and diminished pedagogical mediation. AI-mediated learning environments tend to prioritise immediacy, performance, and predictive guidance, often marginalising dialogical interaction and collective reflection. In platformised labour contexts characterised by digital monitoring and algorithmic management (Gonzalez Vazquez et al., 2025; Cappelli & Rogovsky, 2023), adult learning becomes increasingly aligned with organisational optimisation rather than emancipatory formation. Drawing on critical educational theory (Biesta, 2011; Slowey et al., 2024), the paper argues that opacity should not be conceived solely as a technological deficit requiring transparency, but as a pedagogical condition that preserves indeterminacy, vulnerability, and openness to the unexpected. In contrast to predictive educational design, opacity sustains the possibility of interruption and encounter—elements essential to subject formation. AI-mediated adult learning thus presents a paradox. It expands access to knowledge while simultaneously constraining interpretative autonomy through anticipatory systems that pre-structure meaning. From the perspective of a democratic and socially just lifelong learning agenda (Stiglitz & Greenwald, 2014), the challenge is not to reject AI, but to develop pedagogical practices capable of resisting total optimisation and reclaiming educational spaces as sites of reflexivity and ethical responsibility. By integrating empirical evidence with philosophical reflection, this contribution advances an understanding of adult learning as a critical terrain in which algorithmic power can be interrogated and pedagogical resistance enacted.

ARTIFICIAL INTELLIGENCE AND CONVIVIAL PEDAGOGIES: RETHINKING DEMOCRATIC EDUCATION IN ALGORITHMIC LEARNING ENVIRONMENTS

Alessandro Turano (University of Calabria, Italy)

Convivial Pedagogies · Artificial Intelligence In Education · Democratic Education

The rapid expansion of artificial intelligence within educational systems is reshaping the epistemic conditions of teaching and learning. AI-based platforms increasingly mediate access to knowledge, organize information flows, and influence the forms through which learning is structured and evaluated. While these technologies are frequently framed as neutral tools capable of enhancing efficiency, personalization, and data-driven decision-making, their algorithmic logics may also reconfigure educational environments around predictability, standardization, and automated forms of cognition. Within this evolving landscape, the risk emerges that educational processes become progressively aligned with computational models that prioritize optimization and prediction over critical judgment and dialogical reasoning. This contribution engages with the theoretical legacy of Ivan Illich and Paulo Freire to explore how convivial and non-directive pedagogical traditions can provide conceptual resources for rethinking democratic education in AI-mediated contexts. Illich's critique of radical monopolies offers a particularly relevant lens for examining how technological infrastructures may reach a threshold beyond which tools cease to support human autonomy and instead reorganize educational practices around systemic efficiency. At the same time, Freire's emphasis on dialogical pedagogy and ethical self-formation highlights the importance of cultivating critical consciousness and shared responsibility in educational processes. Building on these perspectives, the paper proposes a conceptual framework for convivial pedagogies capable of sustaining democratic agency in technologically mediated learning environments. Particular attention is devoted to educational practices that encourage critical engagement with algorithmic systems, the recognition of epistemic plurality, and the development of dialogical reasoning as a core democratic competence. Rather than positioning artificial intelligence merely as a technological innovation, the study interprets it as a cultural and epistemic environment that challenges educational institutions to reaffirm their democratic mission. From this perspective, convivial pedagogies may contribute to transforming AI from a mechanism of epistemic normalization into a resource that supports reflective judgment, plural reasoning, and participatory forms of knowledge construction.

EDUCATIONAL OPACITY AND PEDAGOGICAL RESISTANCE IN ALGORITHMIC ENVIRONMENTS: A PARTICIPATORY RESEARCH-FORMATION MODEL FOR TEACHER EDUCATORS

Flavia Di Donato (Università degli Studi Guglielmo Marconi, Italy) · **Travaglini Alessia** (Università degli Studi Guglielmo Marconi, Italy) · **Ugolini Francesco** (Università degli Studi Guglielmo Marconi, Italy)

Artificial Intelligence · Critical Pedagogy · Pedagogical Resistance

The expansion of Atificial Intelligence within educational environments is transforming not only teaching practices but also the epistemic and cultural conditions in which subjectivity and educational experience are formed. Algorithmic infrastructures increasingly operate as forms of digital power: they filter information, anticipate interpretation, and structure the horizons within which knowledge becomes visible and meaningful. In this context, educational environments risk being reorganized according to predictive logics, optimization processes, and algorithmic plausibility, narrowing the epistemic space within which human judgment and pedagogical encounter develop. This paper addresses these transformations by proposing a theoretical and methodological model for the education of teacher educators, seen as University professors responsible for preparing future teachers. The model is grounded in the assumption that teaching professionalism cannot be reduced to disciplinary knowledge alone, but emerges from the relationship between disciplinary knowledge and broader educational responsibilities. Within algorithmic environments, where discursive outputs simulate

competence and understanding, this relationship becomes a crucial place of pedagogical reflection. The theoretical framework integrates complementary traditions. Critical pedagogy conceives education as a dialogical practice oriented toward emancipation and development of critical consciousness (Freire, 1970; hooks, 1994). Theories of complexity and ecological development highlight the systemic interdependence between knowledge, context and person education (Morin, 1999; Bateson, 1972; Bronfenbrenner, 1979). Illich's critique of institutional mediation emphasizes the importance of socially appropriable tools rather than infrastructures governing human action (Illich, 1971). At the level of professional practice, Schön's theory of reflective practice highlights reflection-in-action and professional judgment as central dimensions of pedagogical responsibility (Schön, 1987). These pedagogical perspectives intersect with debates in Philosophy of mind and AI studies concerning consciousness, intentionality, and simulation. Although AI systems generate linguistically persuasive outputs, several scholars argue that such systems lack the phenomenological and intentional structures characteristic of conscious cognition (Searle, 1992; Chalmers, 1996; Tononi, 2004; Faggin, 2024). From an educational perspective, this introduces a significant epistemic risk: discursive plausibility may be mistaken for genuine understanding, producing new forms of epistemic opacity within learning environments. From a methodological perspective, the framework adopts participatory research-formation, seen as a shared reflective process in which teacher educators analyze practices while producing pedagogical knowledge. Through collective inquiry, disciplinary knowledge is reinterpreted in relation to three interconnected dimensions of educational responsibility: responsibility for meaning (humanistic dimension), responsibility for knowledge (scientific dimension), and responsibility for action (technical dimension). Within algorithmic environments characterized by predictive design and informational filtering, the model identifies a central pedagogical task: cultivating discernment in situations where the distinction between simulation and understanding becomes increasingly difficult. From this perspective, opacity, vulnerability, and unpredictability do not merely represent limitations of technological systems, but become educational resources capable of interrupting the logic of algorithmic optimization. Pedagogy thus takes the form of resistance not through rejection of artificial intelligence, but through recovery of the irreducibility of human judgment, the unpredictability of the educational encounter and the openness of subject formation: teacher education can counter anticipatory control and preserve education as a space in which human experience remains an event rather than a programmed outcome.

EXPLORING TEENAGERS' FRIENDSHIP DURING THE AI ERA: FIRST ISSUES FROM A SCOPING REVIEW

Sonia Bonatti (Università degli Studi di Milano - Bicocca, Italy)

adolescence | human-AI friendship | social AI

This presentation is focused on the initial phase of a doctoral research project exploring adolescence in the post-digital era, focusing on the phenomenon of human-AI friendship; main goal is to explore how artificial intelligence and human-AI interaction patterns are influencing teenagers' peer relationships (Følstad et al., 2021), in terms of learning and gathering social skills. More specifically, the aim is to explore the phenomenon from the standpoint of adolescents themselves, considering their point of view as a privileged one (Mortari, 2007). Today's adolescence is influenced by (daily) socio-cultural and economic changes, increasing the feeling of anxiety and global crisis perceived (Benasayag, Cohen, 2023). Moreover, digitalization opens to new and unknown challenges that contribute to intensifying the sensation of unpredict-

ability of the post-digital era. In the past few years, also the pervasive and invasive presence of artificial intelligence in daily life has reshaped our human experience; indeed, AI gained a more important role also in the educational process that can no longer be ignored, especially when the formation of the adolescent subject is involved. During the complex and fragile phase of adolescence, the subject has to achieve some developmental task phased specific (Lancini et al., 2020). Nowadays, it's necessary re-thinking about adolescents' socialization process and the influence that AI has on it, especially Social AI. The spreading of Social AI is questioning not only the common meaning of relationship and friendship, thought as human-human, but also the more recent concept of network individualism (Wellman et al., 2001, 2003), whereas the technology is previously a medium for relating people, but with social chatbots the relationship is between human and AI itself (Brandtzaeg, 2022); indeed, these specific AI systems are capable of humanlike behaviour, including engaging in social conversation and reaching intimate connections with humans (Skjuve, 2021). The pedagogical stance could offer an interdisciplinary perspective to understand better human-AI friendship and the social effects of social AI, using both the emerging concept of AI Individualism (Brandtzaeg, et al., 2025) and qualitative methodologies, inscribed in research traditions in education (Denzin, Lincoln, 2005). Starting from these premises, the proposal will discuss some initial results emerging from the ongoing scoping review and from the initial exploratory field phase; the latter combines ethnographic observation (Bove, 2019) and the use of netnography in digital contexts (Bove, Chinazzi, 2023; Kozinets, 2010). First findings highlight some interesting themes that allow us to explore further the changes in the socialization processes of adolescents (Caronia, 2002; Micheli, 2015), from a pedagogical perspective. Among them, in particular, it seems relevant that teenagers find more enjoyable speaking with social chatbots than human friends (Branch, 2025) for talking about difficulties in personal relationship because they feel less judged, more comfortable and confident because of the perception of major confidentiality (Mascheroni et al., 2026); furthermore, the constantly accessibility is modifying the concept of friendship from a reciprocal relationship to a personalized one, based on user's needs (Brandtzaeg et al., 2022).

AUTOETHNOGRAPHIC DIARIES IN HIGHER EDUCATION: SUBJECTIVITY AND CRITICAL AWARENESS IN THE AGE OF GENERATIVE AI.

Elisabetta Risi (IULM University, Italy) · **Riccardo Pronzato** (IULM University, Italy)

Autoethnographic diaries | Critical pedagogy | Socio-technological opacity

Over the past decade, a growing body of work has sought to develop critical literacies oriented toward socio-technical systems and processes (Markham, 2019; Pangrazio & Selwyn, 2023; Acker et al., 2024; Pronzato & Kubrusly, 2025). These pedagogical approaches, participatory practices, and forms of digital literacy aim to equip citizens to engage critically with algorithms, digital platforms, datafication processes, and AI-based systems. Yet such efforts—designed to foster agency, reflexivity, and resistance in relation to technologies—are persistently undermined by the power asymmetries structuring human-machine relations (Couldry & Mejias, 2019), the illusion of control promoted by interfaces (Markham et al., 2019), and the hegemonic acceptance of futures that appear inevitable (Markham, 2021; Pronzato & Markham, 2023). The most urgent contemporary instance of this tension is the difficulty educational institutions—schools and universities alike—face in responding to the proliferation of generative artificial intelligence (GenAI), in a context dominated by technological solutionism and ideological narratives (Macgilchrist et al., 2025). This contribution presents a research project developed in collaboration with the Futures+ Literacies+ Methods Lab (FLL) at Utrecht University, a center specializing in the design of participatory pedagogical interventions through creative methods to cultivate critical literacies at the intersection of technology, lived experience, and social change. Drawing on critical pedagogy, technofeminism, and critical theory as guiding theoretical frameworks, the study engaged 250 university students in a two-week guided autoethnographic project. The research aimed to investigate how students use and interpret GenAI systems within higher education, and how they perceive the impact of these technologies on the future of the university. Autoethnography was mobilized not merely as a method for eliciting dimensions of literacy, but as a tool for fostering genuine civic empowerment. Consistent with the panel's emphasis on opacity, vulnerability, and unpredictability as educational values that resist algorithmic optimization, the autoethnographic diaries revealed a significant interpretive trajectory: students progressively elevated their conceptual awareness and developed new frameworks for understanding the present. In particular, opaque datafication processes became more legible and critically apprehensible—even as the black boxes of generative AI systems remained irreducibly closed. The pedagogical structure of the diaries compelled students to develop critical thinking through meticulous argumentation—a reflective labor they reported they would not otherwise have undertaken. Furthermore, in line with theoretical perspectives on narrative identity and autobiographical orientation (Di Fraia & Risi, 2017), the autoethnographic experience stimulated forms of emancipatory competence with respect to acritical and compulsive uses of AI. The narrative and self-reflexive character of the diary format—as both a research instrument and a pedagogical proposition—thus emerges as a site of resistance to anticipatory control and predictive design, reclaiming the granularity of human experience. The diary narratives solicited from participants proved valuable in unpacking the socio-technological opacity of certain processes, while also fostering a sense of agency among those involved. This contribution presents the methodological and epistemological architecture of the diary instrument, alongside preliminary findings concerning participants' usage practices of GenAI and self-reflexive narrative orientations. Selected quotations are presented and discussed to ground the analysis in participants' own voices.

Science Communication and Scientific Information: actors, practices, and strategies in the Digital Era

PANEL CONVENORS: Giovanni Brancato (Sapienza University of Rome, Italy); Melissa Stolfi (Roma Tre University, Italy)

PANEL KEYWORDS: Science communication, social media, information

The evolution of the digital media has profoundly reshaped the production, circulation, and consumption of information. The rise of platform-driven logics has redefined editorial practices, transformed traditional journalistic routines, and introduced new actors into the informational scenario (Witschge et al., 2016; Boccia Artieri & Marinelli, 2018). Social media have become pivotal arenas for news access, fostering hybrid models of content production in which legacy media outlets, digital-native publishers, and non-journalistic creators coexist and compete for user attention. These transformations have been further accelerated by the adoption of mobile devices and the algorithmic-driven information flows, which collectively challenge established notions of authority, professional boundaries, and gatekeeping (Newman, 2022; Nielsen & Ganter, 2022). The Covid-19 served as a stress test for this evolving ecosystem, particularly in relation to scientific information and science communication. The simultaneous demand for reliable scientific content and the proliferation of misleading or inaccurate information exposed structural vulnerabilities associated with information overload and the dynamics of the "infodemic". At the same time, the crisis renewed public interest in scientific expertise and reconfigured the visibility of experts across both traditional and digital media—positioning them, on the one hand, as new mediating actors between scientific institutions and society and, on the other, as emerging educational and informational sources in the digital age (Campus & Saracino, 2022; Cataldo et al., 2024). This panel collects theoretical and empirical studies on the evolution of editorial and business models, communication strategies, and production practices that characterize emerging forms of science communication in the platform society.

POP SCIENCE COMMUNICATION AND EPISTEMIC MEDIATION: SCIENTIFIC COMMUNICATION, MEDIATIZATION, AND DEMOCRATIC CITIZENSHIP

Fabio Ciammella (Sapienza Università di Rom, Italy)

science communication | digital platforms | content creators

Processes of platformization and deep mediatization (Hepp 2020) characterizing the contemporary communication ecosystem are profoundly transforming science communication, redefining the boundaries between information, education, and entertainment (Bucchi, Trench 2021). In this context, the circulation of scientific knowledge increasingly takes place through short, visual, and highly accessible content produced by content creators and thematic pages operating outside the institutional circuits of academic and journalistic communication (Schäfer 2016). As a result, a model of pop science communication is emerging that, on the one hand, expands the potential to engage broad and non-specialist publics, and on the other raises critical issues related to information quality, epistemic legitimation, and public responsibility. This paper offers a first theoretical and exploratory overview of science communication on social media, aiming to interpret pop science not merely as an emerging communicative style, but as a form of distributed epistemic mediation within the platform society (van Dijck et al. 2018; Zeng et al. 2021). From this perspective, digital platforms are understood as epistemic infrastructures that intervene in processes of visibility, legitimation, and circulation of knowledge, shaping the ways in which scientific information becomes intelligible, credible, and socially relevant. The study investigates how science is narrated through platform-native formats, which rhetorical strategies and credibility devices are mobilized by science communicators, and how they position themselves between entertainment, epistemic authority, and educational functions (Zhang, Lu 2023). Particular attention is devoted to the ethical and value-related dimensions of science communication practices, which are considered crucial for understanding the role of digital dissemination in fostering informed and critical citizenship. Methodologically, the research adopts a qualitative design (Pink et al. 2016) and a transmedia approach (Ciammella 2024), based on the semi-standardized analysis of a corpus of science-related accounts active across multiple platforms (Instagram, TikTok, and YouTube). The comparative observation of narrative lines, production practices, and engagement dynamics highlights how scientific authority is performed and negotiated in the digital public sphere. Overall, the paper proposes to read pop science communication as a space for the cultural reworking of scientific knowledge and as a form of informal education that shapes processes of democratic learning within the hybrid

media ecosystem. This perspective invites broader reflection on the technological, symbolic, and institutional conditions structuring science communication in the platform era, and on its role in the construction of democratic and epistemically aware citizenship.

EXPERTISE UNDER PRESSURE: EXPERTS' SELF-REPRESENTATION, LEXICOMETRIC MEDIA NARRATIVES, AND PUBLIC RECOGNITION IN THE DIGITAL INFODEMIC

Rosario Aprile (University of Bergamo, Italy) · **Daniele Toscano** (Istituto Superiore di Sanità (ISS) - Italian National Institute of Health) · **Marco Palmieri** (Università Sapienza di Roma - Sapienza University of Rome) · **Antonella Pilozzi** (Istituto Superiore di Sanità (ISS) - Italian National Institute of Health)

expertise infodemic public perception

Contemporary societies are increasingly defined by overlapping crises that generate conditions of persistent uncertainty, a state conceptualized as a "permacrisis" (Zatti, 2024). In these contexts, scientific experts are called upon to act not only as knowledge producers but also as public communicators and mediators between scientific institutions, decision-makers, and citizens. The Covid-19 pandemic served as a definitive "stress test" for this relationship, exposing the fragility of expert authority while simultaneously placing it at the heart of public discourse. Within the current platform-mediated information ecosystem, the circulation of knowledge is filtered through hybrid media logics and an unprecedented "infodemic" (Cosentino, 2023), which complicates traditional hierarchies of knowledge and transforms the communicative expectations placed upon professionals. This presentation investigates the multifaceted processes through which scientific expertise is constructed, represented, and contested. The theoretical framework draws on the sociology of expertise (Eyal, 2019), the social construction of knowledge (Latour, 2005), and the dynamics of recognition in expert-public relations (Pizzorno, 2007). The contribution adopts a dual-methodological approach to capture both the subjective reflexivity of experts and the objective media landscape in which they operate. The first part explores the experts' self-representation through twelve focus groups involving sixty researchers from public and private institutes in geopolitics, climate studies, and healthcare. This qualitative phase investigates how experts interpret their communicative responsibilities and their perceived legitimacy when facing non-expert audiences. The findings reveal that experts' professional identity is increasingly shaped by "reputational recognition" that transcends peer-review circles, moving toward a public validation model. Two relational configurations emerge: a trust-based model, where expertise is accepted as an authoritative guide, and a conflictual model, where expertise challenges epistemic authority, leading to symmetrical and often polarized interactions. To complement this analysis is the study of a particular investigation: a lexicometric analysis (Baker, 2023) of the press coverage regarding the Covid-19 vaccination campaign. By applying multi-dimensional correspondence analysis and cluster analysis to an extensive corpus of national press articles, the research identifies the dominant semantic fields and rhetorical frames that shaped the public narrative of the vaccine rollout. This lexicometric component allows for a mapping of how "expert voices" were mediated, highlighting the tension between technical-scientific approach and the spectacularization of medical discourse. By triangulating the experts' internal reflections with the external media representation of the vaccination campaign, the presentation offers a comprehensive critique of science communication in the digital era. It concludes that expert authority is no longer an inherent institutional attribute but a fluid constructed entity, negotiated through visibility, relational trust, and the ability to navigate in the informational environments.

