This paper explores the cinema of Hayao Miyazaki as a privileged site for an ecofeminist reading of childhood imaginaries, situated at the intersection of children's literature, animation, and the history of educational thought. Ecofeminism is adopted here as an interpretative lens attentive to relational ethics, care, and responsibility toward the living world, in dialogue with foundational reflections on the intertwined domination of nature and vulnerable subjects (Shiva, 1988; Plumwood, 1993; Gaard, 2017). Within this perspective, narratives addressed to childhood are understood as symbolic and educational spaces in which imaginaries of coexistence and responsibility take shape, as already highlighted in studies on children's literature and pedagogy (Faeti, 1986; Beseghi & Grilli, 2011). Miyazaki's films centre on young female protagonists such as Nausicaä (Nausicaä of the Valley of the Wind), San (Princess Mononoke), and Ponyo (Ponyo on the Cliff by the Sea), whose trajectories articulate modes of growth grounded in interdependence, attentiveness, and shared vulnerability. As observed in eco-pedagogical readings of children's narratives, these forms of growth are rooted in relational ways of knowing rather than in mastery or control (Gaard, 2009). Childhood emerges as a liminal and epistemological condition, a posture of openness and sensibility through which relationships with the living world are continuously negotiated, in line with pedagogical reflections on imagination and education (Faeti, 1986; Trisciuzzi, 2013). Nature in Miyazaki's cinema is configured as an active presence that shapes ethical and educational relations. Landscapes, forests, seas, and animal beings participate in the narrative as interlocutors and companions, sustaining fragile ecological balances, as documented in ecological readings of his films (Mayumi, Solomon & Chang, 2005; Boscarol, 2023). Within this narrative ecology, female child figures inhabit worlds marked by crisis and transformation, enacting forms of care that resonate with ecofeminist critiques of anthropocentrism and hierarchical dualisms (Plumwood, 1993; Gaard, Estok & Oppermann, 2013), as well as with more recent reflections on the gendered construction of the nature–culture divide (Del Gobbo, 2023). Through the analysis of recurring archetypal figures – the girl-bird, the girl-wolf, and the girl-fish – the paper highlights metamorphosis as a key narrative and pedagogical device. Transformation appears as expansion and relational becoming, sustaining identities that remain open, porous, and interconnected with the more-than-human world, a theme already explored in ecofeminist and queer-ecological debates (Gaard, 2020). These figures embody forms of embodied knowledge rooted in experience, sensoriality, and emotional attunement, which are central to eco-pedagogical approaches attentive to nature and education (Frabboni, 1990; Dozza, 2018). By situating Miyazaki's work within a

broader genealogy of children's narratives attentive to nature, care, and relational ethics, the paper contributes to current ecofeminist dialogues across the history of education and children's literature. The wildness of childhood emerges as an educational resource capable of sustaining imaginaries of coexistence and ecological responsibility, echoing both historical reflections on nature and education (Merchant, 2017) and contemporary studies on environmental imaginaries in children's literature (Grilli, 2019; Trisciuzzi, 2020, Forni, 2022).

FLOURISHING DESIRE: FEMALE SEXUALITY AND BOTANICAL IMAGERY IN CONTEMPORARY ITALIAN ILLUSTRATED BOOKS

Valentina Baeli (University of Catania, Italy)

Ecofeminism | Sexualities | Femininity

This paper investigates the intersection between female sexuality and natural elements in contemporary illustrated books, adopting an ecofeminist perspective that foregrounds the connections between the disciplining of women's bodies and the exploitation of nature as parallel outcomes of the same patriarchal and anthropocentric system. The starting point of the analysis is Il piacere (2020) by Maria Hesse, a work that traces the history of female pleasure through an iconographic apparatus in which bodies and natural landscapes merge into a visual and symbolic continuum. The Spanish author and illustrator systematically employs botanical, aquatic, and ecological metaphors to restore narrative dignity to a desire historically silenced, constructing an imaginary in which the reappropriation of pleasure coincides with a reconnection to the natural world. In works such as Il Piacere and other illustrated books addressing menstruation, desire, and bodily autonomy, flowers, seeds, tides, forests, and ecosystems become metaphors not of biological determinism but of

relationality, cyclicality, and interdependence. The body is represented as a dynamic ecosystem rather than a passive object of surveillance. Pleasure, in particular, emerges as an epistemic category capable of disrupting disciplinary and capitalist logics that frame sexuality primarily in terms of risk, productivity, or consumption. Building on this text, the paper broadens its scope to other illustrated nonfiction works that share a similar representational strategy, including Katharina Hotter, Lisa Sonnberger and Flo Staffelmayr's picturebook Lina l'esploratrice (2022), and contemporary illustrated books such as Post pink. Antologia di fumetto femminista (2019), in which the femininity interweaves the vegetal world. Methodologically, the paper adopts an interdisciplinary approach combining iconotextual analysis with ecofeminist criticism, drawing on the thought of Val Plumwood, Carolyn Merchant, and Vandana Shiva, who have theorized the structural nexus between the domination of nature and the domination of women. Within this framework, the visual representation of female sexuality through natural metaphors is not read as an essentialist reduction of the feminine to the biological, but rather as a countercultural strategy that subverts the nature/culture dualism upon which the logic of domination is founded. The paper aims to demonstrate that the analyzed works perform an implicit educational function: by offering non-normative representations of sexuality and of the relationship with nature, they challenge anthropocentric and patriarchal views and propose alternative models grounded in the recognition of interdependence between the human and the non-human. In this sense, these texts operate as tools of gender eco-pedagogy, capable of fostering critical reflection on both ecological justice and gender discussion.

WOMEN AND TEACHING BETWEEN SICILY AND AMERICA. THE LESSON OF RURAL TEACHER JOSEPHINE DELVA BETWEEN THE 19TH AND 20TH CENTURIES

Rita Baldi (University of Palermo, Italy) · **Livia Romano** (University of Palermo, Italy)

women's educational work | American school | Italian school

This contribution is dedicated to one of the most problematic issues in the long and arduous journey towards gender equality: the difficult relationship between women and education. In particular, it analyses female education and the teaching profession between the 19th and 20th centuries. For a long time, girls' entry into education was a complex and ambiguous process. Although legislation provided for equality between girls and boys, compulsory education was often evaded, penalising girls more, who were useful in the domestic economy and perceived as future housewives. The teaching profession was an almost unattainable goal for young women aspiring to become teachers, who were considered more suited to lower-level female education and, even with the same qualifications, location and teaching class, received a lower salary than male teachers, which was even lower if they taught in rural schools. It has also been noted that female teachers often, if not always, became the subject of prejudice and heavy social control, especially when they found themselves working in small rural or mountain villages. Women's work in education was a slow path to emancipation, and even in the 1950s, discrimination and wage disparities between men and women were still present in the world of education, which would only be overcome at the end of the 20th century. In this regard, we have chosen to propose a historical-pedagogical reading of All for Love of Teaching as a significant testimony to these gender issues. Through the biographical story of Giuseppa/Josephine, from post-unification Sicily to 20th-century America, the book intertwines individual and collective history, providing an insight into the condition of women and the teaching profession between the 19th and 20th centuries. However, the text highlights the persistent structural inequalities that permeate the teaching profession: wage disparities, contractual precariousness, moral control, and the prohibition of marriage for teachers. The teacher thus emerges as an ambivalent figure: invested with a central public function in the education of citizens, but at the same time limited by legal and cultural constraints that reduce her full citizenship. Over the long period spanning almost a century,

Josephine's story shows how teaching can be a practice of resistance and democratic responsibility. School becomes a place for literacy, social advancement and the development of civic awareness, but also a space of tension with regard to contemporary cultural changes. The volume thus allows us to reinterpret women's educational work as a crossroads between emancipation, professionalism and commitment to inclusive democracy.

ECOFEMINIST YOUTH FICTION AS AN EDUCATIONAL TOOL FOR SOCIAL AND ENVIRONMENTAL CHANGE

Arianna Sechi (Università degli Studi di Verona, Italy)

Ecofeminism | Youth Fiction | Climate Change

According to Greta Gaard and Patrick D. Murphy (1998), «ecofeminism is a practical movement for social change arising out of the struggles of women to sustain themselves, their families, and their communities. These struggles are waged against the "maldevelopment" and environmental degradation caused by patriarchal societies, multinational corporations, and global capitalism.». In this sense, ecofeminism is, by definition, oriented toward eco-social change. In fact, despite the plurality of ecofeminist perspectives, they all share the aspiration to identify concrete alternatives to environmental exploitation and social oppression. Within this framework, ecofeminist youth fiction represents a particularly effective educational tool for facilitating such a transformative process, especially by engaging young people, who are the protagonists of the future. In recent decades, alongside the consolidation of ecofeminist literary criticism as an interdisciplinary field of research (Campbell, 2008; Donovan, 1996; Gaard, 2013; Gaard & Murphy, 1998; Vakoch, 2022), several empirical studies conducted in educational contexts have demonstrated that the reading of ecofeminist fiction can significantly influence worldviews and representations of the future (Kostecka, 2025; Deininger, 2023; Echegoyen-Sanz, Pont-Niclòs & Martín-Ezpeleta, 2025). From this perspective, ecofeminist fiction for young readers may be interpreted as a pedagogical resource capable of challenging hegemonic worldviews, while promoting a commitment to concrete action for social and environmental change. This contribution explores the transformative potential of ecofeminist fiction drawing on the graphic novel Il limite del mondo (2023) by Barbara Borlini and Francesco Memo. Il limite del mondo is a double-sided book, a volume with two covers and two autonomous stories that unfold in opposite directions and meet at the center of the book. Both stories address the issue of climate change through the depiction of a dystopian future, which is narrated by two young characters facing a crisis that the older generation has created but cannot resolve. The choice to employ a graphic novel reflects the direct and engaging nature of the comic book language, which can be highly effective in depicting complex scenarios such as the ecological crisis, facilitating critical interpretation and emotional engagement. The analysis of Il limite del mondo focuses in particular on two aspects: the recognition of the interdependence of the web of life and the construction of the young protagonists' agency. It is precisely through their growing awareness of the connections between human beings, other animals, and the planet that the two characters learn to imagine alternatives to their present situation and to take action aimed at transforming reality. This graphic novel can therefore be interpreted as

a significant example of contemporary ecofeminist youth fiction capable not only of promoting values of inclusivity and environmental sustainability, but also of encouraging the implementation of concrete actions toward more equitable and sustainable futures, thus embodying a pedagogical approach aligned with ecological and gender justice.

NARRATING THE NON-HUMAN. THE OTHERNESS OF THE CHILD BODY IN STORIES FOR CHILDREN

Rossella Caso (University of Foggia, Italy)

body childhood children's narratives

The paper will examine the child body and the ambiguity of its representations in contemporary children's texts: child body is, beginning in the early twentieth century, essentially "other" body, because it is in connection with dimensions, such as animal and plant, that are considered distant from the human - among others, the "aquatic" children of certain literature would be a clear example - and therefore imperfect and "defective." A representation that cracks and fragments the image of the beautiful and healthy child, "all liveliness and health," which is often inherent in the "latent pedagogies" of the adult world, but, at the same time, opens the way for meaningful reflections. The hybrid child body recounted in literature reveals how child bodies are extraordinarily open and metamorphic and revealing, on closer inspection, of the profound connection between "us" and its opposite, between the human and the non-human, natural and plant, opening the way for a radical rethinking of human nature itself.

"AN ANTIDOTE TO THE LOGIC OF DOMINATION": AN ECOFEMINIST READING OF SELECTED RACCONTINI BY CATERINA PERCOTO

Francesca D'Alessio (Independent Researcher, Italy)

Ecofeminism | Environmental Education | Caterina Percoto

In the short essay Ecofeminism and Children, Ruthanne Kurth-Schai highlighted the systematic exclusion of children from political and social participation within their community, which remains deeply "adult-centered [and] age-segregated [...] that better serves the political and economic interests of powerful adults" (1997: 194). This exclusion, mirroring the parallel and centuries-long marginalisation of women from decision-making roles and positions of power, has resulted in the placement of both groups at the lowest levels of social hierarchies, alongside the broad category of non-human nature. Consequently, like Kurth-Schai, a number of activists and scholars in recent years have emphasised the fundamental importance of fostering a relationship between children and nature. A notable example is Rachel Carson who in 1956, in The Sense of Wonder, recounted the reactions of her nephew Roger during their explorations of the natural world, noting the child's instinctive tendency to perceive himself as an integral part of the surrounding environment. Even earlier – and moving more specifically into the field of (eco-)pedagogy – the educational thought of Maria Montessori drew attention to children's need to "live" nature through direct and practical experience, in addition to encountering it through fairy tales. (De Carlo and Pugacheva 2021: 174). Fairy tales, however, have long reinforced – often from a male perspective – the parallel subordination of nature and women, narrating a presumed biological connection between them and at times even personifying the former in the latter. In Gyn/Ecology, perhaps one of the best-known (and also most criticised) works in ecofeminist literature, Mary Daly offered a brief analysis of The Giving Tree by Shel Silverstein, observing how the tree – "referred to by the pronoun she" – is portrayed as an active and cheerful participant in her own mutilation, effectively turning the story into "one of female rape and dismemberment" (1978: 90). Building on these premises, the paper aims to reflect on the richness and validity of ecofeminist perspectives as critical frameworks for the interpretation of children's literature. Drawing on a concrete workshop experience conducted in several middle schools in the province of Trieste, the paper also examines a number of specific case studies: three short stories by Caterina Percoto – La centifoglia, L'orecchio, and Riparazione – dating from the second half of the nineteenth century and presented to students as part of the practical workshop activities. Not coincidentally, this practical component was preceded by a seminar section – later developed into a handbook designed for schools – which focused on different global ecofeminist perspectives and sought to provide students with critical tools for interpreting the texts. Much like activism, which has often preceded theory within the constellation of ecofeminist ideas, the paper ultimately seeks to demonstrate how Percoto's short stories represent an early example of the ways in which environmental literature for children can offer young readers "an antidote to the logic of domination" (Gaard 2009: 327).

Financial Education, Gender and Democratic Empowerment: Rethinking Equity in Economic Learning

PANEL CONVENORS: Luca Refrigeri (University of Molise, Italy); Claudia Maurini (Bank of Italy, Italy); Maria Iride Vangelisti (Bank of Italy, Italy)

PANEL KEYWORDS: Financial Education, Democratic Participation, Gender Inequalities

This panel investigates how financial education intersects with gender and democratic participation, focusing on structural inequalities, educational practices, and empowerment strategies. Despite growing attention to financial literacy, gender disparities persist in access, confidence, and outcomes. The panel will explore how educational systems can address these gaps through inclusive curricula, targeted interventions, and critical pedagogies. Contributions will draw from empirical research, policy analysis, and classroom practices to propose a more equitable and democratic approach to financial education. The Panel Objectives are: Highlight the role of financial education in promoting gender equity and democratic participation; Share research and practices that address gender disparities in economic learning; Foster dialogue between institutions, educators, and civil society; Inspire policy and curriculum innovation for inclusive financial education. The Topics of interest could include: Gender gaps in financial literacy: causes and consequences; Financial education as a tool for gender empowerment; Role of schools in promoting gender-sensitive civic education; Teacher training and gender awareness in financial education; Intersectionality and economic vulnerability; Curriculum innovation for inclusive financial learning. The Target contributors are researchers, educators, policymakers, and practitioners working in the fields of: Education and gender studies; Financial literacy and civic education; Teacher training and curriculum development; Economics of education and educational sciences.

FAMILY ECONOMIC SOCIALIZATION AS A KEY TO EQUITABLE FINANCIAL EDUCATION IN ITALIAN PRIMARY SCHOOLS

Giovanna Andreatti (Free University of Bozen-Bolzano, Italy) · **Monica Parricchi** (Free University of Bozen-Bolzano, Italy) · **Giulia Cavrini** (Free University of Bozen-Bolzano, Italy)

Family economic socialization | primary school | financial education

Financial education is a process through which citizens develop competencies that enable them to critically understand and interpret economic and social phenomena, make informed decisions, and act responsibly within their socio-economic context (Fornero & Lo Prete, 2023). In this regard, financial education contributes to personal and social well-being and supports the exercise of active citizenship (Andreatti et al., 2025; Parricchi, 2023). The increasing complexity of the global context – characterized by rapid digitalization and the democratization of the financial system – has facilitated inclusion and access to services while also increasing citizens' responsibilities and exposure to risks (Amagir et al., 2018; Kaiser & Lusardi, 2024). These processes, combined with generally low levels of competence observed worldwide, have made financial education a central focus of international policy (European Commission/OECD, 2023; OECD, 2020). In Italy, financial education was recently introduced into the primary school curriculum as part of civic education (Gazzetta Ufficiale, 2024), with the Trentino-Alto Adige region anticipating national legislation in 2020. Despite its formal inclusion in the curriculum, operational challenges persist. In particular, curriculum design still tends to adopt an adult-centred approach, which overlooks children's naïve economic theories and the family economic socialization processes that shape their development (Berti, 2004; Kardash et al., 2023; Zhao & Zhang, 2020). This perspective limits the ability of designing equitable and inclusive educational pathways that provide students with the tools to act responsibly as citizens. This study presents the results of an empirical investigation conducted in the Province of Trento, involving a sample of 200 children aged 6, 8, and 10 and their parents. The research combines qualitative and quantitative methods and aims to identify the factors that determine the starting point for designing financial education pathways, considering children's naïve economic theories and family economic socialization processes. This paper focuses on quantitative data obtained through a parental questionnaire, which assessed financial competence (Lusardi & Mitchell, 2023), the degree of family economic socialization (frequency and content of economic conversations, children's involvement in economic decisions, allowance management), and parents' perspectives on the introduction of financial education in schools. Descriptive and exploratory analyses were conducted to examine differences across groups defined by socio-economic characteristics, outlining key profiles of family economic socialization. Additionally, multiple correspondence and multivariate analyses

were performed to identify meaningful patterns and profiles among selected variables. Preliminary results indicate that parents' financial competence, family socialization processes, and attitudes toward school programs are significantly associated with gender, educational level, income, and prior experiences. Bivariate analyses indicate significant associations between socio-economic status and the content of family economic discussions: parents with high-SES more frequently address topics such as economic sustainability, banking roles, and pension planning, whereas low-SES families tend to emphasize basic saving practices. Overall, the findings confirm the central role of the family in the unequal transmission of economic competencies and the potential reproduction of intergenerational inequalities. These results highlight the importance of integrating children's perspectives and family contexts into the design of equitable, inclusive, and developmentally appropriate financial education pathways.

POWERFUL FINANCIAL KNOWLEDGE AS EPISTEMIC JUSTICE: RETHINKING FINANCIAL EDUCATION FOR DEMOCRATIC EMPOWERMENT

Emanuel Mizzi (University of Malta, Malta)

Financial education | powerful financial knowledge | democratic participation

Financial literacy initiatives may reinforce behavioural individualism and overlook structural inequalities, such as a lack of democratic participation and gender gaps in access, confidence and outcomes, thereby exacerbating epistemic injustice in economic and financial learning (Mizzi, 2021, 2025). This presentation addresses this gap by conceptualising 'powerful financial knowledge' that empowers students to think critically in financial matters beyond their everyday experience. Drawing on Young's powerful knowledge framework (Young, 2014), this presentation discusses what constitutes powerful financial knowledge, how it can address gender disparities in financial literacy through critical pedagogies, and what curriculum innovations foster epistemic access for equitable economic agency. The approach synthesises empirical data from Maltese school business education classrooms with theoretical analysis. Findings reveal powerful financial knowledge in three expressions: deepening understanding of the financial world, enabling new thinking in financial matters, and developing students' critical thinking in financial and economic issues. Teachers' representations of pedagogical content knowledge promote reflective perspectives (Mizzi, 2024), but gender-neutral delivery can overlook vulnerabilities, such as over-reliance on credit among young women from low-income families. Key insights include a proposed financial literacy programme that prioritises threshold concepts for epistemic justice (Mizzi, 2025), infuses critical civic education (including gender-aware elements), and provides teacher education in critical pedagogy. This frames financial education

as a shared responsibility and enhances economic agency amid vulnerabilities. Implications encompass policy innovation (e.g., enhancing school economics provision) and teacher professionalisation by advancing epistemic equity and empowering diverse youth – including those facing gender disparities – for democratic economic participation.

EXPERIENTIAL FINANCIAL EDUCATION. ASSESSING THE EFFECTIVENESS OF A BANCA D'ITALIA MUSEUM EXHIBITION

Valentina Maria Andreucci (Bank of Italy, Italy) · **Alessio D Ignazio** (Bank of Italy, Italy) · **Francesca Festa** (Bank of Italy, Italy) · **Marialucia Longo** (Bank of Italy, Italy) · **Francesco Rossetti** (Bank of Italy, Italy)

Financial education · museum/informal learning · randomized control trials

We investigate the impact of a museum exhibition on the financial literacy of young people. The exhibition, titled "The Adventure of Money", took place in Rome between October 2023 and June 2024. It offered a preview of Banca d'Italia's upcoming Money Museum, which aims to stimulate interest in the main events in the history of money and finance. In order to evaluate the effectiveness of the exhibition, we conducted a randomized control trial with about 600 students from 19 Italian upper secondary schools. The results show an improvement in the students' financial knowledge, as evidenced by an increase of around one third in their initial financial competence scores. The results also show that the exhibition had a greater impact on female students. Finally, no learning decay was observed within the first month following the exhibition.

INTEGRATED EDUCATIONAL PARTNERSHIPS IN SCHOOL-BASED FINANCIAL EDUCATION

Monica Parricchi (University of Bozen, Italy) · **Doris Kofler** (University of Bozen, Italy)

Financial Education and Democratic Participation | Integrated educational system | School students and university students

Financial education is increasingly recognized as a key prerequisite for social participation, as it equips individuals with the knowledge and competencies required to make informed and responsible economic decisions. Economic agency, in this sense, extends beyond the instrumental management of financial resources and represents a fundamental condition for autonomous and meaningful participation in contemporary societies. Individuals who understand economic interrelations are better equipped to articulate their interests reflectively, to critically assess societal developments, and to participate competently in public discourse. From a pedagogical perspective, social participation is closely linked to the development of democratic competencies. Active involvement in social, economic, and political processes strengthens democratic awareness, as individuals do not merely comprehend democratic principles cognitively but experience them in practice. In this sense, financial education can be understood as an integral component of comprehensive civic and political education, since economic competence forms an essential foundation for responsible democratic participation. Within this framework, the integrated education system emphasizes the importance of structured collaboration among multiple stakeholders in order to foster students' engagement and support the development of participation competen-

cies. Such collaboration may involve schools and universities, teacher education institutions, public authorities, financial institutions, civil society organisations, local community actors, and families. Accordingly, this study is situated within that perspective and highlights the strategic cooperation between formal educational institutions (schools and universities), policy actors (such as school authorities and governmental bodies), and external stakeholders, particularly banks, operating within both informal and non-formal learning environments and embedded in structured collaborative networks. The integrated education system thus promotes multi-level partnerships in which formal education providers work together with external actors, especially financial institutions partnering with schools to deliver financial education programmes, in order to create coherent, practice-oriented, and socially embedded educational pathways. In a small-scale regional context such as South Tyrol/Alto Adige, three fundamental forms of cooperation have been established through the formalization of agreements: A research partnership between the Faculty of Education and the Faculty of Economics. A programme based on a "train-the-trainers" model involving university students and teachers. A formal agreement between the National Bank, the local bank (Cassa di Risparmio), and the Italian school authority-already involving several school districts and soon to include the German school authority-providing structured training packages and educational formats. In future research, and in line with a growing body of international literature, the research group aims to further investigate the effects of this initiative. In particular, the study seeks to explore whether economic literacy can be confirmed as a significant predictor of students' engagement in civic participation. Moreover, ongoing data collection within this collaborative model will examine whether integrated educational strategies, linking formal curricula with informal learning experiences and peer-group-based economic socialization, are capable of strengthening students' competencies in school settings which foster innovation. The extent to which such collaborative approaches contribute to sustainable educational and civic outcomes remains an open empirical question.

LEARNING FOR DEMOCRACY AND DEMOCRACY FOR LEARNING: FINANCIAL EDUCATION AS A TRANSFORMATIVE PRACTICE IN TEACHER TRAINING

Marzia Leccese (Università degli Studi del Molise, Italy) · **Valeria Miceli** (Università degli Studi del Molise, Italy)

Teacher training | Financial education | Transformative pedagogy

This paper presents an experience in Financial Education developed within the Bachelor's Degree in Primary Education Sciences at the University of Molise, in collaboration with the Bank of Italy. The aim is to explore the value of combining theory and practice, considering university education as a laboratory for educational experimentation capable of generating concrete and transformative impacts in primary school contexts. The hypothesis is that Financial Education can be configured as a pedagogical device capable of promoting awareness, participation, and social responsibility. The central focus of the experience is the transferability, in primary school settings, of the pathways experienced by future teachers. Financial Education takes shape through authentic tasks, such as the collective management of a budget for a project or an event; shared reflection on personal spending priorities; discussion and debate on needs, desires, and the concept of saving in its multiple purposes; the use of role-playing activities to understand how supply and demand work and to practice early forms of conscious economic decision-making. Even before the formal introduction of Financial Education into the curriculum and before our experience as university tutors, these themes were already integral to our teaching practice. Financial Education has indeed been adopted not as an additional content area, but as a cross-cutting perspect-

ive through which to interpret and organize meaningful learning experiences. Through active methodologies, such as circle time, cooperative learning, storytelling, and problem solving, children were guided to engage in dialogue, negotiate, take responsibility, and reflect on the consequences of their decisions. Particular attention was also paid to the concept of social capital and to money understood as a tool oriented toward giving and solidarity. In this context, Financial Education can be interpreted as a pedagogical practice aimed at enhancing children's agency, supporting the development of critical and reflective skills necessary to understand the economic and social dynamics that shape individual and collective decision-making processes, and contributing to the promotion of their capacity for informed participation in economic and social life. Within this framework, university teacher training assumes a strategic role in building a critical and responsible teaching professionalism, grounded in the integration of disciplinary knowledge, pedagogical-methodological competencies, and ethical-social responsibility, with the goal of designing educational practices capable of addressing early forms of educational disadvantage and exclusion, particularly in contexts characterized by socio-economic and cultural vulnerability. To narrate and experience this process, therefore, means offering concrete tools to transform the classroom into a permanent laboratory of active citizenship, where educating about the value of money means educating about the value of choices— which ultimately shape the future of democracy itself.

THE ROLE OF TEACHERS IN FINANCIAL EDUCATION IN ITALIAN SCHOOLS.

Luca Refrigeri (University of Molise, Italy) · **Noemi Russo** (University of Molise, Italy)

Financial education | Economic citizenship | Teacher training

The formal introduction of financial education into the Italian school system as part of the civic education curriculum must draw attention to the teachers tasked with delivering it, as they themselves belong to a vulnerable group; indeed, they have never studied economics or finance, either at school, at university, or even during their initial teacher training. And today, without specific training, financial education risks remaining merely an educational objective rather than a genuine teaching practice. If we consider that the majority of Italian teachers are women and that women are among those with the least financial education—on average displaying lower levels of financial literacy and less confidence in their own financial skills—then this becomes a limiting factor in educating younger generations. Consequently, in an education system staffed by teachers who, like many adults in contemporary society, have not received adequate financial education during their university or professional training, schools struggle to promote financial literacy among students. It is necessary to recognise that teachers, too, require structured training programmes in economic and financial literacy. The report highlights the need to ensure that teachers' economic and financial training is not neglected, through two channels: the establishment of university-level professional development courses for serving teachers, aimed at developing basic economic skills and specific teaching abilities for financial education, and integrating economic and financial education content more systematically – than has been the case for at least a decade – into the initial training programmes for teachers across both school cycles. Investing in teachers' economic training means not only improving the effectiveness of financial education policies but also helping to reduce widespread economic and cultural vulnerabilities among the adult population. From this perspective, schools can become educational spaces capable of promoting critical thinking, independent decision-making, and democratic participation in economic and social life.

FINANCIAL EDUCATION ISSUES FOR INCLUSION, EQUITY AND DEMOCRATIC PARTICIPATION

Gabriella Aleandri (Roma Tre University, Italy)

Financial education | inclusion | equity

In Italy, the strategic importance of economic and financial education has been widely recognised at the political and institutional levels and has gradually established and consolidated itself over the past few decades. Financial education needs to be improved at school level and included in all university curricula, as well as within the lifelong learning perspective, to efficiently contribute to inclusion, equity, and democratic participation. Indeed, despite numerous interventions and training projects, including recent ones, which have led to improvements and expansion in financial literacy awareness, Italy continues to rank inadequately in European and international rankings. Regarding schools, it should be noted that, from a legislative perspective, Legislative Decree No. 237 of December 23, 2016, later converted into Law No. 15 of February 17, 2017, clarified that financial education refers to the process through which individuals improve their understanding of financial instruments and products and develop the necessary skills. Subsequently, Law No. 21 of March 5, 2024, included financial education within civic education in schools. However, despite legislative recognition of the need to institutionalize financial, insurance, and social security education in school curricula, there is still a lack of adequate, systematic, coordinated, and consistent proposals on a scientific-cultural and pedagogical-didactic levels (Refrigeri, 2020, 2021). The three-yearly OECD PISA survey on the skills of fifteen-year-olds in various literacy areas and, since 2012, also on Financial Literacy (FL), now in its fourth survey cycle, shows, in the latest report for 2022 (OECD, 2023) conducted in Italy in collaboration with the Bank of Italy and INVALSI, that fifteen-year-old students achieved an average score below the OECD average, not significantly differing from the results obtained in the two immediately preceding surveys. Regarding the condition of adults, according to the most recent national (Lamboglia, Marinucci, Stacchini, and Vassallo, 2023) and international OECD (OECD/INFE, 2023) surveys, Italy unfortunately ranks among the last advanced countries in terms of basic financial skills. The Bank of Italy also supports financial education through publications for adults (Banca d'Italia, 2023). As part of the Financial Education in Schools program, launched in agreement with the Ministry of Education, the Bank of Italy has created the series "I quaderni didattici della Banca d'Italia" (The Bank of Italy's Educational Notebooks), which includes the volumes "Tutti per uno economia per tutti!" (Bank of Italy, 2023a, 2023b, 2023c, 2023d, 2023e, 2023f, 2023g) as the reference material for the Financial Education in Schools program. These volumes are therefore aimed at students and teachers of all levels in schools. However, there is a lack of widespread similar tools in universities, particularly for those students who do not pursue undergraduate, graduate, or post graduate degrees, etc., that include economics and finance in their curricula. I would hope that the interest and involvement, including that of the Bank of Italy, could broaden its scope to include all university students. This would be an important first step. A further literacy campaign should be implemented on a large scale, targeting the entire adult population, of all ages, genders, and socio-cultural conditions.

PROMOTING WOMEN'S EMPOWERMENT THROUGH FINANCIAL LITERACY EDUCATION: A DESIGN EXPERIENCE IN PRE-SERVICE TEACHER EDUCATION

Barbara Bocchi (University of Trieste, Italy) · **Lisa De Giusti** (University of Trieste, Italy) · **Alessandra Rea** (University of Trieste, Italy)

Financial literacy education

International scientific literature highlights the presence of a persistent gender gap in financial literacy. Numerous studies conducted by the OECD (2020) show that, in many countries, women achieve on average lower scores than men in financial literacy assessments. The Italian context reflects a similar situation. Having a bank account, managing one's money consciously, and making informed financial decisions: economic independence represents a fundamental condition for women's freedom and emancipation. However, as reported by the Edufin Index 2025, women score on average five points lower than men in financial competencies—specifically 54 points compared to 59. Gender stereotypes, according to which women are perceived as less capable of possessing and managing financial resources, significantly contribute to this gap. These misconceptions affect girls from the early years of schooling, when they begin to develop lower confidence in their mathematical and financial abilities (Agasisti, 2022). The literature agrees that this gap cannot be attributed to innate differences in abilities, but rather to structural and socio-cultural factors. Within this framework, financial education emerges as a tool of empowerment capable of acting not only at the cognitive level but also at the social and cultural levels. It goes beyond the mere transmission of technical knowledge by fostering the development of decision-making skills, informed attitudes, and confidence in one's capacity to manage financial resources. International studies show that targeted educational programs can positively influence behaviours such as savings planning, debt management, participation in financial markets, and retirement preparation. In particular, they can support women in achieving greater economic autonomy and reduce conditions of vulnerability related to financial dependence or job instability (Bottazzi & Lusardi, 2021). From a pedagogical perspective, this implies designing educational pathways that are attentive to the diverse life experiences and social conditions of boys and girls. In this direction, the theoretical contribution of Paulo Freire emphasizes the importance of dialogic and contextualized learning processes that foster the development of critical awareness of the economic and social structures shaping everyday life (1971). In light of these considerations, schools represent a privileged context for promoting financial education from the earliest stages of the educational pathway (Parricchi, 2023), as also recommended by the OECD (2020). Within this perspective lies the experience developed within the Primary Teacher Education program at the University of Trieste, carried out in collaboration with the Banca d'Italia as part of the Edufin project. Introduced from the first year of compulsory indirect practicum, the initiative aims to support the design of multidisciplinary teaching activities focused on financial education. The project pursues a dual objective: on the one hand, to reduce the potential gap in economic and financial competencies among future teachers; on the other, to prepare them to address these topics in a conscious and pedagogically effective way within early childhood and primary education. This contribution therefore aims to reflect on the role of initial teacher education as a strategic lever for promoting a more equitable and inclusive financial culture, capable of counteracting gender inequalities from an early stage.

FINANCE THROUGH PLAY:
A COMPARATIVE STUDY OF PLAY-BASED FINANCIAL EDUCATION IN EARLY CHILDHOOD

Riccardo Grazioli (University of Milan, Italy) · **Benedetta Melloni** (University of Modena and Reggio Emilia, Italy)

Finance literacy pre-school

In contemporary societies, where individuals are increasingly required to mobilise knowledge and competences to manage their financial resources and make informed decisions (Martin, 2002), institutional and academic interest in financial literacy has grown substantially. Financial literacy is widely recognised as a key lever for the development of financial capability and, consequently, for the achievement of financial well-being (CFPB, 2015; Sherraden, 2013; Willis, 2022). As a result, financial education initiatives have proliferated and, in some countries – such as Italy – financial education is scheduled to be incorporated into school curricula, starting from primary education. However, although processes of financial socialisation begin in early childhood (Bottazzi & Lusardi, 2020; Drever et al., 2015; Rinaldi, 2015), educational proposals addressing core financial concepts – such as risk, uncertainty, time and value – remain rare in pre-school settings. Moreover, the literature lacks experimental studies assessing the impact of play-based financial education interventions on sufficiently large samples of children aged three to five (Gerasimova et al., 2022; Kamber et al., 2024; Ramli et al., 2022). A research project currently in its conceptualisation and planning phase is therefore presented, pending the securing of the resources required for its implementation, in order to obtain feedback and advice to support its optimal development. The project seeks to evaluate the impact of financial education on the attitudes and behaviours of pre-school children. More specifically, it examines whether play-based activities targeting children aged three to five can leave a lasting imprint on financial socialisation processes, fostering more virtuous developments in attitudes and behaviours. The core research question is: do children who have experienced play-based financial education show, one or two years later, systematically different attitudes and behaviours compared with those who have not? Adopting a comparative and interdisciplinary approach, the study will be conducted in partnership with Reggio Children Foundation, which promotes the Reggio Emilia Approach internationally, and in collaboration with pedagogists and teachers. The sample will consist of approximately 5,000 children attending nursery schools adopting the same educational approach but located in four markedly different socio-economic, cultural, technological and financial contexts: an Italian province, where such schools are public and attended by children from all kinds of family backgrounds; the cities of Milan and Paris, where they are private and subject to access constraints; and San Francisco, where they are even elitist. Within each context, schools will be divided into three homogeneous groups based on average parental financial literacy: one will serve as the control group, while the other two will constitute treatment groups (with variations in timing and frequency of the proposed activities). The findings are expected to confirm differences in financial socialisation across contexts; a key objective, however, is to assess whether structured interventions in early years allow children to co-construct knowledge on concepts that can be linked to financial literacy.

FINANCIAL THINKING FOR REFLECTIVE CITIZENSHIP IN PRIMARY SCHOOL

Silvia Della Rocca (Università degli Studi di Firenze) · **Christian Tarchi** (Università degli Studi di Firenze) · **Annalisa Valle** (Università Cattolica del Sacro Cuore) · **Elisabetta Lombardi** (Università eCampus) · **Lidia Casado Ledesma** (Universidad a Distancia de Madrid) · **Pietro Cappelli** (Università degli Studi di Firenze) · **Giorgia Franchina** (Università Cattolica del Sacro Cuore) · **Federico Colombo** (Università Cattolica del Sacro Cuore)

financial literacy | financial thinking | critical reading

This contribution presents the theoretical framework and findings of the Italian national research project (PRIN 2022KT-B2KX), "Financial Thinking for Reflective Citizenship". At its core, the project is based on a Financial Thinking model (Marchetti et al., 2020) of disciplinary literacy (McConachie & Petrosky, 2010) essential for active and reflective citizenship in the 21st century. By integrating cognitive development, socio-emotional skills, and critical reading, this approach aims to empower children—regardless of gender or socio-economic background—to become informed participants in a democratic society. The necessity for early intervention is driven by evidence that financial literacy gaps, including those related to gender and socio-economic status, are often observable by adolescence (Agenzia Nazionale per i Giovani, 2023). By introducing economic learning in primary school (ages 8–10), the project seeks to establish a foundation of equity before these disparities solidify. The methodology centers on an integrated model that includes two primary components: Financial Thinking for Children: This conversational training uses peer interaction to develop "perspective-taking" and "mentalization". By discussing stories like The Merchant's Bank, students explore economic concepts through the lens of fairness, altruism, and prosocial decision-making. This focus on the "relational" side of economy is particularly vital for creating an inclusive environment where students of all genders can see themselves as economic agents. Financial Knowledge Acquisition Competence: The project utilizes specialized materials to teach students how to navigate the "informational complexity" of the modern world. By explicitly teaching economic vocabulary and critical reading strategies, the program ensures that students from varied backgrounds gain the linguistic tools necessary to participate in socio-economic inquiry. The results from the project indicate that active participation in these dialogic and literacy-based interventions significantly improves students' ability to transfer economic knowledge to broader social themes. Specifically, the data highlights that strong text comprehension is a major predictor of financial learning, suggesting that "reading for democracy" is inseparable from "learning for democracy". Ultimately, this paper argues that rethinking equity in economic learning requires moving away from modular, math-centric curricula. By embedding financial education within the broader framework of civic education and social cognition, we can provide all children with the foundational financial thinking and literacy competence — a prerequisite for exercising citizenship rights and achieving financial well-being in a complex global economy.

Gender and Sexuality Education as Democratic Practice: Bodies, Relations, and Intimate Citizenship

PANEL CONVENORS: Silvia Demozzi (University of Bologna, Italy); Cosimo Marco Scarcelli (University of Padua, Italy); Giulia Selmi (University of Parma, Italy); Eleonora Bonvini (University of Bologna, Italy)

PANEL KEYWORDS: Gender and Sexuality Education, Care and Embodiment, Intimate Citizenship

This panel examines how gender and sexuality education can contribute to democratic learning, social justice, and active citizenship in contemporary educational contexts. In a moment marked by anti-gender polarisation and misinformation, gender-inclusive and intersectional approaches emerge not only as pedagogical strategies but as democratic commitments. Sexuality and gender education provide a key lens for understanding how rights, diversity, and relational ethics are negotiated in school life and how young people learn to inhabit plural, equitable communities. Drawing on democratic education traditions, sociological perspectives on inequalities, and feminist and queer critiques of epistemic injustice, this panel investigates how practices of bodies, relationships, and care can sustain democratic coexistence grounded in agency and mutual respect. The notion of intimate citizenship (Plummer, 2001) highlights how identity, embodiment, and relationality are intertwined with democratic processes and the capacity to participate fully in social life. Rather than conceiving sexuality and gender education as mere transmission of normative knowledge, we understand it as a democratic practice that shapes interactions, imaginaries, and modes of living together. From this perspective, Comprehensive Sexuality Education (UNESCO, 2018) constitutes a transformative approach and a vantage point for interrogating and transforming the norms and power relations that determine who is recognised, listened to, and able to participate meaningfully in collective life. The ambition of the panel is to reposition gender and sexuality education as a critical lens for renewing pedagogical practices and addressing the challenges posed by complex, polarised societies, while sustaining democratic cultures capable of embracing diversity and equitable coexistence.

AFFECTIVE COMPLEXITY, INTIMATE CITIZENSHIP, AND QUEER(ER) FUTURES IN SEX EDUCATION

Melissa Keehn (University of New Brunswick, Canada)

Sex Education | Queer Joy | Teacher Education

Across Canada, sex education rarely reflects the lived realities of queer and trans youth, particularly those navigating the intersections of queerness, race, disability, and neurodivergence (Bialystok & Anderson, 2022; Burkholder & Keehn, 2024; Maradiya et al., 2025). Historically, sex education has imagined a “normative” student—affluent or middle-class, white, thin, able-bodied, cisgender, endosex, heterosexual, and male (Bruno et al., 2025; Roberts et al., 2020; Wong, 2024)—assumptions that continue to shape curricular content and classroom practice in Canada and elsewhere (Bialystok & Andersen, 2022). As a result, sex education often reproduces cisheteronormative and colonial futures by erasing or marginalizing queer and trans desires, relationships, bodies, asexuality, disability, and intersex variations, producing what Ahmed (2020) describes as disorienting sites of learning. In these contexts, gender and sex education becomes a site of epistemic injustice, where some bodies, knowledges, and relational possibilities are rendered unintelligible or unworthy of recognition. Relately, teachers are frequently positioned to frame gender identity as fixed, bodies and sex as binary, and desire as heterosexual, leaving intersex, trans, nonbinary, and genderqueer youth without language or recognition for their experiences (Burkholder & Keehn, 2025; Collier-Harris & Goldman, 2017). As Robinson et al. (2024) note, queer and trans rights and visibility have far outpaced Canadian sex education, a gap intensified by recent anti-trans political violence and state interventions that restrict support for queer and trans students and curtail school-based sexual health programming across the country (Awde, 2024; French, 2025). Within these conditions of polarization, sex education emerges not only as a pedagogical site but as a democratic arena in which questions of rights, recognition, care, and intimate citizenship are actively negotiated. Responding to these conditions, this presentation draws on scholarship in queer joy (Duran & Coloma, 2023; Keehn, 2025; Tristano Jr., 2022) and critical queer theory (Muñoz, 2019) to ask: How might sex education function as a democratic practice that foregrounds agency, embodiment, and relational ethics? Queer joy unsettles deficit-based narratives of queerness and transness by insisting on affective complexity—lives marked not only by harm and constraint, but also by contradiction, ambivalence, pleasure, agency, and joy, even within hostile conditions (Burkholder, Wright, & Keehn, 2025). In my presentation, I propose that queer theories of joy can offer teachers tools to reimagine gender and sex education as a form of intimate citizenship—one that recognizes young people as relational, embodied subjects

capable of participating meaningfully in plural and equitable communities. Drawing on my teaching in a sex education methods class with pre-service teachers, I share DIY and arts-based pedagogical practices—such as sewing reusable menstrual pads, queering classroom language, and engaging young people in expansive conversations about bodies—to demonstrate how practices of care, joy, creativity, and play can disrupt normative, risk-saturated approaches to sex education. These pedagogies foreground youth agency and relational accountability, repositioning sex education as a site for democratic learning, epistemic justice, and more livable, affirming educational futures.

FOR A FUTURE ITALIAN COMPREHENSIVE SEXUALITIES EDUCATION: AN ANALYSIS OF TEACHERS' AND FUTURE EDUCATORS' SUGGESTIONS

Valeria Bruno (Università degli Studi dell'Aquila, Italy)

Comprehensive Sexualities Education | Teachers | Content analysis

Comprehensive Sexualities Education (CSE) still faces several challenges in Italy, resulting in a lack of school curricula and academic training on the topic (Bruno 2024, 2025; UNESCO, 2023). Aiming to design training and education on sexualities that are coherent with the specific context, following a bottom-up approach, the present work is the outcome of a content analysis of suggestions from Italian high school teachers, future educators, and primary teachers enrolled in Italian universities. Through an open-ended question, the study participants shared their advice or prioritized topics, writing a maximum of three words, keywords, or sentences. Participants' answers were analyzed using a projective content analysis, following the four phases of the data interpretation process proposed by Kleinheksel and colleagues (2020) and, to ensure the reliability of the analytical process and the results, more than one coder was involved (Renz et al., 2018). Statistical analyses were then conducted on the themes derived from the content analysis using SPSS v.27 to investigate possible associations and differences through Chi-square (χ^2) analysis. From the content analysis, eight themes and related subthemes emerged. The first theme has been positioned as such for logical rather than numerical reasons, while the remaining seven themes are presented in decreasing order: No suggestions (n = 145); Topics (n = 392); Strategies and materials (n = 246); Approaches (n = 225); Methods (n = 191); Goals (n = 169); Educational responsibility (n = 134); and Educational/training needs (n = 124). Based on the suggestions of in-service teachers and university students, the themes that emerged seem related to several design aspects recommended in international and national documents and guidelines on CSE (IPPF, 2017; Ordine degli Psicologi, 2024; UNESCO, 2018). For example, a wide range of topics is mentioned, reflecting the importance of including not only medical and preventive aspects in CSE, but also emotional and

relational dimensions, as well as health in a broader sense (Hawkins, 2024). In terms of school implementation, participants emphasized the importance of active participation, a scientific and professional approach, and educational continuity, suggesting the inclusion of CSE as a stand-alone subject or a cross-curricular component (Goldfarb & Lieberman, 2021). Furthermore, CSE should challenge sociocultural taboos and fill the educational gap created and transmitted across generations, increasing awareness of violence's dynamics and phenomena (Bonvini & Demozzi, 2024). Finally, participants suggested the importance of shared educational responsibility, with a support network that encompasses different actors and services while also highlighting the educational and training needs of teachers, educators, and parents regarding SE (Plan International, 2020; UNESCO, 2018; WHO & BZgA, 2010). Chi-square (χ^2) analyses reveal several differences among the participants' suggestions, both between the two groups and within each group. Although the study's findings are not generalizable, the context analyzed appears to be fertile ground for future design and provision of CSE. Based on these results, it is possible to hypothesize training that can be applied across various educational and training contexts and be coherent with the participants involved, while respecting both the bottom-up and top-down approaches.

CORPOREALITY, DISABILITY, AND EPISTEMIC INJUSTICE: THE TRANSFORMATIVE POTENTIAL OF PARTICIPATORY AND CREATIVE METHODOLOGIES IN GENDER AND SEXUALITY EDUCATION

Federica Lapietra (University of Bologna, Italy)

creative methodologies | disability | gender and sexuality education

In the contemporary sociocultural context, marked by the persistence of hegemonic representations depicting people with disabilities, particularly women, in terms of infantilization, desexualisation or victimization, the issue of gender and sexuality education for people with disabilities remains marginalized within both the scientific debate and educational practice. This knowledge gap contributes to forms of epistemic injustice insofar as the recognition of people with disabilities, especially those with complex disabilities, tends to be confined within clinical-healthcare or overtly advocacy-oriented discursive polarities. When assumed as exclusive interpretative frameworks, such polarities may fail to capture the plurality of lived experiences and identity construction processes. This contribution stems from a scoping review conducted within an ongoing doctoral project in the field of Special Education, aiming to explore the identity construction processes of women with disabilities. Preliminary findings highlight a growing tendency toward the use of participatory and creative research methods, such as Photovoice and Body Mapping as narrative forms. The analysis of the literature

clearly indicates that these methods are increasingly adopted to investigate complex and highly sensitive issues, including bodily, relational, and identity-related dimensions. The researchers' choice to employ creative methodological approaches, often combined with more traditional data collection tools appears to respond to the need to expand expressive possibilities, enabling communication and self-expression also for those who do not use verbal language or who privilege non-conventional communication modalities. This methodological orientation reflects a renewed attention to research instruments capable of recognizing, from a biopsychosocial perspective, people with disabilities both as active epistemic subjects in the production of knowledge concerning their embodied, relational, and social experiences and as epistemic agents within the specificity of their functioning profiles. Based on these findings, the paper sets out discuss the emerging methodological perspectives with reference to gender and sexuality education, understood as a democratic practice grounded in the recognition of the plurality of bodies, experiences, and expressive modalities. Creative methodologies, translated into workshop-based activities oriented toward the exploration of bodily imaginaries, social and cultural representations of sexuality, and identity construction processes, are conceived, within this framework, as transformative pedagogical practices, potentially capable of supporting accessible pathways of gender, sexuality, affective, and consent education.

GENDER INEQUALITIES, CO-PARENTING, AND EDUCATIONAL ALLIANCES IN EARLY CHILDHOOD EDUCATION: PRELIMINARY FINDINGS FROM A QUALITATIVE STUDY

Chiara Borelli (University of Bologna, Italy)

gender inequalities | co-parenting | educational alliances

Comprehensive Sexuality Education (CSE) is not only a health-related educational field but also a broader democratic and pedagogical commitment to equality, rights, and relational justice (UNESCO, 2018). Among the key issues addressed by CSE, UNESCO technical guidance includes the disparities reproduced within family life, by stating that "gender inequality is often reflected in the roles and responsibilities of family members" (UNESCO, 2018, p. 38). This perspective becomes particularly relevant in early childhood education and care (ECEC), where educational services play a crucial role in sustaining parental educational responsibilities and fostering school-family educational alliances (Gigli, 2016). This contribution presents preliminary findings from a qualitative study on gender issues in parenting and in the relationship between families and ECEC services. The study originates from prior focus groups with ECEC professionals in Bologna (Italy), where educators reported recurrent parental narratives – especially from mothers – about the persistent feminization of responsibility, even in contexts where fathers were described as present and caring. These accounts suggested a need to investigate whether and how gender inequalities in parenting are changing, how they are perceived by parents, and what role educational services may play in either challenging or reproducing these dynamics. The research is framed by literature documenting the persistence of asymmetries in parenting, with mothers still more exposed to primary responsibility for childcare, emotional labor, and educational management (Craig, 2006; Milkie et al., 2002; Musick et al., 2016; Wall & Arnold, 2007). In Italy, this picture is reinforced by structural inequalities in paid work, welfare supports, and work-family reconciliation, which continue to disproportionately affect women's employment trajectories and wellbeing (Crompton & Lyonette, 2006; Fariello, 2022; ISTAT, 2024, 2025; Naldini & Saraceno, 2011). The study also draws on scholarship on intensive mothering, which highlights how socially valorized models of "good parenting" may intensify maternal responsibility and contribute to guilt, overload, and the reproduction of gender hierarchies (Forbes et al., 2021; Hays, 1996; Meeussen & Van Laar, 2018; Sità, 2017; Verniers et al., 2022). Methodologically, the study employs in-depth semi-structured interviews with a purposive, maximum-variation sample of parents with at least one child under six attending educational services in Bologna (Italy), and uses reflexive thematic analysis (Braun & Clarke, 2008; Palinkas et al., 2015). Preliminary findings show a tension between declared egalitarian ideals and everyday practices: many participants endorse a gender-neutral "50/50" co-parenting ideal, yet traditional gender norms remain visible in the actual organization of care and educational responsibilities. Emerging themes include the perceived "naturalness" of maternal/paternal role division, the weight of economic and professional constraints, the ambivalent influence of participants' own parental models, and the importance of gender awareness for recognizing inequality in everyday family life. These early results suggest that gender education and CSE should also be addressed within school-family educational alliances, not only in child-focused interventions. From the perspective of democratic education and intimate citizenship, supporting co-parenting in more equitable ways may represent a relevant pedagogical strategy for fostering relational justice, agency, and democratic coexistence from early childhood onward.

GENDER EDUCATION AND INTIMATE CITIZENSHIP: YOUTH REPRESENTATIONS OF DEMOCRACY IN EDUCATIONAL SETTINGS

Barbara Sonzogni (Sapienza University of Rome, Italy) · **Gabriella D'Ambrosio** (Italian National Institute of Statistics (ISTAT)) · **Laura Falci** (Sapienza University of Rome, Italy)

gender education | intimate citizenship | democratic education

In a context marked by anti-gender polarization and symbolic conflicts surrounding sexuality education, gender emerges as a privileged terrain for interrogating the democratic quality of educational institutions. This contribution examines how university students conceptualize gender education not merely as curricular content, but as a practice of recognition and a space for democratic negotiation. The theoretical framework draws on the notion of intimate citizenship (Plummer, 2001), integrating perspectives from democratic education that understand learning environments as spaces where citizenship is actively practiced and negotiated (Biesta, 2011). Feminist analyses of epistemic injustice further illuminate how recognition, credibility, and voice are unevenly distributed within educational settings, shaping students' possibilities for participation and self-definition (Fricker, 2007). Within this perspective, gender education is understood as a practice that structures modes of coexistence, legitimizes identities, and contributes to the conditions for participation in the public sphere. The analysis is based on a survey administered to university students and focuses on four main areas: (1) opinions on the introduction, within school curricula, of content related to consent and gender diversity; (2) evaluations of the university as a space for free identity expression and of inclusive policies (e.g., recognition of chosen pronouns and gender-neutral spaces); (3) levels of agreement with the idea of gender identity fluidity; and (4) attitudes toward gender equality and relational norms related to consent, control, and power asymmetries in intimate relationships. Existing research highlights how sexuality education constitutes a key arena in which young people negotiate relational norms, agency, and ethical understandings of intimacy (Allen, 2011). The findings are situated within current debates on comprehensive sexuality education and the resilience of democratic cultures, emphasizing the role of educational institutions in fostering inclusion, respect, and informed participation in plural societies (UNESCO, 2018). Within this framework, the paper argues that gender and sexuality education represents a transformative space for the development of agency, mutual respect, and participatory citizenship, positioning educational contexts as crucial laboratories for democratic sustainability.

WHERE SILENCE TEACHES: HIDDEN CURRICULUM AND DEMOCRATIC LEARNING IN ITALIAN CSE

Eleonora Bonvini (University of Bologna, Italy)

Comprehensive Sexuality Education (CSE) | Hidden curriculum | Gender-sensitive pedagogy

In Italian schools, sexuality and gender education often takes the form of a residual and uneven intervention (Chinelli et al., 2023). The absence of mandatory provision and clear national guidance weakens continuity and increases reliance on individual teachers' sensitivities and local contingencies. In this context, sexuality education tends to enter the curriculum mainly when it is framed as risk management – puberty, reproduction, sexually transmitted infections etc. – while it remains marginal when it addresses meanings, relationships, and rights (European Commission, 2020; Cassar, 2022). Drawing on 46 semi-structured interviews with teachers from early childhood education (kindergarten) to upper secondary school, this paper examines the mechanisms through which this gap between intentions and practices is produced and consolidated in everyday school life. The analysis highlights a recurring discrepancy between what is declared – CSE as education for wellbeing, equity, and citizenship – and what is enacted, which teachers experience as fragile and potentially conflictual. Lack of training, low self-efficacy, fear of disputes with families, and ambiguity around the institutional mandate orient many practices toward what appears "defensible." As a result, teachers often avoid topics perceived as sensitive (pleasure, sexual orientation, gender identity), contributing to a hidden curriculum in which heteronormativity and gender binarism are not explicitly asserted but operate as a "gender dispositive" (Burgio, 2015). Through reflexive thematic analysis and the use of vignettes, the study shows how teachers continuously negotiate the boundaries of what can be said – not so much whether to talk, but how to do so without exposing themselves. Using the UNESCO (2018) Comprehensive Sexuality Education framework as an interpretive lens, the paper argues that "what remains unspoken" functions as a pedagogical mechanism, shaping what can be named, who can be recognised, and which experiences are rendered legitimate within school spaces. From this perspective, CSE is not merely the transmission of information; rather, it can be understood as a transformative and ethical democratic practice (hooks, 2020). It educates for consent, care, and agency and can therefore help counter anti-gender misinformation and polarisation without falling into defensive postures. Finally, the paper proposes an implementation pathway that treats sexuality and gender as social structures (Risman, 2004), consistent with the evidence presented: at the individual level, targeted professional development and supports for teacher self-efficacy; at the interactional level, dialogic micro-practices to welcome students' questions and manage complex discussions; and at the institutional level, school policies that make CSE legitimate and continuous (curriculum planning, formal frameworks, transparent communication with families, and partnerships with local health and social services). Reframed in these terms, CSE can operate as democratic infrastructure: not an "additional topic," but an educational condition that enables recognition, participation, and coexistence in plural school communities oriented toward valuing difference.