DATA, SCIENCE AND INFORMATION IN THE PANDEMIC: DATA-DRIVEN JOURNALISM AS A SPACE FOR SCIENCE COMMUNICATION

Lorenzo Ugolini (Sapienza Università di Roma, Italy) · **Giovanni Ciofalo** (Sapienza Università di Roma, Italy) · **Silvia Leonzi** (Sapienza Università di Roma, Italy) · **Fabio Ciammella** (Sapienza Università di Roma, Italy)

Data journalism | science communication | pandemic

The Covid-19 pandemic represented a moment of profound transformation in the processes of science communication. The centrality of data in the public narrative of the health crisis (especially, during the initial period from March to May 2020 and during the first phase of vaccine distribution in January 2021) made journalism a key mediator between scientific knowledge institutions and the public. Tables, graphs, percentages, and statistical indicators, along with medical and scientific terminology, became a constant presence in everyday news coverage, turning data-driven journalism into one of the main channels through which scientific information reached a mass audience. This contribution reflects on the role of data in science communication through the results of an empirical study on how Italian audiences perceived and interpreted data-driven news during the pandemic. The research is part of the broader project The Social Effects of Fake News and focuses on how audiences approach informational content that incorporates scientific and statistical data. The study is based on a survey conducted between 2020 and 2021 with 399 respondents across Italy, investigating the relationship between media consumption, trust in institutions and the ability to interpret news items involving scientific data. The pandemic clearly showed that science communication does not only concern the dissemination of scientific results, but also the translation of technical languages and complex data systems into narratives that are understandable and socially meaningful. In this context, journalism assumed a crucial epistemic role: not only reporting information, but interpreting and contextualizing data produced by the scientific community. However, the increasing visibility of scientific data in news coverage also revealed new tensions in the relationship between science, media, and public opinion, particularly within an environment characterized by information disorder and the so-called "infodemic." The findings of the research highlight a paradox in the relationship between audiences and science-related information. A significant portion of respondents expressed high levels of trust in doctors and scientists; at the same time, the same respondents showed a relatively high propensity to trust epidemiological or statistical data conveyed and used by the same doctors and scientists. To explain this contradiction, the research proposes the model of the "know-it-all approach". This model describes an attitude in which individuals believe they possess greater interpretative competence than others when evaluating events, policies, and data. Within this framework, scientific data are not rejected outright; rather, they are reinterpreted through personal experience, prior beliefs, or alternative narratives. The result is a tension between scientific authority, journalistic mediation and the social perception of scientific evidence. These findings suggest that, in contemporary media environments characterized by hybridization and platformization, science communication cannot rely solely on the presentation of data or scientific evidence. Instead, it requires greater attention to the ways in which data are translated, contextualized and narratively framed. Data-driven journalism represent therefore a crucial space for science communication, provided it develops narrative and transmedia strategies capable of making data understandable, verifiable, and socially meaningful for diverse audiences.

MEDICAL COMMUNICATION AND SOCIAL MEDIA: THE ROLE OF EXPERTS AS "SCIENCE INFLUENCERS"

Giovanni Brancato (Sapienza University of Rome, Italy) · **Melissa Stolfi** (Roma Tre University)

medical communication · experts · social media

Medical communication finds in social networking platforms a privileged space for visibility, circulation, and legitimation, leading to the development of unprecedented forms of mediation between experts and citizens (van Dijck et al. 2018). While, on the one hand, it is primarily in the context of the Covid-19 pandemic that health became central within public discourse, thanks to the presence of experts in Tv programs across traditional media; on the other hand digital media have provided a new space for medical and scientific communication aimed at fostering and disseminating a culture of prevention, especially among younger people (Goodell 1977; Lombardo & Mauceri 2020; Campus & Saracino 2022; Mihelj et al. 2022). As part of the broader process of redefinition of media landscape – in which actors 'outside' the traditional information system actively participate in the production of specialist information – experts assume the role of "science influencers" and develop successful strategies through their ability to combine scientific accuracy and linguistic simplification, and to adapt their communications, styles, narrative, and languages to the standards of social media (Ducci et al. 2021; Zhang & Lu 2023). The effectiveness of the message depends on the balance between informational accuracy and communicative "proximity": concise graphics, thematic rubrics, non-specialist vocabulary, and attention to current issues all contribute to the construction of content oriented not only towards the transmission of knowledge, but also towards the promotion of informed behaviours in matters of prevention and health, as well as the countering of misinformation. Social media thus become a strategic resource for medical communication, while the authority of experts directly shapes both the credibility of content and their capacity to influence public audiences (van Dijck & Alinejad 2020; Štětka et al. 2026). Instagram and TikTok represent particularly significant communicative tools for medical dissemination due to the use of audio-visual content (images and videos), its capacity to encourage interaction and engagement, and its ability to translate specialist content into accessible formats. Medical communication on Social media, in fact, does not consist just in a simplification (or a "decline") of specialist knowledge, but rather in a cultural translation that entails the selection, hierarchisation, and elaboration of content according to its readability, recognisability, and shareability. Among the most well-known examples in Italy are Dr. Monica Calcagni (@ginecologa.calcagni), Dr. Claudio Olivieri (@dr.claudio_olivieri), Minerva Salute (@minervasalute), and HeiMI-Salute e Prevenzione (@heimi.saluteeprevenzione), which are meaningful case studies for studying the editorial strategies and content production practices that have contributed to a "revival" of medical information through social networking sites. The research was conducted through a qualitative analytical approach applied to three distinctive elements of the above-mentioned selected social profiles: (a) the aims of the profile's content, (b) the evolution of the editorial format, and (c) the business models. The analysis outlines both

strengths and risks in the role of experts as influencers on social media. While platforms enable medical communication to reach wider audiences and foster engagement, data-driven logics reshapes how expertise is communicated, creating tensions between scientific accuracy, visibility, and algorithmic personalization.

EMPOWERING TEACHING COMMUNITIES AGAINST HEALTH MISINFORMATION.

Mihaela Gavrila (Sapienza University of Rome, Italy) · **Maria Magdalena Rosu** (University of Bucharest) · **Emmanouil Zoulias** (National and Kapodistrian University of Athens))

Health misinformation | science communication | digital media literacy

The proposed presentation will focus on the methodological design and evaluation results of the CIVIS Open Lab "Health Misinformation Project", implemented by the National and Kapodistrian University of Athens, Sapienza University of Rome and the University of Bucharest with several local partners. Within the CIVIS Open Lab framework, the project was conceived as an interdisciplinary, co-created pathway linking universities and communities to address the spread of online health misinformation and its impact on different target groups (World Health Organization, 2020). Methodologically, the project combined service-learning, participatory research and mixed-methods evaluation (Mihailidis & Viotty, 2017). A first work package engaged university students from health sciences, media/communication and technology in systematic literature reviews on health misinformation, guided by shared protocols for database search, inclusion/exclusion criteria and thematic coding informed by established reporting standards (Page et al., 2021). In parallel, structured needs-assessment tools (questionnaires and short interview grids) were designed to explore health information practices, perceived source reliability and typical misconceptions among school students, young immigrants and chronic patients in partner organisations, addressing gaps in behavioural and context-sensitive data on misinformation (Vosoughi et al., 2018). The training phase was organised through co-designed workshops and seminars, combining short lectures, guided analysis of real online health content, small-group source-checking exercises and collaborative tasks (drafting guidelines, scripting podcasts, sketching app and game functionalities) (Jones-Jang et al., 2021). To monitor learning outcomes, pre/post questionnaires were administered, concentrating on three indicators: self-reported health and digital literacy; confidence in assessing the credibility of online health information; and declared intentions and behaviours regarding the sharing or contestation of dubious content. Qualitative feedback was collected via brief reflective forms and group discussions, allowing triangulation of quantitative trends with participants' narratives. The presentation will highlight key empirical results emerging from this methodology. The data suggest that the combination of service-learning, co-creation of digital tools (website, guidebook, prototypes of app and game) and systematic evaluation can strengthen critical competences in diverse community settings and support more resilient information ecosystems (Isaakidou et al., 2025; World Health Organization, 2020). The contribution will also reflect on the strengths and limits of the adopted instruments, propose refinements of the evaluation framework and outline how this approach can be replicated or scaled up in future European initiatives. A specific focus will be devoted to the application of this framework in contexts of educational poverty, particularly those reached through organisations belonging to the Forum del Sostegno a Distanza, where risks of informational inequalities are especially acute (Livingstone & Helsper, 2007). In these settings, where access to reliable

health information is often fragmented and mediated by informal channels, narrative outputs such as short, multilingual podcasts have proved especially effective (Gavrila & Pranovi, 2022). By adopting accessible storytelling formats, rooted in everyday experiences and co-constructed with local educators, these podcasts have functioned as empowering tools for socially, culturally and economically vulnerable groups, turning media and health literacy from a perceived "deficit" into a space of recognition, voice and agency in the face of health misinformation (Couldry et al., 2010).

The Implications of Smartphones and Digital Environments for Learning and Psychophysical Well-Being

PANEL CONVENORS: Marco Gui (Università di Milano "Bicocca"); Orazio Giancola (Università di Roma "Sapienza", Italy); Giovanni Maria Abbiati (Università degli Studi di Brescia)

PANEL KEYWORDS: Smartphone use, Educational inequalities, Psychophysical well-being

This research panel examines how smartphone and digital environments shape adolescents' and students' daily lives, with particular attention to learning processes, inequalities, and psychophysical well-being. The debate on digital technologies is often polarized between alarmist narratives about cognitive decline and digital addictions and optimistic views that attribute emancipatory potential to devices. The panel seeks to move beyond these positions by focusing on empirical evidence supported by solid theoretical and methodological frameworks. Recent studies show that the effects of smartphone use on attention, study habits, and academic performance are neither uniform nor linear. They vary according to the intensity and purposes of use, family and school contexts, the timing of first exposure, and students' self-regulation capacities. Contributions investigating how young people use digital devices (for communication, information, entertainment or study) and the consequences for learning and engagement are particularly welcome. A second focus concerns inequalities. Access to technology, digital skills, and usage patterns differ by socioeconomic background, territory, migration background, and gender. Digital environments may reflect, amplify, or reconfigure these disparities. Understanding how smartphones intersect with educational trajectories is crucial to clarifying their role in the reproduction or mitigation of inequalities. A third axis involves psychophysical well-being, including sleep quality, stress, emotional regulation, and peer relations. Here too, mechanisms are complex and require robust empirical approaches. The panel invites contributions adopting diverse disciplinary perspectives and sources - administrative data, surveys, mixed methods, causal inference, qualitative inquiry - to build an empirically grounded and nuanced understanding of digital practices among young people.

THINKING WITH AI IN SCHOOLS: CRITICAL DIALOGUE, METACOGNITION, AND STUDENT AGENCY

Giulia Valentini (SIPEIA, Italy)

AI literacy | Metacognition | Student agency

The rapid integration of artificial intelligence into educational contexts often outpaces shared, critical pedagogical reflection. Dominant approaches to AI literacy tend to prioritize technical and operational skills; however, when everyday AI use is not supported by intentional and reflective practices, it risks fostering forms of cognitive delegation (cognitive offloading). This, in turn, can weaken students' metacognitive reflection, sense of responsibility, and agency within democratic learning environments. This contribution draws on a situated educational experience in upper secondary education (grades 10–12) and is based on participant observation of a cycle of workshops in which AI is not introduced as a tool for providing answers or optimizing learning outcomes, but as an object and interlocutor of critical dialogue. Through structured activities comparing human-produced and AI-generated texts, collective discussion, and guided reflection, students are invited to interrogate not only the correctness or plausibility of responses, but also the cognitive and emotional processes activated in their interactions with AI systems. Across the activities, AI use emerges as responding not exclusively to cognitive needs, but also as a source of immediate reassurance and emotional containment. Especially during adolescence—when identity formation, performance anxiety, and emotional uncertainty tend to intensify—AI often becomes a first interlocutor to whom questions, doubts, and decisions are delegated. While this immediacy may reduce uncertainty, it can also limit students' engagement with doubt, error, and the inherent complexity of autonomous thinking. From this perspective, AI can be understood as a mediating object that, if not made explicit and critically examined, risks shifting from a transitional support to a stable substitute for reflective processes. The pedagogical approach adopted is grounded in a sociocultural and dialogical perspective, in which AI is framed as a potential mediator of learning rather than a replacement for educational mediation and pedagogical judgment. Within this framework, metacognition plays a central role: students are supported in making their thinking processes explicit, distinguishing between automatic reliance and deliberate choice, and developing reflective responsibility in the use of AI as a support for thinking and decision-making. The observations collected consistently indicate that dialogical practices of this kind foster active participation, critical awareness, and student agency. Rather than limiting learning to the acquisition of technical competencies, such

practices sustain processes of deliberation, dialogue, and positioning. In this light, AI is not framed as a threat to autonomy, but as a pedagogical opportunity to rethink and strengthen dialogical practices oriented toward conscious participation and democratic learning. This contribution engages with the panel Critical Dialogue with AI in Schools by foregrounding critical dialogue and metacognition as essential safeguards for nurturing agency, reflective responsibility, and democratic participation amid AI's growing presence in schools.

WHEN (OVER)USE BECOMES RISK: SMARTPHONE PRACTICES AND DIGITAL VULNERABILITY AMONG YOUNG PEOPLE

Orazio Giancola ('Sapienza' University of Rome) · **Benedetto Pasanisi** ('Sapienza' University of Rome) · **Matteo Bonanni** ('Sapienza' University of Rome)

Smartphone overuse | Digital risks | Online vulnerability

Over the past years, sociological research has extensively investigated the use of digital devices and its implications, highlighting both problematic and positive aspects (Busch and McCarty, 2021). While identifying the determinants of problematic digital use has proven complex, age consistently emerges as one of the most relevant explanatory factors (Van Deursen et al., 2015). Building on this literature, the present study focuses on both ascriptive and acquired characteristics to examine which individual-level variables contribute to differentiated profiles of problematic smartphone use, while considering differences in digital skill levels and competencies in the use of digital devices (Gui and Argentin, 2011). This study investigates the relationship between problematic smartphone use (Giancola and Salmieri, 2020; 2024) and direct exposure to digital risks among individuals aged 17 to 31. It is based on an original survey designed to explore digital habits, perceptions, and forms of vulnerability associated with mobile device use. The analytical framework combines intensity of use - measured as hours spent on the mobile phone - with two composite indices: one capturing problematic use and the other measuring experiential exposure to the negative consequences of digital life. A multivariate approach is adopted to identify differentiated vulnerability profiles. The core hypothesis is that intensity of use, perceived problematic use, and directly experienced digital risks are interrelated dimensions of digital vulnerability. To disentangle this complex interplay, the analysis follows four steps: (1) the construction of an index of intensity of use, an index of problematic smartphone use, and an index of digital social risk; (2) the examination of these indices across individual characteristics of respondents; (3) the investigation of their interrelationships through bivariate and trivariate analyses; and (4) the estimation of regression models to identify the determinants of problematic smartphone use and to clarify the interactions between use intensity, perceived problems, and experienced risks. Overall, the study contributes to the literature by moving beyond an individual-pathology perspective on problematic smartphone use and by conceptualizing digital vulnerability as a relational and structural phenomenon emerging from the interaction between behavioural patterns, social positioning, and experiential exposure within contemporary digital environments.

DIGITAL PRECOCITY AND LEARNING OUTCOMES: AN ANALYSIS OF ITALIAN, MATHEMATICS, AND DIGITAL COMPETENCES

Sofia Ercolanoni (University of Milan-Bicocca, Italy) · **Marco Gui** (University of Milan-Bicocca, Italy) · **Chiara Respi** (University of Milan-Bicocca, Italy)

Early digital exposure | Competences | Inequalities

Research to date has largely examined the intensity and type of digital use in relation to well-being and mental health (Twenge & Campbell, 2018; Orben & Przybylski, 2019), while less attention has been devoted to the long-term implications of age at first access for these outcomes (Dempsey et al., 2020). Research addressing the relationship between early digital access and students' academic and digital competences remains scarce (Respi et al., 2025; Rioseco-Pais et al., 2024; Gui et al., 2020). In this work, we investigate how early exposure to different digital technologies is associated with learning performance and digital competence, and how socio-economic, cultural, and territorial differences shape these dynamics. The study draws on INVALSI data from the Grade 10 (cohort 2024/2025). In addition to standardized test scores in Italian and Mathematics, the dataset includes information on students' current and past digital use and a newly developed performance-based measure of digital competence aligned with the European DigComp framework, providing a more robust alternative to self-reported indicators commonly used in large-scale surveys (Siddiq et al., 2016; Giganti, 2024). To examine the relationship between age of first access to digital technologies and learning outcomes, we estimate multivariate regression models controlling for students' socio-economic and cultural background (ESCS), gender, migrant background, school track, and geographical area. Models include both linear and non-linear specifications in order to capture potential threshold effects, and results are adjusted through weighting procedures aimed at improving comparability across groups characterized by different levels of early exposure. Standard errors are clustered at the classroom level to account for shared contextual effects. Findings on the average age of first access to smartphones, messaging apps, and social media are consistent with previous literature. Moreover, students from Southern Italy and those with a migrant background tend to access digital devices at earlier ages, particularly smartphones, messaging apps, and social media platforms. Early access to social media and messaging apps is consistently associated with lower achievement in both Italian and Mathematics. The magnitude of these differences is comparable to, and in some cases larger than, the well-documented gender gaps in Italian and Mathematics. For smartphones, however, the pattern is non-linear: postponing access up to lower secondary school is associated with higher scores, whereas further delay corresponds to a slight decline. A notable exception emerges for early access to personal computers, which is associated with higher academic performance. The relationship with digital competence is more complex: intermediate access to smartphones and messaging apps appears to be associated with the highest levels of competence, while both very early and very late access correspond to lower scores, suggesting a non-linear pattern in which early familiarity does not automatically translate into stronger digital skills. By contrast, access to social media accounts and personal computers follows patterns similar to those observed for academic achievement. Interaction analyses reveal subgroup heterogeneity, particularly by gender, school track and migrant background, although results remain uneven across technologies and outcomes. This study provides evidence to inform educational policies and contribute to reducing digital inequalities.

BEYOND SCREEN TIME: GENDER, INTENSITY, AND GOVERNANCE IN THE RELATIONSHIP BETWEEN SOCIAL MEDIA USAGE AND ADOLESCENTS' MENTAL HEALTH IN THE EUROPEAN UNION

Eleonora Bertoni (Independent Researcher) · **Clara Centeno** (Independent Expert) · **Romina Cachia** (European Commission, Joint Research Centre)

Social media | Adolescents | Mental Health

This study examines the relationship between social media use and adolescent mental health in the European Union drawing on PISA 2022 data. The study moves beyond "screen time" narratives by analyzing intensity of social media use, gender disparities, contextual vulnerabilities, and policy responses under the EU's regulatory framework. The first theme addresses the pervasiveness of social media use among 15-year-olds in Europe. With 96% of adolescents engaging in social media daily and 37% spending more than three hours per weekday on passive browsing activities, social media has become a structural component of youth socialization. The study will contextualize these findings within broader digital transformation trends and adolescence as a sensitive developmental phase marked by cognitive, emotional, and social re-configuration. It will highlight the distinction between moderate and intensive use, noting that excessive engagement, defined as more than three hours per day, is consistently associated with poorer well-being outcomes. The second theme explores the correlation between intensive social media use and self-reported depression and anxiety. Drawing on regression analyses from four EU Member States (Hungary, Ireland, Slovenia, and Spain), the study shows that adolescents engaging in high-intensity social media use are significantly more likely to report symptoms of depression and anxiety compared to low- or moderate-use peers. Importantly, the analysis controls for socioeconomic background, academic performance, family support, sense of belonging at school, and experiences of bullying, thereby strengthening the robustness of the association. While causality cannot be firmly established, the evidence underscores a meaningful and policy-relevant correlation. A third central theme concerns gender disparity. Female adolescents display both higher rates of intensive social media use and substantially higher prevalence of depression and anxiety symptoms. However, the marginal increase in mental health risk associated with higher use appears broadly similar across genders, suggesting that time spent online interacts with other structural and psychosocial factors. This section will argue for gender-sensitive approaches that recognize differential vulnerabilities without oversimplifying the phenomenon as exclusively female-driven. The fourth theme focuses on adolescents' perceptions of digital regulation. Evidence indicates strong resistance to blanket bans on devices or restrictive filtering measures, while demonstrating support for collaborative rule-setting with teachers. These finding foregrounds youth agency and suggests that participatory governance models may be more effective than prohibition-based approaches. The study will connect these insights to ongoing EU policy initiatives, including the Digital Services Act, which mandates risk assessment and mitigation of systemic harms, and the broader agenda on youth mental health protection in the digital sphere. Finally, the study outlines future research and policy directions. It calls for multidimensional interventions combining platform accountability, digital literacy education, parental and school engagement, and longitudinal EU-wide monitoring. It also emphasizes the need for improved access to platform data to better understand behavioral mechanisms and algorithmic exposure patterns. By integrating empirical evidence, youth perspectives, and regulatory developments, the proposed study aims to contribute to a balanced, evidence-based framework for safeguarding adolescent mental health while preserving the social and participatory benefits of digital environments.

THE FIGURATION OF THE OPAQUE: ARTIFICIAL INTELLIGENCE, KNOWLEDGE PRODUCTION AND DEMOCRATIC EDUCATION IN TROUBLED TIMES

Lucy Císař Brown (Institute of Political Studies, Faculty of Social Sciences, Charles University, Prague)

Elias | artificial intelligence | higher education

This paper proposes that the incorporation of artificial intelligence into higher education constitutes a figurational transformation whose implications for democratic knowledge production remain theoretically underspecified. Drawing on Norbert Elias's figurational sociology and the concept of technological re-enchantment developed in relation to Weberian rationalisation theory (Císař Brown, 2025), the paper argues that AI integration is restructuring the interdependence figuration of the university in ways that generate a structural form of epistemic dependence incompatible with the reality-adequate knowledge production Elias associated with civilising processes and functional democratisation. The argument consists of three pillars. First, it examines how Elias's concept of reality congruence, and the graduated detachment it requires, presupposes a figuration in which the transmission and validation of knowledge remains at least in principle reconstructable by participants. Second, it analyses how AI systems, through their subsymbolic architecture and recursive optimisation logic, produce what is characterised here as a structural explanation deficit: not contingent ignorance remediable through better pedagogy, but a constitutive opacity that renders epistemic submission a rational adaptation rather than an aberration. Third, it considers what this means for the Eliasian question of functional democratisation: specifically, whether higher education can continue to produce the capacity for autonomous, self-regulating epistemic judgement on which democratic participation depends when the figuration of knowledge production is being reorganised around interfaces rather than understanding. The paper is careful to avoid technological determinism: the structural conditions described are products of specific developmental choices rather than inherent properties of AI as such. Nevertheless, it argues that these choices have produced a figuration whose civilising and de-civilising implications deserve sustained sociological attention.

Unpacking The Platformisation And Datification Of Education: Processes, Actors, Positionings and contexts

PANEL CONVENORS: Judith Jacovkis (Universitat de Barcelona); Pablo Rivera-Vargas (Universitat de Barcelona); Ainara Moreno (Universitat de Barcelona)

PANEL KEYWORDS: Platformisation, Datification, Education System

Platformisation and datification processes are changing the landscape of many education systems, regarding both its governance and the experiences of the school actors. From the point of view of the political economy, the increasing influence of private actors, and particularly Big Tech corporations, in the agenda setting of education policies worldwide has been analysed (Williamson et al., 2023). Research has also explained the process of adoption of specific private digital platforms in national education systems, highlighting its different expressions at the school level, from alignment to resistance (Jacovkis et al., 2022). In a scenario were nor the adoption neither the restrictions of digital platforms at schools have considered the systematic participation of the school actors, this panel aims to explore different strategies developed by the school actors to manage the platformisation and datification of their school systems and of their own experiences. Therefore, authors are invited to send abstract to this panel which address the platformisation and datification of education focusing on (1) the political and institutional dimensions of the processes or (2) the reconfiguration they represent for the education communities or its members (principals, teachers, students or families) at the school level. Empirical papers and theoretical, analytical and methodological contributions to the study of the platformisation and datafication of education that place democracy and educational justice at the centre are welcome.

FROM CLASSROOMS TO AI TESTBEDS: STRATEGIC BIASES IN IOS' AI LITERACY FRAMEWORKS

Michele Martini (Univeristà di Napoli "Federico II", Italy) · **Susan L. Robertson** (University of Manchester, UK)

AI | Policy | Big Tech

Since the 2022 emergence of advanced generative AI systems such as ChatGPT, narratives of urgency and transformation have come to dominate education policy debates. This paper critically investigates how two major international organizations (OECD and UNESCO) conceptualize "AI literacy" in their flagship policy documents. Drawing on text-mining and network text analysis, we compare their respective visions and the strategic selectivities they advance for reshaping national education systems. Guided by Jessop's (2005) strategic-relational approach, our analysis identifies a significant socio-technical shift: rather than positioning technology as something to be integrated into society, these frameworks portray society itself as being integrated into generative AI. Within this emerging educational paradigm, students are cast as "cybernetic" co-producers of knowledge who continuously interact with AI systems through feedback loops, while teachers are largely sidelined and confined to basic monitoring roles rather than pedagogical mediation. Educational institutions, in turn, are stripped of their pedagogical functions and reduced to sites that legitimize compliance. We contend that these strategic selectivities mark a sharp departure from earlier approaches to educational technology policy. In the documents examined, generative AI is presented as a totalizing force that reorganizes classrooms around productivity and assessment while downplaying key issues such as teacher agency, institutional context, and critical engagement. In particular, within the OECD/EU framework, schools are positioned simultaneously as testing environments and extraction sites for generative AI systems, fundamentally reshaping educational priorities and the roles of educational actors. Most significantly, these efforts to define AI literacy risk foreclosing opportunities for learners to develop a critical understanding of power and influence in a world increasingly shaped by oligarchic control.

ASKING TO THINK: DESIGNING AND VALIDATING A SCENARIO-BASED SURVEY ON DATAFICATION IN SPANISH PRIMARY EDUCATION

Diego Calderón-Garrido (Universitat de Barcelona, Spain) · **Judith Jacovkis** (Universitat de Barcelona, Spain) · **Pablo Rivera-Vargas** (Universitat de Barcelona, Spain) · **Ainara Moreno** (Universitat de Barcelona, Spain)

datafication platformisation scenario-based survey

The accelerated digitalisation of schools following the COVID-19 pandemic has intensified the presence of Big Tech corporations in educational settings, raising critical questions about child protection, data governance, and the everyday experiences of school communities. In Spain, as in many other national contexts, the adoption of digital platforms in primary education has proceeded without systematic participation from school actors, and with limited attention to how teachers and families understand, navigate, or resist these processes. This paper presents the design and validation process of a survey instrument developed within the DigiProtEd project, a mixed-methods study exploring the socio-educational effects of digital platforms and datafication on child protection in Spanish primary education. The survey targets two key school actors -teachers and families of primary school students- across three autonomous communities (Catalonia, Castilla-La Mancha, and Comunitat Valenciana). Although the ambition is having representativity for as many autonomous communities as possible, at least in these three this would be granted. A defining methodological choice in the instrument's design is its scenario-based structure. Rather than asking respondents to evaluate abstract propositions about technology, the questionnaire presents four situated scenarios grounded in recognisable school contexts: the institutional adoption of an official platform, inequalities in digital access when tasks are sent home, digital communication between teachers and families, and the generation and use of student data by the platform. Within each scenario, respondents are invited to assess their own practices, identify their concerns, and prioritise different values and responsibilities. This design serves a dual function: it captures empirical data on positioning and practice while simultaneously fostering reflexivity among participants, prompting them to articulate their own stance on platformisation and datafication processes that often remain tacit or unexamined. The validation process combined expert review —drawing on specialists in education policy, digital rights, and primary education— with cognitive interviews with teachers and families, and a pilot administration in the two target communities. This process allowed the research team to refine item wording, assess the instrument's sensitivity to professional and social diversity, and evaluate the degree to which the scenario-based format effectively activated critical reflection rather than socially desirable responding. The paper discusses the theoretical and methodological rationale behind the scenario-based approach, including its potential and limitations for studying platformisation and datafication from the perspective of school actors. Concretely, participants respond to grounded vignettes — such as a teacher navigating the adoption of a platform imposed by school administration, or a family confronting requests to consent to their child's data collection — that allow latent tensions to surface through practice-oriented reasoning rather than direct attitude measures. It also reflects on the ethical dimensions of designing a tool that, in the very act of measurement, may contribute to making visible processes —surveillance, data extraction, institutional pressure — that respondents have not previously framed in critical terms. We argue that survey design in this field can itself be understood as a pedagogical and political act, one that places democracy and educational justice not only as objects of study but as values embedded in the research process.

CO-DESIGN AND TECHNOLOGY-MEDIATED PERSONALIZATION: TEACHERS' PARTICIPATION IN THE DEVELOPMENT OF DIGITAL LEARNING STRATEGIES

Rocio Villaroel (Departament de Didàctica i Organització Educativa, Facultat d'Educació, Universitat de Barcelona) · **Juan Francisco Hernández** (Departament de Didàctica i Organització Educativa, Facultat d'Educació, Universitat de Barcelona) · **Carles Lindín** (Departament de Didàctica i Organització Educativa, Facultat d'Educació, Universitat de Barcelona) · **Lluís Parcerisa** (Departament de Didàctica i Organització Educativa, Facultat d'Educació, Universitat de Barcelona)

Personalized learning | co-design | learning analytics; artificial intelligence

In recent decades, educational systems have faced increasing tension between standardized teaching models and the need to address the diversity of students' trajectories, interests, and sociocultural contexts (Matosas López, 2019). In this scenario, personalized learning has emerged as a relevant educational approach aimed at adapting learning experiences to the characteristics, motivations, and needs of learners (Gunawardena et al., 2024). At the same time, digital technologies have expanded the possibilities for designing, implementing, and scaling personalized learning processes through virtual platforms, adaptive systems, learning analytics, and artificial intelligence. Despite these opportunities, literature highlights significant conceptual, pedagogical, and ethical tensions associated with technology-mediated personalization. In many cases, technological proposals reduce personalization to algorithmic adaptation mechanisms detached from strong pedagogical frameworks and the participation of educational actors (Bartolomé et al., 2018; Vanbecelaere & Benton, 2021). This situation has generated concerns regarding the autonomy of learners and the evolving role of teachers in highly technologized learning environments (Salazar et al., 2024). From this perspective, we seek the most relevant strategies to incorporate artificial intelligence and learning analytics in secondary school classrooms. We approach it from a critical perspective on the incorporation of digital technologies in education (Macgilchrist, 2021), as well as from a pedagogical perspective far from techno-solutionism (Morozov, 2013) and the submission of classrooms to the logic of techno-feudalism (Durand, 2020). At the same time, we recognize that several countries have incorporated AI into their curricula (UNESCO, 2023), in a transnational framework that promotes digital teaching competence (Punie, 2017), expanded with AI competence for teachers (Miao & Cukurova, 2024) and students (Miao et al., 2024). We give teachers the role of mediator in the incorporation of educational technology with pedagogical meaning (Puentedura, 2013), with the possibility of designing learning scenarios. In this context, co-design has gained increasing relevance in educational research as a participatory methodology that enables collaborative processes among teachers, students, and other stakeholders in the design of curricula, learning environments, and technological solutions (Westbroek et al., 2019; Zeivots et al., 2024). Codesign emphasizes horizontal collaboration, contextual relevance, and shared ownership of educational innovation. From this perspective, co-design may represent a promising strategy for developing more participatory and pedagogically grounded approaches to technology-mediated personalized learning. This study analyzes the challenges and possibilities that codesign initiatives may represent for strengthening teachers' agency and pedagogical mediation in implementing personalized learning strategies supported by artificial intelligence and learning analytics. The research was conducted in four educational centers where teachers participated in structured co-design processes aimed at developing strategies for personalized learning supported by digital technologies. Three collaborative sessions were planned in which teachers identified pedagogical needs, explored technological possibilities, and designed strategies for personalization within their institutional contexts. Among other findings, the results show tensions regarding the appropriation of the IA and AA by teacher communities. Lack of technical knowledge about the functioning of these digital tools, as well as a perceived lack of clarity in institutional policy and school organization regarding the integration of AI and AA, may explain this scenario.

NEGOTIATING DIGITAL PLATFORMS IN SPANISH PRIMARY EDUCATION: TENSIONS BETWEEN OPERATIONAL EFFICIENCY, PEDAGOGICAL MEANING AND INSTITUTIONAL SOVEREIGNTY

Ezequiel Passeron Kitroser (UNIVERSITAT BARCELONA, Spain)

technology education | plataformization of schools | datification of education

The platformisation and datafication of education are transforming school life not only through policy and infrastructure, but also through the everyday negotiations of school actors. In Spain, these processes have accelerated in primary education through the expansion of corporate digital ecosystems, the increased use of learning platforms and the growing presence of data-driven tools. Far from being a linear or consensual process, digitalisation is experienced in schools as a contested terrain in which leadership teams, ICT coordinators and teachers negotiate responsibilities, meanings, limits and risks. This research, developed within the Digiproted project, analyses the tensions surrounding the adoption and use of digital platforms in a Spanish primary schools. Based on qualitative interviews the study examines how actors justify adaptation to platforms, when and why they negotiate their use, and what tensions emerge between actors and within their professional positions. The analysis focuses on how platforms are embedded in school practices and how their use reconfigures pedagogical authority, labour distribution and institutional decision-making. The findings show that digital platform adoption is often driven less by pedagogical reflection than by organisational and economic rationalities. Platforms such as Google Classroom are valued because they reduce technical maintenance, simplify teacher onboarding and facilitate the management of tasks, materials and feedback. In this sense, platform adoption is linked to efficiency, sustainability and workload reduction. However, this operational logic also produces tensions: greater dependency on external providers, concerns about datafication and profiling, and a partial transfer of institutional control to corporate infrastructures. These concerns are particularly visible in family reservations about privacy and in school actors' awareness of the trade-off between convenience and sovereignty. At the pedagogical level, tensions emerge around autonomy, time and the design of teaching and learning. Some teachers value "empty" platforms because they allow them to choose and organise content freely; others experience them as increasing workload and expect more structured tools. The incorporation of complementary content platforms is often seen as a practical solution when these offer pre-designed sequences and personalised pathways. Yet this also raises a central question: who shapes the learning process—the teacher, the platform, or both? Platformisation thus not only introduces tools into the classroom, but also redistributes pedagogical agency and transforms the conditions under which teachers make curricular decisions. These tensions become even more visible in relation to online research and generative AI. Teachers recognise that students increasingly rely on digital sources and tools such as ChatGPT, while they often feel insufficiently prepared to guide critical uses of information, source verification and AI-supported inquiry. Responses range from prohibition to guided experimentation, but they remain fragmented. A key issue is the lack of collective time and institutional spaces to discuss shared criteria for digital and AI use. In this context, adaptation is frequently reactive rather than strategic. Top-down technology provision, limited school participation in decision-making and uneven training opportunities deepen this dynamic. The Spanish case shows that platformisation in primary education is continuously negotiated through unstable balances between operational efficiency, pedagogical meaning and institutional sovereignty.