AFFECTIVE AND SEXUAL RELATIONSHIPS IN THE TIME OF DATING APPS. HOOKUP CULTURE AND THE EXPECTATION SYSTEM OF YOUNG PEOPLE

Vitaliano Corbi (Alma Mater Studiorum-Università di Bologna, Italy)

dating apps | hookup culture | comprehensive sexuality education

This contribution reflects on the preliminary findings of an ongoing qualitative study investigating the relational dynamics of youth sexuality in an "onlife" context. The research involved undergraduate and postgraduate students from humanities departments in northern and southern Italy. The participants fall within the developmental stage of emerging adulthood (ages 19–29), thus encompassing the late stages of adolescence. The study aims to explore the meanings young people attribute to dating apps and "hookup culture," examining how these phenomena influence their system of expectations regarding both physical and virtual encounters. A preliminary analysis of semi-structured interviews reveals that participants perceive dating apps (primarily Tinder and Hinge) as ambivalent environments: on one hand, they offer a venue for effectively experimenting with affectivity and sexuality; on the other, they function as environments heavily permeated by transferential dynamics. These dynamics foster processes of idealization, particularly during the chatting phase, which is characterized by the absence of the interpretative cues typical of face-to-face interaction. Expectations built within such relational dynamics tend to oversimplify alterity, encouraging projections that can lead to disappointment and frustration upon meeting in person. However, the use of these apps can also emerge as an informal educational space for exercising choice, tolerance of boundaries, and conflict management, especially when supported by educational practices guided by the Comprehensive Sexuality Education (CSE) approach (UNESCO, 2018). This framework focuses on skills, attitudes, and values, promoting a positive vision of sexuality as a human right and a democratic means of empowerment. In this specific context, education should guide individuals toward an awareness of their own projections and the ability to navigate them. Furthermore, the qualitative data appear to challenge the monolithic representation of Millennials and iGen as being fully identified with hookup culture. The interviewed students acknowledge the prevalence of casual sex but do not view it as detached from emotional involvement, nor as the defining feature of their personal experiences. Consequently, a general framework emerges that warns against reductionist interpretations and moralistic judgments, which risk producing a "negative Pygmalion effect" impacting the educational practices of parents, teachers, educators and pedagogists. Finally, the study hypothesizes that “existential communication” (Bertin, Contini, 2004), within the specific context of CSE, can serve as a valid tool for supporting young dating app users. In the perspective of pedagogical problematicism (Bertin, 1968), this approach fosters the integration of egocentric and heterocentric attitudes across the subjective and objective moments inherent in the dialectic of personality formation, while simultaneously valuing the complexity of contemporary experiences.

"...LA PRINCIPESSA RACCONTA...": FABULO-TECHNOLOGICAL PATHWAYS FOR INCLUSION OF GENDER VARIANT/NON-BINARY STUDENTS IN ITALIAN SCHOOLS

Marco Martucci (IIS "Clara Leardi", Italy)

gender variance | non-binary inclusion | intimate citizenship

In contemporary Italian schools, an increasing number of children and adolescents identify as gender variant or non-binary, often pursuing—sometimes with family support—paths of gender exploration or affirmation. This action-research project develops and field-tests an innovative, vertically integrated methodological framework for inclusive gender and sexuality education across all school levels (primary to upper secondary), aiming to foster serene, informed, and authentically inclusive learning environments that center diverse embodiments, relations, and intimate citizenships. Aligned with the panel's emphasis on gender and sexuality education as democratic practice (Plummer, 2001; UNESCO, 2018), the project repositions bodies, relations, and care as core to democratic coexistence, epistemic justice, and resistance to polarized anti-gender discourses. Rather than imposing normative knowledge, it cultivates student agency, mutual respect, and negotiation of plural identities. The core intervention, "...La Principessa racconta..." (inspired by Drag Queen Story Hour but uniquely Italianized), merges fabula-based storytelling with STEAM laboratories. Facilitated by an educator embodying a "Princess" (a powerful archetype of femininity re-appropriated for empathy and inclusion), sessions use illustrated "forbidden books" (e.g., Piccolo Uovo) for narrative exploration, followed by hands-on STEAM activities (wearable technology, soft circuits, scribbling machines, podcasting, stop-motion video, electronic music). These clusters collect participatory qualitative data on students' lived experiences, needs, and gender imaginaries, particularly from LGBT+ and gender variant/non-binary youth. The methodology includes direct/indirect observation, reflective logs, online diaries shared via social media, and family questionnaires (Google Forms/QR codes). Pilots began in 2019 (e.g., I.C. Asola, European "We are the Makers"), continued post-COVID in associations and libraries (e.g., Biblioteche di Roma – Vaccheria Nardi), and featured at events like "Educare le Differenze" (Bari, 2023). Challenges include institutional resistance, parental concerns amplified by conservative campaigns (e.g., Pro Vita e Famiglia), and funding/logistical barriers, addressed through no-fee models and community partnerships. Outcomes will yield evidence-based guidelines for curriculum integration, teacher training on gender-inclusive facilitation, and resources supporting intimate citizenship—enabling full school and social participation irrespective of gender identity. By amplifying gender variant/non-binary voices, the project counters epistemic injustices, promotes relational ethics of care and diversity, and renews pedagogy as a site of democratic transformation. Expected impacts include enhanced belonging, reduced stigma, and practical tools for enacting Comprehensive Sexuality Education as a democratic commitment.

ARE THEY READY TO TEACH SEXUALITY EDUCATION IN THE DIGITAL ERA?

Martina Bőhmová (Faculty of Education, Masaryk University, Czech Republic (Czechia)) · **Martin Fico** (Faculty of Education, Masaryk University, Czech Republic (Czechia))

Sexuality Education | Pre-service Teacher | Teacher Professional Development

Contemporary school-based sexuality education must move from pure biology to current challenges (e.g., online sexuality) and social aspects of sexuality. Sexuality education is crucial in reducing the rates of STIs, teenage pregnancies, and gender-related violence according to Společnost pro plánování rodiny a sexuální výchovu (Czech Society for Family Planning and Sexual Education [SPRSV], 2017) and UNESCO (2018). Studies show (UNESCO, 2018) that effective programs promotes responsible behavior instead of promoting earlier sexual activity. Nowadays, social media distorts sexual realities and can facilitate the commercial sexual exploitation of children (Smahel et al., 2020; Titheradge & Croxford, 2021). Schools are essential settings for guiding the perspectives of young people (SPRSV, 2017; UNESCO, 2018). Despite the Czech Republic's reputation as a progressive post-communist country, sexuality education remains fragmented and hindered by outdated methods and insufficient teacher support (Bőhmová, 2025). While attitudes towards sexuality education are frequently studied (e.g., Hrubá, 2022), the preparedness of pre-service teachers remains under-explored. Addressing this gap, this quantitative cross-sectional study maps the knowledge and attitudes of future teachers. Using the ABC model of attitudes, data are collected from Master's students across nine Czech universities via a custom-designed questionnaire combining a didactic test (for objective knowledge) and Likert scales (for attitudes and subjective evaluation of pre-service preparedness). Data will be analysed using techniques such as ANOVA, CFA, and reliability testing; however, the choice of specific methods will depend on data distribution. The study will map pre-service teachers' specific knowledge gaps (e.g., regarding legal frameworks) and assess their attitudes towards sexuality education. Ultimately, this research aims to optimise teacher preparation to improve the delivery of sexuality education in Czech schools.

INTERSTICES OF POSSIBILITY: CREATING DEMOCRATIC SPACES FOR TRANSFORMATIVE GENDER AND SEXUALITY EDUCATION IN SCHOOLS

Caterina Rapini (Università di Milano-Bicocca, Italy)

gender and sexuality education | gender-based violence | school

Schools are deeply shaped by cis-heteronormative, binary and adultist regimes (Hall, 2021; Santambrogio, 2022; Demozzi & Ghigi, 2024) that reproduce broader social hierarchies and sustain cultures of gender-based violence, often through the implicit and hidden curriculum (Donovan et al., 2023; Rapini, 2025; Selmi, 2025). In the Italian context, schools are currently experiencing contradictory tendencies. On the one hand, there is an increasing amount of censorship surrounding sexuality and gender education (Scarcelli & Selmi, 2025), as evidenced by the introduction of parental informed consent for sex education activities and the prohibition of such initiatives in primary schools. On the other hand, schools appear to be increasingly engaging with issues related to gender-based violence, particularly male violence against women and digital violence. However, these topics are often addressed within securitarian frameworks or through paternalistic and victimising narratives, which risk overlooking the broader cultural, material and relational conditions that produce violence. Moreover, discussions concerning young people's uses of digital media frequently tend to be framed through dynamics of moral panic (Scarcelli, 2020), shifting attention toward risk and control rather than fostering critical and situated reflection on gendered power relations in post-digital contexts. Against this backdrop, this paper asks how schools can create interstitial spaces for democratic agency in order to implement transformative gender and sexuality education practices that deconstruct, rather than reproduce, the culture of violence? This contribution is based on an ethnographic research project (Bove, 2019) conducted in an Italian secondary school. The project involved interviews, participatory workshops and collective analysis with teachers and students. The research employs a participatory and reflexive methodology, consistent with a transfeminist epistemology (Branlat et al., 2023; Keenan, 2022; Leach, 2006). Preliminary findings highlight significant tensions surrounding school discourses on gender-based violence. These discourses often generate forms of male resistance (Ging et al., 2024; Keddie, 2022) and struggle to engage students in meaningfully connecting their lived experiences - particularly within post-digital environments - with gender-based violence (Setty et al., 2024). Furthermore, the systematic invisibilization of LGBTQIA+ subjectivities within educational narratives contributes to the reinforcement and radicalisation of anti-gender discourses within the school context, perpetuating epistemic injustice (Fricker, 2007) and violence (Wozolek, 2018). The research also foregrounds the tensions teachers experience when addressing gender and sexuality. These include fear of backlash from families and school leadership, institutional constraints, and a sense of unease in moving beyond disciplinary boundaries toward more dialogical, relational and embodied pedagogical practices. At the same time, the findings suggest that spaces of mutual recognition and critical dialogue can emerge through a pedagogy of discomfort (Reygan & Francis, 2015; Zembylas, 2015) that addresses vulnerability and co-learning, rewriting of classroom hierarchies and challenging the adultist power/knowledge binary that underpins traditional schooling. When conceived as a participatory process, educational research itself becomes a democratic practice of questioning (Agud-Morell & Breull-Arancibia, 2025; Pacheco-Salazar, 2018; Bove, 2009). It fosters collective reflection on educational practices and creates opportunities to sustain gender and sexuality education, even in restrictive contexts.

THE TEACHER AS A BODY IN THE CLASSROOM: TRANSFEMINIST PEDAGOGIES AND COMPREHENSIVE SEXUALITY EDUCATION AS DEMOCRATIC PRACTICES IN ITALIAN SECONDARY SCHOOLS

Alice Valenza (Università degli Studi di Bari Aldo Moro, Italy; Gen-Q) · **Valeria Piras** (Consiglio Nazionale delle Ricerche - Istituto per le Tecnologie Didattiche; Gen-Q) · **Susanna Chiulli** (Gen-Q) · **Emanuele Falcolini** (Gen-Q)

Comprehensive Sexuality Education | Transfeminist Pedagogies | School

In Italy, where Comprehensive Sexuality Education (CSE) is not institutionally established and is increasingly targeted by anti-gender actors seeking to censor or delegitimize it, the integration of gender and sexuality perspectives in secondary schools depends largely on individual teachers' initiative. Drawing on semi-structured interviews with twelve teachers in italian public secondary schools, analyzed through a critical feminist lens using thematic coding, this contribution explores how transfeminist principles are embodied in their everyday pedagogical practice and mobilized in efforts to promote or implement CSE interventions. Findings show that participants, who identify both as transfeminist activists and public school teachers, describe transfeminism as a transversal pedagogical orientation (Barcelos, 2019) that shapes both classroom relations and CSE pathways. A recurring theme across interviews was a critical reflection on teacher positionality: the awareness that the teacher is a body in the classroom, embedded in asymmetrical power relations that must be continuously examined and renegotiated. Through work on language, spatial arrangements, evaluation, and curricular choices, teachers seek to dismantle hierarchical and performative logics that reproduce exclusion and epistemic injustice. In this perspective, CSE (UNESCO, 2018) is understood as a transformative framework enabling students to critically analyze the social and cultural norms shaping sexuality and relationships, and to make autonomous, informed choices about their bodies and relational lives. By recognizing that sexual health is deeply influenced by gender norms and power structures, CSE becomes a vantage point from which to interrogate the norms that determine who is recognized, whose experiences count as legitimate knowledge, and who is enabled to participate meaningfully in collective life. The contribution argues that these embodied and relational practices emerging from the interviewed teachers' experiences enact forms of intimate citizenship within the classroom, transforming everyday pedagogy into a site of democratic struggle. The

contribution shows how intersecting personal and professional trajectories translate into concrete transfeminist pedagogical approaches recognizable within the CSE UNESCO framework: an especially significant finding in the Italian context, where such practices face institutional obstruction. In polarized contexts marked by anti-gender backlash (Prearo, 2024) and attempts to censor or neutralize sexuality education, CSE and transfeminist pedagogies become sites of resistance and a practice of democracy in action, reshaping how we inhabit bodies, relationships, and shared social worlds.

'INTRUDERS', 'TRANSFORMERS' AND 'FALLEN SOLDIERS': EXPERIENCES OF NON-HETEROSEXUAL BOYS AND TRANS AND NON-BINARY STUDENTS IN SECONDARY EDUCATION

Berta Llos (Universitat Autònoma de Barcelona, Spain)

LGBTQ+ gender norms school spaces

Despite increasing legal protections, LGBTQ+ students remain among the most vulnerable groups within educational settings, facing persistent discrimination, exclusion, and emotional distress. Recent studies continue to identify LGBTQ+ youth as particularly exposed to violence and marginalization within schools (Harris et al., 2021; McBrien et al., 2022). In Europe, recent data indicate a concerning rise in school-based bullying against LGBTQ+ students (European Union Agency for Fundamental Rights, 2024). While numerous policies and interventions have been developed to address these issues, critical scholarship highlights that school violence is often framed as the result of individual behaviours rather than as a structural phenomenon embedded in institutional cultures and norms (Ferfolja, 2007; Payne and Smith, 2013). In response to these limitations, this paper examines LGBTQ+ students' school experiences from a relational and institutional perspective that situates them within a broader cisheteronormative logic shaping everyday school life. Specifically, the study focuses on the experiences of non-heterosexual boys and trans and non-binary students in secondary education in Catalonia. The research adopts a youth-centred qualitative approach (Bragg, 2010), combining the use of Relief Maps (Rodó-Zárate, 2014) and focus group discussions with a total of 285 students aged between 12 and 17 from 16 public secondary schools. Relief Maps were used to explore students' perceptions of comfort and discomfort across different spaces and identity axes, while focus groups provided a collective space to deepen the narratives emerging from these visual mappings. The findings reveal how students' experiences are shaped by multiple mechanisms of regulation related to gender and sexuality that operate through what Payne and Smith (2013) conceptualize as gender policing. Among non-heterosexual boys, hegemonic masculinity is often enforced through peer dynamics such as homophobic language, mockery, and humour, which function as mechanisms for reinforcing gender boundaries and hierarchies (Connell and Messerschmidt, 2005; Rawlings, 2019). These dynamics position heterosexual masculinity as the normative and desirable form of masculinity within school contexts. For trans and non-binary students, experiences of discomfort are particularly associated with specific school spaces such as changing rooms, bathrooms, and physical education settings. These spaces not only reproduce binary gender norms through their architectural organization but also through the social interactions they enable, including exclusion, questioning of gender identities, and cisnormative microaggressions (McBride and Neary, 2021). Overall, the study highlights the multidimensional role of school spaces in shaping students' experiences, demonstrating how both spatial arrangements and everyday interactions contribute to the reproduction of cisheteronormative hierarchies. By foregrounding youth voices and analysing how school institutions (re)produce hege-

monic identity models, this research calls for moving beyond individualizing approaches to school violence. Instead, it argues for addressing the structural dynamics through which gender and sexuality norms are enacted in schools, while promoting a feminist ethic of care and shared responsibility in educational practice. In doing so, the paper highlights how students' everyday experiences shape their possibilities for recognition, belonging, and participation within school communities.

"PIACERE DI CONOSCERCI": YOUTH-LED CSE AS DEMOCRATIC PRACTICE OF POLICY-MAKING IN SOUTH ITALY

Francesca Barbino (University of Palermo, Italy) · **Giulia La Barbera** (University of Palermo, Italy) · **Carmen Buglisi** (University of Palermo, Italy)

Comprehensive Sexuality Education | Gender-based violences | Youth participation

Italian schools are increasingly reflecting a plurality of identities and backgrounds, however this growing visibility of non-cis-hetero and non-white subjectivities clash with a parallel rise in oppressive, discriminatory and violent acts (Burgio, 2022; Biemmi, 2023; Di Grigoli, 2023; Rinaldi, 2023; Chiappelli & Bernacchi, 2024). In this scenario, Comprehensive Sexuality Education (CSE) could play a significant role in preventing gender-based violences (GBV) through the promotion of self-respect and respect for others, the expression of consent and enabling to seek support when needed (Bonvini and Demozzi, 2024; Demozzi and Ghigi, 2024; Nimbi, 2025). However, despite almost 50 years of attempts of entering the topic into Italian public policy-making (Bruno, 2024), CSE's structural integration in Italy is not ensured, leading to fragmented, inconsistent and often non-inclusive educational initiatives among the Italian regions (Goldfarb et al., 2021; Chinelli et al., 2024). Drawing on the concept of participatory action research (Orefice, 2006; Cammarota et al, 2008; Demetrio, 2020), this contribution examines the youth-led path that created the campaign Piacere di Conoscerci, launched in Palermo in 2024 to ask the Municipality to engage in the promotion of Comprehensive Sexuality Education (CSE) programs in local schools. The campaign, emerged from a qualitative data collection among students' organisations, educators and parents on their experiences of GBV, was launched in the attempt not to limit their intervention to protest or awareness-raising, but engaging in a participatory process aimed at producing situated knowledge capable of informing local public policy: the research phase informed the development of a public Manifesto which reached 70+ subscriptions from NGOs and CSE experts, and a petition which collected +6000 signatures addressed to the Municipality of Palermo asking to commit to a publicly supported, holistic, compulsory and intersectional local program of CSE. By positioning students as epistemic subjects and policy interlocutors, Piacere di Conoscerci may challenge normative hierarchies that traditionally exclude young people from shaping educational agendas, as well as heteronormative, binary, and moralising framings of sexuality that limit its discourse to a private sphere where young people cannot enter. Ultimately, the case

invites a rethinking of CSE not as curricular content alone but as a transformative infrastructure for democratic coexistence: by situating CSE within broader struggles over normativity, structural inequalities and the control of bodies in contemporary Italy, the paper argues that youth-led, intersectional approaches can contribute to renewing democratic cultures and repositioning schools as sites where intimate life and democratic culture are co-constructed.

WHEN INCLUSION EXCLUDES - SEXUALITY EDUCATION AS DEMOCRATIC PRACTICE BETWEEN NON FORMAL SETTINGS AND SCHOOL LOGICS

Eleonora Dolderer (University of Tuebingen, Germany)

Sexuality Education | Inclusion and Exclusion | Qualitative Research

In societal contexts increasingly shaped by polarization, anti-gender discourses, and moralization, sexuality and gender education has become a central arena for democratic negotiation. International and national framework concepts—such as the WHO recommendations or the European Standards for Sexuality Education—emphasize sexuality education as a contribution to equality, self-determination, and a society guided by compassion and justice. The concept of Comprehensive Sexuality Education (UNESCO, 2018) likewise understands sexuality education as a holistic educational process that addresses cognitive, emotional, social, and physical dimensions and enables learners to make informed, self-determined decisions. Thus, sexuality education moves far beyond conveying biological facts, preventive measures, or normative

knowledge: it becomes a democratic practice that shapes interactions, imaginations, and forms of living together. In Germany, some non-school organizations draw on the aforementioned approaches and offer sex-positive, emancipatory programs. Simultaneously, sexuality education practitioners operate within a highly politicized and contested discursive field, which poses significant challenges to everyday pedagogical work. Against this backdrop, my research examines how sexuality educators interpret these framework concepts and translate them into concrete pedagogical practices. The focus is not on the actors' attitudes or intentions, but on the structural conditions that become visible in communication. More specifically, the analysis centers on the intrinsic logics of sexuality education—those particular expectations, challenges, and communicative patterns that shape this pedagogical field and influence who is addressed, and how. Although the scientific discourse on sexuality education has expanded in recent years, it remains relatively limited, especially with regard to empirical studies. There is a particular lack of analyses grounded in social theory and educational science that investigate the concrete enactment of sexuality education in practice—precisely where this practice explicitly seeks to meet the normative aspirations outlined above. My qualitative research analyzes policy papers, interaction dynamics in sexuality education workshops, and interviews with educators from various non-school organizations. Based on the theoretical premise that pedagogical concepts always rely on implicit assumptions about their addressees, the analysis focuses on the social differentiations that become visible in communicative practice. The study`s findings show that the intended inclusive orientation of sexuality education faces structural limitations. Implicit assumptions about normality—regarding sexuality, relationships, gender, or cultural backgrounds—produce exclusion effects that tend to stabilize existing inequalities rather than reduce them. This gives rise to tensions between normative ideals and practical implementation: while sexuality education aims to promote equality and recognition, its modes of addressing learners sometimes reproduce and strengthens precisely the differences it seeks to overcome.

BEYOND STANDARDS: MAPPING SEXUALITY EDUCATION APPROACHES IN ITALY

Giuliano Flagiello (University of Naples "Federico II", Italy)

Comprehensive Sexuality Education | Educational Approaches | Qualitative Research

Comprehensive Sexuality Education (CSE) promoted by UNESCO (2018) has emerged as one of the main international frameworks guiding the design of sexuality education (SE) interventions. Within this approach, SE is conceived as a formative process aimed at promoting knowledge, skills, and respectful relationships that support both individual and collective well-being. However, despite the growing diffusion of this paradigm, the meaning attributed to the term comprehensive remains the subject of significant interpretative debate (Miedema et al., 2020). This ambiguity is particularly evident in the Italian context where, unlike in most European countries, there are no national guidelines for the systematic implementation of SE in schools (WHO & BZgA, 2010). In the absence of a unified institutional framework, many interventions are promoted by third sector organizations or developed through local projects, contributing to the appearance of an educational landscape characterized by considerable heterogeneity in terms of approaches, contents, and objectives (Chinelli et al., 2022). Starting from these premises, this paper presents an exploratory analysis, currently in progress, aimed at developing a taxonomy of SE approaches in the Italian context. The research takes as an initial reference the theoretical framework proposed by Jones (2015), according to which sexuality education practices can be interpreted through different paradigms (conservative, liberal, critical, and postmodern) used here as a preliminary

analytical framework. The study pursues two main objectives: to examine how the concept of CSE is interpreted and translated into educational practices, and to explore how sexual knowledge is defined, selected, and transmitted within school-based educational interventions. The study adopts a qualitative approach and is based on semi-structured interviews (Lumino & Vatrella, 2012) conducted with coordinators of educational projects implemented by third sector organizations involved in SE programs in Italian schools. Organizations were selected through purposive sampling (Amaturo et al., 2012), identifying institutions that explicitly declare their adherence to CSE principles in the design of their educational activities. Preliminary findings reveal significant heterogeneity not only in the ways SE is conceptualized, but also in the interpretation of the concept of comprehensive and in the strategies used to translate international guidelines into educational practice. Although all interviewed organizations claim to be inspired by the CSE framework, the analysis of interviews shows that this reference does not produce a uniform set of interventions. Instead, different approaches to selecting and transmitting sexual knowledge emerge. In particular, the interviews suggest the presence of several recurring configurations: A) interventions mainly focused on biomedical knowledge of the body and on a romantic and heteronormative representation of relationships; B) approaches centered on the emotional dimension and individual empowerment; C) programs characterized by a strong communicative and media-oriented dimension, often associated with the involvement of private actors; D) initiatives that combine individual well-being with a critical perspective on gender inequalities and the power relations that shape sexuality. These preliminary findings suggest that SE in Italy constitutes a heterogeneous field of practices and interpretations, in which the reference to CSE appears to function more as a general framework of legitimation than as a unified educational model.

sex and emotional education | consent | prevention of gender-based violence

The report "Comprehensive sexuality education (CSE) country profiles" by UNESCO's Global Education Monitoring Programme argues that, in order to promote a culture of emotional and sexual well-being, it is necessary to adopt a holistic and cross-cutting approach that takes into account every aspect of life and is addressed from childhood onwards as a process of support for growth, adapted to each age in a manner consistent with the development of each individual's capabilities. Discussing affectivity and sexuality in schools also means creating a shared vocabulary, not only amongst the student body but also within the formal and non-formal educational community, which enables a broad and unified approach to topics such as consent, boundaries and desire, thereby reducing subjective interpretations linked to a stereotypical patriarchal culture. Educating on differences, of which the authors of this contribution are a part, involves the drafting of a reasoned glossary, identifying the words and vocabulary to be shared among teachers at all school levels, educators, and families. This paper aims to provide an update on the progress of the glossary currently under develop-

ment. Sexual and emotional education enables us to work on group dynamics, the ability to name emotions, listen to one another, and ask questions in order to make informed choices; it helps us develop strategies for responding to aggression and discrimination, and for escaping controlling and violent relationships – fundamental skills for building active citizenship and a democratic society that places care and rights at its heart. This approach serves as a primary tool for combating gender-based violence, bullying and discrimination linked to gender, cultural background, sexual orientation, disability and age. Following the attacks on sex and relationship education programmes in schools by the Meloni government through Minister Valditara's draft bill (DDL) of 23 May 2025, which deals with 'Provisions regarding informed consent in schools' and in the absence of a law guaranteeing children's right to sex and emotional education programmes, it is becoming increasingly necessary to integrate a gender perspective and the Comprehensive Sexuality Education approach into the school curricula of the first cycle of education (nursery, primary and lower secondary).

POETIC SEXUALITY EDUCATION: ART, EXPRESSION AND RELATIONAL LEARNING FOR DEMOCRATIC COEXISTENCE

Chiara Massullo (University of Roma Tre, Italy)

affective education | pedagogy of expression | gender stereotypes

In the Italian educational context, sexuality education remains largely marginal or fragmented (Chinelli et al., 2023), despite its crucial relevance for personal development, relational well-being, and democratic coexistence. At the same time, persistent gender stereotypes continue to shape social imaginaries, expectations, and relationships across generations, contributing to the reproduction of unequal gender norms and, in some cases, fostering violent relational dynamics (UNGEI, 2023; Biemmi & Mapelli, 2023). These conditions highlight the need for educational approaches capable of addressing sexuality not merely as a domain of knowledge, but as a complex human experience involving affectivity, embodiment, imagination, and relational capacity (UNESCO, 2018; 2023). This study presents a pedagogical proposal grounded in the poetic paradigm of education and the theoretical framework of the Pedagogy of Expression (Scaramuzzo, 2013; 2019), which investigates human expressivity and its educability through aesthetic, embodied, and relational processes. Within this perspective, sexuality and affective education are conceived not as the transmission of biomedical information or behavioural norms, but as an educational path that supports the expression, understanding, and relational elaboration of subjective affective and erotic experience. The proposal is grounded in poetic sexuality education, a pedagogical approach developed by MimesisLab and Roma Tre Mimesis theatre company at the Department of Education, Roma Tre University, within the artistic-educational project Stanze di Eros (Scaramuzzo, 2023). Poetic sexuality education emphasises the formative potential of aesthetic languages, free expression, and narrative sharing. Through artistic stimuli, dialogic reflection, and expressive practices, this approach aims to cultivate poetic participation in relational life: the capacity to recognise one's own affective experience and understand that of others through empathy, listening, and care (Massullo, 2025a). The presentation focuses on the workshop "Non spingere, non tirare!" ("Don't push, don't pull"), an affective education programme promoted by the anti-violence centre Crisalide and implemented in eleven upper-secondary classes in Spoleto. The project aims to prevent gender-based violence and foster respectful relationships (Massullo, 2025b). The workshop adopts expressive, experiential, and participatory methodologies, combining artistic stimuli, bodily and relational exercises, dialogic practices, and creative narrative production. Through these activities, students explore dominant gender representations, recognise the normative force of stereotypes, and reflect on alternative relational possibilities grounded in expressive freedom, respect, and reciprocity. The presentation offers a practice-based pedagogical reflection on these educational experiences, drawing on interviews with members of the theatre company, documentation of university and school workshops, and students' expressive productions. Particular attention is given to

aesthetic participation and collective narrative expression in enabling participants to articulate lived experiences and engage with plural perspectives. The analysis suggests that poetic sexuality education can generate educational spaces characterised by listening, trust, and non-judgement, where the expression and sharing of lived experiences become resources for collective reflection. In this sense, the workshop can be interpreted as a democratic environment where dialogue, recognition of plurality, and the co-construction of meaning become key pedagogical practices. By foregrounding art, expression, and relational encounter, poetic sexuality education emerges as a promising educational pathway for challenging gender stereotypes and fostering more respectful and equitable forms of coexistence.

GENDER-EXPANSIVE CHILDHOODS AND THE QUESTION OF EPISTEMIC JUSTICE IN EARLY CHILDHOOD TEACHER EDUCATION

Antonio Raimondo Di Grigoli (University of Siena, Italy)

Epistemic justice | Gender-expansive childhoods | Teacher education

Sexuality and gender education has increasingly been recognised as a relevant dimension of early childhood education. Educational services for children aged 0–6 represent contexts in which children begin to encounter and negotiate social norms related to bodies, relationships and gender roles. Pedagogical practices within early childhood settings contribute to shaping children's early understandings of difference, belonging and relational life. Early childhood education and care services influence children's cognitive, emotional and relational development as well as early identity formation (Catarsi & Fortunati, 2004). Within this debate, increasing attention has been devoted to gender-expansive childhoods. Research suggests that diverse expressions of gender may emerge in the first years of life and become visible between the ages of two and three (Li et al., 2017). Gender-affirmative approaches emphasise the importance of educational environments capable of recognising children's gender expressions and supporting their wellbeing without pathologising gender diversity (Ehrensaft, 2016). These perspectives challenge binary understandings of gender and invite educators to consider gender as a socially and culturally situated dimension of childhood. Research has also shown how early childhood settings may reproduce cisnormativity and gender stereotypes unless educators intentionally develop pedagogical practices supporting trans and gender-expansive children (Burgio & Santambrogio, 2024; Di Grigoli, 2024). Recent debates in gender and education research highlight the need to critically interrogate the epistemological frameworks through which gender diversity is interpreted in educational contexts. Much of the scholarship on queer and gender-diverse childhoods has been developed within Euro-American contexts and risks being universalised as a normative framework for understanding children's experiences across culturally diverse settings. Decolonial and feminist approaches therefore call for unsettling dominant hierarchies of knowledge production and recognising the plurality of situated epistemologies shaping educational research and practice (Manion & Shah, 2019). Similarly, early childhood scholarship emphasises the importance of questioning colonial assumptions embedded in educational practices and re-

flecting on how relations to place, culture and knowledge are framed in early childhood contexts (Nxumalo, 2019). From this perspective, the notion of epistemic justice becomes central, as it calls for recognising whose knowledge, experiences and cultural meanings are legitimised in educational discourses about gender, childhood and family practices. Recent work in queer studies in education shows how Eurocentric understandings of queer identities risk being normalised as universal models, marginalising cultural imaginaries and epistemologies emerging from the global majority (Coloma, 2024). These reflections invite educators to approach gender education through perspectives attentive to epistemic plurality and cultural diversity. This paper develops a theoretical-pedagogical reflection on the education and training of early childhood educators, focusing on how teacher education programmes can support inclusive pedagogical practices in culturally diverse early childhood services. In particular, it argues for approaches that promote gender-expansive pedagogies while maintaining critical awareness of epistemic plurality, in which the category of queerness is critically interrogated through perspectives attentive to epistemic justice and cultural plurality in early childhood education. Such competencies are particularly important in the integrated 0–6 educational system, where teachers play a crucial role in shaping inclusive environments and challenging cisnormative assumptions.

LEGGERE SENZA STEREOTIPI. AN ILLUSTRATED BIBLIOGRAPHY TO COMBAT GENDER-BASED VIOLENCE

Sara Marini (SCOSSE aps, Italy) · **Chiara Antoniucci** (SCOSSE aps, Italy; Università degli studi di Cassino e del Lazio Meridionale) · **Elena Fierli** (SCOSSE aps, Italy) · **Giulia Franchi** (SCOSSE aps, Italy) · **Cristian Greco** (SCOSSE aps, Italy) · **Caterina Rapini** (SCOSSE aps, Italy; Università degli Studi di Milano-Bicocca)

gender education | gender based violence | picture books

Since 2011, the Scosse association has been working on gender education in schools of all levels, from nursery to upper secondary school. Since that same year, we have been running the Leggere Senza Stereotipi project: a research initiative that conducts ongoing monitoring of gender representations in illustrated children's literature published in Italy; a free, regularly updated online catalogue offering a selection of around a thousand titles that serve as tools for deconstructing and critically analysing gender and role stereotypes, whilst also providing the option to carry out advanced searches within the database; an educational approach that, through picture books, encourages the reading of normative models conveyed from early childhood through these media, as well as those that the adults who create, select and mediate these books are consciously or unconsciously carriers of (Fierli et al. 2015, 2020a, 2022) Picture books are deeply complex cultural artefacts based on the dialogue between text and images (Handler & Spitz, 2001; Van der Linden, 2006, 2013). Through their stories, they offer a potentially infinite variety of experiences and perspectives (Chabrol & Gagne, 2011; Fierli et al., 2015), a kaleidoscope of available expressive choices (Van Der Linden, 2003). They represent cultural artefacts that a given society produces to narrate its own story and educate, imbued with norms that influence how readers construct their own imagination and value systems (Hamelin, 2012; Mitchell, 2002). In the three-year period 2024–2026, the project Leggere Senza Stereotipi per contrastare la violenza di genere – Libri, immagini e letteratura per prevenire e contrastare la violenza di genere e tra i generi, funded under the 'Poster – practices beyond stereotypes' call for proposals and coordinated by AIDOS Associazione Italiana Donne per lo Sviluppo, has enabled a substantial update of

the database and the development of a bibliography dedicated to combating gender-based violence for the 0–18 age group. Around 40 titles, including picture books and graphic novels, which address the issue of combating gender-based violence through a holistic approach that incorporates the recommendations of the Istanbul Declaration (Council of Europe 2011) and follows the guidelines for Comprehensive Sexuality Education issued by UNESCO (2018). From this perspective, the ideas put forward in the books under consideration include education in consent, the exercise of self-determination and the affirmation of pleasure from the very earliest years of childhood, critical engagement with gender and role stereotypes that remain so pervasive in the structure of the societies in which we live, and the building of relationships free from dynamics of control and possession, ranging from parental relationships to those within couples – a need underscored by recent statistical surveys (Save the Children Italia 2024; Ipsos 2026; Ipsos Doxa 2026). As the age groups progress, the selection encourages the ability to identify and name all forms of patriarchal and cisheterosexist violence. Bibliographical suggestions that outline a paradigm of gender-based violence and gender as structural, and an educational approach aimed at combating it.

SEARCHING FOR WHOLE-SCHOOL APPROACHES IN EARLY CHILDHOOD EDUCATION AND CARE (ECEC) GENDER EDUCATION

Carolina Trivelli Díaz (University of Verona, Italy)

Gender education | early childhood | whole-school approach

Gender education, most often framed today as comprehensive sexuality education (CSE), is predominantly discussed and implemented in the preadolescent and adolescent age-gap, reflecting the assumption that it becomes relevant only at those ages (UNESCO et al., 2021). However, students have repeatedly described this timing as "too little, too late," consistently calling for earlier engagement (Pound et al., 2016). In fact, when gender education is introduced later in schooling, beliefs, attitudes, and overall social norms are already long embedded in young people's identities and social worlds, making it more complex to enact transformation. Despite global consensus on adopting a life-course approache to CSE (articulated as spiral curriculum models beginning in early childhood and unfolding across grades and subjects), implementation continues to fall short of its transformative aims. Common barriers include insufficient teacher training, weak alignment with learners' needs, limited use of participatory pedagogies, and institutional constraints. These difficulties are intensified by the controversial nature of gender education, which frequently generates "classroom wars" (Mehlman Petrzela, 2015), being a common target of the anti-gender movement. With the 2030 SDG benchmark approaching, persistent gaps in the SDGs crossed by gender education foreground the urgency not only to start in early childhood, but to rethink this educational object as a whole. Gender and sexuality education demands a transversal

approach embedded in institutions' learning cultures instead of being occasional add-ons. Recent research in the field highlights the potential of whole-setting approaches in early childhood gender education, while also emphasizing the complexity of adopting and sustaining such models (Sità & Trivelli Díaz, in press). However, evidence on which ECEC initiatives operationalize whole-school approaches, and how, remains unexplored. This study explores and analyzes early childhood gender education initiatives through a whole-school lens, defined as whole-setting change across curriculum, staff, leadership, and family engagement, with the aim of identifying design features, implementation patterns, and lessons for practice. A literature review and document analysis of secondary sources was conducted to identify ECEC gender education initiatives. Inclusion criteria were: (1) focus on children aged 0–6; and (2) documentation of implementation components extending beyond classroom-based lessons. Initiatives most closely aligned with whole-school approaches like "Body Emotion Education" in Finland and "Welcoming Schools" in the U.S. combine elements such as sustained professional development for educators, leadership commitment, and deliberate family engagement strategies. These initiatives tend to report stronger outcomes, including educator confidence, reduced resistance from families, and more consistent engagement with intersectionality. At the same time, key challenges persist, particularly regarding sustainability over time, coherence across institutional actors and practices, and navigating external contestation (Cacciatore, 2020; Derman-Sparks & Olsen-Edwards, 2012). Findings support whole-school approaches as a promising model for adressing the effectiveness, sustainability, and contextual resilience of gender education in ECEC. While learning in this domain cannot be reduced to narrowly measurable outcomes, longitudinal research could deepen out understanding of ECEC institutions as activity systems (Hedegaard, 2012) and of children's evolving meaning-making and attitudes related to gender over time.

Gender Representations And Democracy: Violence, Media And Cultural Resistance

PANEL CONVENORS: Milena Meo (University of Messina, Italy); Valentina Raffa (University of Messina, Italy)

PANEL KEYWORDS: Gender Equality, Gender-based violence, media representation

This panel explores how gender inequalities - particularly those related to gender-based violence - are reproduced, contested or transformed through educational, media and cultural socialisation processes. In dialogue with the conference theme Learning for Democracy/Democracy for Learning, the panel investigates how democratic values can be cultivated in a communicative environment marked by disinformation, polarisation, and persistent gender stereotypes. In contemporary societies, public discourse play a decisive role in shaping the democratic imaginary, but they often normalise sexist narratives and reproduce structural power asymmetries. We invite researchers to contribute reflections that analyse how media ecosystems, journalism and digital communication spaces represent gender, power and violence, and how these representations influence democratic participation and the possibilities for inclusive citizenship. Particular attention is paid to media narratives of gender-based violence and their impact on public understanding of rights, agency and responsibility, as well as to feminist and LGBTQ+ counter-narratives and reframing practices developed, for example, by civil society and feminist and LGBTQ+ movements, which are capable of countering stereotypes, biases and cultures of blame. The panel promotes interdisciplinary approaches that integrate feminist theories, media studies, sociology of education and political sociology. We particularly encourage proposals that adopt an intersectional perspective and engage with different socio-cultural contexts, including comparative analyses. By intertwining gender, educational processes and democratic practices, the panel aims to highlight how societies can foster the formation of critical, informed and gender-sensitive citizens who are capable of nurturing democracy in its everyday dimension.

FRAMES OF INJUSTICE: HOW ITALIAN JOURNALISM SHAPES DEMOCRATIC LEARNING ON GANG RAPE

Lucia Pelle (University of Tuscia, Italy)

Gang rape | Democracy | Press representation

This paper examines Italian newspapers' representation of gang rape cases, investigating whether and to what extent the press interprets gender-based violence (GBV) through the lens of a democratic concern. While press coverage of GBV has profoundly evolved in recent years, it still largely relies on frames that center on individual responsibility - despite male concealment. Therefore, newspaper articles rarely conceptualise GBV as a social, cultural, and political concern, whose consequences for democracy are far from negligible. GBV represents a profound yet often underestimated wound to democracy. Described as historically one of the most persistent violations of human rights, GBV undermines the very principles of political equality upon which democratic systems are founded. The systematic exposure to gender-related violence that minoritised subjectivities experience both shapes their participation to the public sphere, and the public sphere itself - which becomes even more evident through an intersectional perspective. In this sense, GBV is not just a "women's issue", but rather a democratic one. The media plays a crucial role as an arena of socialisation where cultural norms about gender, violence and power can be produced and reproduced. The press has a responsibility to educate citizens about the correct ways to interpret GBV, free form biases and secondary victimization: journalistic narratives can thus operate as a diffuse form of democratic learning. When the press fails to recognize GBV'S structural nature, it contributes to both hermeneutical injustice, preventing victims and the public from conceptualising it as a political issue, and testimonial injustice, by silencing the structural dimension of the survivors' experiences. Within the spectrum of forms of GBV, gang rape represents a significative case, given that the victim is both outnumbered and subject to sexual and sometimes digital violence (NCSII). Moreover, studying gang rape highlights the performative dimension of violence - evident in the homosocial dynamics through which masculinity is collectively enacted - while intersecting with pressing contemporary political claims, like sexual consent and women's freedom in public space. The study adopts a qualitative research design, combining human content analysis and semi-structured interviews. The content analysis examines a corpus of over 200 Italian newspaper articles covering gang rape cases, focusing on frames of GBV as a social, political and democratic concern. The interviews with Italian journalists explore their interpretative frameworks, investigating whether and to what extent they conceptualise GBV as a structural concern. Preliminary findings suggest that press

coverage predominantly frames gang rape as an isolated incident, rarely articulating its broader implications for democracy. While some journalists recognise the influence of feminist movements, GBV is seldom explicitly framed as a question of political equality. This research contributes to debates within feminist political theory, media studies, and democratic education by underlining the gap between structural understanding of GBV and its limited democratic framing in the press. The study argues that strengthening democracy requires reconceptualising GBV as a core democratic issue, fostering communicative environments capable of nurturing gender-sensitive citizenship.

THE NEW FEMININE MYSTIQUE: A STUDY ON THE PLATFORMIZATION OF EVERYDAY CARE

Antonia Cava (University of Messina, Italy) · **Debora Maria Pizzimenti** (University of Calabria, Italy)

Tradwives | Platformed Motherhood | Digital Ethnography

In contemporary digital culture, traditional femininity has re-emerged not simply as ideology but as a highly mediated practice. While scholarship on "tradwives" has largely examined Anglophone contexts marked by explicit political radicalisation (Proctor, 2022; Sykes & Hopner, 2024), less attention has been paid to culturally situated forms of platformed motherhood in Southern Europe (Abidin, 2018). Focusing on Italy, this study shifts the analytical lens from overtly ideological tradwife communities to the figure of the "digital mother": a content creator who narrativises everyday practices of care, domestic labour, and maternal devotion through social media. Drawing on feminist media studies and a critical reinterpretation of Betty Friedan's The Feminine Mystique (1963), the paper examines how what Friedan described as "the problem that has no name" is rearticulated within regimes of digital visibility. Rather than interpreting these practices as a simple revival of pre-feminist domestic ideology, we conceptualise platformed motherhood as embedded in neoliberal media economies structured by visibility, affective performance, and monetisation (Banet-Weiser & Reinis, 2025). In line with research on mediatized motherhood and sharenting (Mascheroni et al., 2023), maternal self-representation online emerges as both care practice and identity performance shaped by gendered norms (Butler, 1990) and platform infrastructures (Van Dijck, 2013). Methodologically, the study combines digital ethnography (Varis, 2021) and in-depth interviews, with qualitative data analysed using NVivo (Mortelmans, 2019). We first map the semantic and ideological boundaries of "tradwife" across online communities, including Reddit, before shifting to the Italian context. Although explicit self-identification as tradwife remains rare in Italy, family-oriented influencers increasingly frame motherhood and domestic labour as sites of personal fulfilment, moral legitimacy, and entrepreneurial opportunity. Through in-depth interviews with Italian content creators active on Instagram and TikTok, we examine how they negotiate selfhood, agency, visibility, and economic participation. Preliminary findings suggest that contemporary platformed femininity is not sustained by domestic exclusion but reorganised through regimes of visibility in which care becomes publicly narrated and economically valorised. In this context, platformed motherhood functions as an informal site of socialisation in which gender norms are narrativised, aestheticised, and stabilised. Through algorithmic amplification and affective engagement, everyday care is reframed as both entrepreneurial opportunity and personal choice.

BETWEEN INDIAN EDUCATION AND SOCIETY: HATTEE GIRLS OF HIMACHAL PRADESH

Kashmir Kashyap (Higher Education, H.P. (Outsourced), India)

Hattee | Democracy | Education

Introduction: India is a largest democracy in the world. The constitution ensures equity and inclusion for citizens irrespective of caste, creed, religion, ethnicity and gender. Mission 'Education to All'- (2001) declared the child-education as a fundamental right and equal opportunities of elementary education to all girls. 'New Education Policy (NEP-2020)' emphasized sharp curtail in dropout rates at school level. Similarly, 'Prime Minister Higher Education Mission'-(2023)

focused on equity, access and inclusion of women in higher education. But primitive social system presents other side of the coin. Hattee community is settled in trans-Giri area of Sirmaur District in Himachal Pradesh. These people find their ancestry from the kuru dynasty of epic age and follow the related customs. Fraternal polyandry is in vogue and presently practised. This concept is based on Draupadi system of Mahabharata. Hattee society follows the child marriage. In rare cases, the engagement of unborn babies (in womb) can be settled. A girl is considered as the precious person in the family, who is subject to bride-price. These social evils resist the all-round development of girl children. Consequently, large number of poor girls are forced to drop out of the primary or secondary education. As per survey (2015-16), about four hundred girl-children in shilai sub-division dropped out of primary and middle education. These girls are often lured with rosy picture of bright future by the brokers involved and trafficked to neighboring states of Himachal Pradesh (Ground Reports, 2016). The brokers settle these marriages by taking into confidence the parents and close relatives of poor girls. Sadly, rural girls have to face socio-cultural difficulties in urban areas after marriage. Allegedly, a few girls are dragged into prostitution. Such incidences are unfortunate and put the safety and dignity of hattee women at stake. Slogan of the Government is 'save girls and teach girls'. Social reformers and thinkers should motivate the hattee people for women-education and cultural renaissance. Methodology: It is a relevant research question as to what extent primitive social set up resists the gender equality in democratic education system. Diversity of Indian culture provides wider scope for socio-cultural issues. Social evils are the real hindrance in girl's education and democratic rights? Sources of information include the Administrative and Census Reports, Print media Ground Reports, Ministry of Tribal Affairs Reports, Policy documents of Human Resource Development (Government of India) and selected primary sources. Historical Method has been applied in the study. Conclusion: In India, democracy ensures equality and inclusion in education for all citizens. Government schemes enforce democratic values in education for weaker sections of society and women. Gender-equality and women empowerment are always ensured.Indian Constitution guarantees gender- equality. Indian democratic system is legal, transparent and explicit but social system and customs are primitive and complex. Hattee community is a unique cultural identity in Himachal Pradesh and India. Its affiliation with the epic age is a distinct feature, which must be preserved. No doubt, evils crept into socio-cultural life of hattee people. To eradicate these evils is the need of hour.

NAMING FEMICIDE, REPRODUCING BIAS: MEDIA REPRESENTATIONS OF ILARIA SULA'S CASE AND THEIR DEMOCRATIC IMPLICATIONS

Flaminia Saccà (Sapienza University of Rome, Italy) · **Maddalena Carbonari** (Sapienza University of Rome, Italy)

male violence against women | femicide | media representation

The increasing use of the term "femicide" in Italian media suggests a growing public recognition of male violence against women. However, naming does not automatically entail structural understanding. This study investigates whether contemporary Italian press has started to move beyond episodic framings of intimate partner violence or continues to reproduce gendered distortions that silence its structural roots. Although domestic and intimate partner violence is one of the most widespread forms of violence (WHO, 2023; ISTAT, 2025), this phenomenon remains particularly difficult to recognize, even for the victims themselves, since it tends to be socially normalized rather than stigmatized (Gius and Lalli 2014; Hewa 2021; Lalli 2021; Saccà 2021, 2024; Saccà, Carbonari 2025), as we can see from the analysis of the press. Based on this premise, this study analyzes news articles on intimate partner violence published in 2025 by 26 Italian newspapers (2440), with a specific focus on the femicide of Ilaria Sula (159) to assess whether and to what extent the stereotypical frames that have historically shaped journalistic narratives on the issue are still detectable. The results show

that the case of Ilaria Sula received significantly higher media attention compared to other victims, suggesting a hierarchy of visibility. In this case, compared to previous studies (Saccà 2021, 2024; Saccà, Carbonari 2025), explicit victim-blaming is largely absent and the offender is more clearly identified as a "violent man" (e.g., "killer," "abuser"), whereas exonerating strategies of Himpathy (Manne, 2018, 2020) are less frequent than average. Nevertheless, despite the relatively good practices observed for narrating Ilaria Sula's case, the dominant narrative structure remains investigative and sensational, foregrounding brutality while backgrounding the broader cultural and structural dynamics of gender inequality. By exposing the gap between the public naming of femicide and the persistent silencing of structural power relations, the study highlights the democratic implications of media discourse. When gender-based violence is individualized rather than contextualized, the democratic imaginary risks acknowledging the crime while depoliticizing its causes, thereby limiting the development of critical and gender-aware citizenship.

CRITICAL MEDIA LITERACY AND GENDER EQUALITY: FOSTERING DEMOCRATIC AGENCY THROUGH GAZE THEORY AND STANDPOINT EPISTEMOLOGY

Giulia Lombardo (Istituto nazionale di documentazione innovazione e ricerca educativa (INDIRE), Italy)

critical media literacy | gaze theory | standpoint epistemology

Abstract: This paper is a theoretical reflection calling for broadening the perspective on gender stereotypes in the mass media and cinema by integrating political (Foucault 1975/1977) epistemic, aesthetic and formal aspects (Stam et. al, 1999; Dinoi, 2008) that have been neglected in existing educational practices of critical media literacy (CML). As highlighted by the Council of Europe (2016), in an era dominated by visual media, stereotypical images of women and men disseminated by the media can undermine progress made in gender equality. The literature review by Santonicciolo et al. (2023) on gender representation in the media shows that stereotypical, objectifying and sexualizing representations of women are still very common and promote sexism, harassment and violence by men. In the post-truth era (MacIntyre, 2018), disinformation has been the main driver behind the rise of media and digital literacy at European level. The deconstruction of gender biases in the media is an integral part of the process that, through the enhancement of critical skills, moves towards combating the biased and untruthful use of information. Knowing how to recognize and combat disinformation implies the need to extend our understanding and ability to deconstruct media information beyond aspects strictly related to the truth of the content to include formal and esthetic considerations concurring to meaning-generating mechanisms. The critical nature of media literacy and the need to strengthen it are recognized in European Commission, 2020a; 2020b; 2020c). DigComp 3.0 (Cosgrove and Cachia, 2025) also places great emphasis on critical thinking and the evaluation of digital information. However, despite the importance given to media education, specific reflections on how digital media messages are constructed, which points of view are legitimized and in what way, remain neglected dimensions. Extending the scope of media education to epistemological and perspective aspects means creating a deeper understanding of how media products play an important role in shaping and reinforcing hierarchies of power and knowledge.

Starting from a definition of critical media literacy (Hobbs e Frost, 2003; Hobbs e Jensen, 2009; NAMLE 2009; Kellner e Share 2007; Carr 2009; Giroux 2001; Jenkins et al. 2013; Puchner et al., 2015), this study aims to explore the contribution that gaze theory (Berger, 1972; Metz, 1974; Mulvey, 1975; MacCabe, 1976; Bhandari, 2021) and stand point epistemology (Harding, 1986; Smith,1989; Haraway, 1991; Code,1993; Harding, 1993; Tanesini, 2015) can make to the fight against gender biases and the development of student agency. Gaze theory and standpoint epistemology offer a pedagogical space that opens the possibility of moving from interpretation to intervention. Since digital technologies and the internet have made users active creators of content, agency becomes a concrete and real opportunity to rewrite the imaginary. However, this implies the need for forms of literacy that address the deep political ways in which knowledge, practice, discourse, images and values are constructed and enter our lives.

VICTIMS, PERPETRATORS AND MEDIA NARRATIVES: GENDER-BASED VIOLENCE IN ROME NEWSPAPERS

Rosalba Belmonte (Unitelma Sapienza, Italy)

Gender-based violence | Sexist stereotypes | Media narratives

Over the past decades, male violence against women has gained increasing visibility in the public sphere and in media discourse. In this context, the media, and the press in particular, play a crucial role in the social construction of the phenomenon, shaping public opinion through specific narrative, lexical, and interpretative choices. However, research on media representation of gender-based violence has shown that the journalistic narratives of such violence are often permeated by stereotypes and distortions that tend to individualize episodes of violence, re-victimize women, and partially absolve violence perpetrators. The here proposed contribution analyzes how male violence against women and its protagonists — victims and perpetrators — are represented in crime reporting in newspapers published in Rome. The analysis is based on a corpus of 2,037 articles published in 2024 and 2025 by eight newspapers based in Rome. The study combines corpus-assisted analysis using an ad hoc artificial intelligence tool with lexicometric methods and qualitative content analysis in order to identify recurring linguistic patterns and discursive strategies in journalistic narratives about gender-based violence. The findings show that the Roman press reproduces several dynamics already highlighted in international studies: the strong centrality of female figures in news narratives, accompanied by the relative concealment of male perpetrators; the use of discursive strategies such as linguistic avoidance and euphemization that tend to obscure male responsibility; the portrayal of victims primarily through categories of vulnerability and passivity; and, simultaneously, the representation of perpetrators through narratives that oscillate between moral condemnation and mitigation of perpetrators' responsibility grounded in biographical, psychological, or social explanations. The analysis also highlights the emphasis placed on the cultural and geographical origin of perpetrators and the role of social hierarchies in shaping empathy and stigma toward the actors involved in cases of violence. Overall, the study shows how these discursive practices contribute to producing a narrative that, while morally condemning violence, still struggles to fully acknowledge its structural and gendered nature. This contribution aims to reflect on the role of the press in reproducing or challenging gender stereotypes and to emphasize the need to promote greater social responsibility in journalistic reporting on violence against women.