AI AND MULTILEVEL LEADERSHIP IN SCHOOL DEVELOPMENT: FROM DISTRICT INITIATIVE TO SCHOOL IMPLEMENTATION

Kristin Børte (University of Bergen, Norway)

School leadership | School development | AI implementation

This paper investigates how local school authorities, understood as school owners and school leaders, initiate and lead the introduction of artificial intelligence (AI) in schools. Digital technologies have been present in schools for decades. However, studies show that school owners and school leaders have limited understanding of what it means to lead in an era shaped by digital technologies (Tømte 2024). AI is rapidly impacting teaching, learning, assessment and school administration. In this context, AI literacy becomes an important leadership competence, referring to leaders' capacity to critically understand, interpret, and govern AI technologies within educational decision-making and school development processes. School leaders therefore play an important role in working out how to introduce AI into their schools, acknowledging its potential benefits and risks (Fullan et al., 2024). The limited research on AI and school leadership and on school leaders' readiness to adopt and implement AI in local school contexts (Adams & Thompson, 2025; Tyson & Sauers, 2021; Wang, 2021) highlights the need to understand how district level school authorities and school leaders organise and lead the implementation of AI in local school contexts across leadership levels. This study adopts a multi-level perspective on leadership and answers the research question: How do district-level authorities and school leaders organise and lead AI implementation in schools and what barriers and enablers are identified for implementing responsible AI in schools? We followed how the work was initiated, organised and led across leadership levels over a period of 1.5 years in one county school district in Norway governing 43 high schools. The study follows the process from the initial mandate to establish a county-based working group for AI in upper secondary schools, through the AI group's work, to the implementation of local school development processes at two upper secondary schools organising professional development for teachers' pedagogical use of AI. Data consist of semi structured interviews with the regional district school director; members of the county AI working group, including five school authority representatives, four AI pedagogues (teachers hired as technology leaders to work 50% of their time in the county AI working group); two high school principals, two department heads; and 2 teachers appointed project leaders for local school professional development at one high school. Preliminary findings show that although a formal mandate guided the establishment of the county AI working group, the purpose and intentions of the initiative were interpreted differently across leadership levels. These differences also extended to understandings of the role of AI in schools. Furthermore, the study reveals variation in how local school development processes and teacher professional development related to AI were organised at the two participating schools. The paper provides new insights into how leadership across governance levels shapes the organisation and implementation of AI in schools. We discuss how AI implementation introduces new forms of data and algorithmic decision-support, raising questions about how school leaders interpret, negotiate, and act on these knowledge resources in organisational decision-making processes.

ARE EDTECH ECOSYSTEMS ENABLERS OF GROWTH? A DEWEYAN PERSPECTIVE ON RECIPROCAL TRANSACTIONS BETWEEN STUDENTS AND DIGITAL ECOSYSTEMS

Rik van Eijk (TU Delft, The Netherlands; AUAS, The Netherlands)

pragmatism | transaction | edtech ecosystems

This contribution centralizes 'the student' and their aims and experiences, by using the pragmatic concept of 'transaction' to research the reciprocal relationship between students and digital educational technology (edtech). Contemporary edtech is part of complex (platform) ecosystems, with embedded platform logics (e.g. datafication) and connection to Big Tech (Van der Vlist, 2022). From a student perspective, 'edtech' includes not only school-initiated technologies but also digital platforms like YouTube and WhatsApp that support learning, communication, and educational logistics (Noteboom, 2025), thereby extending inquiry beyond the educational institution. The ecosystem too provides conceptual room to research student-edtech-relationship as a Darwinian 'struggle' between the many actors (biotic) and artefacts (abiotic), that give and take (Elliott-Graves, 2024). This creates possibilities to connect student perspectives with evolutionary inspired philosophies of technologies that focus on user-technology interactions, dynamics, and reciprocal shaping and being shaped. Fields such as the Niche Construction Theory (Sterelny, 2010) approach a subject always in combination withs it, in which it consider technologies as value-laden, that steers or certain behavior—whether for good or bad. Recently, Dewey's pragmatism has regained renewed attention in these fields as a way to research these complex interactions (Kivinen & Piiroinen, 2020). I argue that Dewey's well-known philosophy of education and his lesser-know philosophy of technology together offer a rich conceptual framework to study students' perspectives and agency amid the ongoing platformisation and datafication of education. His philosophy of education provides a normative lens to assess what constitutes "good" education and what this implies for students. For example on how Deweyan concepts such as inquiry and experience foster growth, and why education in democratic societies should remain open-ended without fixed end-goals (Dewey, 1916). His philosophy of technology enables an analysis of how contemporary edtech–student relationships unfold transactionally within a broader ecosystem of actors and technologies, and whether these dynamics align with educational ideals (Dewey & Bentley, 1960). Together, these perspectives form a normative framework for interpreting and critically examining today's datafied and platformised educational environments. It shift focus from individual entities, such as students or technologies, to the reciprocal transactions that continually shape each other, for better or worse.

DEEPFAKES AS CYBERSECURITY THREATS: WAR NARRATIVES, SOCIAL ENGINEERING AND THE EROSION OF AUDIOVISUAL TRUST

Gerardo Ferrentino (University of Salerno, Italy)

Deepfakes | Cybersecurity | Strategic narratives

This contribution analyses deepfakes not only as tools of information manipulation, but as emerging cybersecurity threats that reshape how war narratives are produced, weaponised and contested in digital environments. It situates synthetic audio and video within broader transformations of contemporary conflict, where informational and cyber domains are increasingly integrated under the rubric of hybrid warfare and information operations. In this perspective, deepfakes become instruments through which state and non-state actors intervene both in strategic interaction with adversaries and in the mediated relationship between citizens, institutions and distant battlefields. In conflict and crisis contexts, the

convergence between narrative manipulation and technical intrusion has direct implications for coercion, signalling and crisis stability, as well as for public understandings of war. Conceptually, the paper is grounded in a constructivist approach to international politics and security. It draws on work on strategic narratives and the social construction of threat, which highlights how meanings of aggression, defence, victimhood and responsibility are produced and stabilised through communicative practices and visual representations. From this perspective, deepfakes are understood as narrative and performative devices that can reframe identities and intentions by credibly simulating leaders' speech and behaviour ("deepfake diplomacy"), thereby affecting recognition, (de)legitimation and the possibility of de-escalation. The paper also engages constructivist research on norms and practices, asking how security communities, platforms and expert networks come to define certain synthetic artefacts as "incidents", "attacks" or "acceptable" uses of AI, and how these classificatory practices contribute to the emergence of shared expectations and informal rules around the use of deepfakes in international and domestic politics. Empirically, the paper adopts a qualitative, multi-case design focusing on episodes where synthetic media has been used or discussed as a tool to impersonate political, military or corporate actors in high-stakes situations (e.g., fake military orders, fabricated emergency messages, fraudulent requests for access) and where these artefacts intersect with war or security narratives, including in the Russia - Ukraine context. Drawing on opensource investigations, academic and policy studies on "deepfake diplomacy" and "deepfakes and international conflict", and industry reports, it maps how such deepfakes are anticipated, produced, disseminated and detected, and how organisations translate them into cybersecurity incidents (e.g., social engineering attacks, compromise of communication channels, integrity breaches. The central research question guiding the analysis is: How do security communities and political actors, understood in constructivist terms, come to frame deepfakes as a distinct cybersecurity threat, and how does this framing reshape the practices, norms and narratives through which war and security are publicly represented?

PLATFORMIZATION AND DATAFICATION IN SPANISH PRIMARY EDUCATION: A COMPARATIVE POLITICAL-INSTITUTIONAL ANALYSIS

Gustavo Herrera Urizar (Universitat de Barcelona (Spain)) · **Pablo Sánchez Antolín** (Universidad de Castilla-La Mancha (Spain)) · **Lluís Parcerisa** (Universitat de Barcelona (Spain)) · **Borja Mateu** (Universitat de València (Spain))

Platformisation | Datafication | Education governance

This paper investigates how the platformization and datafication of primary education in Spain—largely mediated by infrastructures provided by major Big Tech companies—reconfigure educational governance, institutional agency, and everyday experiences in school communities. Grounded in critical perspectives on digital education, platforms are approached as sociotechnical infrastructures embedded in political, economic, and institutional power relations rather than as neutral pedagogical tools (Williamson, 2017; van Dijck et al., 2018). Within this framing, platformization is conceptualized as the reorganization of professional autonomy, data practices, and governance arrangements around logics of standardization, dependency, and infrastructural control (Selwyn, 2019), raising questions about digital sovereignty in public schooling. Methodologically, the study adopts a comparative qualitative design across three autonomous communities—Catalunya, Castilla-La Mancha, and the Comunitat Valenciana. The comparative focus is justified by Spain's decentralized governance of education, which produces territorially differentiated policy instruments, procurement arrangements, and administrative infrastructures. Comparison therefore enables us to specify not simply whether corporate platforms become dominant, but how platformization is institutionally assembled through distinct mechanisms—particularly (a) identity and access

management and (b) device and service provisioning linked to administrative compliance. Empirical material consists of interviews with policymakers and technology-company representatives, as well as interviews and focus groups with school leaders, digital coordinators, teachers, students, and families. Findings show that Google Workspace, Microsoft 365, Google Classroom, Microsoft Teams, and private communication services (e.g., Dinantia) have become integral to school organization and communication, commonly normalized through usability, interoperability, and perceived efficiency. Yet the comparative analysis highlights substantive territorial differences. In the Catalan cases analyzed, institutionally managed accounts and authentication (e.g., domain-based accounts and single sign-on) operating through corporate platforms appear to produce a systemic form of platformization anchored in administrative routines, narrowing the space for locally developed alternatives and reinforcing infrastructural dependency. In the Castilla–La Mancha cases analyzed, the institutional provision of devices and administrative platforms seems to generate a functional duality between bureaucratic compliance and everyday pedagogical practice, intensifying pragmatic teacher adaptations and producing uneven distributions of data-related responsibilities. In the Valencian Community cases analyzed, despite normative controls over application ecosystems and a legacy associated with open-source solutions, Microsoft infrastructures tend to prevail due to perceived stability and security, even as privacy concerns remain explicit. Across cases, we identify a “usability trap," that is, corporate platforms consolidate dominance not only through policy decisions but also through technical integration that establishes de facto standards and marginalizes public or local solutions. The paper argues that platformization and datafication are political-institutional processes that redistribute agency and digital sovereignty, and it calls for stronger democratic deliberation on infrastructure choices and more just data governance in schooling.

PLATFORMISATION AND DATAFICATION IN HYBRID SCHOOLING: RETHINKING GOVERNANCE, INEQUALITY AND DEMOCRATIC AGENCY

Raffaele Sibilio (Università degli Studi di Napoli "Federico II", Italy) · **Angelo Falzarano** (Università degli Studi di Napoli "Federico II", Italy) · **Paola Buonanno** (Università degli Studi di Napoli "Federico II", Italy)

Platformisation · Datafication · Democratic agency

The growing hybridization of educational spaces, where physical classrooms intersect with digital platforms and informal networks, cannot be reduced to a mere technological shift. It reflects broader processes of platformisation and datafication that are reshaping the governance, visibility, and normative foundations of schooling. In this sense, hybrid schooling must be read within longer trajectories of rationalization and social ordering (Durkheim, 1961; Weber, 1978), now rearticulated through networked infrastructures (Castells, 1996) and cultures of convergence (Jenkins, 2006). This article offers a sociological framework that bridges classical theories of social order and rationalization with contemporary analyses of algorithmic governance and digital visibility (Han, 2015). Rather than celebrating or rejecting digital transformation, the paper conceptualizes hybrid schooling as a field structured by three enduring tensions: stability and adaptability, emancipation and control, inclusion and inequality. These tensions resonate with longstanding debates on democracy and education (Dewey, 1916; Biesta, 2013) and with critical analyses of social reproduction and distinction (Bourdieu, 1979). Building on this analytical triad, the article proposes a governance oriented model for hybrid communities grounded in environmental design, critical media literacy (Buckingham, 2003; Rivoltella, 2017), collaboration as a commons (Benkler, 2006), transparent data governance, and plural evaluation metrics. The central argument is that schools can evolve into reflective institutions only if they consciously negotiate the infrastructural power of platforms, preserve protected spaces of opacity, and redistribute decision making authority over data and metrics. By reframing hybrid education as a site where democratic agency and algorithmic governance coexist in tension, the paper contributes to current debates on the platformisation and datafication of education.

DIGITAL PLATFORMS IN EDUCATION: BETWEEN SUPPORT AND WORK INTENSIFICATION FOR TEACHERS

Mercedes Pilar Blanco Navarro (Universitat de Barcelona, Spain) · **Francisco Ramos** (Universidad de Castilla La Mancha) · **Borja Mateu** (Universitat de València)

School Platformization | School Datafication | Teacher Workload

The COVID-19 pandemic catalyzed an unprecedented and rapid expansion of digital platforms within global education systems. This transition often occurred without sufficient critical reflection on its structural implications for pedagogical processes, school data sovereignty, or teacher labor conditions (Díez Gutiérrez, 2021). The Spanish educational landscape reflects this trend; as noted by Rivera et al. (2023), 79.7% of Spanish institutions rely on digital infrastructures provided by Big Tech conglomerates, such as Google, Microsoft, and Amazon, through institutional agreements with regional governments. This systemic dependency has intensified debates surrounding technological sovereignty, datafication, and the reconfiguration of the teaching profession within platform-mediated environments. Post-emergency, these digital tools and their associated practices have become deeply embedded in the institutional fabric of schools. This new normalcy has introduced emerging professional demands, including: (1) the implementation of techno-pedagogical methodologies; (2) the continuous production of digital content; and (3) the oversight of students' digital wellbeing and the prevention of problematic technology use (Blanco Navarro et al., 2025). Transcending purely regulatory or macro-structural analyses, this study explores the opportunities, constraints, and emerging tensions of school digitalization from the subjective perspective of teachers. Understanding these perceptions is vital for designing educational policies and teacher training programs capable of fostering a reflexive and critical response to the challenges of platformization. Methodologically, this research draws on eleven focus groups conducted with primary school teachers across various Spanish regions. This work is part of the second phase of the R&D project Digital platforms and datafication in Spanish primary education: protecting children in a context of educational digitalization (DigiProtEd), funded by the Spanish Ministry of Science, Innovation and Universities (PID2022-137033NA-I00). Utilizing an inductive qualitative analysis, the study systematizes how pedagogical, managerial, and communicative uses of platforms intersect with daily teaching practice. Preliminary findings suggest a dual reality; while platforms enhance communicative immediacy and administrative efficiency, they simultaneously contribute to the "intensification" of teaching labor. This is evidenced by an expansion of working hours, increased bureaucratic burdens, and the expectation of permanent availability, alongside new responsibilities in data curation and digital guardianship.

CONTESTING WAR NARRATIVES FROM THE MARGINS THE ITALIAN PEACE MOVEMENT BETWEEN PLATFORM LOGICS AND INFORMATION DISORDER

Mattia Zunino (Luiss Guido Carli, Italy)

War narratives | peace movement | platform logics

In an era of intensifying geopolitical conflict and the militarisation of European political discourse, peace movements occupy a paradoxical position within contemporary digital communication: structurally marginalised in mainstream media representation, yet among the few collective actors actively contesting the narrative and visual forms through which wars are told — storylines of aggression and defence, figures of victims and heroes, frames of legitimacy and moral necessity. This paper examines the Italian peace movement as a communicative actor challenging dominant war narratives within a media environment shaped by platform logics, information disorder, and the growing presence of synthetic content. Drawing on Gramsci's concept of hegemony and mediatisation theory (Hjarvard, Couldry, Hepp), and situated within debates on information disorder (Wardle & Derakhshan) and connected publics (Boccia Artieri), the research conceptualises the peace movement as a form of collective enunciation operating under conditions of profound communicative asymmetry. The theoretical framework integrates critical discourse analysis (CDA) with attention to platform affordances and algorithmic visibility. Methodologically, the research combines two approaches. The first is a discourse analysis of political speech acts by Italian parliamentary representatives and government officials concerning peace, war, and military support since the Russo-Ukrainian war and the renewed Middle East crisis. This corpus spans parliamentary debates, media appearances, and social media communication across X, TikTok, and Telegram, mapping the rhetorical structures through which war is legitimised and dissent delegitimised — through securitisation, emotional framing, strategic mobilisation of historical memory, and the discursive construction of peace activists as naïve or complicit. The second approach examines the communicative practices of the peace movement itself across digital platforms, analysing how movement actors produce counter-narratives linking pacifism to critiques of NATO militarisation, arms industry interests, and the democratic deficit in foreign policy. Crucially, it investigates how these counter-narratives operate within a digital environment where epistemic conditions are fundamentally altered: as synthetic media and deepfakes increasingly infiltrate conflict coverage — as investigations into AI-generated content during the 2025 India–Pakistan crisis and staged footage in the Russia–Ukraine and Israel–Gaza contexts have shown — the terrain on which peace movements contest dominant framings is itself unstable. The erosion of trust in audiovisual evidence structurally weakens the evidentiary resources available to counter-hegemonic actors who lack institutional authority to anchor their claims within a fragmented information ecosystem. Comparing institutional and movement discourse reveals a profound asymmetry of symbolic power, but also how platform logics generate contradictory effects: algorithmic visibility tends to favour affective framings reinforcing war narratives, yet the same platforms enable episodic moments of counter-narrative resonance. The paper contributes to critical media studies by arguing that the Italian peace movement functions as a liminal communicative space where alternative political subjectivities are constructed at the margins of platformised discursive power — and that understanding this marginality requires attention to the interplay between narrative contestation, information disorder, and the epistemic crisis of democratic deliberation on war in contemporary Europe.

THE SPREAD OF DISINFORMATION AND CONSPIRACY THEORIES ON SOCIAL MEDIA

Achille Paliotta (INAPP and Presidenza Consiglio Ministri (PCM) and IMT Lucca, Italy)

Disinformation and Conspiracy Theories | Social Media | Post-Democracy and Populism

In the midst of the pandemic health crisis, 20 percent of the world public believed that Bill Gates was planning to use COVID-19 to implement a mandatory vaccine program with tracking microchips. Some years back, the QAnon conspiracy spread on social media (SM), claiming that a cabal of cannibalistic pedophiles, Satan worshipers and child traffickers was plotting against President Trump. Current technology and SMs make it possible to reach both larger and more granular communities, to which hybrid methods can be applied. In the digital environment, SMs has become a vital source of information for many, it has also become a source of conspiracy theories (CTs), dis/mis-information (DMI), information operations (IOs), propaganda, narrative wars, hoaxes, psychological operations (PSYOPs), and fake news. Disinformation, including CT, hoaxes, and rumors, propagate on SM just as readily as factual information. In general, CTs, IOs, PSYOPs, and DMIs operations lead to real effects, from indecision about the usefulness of vaccines, to the denial of scientific consensus on the catastrophic effects of global climate change, and to the denial of human rights violations in Ukraine. Trust can be seen as both crucial and a vulnerable target as these operations aims to gain an advantage over adversaries or cause a change in the target group's policy, through a cognitive process. What emerges from this brief introduction is that there is a plexus of concepts, CT, IO, PSYOP, and DMI that are related to a common background, and it is also to be related to that of populism.

Digital Transformation and Democratic Regeneration: The Essential Role of Critical Education in the Age of Algorithmic Capitalism

PANEL CONVENORS: Gilda Morelli (Aurea Studium, Italy); Giacinto Matarazzo (Aurea Studium, Italy); Roberta Nicchiarelli (Aurea Studium, Italy)

PANEL KEYWORDS: education, democracy, digital platforms

The expansion of digital media is profoundly reshaping democratic culture, transforming modes of political participation, collective imaginaries, and the quality of social time. The contemporary information ecosystem exhibits an amphibious character: while it broadens and simplifies access to knowledge—particularly through the growing use of generative artificial intelligence—it simultaneously intensifies disinformation, polarization, and algorithmic profiling. Digital society also produces new forms of discrimination that disproportionately affect women and marginalized groups. Algorithmic biases entrench structural inequalities, while platforms facilitate gender-based harassment and hate speech, making an intersectional analytical approach indispensable for examining how race, gender, class, and sexuality are being reconfigured within digital power relations. These dynamics are closely intertwined with shifts in labour paradigms and the organization of social time. The transition from Fordism to AI-driven economies redefines foundational dichotomies—individual and collective, care time and work time, labour and consumption—that underpin digital capitalism and lie at the heart of the current democratic crisis. Grasping platform logics requires critical reflection on how algorithmic management is transforming work, leisure, consumption, and intergenerational and gender relations, calling for renewed recognition of non-work and creative leisure. Within this context, formal and informal education assume a crucial strategic role. Schools remain essential intermediary spaces for strengthening dialogical democracies. The panel invites contributions on the following themes: • Media education, digital literacy, and democracy • Generative AI, platforms, and educational processes • Intersectional approaches in digital education • Disinformation, polarization, and the cultivation of critical thinking • Labour, social time, and education in the platform economy • Schooling, digital citizenship, and critical education

NARRATING WORK IN THE AGE OF ALGORITHMS: BIOGRAPHIES, TRANSFORMATIVE EDUCATION AND DEMOCRATIC IMAGINATION IN DIGITAL SOCIETY

Domenico Barricelli (Inapp, Italy)

Biographical learning | Transformative education | Digital capitalism

The rapid expansion of digital media ecosystems is profoundly transforming democratic culture, reshaping participation, collective imaginaries and the organisation of social time. Contemporary digital environments display what may be described as an “amphibious” nature: while expanding access to information and knowledge, they also intensify disinformation, polarisation and processes of data extraction and user profiling. Within the framework of platform capitalism, digital infrastructures operate through algorithmic personalisation and engagement maximisation, generating filter bubbles and echo chambers that weaken informational pluralism and the relational foundations of democratic life. From a sociological perspective, these transformations must be interpreted within broader structural changes affecting labour, culture and everyday life. The transition from industrial capitalism to digital platform economies (Srnicek, 2017) contributes to redefining key social dichotomies such as individual versus collective, care time versus work time, and labour versus consumption, reshaping expectations, professional identities and life trajectories. Drawing on critical analyses of surveillance capitalism (Zuboff, 2019), digital infrastructures increasingly operate as mechanisms of social regulation influencing communication processes, subjectivities and democratic participation. Within this scenario of democratic fragility, education emerges as a crucial space for critical reflection and democratic regeneration. Schools and universities represent key intermediary institutions capable of sustaining dialogical forms of democracy by fostering critical awareness of digital power structures. This requires moving beyond a purely instrumental understanding of digital competences and developing pedagogical practices capable of cultivating reflexivity, narrative interpretation and sociological imagination. This paper proposes a transformative pedagogical approach grounded in biographical and narrative methods. The theoretical framework draws on the tradition of sociological imagination (Mills, 1959) and on the methodological contribution of biographical sociology (Ferrarotti, 1981), emphasising the heuristic value of life stories for understanding the relationship between individual trajectories and broader social transformations. Through processes of biographical learning (Alheit, 1994; Mezirow, 1991), students are invited to reflect critically on their experiences of digital life, media practices and representations of work and the future. The paper presents an educational experimentation

based on biographical narrative workshops implemented in higher education contexts. Students engage in autobiographical reflection, narrative writing and collective interpretation of life stories in order to connect personal experiences with broader socio-economic transformations. This pedagogical experimentation draws on the research presented in the book Storie di vita... e di lavoro. Raccontare il lavoro che cambia nell'era digitale (Barricelli, 2026), based on qualitative biographical interviews with professionals from different sectors. The life stories collected in the research are used as narrative resources in teaching activities, enabling students to recognise the connections between personal biographies and structural transformations of digital capitalism. By linking sociological analysis with biographical learning, the paper argues that transformative education can foster critical agency and democratic awareness. Preliminary observations suggest that narrative practices enhance students' reflexive capacities and their ability to connect personal experiences with broader socio-economic transformations, revitalising the sociological imagination in the age of algorithmic capitalism.

AI LITERACY AS DEMOCRATIC EDUCATION: EVIDENCE FROM AN INAIL PILOT STUDY

Pierpaolo Ferrante (INAIL, Italy)

AI literacy | Experiential learning | Democratic participation

While Artificial Intelligence (AI) is rapidly reshaping professional practices and democratic life, meaningful participation in algorithmically mediated societies requires that AI knowledge be accessible also to non-specialists. Beyond technical competence, overcoming the cultural and emotional barriers associated with transformative technologies represents a crucial educational and civic challenge. This contribution presents a pilot experimental methodological approach, developed within an INAIL research workshop, aimed at fostering critical and operational AI literacy through everyday analogies, micro-narratives, and guided interactions with AI tools. All professionals of the Department of Occupational and Environmental Medicine, Epidemiology and Hygiene were invited; 26 expressed interest and 19 participated (94% female; mean age 53; 50% in research or administrative roles). The training module includes: Analogical teaching: artificial neurons, neural networks, weights, and training are introduced through structured analogies with familiar activities (e.g., baking a cake), fostering intuitive comprehension of abstract computational processes. From natural to artificial models: the narrative moves from biological intelligence to artificial neural networks and Large Language Models, presented as probabilistic predictive systems. Visual diagrams and bridging questions support the formation of coherent mental representations and critical awareness of how AI systems operate. Active practice through prompt engineering: after introducing an acronym-based prompt structure, participants engaged in guided experimentation with generative AI, evaluated outputs, and constructed vertical chats to develop foundational operational skills and reflective use. At the conclusion of the workshop, participants completed a structured questionnaire assessing interest and perceived impact. For 94% this was their first AI-focused training experience. All expressed satisfaction with materials and technologies; 86% reported that the content exceeded expectations. Before the workshop, 72% rarely or never used generative AI; afterwards, all participants reported increased interest in AI tools and related initiatives. These preliminary findings suggest that analogy-driven, hands-on, and narratively structured methodologies can reduce cognitive and emotional barriers to AI understanding, contributing to more inclusive and critically informed engagement with algorithmic systems. In this perspective, AI literacy becomes not only a technical competence, but a condition for democratic participation in digitally transformed societies.

LEARNING ARTIFICIAL INTELLIGENCE IN EARLY CHILDHOOD: ALGORITHMIC AND HUMAN AGENCY

Angelamaria De Feo (UNIVERSITA' TELEMATICA PEGASO, Italy) · **Chiara Bellotti** (UNIVERSITA' TELEMATICA PEGASO, Italy)

Artificial Intelligence | Early Childhood Education | Human Agency

Within the platform society, the silent risk arising from the delegation of human decision-making to algorithmic systems manifests itself in a progressive erosion of human agency in relation to the automatism of algorithmic agency. In this context, it becomes essential to cultivate, from early childhood onward, a critical competence oriented toward understanding how algorithms function. Educational robotics, AI platforms, AI-powered toys, and conversational agents represent, from this perspective, privileged pedagogical devices, as they enable children to recognize the algorithmic influences that anticipate and shape action and decision-making processes. This, in turn, supports the protection of those “micro-spaces of attentional autonomy” (Lazzaroli, 2025), which are fundamental for counteracting the risk of algorithmic discrimination. Such a risk may undermine collective memory, which is grounded in democratic ideals and values, thereby contributing to the perpetuation of anti-democratic political and cultural orientations, as well as racist and gender stereotypes. These mechanisms influence the presentation of online information and intersect with anti-democratic and nationalist dynamics aimed at erasing the identities and sovereignty of peoples and nations. Several studies have shown that the data used to train algorithms are shaped by historical constructions and deeply rooted social practices, which contribute to the systematic reproduction of inequalities (Buolamwini & Gebru, 2018; Noble, 2018). Applications such as ChatGPT, for instance, do not allow users to clearly identify the criteria employed in the training process of algorithms, nor to reconstruct the sources from which responses are generated. This limited transparency may foster the reproduction of stereotypes and biases, as well as the phenomenon of so-called “hallucinations”, namely the generation of responses based on an incorrect interpretation of the user’s request. Consequently, the opacity of the processes through which responses are produced makes it difficult to assess their reliability and limits users’ ability to exercise critical oversight over the generated content (Bordogna & Rubbia, 2024). An additional risk is represented by deepfakes—manipulated images and videos that can be used to distort reality and influence public opinion (Balafrej & Dahmane, 2024). Their detection is particularly challenging due to the high degree of realism with which they reproduce faces and voices, thereby constituting a significant threat to information integrity and democratic processes. Adopting a pedagogical approach grounded in experiential and cooperative learning, and acknowledging the educational value of play in early childhood development (Montessori, 1953), this paper aims to critically examine these processes. In doing so, it conceptualizes AI-based educational technologies both as tools for the pedagogical “debugging” of algorithmic automatism and as formative levers for strengthening critical agency within contemporary educational contexts.

MEDIA EDUCATION, COMPLEXITY, AND DISPOSITIF: HOW ALGORITHMIC GOVERNMENTALITY SHAPES USER EXPERIENCE THROUGH DARK DESIGNS, GAMIFICATION AND GRINDING

Christian Gardoni (European University of Rome, Italy)

Media Education | Algorithmic Governmentality | Complexity

Contemporary digital user experience is characterized by acute techno-social opacity. Algorithms determine and exert significant influence over user choices. Media Education Literacy, in its various constructs, focuses on the multiple risks this entails, as well as aiming to counteract power and its ideologies mediated by narrative, messages, and images, and thus its ideologies. However, insights into complexity through the lens of Morin and Foucault's power-knowledge theory are often overlooked, with the risk of investigating and overlooking certain phenomenological issues of user experience. Through Morin's lens, along with Foucault's, and in conjunction with multiple readings of algorithmic governmentality, including Rouvroy's, it is possible to understand how the power of platforms and stacks, as a meta-device no longer of bodies but of the mind, reaches the user well before conveying their messages, situating itself in the systemic opacity of the interface, inducing errors or gestural repetitions, or so-called digital sludges. Specifically, the aim is to trace and reconstruct the connections and processes that systemically link dark patterns, gamification and nudging, fluidity-error and complexity, distraction, grinding and excessive use as the purposes of digital power-knowledge and surveillance capitalism. Finally, it elaborates these visions in light of Slow Media education, a pedagogy of care as a fundamental basis in contemporary educational contexts.

CRITICAL DIGITAL COMPETENCES FOR SOCIAL INTERVENTION: TRAINING SOCIAL EDUCATORS IN THE AGE OF DATA AND AI

Valentina Guerrini (University of Sassari, Italy)

Digital competences | social workers | social inclusion

The digital transformation of contemporary societies is reshaping social institutions, governance mechanisms, and educational practices. In the context of what many scholars describe as algorithmic capitalism, digital technologies—particularly artificial intelligence and data-driven systems—are increasingly embedded in decision-making processes that affect access to rights, services, and opportunities. While these technologies offer unprecedented opportunities for improving social intervention and public policy, they also risk reinforcing inequalities and opaque forms of governance if not accompanied by critical educational frameworks capable of fostering democratic agency and ethical awareness. Within this context, the DIGICARE project (Digital Competences for the Improvement of Social Intervention Actions in Risk of Exclusion Contexts), funded under the Erasmus+ programme, addresses the growing need to strengthen the digital capacities of social intervention professionals working with vulnerable populations. The project responds to a structural gap in the social sector: despite the growing relevance of data management and artificial intelligence in service provision, many third-sector organisations still operate with limited technological resources and insufficient digital training. As a result, social professionals often lack the skills necessary to critically interpret data, evaluate algorithmic outputs, and integrate digital tools into evidence-based intervention strategies. DIGICARE proposes an interdisciplinary approach that combines vocational education and training (VET), social pedagogy, and digital competence frameworks in order to support the development of innovative training resources for educators and practitioners. Through the creation of open educational resources, best practice repositories, and training modules on advanced digital tools applied to social

intervention, the project seeks to foster a new generation of professionals capable of integrating technological innovation with socially responsible and democratically grounded practices. From a theoretical perspective, the project is grounded in critical pedagogy and digital citizenship studies, which emphasise the importance of empowering professionals and communities to critically engage with digital infrastructures. In the age of algorithmic governance, education plays a crucial role not only in transferring technical skills but also in cultivating critical literacy about the social, political, and ethical implications of datafication. For social educators, this implies developing competencies that enable them to interpret complex datasets, evaluate the biases embedded in algorithmic systems, and ensure that technological innovation contributes to social inclusion rather than reproducing exclusionary patterns. The contribution presented in this paper reflects on the DIGICARE experience as a case study illustrating how digital competence development can support democratic regeneration within social intervention practices. By promoting data-driven yet critically informed approaches, the project demonstrates how digital transformation can become an opportunity to strengthen participatory governance, improve the effectiveness of social services, and enhance the capacity of social professionals to address complex forms of marginalisation. Ultimately, the DIGICARE initiative highlights the strategic importance of integrating digital literacy, critical pedagogy, and social innovation within vocational training systems. In doing so, it contributes to a broader European effort to ensure that the digital transition supports not only economic development but also social justice, democratic participation, and inclusive forms of knowledge production.

EDUCATING IN THE PLATFORM SPACE: SCHOOL, DIGITAL CAPITALISM AND CRITICAL RECONSTRUCTION OF THE PUBLIC SPHERE

Giacinto Matarazzo (Aurea Studium, Italy) · **Cosimo Dolente** (Fondazione Ugo Bordoni, Italy)

platform society | media education | digital capitalism

Contemporary digital ecosystems, grounded in economic models based on data extraction and user profiling, are not merely new communication tools but complex socio-technical environments that reshape cognitive processes, forms of social interaction, and the mechanisms through which information gains visibility. Within this framework, the so-called platform society generates new tensions concerning the quality of the public sphere: algorithmic logics of personalization and recommendation tend to reinforce dynamics of polarization, echo chambers, and misinformation, contributing to the fragmentation of informational environments and to the crisis of traditional cultural intermediaries. In this context, schools assume a crucial role as spaces of cultural and democratic mediation. While young people are among the most intensive users of digital technologies and online platforms, technical familiarity with these tools does not necessarily entail a critical understanding of how they operate or of the social, economic, and political implications embedded within them. As a result, practices of digital media consumption often develop within opaque informational environments governed by algorithmic and commercial logics that remain largely invisible to users. The paper addresses these issues through three interconnected sections. The first provides an analysis of the ICT ecosystem, focusing on the economic and cognitive dimensions that characterize digital capitalism. Particular attention is devoted to the different layers that compose this ecosystem: the material bases and physical infrastructures of networks, the invisible digital infrastructures, the services offered by online platforms, the devices used to access the network, and finally the political and regulatory dimension related to governance and sustainability. Within this framework, the paper also examines processes of datafication and user profiling and their potential implications for informational polarization and shared interpretative frameworks. The second section focuses on the social uses of digital platforms, drawing on recent surveys on Italian society. These data provide insights into the diffusion of digital technologies, the time devoted to online activities, patterns

of information consumption, and the transformation of media diets across different age groups. They also offer indications regarding possible effects on trust in institutions, attitudes toward politics and civic engagement, and selected indicators of social and existential distress. The third section connects the empirical findings with the theoretical framework, arguing that in a context marked by the weakening of traditional intermediary institutions, schools represent one of the few remaining institutional spaces capable of fostering critical debate. Digital competences are not spontaneous but require educational pathways making the operational mechanisms of digital platforms visible and promote critical information skills: from source verification to attention management, from awareness of one's digital traces to the ethical implications of producing and circulating online content. From this perspective, the paper reflects on the role of education within the broader context of digital capitalism, examining the relationship between media education, citizenship, and the transformation of the public sphere. Adopting an interdisciplinary approach that combines media studies, sociology of education, and the political economy of digital media, the paper highlights the need to develop forms of critical literacy capable of addressing the power structures, economic models, and governance logics.

Educating with and Against AI: Pedagogical Practices and Algorithmic Infrastructures

PANEL CONVENORS: Leonardo Piromalli (Iref – Istituto di Ricerche Educative e Formative, Italy)

PANEL KEYWORDS: Teaching, Digital, AI

The panel explores the intersections between education and artificial intelligence, focusing on pedagogical practices and algorithmic infrastructures that shape learning, critical thinking, and democratic engagement. Contributions examine the influence of algorithmic bias and AI autocomplete predictions on students' epistemic autonomy, the use of techno-aesthetic experiences as socio-educational practices for sustainability education, and AI as a political infrastructure fostering algorithmic awareness among secondary school teachers in Calabria and Sicily. Further contributions analyze game-based learning initiatives, such as ClickWise, aimed at bridging the AI literacy gap, the role of Rudolf Steiner-inspired digital practices in Switzerland from the 1990s to the present, and the conceptualization of forgiveness in the age of algorithmic foreclosure as a lens for rethinking education for democratic futures. Overall, the panel highlights how critically informed engagement with AI can support pedagogical innovation, social awareness, and the cultivation of responsible, reflective citizenship.