GENDER AND THE CONSTRUCTION OF "THE PEOPLE": RADICAL RIGHT NARRATIVES AND ANTI-DEMOCRATIC IMAGINARIES IN THE DIGITAL PUBLIC SPHERE

Natale Feo (università degli studi di messina, Italy)

Democracy | Power | Gender

Contemporary democratic societies are increasingly shaped by digital media ecosystems in which political actors produce and disseminate strategic narratives capable of instrumentalizing and redefining concepts such as democracy, rights, and participation (Gerbaudo, 2018). In dialogue with the theme of the conference Learning for Democracy / Democracy for Learning, this contribution examines how the public discourse of the radical right contributes to the construction of an antidemocratic imaginary through hierarchical representations of gender and the delegitimization of subjectivities deemed "other" (Mostov, 2021). Within a hybrid public sphere—where mainstream media and digital platforms intersect—radical right leaders do not merely communicate programmatic content; they mobilize symbolic and emotional repertoires that redefine the boundaries of citizenship and participation. The methodological approach integrates political sociology, communication theory, and gender studies. Specifically, the paper mobilizes the concept of political culture to interpret the radical right not only as a political actor, but as a relatively coherent set of beliefs, attitudes, and norms that shape participation and define the boundaries of the political community (Formisano,2001; Anselmi, 2023). From an illiberal perspective, this political culture sustains a selective conception of citizenship, in which democratic participation is symbolically and morally reserved for a culturally homogeneous "people," while subjectivities perceived as incompatible

are marginalized (Mudde & Kaltwasser, 2018). The paper investigates how these actors instrumentalize digital spaces—Facebook and X—to produce and amplify sexist narratives, heteronormative frames, and exclusionary representations of gender, LGBTQ+ identities, and immigration (Puar, 2017). Rather than interpreting these communicative practices as contingent rhetorical strategies, the study conceptualizes them as structurally embedded mechanisms through which illiberal values and exclusionary visions of the social order are normalized. The empirical basis consists of a corpus of social media content and public interviews by prominent leaders of the Italian radical right. Through qualitative content analysis conducted using NVivo, the research reconstructs recurring discursive patterns, framing strategies, and symbolic oppositions that structure these narratives. Particular attention is devoted to the ways in which gender equality, feminism, and LGBTQ+ rights are framed as threats to national identity, social cohesion, and the "traditional" family. In this context, gender-based violence and minority protection policies are sometimes reinterpreted through securitarian or culturalist lenses, producing an emotionally charged counter-narrative that opposes a morally legitimate "us" to a "them" constructed as deviant and destabilizing (Mudde, 2020; Serughetti, 2021). The analysis shows how digital platforms function as privileged arenas for the production and circulation of a regressive democratic imaginary, in which the symbolic exclusion of certain subjectivities is presented as natural or necessary. These dynamics have concrete implications for democratic participation: by stigmatizing feminist advocacy and LGBTQ+ visibility, radical right discourse contributes to narrowing the conditions of possibility for inclusive citizenship (Mounk, 2018). Understanding these discursive mechanisms is therefore a necessary step toward promoting critical media literacy (Livingstone, 2004) and gender-sensitive educational practices capable of strengthening the everyday dimension of democracy in contemporary European societies through an explicitly intersectional perspective.

Intersectional Methodologies: Approaches, Methods and Tools for Research in Educational and Organisational Contexts

PANEL CONVENORS: Barbara Giovanna Bello (Università degli Studi della Tuscia, Viterbo); Luisa De Vita (Sapienza, Italy); Alessandra Romano (Università di Siena)

PANEL KEYWORDS: intersectionality, methodologies, inequalities

This session invites theoretical and empirical contributions examining how to effectively and consistently conduct intersectional research within university, school, educational, and organizational contexts. Intersectional analysis—acknowledging race, class, gender, disability, and other systems of oppression as interdependent—is essential for understanding complex social inequalities, yet translating this framework into rigorous methods remains challenging. We seek work that explores the methodological, ethical, and epistemological dilemmas involved in applying an intersectional lens. A key focus is the investigation of educational practices from multiple standpoints. This includes analysing learners' experiences and opportunities shaped by intersecting inequalities, as well as the perspectives of educators and those involved in evaluating educational contexts, such as national assessment bodies like INVALSI. Understanding how these actors interpret and implement educational processes is crucial for revealing how intersectional dynamics shape everyday pedagogical and evaluative practices. Theoretical proposals may draw on intersectional epistemologies, feminist materialism, DisCrit, InterDisCrit, and disability studies across disciplines. Empirical studies may include, but are not limited to: i. Developing multimethodological intersectional designs; ii. Navigating data collection and analysis to avoid essentialism and tokenism; iii. Addressing power dynamics in the research process and establishing ethical guidelines that build epistemic alliances with marginalized communities. The session aims to advance both the conceptual clarity of intersectional research and the practical implementation of studies that produce nuanced, equity-oriented, and transformative insights for educational and organizational practices.

INTERSECTIONAL BODY SHAMING. A TOOL FOR QUANTIFYING A RELATIONAL PHENOMENON

Laura Occhini (università di Siena, Italy) · **Maria Rita Mancaniello** (università di Siena, Italy)

Body shaming | Body victimizaction | Intersectional body shaming

Body shaming is a widespread but methodologically elusive phenomenon that challenges traditional quantitative measurement strategies. In scientific literature, it is often studied using tools that focus on isolated aspects of the experience—such as specific physical characteristics, individual traits, or contexts—without integrating them into a coherent framework. This fragmentation risks obscuring the complex nature of body shaming, limiting the interpretability and comparability of empirical results. This study introduces a measurement tool to study body shaming while preserving its relational, contextual, and intersectional complexity. The study assumes that body shaming cannot be adequately understood if treated as a unitary or homogeneous event. Rather, body shaming is conceptualized as an experience produced by the intersection of multiple dimensions, including gender, age, social positioning, relational configurations, and life contexts. In this framework, intersectionality is not addressed as a descriptive variable added a posteriori, but as a methodological principle that guides both the construction of the instrument and the organization of the data. Overall, the study proposes a measurement model that conceptualizes body shaming not as a single variable, but as a layered relational phenomenon that manifests through systematic communicative strategies of devaluation at the lexical level, with implications for self-perception, self-esteem, and interpersonal relationships. To operationalize this perspective, the study developed a questionnaire with a key methodological feature: the analytical separation of dimensions that are often conflated in existing research. The instrument distinguishes between the relational level – defined as the nature of the relationship between victim and aggressor (e.g., strangers, friends, family members) –and the relational context, understood as the interactional configuration in which body shaming occurs (e.g., group settings, one-to-one interactions). Treating these dimensions as analytically independent preserves the complexity of lived experiences and supports a multilevel analysis of the phenomenon, while avoiding hybrid or ambiguous categories. Additional sections of the questionnaire allow these dimensions to be systematically cross-referenced with gender, age, and life contexts, making it possible to identify patterns of differentiated exposure that would remain invisible with one-dimensional measurement

approaches. The tool also includes open-ended options that allow unexpected categories to emerge, thus increasing its sensitivity to lived experience beyond predefined sets of responses. The questionnaire was administered online via Google Forms to a sample of 1,014 participants. A branching logic was implemented to distinguish between respondents who had directly experienced body shaming and those who had only witnessed it. This design choice reduces the burden on respondents and improves data quality by avoiding the administration of irrelevant items. Empirical results indicate that body shaming occurs predominantly within weak or impersonal relationships, but a significant proportion of episodes also occur within meaningful relational spheres, particularly among friends and family members. Group contexts emerge as the most frequent interactional context, amplifying the role of public and performative dynamics. Furthermore, data on non-cisgender participants reveal high exposure across multiple levels and relational contexts, highlighting an intersectional vulnerability linked to the interaction between gender identity and dominant body norms.

OPERATIONALISING INTERSECTIONALITY THROUGH TRANSDISCIPLINARY RESEARCH: METHODOLOGICAL REFLECTIONS FROM THE INTERGEN PROJECT

Mariella Nocenzi (LUMSA University of Rome, Italy) · **Raffaella Monia Calia** (Sapienza University of Rome)

Intersectionality | Trandisciplinarity | Women's Empowerment

Intersectionality is widely recognised as a key framework for analysing complex and overlapping inequalities, yet its methodological operationalisation in educational and organisational research remains contested. This paper contributes to the debate on intersectional methodologies by reflecting on the transdisciplinary research design developed within the INTERGEN project, funded under the Italian National Recovery and Resilience Plan (PNRR), which focuses on women's empowerment and sustainable entrepreneurship in marginal and inner areas. Using the INTERGEN Transdisciplinarity Report as a reflexive case study, the paper conceptualises intersectionality not as a predefined set of additive categories, but as a relational and situated analytical process. Gender, generation, territorial marginality, socio-economic conditions, and - where empirically relevant - migration background and care responsibilities are treated as intersecting axes whose salience emerges through the research process rather than being hierarchically fixed ex ante. This approach requires a transdisciplinary framework capable of integrating sociological, gender, economic, territorial and policy-oriented knowledge with experiential and practice-based forms of expertise. Methodologically, INTERGEN combines multiple, interdependent tools: (1) the mapping and analysis of good practices, conceptualised as situated learning environments in which organisational, educational and community-based knowledge intersect; (2) a Delphi study involving scholars, practitioners and institutional actors, explicitly designed to surface disagreements, policy blind spots and divergent positionalities rather than forcing artificial consensus; and (3) participatory co-design and co-creation processes with women and local stakeholders. Intersectionality is operationalised through iterative analytical strategies, including reflexive positionality work, cross-dimensional analytical matrices and feedback loops with participants, aimed at avoiding essentialisation and tokenistic representations. The paper discusses key methodological and ethical dilemmas encountered in the research process, such as power asymmetries between academic and non-academic actors, the tension between contextual specificity and transferability of practices, and the risk of flattening diversity through policy-driven categories. From an educational perspective, INTERGEN conceptualises learning not merely as skills acquisition, but as a democratic

process of mutual recognition, translation and reflexivity across different forms of knowledge and levels of governance. By linking intersectionality and transdisciplinarity, the paper argues that methodological pluralism is not a neutral technical choice but a democratic one. Intersectional transdisciplinary research can function as a form of learning democracy, fostering epistemic justice in knowledge production, while simultaneously supporting democracy for learning by informing more inclusive, context- sensitive educational and organisational practices. The INTERGEN experience thus offers transferable methodological insights for researchers seeking to operationalise intersectionality in rigorous, reflexive and socially transformative ways.

EPISTEMIC INEQUALITY IN TRANSFORMATIVE RESEARCH WITH WOMEN WITH ENDOMETRIOSIS: THE CONSTRUCTION OF A METHODOLOGICAL FRAMEWORK BASED ON INTERSECTIONALITY PERSPECTIVES

Alessandra Romano (University of Siena, Italy) · **Francesca Bulletti** (University of Siena, Italy) · **Giovanni Gottardo** (University of Siena, Italy)

Intersectionality | Epistemic Inequality | Endometriosis

This paper analyses the methodological implications of adopting intersectional perspectives in inclusive research on disability and forms of systemic and structural oppression (Crenshaw, 2017; Goodley, et al, 2018). Intersectional perspectives are here explored as a methodological matrix for analysing and questioning structural power relations in research settings (Fabbri, 2025). The questions we attempt to answer are: what are the methodological implications of adopting intersectional perspectives in inclusive research? How and under what conditions do intersectional frameworks help researchers explore the “for whom” and “for what” of research? Who is left behind and through what mechanisms? In order to answer these questions, the results of a transformative research project with participants belonging to translocal positions (Anthias, 2008) are presented and discussed. The project, entitled “PEACE” (Prodrugs treatment for Endometriosis And women's well-being CarE), follows a mixed-methods design (Hirose, & Creswell, 2022) that explores the experiences of multiple discrimination and marginalisation in work and healthcare contexts to which women with invisible disabilities, such as women with endometriosis, adenomyosis and gender-related conditions, are exposed. The sociocultural construction of the pathological condition places women in a position of epistemic inequality and undermines their contribution in terms of epistemic agency (Braida, 2024). The qualitative phase involved conducting ethnographic observations and interviews with 25 women. The focus was on an intersectionality-based analysis of the 25 “war

stories", analysed through the construction of thematic analysis matrices referring to the constructs of epistemic injustice (Fricker, 2007; De Lucia, 2018) and hermeneutic injustice (Medina, 2013). The interpretative paradigm-oriented thematic analysis procedure (Winker, & Degele, 2011) focused on embodied biographies that centre on the experiences of silencing that women with invisible pathologies face. The analysis makes visible the structural mechanisms by which women are subjected to a double epistemic delegitimisation, both testimonial and hermeneutic (Fricker, 2007). The relationship with the diagnosis, which is accessed after a "medical diaspora", is reinterpreted in terms of identity affirmation around which informal networks of knowledge are women. The quantitative phase, currently ongoing, involved the use of an online survey consisting of the WHOQOL-Short (World Health Organisation Quality of Life – Short Version) (De Girolamo, et al., 2000) and EHP-30 (Endometriosis Health Profile Questionnaire) (Hansen, et al., 2021) batteries, administered to date to a sample of 830 women throughout the country. The quantitative step explores the perception that women with endometriosis in our country report of their quality of life, examining how the chronic condition affects their perception of aspects related to physical, emotional and relational well-being (Maulenkul, et al. 2024). In discussing the implications for disability studies, a framework of methodological guidelines for conducting transformative research projects from an intersectional perspective is explored, highlighting the implications in terms of research designs, participant selection, choice of data collection tools and researcher reflexivity. The aim is to translate intersectional perspectives into theoretical and methodological approaches in order to problematise the non-linearity and complexity of "how to" conduct intersectional research at every stage, within social, school and university contexts characterised by pervasive inequalities and disparities in every field of knowledge.

INTERSECTIONALITY AND EDUCATIONAL INEQUALITIES FROM CRITICAL LITERATURE REVIEW TO AN ECOSYSTEM OF EPISTEMOLOGICAL GESTURES

Mervé Ozden (UCLouvain, Belgium) · **Géraldine André** (UCLouvain, Belgium)

Intersectionality | educational inequalities | espistemology

The core of the sociology of education developed throughout the 20th century, initially focusing on the connection between educational phenomena and social class stratification. These foundational studies mainly demonstrated the role of families' socio-economic, socio-cultural, and socio-linguistic resources and how, along with institutional and pedagogical factors, these shape educational inequalities. While these theories were important, they lacked the tools to comprehend inequalities stemming from other social relationships and categorisations. Later, the sociology of education

expanded its focus, with increased attention to gender disparities and, especially in Anglophone literature, to ethno-racial social dynamics. More recently, issues such as sexual orientation and disability have also been included. Although some of these foundational analyses have broadened to incorporate studies on categorization and social relationships beyond their original scope, they often act as "separate lenses," examining factors as additive rather than interconnected systems of oppression. To bridge this analytical gap, scholars have more frequently embraced the concept of intersectionality in recent years to develop a more nuanced understanding of school inequalities. Intersectionality is a theoretical framework that stems from black feminist thought and activism, criticizing both monist and pluralist views on analyzing systems of oppression. It seeks to offer a comprehensive perspective to examine the system of domination at once, along with its fundamental and dependent aspects (Bilge, 2010). Thus, it functions as a tool for analysing power (Collins, 2000) aimed at promoting social justice (Cho et al., 2013). Based on this definition, we conducted a critical literature review. We aim to critically analyze, synthesize, and reinterpret a body of literature using intersectionality to examine educational inequalities in order to develop new theoretical insights. Our review's originality lies in addressing the main gaps in the existing literature by exploring a question that has not been thoroughly examined: how and for what purposes can we conduct a sociological analysis of educational inequalities grounded in intersectionality? And how can this advance the field of studies and debates regarding the limitations of foundational approaches to educational inequalities? Through this critical literature review, we identified an ecosystem centred around four epistemological gestures that shape intersectional research in the sociology of education. These four epistemological gestures are: diagnosing inequality by assessing its scope, interpreting how it is experienced, criticizing the systems that produce it, and transforming educational practices and the system itself. These four orientations form an interconnected ecosystem that can help renew analyses of educational inequalities through their relationships: diagnosis, supported by interpretation, can shed light on lived experience; interpretation with a critical perspective maintains political implications; and critique, aided by transformation, offers tangible solutions.

PROMOTING SELF-DETERMINATION IN ADULTS WITH DISABILITIES. INTERSECTIONAL APPROACHES

Valeria Friso (Università di Bologna - Dipartimento di Scienze dell'Educazione, Italy) · **Sara Marchesani** (Università di Bologna - Dipartimento di Scienze dell'Educazione, Italy) · **Marco Cadavero** (Università di Bologna - Dipartimento di Scienze dell'Educazione, Italy)

self-determination | disability in adulthood | Universal Design for Working

The intersectional paradigm emerged from the movements that, since the second half of the twentieth century, challenged one-dimensional readings of discrimination: Black feminisms, LGBTQIA+ subjectivities and decolonial perspectives highlighted the simultaneous and stratified nature of systems of oppression. Within this framework, Crenshaw (1991) conceptualised intersectionality as the interaction of multiple identity positions – gender, ethnicity, age, sexual orientation, disability and neurodivergence – producing configurations of privilege and marginalisation (Collins, 1990; King, 1988). The Wheel of Intersectionality (Simpson, 2009) represents this dynamic by placing subjective experience at the centre of interconnected dimensions that cannot be analytically isolated. This paper presents three ongoing research projects based at the Department of Educational Sciences of the University of Bologna, united by their adoption of intersectionality as an epistemic stance and methodological orientation for promoting the self-determination of adults with disabilities across different life contexts. The first study investigates self-narration among adults with intellectual disabilities in socio-rehabilitative day centres. Drawing on a participatory narrative approach, it explores how autobiographical storytelling enables individuals to reclaim their own stories beyond diagnosis (Atkinson, 2010), interrogating the power asymmetries that determine who is recognised as a legitimate interlocutor (Rice et al., 2015). The use of communicative mediators makes narrative practices accessible, acknowledging that barriers to expression are structurally

situated (Grove & Harwood, 2021). The second study is situated within the framework of Universal Design for Working (UDW), developed to rethink work environments by recognising the plurality of human functioning (Canevaro, 2004). Drawing on Universal Design for Learning (CAST, 2018) – which proposes flexible design principles for accessible learning environments – UDW extends this perspective to the workplace. Starting from four principles modelled on the three UDL principles and reworked for the employment context, the research aims to develop guidelines for professional environments that foster coexistence and valorisation of differences, on both utilitarian and deontological grounds. The methodological design comprises focus groups with inclusion advocates, followed by questionnaires administered to workers and employers for the validation of the resulting indicators. The intersectional perspective informs both the framework – which recognises that workplace experience is shaped by the interaction of disability, gender, neurotype, ethnicity and generational belonging – and the participatory process of construction. The third study explores the integration of Montessori principles into the education of adults with disabilities. The emphasis on the prepared environment, autonomy and respect for individual pacing is reinterpreted through an intersectional lens as a valorisation of the singularity of each learning trajectory. Adapting these principles to adulthood makes it possible to move beyond standardising approaches, recognising that educational needs are shaped by the interplay of social, cultural and embodied experiences. The research adopts an exploratory design involving participant observation and interviews. Together, the three studies demonstrate how intersectionality can be translated into concrete methodological choices – in the design of research instruments, the selection of participants, and data analysis – capturing the complexity of those who inhabit multiple positions of marginalisation, while raising shared questions concerning the risk of categorical essentialism, power dynamics in the research process, and the building of epistemic alliances with the communities involved.

EMOTIONAL INTELLIGENCE AND DEMOCRATIZATION PROCESSES: THE CONTRIBUTION OF INTERSECTIONAL RESEARCH IN THE POEMS PROJECT

Alessandra Viviani (University of Siena, Italy) · **Alessandra Romano** (University of Siena, Italy) · **Giovanni Gottardo** (University of Siena, Italy) · **Gaia Ciccarelli** (University of Siena, Italy)

Emotional intelligence | Intersectionality | Transformative Research

This paper presents the objectives, methodology, and outputs of the Erasmus+ PoEmS project (Promoting Emotional Intelligence at School). The project focuses on promoting Emotional Intelligence (EI) in middle and high school students and teachers, considering it a key competence for inclusion (Jagers, Rivas-Drake & Williams, 2019), with a direct impact on human rights education and global citizenship (Kubacka, 2018). The project integrates emotional learning into the school curriculum, using EI as a tool for raising awareness of social justice and combating discrimination (Biemmi & Viviani, 2025). EI is here intended as a multifaceted construct, composed of situated social and cultural dimensions, such as embodied knowledge and activation (Bar-On, 2006). Research Design Consistent with this premise, the Unisi research team adopted an intersectional research paradigm (Esposito & Evans-Winters, 2022; De Vita & Romano, 2025; Viviani, 2018). This epistemological and methodological choice stemmed from the researchers' deep reflection on their own positioning and on the power dynamics acted within the research. They recognized the risk of rendering the voices and experiences of the partner schools (from Italy, Turkey, Spain, Romania, and Latvia) invisible if participatory research models were not used. The project aimed to enhance the situated knowledge (Lave, & Wenger, 1991) of teachers in partner schools, considering them to be holders of unique and authoritative perspectives. Recognizing that each school

was a “g-local context” with its situated norms and cultures, an “ethic of reciprocity” (Esposito & Evans-Winters, 2022) based on symmetrical and collaborative relationships was established within the partnership. Through a shared drive, a mailing list, regular online meetings, and a week of in-person training, it was possible to engage in epistemic collaboration (Fricker, 2007) that led to the co-construction of two main outputs: a training package for teachers, which includes self-assessment tests and theoretical references, and a repertoire of twenty multidisciplinary lesson plans. The process of designing, validating, and testing the lesson plans will be specifically analyzed. Each school proposed four lesson plans, which were then integrated and adapted by the other partners in an intensive in-person training. To give a voice to teachers not directly involved in the project, the research team involved 292 teachers in the validation process through a peer review consisting of Likert scales and an open-ended question. Results and Implications for Practice This ‘multi-level’ process of development, writing, and validation is not merely a technical step, but embodies the epistemology of the project: to provide resources that are the result of the application of multidimensional and multi-axial interpretative frameworks. Resources that can adapt to the intersectional specificity of school contexts, without appearing overly broad and generic, ‘one size that should fit all’ (De Vita & Romano, 2025). Through the experience of the PoEmS project, our aim is to theorize that the construction of democratic and inclusive societies cannot be separated from the commitment of educational systems to promote a polyphonic, emotionally intelligent dialogue, capable of cultivating a plurality of voices while respecting pluriverse belonging and human rights (Kubacka, 2018).

INTERSECTIONAL CO-DESIGN AND SOCIAL ROBOTICS: REFRAMING WORK PREPARATION FOR AUTISTIC ADOLESCENTS

Valentina Pennazio (University of Genoa, Italy) · **Rita Cersosimo** (University of Genoa, Italy)

Social robotics | autism | job preparation

This contribution presents an intersectional participatory study exploring the co-design of a work-preparation pathway for autistic adolescents (16-18 years old) mediated by the humanoid robot Pepper. The project builds on research in social robotics and autism showing that humanoid robots can function as relational mediators by providing predictable, structured, and emotionally regulated interactions (Scassellati et al., 2012; Belpaeme et al., 2018). The relative directness and reduced ambiguity of robotic communication may decrease social overload and support reflective dialogue in contexts such as job interviews, where implicit norms and micro-expressions often generate anxiety. In this perspective, Pepper is conceptualized not as a substitute for human interaction, but as a scaffold that may facilitate self-expression and gradual engagement in work-related communication. A preliminary eight-session script was outlined, structured around social stories (Gray & Garand, 1993), guided dialogue, and tangible outputs (e.g., strengths maps, interest profiles, communication-of-needs cards, simulated interviews). Consistent with life-design and self-determination approaches (Nota et al., 2016; Wehman, 2011), the pathway aims to support adolescents in identifying strengths, preferences, and environmental needs, in alignment with current disability rights frameworks emphasizing personal projects of life and quality of life indicators. The design process unfolded on two interconnected levels. First, prospective adolescent participants were consulted to gather expectations and interests regarding robotic interaction. Second – and this is the focus of the present

contribution – four autistic adults (aged 25-64; 1 female, 3 males; diverse professional histories; varied diagnostic trajectories) were interviewed to critically reflect on the proposed script. Drawing on intersectionality (Crenshaw, 1989) and epistemic justice (Fricker, 2007), the study treats adult autistic workers not as informants but as situated epistemic agents whose lived experience can interrogate pedagogical assumptions embedded in work-oriented education. The interviews revealed several tensions. Participants problematized normative "social skills" training, describing workplace conventions as a form of linguistic translation requiring asymmetric effort ("speaking English" to neurotypical expectations). They highlighted the energetic costs of masking and questioned unidirectional adaptation. Environmental and sensory factors (light, noise, color, unpredictability of schedules) emerged as central to work sustainability yet often treated as secondary. Generational differences were significant: older participants diagnosed in adulthood reported long histories of misrecognition within deficit-oriented school systems, while younger adults described improved awareness but persistent anxiety and ambiguity in professional contexts. Methodologically, the study demonstrates how an intersectional participatory approach can transform a technological proposal into a site of epistemic negotiation. Rather than validating a predefined model, adult standpoints reframe the robot's role: from trainer of normative behaviors to potential "translator" and decompression space within broader relational ecologies. The paper argues that intersectional research in educational and organizational contexts must allow marginalized knowledges to reshape not only content but also the very architecture of intervention, thereby advancing equity-oriented and reflexive practices.

EDUCATING FOR DIVERSITY THROUGH AN INTERSECTIONAL LENS: METHODOLOGICAL REFLECTIONS FROM AN ERASMUS BLENDED INTENSIVE PROGRAMME IN EDUCATOR TRAINING

Valentina Guerrini (University of Sassari, Italy)

Higher education | differences | intersectionality

Starting from the assumption that differences and educational inequalities cannot be fully understood without analysing the interdependence of gender, class, migratory background, ability, sexual orientation, and cultural belonging (Crenshaw, 1989; Collins, 2000), this paper explores how an intersectional approach can be translated into concrete university training practices. Although intersectionality is widely recognised as an essential epistemological framework for interpreting dynamics of power and discrimination, its operationalisation in educational contexts raises significant methodological and ethical dilemmas. The paper presents and analyses an Erasmus Blended Intensive Programme (BIP) entitled "The territory as an educational community for educating in differences and preventing all forms of discrimination", developed in collaboration among four European universities (Sassari in Italy; Salamanca and the European University of Madrid in Spain; Maia in Portugal) and coordinated by the University of Sassari. The project involved students and academic staff in a blended pathway—combining online activities and an intensive in-person week—aimed at promoting education for differences from an intersectional perspective. The BIP experience was conceived as a pedagogical laboratory in which participants were invited not only to discuss differences, but to experience them directly. Through participatory methodologies, group work, analysis of local case studies, and structured reflective sessions, students were encouraged to critically problematise their own representations, recognise situated privileges and vulnerabilities (bell hooks, 1984), and reflect on their role as future education professionals in plural contexts. Within this framework, the territory was approached as an educational community and as a space for observing the intersections of social, cultural, and institutional dimensions that

shape educational opportunities (Tramma, 2009). The results highlight how the international and collaborative dimension of the Erasmus programme constitutes a privileged setting for making visible the intersections between systems of oppression and opportunity. The exchange among students from different national contexts fostered the emergence of plural—and at times conflicting—narratives, revealing how categories such as "integration," "equality," and "neutrality" are culturally situated. In line with intercultural education perspectives (Portera, 2020; Tarozzi & Torres, 2016) and with Banks' (2016) conception of democratic citizenship education, the experience contributed to the construction of a transnational learning community oriented towards dialogue and the recognition of differences as a resource. The paper contributes to the debate on higher education practices examined from multiple standpoints—students, teachers, and institutions—by showing how intersectionality can become not only an object of study, but also a guiding principle in curriculum design. The BIP experience suggests that education for differences should not be considered a peripheral area of pedagogical reflection; rather, it represents the core of an authentically democratic and inclusive education, capable of preparing professionals who are aware of the complexity and ethical responsibility inherent in their work within contemporary educational contexts.

LANGUAGE EDUCATION AND BI-PLURILINGUAL STUDENTS LABELLED AS DISABLED: AN INTERSECTIONAL ACTION RESEARCH STUDY

Claudia Menduni (University of Milano-Bicocca, Italy)

DisCrit | Raciolingustic Perspective | Language Education

Introduction Within the Italian school system, despite the formally inclusive framework, educational practices aimed at bi-plurilingual pupils labelled as disabled often follow an approach that separates 'language needs' from 'special educational needs', alongside processes of categorisation, medicalisation and micro-exclusions (D'Alessio, 2011; Migliarini et al., 2020; Stinson et al., 2025). In this context, these pupils risk falling into intersectional gaps (Artiles & Kozleski, 2016), due to educational practices that proceed along parallel tracks (Bini, 2020; Caldin & Cinotti, 2018). Building on this tension, and integrating Disability Critical Race Theory (Annamma et al., 2013, 2018) with the Critical Disabilities Raciolinguistic Perspective (Cioè-Peña, 2021; Migliarini & Cioè-Peña, 2024), this paper presents an ongoing research project aimed at examining the interdependence of various forms of oppression (Collins, 1990; Crenshaw, 1991) in shaping discourses and practices related to language education in a school context. Methodology This action research project, conducted in a primary school in north-eastern Italy, views the language education process as a prime vantage point for an intersectional analysis that examines the interdependence of racism, ableism and linguicism in perpetuating notions of normality (Annamma et al., 2013) and in affecting access, participation and inclusion. Furthermore, the project aims to make visible the implicit assumptions that guide these processes, through cycles of observation, reflection and intervention, fostering critical reflexivity among teachers (Kemmis & McTaggart, 1988) and developing replicable methodological approaches for intersectional research in school settings. Firstly, the research design does not focus on individual 'cases' and avoids reproducing categorising logics and categories themselves, such as 'SEN' or 'migrant background', which are instead treated as constructions that are not neutral, but performative and essentialist, fuelling processes of pathologisation and compartmentalisation of students (Stinson et al., 2025), and linguistic or behavioural expectations. The focus is therefore placed on school practices, from a contextual and situated perspective. Furthermore, the project involves teachers, classes and families, combinating observations, interviews, document analysis, interventions and focus groups. This approach contributes to the analysis of different perspectives, whilst minimising researcher bias. The research adopts micro-experiments based on the TrUDL (Translanguaging Universal Design for Learning) model, conceived as a practice of

intersectional social justice (Cioè-Peña, 2022). In addition to offering tools for overcoming the dichotomy between language acquisition and disability (Przymus & Alvarado, 2019), the application of this intersectional educational model helps to transform the view of language-culture and disability from a problem into a 'gift to be nurtured' (Annamma & Morrison, 2018, p.77). Finally, the introduction of micro-experiments allows us to explore whether the renegotiation of practices fosters processes of problematisation, reflexivity and transformation of the representations that guide inclusion. Conclusions Whit a transformative intent (Kemmis et al., 2014), this action research project aims to provide tools for intersectional inclusion that move beyond fragmented perspectives and practices and recognise the multidimensional nature of identities. At the same time, the project seeks to outline forms of intersectional research capable of fostering greater awareness of the processes that shape inclusion and exclusion, from a social justice perspective.

WOMEN TEACHERS WITH DISABILITIES AND INTERSECTIONAL METHODOLOGIES: A CASE-STUDY IN EDUCATIONAL CONTEXTS

Elena Rosciani (University of Macerata, Italy) · **Arianna Taddei** (University of San Marino Republic, San Marino Republic) · **Barbara Alesi** (University of Macerata, Italy)

intersectionality teachers disability

In recent decades, intersectionality has emerged as a key theoretical perspective for understanding the marginalization and vulnerability experienced by women with disabilities (Emmett & Alant, 2006; Naples, 2018). Positioned at the intersection of multiple identity factors, such as gender, disability, social class, age, and ethnicity, they are often exposed to socio-cultural stereotypes that generate multiple and intersecting forms of discrimination across different contexts, including the labour market (EDF, 2022; Chan & Hutchings, 2023). The contribution aims to present the results of a qualitative narrative study grounded in Feminist Disability Studies (Garland-Thomson, 2005) and, more specifically, in an intersectional approach (Crenshaw, 1989). The study reflects on the potential and methodological challenges of intersec-

tional research in school contexts (Davis, Brunn-Bevel, & Olive, 2015), focusing on the labour inclusion of teachers with disabilities, who remain underrepresented in both international and national literature (Neca, Borges, & Campos Pinto, 2022; Bellacicco, Ianes & Macchia, 2022). Moreover, policies and discourses on inclusive education often focus primarily on students, overlooking an ecological vision of the school (Bronfenbrenner, 1979) and neglecting professional actors such as teachers with disabilities, who often remain relatively invisible and insufficiently protected from a rights-based perspective (Lincoln, 2021). The study is based on an intersectional methodology (De Vita & Romano, 2025) and involved several teachers with disabilities working across different levels of schooling and with diverse personal and cultural backgrounds. Data were collected through semi-structured interviews exploring professional experiences, forms of discrimination in school contexts, and emancipatory pathways. This methodological approach supported a reflexive and situated perspective while promoting participants' active involvement as co-researchers in the co-construction of knowledge. The thematic analysis of the interviews (Braun & Clarke, 2006) revealed barriers to multidimensional accessibility and exclusionary relational dynamics linked to sexist and ableist stereotypes. At the same time, participants described strategies of advocacy, resilience, and empowerment to challenge discriminatory conditions. The use of narrative and teachers' testimonies thus allows their life stories to be valued as key sources for understanding the meanings attributed to their professional trajectories and emancipatory pathways (Taddei, 2020; Del Bianco, 2022). These findings highlight the need to rethink inclusion as a complex issue of social justice (Ayers, Quinn & Stovall, 2009) and to adopt a broader perspective that considers discrimination affecting all members of the school community. In this regard, the presence and engagement of women teachers with disabilities may act as levers for change, promoting the rights of those facing multiple forms of discrimination and fostering more equitable and inclusive transformations of policies and services. Ultimately, this may contribute to improving the quality of life of women with disabilities (Ferrara, 2014).

LINGUISTIC DISCRIMINATION AND INTERSECTIONAL INEQUALITY IN EDUCATION

Rosalba Nodari (University of Siena, Italy) · **Silvia Calamai** (University of Siena, Italy) · **Claudia Soria** (ILC-CNR, Italy) · **Souzana Maria Serveta** (ILC-CNR, Italy) · **Andrea R. Leone Pizzighella** (EURAC Research)

Linguistic discrimination | Linguicism | Language Education

Discrimination can occur along different axes and in various forms. While multiple and compound forms of discrimination involve the coexistence of different disadvantages, intersectional discrimination emerges from the interaction of different axes of inequality that operate simultaneously and in an inseparable manner (Makkonen, 2002). Within this framework,

language can be considered one of the possible axes through which intersectional discrimination is experienced. This dimension has been extensively addressed in studies on linguicism and related phenomena. Skutnabb-Kangas (2016) defines linguicism as the set of ideologies, structures and practices which are used to legitimate, effectuate and reproduce an unequal division of power and resources (both material and non-material) between groups defined on the basis of ethnicity, culture or language. Linguistic discrimination can operate at different levels. In some contexts, it may involve the explicit prohibition of using languages other than the national standard language (Blanchet, 2016). However, language – and particularly speakers' voice – can function both as a personal attribute and as a marker indexing multiple dimensions of social identity, including ethnic background, gender, age, sexual orientation and socioeconomic status. In this sense, evaluations of accents are rarely evaluations of language alone; rather, they often entail broader social judgements about the speakers themselves. Crucially, these categories are not independent but deeply intertwined and mutually constructed through social and linguistic practices (Levon, 2015). Language can therefore function as a powerful lens through which multiple dimensions of identity become visible. For this reason, linguistic discrimination often manifests itself in subtle forms, such as discrimination against the way individuals speak a given language. These may include accent bullying, being judged as incomprehensible, being mocked for one's pronunciation, receiving corrective comments targeting spelling, accent or pronunciation, or being criticised for speaking in ways perceived as inconsistent with one's gender or sexual orientation (Corona & Block, 2020; Dovchin, 2020; Tankosić & Dovchin, 2021). In some cases, linguistic discrimination can evolve into what has been described as linguistic racism, a form of racism grounded in speakers' linguistic repertoires and communicative practices (Dovchin, 2019). Against this backdrop, this presentation aims to open a space for reflection on the potential role of linguistic discrimination as an entry point for broader discussions about social inequality in educational contexts. Introducing classroom activities that explicitly address linguistic discrimination may not only foster critical awareness of language but also encourage reflection on wider issues related to race, ethnicity, gender and social belonging. The presentation will also include a collaborative discussion with teachers of teaching materials developed within the Erasmus+ project CIRCE – Counteracting discrimination practices in education, designed to support educators in addressing linguistic discrimination and promoting more inclusive pedagogical practices.

Intersectionality in Educational Research: Epistemologies and Methodologies favouring a Democratization of Postmigrant Societies

PANEL CONVENORS: Barbara Gross (Free University of Bozen-Bolzano, Italy); Luisa Conti (University of Jena, Germany); Robert Pham Xuan (University for Continuing Education Krems, Austria); Giulia Filippi (Free University of Bozen-Bolzano, Italy); Lisa Bugno (Università degli Studi di Padova, Italia); Giulia Messina Dahlberg (University of Gothenburg, Sweden)

PANEL KEYWORDS: intersectionality, diversity, postmigrant societies

This panel examines how critical, intersectionally informed research can revitalize the relationship between education and democracy in postmigrant societies amid a global backlash against diversity, equity, and inclusion (DEI). We treat intersectionality as an analytic and methodological lens to shed light on how overlapping systems of oppression (re)produce marginalization, discrimination, and exclusion (Crenshaw, 1989/2011; Collins, 2019) in both formal and informal educational contexts. The aim of the panel is to foreground intersectionality's transformative potential to reconnect education and democracy through practices of equity, belonging, and peaceful coexistence. We invite contributions that investigate how educational policies and practices can move beyond declarative inclusivity, that is, contexts in which rights are affirmed in principle while multiple barriers persist. The panel mobilizes critical, interdisciplinary, and decolonial perspectives to advance a holistic understanding of individuals, educational pracitces and institutions. In line with international calls for intersectional approaches in educational research and practice (Varsik & Gorochovskij, 2023; Gross & Portera, 2025), we seek to synthesize productive epistemologies and methodologies capable of grasping social complexity and to chart a forward-looking methodological agenda for democratizing postmigrant society. We welcome papers that explicitly move beyond the realm of normative argumentation, and empirical studies assessing the effects and impacts of (missing) DEI approaches. Expected outcomes include: (1) a state-of-the-art synthesis of research on the nexus between education and democracy in postmigrant societies; (2) an interdisciplinary reflection on methodologies for intersectional inquiry; and (3) a forward-looking research agenda offering policy-relevant insights for building genuinely diverse, democratic schools and societies.

RE-READING INTERSECTIONALITY: A SYSTEMATIC LITERATURE REVIEW WITHIN THE FIELD OF EDUCATIONAL RESEARCH

Barbara Gross (Libera Universtià di Bolzano, Italy) · **Giulia Filippi** (Libera Universtià di Bolzano, Italy)

intersectionality | educational research | systematic review

In recent years, intersectionality has become increasingly prominent in educational research, predominantly serving as a theoretical paradigm for examining the complex interplay of inequalities, power relations, and the dynamics of exclusion and participation within educational contexts. Nevertheless, its systematic application in educational research remains inconsistent and fragmented (Varsik & Gorochovskij, 2023; Gross & Portera, 2025; Pham Xuan, 2025), compared to its widespread use in gender and social studies (Crenshaw, 1989; Collins, 2019). A persistent tension can be observed between the use of intersectionality as a critical conceptual framework and its operationalisation in empirical research, educational policies, and pedagogical practices. This paper presents the results of a systematic literature review on intersectionality within the field of empirical educational research, mapping theoretical developments, methodological approaches, emerging areas of inquiry, and the results obtained between 2015 and 2025. The review was conducted through a structured analysis of two international databases (Scopus and Web of Science), following the PRISMA guidelines for identification, screening, and synthesis (Page et al., 2021). The initial search identified 185 records. After removing duplicates, excluding publications prior to 2015, and distinguishing empirical studies from non-empirical contributions, a final corpus of 81 empirical studies was selected for further analysis. The findings indicate a gradual consolidation of intersectionality as a critical analytical lens for interpreting the plurality of identities and educational experiences. At the same time, a significant share of the literature remains predominantly theoretical, while empirical research is still unequally developed and concentrated mainly in Western higher education contexts. The analysis of the papers explores how intersectionality is conceptualised and operationalised within empirical educational research, examining its translation into research design, sampling strategies, data collection methods, and identifying recurring patterns of use across the selected corpus. It also delves into the results of studies, examining how these findings are intrinsically linked to the methodological framework and methods employed in the process of knowledge production. This

systematic review contributes to clarifying both the potential and the current limitations of intersectionality in educational research, offering an overview of existing approaches and highlighting areas where further methodological development is needed across different educational levels, institutional settings, and diverse contexts.

SAFETY, BELONGING AND VOICE AS DEMOCRATIC INFRASTRUCTURE: A STEPWISE INTERSECTIONAL METHOD FOR SCHOOL DEVELOPMENT TO ACHIEVE SDG 4

Robert Pham Xuan (University of Jena, Germany)

School-Development | SDG4 | Intersectionality

Schools in post-migrant societies are increasingly finding themselves in a difficult position. They are expected to provide safe and inclusive learning environments, yet there is growing public and political backlash against diversity, equity and inclusion (DEI) (Kuhar & Zobec, 2017). This talk puts forward a proposal for an Intersectional Participatory Safety & Inclusion Audit (IPSIA) as a school development methodology to operationalize parts of the SDG Target 4 ('safe, non-violent, inclusive and effective learning environments') as democratic accountability in practice, rather than declarative policy. Drawing on the concept of intersectionality, IPSIA identifies safety, belonging, the right to express oneself, and access to remedies as the three interdependent democratic pillars of school life. These pillars are frequently overlooked by single-axis indicators and 'average' school climate metrics (McCall, 2005; Thapa et al., 2013). IPSIA is therefore compatible with current international projects, such as the 'Lets Care' project funded by the Horizon programme. This transnational research network comprises nine countries and 120 schools, and is developing a 'safe school' model. Through participatory workshops and collaborative research, teachers and pupils will develop strategies to foster emotional security and a sense of belonging in everyday school life. However, IPSIA takes a different approach with a structured, four-stage process covering from audit to implementation. First, schools conduct participatory hotspot mapping. This involves student-led mapping and walk-alongs, as well as scenario-based mini-interviews, to identify the specific spaces, routines and moments of interaction where feelings of safety and belonging are experienced or lacking (Mitra, 2004). Secondly, the resulting hotspot patterns guide an institutional analysis focused on mechanisms that trace how specific practices and rules (routines, assessment and feedback practices, language rules and complaint procedures), produce or amplify vulnerabilities in particular intersectional constellations (McCall, 2005). Thirdly, the findings from the first two stages are used in participatory sense-making workshops, where students and educators jointly interpret the evidence and translate it into change hypotheses (i.e. what needs to change, for whom, through which mechanism and why). This co-interpretation stage is designed to counter epistemic injustice by treating lived experience as an indispensable analytical resource (Fricker, 2007). Fourthly, the jointly developed hypotheses for change are translated into concrete school development actions and measures. Subsequently, iterative checks are carried out to determine whether the measures are reaching all relevant groups and situations and whether certain school routines continue to cause challenges (McCall, 2005; Thapa et al., 2013). The proposed action audit therefore has three objectives: (a) the practical implementation of SDG 4 for school development; (b) developing a replicable, participatory, intersectional method that retains accountability (McCall, 2005); (c) providing guidance on the democratic governance of inclusion in the face of DEI backlash, through transparent remedial infrastructures, durable student voice architectures and reforms at the level of individual schools (Mitra, 2004; Tabron et al., 2024). After the presentation, the audience will be invited to participate in a discussion about the further development of the methodological school development proposal, as the project idea is to be submitted for third-party funding.

WIDENING PARTICIPATION OR NARROWING THE PATH? INTERSECTIONAL AND DECOLONIAL READINGS OF SUPPLEMENTARY HIGHER EDUCATION POLICIES FOR MIGRANT ACADEMICS IN SWEDEN

Giulia Messina Dahlberg (University of Gothenburg, Sweden) · **Helena Korp** (University of Gothenburg, Sweden) · **Sofia Persson** (University of Gothenburg, Sweden)

Migrant Academics | Supplementary Higher Education | Sweden

Across Europe, supplementary higher education programmes and other forms of recognition of foreign qualifications for migrant academics have emerged as key policy instruments within agendas of integration, employability, and widening participation in higher education (https://education.ec.europa.eu/education-levels/higher-education/inclusive-and-connected-higher-education/higher-education-for-migrants-and-refugees). In Sweden, such programmes that are often framed as short, targeted, and profession-oriented pathways, aim to facilitate rapid transitions into regulated professions in, for instance, the educational or medical sector (Messina Dahlberg, Vigmo & Surian, 2021). This paper examines how these ambitions are articulated and negotiated in policy through a narrative analysis of (intern)national and institutional documents governing supplementary higher education, with a particular focus on the Swedish teacher training program (ULV). This particular programme, which targets immigrant teachers and academics is by far the largest supplementary program, with 74 percent of registered students (Odelberg & Viberg, 2022; UKÄ, 2019). The ULV program is designed for individuals with a foreign teaching degree or an academic degree in a subject area that corresponds to school subjects included in the Swedish school curriculum. The study is situated within the broader context of widening participation and integration policies in higher education, where inclusion is often framed in instrumental terms linked to labour market efficiency and to address shortages of professional skills. Drawing on intersectionality as an analytical lens, this study explores how policy narratives construct "the migrant academic" or the "scholar at-risk" through intersecting dimensions of migration status, language competence, professional identity, and institutional belonging (Hancock, 2016). These constructions are further examined through a decolonial perspective, which foregrounds questions of epistemic authority, recognition of prior knowledge, and the asymmetrical process of recognition of professional and academic competences acquired in the so-called "third countries" (non-EU/EEA). Methodologically, the paper adopts a narrative approach to policy analysis (Bansel, 2015, Fenwick et al. 2015), treating policy not as static text but as a situated practice that produces particular subject positions, expectations, and trajectories. In dialogue with sociomaterial perspectives (Gherardi, 2017; Nicolini, 2013), the analysis attends to how policies assemble human and non-human elements (language requirements, assessment policies, documentation practices, and time/space framings) into sociomaterial configurations that enable some forms of participation while constraining others. Preliminary findings show how this relational focus shed lights on the tensions between a focus on rapid labour market entry and on integration, belonging, and professional recognition but also between standardisation and diversity. Even though supplementary programmes are framed as inclusive solutions, they often rely on narrow imaginaries of employability and professional becoming as the only narrative for successful integration of migrant academics. By foregrounding intersectional and decolonial critiques, the paper contributes to debates on the democratization of postmigrant societies, arguing for policy approaches that move beyond deficit-oriented and time-compressed models of integration. Such a shift, we argue, calls for relational and epistemically just policy framings of supplementary higher education and qualifications recognition, that tell the story of migrant academics not only as employable future workers, but as knowledge-bearing subjects within higher education.

DECOLONIAL AND QUEER APPROACHES TO CSE REIMAGINING SCHOOLS BEYOND PATRIARCHAL AND EUROCENTRIC NORMS

Francesca Barbino (University of Palermo, Italy)

Comprehensive Sexuality Education | Sexuality | Gender-based violences

Gender-based violences, understood as any physical, verbal, symbolic and psychological violence acted against women, homosexual, bisexual and trans* people (Educare alle Differenze, 2024) are caused by structurally embedded gendered power asymmetries, rooted in patriarchal models that affect young people as adults, and which intersect with other oppressions generating more severe traumas (Crenshaw, 1989; Walby, 1990). Comprehensive Sexuality Education (CSE) is internationally recognized as a concrete solution to tackle discrimination and violence, as it allows to learn how to recognize, react and not perpetrate them (WHO, 2010; UNESCO, 2018), to act on sexism, homonegativity, hegemonic masculinity, bullying and cyberbullying (Demozzi and Ghigi, 2024), to protect the sexual rights of all subjectives (WAS, 2014). However, when implemented within schooling systems shaped by coloniality and hetero-cisnormative institutional cultures, CSE risks reproducing the very hierarchies it seeks to dismantle. Despite attempts to legislate on the matter (Bruno, 2024), Italy remains one of the few European countries not to include compulsory sex education in school curricula, resulting in a fragmented framework with significant regional disparities, particularly disadvantaging the center-south (Chinelli et al., 2024; Lo Moro et al., 2023), also due to the opposition of the so-called “anti-gender” movements (Garbagnoli, 2014; Selmi, 2015; Bellé and Poggio, 2018; Lavizzari and Prearo, 2019; Barbino, 2025; Prearo, 2025), which challenge the epistemic legitimacy of gender and sexuality knowledge within public education. This study aims to explore the contribution of critical queer and decolonial theories on education (Lugones, 2007; Walsh & Mignolo, 2018) to the debate on CSE, foregrounding the intersections of power, knowledge production and institutional practices in order to deconstruct, from an educational perspective, those monolithic, hetero-cisnormative and Eurocentric visions that see the study of sexualities as taboo and deviation from the "norm". The hypothesis is to experiment a model of CSE that can broaden, at a theoretical level, the current approaches promoted by international organizations towards a more resistant, intersectional and inclusive understanding of sexuality and affectivity, which could be effectively useful to eradicate the root causes of oppression, discrimination and gender-based violence from an early age and starting from schools (Borghi, 2011; Burgio, 2019; Di Grigoli, 2023; Rinaldi, 2023; Seal, 2019).

INTERSECTIONAL ADULT EDUCATION PATHWAYS: PARTICIPATORY ACTION RESEARCH AND EPISTEMIC JUSTICE IN COMMUNITY–UNIVERSITY PARTNERSHIP

Rebekah Brennan (An Cosan and SETU, Ireland) · **Rosemary Kunane** (An Cosan and SETU, Ireland) · **Emma Fox** (An Cosan and SETU, Ireland)

Adult education | intersectionality | participatory action research

Adult and community education has historically functioned as a democratic counterspace for learners marginalised by the Irish Education System. In Ireland, widening participation policy under the National Access Plan (NAP) identifies priority groups including socio-economically disadvantaged learners, lone parents, mature students, disabled learners, members of the Traveller community, and migrant communities. While these categories structure policy intervention, lived experience is intersectional and relational. Adult learners frequently navigate multiple, overlapping forms of structural inequality. This paper presents findings from an ongoing participatory action research (PAR) collaboration between a regional technological university and a community-based adult education organisation working predominantly with learners across several National Access Plan priority groups. The study examines how adult community education functions not simply as a preparatory bridge into higher education, but as a democratic learning space that reshapes learners' epistemic positioning. PAR was mobilised as both research methodology and adult pedagogical practice. Peer researchers with lived experience of community education were centrally involved in research design, facilitation of focus groups, and collaborative analysis. Data was generated through learner dialogues, community stakeholder discussions, and structured reflective workshops. This approach intentionally redistributed epistemic authority, challenging conventional researcher participant hierarchies. Findings indicate that adult community education cultivates forms of epistemic confidence that are foundational to progression. Participants describe a shift from internalised deficit narratives to recognition of lived experience as legitimate knowledge. For learners situated at the intersection of class disadvantage, gendered care responsibilities, disability, and migration, this transformation is precondition for engagement with formal higher education

systems. However, the research also highlights tensions. The paper argues that a culture of inclusion in lifelong learning requires structural reciprocity between community education and universities. Adult education must be recognised as a site of knowledge production. Democratic partnership, co-designed curricula, and shared governance are proposed as components of what we term "intersectional pathway architecture." By situating adult community education within debates on inclusion and epistemic justice, this paper contributes empirical insight into how lifelong learning can operate as democratic renewal.

INTERSECTING REALITIES: GUIDELINES FOR INTERSECTIONALITY-INFORMED EDUCATIONAL RESEARCH DESIGN

Lisa Bugno (University of Padova, Italy) · **Luisa Conti** (University of Jena, Germany)

intersectionality | intercultural education | research methodology

Intersectionality, as conceptualized by Crenshaw (1989) and further developed within educational research by scholars such as Davis (2015; 2023), provides a powerful framework for examining the compounded effects of social identities including 'race', gender, class, and disability. These foundational texts underscore intersectionality's role in exposing how overlapping oppressions shape educational inequities, challenging monolithic analyses that fail to represent lived experiences. Recent scholarship, including Nichols and Stahl's (2020) systematic review of higher education applications and OECD reports on policy implications, highlights its urgency (2023): without it, research risks perpetuating simplistic categories, invalidating findings, and failing to inform equitable practices. Using as a research object a study carried out in the recent past by one of the authors on teachers' conceptions of intercultural education, the paper explores how intersectional blind spots can arise in the design and analysis of educational research. The analysis unfolds in two phases: the first re-examines the original study to identify where intersectional dimensions were overlooked. The analysis focuses on how the research framed participants and interpreted their perspectives through singular analytical categories. This framing risks overlooking how intersecting identities shape teachers' conceptions and may conceal power relations present in diverse educational contexts. The analysis is conducted through two complementary standpoints: the insider perspective of one researcher who participated in the original study, and the analytic distance of a second researcher who was not involved in the data collection. This dual perspective is used to identify methodological blind spots and tensions that emerge when attempting to apply intersectionality in empirical research. The second phase identifies concrete points in the research design where an intersectional perspective could have been introduced. Methodological components, including participant selection, data elicitation strategies, and thematic coding, are examined to determine where intersectionality was ignored, where it could have been incorporated, and which specific methodological choices could have supported it. Based on this two-step analysis, the paper develops a set of methodological guidelines for designing and reviewing research that help researchers develop intersectionality-informed studies, avoiding reducing complex identities in simplified social categories by recognizing where and how typical gaps may emerge throughout their research process. These guidelines translate intersectional theory into concrete research practices, addressing participant recruitment, conceptual operationalization, data analysis, and reporting procedures. They are formulated as practical design principles that can guide future studies examining teachers' conceptions and similar educational phenomena. . The tools presented shall support a practice coherent with the fundamental understanding that intersectionality should be treated not as an additional analytical layer, but as a fix methodological requirement when studying complex educational realities. In particular, the paper shows how intersectional realities can become methodologically invisible when research relies on conventional categories and examines social positions through singular lenses, rather than approaching social positioning as relational, dynamic, and shaped by power relations.

REPRESENTATIONS AND PEDAGOGICAL CHOICES IN SCHOOL CONTEXTS: A REFLECTION BASED ON PICTURE BOOKS.

Pamela Prosperi (Unipg, Italy) · **Ilaria Santilli** (Uniroma1, Italy)

inclusion | picture book | critical pedagogy

This contribution begins with a central question in the educational field: in what ways might the choices and attitudes of adults contribute—sometimes unconsciously—to the consolidation of stereotypes and the reproduction of forms of structural marginality (Galtung, 2006; hooks, 2020). Recent literature highlights how teachers may pay greater attention to, or grant greater recognition to, learners perceived as belonging to the dominant group—that is, those who share the prevailing cultural and social references (Fallon et al., 2023). This mechanism may disadvantage those who are perceived as "others" or "different" (Dell'Anna, Parisi, Pedron, 2024). Such dynamics are linked to cognitive processes of belonging and social categorization, through which people tend to distinguish between an in-group, toward which stronger identification and appreciation develop, and an out-group, which is more exposed to forms of exclusion or devaluation. bell hooks (2020) emphasizes the need for teachers to recognize the value of situated knowledge and to adopt a reflective stance regarding their own positionality, highlighting how awareness of one's standpoint and its identity implications are necessary conditions for creating educational spaces that are genuinely critical and inclusive. From this perspective, inclusion is conceived as a dynamic process, constructed also through everyday relationships, choices, and practices (Booth & Ainscow, 2014; Mitchell & Sutherland, 2020). This contribution aims to focus attention on picture books, considered narrative tools of great narrative and pedagogical power—symbolic spaces for encountering otherness, but at the same time potential vehicles for stereotypical representations (Beseghi, 2003; Zizioli, 2017; Terrusi, 2024; Coll-Planas & Garcia-Castillo, 2025). Starting from the question: in what ways do the representations found in picture books contribute to the reproduction of stereotypes and forms of discrimination in educational contexts? The paper intends to critically reflect on the role of visual and textual narratives in the processes of identity formation and the shaping of children's imaginaries. In line with bell hooks' perspective (2020), which conceives education as a practice of freedom and as the construction of communities capable of valuing the plurality of experiences and voices, the paper will explore the possibility of using picture books as pedagogical devices for the deconstruction of stereotypes and for the reactivation of plural perspectives on identity, fostering practices of intersubjective recognition and critical dialogue (Coll-Planas & Garcia-Castillo, 2025). In this direction, reference is made to the idea of engaged pedagogy proposed by bell hooks, in which theory and practice intertwine in the construction of educational contexts capable of supporting forms of democratic and transformative participation (Bocci & De Castro, 2022; Bianchi & D'Antone, 2024). The picture book thus emerges not only as a cultural object, but as an educational device capable of promoting awareness, inclusion, and critical thinking within educational settings. An intersectional lens provides the conceptual framework for understanding how more conscious educational practices and choices can help build plural and welcoming spaces for learning, participation, and encounter, within the perspective of a critical and transformative pedagogy.