SENSABLE CITIZENS: RUDOLF STEINER AND DIGITAL TECHNOLOGIES IN SWITZERLAND FROM THE 1990S TO THE PRESENT

Sara Kinell (ETH Zurich, Switzerland)

subjectivity | technology | Rudolf Steiner

In the midst of collective experiences of uncertainty and instability, how to educate new generations of citizens has become an increasingly contested question in technological societies. This piece asks how social actors—parents, educators, policymakers, and technologists—problematize the relation between digital technology and educational institutions and the ways in which this relation helps shape the human subject. It traces how these actors collectively respond in attempts to set this relation 'right' and the ways in which their responses reconfigure subjectivity and relationality in technological societies. This presentation builds upon an early version of one of my dissertation chapters, which focuses on how people come together around the educational philosophies and practices of Rudolf Steiner in efforts to make the social and technological conditions of subject formation through conventional forms of schooling into a concern worthy of public attention. This chapter traces how people committed to Steiner's pedagogy in Switzerland responded to the advent of the internet in the 1990s, the widespread use of mobile phones in the 2000s, the introduction of smartphones in the 2010s, and to the emergence of generative artificial intelligence in the 2020s. This piece contributes to this panel discussion by attending at once to the novelty of the mutual formation between algorithmic environments and the human subject, and to historical trajectories that have helped give the contemporary societal fabric its form. It aims to open avenues for continued and deepened dialogue between scholarship in Science, Technology, and Society (STS), history and philosophy of education. This piece brings together, on the one hand, a leading edge of scholarship in STS which builds upon and extends the Latourian notion of constitution (Latour [1991] 1993) and theories on bioconstitutionalism (Jasanoff 2003, 2011) to characterize constitutions of the human with science and technology in modern societies (Sunder Rajan 2011; Laurent 2017, 2024, 2025; Boenig-Liptsin 2024; Boenig-Liptsin and West Bassoff forthcoming). On the other hand, this text complements historical and contemporary accounts of education and technology by—in a dual sense—bringing 'and' back to life. It extends historical accounts of education technology (Cain 2021; Watters 2021; Flury and Geiss 2023; Trumbore 2025) by focusing on the lived experience of ordinary people, attending to the changing conditions of teaching, learning, and living with digital technologies as they were experienced by social actors committed to the educational philosophy and practice of Rudolf Steiner. Whereas earlier scholarship primarily focused on how technological artifacts entered the classroom, my project understands technology as social relations (Haraway 1997), as sets of techniques, practices, and epistemologies that are constitutive of ways of life (Latour 1987). Understood in this way, this chapter traces relations between education and technology in ways which extend histories of education technology (see also

Boenig-Liptsin forthcoming) by engaging ethnographic and historical source materials, privileging the situated experience of people living in particular social, cultural, political, and historical contexts, and by drawing on key theories and methods in social constructionism and phenomenology.

THE INFLUENCE OF ALGORITHMIC BIAS AND AUTOCOMPLETE PREDICTIONS OF AI SYSTEMS IN EDUCATION (AIED) ON CRITICAL THINKING AND STUDENTS' EPISTEMIC AUTONOMY

Agnese Addone (Lab. Informatica&Scuola CINI, Rome, Italy; Institute for Globally Distributed Open Research and Education (IGDORE), Rome, Italy) · **Pietro Boccadoro** (IEEE member, Bari, Italy; Nextome srl, Bari, Italy)

AI | STEM Education | Critical Thinking

This study investigates the relationship between human agency and Artificial In- telligence (AI) systems, focusing on Artificial Intelligence in Education (AIED) dynamics and the growing crisis of technological integrity. As generative tools become part of everyday life, a significant threat to independent thinking arises from the hidden biases within autocomplete predictions ([8, 9]). These suggestions are the real-time word or phrase hints provided by an AI as a user types. Far from being neutral aids, they are weighted by the biases of their underlying training data. In education, AI may systematically steer students toward specific cultural perspectives, gender stereotypes, or Western- centric worldviews ([1]). When interacting with these systems, learners encounter a subtle but persis- tent form of algorithmic nudging, leading to subconscious adoption of both the logic and lexicon of these biased suggestions. This gradually reshapes a student's original intent, presenting a critical challenge for educators: ensuring that the AI does not lead to standardized thinking, nudging the next generation towards biased, polarized or ethically compromised worldviews ([4, 5, 6]). Given the recent geopolitical landscape, the integration of Large Language Model (LLM)s into national defense infrastructures and the resulting regulatory pressures on private AI labs, (e.g., the "supply chain risk" designation of entities resisting military dealignment). this study analyses the socio-pedagogical impact of autocomplete bias. As training datasets may move toward a "war-centric" ori- entation, the predictive nature of AI may cease to be a neutral utility, and may be a vehicle for cognitive heteronomy ([2, 7]). The analysis identifies three vectors of technological misuse and their impact on the educational landscape: • Dangerous Data Polarization and the Martial Shift: With given opti- mizations, a martial bias turns creative tools into devices for normalized conflict. These algorithms trap students into narrow, reactive thought echochambers. • From Surveillance to Cognitive Homogenization: The black-box implemen- tation of predictive analytics for student grading and the deployment of invasive biometric surveillance in schools are often framed as optimization. Learners are considered as data points to be managed rather than subjects to be nurtured. • Restoring the Ethical Covenant in Pedagogy: The educational stakehold- ers cannot effectively engage with tools appearing clandestine vehicles

for state propaganda or militarized logic. The paper posits that trustworthy and ethical AI is actually a pedagogical requirement for democracy. In conclusion, this work advocates for a Sovereign Ethical AI in Education, denouncing the risk of tools that may transform into silent devices for martial indoctrination ([3]). It also calls for schools to become sites of Critical AI Literacy, where polarized biases of modern technology are deconstructed. The transparency and ethical non-negotiability demand can ensure that technology remains an instrument for human flourishing, rather than a silent and polarized architect.

TRANSCALARITY AND AI: THE TECHNO-AESTHETIC EXPERIENCE AS A SOCIO-EDUCATIONAL PRACTICE FOR SUSTAINABILITY EDUCATION

Emanuela Guarcello (University of Turin, Italy) · **Adelaide Gallina** (University of Turin, Italy) · **Cristina Scarpocchi** (University of Turin, Italy) · **Antonio Falco** (University of Turin, Italy) · **Giorgio Borla** (University of Turin, Italy)

Education | Sustainability | Transcalarity

From work to everyday life, AI profoundly transforms processes and social relationships in ways that we are only beginning to understand. Human interactions, economic structures, and even decision-making processes are undergoing an unprecedented metamorphosis. With the rapid growth and diffusion of Artificial Intelligence technologies, many countries have recognized the importance of developing a specific national strategy aimed at promoting the effective, regulated, and sustainable adoption of these technologies. With particular regard to sustainability, the concept of transcalarity can represent a meaningful interpretative key for understanding how sustainability education from a transcalar perspective may foster the ability to recognize connections, interdependencies, and the consequences of choices made by individuals regarding AI, as well as by collective actors within complex systems. Indeed, AI operates

simultaneously across multiple levels: (i) Global: shaping information dynamics, technological infrastructures, and the scientific capacities needed to address sustainability challenges (climate, biodiversity, food security); (ii) National and institutional: influencing educational policies, school curricula, and investments in digital skills; (iii) Local and community: supporting participatory processes, environmental data management, and local monitoring tools; (iv) Individual: affecting the ways in which learners study, contributing to the development of critical thinking, and shaping the relationship between individuals and technology. Within this perspective, the paper aims to present and discuss the structural elements and the main educational outcomes of a new socio-educational practice designed to promote sustainability education in relation to the use of AI: the semi-immersive techno-aesthetic experience. This experience was developed within the international research project CairƐ (2023–2026), launched in partnership with Middlesex University London and West University of Timișoara. The techno-aesthetic experience has been tested with approximately 450 children in Grades 4 and 5 of primary school. The experience allows children, working in small groups, to "enter" an aesthetic virtual environment (a "painting") created in 3D and accessed using sensor-equipped goggles and a joystick. The environment is specifically designed around the theme of Gaia Earth and presents two different virtual spaces: a mountain and its surrounding natural habitat (external environment) and, at a second level, the cave inside the mountain (internal environment). Children explore the environment in order to search for clues related to the theme of sustainability and discuss their transscalar implications in groups (external environment), and to reflect on the specific relationship between transscalar sustainability and AI (internal environment). This reflection is also carried out through interaction with a humanoid robot integrated with AI.

ARTIFICIAL INTELLIGENCE AS POLITICAL INFRASTRUCTURE: DEMOCRATIC EDUCATION AND ALGORITHMIC AWARENESS AMONG SECONDARY SCHOOL TEACHERS BETWEEN CALABRIA AND SICILY

Paolo Siclari (Pedagogista ed Educatore professionale)

democracy education AI

The growing geopolitical disorder, characterized by the fragmentation of the information ecosystem and the progressive platformization of the public sphere, has profoundly redefined the conditions of possibility for democracy. As Habermas observed in his analysis of the structural transformation of the public sphere (Habermas, 1962), changes in communication technologies directly affect the forms of democratic deliberation. Today, artificial intelligence, while constituting an enabling technology, also represents a true epistemic and political infrastructure that shapes the formation of public opinion and the deliberative processes of individuals. From this perspective, AI cannot be interpreted merely as a tool; rather, it should be understood as a socio-technical device capable of organizing the relationship between knowledge, power, and the governance of information (Floridi, 2017). The structural transformation of the res publica now assumes a global dimension, within which AI contributes to redefining the boundaries of public information. In this context, education, as a foundation of democracy and a space for the formation of public intelligence, calls for a reconsideration of

educational practices in light of digital tools that mediate knowledge, opinion, and participation (Panciroli & Rivoltella, 2023). Consequently, there is a need to develop forms of algorithmic literacy and critical awareness of communication systems that today organize access to information and orient - more or less implicitly - the cognitive and decision-making processes of citizens (Beer, 2017). Starting from these epistemological premises, this contribution presents an exploratory quantitative descriptive study conducted through a questionnaire administered to a sample of secondary school teachers in Calabria and Sicily. The study analyzes teachers' level of awareness regarding the functioning of algorithms and artificial intelligence systems, the perceived effects of disinformation within the educational environment, and the emerging practices of critically integrating AI into teaching. The objective is twofold: on the one hand, to understand the degree of preparedness among teachers with respect to the transformations introduced by AI; on the other, to identify possible directions for the development of a democratic pedagogy of the algorithm, capable of integrating digital competencies, critical thinking, and civic responsibility into students' education.

FORGIVENESS IN THE AGE OF ALGORITHMIC FORECLOSURE: RETHINKING EDUCATION FOR DEMOCRATIC FUTURES

Mario Di Paolantonio (York Univesity, Toronto, Canada)

algorithmic subjectification | the ethics of forgiveness and forgetting | digital capitalism

This paper aligns with the panel "Opacity, Subjectivity, and Pedagogy in Algorithmic Times" by examining how informational capitalism and algorithmic authority reshape conditions for trust, legitimacy, and sense-making among young people. Education, long entrusted with cultivating interpretative capacities and intergenerational connection critical to democratic subjectivity, now confronts chronopathologies that are eroding its very foundations.[i] Today's youth inhabit an unforgiving digital environment where interiority (attention, affect, desire) is converted into data, and their past is never permitted to fade.[ii] Social media platforms, driven by profit motives, construct a "digital unconscious" that archives every action in an endless loop, making forgetting and forgiveness increasingly arduous. While forgetting and forgiving are distinct –one can forgive without forgetting and forget without forgiving – the "digital unconscious" undermines both by trapping individuals in cycles of hyper-transparency and moralization, where every move is subject to scrutiny and social-judgement. For young people, this means fewer opportunities to reimagine themselves beyond their past actions or engage in the interpretive acts required for repair and renewal.[iii] These capacities are essential not only for individual formation but for cultivating democratic sensitivities (patience, interpretative generosity, tolerance for opacity, openness to otherness) upon which collective-convivial life depends. However, their erosion exposes fissures in institutional legitimacy. In an environment where algorithms immortalize missteps and intensify provocations, how can educational institutions sustain trust, forgiveness, and the possibility of beginning again? Under such conditions, education's role as a place for experimentation, failure, and renewal is squandered, threatening the very cultivation of sensibilities that make democratic life imaginable in the first place. Yet education retains a crucial "reparative potential." Drawing on an educational archive that includes notions such as skole, studium vs. acedia, and intellectus vs. ratio, this paper explores alternative temporalities to counteract the accelerating, punitive chronopathologies of digital life. These vocabularies, the paper proposes, help articulate how classrooms can cultivate the conditions necessary for forgiveness: interpretive generosity, symbolic room for error, and the temporal distance required to see oneself and others anew. Informed by thinkers like Hannah Arendt and Julia Kristeva's work on "forgiveness," this examination highlights the importance of rethinking forgiveness in light of digital realities.[iv] Additionally, by engaging with Mark Fisher's ideas on attending to "the strange, the unexpected, the weird, and obscured,"[v] this paper argues that education must create spaces for imaginative and ethical possibilities in an age of algorithmic foreclosure and the tyranny of transparency.[vi] By fostering experiences that exceed the logic of "total recall," the educational in education can help young people recover capacity to orient themselves toward ambiguity, renewal, generosity and relational repair. Ultimately, the paper argues that nurturing these

capacities is indispensable for rebuilding trust and sensibilities required for democratic life in an age when both education and democracy are being rendered increasingly senseless and hapless. Education remains one of the last institutions capable of cultivating the interpretative, temporal, and ethical resources necessary for democratic futures in which forgiveness, and thus genuine new beginnings, remain possible.

Pedagogies of Wellbeing: Self-Regulation, Inclusion and Learning in Diverse Educational Contexts

PANEL CONVENORS: Letizia Zampino (University of Trento, Italy)

PANEL KEYWORDS: Self-Regulation, Inclusion, Learning

The panel explores pedagogies of wellbeing, self-regulation, and inclusion, examining how diverse educational contexts can foster holistic learning and support for all students. Contributions address a range of topics: the role of special pedagogy in responding to future challenges, poetry therapy as a convivial pedagogical practice promoting autonomy, bias awareness, and democratic plurality in the age of AI, and music therapy interventions to enhance self-regulation and learning for youths with autism, SLD, ADHD, and other special educational needs. Further contributions analyze the accessibility of school buildings in Italy through a longitudinal study of architectural barriers from 2020 to 2025, practices of subjectivation and democratic learning in digital mental health narratives beyond the "clinical case," and the redesign of school-to-work transition programs for students with disabilities, highlighting inclusive approaches to adult life preparation. Overall, the panel emphasizes the potential of wellbeing-centered pedagogies to promote inclusion, agency, and transformative learning across educational settings.

MUSIC AS A TOOL FOR SELF-REGULATION AND LEARNING: A MUSIC THERAPY RESEARCH-INTERVENTION FOR YOUTHS WITH AUTISM, SLD, ADHD, AND SEN

Gabriella Aleandri (Roma Tre University, Italy) · **Samira Paradiso** (External collaborator)

Music therapy | Disability | Inclusion

Neurodevelopmental disorders and Special Educational Needs (SEN) consist in a complex framework characterised by marked functional heterogeneity, behavioural variability, and the clinical necessity for highly personalised educational and rehabilitative approaches. Children and adolescents with Specific Learning Disorders (SLD), Attention-Deficit/Hyperactivity Disorder (ADHD), and Autism Spectrum Disorder (ASD) frequently exhibit deficits in sustained attention, emotional regulation, impulse control, and social participation. Those factors negatively impact academic courses, the quality of interpersonal relationships, and overall psychophysical well-being. Within such a scenario, music therapy proves to be a privileged pedagogical intervention strategy, capable of simultaneously activating cognitive, emotional, and relational processes due to its intrinsically accessible and integrated nature. The proposed musical activities—specifically clinical improvisation, sonorous dialogue, shared listening, and the structured use of rhythm—stimulate complex neural circuits involved in self-regulation, interpersonal synchronization, working memory, and selective attention. The non-verbal characteristic of music further facilitates the activation of alternative and spontaneous forms of communication, proving particularly effective for neurodivergent profiles. The study analyses the impact of a research-intervention protocol consisting of eight sessions (individual or small group) conducted on a sample of ten participants, aged between 5 and 20 years, with diagnoses of SLD, ADHD, ASD, or other certified and non-certified forms of SEN. The research adopts a mixed-methods approach, integrating quantitative tools, such as assessment scales and observation grids, with qualitative

instruments including the music therapist's clinical diaries, semi-structured interviews with parents, and thematic analysis of direct observations. In this paper we will present some preliminary findings. The primary objectives aim to evaluate the effectiveness of the treatment in improving attentional skills, emotional self-regulation, and social participation. Secondarily, the study investigates how improvisation and sonorous dialogue can act as catalysts for communication and cooperation. A distinctive element of this work is the inclusion of the family perspective to monitor the transferability of changes emerged in the musical setting to daily and school life. Finally, the study proposes an integrated operational model that combines music therapy, educational psychology, and special pedagogy. The intent is to expand the empirical evidence on the use of music in the psycho-educational field, offering theoretical and practical contributions for the creation of replicable, evidence-based protocols to support the development of individuals with neurodevelopmental disorders.

POETRY THERAPY AS CONVIVIAL PEDAGOGY IN THE AGE OF AI: AUTONOMY, BIAS AWARENESS, AND DEMOCRATIC PLURALITY

Dimitri Ruggeri (Independent Researcher, Italy)

Poetry Therapy | Convivial Pedagogies | AI Ethics

This panel explores poetry therapy as a form of convivial and non-directive pedagogy capable of sustaining autonomy, ethical self-formation, and democratic plurality in educational contexts increasingly shaped by artificial intelligence. Drawing on Ivan Illich's Tools for Conviviality and Paulo Freire's Pedagogy of Autonomy, the panel frames poetic and expressive practices as counter-hegemonic educational tools that resist epistemic homogenization, affective standardization, and predictive normalization. The panel challenges the assumption that AI is a neutral educational tool. Instead, it conceptualizes AI as a socio-technical agency whose computational logics shape language, cognition, and emotional expression. In educational settings, the integration of generative AI raises critical questions about linguistic autonomy, authorship, and the automation of meaning-making. Poetry therapy is proposed as a pedagogical and ethical response to these challenges, offering a way to preserve human agency and creative plurality in learning. Poetry therapy involves non-directive practices such as free writing, reflective reading, collective poem-making, and dialogical interpretation. These activities encourage learners to explore personal and collective meanings through language that resists quantification and algorithmic optimization. For example, a classroom exercise might invite students to write a poem about their experience of AI in daily life, then discuss how different metaphors reveal diverse perspectives. Another practice could involve co-creating a poem as a group, emphasizing listening, negotiation, and shared authorship rather than standardized outcomes. In university settings, reflective poetry journals can support students in articulating ethical dilemmas related to AI, data privacy, and digital surveillance. These practices privilege ambiguity, metaphor, and narrative plurality, fostering critical awareness of both cognitive and algorithmic bias. They also strengthen learners' capacity for reflective judgment and dialogical responsibility, as students are encouraged to interpret, challenge, and respond to each other's expressions rather than merely producing correct answers. This aligns with Freirean notions of conscientização, where education becomes a process of critical consciousness and moral agency. The panel further considers poetry therapy as an ethical-political pedagogy that can be integrated into institutional curricula. It discusses how schools and universities might

implement poetry-based modules to support emotional literacy, resilience, and democratic participation, countering educational models focused primarily on efficiency, prediction, and control. For instance, poetry therapy can be used in teacher education programs to develop reflective practice, or in digital literacy courses to foster critical engagement with AI-generated content. Interdisciplinary in scope, the panel brings together perspectives from philosophy of education, expressive arts therapy, critical AI studies, and media ethics. Ultimately, it asks how poetry-based pedagogies might contribute to reconfiguring AI from an apparatus of normalization into a convivial partner, capable of sustaining autonomy, plural reasoning, and non-homogenized educational experience.