HOW DECONSTRUCTION INFORMS INTERSECTIONAL ANALYSIS

Eloïse Drure (University of Modena and Reggio Emilia, Italy)

epistemology | deconstruction | right to early childhood care and education

This ongoing study examines the role of civil society organizations in advancing the right to Early Childhood Care and Education (hereafter ECCE) (Beiter, 2025; Bianchi et al., 2022; Boly Barry, 2022; Lee et al., 2015; UNESCO, 2022). This research adopts a critical qualitative inquiry (Denzin, 2017; Denzin & Giardina, 2010; Skarstad, 2024) conducting with professionals working or people engaging as volunteers in a civil society organization – including NGOs, associations, foundations, workers unions, etc – within the early childhood sector. Early childhood education and care is inherently multisectoral and holistic integrating education and the care part that includes protection, health, well-being (Marope & Kaga, 2015). The perspective based on evidences emphasizes the interconnectedness of these dimensions in fostering child development. The intersectional dimension of this research was not immediately apparent. However, through the movement of Deconstruction as theorized by Jacques Derrida (Derrida, 1972, 1979; Ina Culture, 2002; Ramond, 2008; Ramond & Adami, 2011) about the role and action of civil society organizations in the advancement and realization of the right to education and early childhood care. This deconstructive approach revealed the intersectionality inherent to the research topic. It was further reinforced by empirical research with the target audience (interviews, questionnaires) and after having myself undertaken a critical study of my position (self-reflection work and immersive experiences). Deconstruction, like Complex and Systemic Thinking (Dielbot, 2025; Morin, 1991, 2014), forms a key component of the study's epistemological foundation. Contrary to common misconceptions, deconstruction is neither a prescriptive method nor a nihilistic endeavor. Instead, deconstruction seeks to question, highlight, and analyze hypotheses of binary oppositions that include: the balance of power between valued and devalued poles, tensions, absences, implicit and unspoken elements and concepts within discourse but also, practices as bell hooks already done (1994). The deconstructive process also evaluates its own feasibility, as not all phenomena are equally open to deconstruction. Eight hypotheses of binary oppositions have been identified: (1) between the public sector and the private sector, and between private non-profits, community-based; (2) between the collective and the individual like organizations/individuals; (3) between theory and practice like de facto/de jure right to ECCE; (4) between the universal and the local, including universal right to ecce/ right to local, contextual and objectivity/subjectivity; (5) between men and women including professionals in early childhood and care; (6) between observer-knowing versus observed-participating (about my position); (7) between education/protection/health sectors in ECCE and finally (8) between childhood and adulthood. Through the gesture of deconstruction throughout the study and enriched by empirical research in a socio-constructivist (Rinaldi, 2021) and praxeological approach (Lhotellier & St-Arnaud, 1994), this study reveals the intersectoral feature of the subject. This complexity manifests at different levels: individual, micro, macro, exo, meso (Bronfenbrenner, 1977) intersecting with gender, age, social class and nationality, origins dimensions.

CEILING IN GIFTED EDUCATION: TOWARD AND INTERSECTIONAL FRAMEWORK FOR TALENT DEVELOPMENT IN POST-MIGRANT GERMANY

Mariella A. Winter (University of Education Karlsruhe, Germany)

intersectionality | gifted education | educational equity

Germany is a comparatively diverse post-migrant society, shaped by transcultural formations and growth, while simultaneously carrying historical and cultural continuities of atrocity and dehumanization. Yet its educational systems still rank among the most segregating in international comparison, systematically reproducing inequities along the lines of multiple interlocking dimensions of social inequalities. This tension is nowhere more visible than in the field of gifted education (Begabungsförderung), where structural barriers continue to obstruct the recognition and development of talent among marginalized children and youth. A systematic review (Winter, 2026) confirms what practitioners have long sensed: intersectional perspectives are virtually absent from German gifted education research. Existing scholarship largely adopts monoaxial frameworks, addressing gender OR migration background OR socioeconomic status in isolation, or solely applies implicitly intersectional notions without explicitly naming them as such (Stamm, 2009). This conceptual gap is consequential: it renders invisible the compounded disadvantages experienced by children whose identities sit at the intersections of marginalized positions. This contribution argues that gifted education research urgently requires what Boger (2019) terms an intersectional corrective lens – a reorientation that moves beyond additive thinking toward an understanding of how overlapping systems of oppression shape access to talent recognition and support. Drawing on Harris and Leonardo (2019) and Mayes, Goldsmith Jones and Hines (2018), we propose that intersectionality functions not merely as a descriptive tool but as a generative epistemological framework capable of exposing and challenging the structural mechanisms that produce glass ceilings in educational opportunity. We situate this argument within the conceptual architecture of the Leistung macht Schule (LemaS) research initiative in Germany – a collaborative endeavor bringing together researchers, schools, and educational administrations - whose understanding of giftedness offers a productive point of departure. Aligned with Gardner's theory of multiple intelligences, LemaS conceptualizes "gifts" as dynamic, fluid, and multidimensional and foregrounds potential-oriented, diversity-sensitive, and transformative approaches to learning (Gardner, 1999; Weigand, 2021). Crucially, it understands giftedness as a construct encompassing transformative knowledge and adaptive capacity for shaping a sustainable world in transition. This vision is inherently democratic in its aspirations: it demands inclusive learning environments in which all children's potentials are recognized and reinventing school architecture in a literal and figurative way, particularly in post-migrant societies where structural barriers most acutely foreclose opportunity. Methodologically, we draw on intersectional inquiry frameworks that fore-

ground social complexity and resist reductive categorization. The contribution presents a qualitative research design following Winker and Degele's (2010) intersectional multilevel framework that examines how intersecting categories – including race, class, gender, body and others – shape access to gifted education programs in Germany integrating the levels of identity, structure, and symbolic representation. Finally, we explore structural pathways toward greater equity, engaging Stojanov's (2011) concept of compensatory as a possible foundation for policy recommendations. We argue that realizing the democratic promise of gifted education in post-migrant Germany requires not only recognition of diverse potentials, but actively dismantling the structural conditions that render those potentials invisible.

INTERSECTIONAL BELONGING: ADULT MIGRANT STUDENTS' EXPERIENCES IN FINLAND

Alessandra Aldrovandi (University of Helsinki, Finland)

belonging | intersectionality | adult education and training

My PhD project investigates the relationship between adult migrant students' fostering of belonging and institutional practices in Finland; more precisely, how education mediates between migrants and broader societal structures thereby facilitating social participation and change. The research engages with much-debated issues related to migration and societal dynamics in Finland. Frequent media discussions report on the tension between, on one hand, the need to attract workforce to fill in key employment positions and to support the national welfare system and, on the other, the structural barriers to the labour market that significantly impact migrants. Although in integration policies adult education is promoted as a vector of economic inclusion, my interest lies in adult migrant students' socio-economic participation and life design. This study draws on an intersectional approach to investigate how overlapping structures of power shape adult migrant students' lived experiences in Finland. Through qualitative analysis of school observations and interviews, it shows how intersecting inequalities manifest in the students' life design in different spheres of their experience, in relationship-building and career plans. Theoretically, I adopted a Nordic postcolonial and intersectional framework to analyse social ties in relation to belonging (see Anthias 2008; Brah & Phoenix Collins 2019; Collins 2019; Keskinen 2019; Lähdesmäki et al. 2016; Yuval Davis 2006); and applied affect theory to examine the effect of institutional and affective practices on students' career plans (Ahmed 2004; Berlant 2010). I carried out ethnographic observations and semi-structured interviews in vocational education and training and Finnish language courses in general upper-secondary education. The study focussed on the participants' educational and work trajectories, social connections and career plans. Teachers and career counsellors were also interviewed as part of the study. By using an intersectional lens, I analysed adult migrant students' social connections through school and employment. The data suggested that, from an institutional perspective, structural systems in adult education and the labour market often restrict opportunities for engagement with the majority population, thereby reinforcing segregation along racial and class lines. From an interpersonal angle, racialisation contributes to disconnection and exclusion. The interplay of race, nationality, and class defines who forms connections with whom, in what contexts, and with what outcomes. Finally, I investigated adult migrant students' life designs and affective practices, departing from the notion of hope as affect and result of contextual and institutional

dynamics. The findings show that institutional promises of inclusion and career development remain unfulfilled, especially in the case of non-white and racialised students, from outside the EU, working in low-status jobs. Over time, students experience recurring cycles of hope, as this is continually produced, sustained, lost, and reconstructed.

PLAY AS PRACTICE: EPISTEMOLOGIES OF EMBODIED INTERSECTIONALITY FOR DEMOCRATIC BELONGING

Silke Werth (Free University of Bozen-Bolzano, Italy)

intersectionality | ludic pedagogy | democratic learning

This paper proposes game design and testing as a democratizing, intersectional pedagogy through which learners explore the systemic and individual configurations of inequality that shape life in post-migrant societies. In an era marked by growing hostility toward diversity, equity, and inclusion, the paper argues that game design and experimentation cultivate empathy and foster belonging, cooperation, and critical awareness. Drawing on Collins' (2019) framework of intersectionality as critical social theory, it emphasizes that intersecting identities do not simply add up but overlap in ways that produce qualitatively different experiences of privilege and oppression. Hands-on, participatory methods make this relational understanding visible by showing how power operates through interconnected structures rather than isolated categories. Building on Wilcox's (2024) ludic theory of cognition, the paper demonstrates how intersectionality games illuminate the ways in which social position shapes perception, mobility, and possibility. Games allow learners to temporarily inhabit alternative social logics, deepening their understanding of intersectional experiences, particularly when they involve reflexive, cooperative, or role-based elements. As de Castell (2023) argues, ludic epistemology treats play as a legitimate form of knowledge-making; thus, designing intersectionality games becomes a way to experiment with and critically reflect on the power systems that organize social life. The empirical foundation is a university course in which students prototyped and tested games to make intersectionality accessible to diverse audiences. These games—ranging from board games to obstacle courses—require players to navigate scenarios where multiple disadvantages (such as linguistic exclusion combined with gendered or religious discrimination) overlap, or where hidden privileges shape outcomes. By translating theory into embodied experience, these games reveal how structural barriers and epistemic injustices persist even when legal frameworks proclaim equality, thereby bridging the gap between abstract theory and lived realities. Analysis of student reflections indicates that gamification facilitated a shift from "visibility" to "reflexivity," making systemic inequality emotionally tangible and demonstrating that outcomes are not solely the result of individual effort but depend on structural conditions. Participants reported moving away from reductionist understandings of identity, echoing hooks' (1994) call for engaged pedagogies grounded in lived experience and collective responsibility. Ultimately, the paper argues that playful, practice-based encounters are essential for cultivating educational environments that are democratic in practice, not merely in principle. Through active engagement with elements of play, learners co-create and deepen theoretical understanding while developing inclusive, reflexive, and socially just orientations toward the world.

Learning For Democracy: Recognising and Deconstructing Sexist Stereotypes for a More Equal Society

PANEL CONVENORS: Flaminia Saccà (Sapienza Unviersità degli Studi di Roma); Rosalba Belmonte (Unitelma Sapienza)

PANEL KEYWORDS: Gender Equality, Sexist Stereotypes, Gender-based violence

Democracy is based on equality before the law, freedom of speech, parity, equality in running for public office, distribution of powers and participation, but if we take a closer look at how these principles are observed even in modern, Western societies, we'll realise that equality and parity are far from being accomplished. In this panel, we will analyse how persistent inequalities between genders are normalised and reproduced through socialisation processes. Despite significant progress over the decades, such gender inequalities and narrations continue to permeate schools, media ecosystems, political institutions, and judicial processes. In this panel, we aim to explore the intersections between gender, education, democracy, and the gendered cultural and institutional dynamics that shape contemporary societies. Therefore, we welcome contributions that address gender stereotypes and prejudices at various stages and in various agencies of the socialisation process. In particular, we seek submissions that investigate sexist stereotypes in the media, in textbooks, court judgements and public discourse, also in relation to gender-based violence representations. We are interested in analysing the role of school textbooks, journalism and media in representing and constructing public discourse on gender, power, and violence. We also welcome papers on the impact of gender in judicial contexts, including the interpretation of gender-based violence in court decisions, the use of gender perspectives in legal reasoning, and the institutional barriers that affect access to justice. We encourage interdisciplinary approaches and methodological plurality. Papers may address local, national, or international contexts.

BEYOND NORMALIZATION: THE RADICAL RIGHT'S "FIFTH WAVE" AND THE POPULIST CONSTRUCTION OF THE GENDER THREAT

Antonio Tramontana (University of Messina, Italy) · **Milena Meo** (University of Messina, Italy)

Radical Right | Gender Identity | Hegemony

In the contemporary landscape of democracy under threat, this paper explores how the radical right is evolving from a phase of institutional normalization toward a complete model of power consolidation, here defined as a potential "fifth wave". By using gender as a "symbolic glue", these forces are building broad anti-liberal coalitions that effectively reshape democratic discourse and institutional practices. The research focuses on the Italian case study of the "DDL Zan" bill against homo-transphobia, analyzing the public debate as a crucial site of ideological struggle and a paradigm for the cultural hegemony of the conservative bloc. The study employs a mixed-method approach, combining quantitative word-frequency analysis with qualitative frame analysis on a corpus of 163 press articles published in 2021 across diverse ideological outlets (including Avvenire, Il Manifesto, Il Fatto Quotidiano, and Corriere della Sera). The findings reveal that the opposition to the bill successfully aggregated a remarkably heterogeneous bloc, ranging from radical right parties like Lega and Fratelli d'Italia to centrist formations and influential extra-parliamentary actors such as the Vatican. This coalition achieved discursive dominance through three interconnected strategies. First, it transformed gender into an empty signifier to mobilize resentment against globalism, promoting cultural homogeneity over individual rights. Second, it employed a selective form of homonationalism that tolerates binary identities while marginalizing non-binary and TQI+ subjectivities as threats to the natural order. Finally, it operated a populist reversal where minority protections were depicted as an "ideological dictatorship" threatening the majority's freedom of speech. The analysis demonstrates that the defeat of the DDL Zan was not merely a legislative failure but a successful exercise of hegemony that anticipated the current Italian political landscape. This research contributes to political sociology by illustrating how the gender battlefield is strategically used to redefine democratic boundaries and normalize anti-egalitarian ideologies.

BETWEEN INVISIBILITY AND POLITICAL CONFLICT. THE REPRESENTATION OF VIOLENCE AGAINST LGBTQ+ PEOPLE IN THE ITALIAN PRESS

Valentina Raffa (University of Messina, Italy) · **Antonio Tramontana** (University of Messina, Italy) · **Fabio Mostaccio** (University of Messina, Italy)

Journalistic representation | LGBTQ+ violence | Power and Inequality

In recent years, violence and discrimination against LGBTQ+ people in Italy have gained increasing visibility thanks to data collected by associations and independent observatories. However, this growing visibility has not been matched by an equally significant journalistic representation: media coverage of the phenomenon remains sporadic, fragmented, and often marginal, contributing to the limited public recognition of the issue as a structural problem. This paper presents the results of research conducted by the Messina research unit within the PRIN PNRR 2022 project STEPSISTER – STEreotypes and PrejudiceS In preSs represenTation of gEndeR-violence, which focuses on the analysis of journalistic representations of violence and discrimination against LGBTQ+ people and associations. The aim is to identify the main narrative frames, stereotypes, and prejudices present in media discourse. The study is based on a content analysis of a corpus of 356 articles published in 2021 in four national newspapers – Avvenire, Il Fatto Quotidiano, Corriere della Sera, and Il Manifesto. The selected year coincides with the parliamentary debate on the DDL Zan, a period marked by strong polarization in the public debate on LGBTQ+ rights. The analysis highlights a prevailing tendency to treat violence as episodic events, with limited reference to their structural context, as well as the presence of stereotypes and prejudices in journalistic representation. The paper concludes with a reflection on the implications of these forms of representation for

the public construction of violence as a social and political problem, showing how media narratives contribute to defining which forms of violence are recognized, which subjects become visible, and which remain at the margins of public discourse.

TEACHING INEQUALITY AT THE DAWN OF HISTORY: GENDER STEREOTYPES IN ITALIAN PRIMARY SCHOOL TEXTBOOKS

Maria Antonietta Augenti (University of Modena and Reggio Emilia, Italy) · **Mario Ederoclite** (Department of Education Studies, Alma Mater Studiorum University of Bologna)

Gender stereotypes | primary school textbooks | multimodal analysis

Primary school textbooks are among the most pervasive vehicles for transmitting gender stereotypes to young children and play a crucial role in the early construction of gendered expectations and identities (Biemmi, 2010; 2015; Blumberg, 2008; Corsini & Scierri, 2016; Gooden & Gooden, 2001). Recent archaeological scholarship has increasingly demonstrated that prehistoric subsistence systems were far more flexible than the traditional male-hunter/female-gatherer dichotomy suggests (Patou-Mathis, 2020). Prehistory, the core historical content of third grade in the Italian curriculum, represents a paradigmatic case: it is the first historical horizon children encounter systematically, and at the same time the terrain where a binary division of gender roles becomes naturalized through a narrative that presents itself as scientifically grounded while concealing its ideological character. The "Man the Hunter" paradigm, consolidated in 1960s anthropology (Lee & DeVore, 1968) and subsequently challenged by feminist anthropology and gender archaeology (Gero & Conkey, 1991) and today widely refuted by paleontological and archaeological research, continues to structure the prehistoric imaginary conveyed by Italian school textbooks, with potentially significant consequences for the gender socialization of school-age children. This contribution presents a multimodal analysis of a sample of history textbooks for third grade from Italian publishers. The analysis operates on two levels: the textual plane, examining discursive strategies of role attribution, the use of the generic masculine as a synecdoche for the species, and the presence or absence of female agency; and the iconographic plane, examining the visual grammar of illustrations and the distribution of roles, spaces, and postures assigned to male and female figures (Kress & van Leeuwen, 2006; Jewitt, 2013). The data document recurring patterns across publishers. On the iconographic level, male figures dominate quantitatively and are systematically associated with open space, action, tool use, and hunting; female figures appear predominantly in enclosed spaces, in passive or caregiving postures. A particularly revealing indicator concerns the positioning of children within scenes: across all publishers analyzed, young children are placed alongside female figures and within caregiving spaces, never in hunting or action scenes — a pattern that implicitly conveys a model of male development as progressive distancing from the female sphere toward open space and risk. A further significant finding emerges from the analysis of text-image relationships: in several cases the written text adopts inclusive or cautious formulations, while the illustrations contradict this openness, reproducing the stereotyped division. This systematic gap suggests that iconographic bias operates independently and more effectively than textual bias in shaping readers' imaginaries. The contribution discusses the implications of these patterns for a democratic school: a curriculum that presents gender inequality as inscribed in the dawn of humanity functions as a device for the historical legitimation of contemporary stereotypes. Such an analysis must therefore also serve as a pedagogical invitation for teachers to engage in critical self-reflection on their own implicit gender stereotypes, recognizing how these assumptions may shape classroom practices, expectations, and interactions in ways that either reproduce inequality.

DIGITAL GENDER-BASED VIOLENCE AND NEWS MEDIA REPRESENTATION: NON-CONSENSUAL DISSEMINATION OF INTIMATE IMAGES IN ITALIAN NEWSPAPERS

Stefania Parisi (Sapienza University of Rome, Italy) · **Maddalena Carbonari** (Sapienza University of Rome, Italy)

non-consensual dissemination of intimate images | male violence against women | media narratives and public discourse

In Italy, the non-consensual dissemination of intimate images became a criminal offence with Law No. 69 (2019), known as "Codice Rosso". In public and media discourse, this crime is commonly referred to as 'revenge porn'. This label is problematic (Hearn, Hall 2018; Henry, Powell 2015; Maddocks 2018) because it reinforces the sexist culture it aims to combat, shifting responsibility from the perpetrator (Hall, Hearn 2019) to the victim: revenge implies a reaction, leading violence to be framed as a consequence of a woman's actions and obscuring the power asymmetries that underlie it (Abbatecola 2021). The phenomenon is part of broader forms of technology-facilitated gender-based violence (Henry, Powell 2015), made possible by the spread of digital platforms, social networking sites, and messaging services that enable the potentially viral and difficult-to-control circulation of content. In this context, the media play an ambivalent role. On the one hand, they are key players in the public definition of social phenomena, including gender-based violence, helping to construct the interpretative categories through which public opinion understands them. On the other hand, the media — especially digital media — can become part of the dynamics of forms of violence that are enacted through online platforms. Specific platforms' (e.g. Telegram; Semenzin, Bainotti 2020) sociotechnical affordances — such as anonymity, large groups, broadcast channels, invitation links, and limited traceability — facilitate the non-consensual circulation of intimate images. These features foster male homosocial spaces where sharing such content functions as a practice of socialization and the construction of masculinities. Also in light of the extensive literature on media and gender-based violence – which has demonstrated the persistence of stereotypes in media narratives (Capecchi, Gius, 2021; Lalli, 2021; Hewa, 2021; Saccà, 2021, 2024) – this paper analyzes how Italian newspapers have reported cases of illegal dissemination of intimate material and to what extent they have reproduced the most widespread gender stereotypes. Through a qualitative content analysis, we analyzed 96 articles published in 2024-2025 as part of a broader study on the journalistic representation of gender-based violence in the Roman press. The findings reveal a limited definitional clarity. Most articles refer to the phenomenon simply as 'revenge porn' while only a minority define it as the illegal dissemination of intimate images, referring to the legal framework. In most cases, the term is used as a generic label to describe forms of digital exposure, without clearly framing it as gender-based violence. As a result, the structural dimension of the phenomenon tends to remain invisible. Moreover, media coverage is largely characterized by an episodic frame, focusing on individual news stories, and a sensationalist tone with overly detailed descriptions that risk reproducing mechanisms of secondary victimization, whereby the victim is portrayed as partially responsible for the violence experienced. Overall, the analysis highlights how journalistic narratives tend to attribute incidents to romantic conflicts or dynamics of 'revenge' between ex-partners, focusing on the personal circumstances of those involved rather than on the social, cultural, and technological dimensions that make the non-consensual dissemination of intimate content possible.

REPRESENTING GENDER-BASED VIOLENCE AT SCHOOL: MEDIA NARRATIVES, STEREOTYPES, AND PUBLIC DISCOURSE

Luca Massidda (Università della Tuscia, Italy)

Gender-based violence | Media representation | School environment

This paper analyses how the press represents male violence against women when it occurs within the school environment. It focuses on news coverage of cases in which violence against women and girls is perpetrated by a schoolmate, a teacher, or a member of school staff, thus addressing the intersection between gender-based violence, education, and public discourse. In line with the main interest in the role of media and socialisation agencies in reproducing or challenging sexist stereotypes, the paper investigates whether the school context activates specific interpretative frames in the journalistic narration of violence. Drawing on data collected by the STEP Observatories, the study first measures the visibility and weight of school-related cases within the broader national and local press coverage of violence against women in Italy in 2024–2025. It then develops an in-depth textual analysis of the articles in order to examine whether gender-based violence in educational settings is narrated through recurrent discursive patterns, whether it triggers distinctive narrative schemes, and whether the stereotypes and prejudices widely documented in the literature on media representations of gender-based violence (Capecchi & Gius 2023; Saccà 2024; Yusri et al. 2025) persist, are reformulated, or are partially transformed when violence takes place in the socially and symbolically specific space of school. By focusing on the school as a key site of socialisation, the paper aims to contribute to the broader debate on how journalism participates in the public construction of gender violence and in the normalisation, exposure, or deconstruction of sexist stereotypes. More broadly, it reflects on the democratic implications of media representations of violence in educational contexts, showing how the press may either reinforce or challenge unequal gendered meanings within a crucial institution of civic formation.

NO COUNTRY FOR A WOMAN'S CONSENT? USING GREY AREAS TO EXPLORE ITALY'S LEGAL DEBATE ON SEXUAL VIOLENCE

Elena Morrone (Università degli Studi di Salerno, Italy)

Sexual consent | gender stereotypes | grey areas

In Italy, the legal debate on the amendment to Article 609-bis of the Criminal Code concerning sexual violence is currently stalled on the proposal of the Chair of the Justice Committee, Giulia Bongiorno: to establish the crime, it is not necessary to assess the possible presence of 'free and current consent', but rather the absence of the 'will of the person' to perform that particular act, giving importance to dissent. The difference between these two expressions is not merely terminological but also prompts reflection on the symbolic level, which in turn interacts with the technical level. The concept of

consent would open the way to questioning cultural models that portray women as passive subjects in sexual relationships, whose participation is assumed and men as active subjects, whose proactivity is taken for granted. The idea of sexuality that consent would express could lead to a renewal of gender roles, moving away from stereotypes and prejudices and towards a dynamic that is less susceptible to power imbalances, though still capable of improvement (Borrello 2023; Millefiorini 2024). From a technical perspective, this focus would also align with Article 36 of the Istanbul Convention (2011), ratified by Italy in 2013. Referring just to the 'will of the person' risks relegating these cultural models to the background. Also, it could allow for ex post reconstructions of will based on gender stereotypes, social expectations, or ambiguous interpretations of behaviour. In this sense, the choice of wording has a direct impact on regulatory technique: while 'consent' directs the assessment towards a paradigm shift, 'will' allows for flexible assessments that can compromise legal certainty and the preventive function of criminal law. This contribution aims to explore this reflection further by considering the two expressions not merely as technical tools but as symbolic devices: 'consent' and 'will of the person' become two discursive categories that contribute to producing and legitimising, in the legal and social spheres, certain configurations of gender and power dynamics. Conversely, it will be considered how these configurations influence the push towards adopting 'consent' or 'personal will', highlighting what these efforts reveal about the current sexual order. To do so, this paper examines these categories through the lens of 'grey areas', that is, situations of sexual interaction that cannot be clearly classified as either consent or dissent (Graf e Johnson, 2020; Gunnarsson 2018, 2025). In this sense, 'grey areas' of sexual interaction could reveal how the legal recognition of consent and/or dissent is shaped by gendered interpretive frameworks that normalise stereotypical expectations, thereby constraining the intelligibility of certain experiences and producing forms of epistemic injustice (Fricker, 2007).

LEARNING FEMININITY ONLINE: FEMALE DATING STRATEGY AND THE REPRODUCTION OF SEXIST STEREOTYPES IN DIGITAL CULTURES

Debora Maria Pizzimenti (University of Calabria, Italy) · **Assunta Penna** (University of Messina, Italy)

digital platforms | sexist stereotypes | digital ethnography

Digital platforms have become central sites of informal socialisation, shaping contemporary understandings of gender, power, and gender-based violence (Banet-Weiser, 2018). While online communities are often framed as empowering spaces for women, they can also function as environments where sexist stereotypes are reformulated and normalised (Gill, 2007). This study examines the Reddit community Female Dating Strategy (FDS) as a digital site in which stereotypes about women and men are simultaneously challenged and reproduced. The study combines digital ethnography (Sumial and Tikka, 2020) with qualitative content analysis of the FDS forum and its 500-page Handbook. The Handbook was coded using NVivo, allowing for the identification of recurrent discursive patterns, normative categories, and evaluative hierarchies. Particular attention was paid to the construction of femininity and masculinity through classifications such as "High Value Woman" and "Low Value Man", as well as to representations of gender-based violence, relational risk, and emotional self-regulation. The analysis shows that FDS contests male entitlement and certain forms of gender-based exploitation; however, it also promotes rigid gender binaries, essentialised representations of male behaviour, and prescriptive models of female worth based on beauty, emotional control, and strategic heterosexuality. In doing so, the community contributes to the circulation of polarised and simplified narratives about gender relations, reinforcing stereotypes even within discourses of empowerment. An intersectional lens (Crenshaw, 1991) reveals how these con-

structions are shaped by classed, racialised, and heteronormative assumptions that marginalise non-conforming identities. At the same time, the study acknowledges its methodological limitations: while digital ethnography and platform-based analysis are crucial for understanding online discourse, they cannot fully capture how these narratives are internalised, negotiated, or resisted offline. Future research should therefore integrate interviews, focus groups, and the triangulation of online and offline data to explore how such representations influence everyday practices and relational expectations (Evans and Lankford, 2024). The study argues that digital communities such as FDS function as powerful informal agents of gender socialisation, influencing how young women and men understand equality, violence, and relational norms. Recognising these ambivalent dynamics is essential for developing critical media education strategies, beginning in schools and extending across media ecosystems, aimed at fostering reflexive engagement with online gender narratives and promoting more inclusive and democratic cultures (Gius, 2023).

COUNTERING STEREOTYPES AND EDUCATIONAL SEGREGATION IN SCHOOLS: THE GENDER EQUALITY CHARTER MARK

Areta Sobieraj (Oxfam Italia, Italy) · **Lorenzo Luatti** (Oxfam Italia, Italy)

Gendered education | gender inequalities | Gender Equality Charter Mark

In Italy, gender segregation in upper secondary education - with some studies being perceived as “for girls” and others as “for boys” - represents a structural phenomenon that has still received limited public debate. This so-called “stereotyped education” intersects with dynamics of “early socialization,” fueled by stereotypes deeply rooted in society and in the labor market, and often reproduced by schools starting in early childhood education. In this way, they contribute to reproducing gender inequalities in professional opportunities and careers, reinforcing the traditional division of roles in the world of work. The causes of this phenomenon are multiple and can be traced back to structural, cultural, and institutional factors. The Italian upper secondary school system includes more than 180 different study choices, distributed across academic high schools (“Licei”) and, above all, technical and vocational programs (“Istituti Tecnici” e “Istituti professionali”). Fifty-two percent of these studies show a strongly unbalanced gender composition: in many cases, girls or boys account for more than 75% of enrolled students, and not infrequently reach or exceed 80%, 90%, or even near totality. In practical terms, one out of every two students experiences an education in which they belong either to a clear gender majority or a clear minority. Girls encounter greater difficulties than their male peers in overcoming barriers linked to “male-dominated” education. Only one third of the studies with strong gender imbalance are skewed in favor of girls, while the remaining two thirds are dominated by boys. Moreover, male students tend to enroll - albeit in smaller proportions - in female-dominated studies (acquiring, among others, care-related, educational, artistic, and linguistic skills). What then, are the underlying causes of this gendered education? And which strategies can be adopted to counter it at the micro level (individual schools), meso level (school systems and local contexts), and macro level (national policies)? What role can other educational agencies and local stakeholders play? The contribution first aims to provide an updated and comprehensive overview of the phenomenon through the analysis of data and its determinants. Secondly, it will present several practical proposals to address it. Particular emphasis will be placed on the Gender Equality Charter Mark (“Carta della parità di genere”), promoted by Oxfam Italy and piloted, in collaboration with INDIRE, in numerous schools across primary and secondary education throughout Northern, Central, and Southern Italy. This is a systemic tool that enables schools to carry out a self-assessment regarding the actions undertaken - in terms of a school’s vision and mission, organization, leadership, subject teaching, textbooks, communication and relationships with students, as well as engage-

ment with local communities - in order to prevent gender discrimination and violence and to make the school environment increasingly inclusive and equal. Finally, the contribution will focus on the tool's impact, namely the processes activated and the evidence emerged.

GENDER STEREOTYPES AND SOCIAL-EMOTIONAL SKILLS IN ITALIAN STUDENTS: GENDER AND TERRITORIAL DIFFERENCES IN A DEMOCRATIC PERSPECTIVE

Paolo Barabanti (INVALSI, Italy) · **Patrizia Falzetti** (INVALSI, Italy)

Gender Stereotypes | Social-Emotional Skills | Gender Inequality

Democratic education requires more than just formal equality; it also demands the development of social and emotional competencies that allow students to actively participate in collective life as equals. Within the OECD framework on social and emotional skills (OECD, 2019; 2023), these competencies are conceptualised as measurable and malleable traits based on the Big Five model (Costa & McCrae, 1985; John & Srivastava, 1999) that are strongly linked to educational attainment, well-being, and life outcomes (Heckman & Kautz, 2014; Roberts et al., 2007). At the same time, gender stereotypes emerge early in childhood and progressively consolidate through socialisation processes, influencing expectations, aspirations, and self-efficacy (Bian et al., 2018; Makarova et al., 2019; Trautner et al., 2005). As socio-emotional skills are teachable and context-sensitive (OECD, 2019; World Health Organization, 1997), they may interact with stereotypes, shaping distinct developmental profiles. From a critical perspective, gender stereotypes can therefore be understood as relational and emotional schemas embedded in educational environments that could limit democratic participation and epistemic recognition. Against this backdrop, this paper investigates whether gender stereotyping among Italian students is systematically associated with social-emotional skills (SESS), and whether endorsement of stereotypes varies by gender and territorial context. We construct a synthetic index of gender stereotyping using data from the ENRICH project (approximately 6,000 students) and an adapted version of the Gender-Stereotyped Attitude Scale for Children (GASC; Liben & Signorella, 1985). This index ranges from 0 (no endorsement of stereotypes) to 1 (full endorsement of stereotypes). We examined its association with nine SESS dimensions: Open-mindedness (Curiosity and Creativity), Task performance (Perseverance and Responsibility), Engaging with others (Sociability and Assertiveness), Collaboration (Empathy) and Emotional Regulation (Stress resistance and Optimism). Pearson correlations reveal systematic and statistically significant associations. Higher endorsement of stereotypes is negatively correlated with Curiosity ($r = -0.185$), Creativity ($r = -0.116$), Perseverance ($r = -0.129$), Responsibility ($r = -0.170$), Empathy ($r = -0.217$), Sociability ($r = -0.042$) and Optimism ($r = -0.038$) ($p < 0.001$). The strongest negative association is with Empathy. Conversely, stereotyping is positively associated with Assertiveness ($r = 0.133$) and Stress resistance ($r = 0.090$). Regression analyses confirm these patterns. Empathy ($\beta = -0.152$), Responsibility ($\beta = -0.107$), Curiosity ($\beta = -0.060$) and Creativity ($\beta = -0.055$) emerged as robust negative predictors, while Assertiveness ($\beta = 0.112$) and Stress resistance ($\beta = 0.077$) showed positive associations. When gender is added to the analysis, a strong independent effect is revealed ($\beta = -0.217$, $p < 0.001$), indicating significantly lower stereotype endorsement among girls. The effects of territorial macro-areas are comparatively smaller. Overall, the findings suggest that gender stereotyping is systematically associated with particular

socio-emotional traits. Therefore, addressing sexist stereotypes in school contexts requires cognitive deconstruction and deliberate pedagogical investment in empathy, responsibility, and openness — core competencies for democratic coexistence and epistemic justice.

THE ITALIAN LGBTQ+ ANTI-DISCRIMINATION CENTERS AS PLACES FOR LEARNING DEMOCRACY

Fabio Mostaccio (Università degli Studi di Messina, Italia) · **Marika Manera** (Università degli Studi di Messina, Italia)

democracy | Anti-Discrimination Centers | Violence against LGBTQ+

In recent years, the Italian political landscape has been marked by the rise of radical right-wing parties which, also through electoral campaigns based on anti-gender rhetoric, have contributed to reinforcing a climate of polarization and delegitimization toward LGBTQ+ people. In this context, public and media discourse plays a crucial role in shaping the democratic imaginary; however, it often tends to normalize gender stereotypes and discriminatory narratives, thereby contributing to the reproduction of inequalities and forms of both symbolic and material violence. In Italy, in the absence of specific legislation aimed at protecting victims of discrimination and homotransphobic violence, and in the lack of structured policies for prevention and education on diversity, LGBTQ+ movements have progressively self-organized by promoting the creation of a nationwide network of Anti-Discrimination Centers (CAD). These organizations provide health, psychological, and legal support services at the local level, with particular attention to the most vulnerable groups—including minors, transgender people, people with disabilities, and migrants. However, beyond their role in providing support and assistance, CADs also perform a political and cultural function, contributing to the construction of counter-narratives capable of challenging stereotypes, biases, and victim-blaming cultures that often characterize the public representation of sexual minorities. This paper presents the preliminary results of a research project conducted within the framework of the European CERV programme (Citizens, Equality, Rights and Values), funded by the European Union. The study, qualitative in nature and conducted on a national scale, is based on in-depth interviews with operators and coordinators from fifteen Italian CADs. Through these interviews, the research analyzes, on the one hand, the services provided by the centers and their impact on local contexts, and, on the other, the advocacy and communication strategies developed to intervene in public debate, raise public awareness, and influence institutions and policy-makers. The research design also includes two focus groups involving the same actors who participated in the interviews. These collective moments of discussion make it possible to revisit and further explore the main issues emerging from the individual interviews, highlighting convergences, divergences, and shared interpretations among participants, while offering a space for collective reflection on practices of resistance, advocacy, and the construction of alternative narratives. Ultimately, the paper aims to show how the practices developed by CADs can be interpreted not only as forms of social support, but also as expressions of democratic action. By addressing situations of violence against LGBTQ+ people on a daily basis, CADs contribute to dismantling stereotypes and prejudices, while promoting more inclusive models of society.

Challenging Educational Inequality Through Alternative: Thinking In Comics Visual Narrative and Hip Hop Pedagogical Frameworks

PANEL CONVENORS: Veronica Moretti (Università di Bologna, Italy); Stefano Ratti (University of Bologna, Italy); Pamela Jofre (University of Valparaiso, Chile); Juan Pablo Gigoux (University of Valparaiso, Chile); Martina Consoloni (University of Bologna, Italy)

PANEL KEYWORDS: comics, epistemic injustice, visual storytelling

Comics have increasingly entered the sociological debate as epistemic and pedagogical devices capable of interrogating the politics of knowledge that structure educational institutions. Their multimodal nature destabilizes the textual normativity that traditionally defines what is recognized as legitimate knowledge within schooling. By integrating visual, affective and narrative registers, comics provide forms of meaning-making that illuminate dimensions of experience, embodiment, vulnerability, marginality, resistance, often silenced or rendered invisible in dominant educational discourses. In this sense, visual narratives represent a fruitful terrain for addressing epistemic injustice (Fricker 2007; Jofré 2024): they enable the articulation of situated knowledges and counter-narratives that challenge testimonial marginalization and hermeneutical gaps. Beyond their expressive potential, comics operate as sociological artifacts within various domains: autobiographical comics that explore classed, racialized or gendered identities; community-based participatory comics used in youth work and citizenship education; graphic ethnographies that document lived experience; memory-work comics addressing migration, conflict or intergenerational trauma; as well as fields such as graphic medicine, which exemplify how visual storytelling can redistribute epistemic authority and foreground experiential knowledge (Moretti, Della Puppa 2025). This panel invites interdisciplinary contributions investigating comics as critical mediators of educational experience, tools of visual and participatory sociology, and semiotic forms that unsettle established pedagogical paradigms. Papers may focus on inequalities, recognition, multimodal literacies, counter-narratives, or the sociological reconfiguration of educational justice. The aim is to explore how “thinking in comics” expands the sociological imagination and supports more equitable and reflexive educational environments.

HEROES, ETHICS, AND DEMOCRACY: SUPERMAN AND MY HERO ACADEMIA AS EPISTEMIC LENSES FOR CITIZENSHIP

Cristiana D'Aprile (Università di Foggia, Italy)

democratic education | ethical archetypes | comics

The complexity of contemporary socio-political challenges requires a rethinking of the hermeneutic models that convey the education-democracy binomial. This paper analyzes the ethical models that characterize two narrative paradigms of popular comic culture: the lone Superman icon and the institutional ecosystem depicted in My Hero Academia. The primary objective is to compare the axiological foundations of the values embodied by the respective heroic figures to reveal two distinct epistemic perspectives on democracy and its pedagogical implications in Civic Education. The research will be conducted through a comparative qualitative analysis of narrative content, applying a cultural critique lens to the selected texts. The thematic analysis method will be used to identify and codify ethical frameworks and action patterns. Superman will be decoded as a transcendent ethical archetype (Vogler, 2020), with specific reference to the philosophy of otherness (Levinas, Hayat & Ragazzoni, 2006) and the existentialist thought of hope (Palmitessa, 2017). My Hero Academia will, in contrast, be analysed as an expression of collective consciousness and Durkheim's structural functionalism, with particular emphasis on Merton's theory of deviance to examine the systemic criticalities of society. The investigation aims, in conclusion, to define the didactic and value implications carried out through an artifact outside the circuits of formal education and to highlight whether democratic learning should be anchored to universal and stable ideals (Superman) or to a reflective and contextual understanding of the dynamics of current reality (Horikoshi's manga), thus providing analytical tools for the formation of a conscious citizenship.

BREAKING AS INTELLIGENT MOVEMENT: EMBODIED PEDAGOGY AND EDUCATIONAL ECOLOGY IN HIP HOP DANCE

Jacopo Ferri (Independent Researcher)

Embodiment | Hip Hop Pedagogy | Educational Ecology

Drawing on The Intelligent Movement, this paper frames breaking as an embodied educational ecology grounded in cultural incorporation. Movement becomes a site where perception, cognition, and relationality co-emerge, reshaping subjectivity and collective formation. Hip hop dance reconfigures how bodies inhabit space, offering transformative pedagogical possibilities within contexts marked by social inequality.

WHEN THEY RAP US. EPISTEMOLOGICAL INSIGHTS FROM PEDAGOGIC DISCOURSES IN THE POSTCOLONIAL RAP SCENE IN ITALY

Francesco Fabbro (University of Rome Tor Vergata, Italy)

rap | decoloniality | Critical Hip-Hop Pedagogy

While the French rap scene was significantly shaped by the voices of young people with migrant backgrounds from the banlieues since its origin in the 1980s (Hammou, 2012), postcolonial identities and imaginaries in the Italian "rap game" have gained cultural and commercial relevance only in the past decade (Ardizzoni, 2020; Calò, 2012). Today, the multivocal mosaic of postcolonial rap challenges the often patronizing and criminalizing media and political narratives surrounding post/migrant youth from working-class or underclass backgrounds in the Italian suburbs through its own codes (Fabbro, 2025; Saitta, 2023; Sarti, 2025). Recent statistics indicate that these youths represent the most socially and educationally disadvantaged group in the Italian education system (INAAP, 2021; INVALSI, 2025; MIM, 2024). This situation underscores that even pedagogic discourse (Bernstein, 2000) in Italy is not exempt from power asymmetries, especially along the lines of class and ethnicity (Arena, 2025; Hakuzwimana, 2024). Schools thus emerge not only as sites of instruction, but also as spaces where recognition, misrecognition, and symbolic exclusion are produced and contested. This research draws upon decolonial revisitations of Bernstein's concept of pedagogic discourse (or device) (Hlatshwayo, 2024; Parada & Whatman, 2025) to examine educational disadvantage by looking at how young post/migrant artists (e.g. Baby Gang, Chadia, Ghali, Lorenzza) rap about their formal and informal education experiences. Utilizing a critical discourse analysis (Rogers, 2018), this study analyzes a targeted sample of rap songs and corresponding music videos to explore how educational experiences are represented and which pedagogic discourses are contested, negotiated, or upheld. By mobilizing a decolonial lens, rap lyrics and music videos are approached as sites of knowledge production, where schooling, street education, family socialization and racialized surveillance intersect. Finally, findings are discussed to provide some epistemological insights into the challenges face by Critical Hip-Hop Pedagogy (Adjapong & Allen, 2024; Edmin, 2016). By foregrounding the voices of post/migrant rappers, the article reflects on the possibilities and limits of incorporating subaltern cultural knowledge into formal education, asking whether and how rap can function not only as a pedagogical tool, but also as a critique of the pedagogic device itself.

DRAWING THE RIGHT TO THE CITY COMICS AND CREATIVE METHODS AT THE INTERSECTION OF TEACHING AND RESEARCH ON GENDER, SEXISM AND URBAN SAFETY.

Giulia Selmi (University of Parma, Italy)

Sexism | urban safety | participatory research-teaching

The objective of this paper is to critically discuss the impact and potential of a research-teaching project that places comics and visual storytelling at the core of a creative and participatory inquiry on girls' perceptions of urban safety and the gendered livability of the city. The project was carried out with a group of graduate students in social work and was designed as a research-teaching initiative combining scientific research, academic teaching, and community engagement (Pellegrino 2018; Tarsia 2020). Within this framework, creative methods—and comics in particular—are conceived not merely as dissemination tools, but as methodological and pedagogical infrastructures that enable participation, reflexivity, and accessibility. The project Che genere di città? - developed within the standing group ParTeR (Participatory Teaching & Research, University of Parma) - emerged as a deliberately non-securitarian response to student representatives' claims for increased "security" in the city and on campus, particularly for women and girls. Rather than reinforcing dominant securitization discourses, the project aimed to challenge mainstream gender models and promote a culture of equality and non-violence. Drawing on feminist and critical literature on gender and urban space (Andreola & Muzzonigro 2024; Kern 2021; Valentine 1989, 1990), the project involved 104 students as both participants and co-researchers in six-month research and learning process. Activities included one creative workshop, 46 in-depth interviews, three art-based focus groups, and two collaborative art-based workshops conducted in close collaboration with a professional cartoonist. Building on Giorgi et al. (2021), who highlight the use of creative methods across different stages of the research process, this paper focuses specifically on the pedagogical and participatory value of comics and illustration within research-teaching practices. First, it discusses how a creative workshop involving drawing, coloring, maps, and stickers was used as a didactic tool to collectively design the qualitative interview outlines.Second, it examines how the collaborative transformation of narrative interview data into comics functioned as a situated teaching and learning strategy for qualitative data analysis. Rather than treating comics as a mere visual translation of research findings, the process of co-creating illustrated narratives with a cartoonist was designed as a pedagogical device through which students were required to actively engage with core analytical practices, such as data selection, coding, abstraction, and interpretation. In order to translate interview excerpts into visual sequences, students had to collectively decide which narratives, meanings, and emotions were analytically relevant, how to condense complex accounts into scenes, and how to represent power relations, spatial dynamics, and gendered experiences of safety through visual metaphors. This process made interpretative choices explicit, discussable, and contestable, thus fostering reflexivity and methodological awareness. At the same time, the comics format enabled forms of participatory validation, as the visual narratives were shared and

discussed with research participants, opening up a dialogical space in which interpretations could be confirmed, negotiated, or challenged. In this sense, comics operated simultaneously as a learning environment, an analytical tool, and a participatory research device, reinforcing the interconnection between teaching, research, and community engagement.

„CHI SONO IO, CON PERMESSO?“: THE EDUCATIONAL POTENTIAL OF GRAPHIC NOVELS FOR NARRATIVES OF MIGRATION, IDENTITY AND CITIZENSHIP IN TEACHING ITALIAN AS A FOREIGN LANGUAGE

Stefanie Faustmann (Masarykova Univerzita, Czech Republic (Czechia))

graphic novels | migration | global citizenship and mediation-oriented learning

This paper explores the potential of graphic novels for culturally reflective, mediation-oriented education in the contexts of migration, identity negotiation and democratic participation. Focusing on Italiana, con permesso (Ben Mohamed, 2025), it analyses the portrayal of the author's experiences of migration, multilingualism, religious affiliation and social positioning in Italy. The protagonist's story illustrates how issues of belonging, cultural identity and social participation are negotiated within migrant communities. The study also investigates how visual narratives can engage learners with experiences of migration and plural identities. Assuming that narrative and visual representations can make complex social realities more accessible, this paper presents how graphic novels can serve as educational resources that promote global citizenship and reflection on democratic values and social participation in Italian language classes for foreign learners (Zadra & Bartoli-Kucher, 2023). Visual narratives empower learners to critically engage with diverse perspectives on migration and social belonging (Spadaro, 2020). The theoretical framework integrates culturally reflective learning and the mediation concept of the CEFR Companion Volume (Council of Europe, 2020), which emphasises linguistic, social, and cultural mediation within multilingual societies. Global citizenship education offers a perspective through which to critically consider social diversity, migration experiences and democratic participation (UNESCO, 2014; Zadra & Bartoli-Kucher, 2023). Using selected scenes from Italiana, con permesso, this paper demonstrates how belonging, discrimination, identity negotiations, and social expectations are visually and narratively presented. This highlights the potential for critical, reflective, dialogical, and mediation-oriented learning processes (Bartoli-Kucher, 2025). Therefore, graphic novels can be used as educational resources to foster democratic values, social responsibility and active citizenship in foreign language teaching.

VISUALIZING THE UNTHINKABLE: THE DEPICTION OF THE HOLOCAUST IN COMICS

Anna Schnepper (Freie Universität Berlin, Germany)

Holocaust Education | Comics | marginalized victims' perspectives

"History dissolves into images, not into stories," Walter Benjamin (1983, 596) writes in the Passagen-Werk — a formulation that helps explain why our remembrance of the Holocaust is so powerfully visual. These visual representations appear as photographs, films and, increasingly, as comics. Long viewed with skepticism as an inadequate mode for representing the Holocaust, the comic today nonetheless offers distinctive affordances and poses characteristic risks (Grünewald 2014; Frenzel, 2014; Merten 2021). This contribution explores the possibilities and pitfalls of depicting the Holocaust through comics, arguing that they can encourage critical reflection rather than documentary literalism. Their multimodal grammar — sequential panels, juxtaposed image and text, deliberate omission — can generate concrete yet pluralistic images that resist the abstraction of universal remembrance while simultaneously pointing to their constructed nature. (Frahm 2006). This duality enables comics to bring to light the perspectives of marginalized victims, to interrupt perpetrator-centered gazes that prevails in historic photography with few exceptions (e.g. Didi-Huberman 2012), to juxtapose past and present, and to invite readerly reflection through deliberate artifice. At the same time, comics carry specific hazards: they can simplify causalities, aestheticize suffering, instrumentalize survivor testimony for broader moralizing narratives, or reproduce voyeuristic framings that occlude complexity (Köppen/Scherpe 1997). They have the potential to reproduce harmful visual tropes that resonate with antisemitic and dehumanizing iconography, and the creation of retrospective narratives that impose spurious causal coherence onto acts whose brutality and irrationality resist explanation (McLaughlin 2021; Brink 1998). The considerations are based on debates about photography that have shaped our view of the Holocaust and are conducted mainly from the perspective of the perpetrators or liberators, trapping the people who suffered during the Holocaust in the position of victims, e.g. in photo collections such as The Yellow Star (Schoenberner 1978) and on pictures drawn by prisoners, which reflect the perspective of the survivors but are mostly neglected in the debate because they are accused of lacking objectivity. The contribution develops four analytical categories – (1) perspective, (2) authenticity, (3) 'the unthinkable' and (4) narrative – and applies them to four selected works: MAUS, Yossel, Auschwitz and Der Boxer (Spiegelman 1986/1991; Kubert 2003; Croci 2005; Kleist 2012). The contribution examines how comics can shed light on (historical) epistemic injustice and on the role of Holocaust victims as witnesses, which is central for epistemic agency (Fricker 2007): What perspectives do comics enable or interrupt, how do they signal constructedness as opposed to documentary claims, and how can they bring neglected victim groups to the fore? The contribution concludes with concise, practice-oriented implications for historical-political education: selection criteria, contextualization imperatives and ethical guardrails to leverage comics' pedagogical strengths while minimizing aestheticization and instrumentalization.

FROM COMICS TO HEALTH: A QUALITATIVE COMPARATIVE STUDY BETWEEN ITALY AND CHILE WITHIN MEDICAL EDUCATION

Veronica Moretti (Università di Bologna, Italy) · **Martina Consoloni** (Università di Bologna, Italy) · **Alessia De Stefano** (Università di Bologna, Italy) · **Stefano Ratti** (Università di Bologna, Italy) · **Pamela Jofre** (University of Valparaiso, Chile) · **Juan Pablo Gigoux** (University of Valparaiso, Chile)

Graphic Medicine | Comics and Education | Medical Students

Graphic medicine (GM) has emerged as an interdisciplinary field integrating comics, visual storytelling, and healthcare, offering innovative tools for medical education and reflective practice. Despite growing interest, there is still limited qualitative research examining how GM is experienced by medical students across different cultural and institutional contexts. This study explores and compares students' experiences with graphic medicine at the University of Bologna (Italy) and at the Universidad de Valparaíso (Chile). A qualitative research design based on semi-structured interviews was adopted. Participants included medical students (10) from different years of training who had taken part in graphic medicine and narrative medicine courses, laboratories, or extracurricular projects in the two universities. Interviews were conducted in Spanish and Italian, audio-recorded, transcribed verbatim, and analyzed using thematic analysis. Analytical focus was placed on participants' prior relationships with drawing and visual arts, their experiences of graphic medicine as a learning environment and the role of drawing and comics in emotional expression and reflection. Across both contexts, GM was described as a distinct educational space characterized by openness, safety, and collective reflection, in contrast to traditional biomedical training. Participants reported increased awareness of the ethical and communicative dimensions of clinical practice, particularly regarding the weight of medical language, gestures, and attitudes. Participants also highlighted structural and institutional challenges, including the elective status of GM courses and the difficulty of integrating reflective, non-assessed practices within highly standardized and performance-oriented medical curricula. In this sense, GM operated as a redistributive epistemic practice, giving voice to students' situated knowledge and enabling counter-narratives to the techno-scientific authority that structures medical training The comparative findings from Chile and Italy indicate that integrating GM into medical curricula may help bridge the gap between technical-scientific training and the humanistic dimensions of care, promoting more empathetic, reflective, and socially aware future physicians.

Homeschooling, Democracy, and the Public Sphere: Rethinking Education through Plural Perspectives

PANEL CONVENORS: Angela Biscaldi (Università degli Studi di Milano); Anna Chinazzi (Università degli Studi di Milano-Bicocca); Emilia Restiglian (Università degli Studi di Padova)

PANEL KEYWORDS: homeschooling, public sphere, democratic education

Home education has expanded considerably across European and international contexts, and it is frequently framed as a private choice standing outside the collective purposes of schooling. This session takes a different starting point: homeschooling constitutes a privileged vantage point from which to interrogate the public function of education, the shifting boundary between family and state, and the conditions under which democratic participation is enacted. Rather than reproducing the polarisation between defenders and detractors, the session brings plural perspectives into dialogue and treats the critiques that homeschooling families address to institutional schooling — spatial and temporal rigidity, standardised curricula, the selective weight of assessment, limited responsiveness to individual differences — as material for a shared and transformative inquiry. We invite contributions that explore the parenting models, aspirations and anxieties underpinning the decision to educate at home, and the ways in which these models relate to broader transformations of the family and to processes of individualisation. We encourage submissions that investigate how learning, care and assessment are reconfigured outside formal institutions, and how such informal practices might be made visible, communicable and theorisable within a wider social space. We equally welcome contributions examining the relationship between home education and the public world: the communities, networks, journeys and encounters through which children educated outside school participate in shared social life, as well as the regulatory frameworks through which states define "suitable" education and negotiate legitimacy with families. Empirical, theoretical and participatory contributions are all welcome, including those adopting qualitative, ethnographic, autoethnographic or dialogic methodologies. The overarching question is what public schooling can learn from these dissonant voices — not by abdicating its social function, but by strengthening it as a common good sustained by collective responsibility.

HOMESCHOOLING AND PARENTING MODELS: A CHALLENGE TO SECONDARY SOCIALISATION PROCESSES

Francesca Lagomarsino (Disfor, Università di Genova, Italy) · **Chiara Lanini** (Disfor, Università di Genova, Italy)

homeschooling | intensive parenting | secondary socialisation

The phenomenon of homeschooling raises questions about various aspects of contemporary social life: the meaning of education, the socialisation process, the concept of citizenship, the relationship between the individual and the state, the relationship between the public and private spheres, and the sense of belonging to a broader social system regulated by institutional actors or limited to the family or community (Watson 2018,Restiglian, Busato 2024; Di Motoli 2020, Chinazzi 2020, 2021,2025). Based on the results of research on the phenomenon of homeschooling conducted in Liguria during the years 2024 and 2025, this paper seeks to examine how the practice of homeschooling may be interpreted as an expression of an intensive and extensive parenting model (Lee, Bristow , Faircloth , Macvarish 2014, Faircloth 2023), centered on the idea of personalized individualism (Lipovetsky, 2013), which can be said to be dominant today, albeit in mostly less radical terms. Adopting a sociological approach, we understand parenting as a field of action that, in a broad sense, intercepts the relationship between the individual and the social context, bringing into play not only subjective representations of the parenting model but also social ones. Starting from an analysis of the literature on the subject and interviews with homeschooling parents (a part that we are expanding in a second phase of research that has just begun), we intend to bring out and analyse the demands, needs, desires, concerns and expectations that characterise the parental role of families who decide to organize their children's education and socialization independently, foregoing the offer of public or state-approved schools.

FROM HOMESCHOOLING TO SKOLÉ. WHAT CAN WE LEARN? INQUIRING AND WONDERING TOGETHER, TO RELEASE OUR SCHOOL

Eleonora Zorzi (Università di Padova, Italy) · **Emilia Restiglian** (Università di Padova, Italy)

Homeschooling | Skolé | Community of Philosophical Inquiry

...] to recognize at the same time that there are always multiple perspectives and multiple vantage points, is to recognize that no accounting, disciplinary or otherwise, can ever be finished or complete. There is always more. There is always possibility, and this is where the space opens for the pursuit of freedom (Greene, 1988, p. 128). This contribution proposes a collective inquiry into the creative potential of critiques that the homeschooling movement directs towards contemporary educational institutions. Through a participatory methodology inspired by the Community of Philosophical Inquiry (CoPI), we aim to transform participants into a research community that questions and shares essential queries (Lipman, 2003; Zorzi, Santi, 2023). The provocations raised by Illich in Deschooling Society (1971) – school as a disabling institution, as a mechanism for reproducing inequalities, as a site of commodification of learning – maintain striking relevance today. Testimonies from families choosing unschooling or homeschooling highlight persistent vulnerabilities (Rochovská, 2023): i.e., spatial-temporal rigidities, inflexible curricula, and limited capacity to welcome individual differences such as giftedness or learning difficulties. From an authentically democratic perspective (Popper, 2000), which recognizes minority voices as constitutive elements of plurality, it is fundamental to critically interrogate these instances and collectively pose central questions (Biscaldi, et al., 2024): what can a public school learn from homeschooling critiques without abdicating its social function but rather strengthening it transformatively? Our methodological approach does not limit itself to theoretical-critical analysis of nodal points identified by recent studies (Cheng, Hamlin, 2021; Chinazzi, 2021; English, et al., 2024; Restiglian, Busato, 2024) but employs CoPI to collectively imagine new research questions. Through shared interrogation, we aspire to map two dimensions: first, critical issues characterizing homeschooling movements from an educational standpoint (i.e. what society is envisioned? Are those choices accessible to all? Towards what "good" do these educational movements tend? What role do collectivity and educational community play?); second, critical issues homeschooling highlights within current schooling (i.e. inability to attend to individual wellbeing; structural rigidity; transmissive teaching-learning overlap; adaptation requirements to hierarchical logics conveyed through implicit curricula). This plural inquiry aims to transcend polarization between "defenders" and "detractors", nurturing critical and democratic reflection oriented towards a transformative horizon that recovers skolé's original meaning as liberated time and libertarian space (Freire, 2014; Kohan, 2011). From a Freirean perspective (Fain, 2002), homeschooling's dissonant voices offer creative opportunities for rethinking schooling profoundly. Reconsidering school through these solicitations means reaffirming it as a common good (UNESCO, 2019) – not as a uniform, standardized service, but as a public space with strong educational and political roles (Kohan, et al., 2016) requiring collective care. This common good demands shared responsibility, democratic participation, and continuous transformative capacity. Only a school capable of listening to critical voices, becoming flexible without losing its public function, personalizing without privatizing, can constitute an authentic bulwark of social justice and active citizenship.

LEARNING DEMOCRACY ON THE MOVE: ITINERANT EDUCATION AND MOBILE COMMUNITY LIFE AT LIBERSCHOOL

Ana Maria Spariosu (Liber S Aps, Italy)

itinerant learning | experiential education | caring democracy

What happens to education when the classroom begins to move? This presentation examines itinerant learning at LiberSchool, an alternative school in Northern Italy that emerged within the intentional community of Damanhur—one of the largest intentional communities in Europe. Drawing on more than forty years of pedagogical practice, the paper explores how recurring educational journeys reshape relationships between autonomy, care, and participation in the public world. At LiberSchool, itinerant learning refers to educational journeys integrated into the curriculum, ranging from day trips to journeys lasting up to two weeks. These experiences accompany the entire educational path of the school, typically beginning around the age of two and evolving in duration and complexity through the elementary and middle-school years. Itinerancy is therefore not an occasional activity but a recurring pedagogical practice and a defining feature of the school's educational approach. Traveling together transforms the class into a temporary learning community in which students and educators share responsibility for daily life and collective well-being. In this sense, itinerant education can be understood as a form of education through mobile community life. As the group moves through different places and situations, children participate in everyday decisions that shape the life of the group, learning to negotiate needs, responsibilities, and collective choices. Within these shared journeys, educators are encountered not only as teachers but also as companions and caregivers in everyday life, while relationships among peers often deepen through cooperation and mutual support. Such experiences allow children to experiment with autonomy while remaining embedded in a relational network of care. In this sense, care is not treated as a private virtue but as a shared social practice through which collective life is sustained—echoing broader discussions on caring democracy in contemporary educational thought. Within current debates on unschooling and home education, such practices challenge the frequent assumption that educational choices outside institutional schooling imply a withdrawal from the public sphere. In the case of LiberSchool, itinerant learning instead functions as a bridge to the public sphere: students encounter unfamiliar places, interact with people beyond their immediate community, and gradually learn to orient themselves within the complexity of shared social life. The contribution draws on practitioner knowledge developed within the school and adopts a methodological approach based on reflective practitioner inquiry, combining autoethnographic reflection with narratives of lived educational experience. Rather than presenting itinerant learning as a model to be replicated, the paper treats LiberSchool as an empirical site through which to explore how democratic participation, autonomy, and relations of care emerge through shared movement in the world.

ASSESSMENT AS A DEMOCRATIC PRACTICE: A COMPARISON BETWEEN SCHOOL AND HOMESCHOOLING

Emilia Restiglian (University of Padova, Italy)

School | Homeschooling | Formative Assessment

This contribution critically interrogates the notion of assessment as a central node of the school experience, placing it in tension with the practices of home education (homeschooling). Whilst in formal schooling assessment functions as a key dispositif, frequently embedded in everyday practices and the hidden curriculum, in homeschooling contexts it tends to be marginalised, driven by the belief that it may interfere with the child's well-being and with an educational relationship genuinely centred on the learner. The paper explores the tensions between two paradigms. On the one hand, school-based assessment, despite its well-known limitations (standardisation, rigidity, selective function), has increasingly opened up to perspectives of formative assessment and assessment for learning (Black & Wiliam, 1998): a continuous process of gathering evidence, providing feedback, and enabling reciprocal regulation between teaching and learning, capable of fostering awareness, self-regulation, and student participation. In this view, assessment does not merely certify outcomes but becomes a public device for recognition and the construction of shared meaning. On the other hand, home education practices tend to privilege personalisation, flexibility, and the suspension of formal judgement, at times leading to its implicit removal. The marginalisation of assessment in homeschooling does not, however, imply its absence. Rather, it is transformed into implicit and informal practices which, whilst echoing some principles of formative assessment (continuous observation, responsiveness to learners' needs, centrality of feedback), risk remaining under-theorised and difficult to make visible and communicable within a broader social space (Restiglian & Busato, 2024; 2025). The contribution does not aim to oppose schooling and homeschooling, but rather to identify a shared space for enquiry: how can assessment processes be reconfigured as democratic practices, capable of supporting well-being without relinquishing the public dimension of education? To what extent can formative assessment act as a mediating ground between the need for personalisation and the need for socially shared recognition of learning? In this regard, Boud's notion of sustainable assessment is particularly relevant, as it highlights the importance of developing practices that support learners beyond formal schooling, fostering self-assessment and lifelong learning capabilities (Boud, 2000). From this perspective, the paper proposes to rethink assessment as a situated, dialogic, and plural practice which, consistent with a view of education as a common good (UNESCO, 2021), is able to integrate the demands for personalisation emerging from homeschooling without renouncing its social function. Assessment, thus conceived, is neither mere certification nor its negation, but rather a formative space in which feedback, negotiation of meanings, and the co-construction of shared criteria sustain an ongoing tension towards still-unexplored educational possibilities.

BEYOND SCHOOLING

Lucie Wheeler (Anglia Ruskin University)

Home education | democracy | public sphere

Home education occupies a contested position within contemporary education systems, frequently framed as a private choice operating outside the collective purposes of schooling. At the same time, increasing numbers of families are turning to home education, often in response to unmet needs within mainstream provision, particularly for neurodivergent children and those experiencing exclusion. This raises critical questions about how education is conceptualised, who it

serves, and how democratic participation is enacted within - and beyond - formal institutions. This paper draws on an ongoing doctoral study exploring the lived experiences of home-educating families in England. Adopting a qualitative, collective case study design, the research is informed by ecological systems theory, critical reflective practice, and late modern perspectives on identity and agency. Data are generated through in-depth, multiple interviews with families, supported by iterative cycles of reflection and co-construction. This approach enables a nuanced exploration of how families navigate educational systems, negotiate legitimacy, and reconstruct educational pathways over time. Findings suggest that home education is not simply a withdrawal from the public sphere, but a reconfiguration of engagement with it. Families describe processes of "recalibration," in which educational decisions are reshaped around children's identities, wellbeing, and relational needs. In doing so, they actively challenge dominant, standardised models of schooling and expand the boundaries of what counts as education. Learning is repositioned as embedded, participatory, and responsive to context, rather than confined to institutional settings. At the same time, the study highlights ongoing tensions between plural educational practices and regulatory frameworks that seek to define and govern "appropriate" education. These tensions expose underlying assumptions about citizenship, responsibility, and the role of the state in shaping educational trajectories. While policy discourse often positions home education as marginal or problematic, the lived experiences of families suggest a more complex reality in which agency, care, and responsiveness are central. By foregrounding these perspectives, the paper contributes to debates on homeschooling and the public sphere by offering an empirically grounded account of how education can be enacted beyond institutional boundaries. It argues for a more expansive, pluralistic understanding of education within democratic societies - one that recognises diverse pathways, values lived experience, and reconsiders the relationship between individuals, families, and the state in shaping educational futures.

Home education, democracy, public sphere

Women's Work and Emancipatory Pathways

PANEL CONVENORS: Emilija Voinovska (Università degli Studi di Roma Tor Vergata, Italy); Erica Spagnolo (Università degli Studi di Roma Tor Vergata, Italy)

PANEL KEYWORDS: democracy, women's work, female agency

Although women in the twentieth century gained greater access to education in many parts of the world, their pathways toward autonomy and emancipation remain fragile. Women's work has taken shape across multiple disciplinary fields: in political and social action, in scientific progress within all STEM fields, in literature, in the expressive arts, in educational institutions, and within the family. This panel aims to highlight the forms of women's work that, across different historical periods and regions of the world, have contributed to their emancipation, autonomy, and participation in social life, while also fostering democracy. We encourage contributions that: 1. explore intersectionality as a lens through which to address the persistent inequalities that have shaped educational contexts, examining how educational institutions may operate as democratic spaces fostering feminist awareness or, conversely, as sites of oppression; analyse models of femininity and masculinity conveyed through school curricula; investigate how guidance systems have contributed to overcoming – or reproducing – inequality. 2. explore the relationship between women's work and pathways to democratic citizenship and emancipation, drawing on the biographies of both well-known and lesser-known figures; examine how women have articulated care work, as well as the extent to which institutions have recognized – or dismissed – its value. Contributions should adopt historical or theoretical perspectives and may draw on interdisciplinary and international approaches. They should foreground how women's work – although often shaped by power relations, political pressures, and forms of exploitation – has nonetheless generated pathways to autonomy, agency, and professional development.

BEYOND EUROCENTRIC SCHOOL DESIGN: CLIMATE, ARCHITECTURE, AND LEARNING FROM EAST AFRICA

Carla Schwaderer (TU Wien, Austria)

Decolonial Architecture | Educational Equity | Climate-Responsive Design

This paper examines school architecture as a constitutive yet often neglected dimension of democratic education. Drawing on intersectional and decolonial approaches, it explores how the spatial and material conditions of school buildings shape everyday educational practices and contribute to the reproduction or reduction of social, environmental,

and epistemic inequalities. While debates on democratic schooling frequently emphasize curricula, participation, and governance, the built environments in which education takes place remain under-theorized, despite their profound impact on embodied experience, well-being, and educational access (Soja, 2010). The paper is grounded in empirical field research conducted primarily in public schools in Austria. It shows that many recently constructed school buildings—widely celebrated as innovative—are already struggling with the effects of climate change. Students, teachers, and school staff report insufficient shading, inadequate natural ventilation, limited passive cooling strategies, and severe overheating during summer months. These conditions restrict pedagogical practices and disproportionately affect those who spend long hours in educational spaces, raising questions of environmental injustice and unequal exposure (Young, 1990). From a decolonial perspective, the paper argues that dominant Central European school architecture relies on technocratic, energy-intensive design paradigms that privilege abstract efficiency over lived experience and situated climatic knowledge. Such paradigms reflect colonial continuities in architectural thought, positioning Eurocentric traditions as universal while marginalizing other ways of knowing and building (Mignolo, 2011). Black decolonial scholarship emphasizes that space is a key site through which colonial power operates: Fanon (1963) analyzes colonial spatial ordering, while Mbembe (2001) shows how built environments discipline bodies and structure educational life. The paper foregrounds African-based architectural knowledge as theory rather than a field of application. Architects and scholars such as Francis Kéré, whose school buildings in Burkina Faso exemplify climate-adaptive, community-based design (Kéré, 2017), and Abdou-Maliq Simone, whose work highlights everyday spatial practices and collective life in African cities (Simone, 2004), demonstrate how architecture emerges from local material ecologies, social relations, and pedagogical needs. Clay construction, widely used in African schools, enables passive thermal regulation, minimizes mechanical cooling, and draws on intergenerational knowledge systems. As Nnamdi Elleh (1997) argues, African architecture must be understood through its cultural, climatic, and social specificities rather than Eurocentric evaluative frameworks. The marginalization of such knowledge in Central European school construction is not merely technical but epistemic. Dominant approaches to materiality and environment remain entangled with racialized histories of knowledge production (Yusoff, 2018; Wynter, 2003). Re-centering African architectural practices is thus both a matter of epistemic justice and environmental sustainability. Methodologically, the study combines qualitative case studies of schools built with sustainable materials in African contexts with interviews with students, teachers, school staff, and local architects. Drawing on dialogical pedagogical traditions (Freire, 1970; hooks, 1994), it rejects extractive comparison, framing transnational learning as reciprocal and situated. In line with the Scuola Democratica conference, the paper argues that climate-resilient and socially just school architecture is a prerequisite for democratic education. It concludes that centering African-based architectural knowledge is essential for reimagining educational spaces that foster participation, inclusion, and equality in a warming world.

WOMEN’S WORK IN POLITICS: THE CONTRIBUTION OF ANGELA MARIA GUIDI CINGOLANI

Paola Dal Toso (Università degli studi di Verona, Italy)

Angela Maria Guidi Cingolani | women’s work | emancipation

The contribution aims to outline the socio-political commitment of Angela Maria Guidi Cingolani (31/10/1896 – 11/07/1991, Rome), the first woman in the Italian Republic to hold a government position. She received her early formation within the women’s associations of Catholic Action; her encounter with Luigi Sturzo was decisive, as he involved

her in the Organization for Civil and Religious Assistance to War Orphans and encouraged her to join the Italian People's Party in 1919, where she assumed the position of secretary of the Roman women's group until the party's dissolution by the Fascist regime in 1926. In 1921, she founded the National Committee for Women's Labour and Cooperation, serving as its secretary until 1926. In 1925, she passed the competitive exam to become a Labour Inspector. Throughout the Fascist period, she continued to devote herself to women's work and, together with her husband Mario Cingolani – a prominent figure in Catholic Action and later a deputy to the Constituent Assembly – she took part in the clandestine network of the Christian Democracy, of which she was a national councillor from 1944 to 1947. In the post-war period, she joined the party's national leadership as well as the central committee of the women's movement. In 1945, as a member of the National Council (Consulta Nazionale), her voice as a woman was the first in history to resonate in Montecitorio. She was elected in 1946 to the Constituent Assembly of Italy and, in 1948, became a deputy in the first republican legislature, devoting particular attention to the debate on the law for the protection of working mothers. She was among the founders of the Italian Committee for the Moral and Social Defence of Women in 1950 and served as Undersecretary for Crafts at the Ministry of Industry and Commerce from 1951 to 1953.

FEMALE TEACHERS IN FASCIST ITALY: WOMEN'S WORK, AGENCY AND EMANCIPATION IN AN AUTHORITARIAN CONTEXT

Erica Spagnolo (Università degli Studi di Roma Tor Vergata, Italy)

Women's Educational Labor | Care Work | Emancipation

This paper examines the work of female teachers in a rural school in Vicenza during the Fascist period in Italy (1922–1943). Specifically, it explores women's teaching labor within a context of intense political and symbolic discipline as an ambivalent space between subordination and agency. The study conceptualizes the teacher as a figure situated at the intersection of gender, professional identity, rural context, and institutional constraint, adopting a historical-critical perspective and engaging with gender pedagogy. Furthermore, it interrogates whether and to what extent women's educational work functioned not only as a mechanism of ideological reproduction, but also as a site of professional self-definition and emancipation. Drawing on the analysis of school registers, classroom reports, and personal files preserved in the school's historical archive, the research reconstructs several professional trajectories, highlighting how women's educational work simultaneously functioned as an instrument of the regime's ideological project and as a daily practice of care, mediation, and civic responsibility. The sources reveal the material and symbolic conditions shaping teaching practices, including moral surveillance, political expectations, limited resources, and the naturalization of women's pedagogical roles. Within a highly hierarchical structure shaped by authoritarian control, female teachers developed differentiated strategies of adherence, adaptation, negotiation, and subtle resistance in response to imposed norms. Primary schooling thus emerges as a site of tension: a space where disciplined models of femininity and political directives were reproduced, but also one in which professional competences were exercised and meaningful educational relationships were formed. Through everyday classroom practices, interactions with families, and the management of local social dynamics, these teachers contributed to processes of literacy, socialization, and community cohesion that extended beyond the regime's ideological objectives. From this perspective, women's teaching can be interpreted as a form of professional care work - often undervalued and institutionally marginalized - yet capable of producing long-term social effects. Even within an authoritarian system, such labor generated processes of professional autonomy and forms of civic engagement that later constituted important preconditions for democratic citizenship. By analysing the epistemic dimension of women's educational role, the paper aims to restore visibility to women historically overlooked in official narratives. Furthermore, it contributes to broader debates on women's work, agency, and the complex and ambivalent paths toward emancipation.

CARE WORK OR DEMOCRATIC PRACTICE? WOMEN'S TEACHING WORK IN FREIRE'S THOUGHT

Matteo Umbro (University of Rome "Tor Vergata", Italy)

Teacher professional identity | Paulo Freire | Democratic education

The feminisation of the teaching profession in Brazil cannot be separated from the processes of symbolic and material devaluation that have historically marked educational labour. The widespread figure of the tia ("aunt/auntie"), especially in primary schooling, has helped to naturalise teaching as an extension of care labour, weakening its professional standing and obscuring its epistemic and politico-pedagogical responsibility. This paper offers a theoretical rereading of Paulo Freire's Professora sim, tia não: Cartas a quem ousa ensinar (1993), placing it in dialogue with scholarship on the feminisation of the magistério and with recent analyses of teacher-education policy in Brazil. For analytical purposes, the argument distinguishes three ways of interpreting feminised teaching work: first, a vocational naturalisation that assimilates teaching to a maternal disposition; second, a technico-corporate professionalisation oriented towards institutional recognition yet not necessarily attuned to the political character of education; and third, a political-epistemic valorisation which, in Freire, takes the form of de-naturalising and de-familiarising the teaching role. The latter does not entail the ideologisation of schooling. Rather, it rests on an explicit acknowledgement of education's non-neutrality and of the school's formative function in shaping historical and critical subjects. What Freire articulates within his specific context may serve, in light of subsequent developments in critical pedagogy, as a theoretical framework for reconsidering the public and epistemic dimensions of teaching more broadly. Such a shift in perspective requires a reconstruction of teacher authority as a democratic practice grounded in intellectual discipline, continuing formation, and coherence between theory and practice. Politicisation, here not synonymous with partisan militancy, names the assumption of the ethical and public responsibility inherent in every educational act. In this sense, it restores to teaching the status of situated knowledge production and civic formation, resisting both the sentimental moralisation of care and the reduction of teaching to technical delivery. The paper also briefly considers the normative transformations that have affected teacher education and curriculum regulation in Brazil over recent decades, asking to what extent these developments enable or constrain a reconfiguration of teaching work consistent with Freire's horizon. Without offering a comprehensive policy review, it highlights how professional recognition remains entangled with gendered dynamics and with the epistemic definition of teachers' roles within schooling institutions. The paper concludes that the emancipatory potential of a predominantly female teaching body lies in its political-epistemic reconfiguration as a democratic practice capable of generating professional agency, critical authority, and informed participation in public life.

FINANCIAL LITERACY: A TOOL OF EMPOWERMENT TO' REDUCE TRE RISKS OF DOMESTIC ECONOMIC VIOLENCE

Elisabetta De lorenzo (Università degli studi di Foggia, Italia)

Empowerment | Autodeterminazione | violenza economica

Any reflection on women's empowerment that leaves aside the issue of control over economic resources risks overlooking one of the most subtle and difficult to recognize forms: domestic economic violence. Money in this view becomes a symbol, which amplifies its instrumental function, taking the form of a power device that prevents the achievement of self-determination. "There can be no female empowerment without financial autonomy" (Granata 2024.) In our country, one-third of women do not have a personal current account, this prevents them from fully developing empowerment and often leads them to assume a position of subordination towards their husbands or partners. It is within the family as a safe place that domestic economic violence occurs. In the international legal framework, UN Women defines domestic violence as a pattern of abusive conduct within a family relationship, the man prevents the woman from using and managing the financial resources of the household. The goal is to make women weak and economically unstable, by exercising decision-making power over consumer choices, also establishing what can be bought and what must be denied, forcing her partner to ask him for money even for small daily expenses and refusing to contribute to the costs necessary for family subsistence. According to the World Bank's report, Women, Business and the Law 2022, more than 30 countries do not yet have laws that limit or punish such violence. The regions where there are more cases are: Abruzzo, Apulia, Tuscany, Veneto, Valle D'Aosta and Sicily, a constant data is the economic vulnerability (Rinaldi 2023) of women who suffer violence, only 37% say they have a stable income from work or retirement. This data highlights how economic vulnerability can affect the possibility of escaping violent relationships and to undertake paths of autonomy. Of the total number of women who have turned to an anti-violence center instead, (Rinaldi 2023) 37% said they were subjected to economic violence, so more than one woman in three, and also in 91% of cases the perpetrator is a man with whom the victim has or has had a significant relationship, so it is rare that this happens at the hands of a stranger. In summary, the contribution is part of the pedagogical debate on power dynamics within family contexts, considering domestic economic violence as a formative issue. In this, we intend to analyze how financial literacy can be configured as an economic empowerment tool, which is not limited only to the transmission of technical knowledge, but is proposed as an emancipative educational device (Lopez 2025) which activates individual capacities and strengthens decision-making autonomy by increasing agency possibilities, also allows women to manage economic resources independently, countering risks of abuse, and supporting the possibility of making own decisions and actively participating in social life.

EDUCATING INTIMACY AND RELATIONAL AWARENESS: AN EDUCATIONAL INTERVENTION TO COUNTER GENDER-BASED VIOLENCE IN UNIVERSITY SETTINGS

Martina Bianchi (Università degli Studi Roma Tre, Italy)

Gender-based violence | Prevention | Relationship education

This proposal offers a reflection focused on the role of educational prevention as a fundamental strategy of equality education in reducing gender-based violence, with particular attention to university students and young adults. It places the intervention in the context of higher education as a crucial setting in which intimate relationships, emotional expectations and gender norms are actively constructed and renegotiated. In this perspective, prevention is conceived not only as risk reduction but as a formative process aimed at promoting relational awareness and responsibility among university students in their present and future intimate relationships. In its most invisible forms, gender-based violence compromises the possibility of building healthy and respectful intimate relationships, normalising power asymmetries and emotional control in everyday interactions. Universities, as transitional environments where young adults develop their

identity, autonomy and emotional skills, are strategic contexts for implementing prevention and empowerment programmes. In this perspective, relationship education becomes essential for recognising early warning signs of violence, questioning harmful norms and preventing the normalisation of violence. It provides students with tools to critically examine relational expectations, power imbalances and implicit gendered assumptions that may shape their intimate interactions. By fostering reflexivity and mutual responsibility, relationship education supports the development of relational patterns grounded in respect, reciprocity and care. Alongside this theoretical framework, the proposal discusses preliminary results from an educational intervention addressed to a university student population, aiming to support prevention and empowerment in the domain of intimate relationships. The quasi-experimental research design included a pre–post survey and adopted a mixed-methods approach to explore perceptions, gender stereotypes, myths about violence, and dynamics of affective dependence. These dimensions are examined as relational mechanisms that shape what students recognise as acceptable within intimacy, influencing their capacity to name coercion, set boundaries, and take responsible action when problematic dynamics emerge.

ELSA CONCI: THE WORK OF A WOMAN IN POLITICS FOR THE EMANCIPATION OF WOMEN

Carla Roverselli (University of Rome Tor Vergata, Italy)

women Politics Emancipation

Elsa Conci (Trento 1895-1965) was one of 21 women who took part in the Constituent Assembly on 2 June 1946. Elected to the Italian Parliament in 1948 as a member of the Christian Democracy party, she remained there until her death. She was secretary of the Christian Democracy parliamentary group from 1952 to 1965 and a member of the party leadership. From 1948 to 1965, she presented 75 bills in Parliament, 24 of which became law, delivered 70 speeches, and participated in numerous parliamentary committees. All this parliamentary activity shows that her interests were mainly focused on women, regional autonomy in Trentino, refugees, schools, and teachers. From 1954 to 1964, she was the national delegate of the Christian Democratic Women's Movement. A passionate supporter of the European ideal, in 1955 Elsa Conci was one of the founders of the European Women's Union, promoting the entry of Christian Democrat women into a European body, and in 1959 she was elected President of the Union in Berlin, a position she held until 1963. She was a member of the Italian delegation to the European Parliament in Strasbourg. Immediately after 1946, the aim was to combat the negative stereotype of women in politics, "a model constructed over decades through rhetoric that had made ridicule its register and, with cartoons, caricatures and so on, had shaped an ambiguous image of uncertain gender: it was the staging of the threat posed by the reversal of roles and the consequent violation of moral norms." Catholic women, on the other hand, as Conci herself later pointed out, had been prepared for their new political commitment through their

active participation in the Resistance, which tempered their courage and led them to develop a “sense of responsibility” towards a duty that was both moral and social. Women “could no longer remain absent from the work of rebuilding the country” and therefore entered politics, according to Conci, “bringing with them everywhere the valuable contribution of their competence and generosity”. Conci was the architect of women's political education and strenuously defended their rights. She worked to make them aware of the rights and duties associated with voting; she effectively promoted their participation in civic life; at the same time, she fought for the real inclusion of women within the Christian Democratic Party. Her commitment was therefore directed externally towards all Italian women and internally towards the life of the Party, which men mainly ran. My presentation will examine the speeches delivered by Elsa Conci, national delegate of the Christian Democratic Women's Movement, from 1954 to 1964.

PICTUREBOOKS AND NARRATIVE SELF-RECONSTRUCTION AS PRACTICES OF WOMEN’S EMPOWERMENT IN MIGRANT CONTEXTS

Delia Maria D'Onofrio (Università di Roma Tor Vergata, Italy)

migrant women’s empowerment | picturebook | shared reading

This paper examines shared reading of illustrated picturebooks as a form of women’s cultural and relational work that facilitates emancipatory pathways in migrant contexts Traditionally considered tools for children’s education, picturebooks are increasingly recognized in contemporary pedagogy as powerful mediators of meaning for adult learners, especially where linguistic barriers, social marginalization, and gendered power asymmetries intersect. The study is based on community workshops with migrant women and local volunteers in Tor Pignattara (Rome), a multicultural neighborhood with long-term migrant settlement and conditions of “incomplete integration.” Despite stable residence, many women face linguistic dependency, limited access to public participation, and subtle forms of invisibilization. This study adopts a qualitative, ethnographic approach to explore the potential of shared reading of illustrated picturebooks as a pedagogical tool for promoting intercultural inclusion and temporarily suspending social asymmetries in adult marginalization contexts. Data collection includes participant observation, reflective journaling, semi-structured interviews, and analysis of narrative materials produced during the workshops. Thematic analysis followed an inductive approach, emphasizing triangulation of sources to deepen the understanding of relational processes and symbolic agency among migrant women participants. Through collective reading and dialogic interpretation, participants engaged in processes of self-reconstruction. The metaphorical power of illustrated picturebooks created a “third space” where women could gather on equal terms, reimagining and reshaping their experiences. Using images, metaphors, and fictional characters, participants expressed experiences of migration, care work, exclusion, and resilience, without being confined to deficit-based or testimonial frameworks. Narrative practice thus functioned as a form of symbolic agency, enabling participants to re-signify lived experience and renegotiate their self-representations. Empowerment is understood as relational and situated, emerging through shared narrative work. The workshops served as capacitating services, expanding expressive, relational, and participatory capabilities often constrained in migrant women’s everyday lives. By foregrounding narrative reconstruction as women’s cultural work, this paper contributes to debates on democratic citizenship, intersectionality, and emancipatory pathways. It argues that illustrated picturebooks, embedded in dialogic and horizontally structured spaces, generate micro-democratic environments of recognition and belonging, empowering migrant women to exercise symbolic agency and participate more fully in social life.

MAINTENANCE OF GENAI IN SUPERDIVERSE ADULT EDUCATION: TEACHERS' AI LITERACY AND POSTDIGITAL PRACTICES

Enrico Vignando (University of Udine; University of Modena-Reggio Emilia)

AI literacy | participatory action research | adult education and learning

A critical approach to AI literacy in adult learning and education (ALE) cannot overlook the fact that Generative AI (GenAI), the most commonly used tool for non-AI experts (Zhou et al., 2026), enters educational environments as a socio-technical assemblage (Lindgren, 2023). As such, GenAI systems encapsulate the political, epistemic, and socio-cultural perspectives of those who own, design, and commercialize AI systems, implying dominant epistemologies and amplifying asymmetrical power relations when generating content (Campolo & Crawford, 2020; Suchman, 2023). In ALE environments, and particularly in those characterised by superdiversity (Pasta & Zoletto, 2023), in-service professional development in AI literacy must address reproduction and amplification of discriminatory practices in AI-generated content, such as the omission, subordination, and sterotyping of students' differences in educational content and materials (Shieh et al., 2024). Recent research (Selwyn et al., 2025) highlights teachers' practices of remixing or rejecting AI-generated content that mismatches with pedagogical and ethical expectations. Such practices, which can be defined postdigital (Jandrić et al., 2018) as they take place somewhere between online and offline, can also be considered as practices of repairing GenAI malfunctions. Literature on repair and maintenance (Denis & Pontille, 2023) frames human interaction with technology as potentially transformative, given that agency can be recognised to users when they engage with technology (and its malfunctions) by reconfiguring its potential uses and the values embedded in its original design (Steinert, 2024). Building on sociomaterial approaches in ALE (Fenwick & Edwards, 2013), this contribution presents the initial findings form a participatory action research (Bove, 2019; Medrado & Verdegem, 2024) investigating in-service teachers' practices with GenAI in Adult Education Centres in Italy (CPIAs) throguh the explicitation (Vermersch, 2005) of teachers' postdigital practices. The thematic analysis (Fereday & Muir-Cochrane, 2006) of the qualitative data generated in preparation of and during the action research provides insights into teachers professional considerations and strategies when interacting with GenAI regarding the design and personalisation of learning materials, and the mitigation of bias in AI-generated content. Following the maintenance perspective, such postdigital practices of teachers interacting with GenAI tools can be interpreted as practices of care (Puig de la Bellacasa, 2017) regarding their educational environments, according to what teachers may consider good education (Biesta, 2015) for adult students with diverse migratory and educational backgrounds. In this sense, teachers' repairs of GenAI can be seen as examples of siutated AI literacy, a site of professional agency and epistemic negotiation of dominant AI-generated narratives through critical maintenance of GenAI in superdiverse adult education.

THE ART OF CHILDBIRTH AND THE PEDAGOGY OF REDEMPTION: THE HOSPITAL OF SAN ROCCO DELLE PARTORIENTI E DELLE CELATE AND THE EMANCIPATION OF ROMAN MIDWIVES

Rita Chiricò (Università degli Studi Niccolò Cusano, Italy)

Democracy | Emancipation | Women's work

This paper analyses the institutionalisation of obstetrics in the Papal States between 1786 and 1845, examining a case in which education, women's work and female agency converged to produce an early and structurally democratic process of professional emancipation. The research focuses on the history of the San Rocco delle partorienti e delle celate Hospital in Rome and draws upon primary sources preserved in the State Archives of Rome (ASR, University Fund, Envelopes 24-43-44-47-59-69-761-1083). It argues that the institutionalisation of the midwifery profession was fundamentally driven by a pedagogical challenge, one that ultimately reconfigured the social and epistemic conditions under which women could legitimately claim professional authority. In 1786, Pasquale di Pietro, a consistorial lawyer, financed Professor Francesco Asdrubali's trip to Paris, where Asdrubali trained at the school of Jean-Louis Baudelocque, author of L'art des accouchements (1781) and architect of a teaching method grounded in anatomical measurement and practical simulation using a mannequin. Asdrubali subsequently brought this method to Rome, together with a premise that was radical for the period: that obstetric knowledge could be taught, assessed and formally certified to women. The Edict of Cardinal Camerlengo Carlo Rezzonico of 1786 established that female students were required to complete a full academic course (ASR, University Fund, Envelope 59, 1786) prior to practising professionally, thereby transforming the empirical transmission of knowledge characteristic of the mammane into a regulated public training programme. It was precisely through institutional access to scientific knowledge that women secured the right to practise midwifery legitimately. A silver medal awarded annually to the most distinguished student at San Rocco Hospital gave formal recognition to this important achievement. Archival sources demonstrate that women were by no means passive recipients of this transformation: they were conscious and active agents within it. The licence registers document a wide and geographically diverse professional community, including Maria Antonelli (1815), Caterina Allini and Angiola Ansolmi (1816), Giulia Botti of Urbino and Teresa Bresciani of Macerata (1820), Bernardina Angeloni (1827), Lucia Altipimi, widow of Gentili of Tivoli (1831) and hundreds of others. The annotation free appearing beside certain names is not a marginal detail: it constitutes evidence of a deliberate policy of inclusion, demonstrating that the Department of Obstetrics at San Rocco Hospital, responsible for issuing licences and administering training (ASR, University Fund, Envelopes 43, 44, 47, Licence Registers,

1815–1845), recognised the transformative potential of professionalisation with respect to class distinctions and social democratisation. Particularly eloquent is the handwritten petition in Envelope 1083, in which Anna Conti requests from Monsignor Filipponi the position of substitute midwife left vacant by Anna Maria Andreoli — not an appeal for charity, but the conscious exercise of an acquired right. This paper contends that the professionalisation of the art of childbirth at San Rocco Hospital constitutes a genuine historical laboratory of female emancipation mediated by pedagogy, predating the major nineteenth-century movements for women's rights. Restoring a name and a voice to each of these women contributes not only to the history of women, but to the history of education itself.

CHALLENGING GENDER-BASED VIOLENCE AGAINST WOMEN WITH DISABILITIES: NARRATIVE PRACTICES AND PEER COUNSELLING FROM AN INTERSECTIONAL PERSPECTIVE

Barbara Alesi (Univeristy of Macerata, Italy) · **Arianna Taddei** (University of San Marino Republic, San Marino Republic)

Women With Disabilities | Multidimensional Violence | PeerCounselling

Gender-based violence affects women and girls around the world (WHO, 2021). This phenomenon becomes even more complex in relation to women with disabilities, who are two to five times more likely to experience violence than women without disabilities (WHO, UN Women & HRP, 2024). From the perspectives of Feminist Disabilities Studies (Garland-Thomson, 2005; Mays, 2006) and the Intersectionality Approach (Crenshaw, 1989), women with disabilities experience the intersection of multiple systems of oppression (i.e. sexism, ableism, classism, etc.) which expose them to multiple discrimination and multidimensional violence (EDF, 2021). Particularly concerning are physical and sexual forms of violence, which disproportionately affect women with intellectual disabilities and occur mainly within intimate relationships and caregiving or family contexts (Meyer et al., 2022; García-Cuéllar et al., 2022). A further critical issue concerns the invisibility of victims, described as "bodies without weight on the scales of social justice"(Bernardini, 2018, p. 12). Women with disabilities are often excluded both from official statistics on gender-based violence and from policies aimed at preventing and addressing violence (WHO, UN Women & HRP, 2024). This invisibility is also reflected in the functioning of support services, from which they remain excluded due to multidimensional accessibility barriers and insufficient professional competence on the intersections between gender-based violence and disability (Robinson et al., 2021). Considering these critical issues, the contribution reflects on the educational challenges that Special Education should address to promote prevention strategies and emancipatory pathways for women with disabilities who have experienced violence (Romano and Taddei, 2024; UN, 2015, SDG 5.2). Attention is paid to the role of narrative and autobiographical practices as pedagogical devices capable of fostering processes of personal and social transformation (Giaconi and Capellini, 2019; Taddei, 2020; 2022). Through narrative, women with disabilities can reinterpret their experiences, recognize their rights, and strengthen processes of empowerment. At the same time, narratives contribute to challenging the sexist and ableist stereotypes that sustain violence and discrimination. At least, it provides researchers and practitioners with valuable insights for the development of inclusive anti-violence services and support interventions. Within this perspective, peer counselling (Patterson, 1990) emerges as a particularly effective transforming training strategy based on the sharing of personal experiences and mutual support. The literature highlights its emancipatory potential with women with disabilities (Barbuto et al., 2006). The processes of mirroring, empathy, and recognition of lived experience that develop between the counselor and the counselee foster the learning of trauma coping strategies, increased self-confidence, and hope for a self-determined and emancipated future (Collings, et al., 2020; Aguillard et al., 2021). In conclusion, the need to promote participatory research projects in synergy between the scientific community,

services, and women with disabilities is emphasized. As illustrated in a recent study (Buettgen et al., 2025), leveraging the experiential knowledge of women with disabilities is a key element in designing inclusive anti-violence services that include educational strategies that truly address the support needs of women with disabilities.

BELL HOOKS AND THE LEGACY OF BLACK FEMINISM. FEMINIST THOUGHT AND PEDAGOGICAL REFLECTION

Emilija Voinovska (Università degli Studi di Roma Tor Vergata, Italy)

bell hooks | Engaged Pedagogy | Black Feminism

The contribution aims to examine the relationship between feminist claims and pedagogical reflection in bell hooks' thought, exploring some of the theoretical and epistemological assumptions that inform her engaged pedagogy. Specifically, through a combined historical and theoretical reading, it seeks to foreground hooks' contribution to expanding the horizons of feminist and anti-racist critique, thus drawing attention to the theoretical frameworks that shaped her conception of teaching as transgression—against and beyond boundaries. Situating the analysis within the intellectual climate of the Black Women's Literary Renaissance and in implicit dialogue with Audre Lorde's thought, the talk will, on the one hand, reconstruct the historical, social, and cultural milieu in which hooks' early writings—often read as precursors to intersectionality—took shape; on the other, it will show how the cultural and political work of leading figures of Black feminism contributed to redefining the categories of woman, difference, and liberation within the feminist and anti-racist movements that emerged between the 1960s and 1970s. From this perspective, Black feminism can be understood as an epistemic practice—shaped by the "outsider within perspective" (Collins, 1986)—aimed at expanding the traditional boundaries of knowledge, citizenship and democratic participation by interrogating the relations among race, gender, social class and sexuality, thus opening up new possibilities for political imagination. Against this background, drawing on central motifs in the thought of Lorde and hooks—especially the interplay between experience, language, and action—

there emerges a reconceptualization of power as a generative and creative force capable of shaping processes of subjectivation as well as fostering forms of critical reflexivity in both teachers and learners. Within this framework, hooks' engaged pedagogy appears as a deeply political and relational act (Maddalena, 2025), as the outcome of a broader radical feminist vision aimed at challenging hierarchies while fostering mutual transformation.

RELATIONAL BIOGRAPHIES AND THE DEMOCRACY OF CARE IN ELENA FERRANTE'S MY BRILLIANT FRIEND

Sara Carlesimo (Indipendent researcher, Italy)

democracy of care | female friendship | Elena Ferrante

This paper aims to analyse the theme of the democracy of care and the possibility it offers to weave networks and relationships that are alternatives to the patriarchal model, focusing on the representative example provided in Elena Ferrante's My Brilliant Friend. The networks of ambivalent and complex relationships that develop between the women in the tetralogy, although they unfold on different levels and in multiple ways, can be broadly categorised into two main groups. On the one hand, the impromptu moments of confrontation in which the women find themselves discovering, with a light-heartedness and a playful spirit tinged with bittersweet tragicomedy, the difficulties they share in navigating the male rules (Ferrante 2012: 81). The shared experiences discovered in face-to-face encounters with one another and the resulting unexpected alliance forged in these occasional moments of self-awareness are, at the same time, both a personal and political prerequisite for the explosion of collective organisational movements that constitute the second broad category under consideration. We will examine figures of men and women who embody patriarchy in its most overt forms of physical violence, but also in the more subtle forms of psychological violence and the more systemic forms of symbolic violence. In contrast to these models, we will seek to outline the complex exemplarity of the democratic project, which is articulated in the complementarity between the relational history of the biographical narratives of two women and Italian, European and global history, from the post-war period up to the 2000s. The moments of relational networks between women come to represent the 'history' and the 'History' of feminism: the representations, the destinies of women, the constitution of individuality and otherness in shared lives that are part of the overwhelming tide of the founding and widespread diffusion of Italian feminism. The model of the democracy of care proposed by Ferrante is revolutionary from the very moment of its articulation and artistic assertion. Among the major gaps in a patriarchal literary history is, in fact, the scant literary representation of relationships between women (Woolf 2013: 174), whilst cultural and linguistic representations show a strong emphasis on the demonisation of female relationships (Federici 2004: 243). For Ferrante, the choice to depict female friendship serves merely as a starting point for a broader symbolic and representational redefinition of relationships between women, paving the way for a political, literary and philosophical project that challenges the egotistical framework of the Subject (Cavarero 1997: 78). Considering the foundational principles of feminist thought, a revolutionary democracy of care begins with a new conception of the relationship with mothers and friends. The narrative of patriarchal motherhood is subjected to critique so that it may be accepted in its ambivalence and analysed as the first form of mutual dependence experienced between women. Recognising oneself in the Other and the fundamental importance of sisterhood among women for each woman's survival in the patriarchal world offer a narrative of friendship that stands in critical opposition to simplistic representations of relationships that are subservient to the male world.

CAN THE MUSEUM FUNCTION AS A PLATFORM FOR SOCIAL RESONANCE?

Bianca Basile (Università degli Studi di Milano Bicocca, Italy)

museum social impact | social measuring tool | intersectionality

According to the last International Council of Museums (ICOM) definition of 2022, museums are: «Open to the public, accessible and inclusive, [fostering] diversity and sustainability. They operate and communicate ethically, professionally and with the participation of communities, offering varied experiences for education, enjoyment, reflection and knowledge sharing»[1]. Although lagging significantly behind the international scene, in recent years Italian museums embraced the themes of accessibility, critical thinking and contemporary social issues from an intersectional perspective. This theoretical alignment is usually reflected in the exhibition topics. However, the incorporation of this perspective is most often the responsibility of the Education Department, which manages relations with the public. Measuring a museum's social impact involves creating a genuine dialogue between the public and the institution, as well as promoting a governance model that responds as much as possible to the public's needs, both as a community to which the museum belongs and as a community it represents. The aim of this ongoing research project is to explore the reasons behind and the foundations of the creation of the Museum of Impact Framework, and to investigate whether and how Italian museums incorporate the theme of social impact. Based on the tool's glossary, an interview framework will be developed and presented to a sample of education departments in Italian museums located across different geographical areas, starting with those specializing in contemporary art. LEARNING FROM LADY ADA LOVELACE: BRIDGING EARLY COMPUTING AND ARTIFICIAL INTELLIGENCE

Rita Franceschetti (Università degli Studi di Roma Tor Vergata, Italy)

Ada Byron Lovelace | Computing machine | Education

The English Scientist Alan Turing, with his hypothesis, aimed at establisishing a mathematical analogy between the numerical computer and the human mind. Turing therefore examines the main objections to the idea that machines can think and, at the same time, proposes his own definition of thought and intelligence. This definition comes from his refutation of the argiument proposed by Ada Byron Lovelace, known as the "Lady Lovelace objection". Turing cites a statement by Lovelace, often regarded as the first programmer in history, taken from an essay on the Analytical Engine designed by the inventor Charles Babbage. In this text she states that "the Analytical Engine has no pretentions to originate anything. It can do whatever we know how to order it to perform." According to this view, a machine would be incapable of producing anything truly new, merely executing instructions and performing actions whose consequences are predictable for humans. Although neither Lovelace nor Babbage could foresee the later developments and potential of computing machines, Turing considers this claim incorrect. The weak version of the Lovelace objection argues that a machine can never do anything genuinely new. Turing responds ironically by invoking the saying "There is nothing new under the sun," adding that no one can be certain that their own "original work" is not simply the result of a seed planted by education or the consequence of applying well-known general principles. Finally, Turing addresses the strong version of the objection, according to which a machine can never take a human by surprise. He challenges this claim by referring to his own experience, noting that machines often surprise him. Although he recognizes that this response is not fully decisive, he observes that judging something as "surprising" always requires a creative mental act, whether the source of

the surprise is a human being, a book, a machine, or something else. Turing beliefs that machines cannot produce surprising outcomes often stems from a common error, particularly among philosophers and mathematicians: the assumption that once a fact appears in the mind, all its consequences are immediately apparent. As a result, people tend to underestimate the value of simply working out the consequences of given data and general principles, overlooking the genuine significance of such processes. The objective of this abstract is to highlight the historical and pedagogical importance of Ada Lovelace, not only as a pioneer of computing but also as a figure of educational significance and as the first woman to address the issue of creativity and originality in computers. By examining the debate surrounding the Lovelace Objection, the study aims to emphasize the role of Lady Lovelace not only as a mathematician but also as an intellectual and pedagogical personality whose reflections on machines and logical instruction contribute to a broader pedagogical understanding of computational thinking. From this perspective, Lovelace emerges as an early thinker linking mathematical reasoning, education, and the conceptual foundations of computer science, becoming an anticipator and a key reference point for contemporary reflections on artificial intelligence.

Uncertain Futures, Structured Inequalities: Habitus, Time and Transformation in Education

PANEL CONVENORS: Marco Romito (Università di Milano-Bicocca, Italy)

PANEL KEYWORDS: Habitus, Time, Transformation

The panel explores the theme of de-classifying higher education, examining how temporal factors, shared barriers, and imagined futures shape students' experiences and academic trajectories. The contributions investigate dynamics of access, retention, and social mobility, highlighting how structural and cultural obstacles intersect with the expectations and aspirations of young people in university contexts. The analysis of "temporal fields" allows for an understanding of how educational pathways are shaped not only by present conditions but also by projections and desires for the future, offering insights for rethinking policies, practices, and tools that can foster equity, inclusion, and shared visions of educational development.

HYSTERESIS, SYMBOLIC VIOLENCE AND A HABITUS OF RESISTANCE: A BOURDIEUSIAN ANALYSIS OF SCHOOL GOVERNANCE IN ENGLAND.

Dr Jan Hetherington (University of Derby, United Kingdom)

hysteresis | resistance | corporatised leadership

Global education systems have experienced significant structural transformation as corporatised reform imperatives increasingly penetrate the field of public education (Lingard and Hursh, 2019). Privatisation agendas have progressively displaced democratic logics, installing market-oriented doxa as the organising principle of educational governance (Gunter et al., 2016). This reconfiguration has transferred legitimate authority away from democratically constituted institutions toward corporate actors, whose accumulated economic capital affords disproportionate symbolic power in shaping educational policy trajectories (Au and Ferrare, 2015). This paper explores the hysteresis effect and the symbolic violence experienced by parents engaged in decision-making within the empowered and public spaces of a corporatised school governing body in England. Specifically in England, the field conditions structuring school governance have become simultaneously corporatised and professionalised (Hetherington and Forester, 2025a; Healey, 2024), producing a system-

atic privileging of skill over stake (Simkins et al., 2019). Subsequently, valorising particular parents in participating in school decision-making, reproducing the dominance of white, middle-class professionals across both the formal empowered and informal public spaces of governance (Kultz, 2021; Reay, 2004; Hetherington and Forester, 2025b), and generating fundamental questions concerning whose voice legitimately represents the local (Woods et al., 2014). I draw on Bourdieu's concepts of field, habitus and hysteresis to explain and theorise the positioning of parents in the field and their response to misrecognition and associated symbolic violence. I argue that those privileged and valorised parents navigating the corporatised field of school governance having the dispositions and symbolic capital to enter the field successfully accumulating further capital and positioning themselves higher in the field. Those others or marginalised parents from subordinated communities, find their dispositions and capital out of place in the field, experiencing both the hysteresis effect and misrecognition of their capital, experiencing significant symbolic violence. Symbolic violence in the form of anti-democratic, civilising and silencing practices is metered out to all parents, irrespective of their illusio for the game. Furthermore, I argue that the response to this symbolic violence is dependent on individual parents' historical trajectories, habitus and capital. This argument is revealed through the analysis of data from the accounts of three parents contributing to the decision-making in school governance. The data originated from a wider study exploring alternatives to corporatised models of school governance in neoliberal contexts of education (Hetherington and Forester, 2025b). Using hysteresis in this way allows me to make significant and original empirical and theoretical contributions to the field. Thinking with Bourdieu, firstly I contribute that parents navigate hysteresis, misrecognition and symbolic violence, whether acquired to the field (Healey, 2024) or not. Secondly, symbolic violence, I argue, is mandated through inculcated corporatised leadership practices, is designed to advance the orthodoxy of dominant field structures, reinforcing dominant field positions whilst further subordinating others. Significantly and finally drawing on Bourdieu and his lacuna regarding individual acts of resistance, I argue that the concept of hysteresis be expanded to include notions of agentic resistance, habitual reflexivity and postulate a habitus of resistance.

FORCED HABITUS TRANSFORMATION: FAST TRACK TO EMPLOYMENT FOR NEWLY ARRIVED ACADEMICS IN SWEDEN

Ida Lidegran (Uppsala University, Sweden)

establishment program | newly arrived academics | habitus

The object of the study concerns interventions aimed at newly arrived highly educated migrants in Sweden. I have investigated participants attending a so-called 'establishment program', with the optimistic designation 'The fast track'. From a theoretical point, the individuals' encounter with the establishment program, 'The fast track', is seen through the lens of Abdelmalek Sayad: the immigrant must be understood in relation to his or her previous emigrant status (Sayad 1999). As Sayad clearly points out, the immigrant is above all a migrant whose social history sets the conditions for immigration. Pierre Bourdieus's concept habitus (Bourdieu 1980), is used in the study to understand the forced habitus transformation that migrants experience during their establishment in a new community. The empirical material consists of 60 interviews with newly arrived academics. The time during 'The fast track' invoked to a great extent their shared experience of not being Swedish. 'The emigrant' was given little space or none at all. For the participants, their educational background is important, which can be understood in terms of a matter of honour, where education is the resource that makes one honorable and that one hopes will be recognised in the new country. The participants wish to rehabilitate their cultural capital with the emigrant's feeling that the background is important, but learn to cope with being just an immigrant. In general, education is closely connected to cultural values and traditions, but this link is here decoupled, which leads to a process of misrecognition of the immersion of education in culture. To handle a group of individuals from different parts of the world, with various needs, the solution becomes an acculturation process in 'the Swedishness' which at the same time means a deculturation process for the migrants, in short a forced habitus transformation process.

DROPOUT AND THROUGHPUT IN TEACHER EDUCATION: STUDENTS' EDUCATIONAL STRATEGIES

Emma Laurin (Stockholm University, Sweden)

Bourdieu | Dropout | Teacher education

Higher education has undergone a massive expansion in recent decades. However, dropout rates remain high. In countries within the Organisation for Economic Co-operation and Development one-third of students who enroll in university drop out (Aina et al. 2022). Studies identifying individual factors contributing to dropouts, such as health, finances, and academic capacity (e.g., Li & Carroll 2020, Von Hippel & Hofflinger 2021), have been complemented by research acknowledging the importance of contextual factors (Behr et al. 2021). Yet there is a lack of studies that consider the status and position of an education program within the field of higher education. Drawing on Bourdieu's concepts of fields, strategies, and capital (Bourdieu, 1996; Bourdieu & Wacquant, 1992) this study explores throughput and dropout in preschool and primary teacher education programs in Sweden. These programs were characterised by low throughput and a subordinate position within the field of higher education. The aim of the study is to examine how throughput and dropout are related to the positions of the programs within the field of higher education and to the educational strategies of students attending the programs. The study is based on 47 interviews with students and staff at the preschool and primary teacher programs at Uppsala University. Most of the interviews were carried out digitally and lasted 50–60 minutes. The themes for the student interviews were the students' professional and educational backgrounds, pathways to and expectations of the teacher program, experiences of the studies, views on the preschool and primary teaching profession, and experiences of dropped studies. Interviews with educational officials focused on student throughput and dropout. The interviews were analysed using thematic analysis (Braun & Clarke 2022). The study offers three key insights. First, a significant gap existed between students' expectations of easy program completion and the actual demands. This gap was fuelled by the programs' marginalised status in higher education alongside staff efforts to uphold educational quality. Second, students with relatively much cultural and social capital developed educational strategies in which they collaborated with each other to

bridge this gap. Lastly, staff efforts to protect education quality, and the strategies of well-resourced students created internal tracking systems that instigated dropout among less-resourced students. The results resonate with previous Bourdieusian research which indicates that students lacking social and cultural capital are more likely to drop out (Thomas 2002, Lehmann 2007, Longden 2004, Romito et al. 2020). However, the study develops this by identifying that a scarcity of resources not only fosters a sense of alienation within the higher education system but also that students with more capital may distance themselves from those with fewer resources, thereby possibly contributing to their risk of dropping out. This distancing serves both to manage the resource rich students' own academic commitments and to protect the status of the preschool and teacher program and the preschool and teacher profession.