ACCESSIBILITY OF SCHOOL BUILDINGS IN ITALY: A LONGITUDINAL ANALYSIS OF ARCHITECTURAL BARRIERS FROM 2020 TO 2025

Giulio Lucentini (University of Macerata, Italy; Sapienza Università di Roma) · **Giada Viotti** (Università degli Studi Roma Tre)

architectural barriers | school buildings | educational inclusion

This study examines the diffusion of architectural barrier removal measures in Italian school buildings over five school years, from 2020-2021 to 2024-2025, using open data collected by local authorities and made available through the Italian Ministry of Education portal. The legal framework requiring local authorities to ensure the accessibility of school buildings has been in place since Law No. 23 of 11 January 1996, yet the actual degree of compliance across the national territory has rarely been examined systematically over time. The dataset covers individual school buildings nationwide and includes information on school type and geographic location at regional, provincial and municipal level. Each building is classified according to whether accessibility measures are in place, allowing for both cross-sectional and longitudinal comparisons. The analysis adopts a descriptive approach to map the distribution and temporal evolution of these measures across different school levels, from kindergarten to upper secondary education. A core focus of the study is the identification of persistent geographic disparities, examining whether certain regions or municipalities consistently show lower rates of accessible buildings over the observation period. Differences across school types are also explored, as infrastructure characteristics and ownership arrangements may vary considerably between levels of education. In addition, buildings with "not defined" accessibility information are explicitly incorporated into the analysis. Rather than being excluded as simple missing data, their non-response is considered analytically relevant, especially given its concentration in specific segments of the school building stock, thereby enriching the overall national picture. Results describe how the share of accessible buildings has evolved over time, which school types and regions lag furthest behind, and where data coverage remains incomplete, offering a systematic overview of a dimension of school infrastructure that is central to inclusive education.

THE INDIVIDUAL BEYOND THE "CLINICAL CASE": PRACTICES OF SUBJECTIVATION AND DEMOCRACY OF LEARNING IN DIGITAL MENTAL HEALTH NARRATIVES

Laura Di Passio (La Sapienza University of Rome, Italy)

New practices of active citizenship | process of subjectivation | spatial re-figuration

Democracy requires that all voices possess citizenship. Yet, in the field of mental health, since the 17th century, medical knowledge has held an interpretive monopoly over the social experience of mental distress (Foucault, 1961; Goffman, 1961). This proposal analyzes how the figures of bloggers who disclose their mental health status on social media platforms break this hegemony, positioning themselves as "experts by experience" (Rose, 1996; 1999), capable of restoring cognitive and transformative value to subjective lived experience. In these spaces of “democracy of learning” (Freire, 1970), the individual transits from object (“clinical case”) to narrating subject through processes of subjectivation (Dubet, 1994; Rose, 1999) and new forms of democratic citizenship, passing through the effects of digitalization on mental health (Illouz, 2012). Integrating the Re-figuration of Space (Löw, 2001; 2022), the Sociology of Experience (Dubet, 1994), and the Politics of Subjectivation (Rose, 1996; 1999), the contribute explores how users practice active citizenship by reclaiming their experience, conquering their own spaces of listening and representation, and partially redefining treatment practices. The empirical research, based on a digital ethnography of 70 social profiles and 30 in-depth interviews, examines how the tactics of social actors intersect with institutional strategies (de Certeau, 1980), focusing on the co-production of knowledge and affective practices (Slaby & von Scheve, 2019). This research highlights, therefore, how media self-exposure is not merely an empowerment strategy, but a practice of knowledge production that challenges stigma, transforming digital technologies into tools for emancipation and the restoration of agency (Rebughini, 2014). In conclusion, the study investigates the transformation of the psychiatric patient into a digital narrating subject, analyzing how self-narration on social media configures, emphasizing the valorization of subjective voices as essential partners in the design of clinical services and the fight against discrimination.

BEYOND THE SCHOOL GATE: RETHINKING THE TRANSITION TO ADULT LIFE FOR STUDENTS WITH DISABILITIES THROUGH SCHOOL–WORK ALTERNATION PROGRAMMES

Veronica Berni (Università di Milano - Bicocca, Italy) · **Monica Facciocchi** (Università di Milano - Bicocca, Italy)

Disability studies | school-to-work transition | educational inequalities

In recent decades, disability studies have emphasised that disability cannot be understood merely as an individual condition, but as the outcome of social, institutional, and cultural factors that produce inequality (Medeghini, 2015). From this perspective, people with disabilities can be considered a social group subject to structural oppression (Thomas, 2007; 2024), generated by systems of beliefs, practices, and institutions that implicitly define who is fully entitled to social participation (Allen, 2005). As Campbell (2009) argues, these processes are underpinned by ableism: norms and expectations that construct an implicit ideal of ability and productivity. These tensions are particularly evident in the transition from school to work for students with disabilities. They emerge through classification systems, organisational practices, and institutional expectations that structure educational trajectories in differential ways (Friso, 2017). Although inclusion policies have broadened access to education, the transition to adulthood and entry into the labour market remains one of the most vulnerable stages and among the least investigated by research (Traina et al., 2022). In this context, the Pathways for Transversal Skills and Guidance (PCTO) were introduced into the Italian school system to promote situated learning experiences and vocational guidance. However, recent studies (Pagani et al., 2025) highlight that their educational value depends on the quality of host contexts, student engagement, and the role of stakeholders shaping learning experiences. This report presents preliminary results of an action research project conducted within “PCTO: a support

system for students with disabilities", implemented in the Milan metropolitan area and promoted within the EMERGO programme. The project aims to support school-to-work transition processes for young people with disabilities through guidance and mediation between schools, families, and workplaces. The research investigates how work placement experiences during upper secondary school contribute to the development of life projects and future expectations among students with disabilities (Tino & Ruzzante, 2016), and which conditions facilitate or hinder the educational potential of PCTO. The study was conducted at the Milan branch of the Enaip Foundation. The research design adopts a qualitative approach based on narrative and semi-structured interviews with students with disabilities, parents, educators, curricular and special education teachers, and school representatives for inclusion and PCTO. Including multiple perspectives enables identification of convergences and dissonances between experiences, supporting data triangulation that enriches understanding of educational processes and relational dynamics. Data are analysed through reflective-interpretative thematic analysis (Braun & Clarke, 2022), aimed at identifying emerging patterns, shared meanings, and interpretative differences among participants. Preliminary findings show that PCTOs can represent meaningful contexts of learning and recognition, where students experience participation and skill development difficult to achieve in traditional school settings. At the same time, the analysis highlights challenges related to the discontinuity of experiences, the quality of work contexts, and the need for mediation between schools, families, companies, and local services. Overall, these results suggest that the inclusive potential of PCTOs lies not simply in access to work experience, but in the possibility of creating relational learning contexts capable of redefining participation and supporting transitions to adult life. .

Digital Culture, Knowledge and Democracy

PANEL CONVENORS: Giovanni Brancato (Sapienza University of Rome, Italy)

PANEL KEYWORDS: Digital Culture, Knowledge, Democracy

The panel explores the intersections of digital culture, knowledge, and democracy, examining how digital technologies, media practices, and socio-psychological processes shape participation, inclusion, and civic engagement. Contributions address diverse themes: the dynamics of affective fandom and their implications for democratic stability in European digital politics; systematic and bibliometric analyses of social sciences approaches to conspiracy interpretation; and critiques of how capitalist structures have eroded sensorial engagement and weakened democratic practices. Further contributions investigate the use of generative AI and digital storytelling to develop AI literacy among undergraduate students, the role of digital and virtual technologies in fostering inclusion in sports education, and the application of self-regulation, motivational design, and game-based contexts to promote wellbeing and human flourishing. Overall, the panel highlights how digital and technological practices can both challenge and enhance democratic knowledge, participation, and agency.

AFFECTIVE FANDOM DYNAMICS AND DEMOCRATIC STABILITY IN EUROPEAN DIGITAL POLITICS

Elena Varotto (UCAM UNIVERSITY/SISP MEMBER, Italy)

MEDIA SOCIALMEDIA DIGITAL

Affective Fandom Dynamics and Democratic Stability in European Digital Politics Elena VAROTTO Universidad Católica de Murcia (UCAM) Abstract (This paper develops the notion of fanatic politics to describe an expanding mode of political engagement shaped by platform architectures, affective identification, and the cultural grammars of fandom. In contemporary digital ecosystems, political leaders and parties are increasingly consumed as symbolic brands, while policy debates are reframed through aestheticized storytelling, emotional intensification, and algorithmic amplification. Drawing on mediatization theory (Strömbäck 2008; Couldry & Hepp 2017), affective polarization research (Iyengar et al. 2019; Huddy et al. 2015), and fandom studies (Jenkins 2006; Sandvoss 2013), the paper argues that political participation is progressively reconfigured as a form of affective consumption rather than deliberative engagement. The central research question is: How does the fan-driven transformation of politics reshape economic priorities and democratic resilience within European political systems? To address this question, the paper employs a qualitative, multi-layered methodology combining frame analysis, narrative reconstruction, and visual-aesthetic coding. It examines how political actors mobilize symbolic repertoires, emotional grammars, and platform-specific aesthetics across Instagram, TikTok, and Telegram. Particular attention is devoted to the construction of polarizing dichotomies, the personalization of conflict, and the conversion of political identity into a form of digital belonging. Through case studies from Italy and Spain, the analysis shows how fan-oriented narratives—such as anti-taxation frames surrounding property levies or crisis-centered energy discourses—can influence fiscal debates, redirect political attention, and weaken long-term industrial strategies. These dynamics are situated within broader debates on platform governance (Gillespie 2018; van Dijck, Poell & de Waal 2018), digital capitalism (Fuchs 2014; Zuboff 2019), and geopolitical vulnerabilities, including European dependencies on private data-analytics infrastructures, cyber-security incidents, and the democratic implications of algorithmic opacity. Pedro Sánchez's recent call for greater transparency in algorithmic decision-making provides an institutional anchor for discussing democratic stability under conditions of platform power. The paper contributes to digital politics scholarship in three main ways. First, it conceptualizes fanatic politics as a hybrid formation integrating affective, aesthetic, and algorithmic dimensions of political communication. Second, it demonstrates how fan-based political narratives can shape economic policy agendas, generating distortions that privilege short-term symbolic gains over long-term strategic planning. Third, it proposes an analytical framework for assessing the vulnerabilities of democratic systems exposed to platform-mediated polarization, emphasizing the need for institutional mechanisms capable of counterbalancing the emotional and economic pressures produced by digital fandoms. Keywords fanatic politics; affective polarization; digital platforms; political communication; democratic resilience References Couldry, N., & Hepp, A. (2017). The Mediated Construction of Reality. INTERPRETING CONSPIRACY: A SYSTEMATIC AND BIBLIOMETRIC ANALYSIS OF SOCIAL SCIENCES APPROACHES

Maurizio Cavaliere (University of Salerno, Italy) · **Elisa Musto** (University of Salerno, Italy)

conspiracism literature analysis biases

Since the mid-twentieth century, conspiracism has been predominantly interpreted within the social sciences through pathologizing paradigms, which have tended to frame it in implicitly or explicitly negative terms. From the early 2000s onward, several scholars have begun to challenge these approaches, drawing attention to their potential political weaponization and questioning the axiological neutrality of literature. Nevertheless, systematic reflection on these underlying assumptions remains limited and fragmented, potentially contributing to the reproduction of misinterpretations in subsequent research. This study aims to provide a historical and comparative analysis of the social scientific literature on conspiracism to assess whether, and to what extent, the phenomenon has been shaped by pre-existing axiological orientations that have constrained its analytical understanding. This has limited the possibility of scholars proposing critical instruments aimed at recognizing conspiracy thinking as an inter-partitical tool for gaining electoral consent in politics. The guiding hypothesis is that a substantial portion of literature has constructed ideal-typical models of conspiracism based on non-essential characteristics of the phenomenon, selectively emphasized through value judgments antecedent to empirical observation. This process may have contributed to the crystallization of predominantly negative paradigms and to their systematic association with other similarly stereotyped phenomena, such as populism. Our primary goal is to reconstruct the main interpretive paradigms that have emerged since the publication of “The Paranoid Style in American Politics” (Hofstadter, 1965), a proper milestone of the above-mentioned negative approach to conspiracism in social science. More specifically, we aim to identify their theoretical, disciplinary, and geographical foundations, and (if any) the consequent presence and persistence of evaluative biases in literature. Methodologically, the study adopts a quantitative approach based on a bibliometric analysis of papers in English and Italian produced in Europe and the United States. Using Bibliometrix, co-word and co-citation analyses will be conducted on datasets extracted from social science databases to identify recurring conceptual associations and dominant interpretative frameworks, as well as the most influential epistemic communities, references, and schools of thought. Further articulation of the analysis on a longitudinal and geographical basis, through the organisation of data into time intervals and geographical areas, will capture the phases of research development and conceptual evolution over time, identify regional clusters, and enable systematic comparison between regional normative and interpretative orientations. The expected outcomes include the identification of recurring theoretical approaches and evaluative elements that can be interpreted as structural biases. The study introduces analytical frameworks designed to provide guidance and critical tools for analysing bibliographic production, to strengthen critical thinking and to foster an impartial, contextualized understanding of the use of conspiracy theories, since their deployment has significant implications for the quality of democracy and participation. By seeking to identify

hypothetical value-based and epistemic biases, this study could make an important contribution to media literacy, promoting a critical view of the value-based categorization of certain social phenomena and how this is legitimized and disseminated through legacy and digital media.

SELF-REGULATION, MOTIVATIONAL DESIGN AND WELLBEING: FROM PSYCHOLOGICAL REGULATION TO GAME-BASED CONTEXTS FOR HUMAN FLOURISHING

Salvatore Fadda (University of Sassari, Italy) · **Carlo Andrea Pensavalle** (University of Sassari, Italy) · **Maria Giuliana Solinas** (University of Sassari, Italy)

Human Flourishing | COTS Board Games | Complexity Citizenship Education

This contribution reframes psychological wellbeing and human flourishing within the challenges of educating for democratic citizenship in an era of complexity, instability, and technoscientific opacity. Building on Self- vs. Externally-Regulated Behavior Theory, the paper argues that learners' capacity to inhabit complex systems responsibly depends on the interplay between (a) self-regulatory competencies and (b) the "regulatory quality" of learning environments—especially their emotional climate. Emotions are treated not as secondary outcomes but as the neuropsychological infrastructure of learning: supportive affective states enable exploration and deep understanding, while anxiety and stress—frequently triggered by uncertainty, feedback loops, and perceived loss of control—can produce cognitive withdrawal and helplessness. The paper proposes COTS board games as accessible "complexity simulators" for citizenship education: rule- based worlds where players experience uncertainty, systemic risk, resource conflicts, ethical dilemmas, cooperation/competition, and failure in a psychologically safe setting. Through structured play, students encounter emotionally resonant decision-making situations that can be debriefed to strengthen emotional intelligence (recognition, regulation, perspective-taking) and to transform mistakes into curiosity and redesign rather than fear and avoidance. In this way, game design becomes a pro-regulatory educational ecosystem that supports autonomy, competence, and relatedness while cultivating resilience, critical awareness, and hope—key dispositions for democratic agency under complexity. Finally, the paper explores how generative AI can function as a dialogic cognitive–emotional mediator integrated into game-based learning: not as an authority that simplifies complexity technocratically, but as a reflective scaffold that helps teachers and students articulate strategies, interpret emotional responses, test alternative narratives, and reduce performance anxiety. By combining complex-systems play, motivational design, and AI-supported reflection, the proposed framework expands learners' ability to understand technoscientific systems critically and to act with greater clarity, wellbeing, and responsibility in contemporary democratic life.

FROM PROMPT TO STORY: GENERATIVE AI, DIGITAL STORYTELLING, AND AI LITERACY WITH UNDERGRADUATE STUDENTS

Melania Talarico (University of Turin, Italy)

Digital storytelling | AI literacy | undergraduate students

The growing development of generative artificial intelligence (AI) is increasingly assuming a central role in media communication processes. The textual and visual information that we produce and disseminate daily represents an important educational challenge today, requiring greater critical awareness of the role of artificial intelligence and media in democratic participation processes (Panciroli & Rivoltella, 2023). This context highlights the need to promote forms of thinking oriented toward solving complex problems and managing contemporary challenges. Data from ISTAT (2024) show the importance of strengthening digital competence in order to improve citizens' democratic participation. Long and Magerko (2020) also emphasize the need to develop skills related to data interpretation, understanding machine learning processes, and reflecting on the ethical and social implications of algorithms. In this context, it becomes crucial to train future teachers to critically understand media languages within educational processes. The new DigComp 3.0 framework (European Commission, 2025) highlights the importance of reflecting on artificial intelligence across the five areas of digital competence. This paper presents a teaching experience carried out within a university course on Educational Technologies, involving students enrolled in the Primary Teacher Education program. The activity was designed as a digital

storytelling laboratory in which students created short educational video stories intended for primary school pupils, using generative artificial intelligence tools to produce images. The activity aimed to enhance narrative design (Bruner, 1990; Robin, 2016), multimodal communication, and critical reflection on the role of AI in the creation of educational content. The choice to adopt a narrative methodology is linked to the role that storytelling plays in encouraging learners to ask questions, construct logical and causal relationships between events, and develop alternative perspectives. Recent studies highlight how the integration of generative artificial intelligence in storytelling activities can support students' creative and metacognitive processes, fostering a comparison between human ideas and AI-generated suggestions (Niclós et al., 2024). Accordingly, this study addresses the following research question: how can the use of generative artificial intelligence in digital storytelling activities contribute to the development of critical competencies related to media and algorithms in teacher education? The exploratory study adopts a qualitative approach. A sample of 100 video stories created by the students was analyzed considering three main dimensions: a. the narrative coherence and educational intention of the produced stories; b. the relationship between textual prompts and the images generated by AI systems; and c. the integration of multimodal elements in line with principles of multimedia learning (Mayer, 2024). A questionnaire was administered to explore students' perceptions of narrative meaning-making and the potential and critical aspects of AI in generating stories and images. Preliminary findings indicate that narrative guided the construction of visual meaning in the videos, shaping the use of prompts and the generation of both referential and evocative images. The analysis also revealed the presence of bias in the generated images, offering students an opportunity to critically reflect on algorithmic processes and on the role of artificial intelligence in the production of media content.

ECHOES, SHADOWS: HOW CAPITALISM HAS DRAINED SPACE AND TIME OF SENSORIAL ENGAGEMENT AND DEGRADED DEMOCRACY

Lana Parker (University of Windsor, Canada)

everyday life | algorithmic capitalism | material conditions

In this paper, I draw upon contemporary engagements with Lefebvre's spatiotemporal critique of capitalism to argue that the emptiness of our common spaces degrades democratic commitments. Drawing from a Heideggerean phenomenological perspective, Lefebvre (2004, 2014) is concerned with the formation of being in relation to everyday life amidst the spaces of the world. Unlike Heidegger, however, Lefebvre states that it is in the everyday encounter with the world, and with the cultivated spaces of one's immediate environment, that capitalism asserts its control (Schmid, 2022). Here, I argue that capitalism has flattened our everyday environments by eliminating materials—what Heidegger (2001) calls the ready-to-hand—through programs of austerity and by impoverishing our imaginaries by tying life's worth to labour and consumption. A fulsome lifeworld, I contend, cannot be constructed from the remains, from the shadows and echoes of meaningful engagements with the world around us and with others. To develop this argument, I begin by describing how capitalism makes incursions into the spaces of young people's lives in two ways: first, through consumerist online worlds; second, through classrooms eroded by neoliberal conditions. For the former, I draw on Lefebvrian analyses to describe how capital's rapacious tendency toward marketization has shaped online environments into vapid spaces where children are both labourers for and consumers of Big Tech, but have few opportunities for meaningful human connection. For the latter, I extend the Lefebvrian analysis to argue that the neoliberal iteration of capitalism has altered the material conditions of schools, ridding them of rich, experiential opportunities for the arts and hands-on learning through

underfunding. These classrooms, I suggest, are now increasingly spaces for more blinkered, algorithmically-controlled online time, as students are rarely given materials outside of laptops or phones. Both online and classroom spaces then facilitate what Crary (2022) calls an "atomized crowd of individuals" (Ch. 3, para. 48). In the third section of the paper, I discuss how a lack of space to forge communities—to meaningfully experience the in-the-world phenomenon of being with—corrodes the foundations of democratic participation. That is, as fewer materials are available ready-to-hand, there are fewer opportunities for young people to encounter and forge care for the world. This lack of connection, of intention, and of imaginaries is a product of the emptiness of capitalist space, but not an accidental one. It is a way of insuring that democracies are less viable and that oligarchic regimes face fewer obstacles. I conclude my paper with an invitation to consider what Lefebvre's relentless focus on space permits us to see: that cultivating time and place for togetherness, in respite from capitalist phenomena, is a promising way forward. I assert that place-based, material enrichments should form the basis for arguments in support of public education, and for how children might spend their leisure time as well.

PITFALLS OF ONLINE DISTORTED SCIENTIFIC KNOWLEDGE. A CASE STUDY ABOUT THE INSTRUMENTAL USAGE OF FAILED CLIMATE CHANGE PREDICTIONS

Fiammetta Corradi (Università degli Studi di Pavia, Italy)

Climate change denial | Scientific communication | Epistemic status of scientific knowledge

Manipulations and distortions in scientific divulgation and communication on the internet have become top issues in STSs and among the sociologists of cultural and communicative processes. Climate change, among other topics, has fallen under the lens. For instance, Dunlap and McCright (2010) have explored the heterogeneity of the so-called "climate denial blogosphere"; others have analysed the "rhetorical constellations" posted by bloggers on the public Facebook page of a denialist digital platform (Bloomfield and Tillery, 2019; Tillery and Bloomfield 2022). The present study, moving from the theory of "Co-Production" of science and social order (Jasanoff, 2004; Jasanoff and Kim, 2005), further explores the phenomenon of online climate change denial focusing on the website "Wattsup with that" (https://wattsupwiththat.com), founded in 2006 and run by William Anthony Wattsup, former television meteorologist, chatted climate change skeptic, among the protagonists of the American "Climategate" (Scott, 2021). The platform, self-proclaiming "the world's most viewed website on global warming and climate change", is one of the several adversaries of the Intergovernmental Panel on Climate Change (IPPC), established since 1987 by the United Nations, the main advocate of the anthropogenic theory of global warming (ATGW), currently shared by 99% of scientists (Lynas et al. 2021; Myers et al. 2021). In particular, the analysis concentrates on the archive of "failed predictions", containing more than sixty climate forecasts, delivered since 1966 until nowadays, by representatives of mainstream climate science and proved, based on observational data, ex post wrong. Together with some surprising outcomes (to anticipate one, until 1988 every prediction hinted at the coming of a new Ice Age, and not towards a warming trend), the empirical case study provides interesting insights to develop an inter-disciplinary reflection upon a constellation of related topics that span from the epistemic status of contemporary climate change science to the future of our climate modelling (Bordoni, 2025); from a critical discourse analysis unveiling fallacious reasonings and flaw explanatory logics, rhetorical tricks and unsound conclusions, to a deeper understanding of the role of epistemic coherence in climate change science (Corradi, 2025); from the intrinsic and multidimensional complexity of climate change predictions, to their instrumental, economic and political usages to erode public trust in mainstream scientific accounts (Blöbaum, 2016; Fischer, 2017). One important implication is that against climate change denial, it is urgent to safeguard the specific epistemic status of climate predictions, and disclose the actual limits of their reliability, showing the (ever shifting, but nonetheless knowledgeable) boundaries between what we know, what we don't know, and what we cannot know (Krauss, 2021; Stainforth, 2024). More generally, the positive democratization of access

to scientific knowledge through the internet, hiding distorted communicative means and aims, more urgently needs a careful and timing critical sociology of scientific communication, ready to reveal the pitfalls of misleading interpretations and instrumental usages of scientific tenets and findings: before they turn, online, quickly viral.

SYMPOSIUM

WHAT PEDAGOGY FOR MEANINGFUL LEARNING? FROM NEUROSCIENCE TO TEACHING PRACTICE

meaningful learning | neuroscience | teaching practice

PROMOTED BY ANP – Associazione Nazionale Presidi
VENUE Edificio di Scienze Politiche (CU002), Sala Lauree
DATE AND TIME 02/09/2026, 2:00–3:45pm
PROGRAMME 2 hours – in Italian
SPEAKERS Antonello Giannelli (President, ANP); Maria Luisa Iavarone (Università degli Studi di Napoli Parthenope); Luisa Anna Maria Giordani (Headteacher, I.C. "Terralba" Genova); Daniela Pes (Headteacher, Liceo Scientifico "Galileo Galilei" Napoli)
MODERATOR Licia Cianfriglia (ANP)

Promoted by ANP – Associazione Nazionale Presidi. Neuroscientific research over recent decades has profoundly transformed our understanding of learning processes, offering pedagogy conceptual and operational tools of extraordinary scope. Yet the dialogue between cognitive science findings and everyday teaching practice remains fragmented — often mediated by simplifications that risk distorting the complexity of both fields. This round table opens a space for genuine cross-disciplinary exchange, centred on a core question: what does 'meaningful learning' actually mean? When does an educational experience leave a lasting mark on the student's mind and person? What cognitive, relational, and contextual conditions must be created for learning to be more than momentary performance? Neuroscience teaches that learning is a deeply embodied act, modulated by emotion, memory, attention, and intrinsic motivation. Yet schools continue to organise time, space, and assessment according to logics that often disregard these fundamental mechanisms. How can this gap be bridged? How can scientific evidence be translated into concrete teaching choices, without falling into neurobiological determinism or methodological improvisation? The discussion will explore pedagogical practices that place the learner in their full complexity at the centre: competency-based teaching, cooperative learning, metacognition, the role of formative feedback, and the management of emotions in the classroom as a resource rather than an obstacle. The aim is not to import foreign models uncritically or to chase pedagogical trends, but to build a grounded, reflective, and scientifically informed professional teaching culture. The round table is addressed to school leaders, teachers, researchers, and trainers.

SYMPOSIUM

CONFUSED AND HAPPY. ITALIAN TEACHERS BETWEEN CHANGE, CRISIS, AND JOB SATISFACTION

teachers | job satisfaction | teacher surveys

PROMOTED BY Be for Education Foundation
VENUE Edificio di Scienze Politiche (CU002), Sala Lauree
DATE AND TIME 02/09/2026, 4:15–6:00pm
PROGRAMME 2 hours – held in Italian
SPEAKERS Gianluca Argentin (University of Milano-Bicocca); Laura Palmerio (INVALSI); Veronica Velasco (University of Milano-Bicocca)
CHAIR AND DISCUSSANT Orazio Giancola (Sapienza University of Rome)

Promoted by Be for Education Foundation. Teachers play a crucial role in the daily functioning of the school system and are called upon to mediate among numerous demands, covering different roles even within a single day. At the same time, teachers are central actors in school transformations, as they are the primary implementers of educational policies and systematically find themselves mediating between social innovations and the persistence of school bureaucracy. Alongside these tensions, which place teaching somewhere between an autonomous profession and clerical employment, a further set of significant challenges stems from the demands of social interactions—not only in educating and caring for students, but also in interfacing with parents and other professional figures. This complex set of tasks, roles, and

responsibilities leads to high stress levels for teachers and, particularly in Italy for those at the end of their careers, modest salary recognition. It is therefore unsurprising to find profound dissatisfaction among teachers regarding the social perception of their work and the belief that they do not enjoy the social prestige they deserve. Nor is it surprising to see the media representation of teachers as burned out and in deep crisis. Closer inspection, however, reveals that teachers generally tend to reaffirm their career choice and, above all, report widespread and high satisfaction with many aspects of their job. The symposium stems from this apparent contradiction and seeks to address three crucial questions: How do elements of satisfaction and crisis coexist within the teaching body? Which teacher profiles appear most at risk, and which school factors can tip teachers toward distress? Which factors can serve as resources? What policies can be introduced to support teachers? The symposium compares the results of three major surveys on teachers—OECD-TALIS 2024, the Fourth National Survey on Teachers, and HBSC (Health Behaviour in School-aged Children) Teachers—aiming to provide a nuanced answer to these questions, which are often oversimplified in the press. It highlights the importance of conducting rigorous research on teachers' needs as a vital component for the smooth functioning of the school environment.

SYMPOSIUM

DEMOGRAPHIC DECLINE AND THE FUTURE OF SCHOOL SYSTEMS: CONSTRAINTS AND OPPORTUNITIES

demographic decline | school networks | educational policy

PROMOTED BY Fondazione per la Scuola (Compagnia di San Paolo Foundation)
VENUE Edificio di Scienze Politiche (CU002), Sala Lauree
DATE AND TIME 01/09/2026, 11:00–12:45
PROGRAMME 2 hours – in Italian
WELCOME Giulia Guglielmini (President, Fondazione per la Scuola)
PRESENTATIONS Cristina Solera (Università degli Studi di Torino) – Too few children: by choice or by constraint? Low fertility in Italy in a comparative perspective; Roberto Ricci (President, INVALSI) – Rethinking school systems: organisation, quality and equity
Panel discussion – From demographic decline to policy and practice, chaired by Giulia Guglielmini (Fondazione per la Scuola): Roberto Ricci (President, INVALSI); Giuseppina Rita José Mangione (Researcher, INDIRE); Alessandro Clavarino (Head, Genoa Provincial School Office)

Promoted by Fondazione per la Scuola (Compagnia di San Paolo Foundation). Across Europe, demographic change is reshaping societies, with declining birth rates and ageing populations becoming structural features of many countries. Italy represents one of the most pronounced cases of this trend, with a sustained and significant reduction in births over the past decades. While the economic and social implications of demographic decline are widely discussed, its consequences for education remain insufficiently addressed. The progressive reduction of the school-age population is already producing declining enrolments, fewer classes, and — in some areas — the closure or consolidation of schools. In rural, inner, and peripheral areas, the contraction of school networks risks weakening access to education and reinforcing territorial inequalities. In urban contexts, demographic decline interacts with residential segregation and school choice, potentially reshaping the social composition of schools and amplifying inequalities. A critical but often overlooked dimension concerns the teaching workforce. Demographic decline is expected to reduce demand for teachers, raising challenges related to workforce planning, recruitment, and retention. Without strategic policy responses, there is a risk of a purely proportional reduction in teaching staff, potentially undermining the attractiveness of the profession and limiting opportunities for generational renewal. Demographic decline is not merely a quantitative contraction, but a structural transformation affecting school organisation, resource allocation, and classroom composition. At the same time, it opens a policy window: fewer students may allow for improved student–teacher ratios, more personalised learning, and innovative organisational models — if supported by appropriate strategic choices. The symposium explores these challenges with the school system as the main unit of analysis, combining demographic, territorial, and educational policy perspectives. It aims to move beyond a defensive approach centred on cost containment, and to discuss how demographic change can be leveraged as an opportunity to redesign school systems, improve quality, and strengthen equity. Key questions: What demographic scenarios are most relevant for the future of school systems, and how should they inform long-term plan-

ning? How does demographic decline reshape school networks, territorial inequalities, and the teaching workforce? Can demographic decline be leveraged as an opportunity to redesign school systems and improve equity and quality, rather than leading to proportional downsizing?

SYMPOSIUM

READING THE EDUCATION AND TRAINING ECOSYSTEM: INTERPRETIVE PERSPECTIVES ON EDUCATIONAL CHANGE

educational ecosystem | innovation | system monitoring

PROMOTED BY INDIRE – Istituto Nazionale di Documentazione, Innovazione e Ricerca Educativa
VENUE Edificio di Scienze Politiche (CU002), Sala Lauree
DATE AND TIME 03/09/2026, 4:15–6:00pm
PROGRAMME 2 hours – in Italian
CHAIR Elisabetta Mughini (INDIRE)
SPEAKERS Giuseppina Rita José Mangione; Jessica Niewint; Margherita Di Stasio
DISCUSSANT Francesca Borgonovi (OECD)

Promoted by INDIRE – Istituto Nazionale di Documentazione, Innovazione e Ricerca Educativa. The social, demographic, technological, and cultural transformations characterising our time are profoundly reshaping the role of educational institutions in contemporary societies. Schools — together with other segments of the education and training system — can no longer be understood solely as institutions devoted to the transmission of knowledge. They are increasingly configured as part of a complex educational ecosystem, in which schools, adult education pathways, professional tertiary education, and mechanisms integrating education, training, and work all interact. Understanding these transformations requires data collection and analysis tools capable of capturing the complexity of ongoing educational phenomena. The integrated use of quantitative data, system observatories, continuous monitoring, and analyses of emerging phenomena enables the research community to develop more nuanced interpretations of the processes of change affecting the education and training system. The symposium explores transformations in the education system through four complementary interpretive perspectives: a territorial perspective, examining the relationship between educational institutions and local contexts, demographic transition, and territorial learning ecosystems; a pedagogical perspective, focusing on how education systems respond to contemporary challenges — foundational competencies, metacognition, generative AI literacy, and new ecologies of knowledge; a professional perspective, considering innovation processes through the development of teachers, school leaders, and other educational professionals, and the role of in-service training and professional communities; and a systemic perspective, focusing on inter-organisational and inter-institutional processes through which innovations spread and become institutionalised within the education and training system.

SYMPOSIUM

LEARNING FOR DEMOCRACY / DEMOCRACY FOR LEARNING: GENDER STEREOTYPES AND THE DEVELOPMENT OF COMPETENCIES

gender stereotypes | competencies | financial literacy

PROMOTED BY INVALSI and Banca d'Italia
VENUE Edificio di Scienze Politiche (CU002), Sala Lauree
DATE AND TIME 01/09/2026, 2:00–3:45pm
PROGRAMME 2 hours – in Italian
CHAIR Patrizia Falzetti (INVALSI); Claudia Maurini (Banca d'Italia)
KEYNOTES (60 MINUTES) Michela Carlana (Università Bocconi, Milano); Carmela Aprea (University of Mannheim)
POLICY PANEL (40 MINUTES) Annamaria Ajello (Università "Sapienza", Roma); Roberto Ricci (INVALSI); Maria Teresa Sagri (INDIRE); Magda Bianco (Banca d'Italia); Carmela Palumbo (MIM – Ministero dell'Istruzione e del Merito)
OPEN DISCUSSION 20 minutes

Promoted by INVALSI and Banca d'Italia. Despite progress in recent decades, significant gender gaps persist in students' disciplinary and transversal competencies. The literature shows that such inequalities are strongly shaped by cultural stereotypes, social expectations, and interactions among students, teachers, and families. Gender gaps emerge early: evidence on adolescents indicates that socioeconomic status and family attitudes towards gender roles significantly influence performance differences between girls and boys, with effects that are amplified in contexts characterised by greater cultural and material inequalities. Teachers also play a crucial role: numerous studies document that implicit teacher stereotypes can widen the gender gap, particularly in mathematics and quantitative reasoning. Similar gaps are observed in financial literacy, where girls and women show lower levels of competence — including in non-numerical tasks. Gender stereotypes can heighten financial anxiety, reduce self-confidence, and impair performance in situations perceived as 'masculine'. Recent research further shows that, even among finance students with comparable knowledge, girls are less inclined to seize advantageous economic opportunities, revealing a persistent behavioural gap affecting economic choices and future career trajectories. In line with the conference theme Learning for Democracy / Democracy for Learning, the symposium explores how gender stereotypes influence the formation of competencies fundamental to democratic participation. Strong cognitive competencies, socio-emotional capacities such as agency and self-efficacy, and informed decision-making skills are essential preconditions for active and responsible citizenship. School environments informed by democratic practices — participation, collaboration, mutual recognition — can mitigate the impact of stereotypes and foster more equitable and inclusive competency development. The symposium adopts an interdisciplinary approach, integrating perspectives from economics of education, developmental psychology, sociology, and teacher education research.