GEOGRAPHIC CAPITAL, TERRITORIAL STIGMA AND EDUCATIONAL INEQUALITIES: A BOURDIEUSIAN PERSPECTIVE ON SOUTHERN ITALIAN MIGRATIONS

Martina Brighenti (University of Palermo, Italy)

Geographic Capital | Intersectionality | Southern Italians Migrations

This paper examines educational inequalities through the case of Southern Italian migrations to the North (Italy and Europe), developing a Bourdieusian and intersectional framework to analyse how territorial origin shapes social recognition, educational trajectories, and opportunities for social mobility. In particular, the paper highlights the role of territorial stigma in reproducing inequalities and constraining opportunities for social change within educational systems. Drawing on documented micro-aggressions against "new Southern Italian migrants," the paper examines how these stereotypes have persisted over time—becoming more latent yet remaining deeply effective in structuring social reality and producing forms of structural exclusion (Mazzola et al., 2019; Veneziano Labanca et al., 2025; Berti & Zanotelli, 2008). In the Italian context, historical North–South divides and entrenched anti-Southern racism manifest in unequal access to educational opportunities, including educational services, underinvestment in school infrastructure in the South, and higher levels of educational poverty. This divide also persists in more recent educational migrations, including at the university level. In this context, migration has often functioned as a strategy for social mobility, with individuals and families moving to Northern Italy or Northern Europe in pursuit of better educational and economic opportunities. The theoretical framework integrates Pierre Bourdieu's theory of practice with insights from social stratification and migration sociology. While Bourdieu documented the reproduction of inequalities through habitus, symbolic power, and different forms of capital, this paper extends his framework to a geographical dimension by conceptualizing Geographic Capital as a distinct form of capital. Geographic Capital interacts with cultural and symbolic capital, is field-dependent, closely tied to social class and gender, and operates through mechanisms of symbolic violence that structure recognition and legitimacy within educational contexts. This approach allows us to integrate social class, gender, and territorial origin as interdependent axes shaping educational outcomes, highlighting how inequalities are reproduced within schooling. The concept emerges from structural inequalities both within the nation-state and across European regions, helping to explain the "territorial penalty" observed in historical internal migrations of the 1960s as well as in more recent mobility patterns, including second-generation educational outcomes (Badino, 2014; Berti & Zanotelli, 2008; Ceravolo et al., 2011; Panichella, 2014,

2018; Romito, 2012). By positioning geographic origin as a central axis of inequality within an intersectional perspective, the paper combines decolonial and gender analyses with Bourdieusian sociology (Bourdieu, 1972; Kimberlé Crenshaw, 1989; Conelli, 2022; Chambers, 2014; Giuliani, 2011; Mezzadra, 2002). Historical patterns of internal migration and the formation of peripheral neighbourhoods demonstrate how territorial stigma and layered social networks are reproduced across generations, shaping educational aspirations, trajectories, and opportunities for mobility. The key contribution of the paper is both conceptual and analytical. Geographic Capital provides a tool to understand how territorial origin mediates recognition, capital convertibility, and social trajectories within educational fields. By foregrounding the spatialized dimension of inequality, the paper contributes to debates on the reproduction of educational inequalities and offers insights for addressing persistent territorial disparities in contemporary European education.

INVESTING IN SCHOOL HEALTH SERVICES: ILLUSIO AND MARKET COMMITMENT IN THE NEOLIBERAL WELFARE STATE

Joakim Lindgren (Umea university, Sweden) · **Emma Laurin** (Stockholm university, Sweden) · **Linda Rönnberg** (Umea university, Sweden) · **Malin Benerdal** (Umea university, Sweden)

marketisation · illusio · school health services

Neoliberal restructuring has shifted welfare provision from state responsibility to a market-driven model involving private actors (Harvey, 2005; Jessop, 2002). This has transformed the management and understanding of social issues. Increasingly, entrepreneurial actors are seen as key drivers of innovation and responsibility within evolving policy networks (Rose, 1999; Ball, 2012). Social entrepreneurship that creates social value through different business methods, positions private providers as essential in addressing gaps within the welfare system (Dees, 1998). However, as Bandinelli (2020) observes, the term 'social enterprise' captures a tension between market-oriented profit motives and traditional public sector norms. This raises questions about how social entrepreneurs reconcile such tensions and what their motivations can reveal about the welfare state more generally. In this presentation, we aim to address these questions by listening to private actors in the Swedish School Health Service (SHS) field. In Sweden, all students must have access to SHS, including medical, psychological, psychosocial and special-education support. Private actors offer their services to schools and principal organisers who struggle with the complexities of various health promotion strategies and preventative measures, addressing increasing problems such as declining mental health, bullying, absenteeism, and low academic achievements. Services may include staffing, CPD, methods, programmes, and digital tools (Lindgren et al, forthcoming). The presentation analyses interviews with 18 private SHS actors representing companies with varying sizes and focus. The interviews addressed how the private actors described their work, mission, aims and experiences from collaborating with schools and the principal organisers. To analyse the interviews, we draw on the notion of illusio, i.e. the collective conviction that the stakes within a particular field are worthwhile (Bourdieu & Wacquant,1992). Illusio describes a

practical engagement, interest, and emotional investment that connect individuals to the field, rendering their involvement meaningful. The tentative results show that the private actors act based on a distinctive illusio, shaped by a mix of economic, symbolic, moral, and professional motivations. They pursue expansion and contracts, and they seek legitimacy and recognition from schools and principal organisers. They are committed to narratives of care, child wellbeing, and social responsibility, and their engagement is characterised by expertise, evidence-informed practices, and innovation. Their convictions help explain why they prioritise branding that prioritise care over commerce, accept regulation and share professional norms, tolerate slim profits, and present expansion as a means rather than merely an end. Taken together, we argue that illusio offers a powerful theoretical tool to analyse SHS as hybrid welfare–market field, where economic, professional, moral, and regulatory logics are intertwined. The SHS field is a "state-constructed market" (cf Bourdieu, 2014), and the results display a close relationship between state policy and actors' illusio. Regulation and procurement practices thus serve to produce the ideals and stakes worth believing in. In sum, these results provide important insights to understand the transformation of the welfare state, including how the dominance of New Public Management has colonised and instrumentalised professional domains – a situation where a social entrepreneurship-career may constitute an alternative and even an act of resistance.

THE PERFORMATIVE LOGIC OF SCHOOL EXPERIENCE: WHEN THE FUTURE FADES AND JUDGMENT TAKES OVER

Rita Fornari (Unimarconi, Italy)

School performativity | Authenticity | Student voice

This contribution starts from a question that emerged from the encounter with students' metaphors and silences: what are we really evaluating when we measure school experience? Behind grades, learning outcomes, and standardized performances, what remains unheard? Drawing on a school guidance project launched in 2024 involving over 300 high school students in Italy, the paper explores how a performative logic pervades contemporary school experience. The interpretations presented are not imposed from above but emerge from a situated, participatory process based on students' responses to open-ended questionnaires, revisited in classroom workshops, and negotiated with students through dialogue. This methodological approach ensures that students' voices are not merely illustrated but actively shape the analysis. The findings suggest that performative pressures operate on two interconnected fronts: emptying the future of orientation while crushing the present under the weight of bureaucratic, impersonal, and relentless evaluation. On one side, the future becomes evanescent. Students describe school as an "exercise bike" on which they "pedal a lot but remain stationary", a "hell where, at the end of it all, there is light", a "roundabout" where, not knowing which direction to take, they "keep going round in circles". They invest effort without real belief and work without a clear horizon. When asked about their dreams and their likely future jobs, a consistent gap emerges: the multiplicity of possible futures (MotoGP racing, K-pop idol, tattooing) collides with the pragmatism of the "Plan B" (kindergarten teacher, choreographer). The future is not a project but a source of anxiety – too distant, too uncertain, too abstract to grasp. On the other side, the present is saturated with judgment. Students' most difficult moments are almost always moments of evaluation: the first failure ("the first 3.5"), the accumulation of tests, the threat of being held back. The pervasiveness of evaluative anxiety extends beyond grades to the very relationship with teachers: students describe being "targeted", "humiliated", "abandoned". One student, reflecting on a teacher's comment – "what kind of man will you become?" – adds: "I would kill myself if I were held back." Another recalls: "no teacher wanted to help me, and I felt abandoned to myself." In this context, authenticity –

understood in a Sartrean sense as the capacity to assume responsibility for one's own choices and future – becomes a fragile and conflictual process. Students are asked to project themselves into an uncertain future while being constantly judged in a present they struggle to inhabit.

DE-CLASSIFYING HIGHER EDUCATION: TEMPORAL FIELDS, SHARED BARRIERS AND IMAGINED FUTURES

Ryan G Wilkinson (University of Leeds) · **Lucy Hemingway** (University of Leeds) · **Eleanor Dutton** (University of Leeds)

Cleft Habitus | Temporal Inequality | Class Mobility

This paper presents an original theorisation of class-based inequality in higher education (HE) by integrating Pierre Bourdieu's "Theory of Practice" with the concept of "temporal fields." Drawing upon findings from a study at a Russell Group institution in England, we argue that the modern university continues to function as a middle-class space that strategically excludes working-class agents through affective experiences. While other Bourdieusian analysis has focused on "hysteresis"—the lag between habitus and field—we contend that the academic field is a dynamic "temporal field" where the "rules of the game" are increasingly structured by accelerated pace and long-term strategic horizons by players within a specific field. Bourdieusian scholarship emphasises "hysteresis" as an externalised lag between habitus and field, this paper shifts the analytical focus toward the internal "time-space" of the class-mobile agent (Keil, 2023). We propose that this exclusion is best understood through a shared structural homology between staff and students, manifested in a "cleft habitus" (Bourdieu, 2002) that operates as a temporal bridge between a persistent past and a desired academic future. This paper presents initial findings from methods utilising staff-student research events, specifically "Story Circles" which saw staff and students discussing their experiences of being working-class in a shared space. Our research reveals a profound structural homology: working-class staff and students face strikingly similar barriers to belonging and success, despite their differing hierarchical positions within these elite spaces. Both groups inhabit a "cleft habitus" characterised by a fractured sense of identity and the constant emotional labour of navigating an alien cultural terrain. Our research reveals a profound structural homology: working-class staff and students face strikingly similar barriers to belonging, despite their differing hierarchical positions. We theorise this experience through an "in-between temporal space"—a state

of "in-between-status" generated by the cleft habitus. This space acts as a site of collision between the primary habitus's affinity for the past and the secondary habitus's orientation toward a desired academic future. Crucially, the desired academic future is based on unknown changes within spaces responsible for symbolic violence and disruptive, affective experiences (Threadgold, 2020). This internal "time-space" is where the "transfuge" (Köbli, 2025) negotiates the tension between the "notion of the possible" rooted in their origins and the "logic of practice" demanded by the elite field. By positioning the cleft habitus as a temporal bridge, we illuminate how agents manage a "doubled temporality": a persistent loyalty to class roots alongside the strategic cultivation of a future-oriented academic self. This theorisation aims to move beyond reproduction to capture the active, temporal "becoming" of the class-mobile agent.

Unschooling, Democracy and Caring Citizenship

PANEL CONVENORS: Elena Piffero (L'Associazione Istruzione In Famiglia Italia)

PANEL KEYWORDS: unschooling, democratic citizenship, self-directed learning

Public debates often portray homeschooling as a withdrawal from the public sphere or a challenge to institutions considered essential for democratic life. Yet homeschooling encompasses a wide range of educational practices, and the category itself often obscures important differences. This panel focuses specifically on unschooling, which should not be conflated with homeschooling in general or with forms of home-based schooling that reproduce school curricula outside institutional settings. Unschooling is grounded in distinct philosophical, ethical, and pedagogical assumptions: it challenges compulsory schooling, fixed curricula, and hierarchical models of learning, while understanding education as self-directed, relational, and embedded in everyday life. Rather than retreating from society, many unschooling families describe their practice as a way of enacting democracy in daily relationships through autonomy, participation, negotiation, mutual responsibility, and care (English et al., 2024; Kunzman, 2021). From this perspective, unschooling raises broader questions about citizenship, collective life, and the social organization of learning. We invite contributions that examine whether and how unschooling contributes to: 1. Reconceptualizing the relationship between private and public life By exploring how democratic participation emerges through everyday practices of self-determination, interdependence, and collective responsibility, and by reconsidering the relationship between family autonomy, community engagement, and institutional authority. 2. Reimagining education through the lens of care By investigating how unschooling values, redistributes, and politicizes care work, opening new pathways for theorizing and practicing a caring democracy (Tronto, 2013). We welcome theoretical, empirical, ethnographic, autoethnographic, policy-oriented, and interdisciplinary contributions, as well as narratives of lived experience.

CITIZENSHIP AT THE MARGIN OF SCHOOLING: AN AUTOETHNOGRAPHY OF UNSCHOOLING, ASSESSMENT, AND DEMOCRATIC RECOGNITION

Elena Piffero (L'Associazione Istruzione In Famiglia Italia, Italy)

Unschooling | Autoethnography | Democratic Recognition

This autoethnographic paper explores the annual negotiations surrounding compulsory assessments for unschooled children in Italy. While unschooling is grounded in self-directed learning, community participation, and the recognition of children as active citizens, families in Italy must confront yearly examinations based on school curricula and standardized evaluation. Drawing on lived experience as a parent of unschooled children, the paper examines encounters at the interface between families and schools. These interactions involve efforts to establish dialogue with teachers, principals, and educational authorities while explaining learning pathways that do not follow age-graded programs, disciplinary boundaries, or conventional instructional methods. Particular attention is paid to tensions arising from assessment procedures modeled on classroom learning. The analysis highlights recurring experiences of misunderstanding, skepticism, and, at times, hostility. While unschooling families seek recognition of learning emerging through projects,

community participation, reading, volunteering, travel, digital exploration, and everyday life, schools often struggle to evaluate knowledge beyond familiar academic formats. This creates a paradox: educational pathways broadly consistent with the learner-centered principles of the Indicazioni Nazionali per il Curricolo (2012) remain difficult to recognize within standardized systems. The paper argues that this friction is not merely pedagogical but civic. The right of children to be acknowledged as legitimate learners is also a question of democratic recognition and educational pluralism. It concludes by proposing alternative assessment models, including portfolios, narrative documentation, community review panels, and mixed committees involving librarians, cultural educators, and independent educational officers. Such approaches may better capture diverse learning trajectories while fostering constructive relationships between institutions, families, and young citizens.

PARENTS' VS. STATE'S DUTIES AND RIGHTS IN UNSCHOOLING

Nunzia Vezzola (LAIF (L'Associazione Istruzione Famigliare), Italy)

Unschooling | Rights and duties | Private and Public Spheres

Parents have the primary responsibility to provide their children's education. In Italy this parents' right and duty is guaranteed by the Constitution. At the same time, a welfare state has the duty to ensure that all children have access to (a possibly good) education. The boundary between state's authority and family rights in education is a contentious, evolving legal and ethical space. When children are unschooled the parental (and children's) range of choice is much wider and includes the places and times of learning, the approaches, the social groups, the learning context, the contents, the curriculum, the learning language(s) and even more. Might this mean that the state's supervisory power about education is less wide in unschooling than in schooling? Where is the "border line" between state's authority and parents' rights in unschooling? If some of the state's and parents' competences overlap, how can this overlap create synergy and cooperation in the child's best interests instead of friction? In recent years state pressure on parental choices and the consequent friction between state's authority and unschooling families have both increased. The investigation into this interplay between family autonomy and state intervention highlights how most state interventions in the educational field, at least in Italy, especially towards unschooling families, are inspired less by democratic principles or solidarity, support and a spirit of collaboration than by the need to control, to influence and interfere, as if unschooling were a kind of insubordination.

RE-EDUCATING THE ADULT: UNSCHOOLING AS A PARENT-CHILD CO-TRANSFORMATIVE PRACTICE OF DEMOCRATIC CITIZENSHIP AND MUTUAL CARE WORK

Laura Bianconi (Associazione LAIF, Italy)

Unschooling | Caring Democracy | Youth Agency

The choice of unschooling is often criticized as an individualistic withdrawal from civil society. Drawing on a situated and experiential perspective as an unschooling parent, this presentation challenges that narrative. Building on English et al. (2024), it examines unschooling as a form of “democracy without curriculum,” where learning emerges through participation, relationships, and shared decision-making rather than externally imposed educational structures. Although contemporary educational theories increasingly emphasize learner-centered approaches, institutional schooling often limits genuine autonomy through compulsory curricula, standardized assessment, and age-graded progression. Unschooling pushes student-centered principles further by recognizing children’s capacity to direct their own learning and participate meaningfully in decisions affecting their lives. The paper focuses on unschooling as a process of mutual parent-child transformation. Creating a democratic learning environment requires adults to engage in a continual process of deschooling, unlearning assumptions rooted in performance, control, surveillance, and standardized outcomes. Following Illich (1971), this involves questioning the tendency to equate education with institutional instruction. Adult authority is not abandoned but reconfigured through dialogue, collaboration, and co-research. From this perspective, the home becomes a porous social space where learning, care, and citizenship are continuously enacted. Rather than preparing children for future participation, unschooling recognizes them as citizens in the present, actively engaged in cultural, relational, and community life. The presentation argues that unschooling is not civic disengagement but a practice of democratic renewal grounded in relational care. It concludes that regulatory frameworks imposing school-based standards risk undermining educational pluralism and limiting democratic innovation, whereas unschooling offers a living example of citizenship practiced through autonomy, responsibility, and mutual care.

THE DIALECTIC BETWEEN THE PUBLIC AND THE PRIVATE SPHERE AS A CONSTITUTIVE MOMENT OF THE LEARNING PROCESS IN UNSCHOOLING

Sergio Leali (LAIF - L'Associazione Istruzione Famigliare, Italy)

Public and private spheres | Unschooling | Personal interest

Unschooling is often seen as a phenomenon that emphasizes individualism to the detriment of the social, public dimension of the individual. Empirical data and literature on unschooling, however, lead to completely different conclusions. The characteristics of this approach and its practice highlight how the relationship between public and private sphere can be deeper, richer, more multifaceted and advanced than in other educational and learning approaches. The educational system's beginning and ending point is the person. The Italian Constitution includes among its foundation principles a commitment to removing obstacles that impede "the full development of the human person." Unschooling creates the conditions for all the aspects that ultimately constitute the person to emerge and develop. This approach finds the concept of interest as the key to every activity. Interest is the moment of convergence and synthesis between the subject's interiority (the private) and the world (the public sphere) (Stern, 2006). Interest is the vital nucleus that begins and sustains the process of shaping the person, arising from the encounter between the public and the private sphere, where its propulsive and necessary action transmutes the individual's inner temperament into the character that will be

the figure of their person (Bollea, 1995). In unschooling, learning dynamics unfold in real contexts, both cultural and natural, and there, without pre-orders or prescriptions, study and research paths are liberated and unfold, where the individual penetrates the public sphere, gathers its stimuli, and investigates its components and connotations.

UNSCHOOLING IN FRANCE FOLLOWING THE 2021 REFORM: PRACTICES, MOTIVATIONS AND CONSEQUENCES OF THE TRANSITION TO THE AUTHORISATION SYSTEM

Elena Fanti (Université Paris Nanterre, Italy)

citizenship | civil disobedience | de-schooling

This contribution presents the progress of a joint PhD research project between the University of Paris Nanterre and the University of Bologna, focusing on the analysis of home education in the Italian and French contexts. The two legal systems adopt profoundly different models. In Italy, homeschooling is subject to parents' annual notification of their educational choice and compliance with the obligations laid down by current legislation; in France, following the 2021 reform, it is instead subject to a system of prior authorisation that restricts access to it to specific conditions laid down by law. Building on this difference, the research examines home education as an educational and social practice, with particular attention to families' motivations, the ways in which learning pathways are organised, and the effects produced by the different regulatory frameworks. After outlining the theoretical framework, the research objectives and the methodological design adopted, the paper presents the initial results of the empirical survey conducted in France using a questionnaire administered to a sample of families. The focus is specifically on unschooling experiences, examining their pedagogical motivations, how learning pathways are organised, and the impact of the authorisation scheme introduced by the 2021 reform. The findings highlight how the new regulatory framework has affected the possibility of practising unschooling, altering the strategies adopted by families and, in many cases, leading to the initiation of administrative and legal proceedings against those who have continued to provide home education without the authorisation required by law.

Framing School-to-Work Programs: Evaluation, Voice and Social Justice

PANEL CONVENORS: Donatella Poliandri (INVALSI - Italian National Institute for the Evaluation of Education, Italy); Mauro Palumbo (University of Genoa (UniGe), Italy); Alessandra Decataldo (University of Milano-Bicocca (UNIMIB), Italy)

PANEL KEYWORDS: School-to-Work Programs, Evaluation, Voice and Recognition

School-to-Work Programs (SWPs) are increasingly promoted as policy responses to the challenges young people face in accessing meaningful learning and work opportunities. Yet, evaluations often focus on immediate functional outcomes, capturing only part of their significance. Their democratic and distributive implications also depend on how SWPs are framed, evaluated and governed—on the assumptions they embed, the opportunities they open to different groups of students, and the forms of recognition and participation they enable or constrain. Drawing on capability and social justice perspectives, this panel examines SWPs as policy instruments whose design can either broaden opportunities or reinforce stratification. We welcome contributions that investigate SWPs through evaluation lenses capable of making issues of justice, recognition, and voice visible. Proposals may explore: (a) how SWPs distribute learning and work opportunities across social groups; (b) how teachers, school leaders, educational and company tutors, families and host organisations negotiate responsibilities and expectations in contexts of institutional change; (c) how students interpret and articulate their SWP experiences, bringing their voice to the forefront; (d) how evaluation and monitoring tools illuminate the mechanisms linking local practices to broader regimes of inequality and precarious work. During the panel, the Special Issue Learning for Democracy, 2/2025, “School-to-Work Programs: an Opportunity for Social Justice?”, will be presented, providing a shared framework for discussing its conceptual contributions and empirical insights. This presentation will support a broader exchange on comparative and international perspectives, upcoming research, and future directions for advancing work on SWPs, democratic evaluation, and educational justice.

PCTO BETWEEN POLICY FRAMES AND LOCAL CONSTRAINTS: HOST ORGANISATIONS, COORDINATION GAPS, AND STRATIFIED OPPORTUNITIES

Alessandra Decataldo (Università degli Studi di Milano-Bicocca) · **Federico Paleardi** (Università degli Studi di Milano-Bicocca)

School-to-work programs | host organisations | educational governance

Within a broader European shift toward work-based learning centred on key competences and lifelong guidance, Italy’s PCTO (Percorsi per le Competenze Trasversali e per l’Orientamento - starting from the 2025/26 school year School-to-Work Training FSL) reframes school-to-work programs around transversal competences, orientation and the governance of the partnerships among school, host institution and other stakeholders. With this contribution, we aim to reconstruct how that frame is interpreted in practice and how it shapes the distribution of learning and work opportunities from the point of view of host structures. The study is part of broader national research on PCTO; we draw our evidence from 27 interviews with key informants and host tutors and a two-stage email survey targeting host tutors (2022–2023. N=356). First, we observe a gap between formal alignment with the aspirations of PCTOs and their implementation. Overall, host tutors agree on the centrality of transversal competences and orientation, yet implementation diverges systematically across host organisations. Some organisations, often public/third-sector, cultural or research-oriented, tend to conform more easily and consistently to the transversal competences frame, whereas projects hosted by businesses, especially in Italy’s SME-dominated economy, tend to remain geared toward technical training and job-specific skills. This is not simply a matter of preferences or stiffness: it reflects tensions between educational expectations and the organisational constraints of the Italian economic fabric. Case-by-case adaptations generate sharp heterogeneity in project quality and learning outcomes. The reform reduces project hours and widens a divide between host organisations that can easily align with students’ and families’ expectations and the policy’s broader goals, and less structured organisations, especially micro and small firms, whose technically oriented training becomes less effective when squeezed into shorter timeframes. The result is a two-speed PCTO system that reproduces school segregation and educational inequalities within the host structures. Second, PCTO guidelines call for integrated cooperation between schools and host organisations, as the main driver for customisation and the overall quality of the projects delivered. However, our evidence shows that fully collaborative coordination is relatively rare. Most projects are governed through fragmented or partially integrated arrangements, where responsibilities for design and monitoring are unevenly shared and interactions between tutors are intermittent. Importantly, integrated coordination is less explained by sector, territory, or organisational size per se than

by internal organisational conditions, such as strong support, time and capacity to sustain the coordination work required for partnership. Finally, we highlight how contextual factors such as relational and experiential capital, (e.g accumulated organisational experience with PCTO, pre-existing networks) shape also the likelihood of post-PCTO work-related collaborations. Where internal support is scarce, organisational constraints are tight and host structures have less experience in PCTOs, partnerships tend to remain episodic and reactive; where resources, capacity and networks exist, PCTOs are successful. In this sense, the policy tends to presuppose, rather than build, the organisational and relational conditions needed, struggling to challenge pre-existing inequalities and school segregation, but rather mirroring within host structures.

CAN ACTIVE CITIZENSHIP INCREASE EMPLOYABILITY?

Federica De Luca (INAPP, Italy)

School-to-Work Transitions | Active Citizenship | Employability

Can an active citizenship programme — not originally designed to facilitate school-to-work transitions — produce significant effects on young people's employability? While school-to-work programs (SWP) are increasingly central to educational and labor policy, their evaluations tend to focus primarily on process outcomes and immediate behavioral changes, often overlooking longitudinal results as well as the dimensions of justice, recognition, and voice that define their democratic potential. The case of the Italian Universal Civil Service (SCU) offers key insights that can enrich this analytical framework. INAPP surveys indicate that volunteers' employability increases by an average of 12% following their service experience, across gender, educational attainment, geographical area, and family background—suggesting an effect that is widespread and relatively independent of initial conditions. Furthermore, among young people who simultaneously exhibit high levels of both employability and active citizenship, the employment rate reaches 73.7%, compared to an overall average of 57.2%. These findings stem from a research programme aimed at investigating the extent to which higher employability may reflect a more conscious and practiced form of citizenship, moving beyond the dominant paradigm that identifies education and training as the sole relevant drivers of active labour market policies. Through the use of two original indices — OKI-INAPP for employability and ACCI-INAPP for active citizenship — the research provides evidence that appears to support this hypothesis. By integrating these findings with the capability approach (Sen, 1999; Nussbaum, 2011) and the framework proposed in the volume School-to-Work Programs: an Opportunity for Social Justice?, this paper interprets the SCU as a potential conversion factor capable of transforming institutional resources into substantive freedoms and real opportunities. Although not a transition programme in the strict sense, the SCU produces systemic effects on both the probability of labour market entry and civic agency, proving to be a highly relevant empirical laboratory for questioning dominant evaluative criteria. From this perspective, the paper raises two main issues. First, it advances the hypothesis that integrating civic and relational dimensions into transition pathways may strengthen employability rather than divert resources from it: if a citizenship programme produces employment as an indirect outcome, policies that ignore this

dimension may be based on a partial representation of the phenomenon. Second, it proposes an impact measurement framework based on the OKI and ACCI indices, capable of making visible dimensions — such as active citizenship — that current evaluative approaches tend to overlook. In doing so, it contributes to the development of more comprehensive tools for assessing whether school-to-work programmes truly expand the substantive freedoms and civic agency of participating youth.

H.00. Framing School-to-Work Programs: Evaluation, Voice and Social Justice

CAN THE CHANGING REGULATORY CONTEXT STRENGTHEN THE RELATIONSHIP BETWEEN SCHOOL AND THE WORLD OF WORK?

Graziella Arazzi (Ufficio Scolastico Regionale per la Liguria, Italy)

responsibility negotiation social cohesion

Starting in the 2025/26 school year, the programs for transversal skills and orientation (PCTO), established by Law 145/2018, have been reformulated as “School-to-Work Training” (Decree No. 127 of September 9, 2025). According to the technical report of the Ministry of Education, the reform aims to strengthen the connection between school-to-work experiences, educational processes, and students’ concrete needs. The new framework refers to a perspective centred on students’ personal and social development and encourages forms of self-assessment accompanied by verification and documentation.Between the previous regulatory framework and the new configuration—on which public policy debate remains limited—lies the broader perspective of the National Recovery and Resilience Plan (PNRR). Within Mission 4, Component 1(Strengthening the Offering of Educational Services),six reforms are envisaged. Two of them are particularly relevant to the reconfiguration of the school–work relationship: the reform of Technical and Vocational Institutes and the Orientation Reform(Ministerial Decree No. 328/2022). Law 22/2025 further emphasizes the development of non-cognitive and transversal skills as key outcomes to be fostered through school-to-work training.Overall, this policy framework aims to promote equity, social cohesion, and students’ capacity for self-orientation(Life Design), fostering interaction between learning processes and socio-relational development across upper secondary education, with particular attention to technical institutes currently undergoing reform. Within this scenario, the introduction of Educational Agreements 4.0—conceived as a support structure for designing and implementing school-to-work programs—suggests possible connections between democratic forms of student development and work environments characterized by participatory organizational cultures, on-the-job learning, and shared responsibility. However, beyond policy expectations, a gap emerges between legislative objectives and stakeholders’ perceptions. Exploratory work conducted by several Regional School Offices, including Liguria, indicates that many internal tutor teachers and school principals do not always demonstrate a clear understanding of the systemic links among the different regulatory components. Some stakeholders call for stronger central coordination to clarify the relationship between regulatory innovation and implementation contexts.Only a limited number of schools—mainly technical institutes, sometimes connected to ITS foundations—show more integrated practices, including international mobility experiences linked to STEM and multilingualism and collaboration between orientation tutors, counsellors, and teachers responsible for school-to-work programs.More encouraging insights emerge from focus groups conducted with students from technical and vocational institutes and from an art high school in Western Liguria. Students highlight the role of host organizations in shaping their life projects, the importance of supportive workplace teams, the learning value of mistakes and unexpected situations, and the development of relational competences. Keywords used to describe these experiences include awareness, change, immersion, group, growth, and effectiveness. A shared critical issue concerns the Student Digital Portfolio (e-Portfolio) on the Unica ministerial platform, designed to support orientation and collaboration among school stakeholders. At present, the platform does not allow students to carry out structured self-assessment of their school-to-work experiences. Finally, international mobility programs raise additional concerns: participants are often selected based on high academic achievement, limiting wider access, while the mediation of private agencies can reduce the educational value of these experiences and weaken the role of school communities.

FEELING INFORMED? STUDENTS' PERSPECTIVES ON GUIDANCE AND CHOICE IN SCHOOL-TO-WORK PROGRAMS IN ITALY

Donatella Poliandri (INVALSI - Italian National Institute for the Evaluation of Education, Italy) · **Graziana Epifani** (INVALSI - Italian National Institute for the Evaluation of Education, Italy)

School-to-Work Programs | student voice | career guidance

School-to-Work Programs (SWPs) are widely promoted as policy instruments to support students' orientation and skill development during upper secondary education (Vermeire, De Cuyper, Kyndt, 2022). Beyond organisational arrangements and short-term outcomes, students' experiences and levels of awareness provide evaluative evidence for examining how School-to-Work Programs are implemented in schools. From an evaluative perspective, students' accounts and levels of awareness constitute a crucial source of evidence for assessing the quality and coherence of SWP implementation. This paper analyses students' perspectives on SWPs in the Italian context by focusing on information, guidance, and choice. Drawing on student voice as an evaluative lens (Esposito, Galeotti, 2018), the study explores how students assess the functions of SWPs, how informed they feel about key aspects of these pathways, and which actors they identify as central in guiding their choices, in line with recent research on PCTOs and orientation in secondary education (Germani, Marini, Stanzione, 2025). The analysis is based on the first wave of a broader longitudinal study conducted within a national PRIN project. Data were collected through a CAWI survey administered in the 2021–2022 school year to 4,045 students enrolled in 78 Italian upper secondary schools. The sample includes students attending academic (49.6%), technical (36.8%), and vocational (13.6%) tracks, with 1,871 males (46.2%) and 2,174 females (53.8%). The questionnaire investigated students' evaluations of SWPs' functions, sources and clarity of information, participation in training activities, and awareness of certification procedures. Overall, students express positive evaluations of SWPs, primarily viewing them as opportunities to become familiar with the world of work, test personal abilities, and support future educational or career choices. Perceived usefulness is generally high, with students enrolled in vocational tracks reporting more favourable assessments than their peers in academic and technical pathways. However, these positive evaluations coexist with moderate levels of self-reported awareness. On a scale from 1 to 10, students' perceived level of information averages 6.84, with fewer than 40% considering themselves well or fully informed. Although more than 97% of students report having participated in informational sessions, these activities tend to focus mainly on organisational aspects, while issues related to tutoring roles and certification procedures are less clearly understood. Nearly 15% of students report being unaware of the existence of a final certification, and among those who expect to receive one, a substantial proportion express uncertainty about how competences will be certified. Students identify the school as the primary context guiding their choices. Teachers, educational tutors, company tutors, and peers play a pivotal role in mediating information and supporting decision-making (Poliandri, Graziosi, Epifani, 2025), whereas advice from families or external actors appears marginal. Differences across educational tracks persist, with vocational students reporting higher levels of information and guidance. By foregrounding students' perspectives, the study highlights how high expectations towards SWPs coexist

with information gaps that may affect orientation and recognition processes. These findings suggest that strengthening clarity, guidance, and transparency—particularly regarding tutoring roles and certification—represents a key evaluative issue for ensuring that SWPs effectively support informed choices and equitable opportunities across educational pathways.

PROBLEMATIZING SCHOOL-TO-WORK PROGRAMS THROUGH STUDENT VOICE

Valentina Pagani (University of Milano-Bicocca, Italy) · **Irene Stanzione** (Sapienza Università di Roma) · **Elisa Truffelli** (Alma Mater Studiorum - Università di Bologna) · **Guido Benvenuto** (Sapienza Università di Roma)

School-to-Work Programs | Student Voice | Mixed-methods

For decades, guidance has been framed as a strategic lever of educational policy, intended to prevent school delay and dropout, foster academic success, and align schooling with active labour market measures. Within this policy architecture, School-to-Work programs have been consolidated as structural devices designed to accompany students in constructing informed educational and professional trajectories. Yet a persistent paradox underlies these initiatives: although students are their primary addressees, they are seldom involved in their design, evaluation, or reflective re-elaboration. Currently configured in Italy as Formazione Scuola-Lavoro (FSL), formerly PCTO, these pathways risk functioning as hetero-directed dispositifs in which aims, contents, and methodologies are predominantly defined by adults, while young people occupy a largely receptive role. Such a configuration appears particularly problematic if guidance is understood as a process aimed at strengthening agency, autonomy, and the capacity to attribute meaning to one's own future. Marginalizing students' voices may therefore undermine the emancipatory potential that guidance policies explicitly seek to promote. This contribution draws on findings from the PRIN 2022 research project (Stanzione, 2025; Truffelli, Stanzione, Pagani, in press), which—grounded in the Student Voice framework and its conception of listening as both a democratic imperative and a driver of educational improvement—adopted a mixed-method design. The study involved 297 students across five Italian secondary schools in qualitative focus groups and collected survey data from 1,575 students, allowing for an integrated analysis of lived experiences and broader trends. By foregrounding their perspectives, the paper critically reinterprets School-to-Work programs through the voices of those most directly concerned yet often excluded from governance processes. Drawing on both qualitative and quantitative evidence, the contribution reflects on how limited student involvement can constrain recognition, agency, and meaningful participation. Conversely, when students are acknowledged as legitimate co-constructors of their pathways, School-to-Work programs are more likely to operate as emancipatory spaces that expand capabilities, foster reflexivity, and contribute to more socially just educational trajectories.

H.00. Framing School-to-Work Programs: Evaluation, Voice and Social Justice

H.01

Adult Education and Lifelong Learning: Toward a Culture of Inclusion

PANEL CONVENORS: Annalisa Buffardi (Indire, Istituto Nazionale di Documentazione, Innovazione e Ricerca Educativa, Italy); Stefania Sansò (Indire, Istituto Nazionale di Documentazione, Innovazione e Ricerca Educativa, Italy)

PANEL KEYWORDS: lifelong learning, active ageing, digital inclusion

Rapid demographic transitions and increasing digitalization are redefining the boundaries of democratic citizenship, with significant implications for social and occupational inclusion. Rising longevity, declining birth rates, and increased migration highlight the need for new social equilibria involving educational, welfare, and economic–productive systems, while digital transformation is reshaping cultural and social participation. Within a broader reflection on education as a strategic lever for democratic, inclusive, and intergenerational citizenship, the panel focuses on three issues: population ageing and the emergence of heterogeneous categories of social actors with diverse needs and expectations; migration as an opportunity for social cohesion and sustainable growth; the digital transition, the deep mediatization of social life, and the new forms of exclusion that accompany these processes. The panel welcomes theoretical, analytical, empirical, and methodological contributions on: Roles, methods, and practices of Lifelong Learning and Adult Education in contemporary contexts, supporting the re-engagement of youth and adults in education, the upskilling and reskilling of mature workers, active ageing, and the digital inclusion of younger seniors (aged 65 to 74), migrants, and individuals in precarious employment. Recognition of non-formal and informal learning, and the valorization of individual biographies, as key components of a lifelong learning culture. Coordinated actions linking schools, the labour market, and local communities to address the emerging needs of a heterogeneous range of social actors and to foster the development of territorial communities. Digital competencies, as well as media and digital practices of older and younger seniors.

WHEN PERSONAL IS POLITICAL? MIGRANT BIOGRAPHIES THROUGH PODCASTING

Sara Gemma (Università degli Studi di Macerata, Università degli Sudi di Napoli "Parthenope", Italy) · **Maria Luisa Iavarone** (Università degli Sudi di Napoli "Parthenope", Italy) · **Francesco Girardi** (LESS Società Cooperativa Sociale)

Transformative Education | Participatory Action Research | Migration

This study explores a crossmedial workshop with migrants and refugees through the lens of lifelong learning. Learning is conceptualized as an adaptive (Iavarone, 2025) and transformative process (Mezirow 2003) that emerges through care, embodiment, creativity, and collective meaning-making. Within this framework, narrative practices (Hoggan, 2009) are understood not merely as pedagogical tools, but as epistemological devices capable of questioning dominant knowledge regimes, fostering agency, voice, and democratic participation. The contribution presents a laboratory conducted within the cooperative for reception and integration LESS Cooperativa Sociale (Naples, Italy) in a non-formal educational context during Italian L2 courses for Unaccompanied Minors. The experience is situated within a doctoral research project in experimental pedagogy and is framed as a participatory action research process (Orefice, 2006). Educational intervention and qualitative inquiry are therefore conceived as intertwined dimensions of a single transformative practice. The methodological design integrates participant observation, autoethnographic field notes (Biffi, 2025) focus group and the collection of narrative and audio materials co-produced with participants, in order to account for both learning processes and relational dynamics unfolding in everyday educational settings. Podcasting (Sottocorno, 2025) was introduced as a multimodal practice combining oral language development, storytelling (Menéndez, 2025) sound exploration, and collaborative scripting. Participants were involved in all phases of the process, from the definition of themes to recording and editing, thus occupying active roles as authors and cultural producers rather than as passive learners or research subjects. The narratives (Marmié, 2024) addressed experiences of migration, daily life in reception facilities, aspirations, and encounters with Italian society, generating a shared narrative space where individual trajectories could be recognized and negotiated collectively. The researcher assumed a dual position as educator and participant-observer, explicitly reflecting on positionality (Holmes, 2020) power relations, and ethical responsibility. Autoethnographic observation functioned as a tool for tracing moments of rupture, resistance, emotional intensity, and learning transformation, as well as for interrogating the implicit pedagogical assumptions embedded in institutional language education practices. Attention was paid to how linguistic vulnerability, silence, humor, and embodied forms of expression contributed to the construction of meaning beyond standardized notions of communicative competence. The present findings suggest that podcasting could operate simultaneously as a linguistic resource, a pedagogical device, and a research method, enabling forms of counter-narration

that challenge homogenizing representations of these jeunesses en movement (Marmié, 2025). More broadly, the study highlights the potential of personal biographies (Erel, 2007) to reconfigure educational and research spaces as sites of care, relational ethics, and political subjectivation. By integrating transformative learning theory, participatory action research, and creative-based methodologies, this paper argues that it is possible to enhance the quality of wellbeing and integration, particularly within complex and vulnerable educational systems. However, as often occurs in pedagogical research conducted in targeted settings, the findings are not generalizable. Further investigation is needed to refine these methods, strengthen their transferability, and develop specific impact indicators capable of assessing their effectiveness across diverse educational contexts.

THE ROLE OF INNOVATION STUDIES IN THE KNOWLEDGE SOCIETY: SHARED RESPONSIBILITY, INCLUSIVE CITIZENSHIP, AND COMMUNITY EMPOWERMENT

Fiammetta Fanizza (University of Foggia, Italy) · **Fiorella Spallone** (University of Foggia, Italy) · **Riccardo Scuccimarra** (University of Foggia, Italy) · **Francesco Ciarnelli** (University of Foggia, Italy)

Innovation Studies · intirdisciplinarity · Lifelong Learning

In response to the need to connect learning processes to ongoing transitions, and considering how the growing digitalisation of today's society requires a profound reconfiguration of education and welfare systems, this paper discusses the possibility that Innovation Studies (Fanizza, 2019; Fagerberg et al. 2013) provide an indispensable infrastructure for enhancing the practices of constructing new knowledge. Therefore, this paper proposes Innovation Studies as a methodological paradigm capable of making a structural contribution to the debate on interdisciplinarity and lifelong learning processes (OECD, 2024). The central hypothesis is that the three constituent dimensions of Innovation Studies – methodology, interdisciplinarity and communication – can function as a connecting architecture between schools, universities, the labour market and local communities, promoting coordinated actions geared towards the needs of a heterogeneous plurality of social actors. It is not just a question of "studying" innovation, but of practising it as an educational tool: an approach that integrates empirical analysis, territorial experimentation and critical reflection, promoting learning environments capable of connecting formal, non-formal and informal education. From a methodological point of view, Innovation Studies enhance the informative value of research and co-design processes between educational institutions and socio-economic actors (Ramella, 2015). In this perspective, lifelong learning becomes a space for reactivation for young people and adults, but also an area for the development of research skills for senior and junior researchers. The focus is particularly on building the transversal skills – analytical, collaborative and communicative – necessary to interpret the complexity of the knowledge society (Bauman, 2018). The contribution highlights a crucial theoretical point: in the knowledge society, the problem is not the quantitative accumulation of knowledge, but rather the ability to learn new knowledge through the conscious use of plural scientific languages. Interdisciplinarity is not a simple juxtaposition of disciplines, but a cognitive and relational skill that allows different perspectives to be translated, integrated and communicated. In this sense, "learning to learn" takes on a political value: it becomes the condition for citizenship

capable of navigating the processes of digitalisation, actively participating in the public sphere and addressing emerging inequalities. Finally, communication plays a decisive role in countering the new forms of exclusion produced by the mediatisation of social life. Knowing how to communicate knowledge and transform it into social and professional competence means making innovation accessible, inclusive and transferable. In this way, Innovation Studies are a relevant methodological proposal not only for student training but also for the continuous qualification of researchers and professionals, from an intergenerational and interdisciplinary perspective. In conclusion, the paper argues that Innovation Studies can contribute to the empowerment of societies, enabling them to connect learning processes, knowledge and skills in a permanent educational ecosystem.

VALUING NON-LINEAR PROFESSIONAL IDENTITIES IN LIFELONG LEARNING SYSTEMS: SKILLS RECOGNITION, CONTINUING TRAINING, AND DUAL LEARNING UNDER ITALIAN DECREE NO. 115/2024

Bastianelli Michela (INAPP, Italy)

Identity | Non formal learning | policy makers cooperation

In line with the European Recommendation on the validation of non-formal and informal learning (2012) and the latest Cedefop Guidelines (2023), Italian Decree No. 115/2024 pursues two closely interconnected objectives: strengthening the usability and portability of competences and expanding individuals' learning opportunities. The Decree is embedded within the broader European policy framework on lifelong learning and skills development and reflects the strategic orientations of the European Skills Agenda (2020) and the Osnabrück Declaration (2020). The regulatory framework focuses on three core pillars: the recognition of competences acquired outside formal education and training pathways; continuing vocational training as a driver of updating, employability, and social inclusion; and dual learning systems based on strengthened cooperation between education providers and enterprises. Central to this approach is the validation of competences acquired in formal, non-formal, and informal contexts, understood as a key mechanism for ensuring transparency, transferability, and coherence across individual learning trajectories. Drawing on a holistic and integrated perspective, the Decree promotes new forms of institutional cooperation between regional vocational education and training systems and economic and social partners, with a particular emphasis on the role of Interprofessional Funds for Continuing Training and Bilateral Funds for Training and Income Support. It also introduces complementary services for competence recognition aimed at enhancing individuals' existing skills, supporting personalized pathways through skills gap analysis, and improving competence-based programme design in close interaction with enterprises. The Decree was presented at the European level during the Peer Learning Activity "Inclusion of qualifications from outside formal education and training in National Qualifications Frameworks" (Warsaw, April 2025). Contributions from Member States confirmed that, when supported by appropriate policy frameworks, lifelong learning can represent a crucial resource for active and informed citizenship. At the same time, participants highlighted persistent challenges at both national and European levels, including integration with qualification frameworks and quality assurance systems, balancing standardization and personalization, reducing territorial inequalities, strengthening links with active labour market policies, enhancing guidance and coaching services, raising awareness, monitoring outcomes, reducing administrative burdens, integrating micro-credentials, and ensuring data interoperability. The article argues that the effectiveness of the Italian validation system ultimately depends on its capacity to operate as part of an integrated governance framework and to ensure inclusive access to recognition and learning opportunities. Particular attention must be paid to overcoming

structural and institutional barriers that disproportionately affect vulnerable and disadvantaged groups. In this perspective, Decree No. 115/2024 represents a significant step towards a more inclusive, transparent, and sustainable lifelong learning system, while also highlighting the need for continued policy innovation and multilevel coordination.

ADULT EDUCATION AND LIFELONG LEARNING TOWARDS INCLUSIVE CULTURES: FREEDOM, RESPONSIBILITY, AND GENERATIVE PEDAGOGY

Giorgia Altobelli (INDIRE, Italy)

Adult education | Lifelong learning | Generative pedagogy

In the contemporary context, characterized by biographical transitions, job losses, and growing social inequalities, adult education and lifelong learning assume a strategic role in promoting inclusion, active citizenship, and social justice. Lifelong learning is no longer simply an educational opportunity, but a fundamental educational right, capable of supporting adults in the processes of educational, professional, and existential reorientation throughout their lives (Delors, 1996; European Commission, 2019). This paper offers a theoretical and conceptual reflection on career guidance as a transformative pedagogical practice in adult education contexts, interpreting it as a generative device grounded in the dimensions of freedom, responsibility, and desire (Riva, 2017; Mannese, 2023). Drawing on the paradigm of generative pedagogy and the educational empowerment approach (Freire, 1976; Zimmerman, 2000), the analysis developed here challenges a static and individualistic conception of talent, proposing instead a dynamic, relational, and processual interpretation. Talent is understood as the outcome of journeys of awareness, reflexivity, and planning that develop over time through the interaction between subjectivity, training contexts, and educational opportunities, within a capability-oriented perspective that values individuals' real possibilities for choice and action (Sen, 1999; Nussbaum, 2012). Within this framework, lifelong guidance takes on an emancipatory and inclusive function, capable of accompanying adults through moments of transition and vulnerability, supporting their autonomy, capacity for choice, and the construction of meaningful life projects (Guichard, 2021; Riva, 2020). Particular attention is paid to enhancing individual biographies and non-formal and informal learning experiences, recognized as key resources for building lifelong learning paths geared towards equity and the recognition of differences (Formenti et al., 2017; Mortari, 2003). Adult education is thus interpreted as a generative and democratic space, in which reflexivity, nurturing educational relationships, and the intentional design of learning contexts foster processes of social inclusion and active participation. The proposed reflection highlights how orientational educational practices, grounded in reflective, autobiographical, and dialogic approaches, can contribute to countering exclusion, precariousness, and marginalization, promoting the exercise of responsible and sustainable freedom. In conclusion, the adopted perspective proposes a vision of adult education and lifelong learning as key practices for building a culture of inclusion, capable of valorizing subjectivities, recognizing life paths, and supporting individual and collective transformation within a framework of educational and social justice.

BIOGRAPHICAL FRICTION: PERSONALITY, MIGRATION AND WORK IN ADULT LEARNING TRAJECTORIES

Matteo Borri (INDIRE, Italy)

Adult education | cognitive friction | life course

Adult education is often framed within the policy discourse of upskilling and employability. Yet, when observed through the lens of life-course trajectories, it reveals a more complex dynamic: learning frequently emerges at moments of rupture — job loss, migration, interrupted schooling, downward mobility, or delayed certification. Building on previous research on personality as a cognitive "filter" in adult learning and on the notion of learning as resistance within evening schools and CPIA contexts, this paper advances a further step: cognitive friction is not merely instructional, but biographical. The life-course perspective allows us to reinterpret adult learning as a transitional space where identity, work and migration trajectories intersect. In such contexts, learners do not encounter new knowledge in a neutral cognitive vacuum; they confront it through sedimented beliefs, self-concepts and work-related identities. Personality traits — including openness to experience, conscientiousness, tolerance of ambiguity and perceived self-efficacy — shape how individuals interpret and metabolize educational demands during periods of instability. Cognitive friction thus arises when new epistemic frameworks challenge previously stabilized biographical narratives. This friction becomes particularly visible among migrant learners and adults returning to education after prolonged exclusion. For migrant students, educational participation is entangled with linguistic adaptation, recognition of prior learning and renegotiation of professional status. For adults in work transitions, learning may threaten established self-definitions while simultaneously offering re-legitimation. In both cases, resistance to learning should not be read as deficit but as a signal of biographical realignment in progress. Drawing on empirical reflections from Italian adult education settings (CPIA and evening courses) and integrating personality theory with transformative learning perspectives, the paper proposes the concept of biographical friction. This notion designates the tension generated when institutional learning structures encounter life histories marked by discontinuity. Unlike traditional models that focus on learning styles or purely motivational variables, biographical friction situates cognitive resistance within broader socio-economic and migratory trajectories. The argument has two implications. First, adult education policies centered exclusively on human capital and employability risk overlooking the identity work required in transitional phases of life. Second, personalization in adult learning should move beyond adaptive didactics toward recognition of biographical density — including work histories, migratory experiences and prior educational failures. Within the panel's focus on life courses, youth, migration and work, this contribution suggests that adult education functions less as a linear continuation of schooling and more as a critical hinge in life trajectories. Where friction appears, transformation becomes possible — but only if educational institutions recognize that learning, at certain stages of life, is never purely cognitive: it is existential, social and biographical.

RETHINKING INCLUSION IN AIED (ARTIFICIAL INTELLIGENCE IN EDUCATION): EXPLICABILITY AND LITERACY IN THE ONLIFE ERA

Giulia Lombardo (Istituto nazionale di documentazione innovazione e ricerca educativa (INDIRE), Italy)

Digital inclusion | AIED colonialism | AIED literacy

Abstract: This study is a theoretical reflection on the inclusive use of Artificial Intelligence in Education (AIED). The literature review by Wang et al. (2024) on AIED highlights that most existing papers focus on its applications and characteristics, without providing a comprehensive overview of research topics and methodologies. As pointed out by Wang et al. (2024), there is a lack of in-depth analysis of the fundamental theories commonly used to guide research on AIED. The theoretical nature of this contribution seeks to restore AIED to the socio-political context of its use and to the profound epistemological changes resulting from the hybridization of the real with the digital, the Onlife (Floridi, 2014). This work analyses the theme of inclusion along two lines. The first frames inclusion within competence-based teaching (European Commission, 1995; John 1997; Murphy 1997; Angelucci 2018; Caputo, 2019; Cosgrove & Cachia, 2025), highlighting its implicit assumptions regarding the educational goals underlying the constructivist pedagogical model and the consequent "learnification" of educational discourse (Biesta, 2006; 2010; 2011; 2012; 2022). In a context where measurable learning outcomes take precedence over reflection on the pedagogical principles that guide educational action (Wang et al., 2024), education finds itself completely reduced to learning (Bulger, 2016). The need to clarify educational goals is even more urgent when placed within the broader discourse of the digital age. As Floridi pointed out, in the digital age « the re-ontologization of agency has not yet been accompanied by an adequate re-epistemologization of its interpretation » (Floridi, 2022, p.32). We therefore put forward the hypothesis that the same re-epistemologization is necessary in AIED. The new agency of artificial intelligence (AI) and, consequently, AIED requires a complex and new interpretative effort that takes into consideration educational goals, beyond the mere acquisition of skills for work. This calls for an idea of inclusion accounting for the ethical and epistemological issues at stake, which are still largely not made explicit, in the new learning scenarios. The second line of this study addresses the issue of inclusion from a more political side, starting from European Commission (2018) to continue with Cesaroni's (2024) review of key UNESCO documents, which highlights the prevalence of a techno-solutionist approach that reduces inclusion to integration. The profound epistemological changes resulting from the Onlife (Floridi 2020; 2025) make the link between technology and power (Winner, 2017; Adam, 2019; Knox 2019; Cotterell et al., 2020; Naismith & Juffs, 2021; Nemorin et. al 2022; Bisconti, 2024) a fundamental aspect in relation to the ethical and inclusive use of digital technologies and AI. After recognizing the danger posed by AIED colonialism (Benjamin, 2019; Costanza-Chock, 2020; Earl, 2021; Zembylas, 2021; Holmes & Tuomi, 2022) and the risk that economic interests prevail over educational goals (Holmes et al., 2022), we advocate for the application of the principle of explicability (Floridi, 2022) to AIED and the creation of an adequate literacy for teachers and learners, based on the topics addressed.

ACTIVE AGING IN LOCAL COMMUNITIES AND PARTICIPATION

Edoardo Renzi (University of Perugia, Italy) · **Agnese Rosati** (University of Perugia, Italy) · **Mina De Santis** (University of Perugia, Italy)

Active aging | social cohesion | skills maintenance

Demographic, technological, and social transformations are redefining the conditions for exercising democratic citizenship, posing new challenges for local education and welfare systems. In this scenario, population aging is not only a factor that puts pressure on services, but also a test of communities' ability to promote social cohesion (Cramm, van Dijk, & Nieboer, 2013; Cramm & Nieboer, 2015), active participation, and lifelong skills maintenance. The case of the Umbrian municipality of Corciano fits into this dynamic. Over the last twenty years, the resident population has grown from approximately 15,200 inhabitants in 2001 to approximately 21,400 in 2021; at the same time, the proportion of citizens over 65 has grown from 17.9% to 21.8%. This data indicates a structural trend that requires preventive policies focused on active aging and the enhancement of the experiential capital of older adults. This paper presents a pedagogical analysis of the "Longevo Project", configured as a territorial research-intervention based on the "Community House" model, understood as a proximity device. The aim is to investigate how an integrated approach to lifelong learning, digital inclusion, and civic engagement can facilitate the transition from a predominantly welfare-based system to a participatory approach (Pellegrino & Rodeschini, 2024), capable of recognizing those over 65 as competent and co-responsible actors in local public life. The theoretical framework is rooted in community pedagogy and lifelong learning perspectives, viewing active aging as a multidimensional process (Urtamo, Jyväkorpi, & Strandberg, 2019) that includes continuous learning, maintaining cognitive and relational skills, informed access to technology, and the opportunity to contribute to collective decision-making processes. Methodologically, the project was structured around a neighborhood support desk that listens, provides guidance, and continuously monitors needs, including through a "permanent census" aimed at identifying situations of social isolation or digital exclusion. In this context, the implementation of "CorciALBO" - the municipal register of volunteers - has taken on a strategic role. It serves not only as an administrative registration tool, but also as a means of recognizing and reactivating skills developed throughout working and social life. Through registration and participation in the project, people over 65 were able to transform their experiential capital into a collective resource, contributing to cultural and local support initiatives. This process has helped to maintain skills, strengthened perceived

self-efficacy, and consolidated a sense of belonging to the local community, underscoring the role of social relationships in promoting older adults' well-being (Luppi, Ricci & Bruni, 2025). The analysis of the experience shows how the "Community House" operates as an infrastructure capable of integrating social support, continuing education, and civic engagement, creating conditions conducive to democratic co-responsibility. The establishment of stable networks between local government, the third sector, and citizens emerges as a decisive element for the sustainability of the intervention. The case study suggests that proximity-based models rooted in lifelong learning and active participation can help transform longevity into a lever for social cohesion and democratic renewal at the local level.

FAMILY CENTERS AND ACTIVE AGEING: ACTION RESEARCH BETWEEN GOOD PRACTICES AND LOCAL CAPACITY BUILDING

Donatella Bramanti (Università Cattolica del Sacro Cuore, Italy) · **Sara Nanetti** (Università Cattolica del Sacro Cuore, Italy) · **Nicoletta Pavesi** (Università Cattolica del Sacro Cuore, Italy)

active ageing | lifelong learning | Family Centres

This paper examines the professional development work carried out with the Family Centres (Centri per le Famiglie) of Sardinia, treating active ageing as a field for piloting place-based practices of adult education and lifelong learning. From an ecological and community-oriented perspective, Family Centres are construed not only as parenting-support services, but also as proximity-based social systems with the potential to activate intergenerational mechanisms, prevent loneliness, and tackle inequalities (including digital inequalities), in line with a conception of lifelong learning distributed across the life course. The theoretical framework integrates: (a) the lifelong learning tradition as a paradigm of citizenship, capability enhancement, and participation; (b) active ageing studies, interpreted here not in a narrowly productivist sense but as a multidimensional construct (health, participation, security, social relations, and agency); (c) scholarship on the digital divide and digital inclusion in later life, with attention to access, competence, meaningful use, and social mediation; and (d) the educational approach of problem-posing education, which makes it possible to valorise practitioners' existing competences while integrating them with trainers' academic knowledge, with trainers acting as facilitators in fostering critical consciousness regarding problems and potential solutions. The action research adopted a sequential multi-method design (documentary–comparative and translational) and comprised two phases. In Phase 1, a comparative analysis was conducted of good-practice cases collected within the PNRR Age-It project by the LEAA cross-cutting Board, using a standardised template that combines structured variables (target groups, settings, scale, recruitment, methodologies, timelines, co-design, monitoring, evaluation) with reflexive notes, with the aim of constructing an inter-case matrix. In the subsequent phase, findings were translated into a training pathway for practitioners working in Sardinia's Family Centres, structured around thematic sessions, supported project work, and follow-up activities, in accordance with a logic of capacity building, contextual adaptation, and territorial transferability. The guiding research question is as follows: how, and under what conditions, can a comparative analysis of good practices in active ageing be translated into a transferable training dispositif for proximity-based local services, capable of supporting integrated planning, inclusion, and participation? Accordingly, the paper pursues a twofold objective: (1) to identify recurring patterns and conditions for adaptability/replicability across the practices analysed; and (2) to formalise an analytical–operational model for practitioner training oriented towards place-based co-design and collaborative governance. The paper is situated within the framework of Italy's recent reform of policies for older persons (Law 33/2023; Legislative Decree 29/2024), which explicitly foregrounds dignity, autonomy, social inclusion, active ageing, and the prevention of frailty, while strengthening the integration

of social, health, and socio-health interventions, including through territorial and community-based approaches. In particular, the Decree introduces provisions that are salient for this study (CIPA and the National Plan, frailty prevention, digital facilitation, transversal digital competences, community services, and service integration). In the Sardinian context, the recent establishment of the Regional Working Group on Active Ageing and the involvement of institutional actors, socio-health districts, and PLUS territorial areas further underscore the relevance of a training dispositif oriented towards collaborative governance and the networking of practices.

TERRITORIAL NETWORKS FOR LIFELONG LEARNING: ORGANIZATIONAL DYNAMICS AND GOVERNANCE CHALLENGES IN THE CAMPANIA REGION

Lifelong Learning | Territorial Service Networks | Social Network Analysis

The concept of lifelong learning is recognized at various levels as one of the key strategic levers for economic, social, and cultural development. For it to transform from an abstract construct into a real right, it must be supported by political will, organizational structures, and adequate operational tools. In this framework, territorial service networks represent the organizational form through which public administration is called upon to ensure equal opportunities for access to learning at every stage of life. This study examines the organizational and relational dynamics of territorial service networks through the analysis of the relationships of a Provincial Centre for Adult Education (CPIA) and the Regional Network for Lifelong Learning (ReTAP) in Campania, investigating their capacity to promote lifelong learning and social inclusion through external connections. Grounded in an interpretive and constructivist approach, the work adopts a meso-level perspective to analyze the shift from hierarchical "government" models toward networked forms of "governance" (Mayntz, 1999), characterized by multilevel coordination among public institutions, schools, labor market actors, and civil society organizations. Through network systems theory (Castells, 2000; Barabási, 2004) and studies on organizational cooperation between public bodies (Hjern & Porter, 1988), the research applies Social Network Analysis to identify the structure, density, and relational dynamics of the network, assessing the strength and significance of ties between institutional nodes. Data were collected through semi-structured interviews guided by a questionnaire and analyzed using mixed methods, including Unfolding and Classification and Clustering of Preference Rankings techniques (Borg, Groenen & Mair, 2018). The findings highlight both the potential and the critical limitations of networked governance in implementing lifelong learning policies at the regional and local level. The results contribute to the broader reflection on how public

administration can build effective welfare networks capable of ensuring equal opportunities for access to learning throughout life, with particular attention to the most vulnerable adult populations and the strengthening of a culture of social inclusion.

MEDIA AND DIGITAL LITERACY NEEDS AMONG ITALIAN SENIORS. THE KEY ROLE OF ALGORITHMIC LITERACY LEVEL IN THE NEWS MEDIA DIET DIVERSIFICATION

Francesco Marrazzo (Autorità per le Garanzie nelle Comunicazioni, Italy)

media and digital literacy | algorithmic literacy | high-choice news media environment

Media literacy is increasingly recognized as a key element in European Union (EU) media regulation policies (Lacourt 2024; ERGA 2024) as well in the promotion of digital citizenship (CoE 2019) and in the protection of information integrity (OECD 2024). While UNESCO has launched relevant initiatives in media and information literacy field since the previous decade (UNESCO 2013), in the last few years the EU Audiovisual Media Service Directive has invited for the first time Member States to promote the development of media literacy skills and to report to the European Commission on the implementation of such measures (ERGA 2023), and the European Media Freedom Act has finally given a definition of media literacy in an EU legislative measure. Following this recent attention to media literacy, different studies and initiatives have sought to provide guidelines in this field, with a particular emphasis on younger and older populations as target groups (Melstveit Roseme et al. 2024; EDMO 2024). In this context, AGCOM, the Italian convergent communications regulatory authority (AGCOM 2025a), entrusted with monitoring tasks concerning the media and digital literacy skills promotion at national level (AGCOM 2025b), has launched a research activity aimed at identifying the main media and digital literacy needs in the Italian population. This research activity has been implemented through a survey addressed to a sample of 7.053 individuals, representative of the population aged 6 and above residing in Italy. The sampling plan has involved the use of the area of residence and gender variables, and a specific emphasis on age, identifying 8 specific groups, including younger (61-13 yo) and older minors (14-17 yo) as wells as seniors (65 yo and above). The main findings of this research activity concern (i) the availability of devices, access to media, access to news media, and ways to regulate minors' media access adopted by parents, (ii) the analysis of the level of concern about and the frequency of exposure to the main activities and content that may constitute risk factors in the legacy and digital media environment, and the ways in which citizens prevent and tackle such phenomena, and (iii) the knowledge of algorithmic recommendation systems and of the use of specific algorithmic curation tools provided by online platforms in the Italian population (AGCOM 2025c). The goal of this proposal is presenting the main results of this research activity, with particular reference to the seniors, highlighting the main differences between this category and other age groups, and giving policy recommendations aimed at increasing specific media and digital literacy skills among the seniors themselves. In particular, the high level of concern regarding potentially risky activities and content, with specific regard to disinformation, and the low algorithmic literacy (Frau-Meigs 2024) level among seniors will be further analysed and contextualised, with the aim of highlighting the need for tailored media and digital literacy interventions including specific activities to enable this population segment to navigate the high-choice media environment (van Aelst et al. 2017; Castro et al. 2022) and diversify their news media diet.

NARRATIVE PRACTICES FOR PREVENTING SOCIAL ISOLATION AND FOSTERING COMMUNITY CONNECTIONS: INSIGHT FROM THE GINKGO ERASMUS+ PROJECT

Aurora Ricci (University of Bologna, Italy) · **Elisa Bruni** (University of Bologna, Italy) · **Elena Luppi** (University of Bologna, Italy)

Lifelong Learning | Active Ageing | Social Inclusion

Contemporary European societies are confronted with profound demographic transformations that challenge educational systems to rethink the role of lifelong learning in fostering inclusion and intergenerational cohesion (WHO, 2021). Social isolation among older adults is an increasingly widespread condition, characterised by the progressive weakening of social networks and a reduced sense of community belonging (Cornwell & Waite, 2009), with significant consequences for physical, psychological, and relational well-being (Badcock et al., 2023; Holt-Lunstad et al., 2015). The Covid-19 pandemic further intensified these dynamics, highlighting the centrality of meaningful relationships for individual and collective health (Deluigi & Ricci, 2023). Within this scenario, lifelong learning plays a crucial role in supporting active ageing, recognising informal competences, and fostering intergenerational citizenship (WHO, 2021). This contribution presents the educational design and implementation of Ginkgo – La Fabrique du Lien Social, a European Erasmus+ project aimed at preventing social isolation among older adults through structured non-formal learning pathways. Rather than adopting a standardised curriculum, the pathway was flexibly configured according to the specific characteristics and training needs of different participant groups, including university students, care professionals, caregivers, volunteers, and older adults at risk of isolation. Grounded in biographical learning and reflective methodologies, the training programme combined theoretical inputs with experiential and participatory activities (Knowles, 1978; Kolb, 1984). Particular attention was devoted to narrative practices as educational tools capable of fostering reflexivity, relational competences, and critical awareness of age-related stereotypes (Levy, 2009; Staudinger & Bowen 2010; WHO, 2021). Within this framework, the development of photobooks emerged as a workshop-based learning process integrated into the training structure. The photobooks—combining interviews, images, and narrative reconstruction—functioned both as formative experiences and as outputs of the educational pathway. The contribution adopts a qualitative and pedagogical perspective to analyse how the modular structure and narrative workshops supported: (1) the recognition of informal and experiential knowledge; (2) the development of relational and reflective competences across heterogeneous groups; (3) the strengthening of connections between higher education, care services, and local communities. By examining the adaptive design of the training pathway and the role of narrative artefacts within it, the contribution explores how biographical and participatory

methodologies can contribute to building inclusive lifelong learning cultures in ageing societies. The experience highlights the importance of flexible educational design capable of responding to differentiated needs while maintaining a coherent pedagogical framework oriented toward active ageing and social inclusion (WHO, 2021).

Adult Learning as Democratic Renewal: Empowering Citizenship and Envisioning Alternative Futures

PANEL CONVENORS: Marcella Milana (Unievrsity of Verona, Italy); Margherita Bussi (UCLouvain, Belgium); Roberto Angotti (Inapp, Italy)

PANEL KEYWORDS: adult learning, citizenship, alternative futures

In a moment of profound social, political, and technological transformation, adult education and learning play a central role in sustaining and renewing democratic life. We invite contributions exploring how adult education in any setting can serve as a cornerstone for active citizenship, social inclusion, intergenerational solidarity, and cultural justice. We welcome theoretical, empirical, and policy-oriented papers examining adult education as a space where civic competences, social responsibility, and critical awareness are cultivated across the life course, including from an intergenerational perspective (Angotti & Campisi, 2024). Proposals may address, among others, the tension between instrumental visions of adult education and more transformative approaches that consider adult learning as a driver of individual and collective empowerment (Milana, Rasmussen, & Bussi, 2024). A related tension concerns the distinction between reactive, future-ready skills, which enable adults to adapt to change, and proactive, future-oriented skills, which support the anticipation, collective imagination, and construction of fairer futures by questioning dominant narratives of progress (Facer, 2021). Additional areas of interest include: Policy and institutional arrangements promoting access, flexibility, and inclusion in adult education. Adult and continuing education, community-based learning, and intergenerational projects fostering active, informed, and global citizenship. Studies examining how workplace training and human capital development policies foster the emergence of collective capabilities, inclusion, and participation within organisational environments. By examining adult education as a continuous democratic project, this call aims to show that adult and intergenerational learning are not merely matters of individual retraining or employability, but collective investments in democratic resilience and sustainable futures.

"SEHNSUCHT" (LONGING) AS DEMOCRATIC PRAXIS AND RESOURCE IN CIVIC ADULT EDUCATION

Elisabeth Vanderheiden (Catholic Adult Education of Germany, Germany)

civic adult education | Sehnsucht | democratic praxis

In contexts marked by polycrisis, democratic erosion, social fragmentation, and growing experiences of political powerlessness and public anger, civic adult education faces a fundamental question: how can learning processes reconnect personal experience with public responsibility and participation? This paper proposes the German concept of "Sehnsucht" as a conceptual and pedagogical resource for democratic praxis in civic adult education. While often translated as longing, Sehnsucht denotes a culturally specific notion within German intellectual and literary traditions that combines desire, absence, and future orientation in a reflective and historically layered way. Sehnsucht is understood here as an orientation towards what is missing in the present—justice unrealised, belonging insecure, dignity unrecognised, participation restricted. In this sense, it discloses the normative horizon of democracy. It makes visible the distance between lived experience and democratic commitments and identifies fields for reflection and transformation. Drawing on the pedago-

gical thought of Paulo Freire, Sehnsucht is framed as a generative starting point for conscientização. Freire locates education in lived experience and develops it through critical dialogue about concrete contradictions. Sehnsucht can function as such a generative theme: it articulates experiences of exclusion, injustice, or unrealised possibility. Within dialogical settings, these articulations become shared inquiries into social conditions and collective responsibilities. Freire's concept of amorosidade further grounds this approach. Civic dialogue rests on an ethical commitment to respect, humility, and recognition of the dignity of others. Engaging Sehnsucht pedagogically therefore requires learning environments shaped by reciprocity and care. Dialogue serves the collective naming of reality and the development of socially responsible alternatives. Illustrations from contemporary adult education practice show how participatory, narrative, and digitally mediated formats open spaces for these processes. Participants situate their own Sehnsucht within historical and socio-political contexts, connecting personal aspiration with civic responsibility. Recurring themes include recognition, justice, ecological responsibility, and meaningful participation. These patterns indicate that Sehnsucht frequently expresses democratic aspiration and an orientation towards shared futures. Within the framework of Learning for Democracy / Democracy for Learning, this perspective links individual motivation and institutional practice. Sehnsucht can energise civic engagement and support the development of democratic competencies. Its dialogical exploration shapes learning spaces in which democracy is enacted through shared inquiry, reflective disagreement, and responsible participation. By conceptualising Sehnsucht as democratic praxis, the paper contributes to debates on civic education and democratic resilience. It argues that civic adult education benefits from spaces in which unfulfilled aspirations are articulated, critically examined, and connected to public action. In this way, Sehnsucht operates as a forward-looking force within democratic life.

BEYOND EMPLOYABILITY: ADULT EDUCATION AS DEMOCRATIC EMPOWERMENT

Andrea Cegolon (Università di Macerata, Italy)

Adult Education and Training | Soft Skills | Human Flourishing

Background and Rationale Contemporary adult education and training (AET) is characterized by a fundamental tension between instrumental visions reducing lifelong learning to employability, upskilling and labor market adaptation; and transformative approaches positioning it as a space for democratic empowerment and collective capability building (Milana et al., 2024). This tension has intensified with automation and digitalization, where dominant discourses emphasize "reactive, future-ready skills" – adapting to technological change (WEF, 2025; OECD, 2025a) – while marginalizing "proactive, future-oriented skills" – the capacity to imagine collectively and construct more just futures (Facer, 2021; Barcinas & Fleener, 2023). Drawing on the capabilities approach (Sen, 1999; Nussbaum, 2011), the transformative learning theory (Mezirow, 2000; Illeris, 2014), and adult education as empowerment (Boyadjieva & Ilieva-Trichkova, 2021), I examine whether AET in Italy develops soft skills as distinctly human capabilities essential for democratic citizenship, or merely as market-demanded competencies. Research Questions 1) To what extent does AET develop soft skills, and what factors predict this development? 2) Does AET operate differently for different social groups, particularly those inside versus outside labor market logic? Methods and Data Analyzing INDACO-Adulti 2022 survey data of INAPP (N=40,477 adults aged 18-64), I construct a soft skills index, synthesizing six competencies: problem-solving, discipline, communication, collaboration, teamwork, and leadership. Using linear regression models, I estimate the association between the participation in different AET programmes and soft skills development, controlling for sociodemographic variables and perceived training importance. Then, I disaggregate analyses by employment status to examine whether AET operates differently among different social groups. Key Findings Three findings address the panel's democratic

renewal concern. First, perceived importance of training – intrinsic motivation – is the strongest predictor of soft skills development, three times stronger than any training type. This aligns with self-determination theory (Ryan & Deci, 2017), suggesting AET works best when perceived as intrinsically valuable – empowerment rather than instrumentalization (Boyadjieva & Ilieva-Trichkova, 2023). Second, the impact of AET on soft skills development grows systematically as we move away from labor market logic. For employed individuals, the effect is small (β=0.084; p<.001); it doubles for unemployed (β=0.165, p<.001), quadruples for retirees (β=0.304; p<.001), and reaches its maximum for persons unable to work (β=0.580, p<.05) - nearly seven times the effect on employed individual. Third, this gradient empirically challenges human capital discourse (Becker, 1964) and empirically demonstrates transformative education theory (Mezirow, 2000): when liberated from instrumental pressure, education develops those future-oriented capabilities essential for democratic citizenship. Theoretical and Policy Implications Theoretically, these findings operationalize the reactive versus proactive learning distinction and align with the recent OECD (2025b) Framework on "Education for Human Flourishing", which advocates for a shift from instrumental human capital development to the cultivation of 'transformative competencies', essential drivers for both individual flourishing and democratic participation. From a policy perspective, the results support viewing adult education not merely as individual retraining or employability investment, but as a collective investment in democratic resilience – a universal right across the life course to be evaluated by its impact on democratic participation (Hoggan-Kloubert & Hoggan, 2025)

THE EVOLUTION OF THE CONCEPT OF LIFELONG LEARNING IN THE CONTEXT OF THE TRANSFORMATION OF CAPITALIST SOCIETY SINCE WORLD WAR II

Maren Elfert (King's College London, United Kingdom)

Lifelong learning | skills | international organisations

Drawing on an analysis of policy reports produced by international organisations, in particular UNESCO and the OECD, this contribution will trace the evolution of the concept of lifelong learning in the context of the transformation of capitalist society. Lifelong education emerged as an idea in the context of the post-World War II struggles for greater democratisation and equality of the education system and of society as a whole and debates about the balance between economic growth and the welfare state. However, lifelong education represented too many challenges to established institutions to gain traction as a policy idea. Under the influence of neoliberal policies, lifelong learning has been largely reduced in scope

and co-opted by the neoliberal agenda of efficiency and employability (Elfert, 2018). In the contemporary late capitalist moment, characterised by the commodification of all aspects of life, the broken contract between the state and the citizens, and the exhaustion of the promises of globalisation and neoliberalism (Brown, Lauder, & Ashton, 2010; Beckert, 2020), the meaning of lifelong learning has shifted towards the necessity to acquire "resilience" to keep up with the pace of (working) life characterized by ever greater precarity and uncertainty and technological requirements in an ever-changing and crisis-ridden world (Evans & Reid, 2016; Jameson, 1991). While the discourse of lifelong learning is still ubiquitous (e.g. Schleicher, 2025), the prevailing focus on "skills" and digitisation diminishes the emancipatory and humanistic dimensions of lifelong learning and promotes a fragmented understanding of the human person. By concentrating on measurable performance while marginalising the broader concept of lifelong learning, educational discourse appears to be shifting away from democratic principles.

ENHANCING ORGANIZATION WELL-BEING THROUGH INTERGENERATIONAL LEARNING: INSIGHTS FROM THE AGEMIL PROJECT

Francesca Campisi (INAPP, Italy) · **Michael Schepisi** (LATTANZIO KIBS S.p.A. Benefit Corporation) · **Roberto Angotti** (INAPP, Italy) · **Giada Grasso** (LATTANZIO KIBS S.p.A. Benefit Corporation) · **Anna Teselli** (LATTANZIO KIBS S.p.A. Benefit Corporation)

Intergenerational Learning | Age management | Organizational well-being

The aging population – at least in the Italian and Western context – and the digital transition are structurally reshaping the labor market and society as a whole. Intergenerational Learning (IGL) – as a mode of knowledge transfer and exchange between generations[1] – plays a strategic role in the broader framework of age management and lifelong learning by supporting organizational adaptation and promoting more inclusive participation across different generations of workers. This contribution highlights key findings from the AGEMIL (Age Management Intergenerational Learning; INAPP, 2025) study on the role of IGL practices in organizational contexts within both private enterprises and public administration. The study comprised a desk phase involving a review of national and international scientific literature, the reconstruction of relevant Italian and European public policies, and the analysis of the quantitative surveys "INDACO Enterprises" and "INDACO Public Administration". The subsequent field phase included interviews with key informants, focus groups (involving senior, junior, and mixed employees, managers, and representatives from Interprofessional Funds and training institutions), as well as case studies of best practices within private companies and public administrations. The findings indicate that IGL significantly contributes to organizational well-being, particularly when the process adopts a structured approach to knowledge transfer between senior and junior employees (top-down) and vice versa (bottom-up). This exchange fosters a shared language across generations and helps overcome age-related prejudices, reducing conflict. The impacts on organizational well-being are multifaceted, spanning various levels: at the organizational level, knowledge transfer helps retain internal know-how and disseminate corporate values, improving employee retention and the organization's ability to attract new talent; at the individual level, it boosts the motivation of senior workers, who, feeling recognized and valued, can find new purpose as they approach retirement; finally, from a broader social perspective, intergenerational cooperation strengthens social cohesion and enhances resilience to ongoing societal changes. A particularly important issue is the measurement and evaluation of the effects of IGL practices, which remains underexplored and inconsistently addressed both in academic research and organizational settings. This is partly due to an emerging evaluative culture in this field and partly to a limited awareness by organizations of the value and effectiveness of IGL practices, often implemented informally and without structure. Therefore, a paradigm shift is needed, where IGL is no longer seen as a supplementary or spontaneous practice but as part of a broader, structured strategy for age and human resource management, to effectively tackle the ongoing changes in both the labor market and society. To this end,

a synergistic and multidisciplinary approach involving all stakeholders (institutions, the educational and academic system, and businesses) is essential to address the needs of a constantly evolving labor market while valuing the contributions of all generations.

ADULT LEARNING, ARTIFICIAL INTELLIGENCE AND WORKPLACE TRANSFORMATION: TOWARDS A DEMOCRATIC DIGITAL TRANSITION

Giovanna Di Castro (INAPP (The National Institute for Public Policy Analysis), Italy) · **Simona Carolla** (INAPP (The National Institute for Public Policy Analysis), Italy)

Adult learning | Artificial intelligence | Lifelong learning

The rapid diffusion of artificial intelligence (AI) is profoundly reshaping the relationship between work, learning, and social participation. This transformation generates new opportunities for empowerment, innovation, and organizational improvement, while simultaneously producing risks of skill polarisation and widening inequalities. In this context, understanding how adults use AI and how firms adopt it - within rapidly evolving technological ecosystems- becomes essential for reflecting on the role of lifelong learning as a lever for individual and collective agency, social inclusion, and democratic renewal (Di Rienzo, 2024). This study offers an integrated reading of the AI modules included in the INAPP (The National Institute for Public Policy Analysis) INDACO-Enterprises 2025 and INDACO-Adults 2025 surveys, which provide some of the first systematic evidence on the topic in the Italian context. The analysis explores whether, and under which conditions, the digital transition can strengthen both individual and collective agency, or whether it may instead reinforce asymmetries in decision-making processes and in access to learning opportunities. On the individual side, the analysis explores AI-related practices in personal and professional domains, the motivations behind adoption, participation in dedicated training activities, and the representations individuals construct around these technologies. Findings highlight diverse postures: alongside those who perceive AI as a tool for improving efficiency, supporting learning, and expanding autonomy, there are more cautious or critical attitudes, often related to concerns about employment consequences or the potential loss of control in decision-making processes. From the organisational perspective, the focus is placed on the ways AI is introduced into production and organizational processes, the drivers of its adoption, and the role played by training. The adoption of AI, particularly generative AI, often remains at a preliminary stage. More substantial transformative effects emerge primarily where complementary investments in digital infrastructures, data quality, and structured training programmes are in place, confirming evidence in the international literature (Lee et al., 2022; Solaimani et al., 2024). In this regard, training is not only a technical adaptation tool but a strategic arena in which access, understanding, and governance of technological changes are negotiated (Khanfar et al., 2025). Although the two INDACO surveys are methodologically autonomous, their integration makes it possible to observe potential misalignments between individual learning trajectories and organisational strategies, raising questions about the role of workplaces as adult learning environments. Grounded in the broader debate on lifelong learning as democratic infrastructure, the analysis suggests that the quality of the digital transition depends on the capacity to develop not only technical skills but also critical and ethical competences, ensuring inclusive access to learning opportunities. From this perspective, AI is not merely a productive technology but a terrain in which power relations, responsibilities, and participation opportunities are reconfigured. Analysing its intersection with adult learning thus means questioning the conditions for a more equitable, participatory, and democratically sustainable technological transition.

POLICY FEEDBACK EFFECTS ON MASS POLITICS IN ADULT EDUCATION: THEORETICAL CONTRIBUTION AND RESEARCH DESIGNS

Margherita Bussi (UCLouvain, Belgium)

adult learners | policy feedback | democracy

Do adult learners support adult education programmes? Does policy design matter for triggering learners' support, opposition or indifference towards educational programme? What are the effects of policy design and implementation of adult education programmes on adult learners' democratic and civic behaviour? Drawing on historical institutionalism, the policy feedback effects on mass politics can help answering these questions by unveiling how policy design distributes resources and sends interpretative messages to beneficiaries (Bruch et al 2010) and, in turn, how these shape or unmake beneficiaries' demand for that specific policy (Pierson, 1993; Bussi et al, 2022). Moreover, policy feedback scholars have also investigated the effect of policy design on beneficiaries' democratic and civic behaviour, such as volunteering (Mettler, 2002). Right and far-right parties are in power in several European countries and their conception of social policies (Fenger, 2018), including adult education (Grotlüschen et al 2025), might have long lasting effects on how policies are designed and their effect on democratic aspects ranging from adult learners' opinion towards policies to individual civic engagement (Larsen, 2019). For this reason, this approach is promising because it delves into the policy-politics dynamics and their democratic implications. Moreover, while policy feedback effects on mass politics dealing with social and educational policies has received attention (Garritzmann & Wehl, 2025; Mettler 2005), there are hardly any studies focusing on adult learners. While this can be due to the fragmented nature across policy areas (Kalenda and Desjardins, 2025), it is argued in this contribution that is possible to develop a new research agenda developing adopting the policy feedback effect on mass politics as theoretical stance. The paper starts by contextualising policy feedback effects and its mass politics aspect. It secondly delves into the recent literature dealing with social and educational policies. The third part presents how the main concepts linked to the policy feedback effects on mass politics could apply to adult education policy and their beneficiaries as well as how it articulates with existing adult education policy research. The fourth part uses the case of training policies for the unemployed as an example. A final part concludes on the limits and benefits of this approach.

MUTUAL AID GROUPS AND AUTOBIOGRAPHICAL PRACTICES FOR THE WELL-BEING OF EDUCATORS

Federica Montalto (Università degli Studi di Padova, Italy)

Well-being | mutual aid groups | autobiographical practices

Current studies highlight the importance of well-being in the helping professions, because the quality of the intervention seems to be closely linked to the well-being of professionals. United Nations Agenda 2030 emphasises the importance and the connection between the well-being and sustainable development. The third SDG, which concerns health and well-

being, and the fourth SDG, which focuses on quality education and lifelong learning, can be considered the most salient priorities. According to WHO (1948), health is a state of complete physical, mental and social well-being and is not merely the absence of disease. When this concept is applied to professional contexts, particularly to helping professions, it implies that working conditions directly affect health. The literature describes burnout as a complex syndrome, with manifestations of emotional exhaustion, that is the feeling of being drained, depersonalisation, that is emotional detachment and negativity towards users, reduced personal fulfilment and a sense of perceived ineffectiveness. Burnout is often conceived as an individual phenomenon, but it should be considered in a systemic way (Maslach e Leiter, 2023). In this sense, preventive care becomes crucial. According to Tronto (1993), care involves considering individuals as interdependent. Tronto's idea of "democracy of care" is significant in highlighting care as a practice (2013) and the centrality of individual needs. In this framework of interdependence, it is useful to refer to the well-being of both users and educators, considering the virtuous circle that can be generated through solidarity and mutual recognition of the other. Promoting the well-being of educators is crucial: there is a wealth of scientific literature on burnout among teachers, while scientific literature on educators is considerably more limited. This study aims to investigate and promote the well-being of educators from a preventive perspective with regard to burnout and to show how good practices can promote it. In particular, it starts from a pedagogical perspective through which narration is considered a constructor of reality and re-signification (Demetrio, 2003; Vygotskij, 1978). The paper develops an initial top-down complemented by a bottom-up approach, assuming the participatory action research perspective. The study aims to show whether autobiographical practices and self-help groups can be useful tools to promote the well-being of educators. Autobiographical workshops would be meaningful in stimulating reinterpretation on a professional and identity level; reformulating helps to retell oneself, and this transformation helps to attribute a different view of past events, while self-help workshops can increase the sense of belonging by preventing isolation. In groups, the dynamics of solidarity and listening promote empowerment and a virtuous circle of awareness. These are horizontal groups where the facilitator is on the same level as the other participants in terms of dialogue (Steinberg, 2002). Both approaches have a transformative matrix oriented towards subjective and intersubjective well-being and can be outlined as adult learning practices to support empowerment and critical reflection in a vision of active citizenship.

Adolescents | Community empowerment | Adult learning

In a complex, fragmented society, rapid cultural transformation and the pluralisation of educational contexts require approaches that can connect different perspectives, methodologies and resources. It is crucial to encourage reflection on the role of adults in relation to the younger generation, and to develop collective skills and transformative approaches

through inclusion and participation. This paper presents an initiative from the Adolescence Working Group (AWG) of the Municipality of Varese. This group comprises institutional representatives, social workers, healthcare professionals, teachers, representatives of voluntary associations and secondary school students. The group aims to redesign programmes for adolescents and their families (Ferri & Bonometti, 2025). The AWG was initially intended as a territorial coordination mechanism to engage and activate various local stakeholders, encouraging reflection on current community development issues related to youth well-being in the Varese area. This would be achieved through shared awareness and collaborative design with shared goals. Subsequently, the AWG recognised the need to create an authentic adult education programme on adolescent issues to help adults adapt to changes. This approach was developed through participatory action research, drawing on Engeström's Cultural-Historical Activity Theory (Engeström, 1987; Engeström et al., 1999; Engeström & Sannino, 2017) and the Change Laboratory methodology (Virkkunen & Newnham, 2020; Botha, 2017). These theoretical and methodological references enabled us to interpret social intervention practices as activity systems situated in history and characterised by contradictions and generative tensions that facilitate expansive learning. Tools such as historical analysis, the activity system model, and the zone of proximal development concept have enabled us to identify organisational fragmentation, overlaps, discontinuities, and criticalities. This has favoured the shared construction of new operational hypotheses (Virkkunen & Newnham, 2020). This process enabled the AWG to evolve into a Community of Practice (Wenger, 1999), providing a reflective, transformative and ongoing educational space. Adults were encouraged to critically examine their role in relation to adolescence, adopting a systemic and relational approach. These moments of interaction fostered the construction of shared knowledge, enabling community members to reflect on their practices and recognise the value of learning from concrete experience. Open discussion has enabled recurring difficulties, which often remain implicit or are addressed individually, to be brought to light through collective reflection and the analysis of different perspectives. Participants were able to strengthen their sense of belonging to the community and promote collaborative learning processes. From this perspective, the AWG can be interpreted as a space for the co-construction of meanings, as well as a laboratory in which adult learning is intertwined with processes of transformation and community empowerment (Sannino, 2022). The experience highlights the Change Laboratory's potential as a training opportunity and a catalyst for paradigmatic change towards collective learning, resulting in the formation of the Community of Practice. This has led to reflection on the social responsibility of adults as a conscious and shared commitment to the community. It has also strengthened intergenerational solidarity based on mutual recognition and the promotion of active and participatory citizenship (Milana et al., 2024).

INCLUSIVE WORKPLACE LEARNING: GENDER- AND AGE-SENSITIVE RETURNS OF TRAINING IN ITALIAN FIRMS

Roberto Angotti (INAPP, Italy) · **Luisa Errichiello** (CNR–ISMed, Italy) · **Greta Falavigna** (CNR–IRCrES, Italy) · **Roberto Ippoliti** (Università del Piemonte Orientale, Italy)

Training diversity | Age inclusion | INDACO-INAPP survey

Workplaces are a central arena of adult learning, yet the training-performance debate (Garavan et al, 2021) still underexplores whether workplace learning systems are inclusive for groups that face barriers inside organisation, i.e., women and older workers (50+) (Okatta, Ajayi & Olawale, 2004). This matters for firms because unequal access can reduce the efficiency of training investments and organisational performance (Alheiji et al., 2016) and for society because learning at work can consolidate norms of fairness, voice, and participation beyond the firm (Rasmussen, Milana & Bussi, 2024). Building on Strategic Human Resource Management (SHRM) evidence that training can improve organisational capabilities and performance (Becker & Huselid, 2006; Jiang et al., 2012), we focus on distributional mechanisms, asking whether "who gets trained" and "how training is designed and evaluated" condition the benefits (Garavan et al., 2021). We connect strategic HRM with the diversity training (DT) scholarship which shows mixed (sometimes adverse) effects and highlights a theory-practice gap and weak evaluation routines (Pendry, Driscoll, & Field, 2007). Reviews also warn against relying on immediate, self-reported "surrogate" outcomes that cannot capture intended systems-level change (e.g., discrimination, retention), motivating longitudinal evidence on organisational outcomes (Devin & Ash, 2022). We conceptualise inclusive workplace learning as a diversity-sensitive training system: observable investments whose design, monitoring, and access patterns can be linked to objective firm outcomes. We test whether workplace training in Italian firms is associated with organisational outcomes and whether narrower participation gaps for women and for workers aged 50+ relate to stronger and more persistent returns. We address five questions: (RQ1) how is training related to HR outcomes (turnover; worker motivation) and to operational/financial outcomes? (RQ2) does quality/evaluation matter beyond intensity? (RQ3) do smaller gender and 50+ gaps coincide with more robust outcomes? (RQ4) do delivery modes and content moderate associations, especially after Covid? (RQ5) do institutionalised arrangements (e.g., interprofessional funds; social partner involvement) correlate with more inclusive training profiles? Empirically, we merge Italian INDACO-INAPP Firms microdata with AIDA balance-sheet accounts to build a pre/post-Covid panel. Training is operationalised through (i) intensity/coverage; (ii) quality and evaluation; (iii) delivery and modality; and (iv) inclusion metrics capturing women's and 50+ workers' relative participation. Outcomes include INDACO-based HR and operational perceptions (e.g., process improvement; innovation capacity) and AIDA indicators (e.g., operational performance; ROE/ROI). We estimate longitudinal models with Post-Covid × Training interactions, explore lags (t → t+1/t+2), and test whether motivation improvements partly transmit training effects to objective outcomes (Ostroff & Bowen, 2000; Aguinis & Kraiger, 2009). We also examine heterogeneity by sector/technology intensity, size, internationalisation, and macro-areas. We hypothesise that narrowing gender and age gaps in training access strengthens collective capability building, reduces turnover, and translates into performance over time. Contributions are twofold: for adult-learning and work research, we offer a replicable measurement strategy distinguishing intensity, quality, delivery, and inclusion using INDACO items; for DT and HR policy, we provide longitudinal field evidence on whether inclusive training systems improve equity for women and older workers without sacrificing performance, and under which organisational and post-shock conditions. We also outline incentives rewarding evaluated inclusion in training systems.

RECONCEPTUALISING THE RELATIONSHIP BETWEEN ADULT LEARNING AND EDUCATION (ALE) AND GLOBAL CITIZENSHIP EDUCATION (GCE)

Marcella Milana (University of Verona, Italy) · **Massimiliano Tarozzi** (University of Bologna, Italy)

global citizenship education | adult learning | adult education

This paper reconceptualises the relationship between Adult Learning and Education (ALE) and Global Citizenship Education (GCE), drawing on a selective reading of the academic literature, research papers and reports issued by supranational institutions, particularly UNESCO, as well as international non-governmental organisations (NGOs). Adopting a conceptual and policy-analytical approach, the paper interrogates how these two educational fields have evolved in parallel yet largely disconnected trajectories. While GCE has gained significant traction in global policy discourse—particularly through UNESCO initiatives and its inclusion in Sustainable Development Goal 4.7— scholarly debates have predominantly focused on its implementation in higher education (Horey et al., 2018) and in formal schooling for children and young people. Studies that connect ALE to GCE are still rare (cf. Larjanko, 2015; Dorio, 2017; Schreiber-Barsch, 2018). We contend that this separation is conceptually and strategically limiting, given the shared commitments of ALE and GCE to democratic participation, social justice, and lifelong transformative learning. This disconnect also reinforces policy silos that obscure ALE's transformative potential in addressing global challenges. First, we discuss how diverse interpretations—from neoliberal, skills-oriented views to critical, social-justice-based perspectives—shape differing expectations of what it means to educate for global citizenship. This analysis underscores the importance of a critical vision that recognises global citizenship as an ethical and political stance oriented toward justice, inclusion, and mutual recognition across diverse contexts (Bourn, 2015; Tarozzi & Torres, 2016). We then demonstrate that ALE and GCE share structural and ethical affinities, including commitments to participatory learning, social justice, and lifelong engagement with global concerns. By bridging conceptual frameworks from both policy and scholarly literature, we elucidate how ALE can be reconceived not merely as a site for GCE content delivery, but as a broader educational paradigm consistent with the aims of global citizenship. Building on this analysis, we advance a conceptual model that frames ALE as inherently constitutive of GCE. The model is organised around four interrelated dimensions: (1) Aims and Scope (What for?), which emphasises the pursuit of social justice, democratic participation, and sustainable futures; (2) Contents and Competences (What?), focusing on critical understanding of global issues, intercultural dialogue, and ethical reflexivity; (3) Processes and Pedagogies (How?), advocating participatory, dialogical, and transformative approaches consistent with critical adult education traditions; and (4) Actors and Learning Environments (Who and where?), recognising the multiplicity of stakeholders and spaces involved in adult learning, including civil society organisations, workplaces, communities, and digital platforms (Milana & Tarozzi, 2021). By articulating this framework, we challenge prevailing hierarchies that prioritise formal schooling in global citizenship agendas and marginalise adult learners. We argue that positioning ALE as a central vehicle for GCE can strengthen policy coherence, enhance curriculum development, and support research that foregrounds adult agency in addressing global challenges such as migration, inequality, and climate change. Ultimately, we call for a paradigmatic shift: rather than viewing GCE as an optional add-on to adult education, ALE should be recognised as a critical and enduring site of global citizenship formation in an interconnected and unequal world.

THE GENERATIVE VALUE OF WORK-BASED LEARNING IN TERTIARY VET: PROMOTING CAPABILITIES, INCLUSION, AND ACTIVE CITIZENSHIP

Valerio Massimo Marcone (Università degli studi di Roma Tre, Italy)

Capability Approach | Tertiary VET | Work-Based Learning

Recent scenarios relating to the transformation of work driven by digital transition have brought to the forefront of international and national debate the issue of the vulnerability of human capital and the need to combat youth unemployment. This is particularly critical in Italy, which suffers from one of the lowest rates of tertiary education attainment in Europe (30%) and a concerningly low employability rate for three-year degrees (27%). The European Commission (2019) has emphasized the need to strengthen technological learning environments to improve the quality and inclusiveness of VET systems. This underscores the urgent need for reskilling and professional development policies aimed at long-term employability. In this context, the paper explores, from a socio-pedagogical perspective, the educational value of work-based learning (Marcone, 2018) within Tertiary VET A significant innovation in the Italian VET system is the "technological-professional" reform (DM 221/2025), which introduces the 4+2 curricular model (linking vocational schools with ITS Academies). The ITS Academy model demonstrates high employability (84% one year post-graduation) and strong alignment between curricula and labor market needs (93%). Moreover, 69% of these programs focus on digital skills via Industry 4.0 technologies (Indire, 2025). The educational value of the ITS Academy lies in the training internship, which serves not merely as a practical application of the curriculum, but as a pedagogical methodology (Potestio, 2020) that enhances learners' agency in making informed career decisions (Poliandri, 2025). From this perspective, work-based learning (WBL) represents a vital lever in European strategies for improving VET quality (European Commission, 2013, 2015), fostering lifelong learning, social justice, and inclusion. According to Milana (2017), vocational training is considered not only as a response to market demands, but as a form of social education for active citizenship. From this perspective, skills represent cognitive potential for building inclusive citizenship rights, where work-based learning serves as a strategic lever to bridge the gap between individual action and the demands of the digital and ecological transitions (Angotti & Fonzo, 2022) Adopting the Capability Approach (Sen, 1999; Nussbaum,2011) as a theoretical framework, this perspective implies a policy transition from supporting mere employability to fostering the development of capabilities (Margiotta,2012). This shift is rooted in the principle that the individual's agentive dimension is the key to developing a critical and conscious approach to life choices, effectively transforming vocational training into a 'training ground' for freedom, enabling students not only to 'be' workers but to 'do' and 'be' what they have reason to value. In conclusion, WBL can represent one of the fundamental pillars of VET system for a qualitatively based approach to the integral development of the person (Alessandrini, 2017) Consequently, this paper emphasizes the necessity to: Bridge the structural and conceptual gap between VET and adult education; Position adult education as a fundamental safeguard against the fragility of human capital; Link adult education to a renewed sense of democratic solidarity and active citizenship; Cultivate WBL environments as generative spaces for human capabilities

Assembled Youths: Complex Biographies and Educational Trajectories For Uncertain Futures

PANEL CONVENORS: Juan de Dios Oyarzún (Pontificia Universidad Católica de Valparaíso, Chile); Aina Tarabini (Universitat Autònoma de Barcelona)

PANEL KEYWORDS: Youth biographies and trajectories, socioeducational injustices, socio-material-spatial analisis

This panel critically explores young students' biographies, learning and educational trajectories from critical approaches that place relationality, socio-materiality and inequality at the center, understanding young people's processes of subjectivation as assembled within networks of relations and power asymmetries influencing their everyday lives and educational pathways. Such relations are produced through the interaction between young students and different dimensions of the social life, such as institutional dynamics (i.e. schools and education policy) and territories (the spatial horizons of young people), and social structures addressed through socioeconomic, cultural, and gender axes of analysis (Threadgold, 2018). This makes youth trajectories deeply embedded in contexts of structural and institutional injustice. Those relational dynamics constitute sociomaterial assemblages (Youdell & Armstrong, 2011) that are as productive as they are restrictive in shaping young people's opportunities and constraints across unequal territorial contexts.Their past, present and future are rooted institutionally, socially and territorially and shaped by different national and international policy landscapes (Farrugia, 2013). The panel seeks to reflect on the ways in which biographies, learning trajectories and educational transitions are relationally and structurally produced, addressing how different forms of affect influence such life courses, but also how the agency, identities and aspirations of young people actively co-constitute these processes within unequal socio-material conditions (Ball et al. 2013). Young people's forms of identity and agency, while socio-materially produced, may take different forms of resistance to neoliberal pathways of precariousness, challenging reproductive patterns and illuminating how injustice is experienced, negotiated and sometimes contested in their educational lives.

RE-FRAMING 'SUCCESSFUL' EDUCATIONAL TRAJECTORIES AND SUBJECTIVITIES – THE ROLE OF STRUCTURAL, DISCURSIVE, AND CONTEXTUAL FACTORS IN SHAPING EDUCATIONAL ACHIEVEMENTS

Jozef Zelinka (University of Münster, Germany) · **Sebastiano Benasso** (University of Genoa, Italy) · **Valeria Pandolfini** (University of Genoa, Italy)

Educational Achievements | Subjective Agency | Success Stories

In the paper, we analyse how subjective agency and various discursive, structural, and contextual factors intertwine in the production of inspirational or 'success stories' of learners. Currently, the dominant policy discourse frames education according to its quantifiable and measurable outcomes (Harris & Clayton, 2019; Ure, 2019). For learners, educational achievements have increasingly been recognised and valued based on their practical application on the labour market (e.g., as credentials, skills, competencies, qualifications etc.). This has valorised and proliferated 'success stories' that highlight trajectories of learners who, despite disadvantaged situations, reach notable educational achievements (Nyström et al., 2018; Bosch et al., 2021; Reynen-Woodward et al., 2025). We argue that the prevailing rhetoric of meritocracy undermines the role of discursive, structural, and contextual factors in shaping the educational trajectories of learners and foregrounds individual motivation and skills as the primary determinants of individual achievements. Against this background, the paper aims to yield new evidence on the interplay of subjective agency and various external factors in the production of 'successful' educational trajectories and subjectivities. The main research question reads as follows: What factors are involved in the production of successful educational trajectories and how does subjective agency intertwine with dominant understandings of educational achievements? The paper is based on research findings of the EU-funded research project Constructing Learning Outcomes in Europe: A multi-level analysis of (under)achievement in the life course (CLEAR) (Agreement No. 101061155) and unfolds in three steps: first, we provide an overview of the conceptual underpinnings and current debates on educational quality and learning outcomes and conceptualise successful educational achievements; second, we analyse the role of discursive, contextual, and structural factors in shaping educational trajectories of young learners in multi-disadvantaged positions, comparing two cases of young learners from Germany and Italy; third, we juxtapose and contrast the findings to unveil how subjective agency and dominant framings of educational achievement collide in producing educational trajectories deemed as successful and desirable future

models. Our methodological design is informed by narrative biographical interviews with young people (18–29 years) from vulnerable positions (N=41) and by a quantitative analysis of educational, socio-economic, and employment indicators (N=51) of the countries and regions studied that provide a comprehensive account of the current developments, patterns, and sub-national trajectories. The qualitative data have been collected in the regions of Hamburg and Halle(Saale) for Germany, and Genova and Marche for Italy between the years 2024 and 2025. The quantitative data are based on Eurostat indicators from 2021. Our findings suggest that subjective agency intertwines with various contextual factors and that successful educational trajectories cannot be decoupled from the experienced socio-economic, cultural, and discursive framings. Our findings also indicate that these factors often render educational systems complicit in reproducing initial social inequalities, hamper on the individual agency, and unequally distribute opportunities. Finally, our analyses advance the study of educational achievements and the concept of agency, which is often viewed as a monolithic subjective capacity rather than a dynamic and fluid exercise of power (Siles et al., 2024).

MAKING FUTURES IN INDUSTRIAL TERRITORIES: YOUTH TRANSITIONS BETWEEN OPPORTUNITY AND SOCIAL REPRODUCTION

Juan de Dios Oyarzún (Pontificia Universidad Católica de Valparaíso, Chile)

Youth | education-work transitions | industrialised territories

This paper examines the early education-to-work transitions of young people living in highly industrialised urban and rururban territories in Chile, focusing on how institutional arrangements, territorial political economies, and socioeconomic precariousness shape the horizons through which future trajectories are imagined and enacted. In the territorial contexts studied characterised by deep levels of industralisation (mining and forestry in the cases of this research) the relationship between schools and companies operates as a key structuring mechanism in the organisation and expectations of youth transitions. Rather than functioning as neutral pathways facilitating mobility, these institutional linkages are embedded within historically produced territorial inequalities and labour market configurations that structure the opportunities available to young people. The analysis conceptualises these dynamics through the notion of territorial assemblages (Tamboukou, 2008b; Youdell & Armstrong, 2011), understood as the contingent yet durable configurations of institutions, economic relations, spatial arrangements, and affective dynamics that organise everyday life in industrialised territories. These assemblages are thus simultaneously productive and restrictive: they generate aspirations, expectations, and narratives of opportunity, while also reproducing structural constraints that shape the limits of social mobility. Empirically, the paper draws on a three-year longitudinal qualitative study that follows the subjectivities and early educational-labour trajectories of 30 young people enrolled in secondary education in two industrialised territories in the country: the Chilean north, the Antofagasta region, characterized by the desert and the historical and wide presence of the copper minning industry; and La Araucanía region in the green south, the territory with the largest Mapuche indigenous population in the country, and the forestry industry. The Chilean State, the Indigenous Peoples and the Forestry industry have held a deep conflict for the ownership of the land. The research traces their experiences from their final year of secondary school through the first two years following graduation, paying particular attention to how aspirations, expectations, and decisions regarding education and work evolve during this critical transitional period. The

findings suggest that young people's expectations for the future are deeply territorialised. Their aspirations and projected trajectories are shaped not only by individual preferences or educational performance but by the specific institutional and economic configurations that organise local opportunity structures. Industrialised territories often sustain powerful discourses of development, productivity, and employment that circulate through schools, families, and local institutions, producing expectations of stable employment and upward mobility. However, these narratives frequently coexist with persistent forms of labour precarity, limited educational mobility, and highly stratified access to post-secondary opportunities. As a result, the early transitions from school to work or further education are characterised by a complex interplay between aspiration and constraint. The analysis therefore points to the importance of understanding youth transitions not simply as individualised processes of choice and decision-making, but as outcomes produced within territorially embedded institutional and economic arrangements. By foregrounding the territorial and political-economic dimensions of youth transitions, this research contributes to broader debates on education, labour, and social reproduction in industrialised regions.

SCHOOL WITHDRAWAL TRAJECTORIES: EXPERIENCES OF ALIENATION AND RESONANCE AMONG YOUTH

Emma Laurin (Stockholm University, Sweden)

Educational trajectories | School absence | Youth

School absence is a growing concern in Europe and beyond (Kreitz-Sandberg & Fredriksson, 2023). Research points to significant and rising levels of absenteeism and its serious consequences for young people's academic, social and mental health outcomes (Heyne et al., 2020) with the risk of absence being especially pronounced among children who lack family support and those with neuropsychiatric and other disabilities (Connolly et al., 2023; SOU 2016:94). School absence research has predominantly been conducted in psychiatry and psychology, often conceptualising school absence in terms of individual factors (Kreitz-Sandberg & Fredriksson, 2023) such as anxiety and neuropsychiatric disability. Few studies examine how broader social forces influence school absence (Kearney, Childs & Burke, 2023) or young people's own experience of school withdrawal (Forsell, 2020). Drawing on Hartmut Rosas sociological theory on our relationship to the world this study explores resonance and alienation in educational and school withdrawal trajectories among young people. While alienation refers to a relation in which subject and the world meet each other with indifference or even hostility, resonance is a responsive, affective and bodily relation in which the subject feels affected by the world. These modes of relating to the world are, according to Rosa, influenced by the social acceleration of modern life that many times undermines resonant relationships (Rosa, 2019). The study builds on interviews with eight young people in Sweden with experience of long-term school withdrawal. Five of the interviews were digital and three were conducted on site. They were carried out in two research projects on long-term school absence, one conducted 2021-2022. The other project started 2024 and will end 2028. Both research projects were approved by the Swedish Ethical Review Authority. In the study school withdrawal is conceptualised as a phased process including pre-withdrawal, withdrawal, continued withdrawal and, for some young people, return to school. The findings highlight a complex interplay between forms of alienation and resonance across these phases, including attempts to foster resonance, experiences of muteness and of resonant relations within school. The results also indicate shifts from one type of resonance to another as well as from resonance in school to resonance in other social contexts such as digital environments. From a resonance perspective, school withdrawal may be interpreted as an attempt to regain control and transition towards contexts where resonance is possible, in an institutional school context experienced as alienating. While such strategies may restore a sense of control and agency, and include elements of resonance, they also risk deepening alienation and reduce exposure to potentially resonant encounters.

INCOMPLETE PUZZLES AND SHALLOW PEDAGOGIES: YOUTH TRANSITIONS IN PERU’S INFORMAL URBAN SETTLEMENTS

Maria Balarin (Grupo de Análisis para el Desarrollo - GRADE, Peru)

pedagogies youth justice

The figure of the incomplete puzzle was used by a secondary school student in the context of a recent study on educational justice (Milligan, L., Balarin, M., et al., 2025). It was the most concrete expression of a feeling of disconcertedness and disorientation, of not knowing how to articulate and understand different ideas, that has consistently appeared in my work with young people living in the vast informal settlements that surround Peru’s urban spaces (Alcázar et al., 2020; Balarin, 2011; Balarin et al., 2017). Whether in relation to social, environmental, citizenship or history issues, these incomplete puzzles emerge in the context of what I have characterised as the shallow pedagogies that predominate in many Peruvian schools, especially those catering to students from disadvantaged backgrounds (Balarin & Rodriguez, 2024). Shallow pedagogies have become widespread over the past three decades, during which Peru has implemented outcomes-based curricula and active teaching methods. This has led towards a marked displacement of knowledge and educational purpose in classrooms (Biesta, 2015). Similar problems have emerged in other countries in the Global South implementing these kinds of curricular and pedagogical reforms (Allais, 2014; Hoadley, 2017; Schweisfurth, 2011). A key characteristic of these shallow pedagogies is the profound disconnection and frequent contradiction between young people’s everyday experiences, marked by precarity and injustice, and the normative ideas that they are presented with in school around citizenship, social inclusion or the role of personal effort in attaining wellbeing. Additionally, schools present young people with mostly surface, scattered and closed knowledge, without inviting them to explore, deepen or make meaningful connections (Balarin & Rodriguez, 2024; González et al., 2017). This not only limits young people’s capacity for critical thinking but also their possibility of understanding complex phenomena and making sense of the world. The presentation will explore the encounter between young people’s experiences of growing up in precarious contexts and school experiences marked by shallow pedagogies. It will discuss how these experiences influence their transitions into adulthood, their understandings of citizenship, their aspirations and capacity to navigate life. The discussion will be based on findings from the JustEd Study (Milligan, L., Balarin, M., et al., 2025), which used qualitative participatory methods to explore secondary school students’ learning and experiences of intercultural, transitional, gender and environmental justice and how these shape their attitudes and dispositions towards sustainable futures. It will also draw on findings from two earlier studies on marginalised citizenship (Balarin, 2011) and precarious youth transitions (Balarin et al., 2017) that provide additional support for the arguments. Shallow pedagogies limit young people’s possibilities for engaging in and generating knowledge, thereby constituting a major form of epistemic injustice at the heart of education (Fricker, 2007, 2015). The presentation will include a discussion of what it might take to establish more epistemically just pedagogies that can provide young people with the resources needed to make sense of their worlds and help them navigate their way towards complex and uncertain futures.

UNEQUAL TRAJECTORIES, UNEQUAL FUTURES: YOUTH ASPIRATIONS AND UPPER SECONDARY TRANSITIONS IN RURAL CATALONIA

Mariona Farré (Autonomous University of Barcelona, Spain)

Upper secondary transitions | aspirations | social inequalities

This paper aims to explore the role of space and social inequalities in shaping youth aspirations in rural Catalonia (Spain) and its consequences for their upper secondary VET choices. Transitions to upper secondary education occur against a political backdrop that emphasises the raising, management and regulation of students' aspirations to ensure realistic choices (Hart, 2012), obscuring the highly conditioned character – by social background and educational context – of such processes (Ball et al, 2000). As Appadurai (2004) points out, the capacity to aspire is unevenly distributed across different social groups. Research highlights that aspirations are mediated by students' habitus, shaping how they perceive opportunities, as well as by dominant conceptions of valued educational pathways within the system (Hart, 2012; Gale & Parker, 2018). Moreover, imagining and pursuing particular futures requires capacities conditioned by students positions and capitals. At the same time, research has emphasized the spatial embeddedness of social and educational inequalities and the importance of place in shaping young people's biographies and identities (Farrugia, 2014). Therefore, making decisions about academic and professional futures often involves choices about (im)mobility (Finn, 2017). In this sense, mobility goes beyond the physical act of moving (Urry, 2008) and relates to individuals' imagined spatial futures (Rönnlund, 2020), which are constructed based on their sense of place belonging and their horizons for action (Hodskinson & Sparkes, 1997). This process is particularly relevant in the Catalan context where VET provision is unequally distributed and centralized, and vocational education is often devalued, considered a 'second-best' option suitable for more vulnerable students. The way in which students imagine their futures and make decisions is therefore strongly influenced by their capacity to exercise spatial reflexivity (Cairns, 2014), in a context where mobility becomes almost mandatory for successful transitions. This paper aims to contribute to the analysis of the intertwining of social and spatial inequalities in shaping educational transitions and, specifically, young people's aspirations. A single case study based on a mixed-methods design with embedded units of analysis was conducted in a rural area of Catalonia, which portrays a particular upper secondary circuit of schooling composed of different types of high schools – in terms of ownership, social composition, supply and location – and student mobility flows. A questionnaire was distributed (N=632) and 45 in-depth interviews with students in the final year of compulsory education were conducted. The analysis explores how students from different social backgrounds, gender and migrant origin construct and navigate their spatial horizons regarding education, work and place to live. First, we identify unequal patterns of upper secondary choice – between tracks and programmes within tracks – in relation to structural variables, students' place of residence and their attachment to it.

Second, we analyse students' imagined futures in terms of the highest level of education they aspire to achieve, the occupations they envision and the characteristics of the place where they would like to live. Overall, this paper sheds light on how social and spatial inequalities structure youth educational trajectories.

TRANSNATIONAL ASSEMBLED YOUTHS: COMPLEX BIOGRAPHIES AND EDUCATIONAL TRAJECTORIES BETWEEN CHINA AND ITALY

Fabiana Marchioro (University of Milano-Bicocca, Italy) · **Chiara Bove** (University of Milano-Bicocca, Italy)

transnational childhood | assembled youths | Chinese-origin youth

This contribution presents the first results from the analysis of data collected within an ongoing ethnographic and biographical study on the school experiences of young adults of Chinese origin who experienced a transnational childhood (Baldassar et al., 2007; Bohr & Tse, 2009; Fresnoza-Flot & Nagasaka, 2015) between China (Gao & Sacchetto, 2024; Lamas-Abraira, 2019, 2023; Liu et al., 2017) and Italy (Ardizzoni & Omodeo, 2022; Costantini, 2023; Paciocco & Baldassar, 2017). The research is situated within educational studies and engages with debates on complex biographies (Ball et al., 2013), mobile childhoods (Fresnoza-Flot & Nagasaka, 2015), the school experiences of Chinese students with migrant backgrounds (Costantini, 2023; Scolaro, 2025; Paciocco, 2018), and youth agency in contexts shaped by transnational mobility (Baldassar et al., 2014; Dreby, 2007; White et al., 2011). The study focuses on the stories of so-called left-behind children, satellite babies (Wang, 2018), and sent-back children (Bohr & Tse, 2009), young adults who spent part of their childhood in China with grandparents or extended family members before reuniting with their parents in Italy. Its aim is to examine how their educational trajectories intertwine with their experiences within the Italian school system. Through semi-structured biographical interviews (Bertaux, 2003; Bichi, 2022; Merrill & West, 2009) with young adults aged 18–31, the study explores how linguistic transitions, school integration processes, peer relationships, and family expectations are experienced and narrated. Particular attention is devoted to identity negotiation processes, dynamics of inclusion and exclusion, and the redefinition of aspirations over time – yesterday, today, and tomorrow – across transnational spaces. Methodologically, the study adopts a student voice perspective that recognises youth agency and their active role in knowledge production (Lundy, 2007). This approach is strengthened through participant-generated visual methods, such as the Self-Portrait (Bagnoli, 2009) and the Language Portrait (Busch, 2018). Interview analysis combines a thematic approach (Braun & Clarke, 2006) with a biographical reading inspired by Bertaux (2003) and an analysis of identity dynamics within narratives following Demazière and Dubar (2000). Preliminary findings are interpreted through the concept of assemblage (Youdell & Armstrong, 2011), in dialogue with the ecological perspective on human development (Bronfenbrenner, 1986) and the life-course approach (Elder, 1977). From this perspective, educational trajectories are not understood as the linear outcome of structural determinants nor as the simple result of individual choices. Rather, they can be interpreted as ecological assemblages in which family dimensions (linked lives), temporal dimensions (the timing of migration), local contexts (schools, peer groups, relationships with teachers), national frameworks (educational policies), and transnational connections (family, friendship and media networks) coexist and co-constitute one another (Ball et al., 2013; Elder, 1977; Fresnoza-Flot & Nagasaka, 2015). Preliminary findings suggest that agency, identity, and

aspirations cannot be treated as decontextualised categories detached from the transnational experiences of “here” and “there”. These ecological assemblages acquire educational value when they become explicit and open to dialogue within a pedagogical perspective. The situated complexity of these life stories calls for further reflection on transnational care and education as a key issue in addressing educational inequalities.

RURAL LIVES, URBAN UNIVERSITIES: ASSEMBLED EDUCATIONAL TRAJECTORIES OF RURAL-ORIGIN YOUTH IN A CHILEAN BORDER CITY

Andrea Alvarado-Urbina (Universidad de Tarapaca, Chile)

rural-urban transition | educational trajectories | socio-material inequalities

This study examines the reflections of rural-origin university students in Arica, Chile's northernmost city, regarding their educational trajectories. Trajectories are understood as the fabric that connects structural, institutional, and individual dimensions (Briscioli, 2016) and as a theoretical–methodological construct that seeks to overcome the sociological dichotomy between social determinism and voluntarism by linking the subjective and objective conditions under which life unfolds (Terigi & Briscioli, 2020). The distinction between theoretical trajectories—linear itineraries prescribed by the school system—and real trajectories—the specific paths followed by each student, which may diverge from the theoretical sequence (Terigi, 2007)—enables analysis of complex processes in educational contexts shaped by forces beyond the school. This qualitative study follows a biographical-narrative approach and is based on life-story interviews with 10 university students (Cornejo et al., 2008). Each participant was interviewed twice, for a total of 20 interviews. The study examines the relationship between the rural–urban school transition and the educational trajectories and self-perceptions of rural-origin university students, foregrounding their own perspectives. Its significance lies in the fact that, in a border region characterized by nationalism as much as by multiculturality, cultural, ethnic, and national identities play a key role in the interplay among territory, institutional contexts, and individual trajectories. Findings show that the rural-urban transition significantly shapes students' educational trajectories, combining academic challenges, logistical burdens, and personal growth opportunities. Since most rural high schools are vocational, rural students feel disadvantaged when enrolling in university, and perceive their urban peers as more familiar with university culture and the professional aspects of their careers. Students also experience a stark contrast between the “homey” environment of rural schools—where

teachers know every student and their family—and the more anonymous urban university setting. Many describe moving from being top students in their rural schools to receiving their first failing grades in higher education as a significant emotional shock, yet they value this learning opportunity. From a socioemotional perspective, students often enter urban institutions with fear of being "different" because of their rural background or migrant status. Many describe themselves as initially "reserved" or "closed off" due to their life experiences and the burden of commuting and participating in agricultural labor. Professors and peers may be unaware of these conditions and inflexible regarding schedules and deadlines. Overall, interviewees understand their rural lives as producing histories and identities distinct from those of urban peers; they see themselves as valuing family effort more highly and as having become more independent and mature through the rural–urban transition, often forming ties with other hardworking, dedicated students. This study thus contributes to the panel by showing how rural-origin university students' educational trajectories intersect with territorial inequalities, institutional expectations, and family work obligations, producing both constraints and resources in their everyday navigation of higher education. By foregrounding their narratives of effort and discipline, the study illuminates how identities and aspirations are co-constituted within unequal socio-material conditions, while also evidencing subtle forms of resistance to dominant, urban-centric models of educational success.

NAVIGATING INEQUALITY: FIRST-GENERATION STUDENTS' CHOICE, ACCESS AND BELONGING IN CHILEAN AND ECUADORIAN UNIVERSITIES

Relmu Antonio Gedda Muñoz (Universitat Autònoma de Barcelona, Spain) · **María Francisca Bustamante Sage** (Universitat Autònoma de Barcelona, Spain)

Higher education policy | social inequalities | working-class students transitions

Over recent decades, higher education has expanded significantly; however, profound inequalities persist for students from socially disadvantaged backgrounds (McCowan, 2016). In this context, university admissions policies have become central to regulating access. Often grounded in principles of merit, competition, and selectivity, admission systems tend to individualise access as a matter of choice and classification (Mijs, 2016; Reay, 2020), thereby obscuring the structural inequalities shaping unequal trajectories and experiences across the field. Within this landscape, transitions to higher education, understood as socially mediated processes, become critical moments in the configuration and reproduction of inequality within stratified systems (Reay, 2018; Tarabini & Ingram, 2018). This article presents a comparative analysis of working-class first-generation students' transitions to higher education in Chile and Ecuador; two countries with massified yet highly stratified higher education systems, but differing in the organisation of admissions mechanisms and institutional provision. In Chile, the admissions system is highly institutionalised and articulated to a mixed provision model, characterised by a strong presence of private institutions and pronounced vertical differentiation. In Ecuador, by contrast, higher education provision is predominantly public, and the admissions system has undergone recent transformations, shifting from a centralised state-led allocation model toward more decentralised schemes regulated by individual universities Drawing on a qualitative study based on in-depth interviews with 45 working-class first-generation students (20 in Ecuador and 25 in Chile), including women and indigenous students, the article examines how national configurations of admissions, institutional hierarchies and support structures interact with students' social positions to shape their educational choices and early university trajectories. The findings identify shared patterns in students' transition experiences. Across both contexts, working-class first-generation students encounter a misalignment between university expectations and their material, symbolic, and relational resources, generating experiences of uncertainty, disorientation, and partial understanding of the 'rules of the game'. In response, students develop pragmatic and often constrained

strategies of choice, adaptation and early integration, which tend to reproduce rather than overcome institutional hierarchies. At the same time, the analysis reveals important internal differentiations, showing how classed transition experiences are reworked through intersections with gender and ethnicity, particularly for indigenous and working-class women students. By foregrounding the transition to higher education as a socially and institutionally mediated process, this contributes to debates on widening participation by showing how admissions regimes and system stratification shape not only access but also students' positioning and sense of belonging.

AFTER UPPER SECONDARY SCHOOL: AN ANALYSIS OF STUDENTS' ASPIRATIONS IN LOMBARDY

Giuliana Parente (Università degli studi di Milano, Italy) · **Rossella Bozzon** (University of Bologna, Italy)

Youth trajectories | inequalities | Post-secondary transitions

This paper explores young people's post-secondary intentions in Lombardy (Italy) as relationally and socio-materially assembled trajectories rather than as isolated individual choices. Drawing on data from the MAYBE – Moving into Adulthood project, the analysis examines how upper secondary students' aspirations, indecision, and orientations towards further education, work, or the combination of both are produced within networks of institutional, familial, and territorial relations that shape their everyday lives and future imaginaries. Moving beyond individualistic accounts of choice, the paper conceptualises post-secondary transitions as processes of subjectivation embedded in unequal socio-material conditions. School tracking, family expectations, economic constraints, and territorial opportunity structures interact to configure differentiated spaces of possibility. Within these spaces, young people negotiate uncertainty, risk, and autonomy, articulating aspirations that are simultaneously shaped by structural inequalities and active forms of agency. The analysis distinguishes three main orientations: continuation into tertiary education, direct entry into the labour market, and indecision. Quantitative evidence shows that these orientations are strongly stratified by school track, family cultural capital, and territorial context. Academic-track students overwhelmingly anticipate university continuation, whereas technical and vocational students display higher levels of indecision and a stronger orientation towards immediate labour market participation. However, rather than interpreting these differences as the outcome of divergent preferences or meritocratic sorting, the paper reads them as the effect of institutionalised inequalities embedded in the Italian education system and in territorially uneven labour markets. Parental expectations emerge as a key relational mechanism within these assemblages. The absence of a clear parental orientation—or the presence of conflicting expectations—significantly increases the likelihood of indecision, suggesting that uncertainty is socially produced rather than individually deficient. Similarly, the intention to combine study and work is not merely a pragmatic choice, but reflects differentiated socio-material positioning. It is more prevalent among students from technical and vocational tracks, among those facing economic constraints, and among those already engaged in regular employment. In this sense, combining study and work can be understood as an adaptive strategy within contexts of precarious futures and limited institutional security. By foregrounding the relational production of aspirations, the paper contributes to debates on youth biographies and socioeducational injustices. Young people's imagined futures are shown to be rooted in institutional pathways, territorial inequalities, and intergenerational transmissions of value and expectation. Yet, these trajectories are not passively reproduced: students actively interpret, negotiate, and sometimes reconfigure the constraints they encounter, co-constituting their educational transitions within unequal socio-material assemblages. Overall, the paper argues that post-secondary intentions should be understood as early crystallisations of broader life-course inequalities, where agency and structure are inseparably intertwined. In doing so, it illuminates how uncertain futures are assembled at the intersection of school systems, family dynamics, territorial conditions, and young people's situated aspirations.

THE TYRANNY OF FLEXIBILITY: COMPULSION TO IDENTITY AND BIOGRAPHICAL PERFORMANCE IN ITALIAN SCHOOLS

Aurora M. Lai (Università di Pisa, Italy)

Singularization | Performative Authenticity | Emerging Inequalities

In a social world that no longer remains stable even within the lifespan of a single individual (Rosa 2015), constructing one's identity has become an existential "challenge-trial" (épreuve) (Martuccelli 2017). Individuals – during the conclusion of formal socialization – enter in "adult" life burdened by heavy biographical expectations. The mandate to be authentic, singular, and unique (Reckwitz 2025) has become a norm operating along a contradictory track: the valorization of what is durable versus the inevitable condition of flexibility (Boltanski & Chiapello 2014). In a context where the risk of "not being seen" is constant, recognition is granted only if one's authenticity becomes performative. In this manner, the biographical project – modulating flexibility and durability – becomes the primary empirical referent of a successful individual. This performative competition (Rosa 2017) has been embraced by the Italian school system, which integrates the value of the "particular" into a system traditionally rooted in the "general". Consequently, bureaucracy itself becomes singularized, altering the mandate of public schooling. This opening manifests in new initiatives of compulsion toward identity and biographical performance, most notably "Il Mio Capolavoro" (My Masterpiece) – a space where students are expected to testify to the "state of the art" of their own singularization. Within a shift from rational-task-based-evaluation to affective-person-based-validation, the student exists only if they are capable of performing a solid identity and projecting themselves into a future. The "tyranny of flexibility" is thus reframed as an occasion for individuation, a challenge that must be successfully overcome. Biographical compulsion initiatives act as existential trials-challenges that mark new forms of inequality. Through a new register of validation, the "capacity to aspire" (Appadurai 2007) is structured around recognizing the self's performativity. As a result, those "poor in singularization" – subjects eclipsed by competition – see their biographical opportunities diminish. While the Schumpeterian entrepreneur emerges as the new model of subjectivation (Sennett 2007), vital forms of equality are being restructured and tolerable inequalities redefined (Rosanvallon 2013). Adopting an approach rooted in analytical dualism, this study drew on the subjective accounts of 140 students from various educational tracks, collected via surveys and semi-structured interviews. By questioning structures through the lens of experience (Martuccelli 2017), a profound contradiction emerges. This tension pits a socialization inspired by modern durability against the imperative to remain flexible in the face of precarity. In this framework, the expectation of the singularized subject is presented as an opportunity, yet it functions as a new form of biographical compulsion. This contribution explores how "singularized privilege" is constructed through an accumulation of experiences that validates the individual as an authentic and unique subject. By reproducing and legitimizing late-modern inequality patterns, this privilege profoundly reshapes the capacity to aspire. Consequently, the future becomes a competitive asset, accessible only through the continuous performance of one's own singularity.

UNCERTAIN TIMES, UNCERTAIN PLACES: EXPLORING POLICIES AND PLACE IN POST 16 TRANSITIONING

Meg Maguire (King's College London, United Kingdom) · **Sharon Gewirtz** (King's College London, United Kingdom) · **Chris Winch** (King's College London, United Kingdom) · **Sait Bayrakdar** (King's College London, United Kingdom) · **Amna Sarwer** (King's College London, United Kingdom) · **Charlotte McPherson** (King's College London, United Kingdom)

Precarity | regional disparity | youth transitions

This paper examines how multiple dimensions of young people's social lives shape their post-16 transitions in two contrasting English settings. It considers the influence of contemporary policies and practices within and beyond schools and colleges, and the material and structural conditions of place, related to recent shifts in labour market policy - factors that interact differently across localities. As Brown and Donnelly (2023:1) argue, advancing a social justice agenda in education requires close attention to the spatial dynamics that produce and reproduce educational inequalities. The paper draws on findings from Young Lives, Young Futures, a mixed-methods longitudinal ESRC-funded study examining how England's vocational, education and training (VET) system can more effectively support the post-16 transitions of young people who do not enter university at 18. The study includes a three-wave nationally representative survey of over 10,000 young people, alongside qualitative interviews with 123 young people (many interviewed three times) and 75 policy-makers and practitioners across four local authorities with contrasting labour markets and education and training provision. This paper follows up on three concerns emerging from our wider project. First, we examine the evolving policy landscape that is reshaping young people's transitions into, through, and between work, education and training (Wyn, et al. 2019). A proliferation of new directives and initiatives—such as the Youth Guarantee and the Jobs Guarantee—is reconfiguring provision and reframing expectations of young people's participation. Second, we explore and contrast the experiences and perceptions of young people in two of our four study regions: Bellden, located in the deindustrialised north of England, and Tapley, a super-diverse, cosmopolitan locale in the south. We analyse how space and place shape these transitions differently across contrasting labour markets, educational opportunities and local policy enactments—the geography of youth transition policy in practice. Finally, we bring these strands together to reflect critically on the limits and challenges of achieving more socially just outcomes for young people navigating post-16 pathways in these uncertain times This abstract is being developed at a time of heightened concern about young people's declining participation in education, training and employment and their uncertain transitions (Berrington, et al. 2017; Diniz and Murphy, 2025). The 2025 White Paper highlights that nearly one million 16- to 24-year-olds are currently not in education, employment or training (NEET), a situation with serious implications for their future life chances, wellbeing and economic prospects. It recognises this as "a national challenge that demands urgent care and coordinated action" (2025: 7). Against this backdrop, our paper interrogates how the emerging policy landscape is attending—or failing to attend—to regional differences that powerfully shape young people's access to opportunities, highlighting the persistent spatial inequalities and uneven geographies of youth opportunity that policy often overlooks.

AFFECTIVE, SPATIAL AND TEMPORAL DIMENSIONS OF INEQUALITY IN YOUTH AND THEIR INTERNALISATION

Maria Keil (Justus-Liebig-University Giessen, Germany)

affects | space | social inequality in youth

Young people today are confronted not only with existential challenges such as the climate crisis and a war in Europe. Income inequality in Western countries is also increasing, and the meritocratic promise of a stable, lifelong career is far from being consistently fulfilled. Research shows that the everyday struggles of young people are also closely linked to their social position (Threadgold, 2018). But how do young people locate themselves in the social world and navigate in stratified social fields, such as the educational or the occupational field? How do they develop a sense of position (Bourdieu, 1987) and how does it shape their experiences in everyday life? Based on an ethnography and interview study with young people (16-29 years) in the city of Berlin, Germany, I show how experiences of social inequality in youth' everyday lives are interlinked with gender, ethnicity, religion and other forms of inequality in forming their sense of position. The justifications young people provide for deviating from educational aspirations during transitions, the ways in which moments of crisis are managed, and how experiences of discrimination and violence are dealt with all demonstrate that everyday life is the key site in which a sense of one's own position within society is formed. By applying an open relational and intersectional lens, I can work out affective, spatial and temporal dimensions of social inequality in young people's everyday lives that form their sense of belonging and of place as classed, racialised and gendered selves. A feeling for society and its power relations becomes especially apparent in affective, but also spatial dimensions. Further, the underlying sense is externalised in practices, symbolic boundaries and meaning making. The findings illustrate how class-based and other social inequalities shape individuals' orientations and actions even before they enter the labour market, and they help to improve our understanding of complex and enduring patterns of social inequality such as ethno-social segregation or the educational success of the middle classes.

Becoming Anticipatory Citizens: Adult Learning for Deep Democracy in Complex, Embodied and Pluriversal Societies

PANEL CONVENORS: Maria Fabiani (Independent researcher and evaluator); Roberta Terzi (Italian Futurists Association – Afi); Mario Cusmai (Italian Center for Lifelong Learning – Ciape); Mattia Cipriani (Ministry of the Interior); Patrizio Pastore (Sapienza University of Rome)

PANEL KEYWORDS: Adult Learning, Deep Democracy, Anticipatory Practices

At a time of democratic erosion, epistemic fragmentation, and growing inequalities, adult education emerges as a vital democratic institution. It is not merely a place where adults are taught about citizenship; it is a space where they can develop the attitudes, skills, and outlooks necessary to engage with democracy as an ongoing, contested, and generative practice. This panel examines how adult learning can sustain deep democracy, a democracy that is embodied, pluriversal, relational, future-oriented, and grounded in social justice. Drawing on traditions from Dewey to Freire and on contemporary approaches, the panel explores how adults can learn to deliberate, negotiate difference, and reclaim autonomy in contexts shaped by emotional triggers, misinformation, and structural inequalities. We invite theoretical, empirical, and practice-based contributions that address: Embodied and anticipatory forms of citizenship, examining how adults confront uncertainty, imagine alternative futures, and develop the agency required for democratic action amid socio-ecological transformations; Democratic learning spaces, from community-based practices to cultural and workplace settings, where adults engage in dialogue, cultivate critical awareness, and confront power dynamics, intergenerational tensions, discrimination, and democratic backsliding; Adult education as a bridge between citizens and democratic institutions, investigating how learning practices can connect with emerging anticipatory governance approaches in public administrations to foster participation, inclusion, and responsibility toward present and future generations. Adopting an interdisciplinary approach, the panel combines perspectives from education, democracy studies, futures studies, anticipatory thinking, civic imagination, and social justice frameworks to shed light on how adult education can evolve into an active practice of democracy.

TOWARDS A MUSEUM OF FUTURES IN ITALY: SEEDS OF FUTURES LITERACY SPROUTING AT THE HUMAN SAFETY NET

Mario Cusmai (CIAPE, Italy)

Future Thinking | Museum of the Futures | Pedagogy of Beauty®

The ability to explore possible futures and make far-sighted choices is an essential competence in today's world, marked by an unprecedented hyper-acceleration. In Italy, however, this competence is still less developed than in other countries. From this perspective, museums carry plural forms of knowledge, rooted in cultural heritages that reflect the essence of humanity and in processes of interpretation and accessibility, and thus in the very meaning of our society in the making. Museum contexts are places of elaboration and hope, able to inspire and nourish imagination and intuition, fostering semantic capital (Floridi 2025) and the shared creation of cultural artefacts oriented towards desirable futures through processes of collective intelligence enacted by citizens. In particular, this contribution explores a possible horizon that goes beyond the network of "museums of the future", attempting to respond to the legitimate question (von Foerster 1987) that follows: why a museum of futures? After an initial premise examining national regulatory references and international documents on the future of new generations, the paper then presents the network of museums of the future and the main global experiences in which museums and hybrid spaces propose significant practices oriented towards Futures Literacy, promoted by UNESCO since 2012, and towards Futures Thinking (Aldford 2025). Finally, after outlining the Pedagogy of Beauty®, an educational approach that promotes learning through beauty understood as a transformative experience capable of awakening human potential and creating authentic connections (Perotti, Cusmai, De Laurentiis 2025), and in order to combine a methodological architecture that enables a virtuous relationship with Futures Literacy, the contribution presents the experience of The Human Safety Net, based in Venice. The workshop proposals planned for 2026, addressed to students, young changemakers, and the broader public, were centred on Futures Literacy as a methodological core, in coherence with the values promoted by the interactive exhibition A World of Potential, through which the importance of being aware of one's potential, and of the right we all have to express and fully develop it, is shared. A play-oriented approach proved to be a significant support for the dissemination and pedagogical rooting of Futures Literacy: rather than treating anticipation as a specialist exercise, it transformed it into an inclusive, creative, and engaging experience. Within this perspective, it becomes possible not only to talk about alternative futures, but also to sense and

imagine them together, opening the way to renewed possibilities for action in the present, including a Museum of Futures that investigates “the futures of society”, where futures act and take shape, and that takes sustainability as a guiding thread, making visible how every choice in the present (energy-related, social, educational, technological) opens up multiple futures, whether conflicting or inclusive.

EDUCATING FOR THE FUTURE: ANTICIPATORY NEEDS ANALYSIS AS A DEMOCRATIC PRACTICE

Roberta Terzi (Fondazione Italiana Studi di Futuro_ETS, Italy)

futures studies | anticipatory | collective imagination

In an age of rapid and unpredictable transformations, the crisis of the present increasingly appears as a crisis of imagination. Ecological, technological, and socio-political dynamics escape linear interpretations and render static categories inadequate for understanding reality. In this scenario, adult learning is no longer merely professional updating, but a space for developing the ability to navigate complexity and contribute to the construction of shared futures. This is where the figure of the “anticipatory citizen” evoked by Poli emerges: someone capable not so much of predicting the future as of cultivating a reflective and responsible stance toward what may come into being. Democracy, too, must transform. A procedural democracy based on representation and formal participation is no longer sufficient; what is needed is a “deep” democracy, as suggested by Dewey and, more recently, by Escobar, one capable of recognizing situated knowledge, embodied relations, and the plurality of forms of life. A deep democracy does not merely manage the present; it nurtures plural and desirable futures, and adult education becomes one of the central mechanisms of this transformation. Traditional models of training needs analysis, however, appear increasingly inadequate. Born in stable contexts, they identify gaps to be filled with already known competencies. In societies marked by uncertainty and interdependence, needs emerge before they become visible and evolve over time. A retrospective analysis risks chasing change rather than orienting it, producing reactive rather than anticipatory citizens. According to futures studies, anticipation is not prediction but a social practice: exploring possible futures, questioning desirable ones, and acting in the present to influence what may happen. Applied to training needs, this implies a paradigm shift: not only asking “what do we need today,” but “what capacities allow us to inhabit and transform complex futures.” Needs are no longer deficits but potentials to be brought forth. This perspective requires dialogic and inclusive processes that involve multiple actors and value marginalized forms of knowledge. The pluriversal societies described by Escobar cannot be understood through technocratic tools: they require listening, collective imagination, and recognition of interdependencies. Anticipatory needs analysis thus becomes an embodied process, attentive to emotions, lived experiences, and ecological and social relationships that shape adult experience. The implications for educational design are profound: adaptive and iterative devices replace rigid and linear pathways, integrating experimentation, reflexivity, and situated learning. Evaluation also changes, focusing not only on acquired competencies but on postures, the ability to read complexity, imagine alternatives, and act collectively. Educating becomes an act of future-making: giving people back the possibility to orient becoming, rather than merely endure it. Adopting an anticipatory perspective in needs analysis is not a theoretical indulgence but an epistemological and political necessity. In complex and pluriversal societies, adult learning contributes to deep democracy only when it embraces the dimension of the possible. Anticipation thus becomes the lens through which to rethink training needs and the role of education in collective life.

MUSEUMS IN VENICE AS ANTICIPATORY LEARNING SPACES FOR AUTISM INCLUSION

Vania Vanzella (Indipendent Researcher in Social Foresight, Italy)

Social Foresight | Inclusive museum | Autism inclusion

In 2022, ICOM revised the definition of 'museum' to recognise its pluriversal role in society, stating that museums are accessible and inclusive. Museums serve as sites of informal learning and social engagement, facilitating inclusive practices and community participation. As confirmed by international scientific literature, museums bridge divides, offer therapeutic benefits, and inspire innovation. In Italy, the prevalence of autism is increasing and estimates indicate that 1 in 77 people have a diagnosis compared to 1 in 89 in Europe. In 2023, the public health authority ULSS 3 Serenissima launched a call for proposals aimed at strengthening the social skills of autistic people. The Gruppo Asperger Veneto association (GAV) was awarded funding for an anticipatory project, originally developed as part of a Master's thesis in Social Foresight, which proposed structured museum visits in Venice as tools for social empowerment. A systemic approach is essential to address complex societal challenges. European policy increasingly promotes cross-sectoral integration linking culture, health, social policy, and education. On 5 February 2026, the Italian Ministers of Culture and Health signed a memorandum of understanding, paving the way for 'art on prescription'. This paper explores how guided museum visits and creative workshops can improve social skills, communication, self-confidence and autonomy of autistic people. It emphasises the importance of providing people with ASD with opportunities to practice their social abilities in a safe environment. It highlights the necessity of a cross-sectoral collaboration in designing suitable measures to help autistic people prepare to lead independent lives, as outlined in their 'Project of Life'. Results confirm that structured museum visits can effectively provide training in social exchange skills for the future. They foster communication, self-confidence, autonomy and social inclusion. They boost personal development and informally educate to broaden interests. Importantly, the project demonstrates how such museum-based interventions can serve as experiential laboratories for anticipatory citizenship, equipping autistic participants with the skills and capacities needed to navigate complex social contexts and participate meaningfully in social life. Exploratory Pathways in a Supportive Territory stands as an evidence-based model of cultural welfare, demonstrating how partnerships between health services and cultural institutions can enhance both individual and collective well-being.

DEMOCRAZY BUZZWORDS OR DEMOCRATIC FUTURES? FINNA AND THE EPISTEMOLOGY OF ANTICIPATORY CITIZENSHIP

Maria Fabiani (Independent researcher and evaluator, Italy)

Anticipatory citizenship | Pluriversal democracy | Adult education

In contemporary policy and educational discourse, democracy is increasingly framed using a growing vocabulary of resilience, participation, inclusion, empowerment and engagement. While this expansion of vocabulary is appealing in principle, it often coincides with democratic fatigue, epistemic fragmentation, the algorithmic mediation of public debate and the widening of socio-ecological inequalities. The result is a paradox: as democratic language intensifies, democratic imagination appears to shrink. To capture this phenomenon, the paper introduces the notion of 'democrazy buzzwords':

rhetorically powerful yet conceptually vague expressions that risk replacing democratic practice with symbolic performance. Drawing on critical scholarship concerning policy buzzwords and governance discourse, this concept serves as an analytical tool with which to examine the discrepancy between the normative vocabulary of democracy and the institutional and cognitive infrastructures necessary for its sustenance. Against this backdrop, the paper presents FINNA (Fabiani & Cipriani, 2025) as a theoretical framework for democratic learning. Rather than presenting FINNA as a pedagogical toolkit, the framework is conceptualised as an epistemological architecture for anticipatory citizenship. The central argument is that, in complex societies, democracy depends not only on institutional arrangements, but also on learning environments that enable citizens to engage with uncertainty, negotiate differences, and take responsibility across temporal horizons. The framework was developed through an integrative synthesis of scholarship in democratic theory, adult learning, and futures studies. FINNA articulates five interdependent epistemic dimensions — futures literacy, institutional reflexivity, narrative imagination, neuro-embodied awareness and action orientation — which connect anticipatory reflection with situated democratic practice. Drawing on Deweyan pragmatism (Dewey, 2018), Freirean critical pedagogy (Freire, 1970), pluriversal political theory (Escobar, 2020), and debates on futures literacy and anticipatory governance (Loudoun & Van Ruyskensvelde, 2025; Miller, 2018; Rosa, 2019; Artelaris & Mavrommatis, 2026 among others), this paper conceptualises democracy as an ongoing, anticipatory practice that is sustained through collective enquiry, rather than as a fixed institutional arrangement. By advancing FINNA as a theoretical framework, the paper connects adult learning theory, democratic epistemology and futures studies. It argues that deep democracy in plural and uncertain societies hinges on cognitive and institutional infrastructures that can accommodate complexity without descending into polarisation, symbolic participation, or technocratic reductionism. From this perspective, adult education is not an auxiliary democratic function, but rather one of the conditions that enable democratic life.

THE MUSEUM AS A MEANING-MAKING DEVICE: ADULT LEARNING AND ANTICIPATORY CITIZENSHIP IN COMPLEX AND GLOBAL SOCIETIES

Patrizio Pastore (Sapienza, Italia) · **Ida Cortoni** (Sapienza, Italia)

cittadinanza anticipatoria | tecnologie digitali | museo del futuro

Contemporary societies are marked by systemic complexity, instability, ecological transitions, technological acceleration and intensified globalisation that reshape economic, cultural and symbolic relations. In this interconnected environment, citizenship cannot be reduced to legal status or informed participation; it must be understood as an ongoing practice of interpretation, responsibility and anticipation. Becoming an anticipatory citizen requires developing critical, future-oriented reflexive capacities that enable individuals to recognise global interdependencies, question dominant narratives and contribute to sustainable democratic futures. Within this framework, adult learning represents a cornerstone of deep democracy. It goes beyond transmitting knowledge to foster conscious and transformative action. Adult education creates spaces for developing systemic awareness and interpretive competencies needed to navigate a globalised world characterised by plural memories, identities and symbolic systems. Rather than adapting passively to change, individuals are encouraged to engage critically with complexity and assume responsibility within it. From this perspective, the museum is not neutral but operates as a cultural and political device. It selects, organises and legitimises narratives, establishes hierarchies of value and determines what deserves remembrance and what may be marginalised. The museum does not simply preserve and display heritage; it symbolically produces it, shaping regimes of visibility and shared horizons of

meaning. In doing so, it contributes to the construction of collective imaginaries and public discourse. In a globalised society, this role becomes particularly significant. Museums bring histories, cultures and heritages from diverse contexts into dialogue, revealing connections that might otherwise remain unseen. They may reinforce identity closures or foster mutual understanding, consolidate singular narratives or open spaces for plural interpretations. Every curatorial decision is an act of cultural politics: to include or exclude, contextualise or naturalise, juxtapose or isolate is to construct a specific discursive framework. Within this symbolic power lies the museum's transformative potential. The embodied dimension of museum experience further reinforces this responsibility. Spatial arrangements, objects and exhibition strategies shape interpretive pathways and influence perception. Museum experience engages not only cognition but also the body, emotions and encounters with otherness. Through this interplay of symbolic and experiential dimensions, museums become environments for cultural exchange, adult learning and civic formation. This perspective envisions a future museum aware of its cultural and democratic responsibilities: relational and dialogic, recognising visitors as co-interpreters; communicative and critically conscious of its semiotic strategies; adaptable to spaces, contents and diverse audiences; interconnected, capable of linking different heritages without reducing them to simplified narratives. Museum design therefore relies on an integrated semiotic and pedagogical approach, conceiving narratives as structures of meaning that generate questions and foster transformation. Within this framework, digital technology plays an instrumental role. It functions as a mediating tool that articulates narrative layers, broadens access and encourages interaction without replacing the cultural project. Innovation lies in using digital media to deepen understanding and sustain participation rather than create spectacle. Conceived in this way, the museum becomes a dynamic cultural device that produces meaning, shapes interpretation and supports democratic engagement, contributing to the formation of citizens capable of navigating the complexities of global society.

LEARNING CITIES, ANTICIPATORY GOVERNANCE AND DEEP DEMOCRACY

Valerio De Nardo (Città metropolitana di Roma Capitale, Italy) · **Elisabetta Venanzi** (Città metropolitana di Roma Capitale, Italy)

Learning cities | anticipatory capacities | metropolitan governance

Exploring the contemporary meaning of a learning city through the case of the metropolitan area of Rome means interpreting it not as a simple metaphor, but as a political-institutional space in which lifelong learning becomes an urban governance factor for societal and territorial transformation. The Metropolitan City of Rome Capital already possesses many of the characteristics identified by UNESCO for learning cities, but the true transformation lies in making learning a guiding principle of public policies and a transversal axis within strategies for innovation, sustainability, and inclusion. From this perspective, lifelong learning is not an additional service but a device capable of generating meaning, direction, and coherence in institutional decision-making. The learning city thus emerges as a democratic knowledge ecosystem, a place where experiences, distributed knowledge, social practices, and civic networks are connected, valued, and brought into dialogue. This network—understood as a "knowledge ecosystem"—integrates schools, universities, libraries, associations, enterprises, and citizens, recognizing the centrality of adults not only as beneficiaries but as protagonists of learning and as holders of educational rights across the life course. The establishment of the "Metropolitan Network of Lifelong Learning" signals a model of cooperative governance that broadens the range of actors and activates stable participatory processes. At the same time, the learning city is a tool for countering inequalities and mending the urban fabric, reducing distances between central and peripheral areas, between generations, and between those who have access to knowledge and those who are excluded from it. Widespread learning acts as a connective tissue that helps individuals and communities to orient themselves within a society perceived as uncertain, providing competencies to face

everyday challenges and to exercise conscious, active citizenship. This approach becomes particularly relevant in the context of digital, ecological, and demographic transitions, which require anticipatory capacities at the territorial level. The learning city operates as a platform for collective preparedness for change: it promotes digital literacy, supports practices of social and environmental resilience, and offers public spaces where new ways of understanding the future can be experimented. The image of young people engaged in civil service, perhaps in a library, supporting disadvantaged individuals in the use of digital services while learning themselves through practice, conveys the tangible nature of the local learning ecosystem as a generative space of reciprocity and shared futures. In this framework, the learning city shows conceptual affinities with deep democracy, understood as the plural and profound involvement of communities in decisions affecting them. The production of distributed knowledge, the centrality of adults as active subjects, and multilayered governance based on networks and participatory processes constitute elements that connect lifelong learning to a form of democracy that is rooted, dialogic, and capable of including the diversity, needs, and visions of citizens.

PARTICIPATORY CONSERVATION AS A DEEP LIVING DEMOCRACY EXPERIENCE: APPLING STRATEGIC FORESIGHT TO THE CONSERVATION OF DISSONANT HERITAGE

Alessia Strozzi (University Politecnica delle Marche, Italy)

DissonantHeritage StrategicForesight Conservation

At a time of democratic erosion and socio-ecological instability, conservation needs to expand beyond formal settings and be reconceptualized as an embodied, relational, and future/anticipatory-oriented democratic practice. This paper proposes cultural heritage conservation as a site of anticipatory citizenship, where conservation expands beyond the preservation of material artefacts, to the negotiation of memory, identity, and collective futures. Drawing on traditions of democratic education inspired by John Dewey and critical pedagogy as articulated by Paulo Freire, and integrating insights from anticipatory systems theory (notably Schwartz, Poli, Inayatullah), the paper argues that participatory conservation processes function as informal and indirect democracy environments. In contexts marked by dissonant heritage, post-disaster reconstruction, and contested narratives, this research aims to show that conservation can become a democratic laboratory where citizens can experience democracy: deliberate across difference, confront power asymmetries, and imagine, together, possible alternative futures. Through a conceptual and practice-based workshop, the study examines how Strategic foresight applied to Conservation processes can cultivate anticipatory competencies: the capacity to navigate uncertainty, integrate risk awareness, assume responsibility toward present and future generations, expand imagination ability and critical thinking: the bases for a strong and multi-support democracy. By framing Conservation as an anticipatory governance interface between communities and public institutions, the paper contributes to debates on how adult can bridge civic participation and democratic decision-making. Rather than treating heritage as a static legacy of the past, this research reimagines conservation as a generative act for the future – an embodied, adult pedagogical process through which plural memories are negotiated and democratic agency is explored. In doing so, it proposes a model of deep democracy grounded in material practice, relational engagement, and shared responsibility in complex and uncertain societies, such as the our own.

Continuing Training for Self-Employed Workers: Lifelong Learning and Inclusive Democracy

PANEL CONVENORS: Carmelo Bruni (Sapienza Università di Roma, Italy); Matteo Finco (Sapienza Università di Roma, Italy); Alessandra Pedone (Inapp, Italy); 2) Barricelli Domenico (1

PANEL KEYWORDS: Lifelong learning, Continuing training, self-employed

The transformation of self-employment requires advanced continuing training frameworks that develop civic competencies, adaptability, and democratic engagement throughout the life course. This panel examines lifelong learning as a strategic means for empowering self-employed workers and strengthening social inclusion, individual agency, and democratic cohesion (Barricelli & Carolla). It critically evaluates innovative pedagogical paradigms that connect adult education with active citizenship, critical reflexivity, and social justice, drawing on education studies, labour economics, and democratic theory. Empirical research shows that training pathways designed for self-employed workers, combining managerial skills, mentoring structures, and reflexive learning methodologies, significantly enhance individuals' capacity to initiate and sustain autonomous enterprises while supporting vocational adaptation in increasingly volatile labour markets (Atarodi et al.). Recent studies indicate that technologies which increase work productivity tend to expand opportunities for highly qualified self-employed professionals, whereas technologies that reduce the need for human labour often generate involuntary individual self-employment among workers with fewer qualifications. This trend underscores the need for targeted initiatives for reskilling and professional renewal (Bachmann et al.). The panel welcomes submissions that include empirical analyses of tailored training programmes for self-employed practitioners such as professional upskilling, digital literacies, and transversal competencies. It also invites theoretical examinations of lifelong learning policy frameworks and qualitative studies on learning practices that connect self-employment with democratic participation. Overall, the panel aims to reconceptualise continuing training as a key arena that links self-employment, inclusive citizenship, and democratic vitality, addressing important gaps in current research that explores the relationship between education and democracy.

CONTINUING TRAINING, SELF-EMPLOYMENT, AND INCLUSIVE DEMOCRACY IN ITALY: ECOSYSTEM INTEGRATION AND POLICY INNOVATION

Alessandra Pedone (INAPP, Italy)

Lifelong learning | Self-employment | Inclusive entrepreneurship

This paper addresses the critical intersection of continuing vocational education, self-employment support systems, and inclusive democratic participation within the Italian context. Drawing on empirical research conducted by INAPP (Institute for the Analysis of Public Policy), the study examines how integrated approaches to lifelong learning and skills development can strengthen democratic inclusion through equitable access to economic participation, specifically via self-employment pathways. Background and Challenge Italy presents a paradoxical situation: whilst entrepreneurial propensity declined from 1.1% (2010) to 0.87% (2023), positioning the country 34th of 46 nations in the Global Entrepreneurship Monitor, 2024 witnessed a recovery with 151,910 new business activations (+5.7%). However, this growth masks persistent inequalities and ecosystem fragmentation. Key barriers to self-employment include administrative complexity (reported by 50.2% of entrepreneurs), restricted credit access (23.8%), and acute skills deficits in digital and managerial competencies. Most critically, opportunity-driven and necessity-driven entrepreneurship diverge sharply: the former, predominantly 35–50 year-old, experienced, opportunity-motivated actors, generate sustainable enterprises; whilst the latter, young people, women, migrants, and unemployed individuals pushed towards self-employment by precarity, face elevated failure risk. Educational Dimensions Educational attainment patterns reveal pronounced disparities. Only 22.6% of self-employed workers hold university degrees, with notably lower rates amongst under-35s (20.3%) and migrants (13.8%). University-educated women represent 25.5%, suggesting potential for increased female entrepreneurship through targeted educational and mentoring pathways. These data underscore the necessity of embedding entrepreneurial competencies (autonomy, problem-solving, creativity, transversal skills, lifelong learning orientation) systematically within secondary and vocational education, and throughout university curricula. Ecosystem Fragmentation and Policy Gaps Current support infrastructure suffers from multi-level institutional fragmentation, weak coordination between universities, trade associations, development agencies, and public bodies, episodic evaluation lacking shared metrics, and significant North-South territorial divides. Emerging good practices, including integrated accompaniment (training + mentoring + digital services), combined measures across finance, training and coaching, and university-led

technology transfer, demonstrate the potential for ecosystemic integration. Policy Framework for Inclusive Democracy The paper proposes a strategic reorientation from emergency sectoral interventions toward comprehensive integration around five pillars: (1) widespread continuing entrepreneurial education across school and VET systems; (2) digital service infrastructure enabling simplified access to support; (3) specialised mentoring and accompaniment targeted at underrepresented groups (young people, women, migrants); (4) a national observatory providing transparent data and shared evaluation metrics; and (5) interinstitutional coordination linking national and regional actors. Democratic Inclusion This integrated approach advances inclusive democracy by: ensuring equitable access to self-employment opportunities across social groups; building resilience in local economies; fostering social capital through intergenerational knowledge transmission; and strengthening territorial capacity to respond to digital and ecological transitions. Self-employment, conceived as qualified, sustainable, and supported economic participation, becomes a vehicle for democratic inclusion, enabling citizens to exercise agency, build social networks, and contribute to collective prosperity. Conclusion The evidence suggests that lifelong learning, embedded in coherent, ecosystemically integrated support systems, is essential for transforming self-employment from a precarious necessity into an inclusive opportunity. This requires sustained institutional coordination, evidence-based policy evaluation, and recognition of continuing training as foundational to both economic resilience and democratic participation.

BRIDGING SKILLS AND JOBS: HOW ITS ACADEMIES ALIGN TERTIARY EDUCATION WITH LOCAL LABOUR DEMAND

Silvia Duranti (IRPET, Italy) · **Natalia Faraoni** (IRPET, Italy)

ITS Academy | dual training | territorial networks

Higher Technological Institutes (ITS Academy) represent the Italian pathway of non-university vocational tertiary education, introducing a dual training model within a traditionally academic-centred system. ITS programmes combine classroom teaching, laboratory-based learning and mandatory work-based training, with a strong involvement of firms in governance, curriculum design and teaching activities. Despite their growing relevance in public debate and policy agendas, the Italian ITS system remains largely underexplored in the sociological and educational literature, particularly with regard to the role played by firms and territorial networks in shaping its functioning. This paper contributes to the literature on vocational tertiary education and dual training systems by analysing the organisational and relational dynamics underpinning ITS Foundations, focusing on the Tuscan ITS network as a case study. Tuscany represents a particularly suitable context for analysis, as its ITS system has expanded significantly over time and currently covers all national technological areas, operating across heterogeneous productive sectors ranging from manufacturing and advanced technologies to services and tourism. The study adopts a qualitative research design based on ten focus groups conducted between May and October 2025, involving all ITS Foundations operating in the region. Participants included Foundation directors, scientific and teaching coordinators, teachers, company tutors, representatives of business associations and other stakeholders. This methodological approach allows the analysis to capture relational processes, informal practices and organisational tensions that are not easily observable through quantitative indicators alone. The findings highlight that the effectiveness of the ITS model largely derives from the dense territorial networks in which Foundations are embedded. Firms play a central role not only as providers of internships and employment opportunities, but also as co-designers of curricula, sources of vocational teaching and partners in continuous curricular updating. Territorial networks act as the core infrastructure of the system, enabling ITS to translate heterogeneous productive needs into coherent training pathways and to support incremental innovation, particularly within small and medium-sized enter-

prises. At the same time, the analysis reveals a set of structural weaknesses that constrain the consolidation and scaling-up of the model. These include the hybrid institutional positioning of ITS within the education system, discontinuous and project-based funding arrangements, high organisational intensity and uneven integration with schools and universities. The paper concludes by discussing the implications of these findings for policy, arguing that strengthening ITS as a stable pillar of vocational tertiary education requires coordinated interventions at both regional and national levels.

LIFELONG LEARNING AND SELF-EMPLOYMENT FOR THE TWIN AND JUST TRANSITION

Massimiliano Mazzanti (University of Ferrara, Italy) · **Laura Evangelista** (Istituto Nazionale per l'Analisi delle Politiche Pubbliche (INAPP), Italy) · **Concetta Fonzo** (Istituto Nazionale per l'Analisi delle Politiche Pubbliche (INAPP), Italy) · **Emy Zecca** (University of Ferrara, Italy) · **Nicolo Barbieri** (University of Ferrara, Italy)

Self Employment | Twin Transition | Just Transition

The aim is to develop a political economy framework to analyze how self-employment interacts with lifelong learning under the twin digital and green transition. In human capital theory, education and training are forward-looking investments undertaken when expected returns exceed costs (Becker, 1964). For self-employed workers, this logic is particularly strong since they directly internalize productivity gains and bear the full consequences of skill obsolescence, while also facing higher economic risk. As documented by OECD (2021), self-employed individuals typically experience weaker access to social protection, higher income volatility and greater exposure to economic shocks compared to standard employees. In principle, such exposure should reinforce incentives for continuous training, as skill upgrading can increase income and provide insurance against market uncertainty. Lifelong learning becomes essential to preserve employability and reduce vulnerability to technological and regulatory change. The acceleration of digitalization and the expansion of green regulatory frameworks increase technological complexity and compliance requirements (European Commission, 2022). Digital transformation intensifies demand for advanced skills while accelerating their obsolescence, in line with skill-biased technological change (Acemoglu and Autor, 2011). Simultaneously, the green transition introduces new environmental standards and reporting obligations that reshape market participation. For self-employed workers, who lack internal organizational buffers, these shifts amplify technological and regulatory risks, making continuous skill updating essential for compliance and access to sustainability-oriented value chains. Yet evidence shows that the self-employed engage less in formal training than employees (Eurofound, 2024). Under these conditions, lifelong learning shifts from a discretionary productivity-enhancing investment to a structural condition. By strengthening cognitive, informational and relational competences, lifelong learning enhances what the capability approach defines as effective opportunities for participation, that is, the conversion of formal rights into real capacities to engage in collective and democratic processes

(Bonvin, Laruffa & Rosenstein, 2018). Since economic independence underpins civic participation (Bonvin and Laruffa, 2022), these dynamics extend beyond the labour market, making lifelong learning a condition for both economic resilience and democratic agency. The framework developed in this paper highlights that while highly skilled and well-positioned autonomous professionals may leverage digital and green transformations to reposition themselves in higher value-added segments, more vulnerable self-employed workers may struggle to meet escalating competence and compliance thresholds. Rather than uniformly increasing training participation, the twin transition may induce selective skill upgrading among advantaged groups and market exit among others, contributing to growing segmentation. A life-course perspective suggests that the returns and risks of lifelong learning and self-employment vary across career stages, producing age-specific patterns in training and entrepreneurship (Kautonen, Down & Minniti, 2014; OECD, 2019). As the twin transition raises required competence thresholds, training becomes less a purely private investment and more a form of public infrastructure; without adequate support and quality assurance, unequal access may deepen segmentation and inequality among the self-employed. By combining human capital theory with institutional perspectives and recent comparative evidence, this survey study contributes to the debate on labour market transformation and provides a framework for designing survey research on barriers and drivers of training investment among self-employed workers.

PROMOTING SOCIAL INCLUSION OF MIGRANTS AND REFUGEES AND HIGH-QUALITY CARE OF OLDER ADULTS THROUGH AN ORIGINAL ELDERCARE TRAINING IMPLEMENTED IN FOUR EUROPEAN COUNTRIES

Sara Santini (IRCSS-INRCA, Italy) · **Matteo Finco** (IRCSS-INRCA, Italy; Sapienza, Italy)

Eldercare | Training | Migrants

The unprecedented population ageing and socio-economic inequalities between developed and developing countries create a strong nexus between the high demand for H24 and personalised long-term care and the offer of low-paid and under-skilled healthcare migrant workforce. On the one hand, the lack of knowledge and competences exposes migrant care workers (MCWs) to a high risk of work discrimination and social exclusion and older people to a higher risk to receive low quality care. On the other side, there is a scarce offer of health and eldercare education tailored for migrants. This study presents the results of the HERO project (Erasmus+ Program, ID: KA204-0C583C5), which co-designed and implemented an original eldercare training curriculum for migrants and refugees in four countries (Cyprus, Greece, Italy and Portugal). The training consisted in 100 hours of lesson (78 face-to-face lessons and 22 of internship). It was implemented in 2022 and reached 83 migrants and refugees (58 women and 24 men) in the four study countries. The impact of the training on the 83 trainees' quality of life and social inclusion was assessed through a mixed-method approach including the WHOQoL-BREF questionnaire, semi-structured interviews and participant observation. A SWOT analysis highlighted strengths and weaknesses of the training, while four ideal-types of migrant learners were drawn, in order to optimise the learning process by designing tailored educational pathways. Some tips for future research and policy are given to improve education and social inclusion as well as to promote social rights of migrants and refugees even in a gender perspective.

RECONCILING INCLUSION AND REGENERATION OF INLAND AREAS. THE CASE OF THE SEPROTER PROJECT

Carmelo Bruni (Sapienza Università di Roma, Italy) · **Matteo Finco** (Sapienza Università di Roma, Italy)

Migration | Education | Inclusion

The lack of an effective reception system not only hinders the integration of migrants, but also increases the risk of social exclusion and exploitation. Without adequate access to education, work and health services, people housed in temporary centres and CASs remain trapped in a limbo of precariousness. The absence of structured programmes for integration into the labour market prevents migrants from achieving economic autonomy, forcing them to depend on informal networks often linked to undeclared work or exploitation. Furthermore, the lack of adequate language support limits their ability to communicate and build ties with the host society, reinforcing dynamics of isolation and marginalisation. From a human rights perspective, the reduction of services in the centres has led to a deterioration in the living conditions of asylum seekers. In many facilities, sanitary conditions are inadequate, spaces are overcrowded and the quality of food is poor. In some cases, there have been incidents of violence and ill-treatment, without the institutions ensuring adequate monitoring of the situation. Southern Italy is also subject to demographic dynamics marked by ageing and depopulation, especially in inland areas. This marks a double abandonment: not only are existing residents leaving, but also immigrants who arrive with the desire to realise their migration project. Reception centres could instead be a lifeline for the rebirth of these territories, especially inland areas. However, for this to happen, functional and indispensable projects are needed to activate the precursors of development consistent with the characteristics of the territories and their economic history, which over time has been undermined by processes of abandonment and emigration. These projects must also be geared towards the recovery of specific knowledge and skills capable of activating new production and employment processes, with a long-term vision. This contribution analyses and presents the initial results of a monitoring activity of a service aimed precisely at enhancing the Lucanian territory, involving migrants hosted in reception centres managed by the Filef Cooperativa Sociale, young unemployed Italians and agritourism facilities. The activity under investigation consists of the creation of guidance courses on business activities in the sectors of tourism and social agriculture in particular, but also in the sectors of the environment, culture and intangible assets. Specifically, four thematic itineraries are being organised to visit specific communities and learn about their cultural, environmental and gastronomic characteristics. The initiative consists of training on existing regulatory opportunities for businesses and support activities for business creation. The research involves users of the initiative, operators and privileged witnesses from the local area.

THE FUTURE OF SELF-EMPLOYMENT: A MIDDLE-TERM ANALYSIS (2021–2025). CONTINUING TRAINING, HYBRIDISATION AND SOCIAL PROTECTION BETWEEN QUALIFIED AUTONOMY AND STRUCTURAL VULNERABILITY

Domenico Barricelli (Inapp, Italy)

Self-employment | Continuing training | Hybrid work

This paper presents a middle-term assessment (2021–2025) of the Delphi survey The Future of Self-Employment: Professional Development, Representation and Support Policies, originally designed with a ten-year forecasting horizon. The interim analysis is based on a new consultation involving a panel of experts in labour markets, continuing training and support policies for the self-employed drawn from academia, professional associations and trade unions. The aim is to evaluate the consistency between the trajectories anticipated in 2021 and the dynamics observed in the first half of the decade, with particular attention to the role of continuing training in fostering sustainable autonomy and inclusive

democracy. The 2021 Delphi survey identified three structural trends shaping the evolution of self-employment: first, the growing polarisation between highly qualified forms of professional autonomy and structurally vulnerable self-employment; second, the expansion of hybrid work arrangements situated in a "grey area" between autonomy and subordination; and third, the increasing relevance of continuing training and welfare reform in supporting sustainable professional trajectories. Recent empirical evidence confirms the relevance of these dynamics. Studies on the European labour market highlight the persistent heterogeneity of self-employment and the coexistence of highly skilled professionals capable of investing in innovation and lifelong learning alongside a wider segment exposed to income instability, weak bargaining power and limited access to social protection (Eurofound, 2024; OECD, 2025). At the same time, the diffusion of hybrid configurations has become increasingly visible. The adoption of the ICSE-18 international classification provides a useful framework for identifying formally self-employed workers who experience economic dependence and reduced organisational autonomy, enabling better analytical clarity and international comparability (ILO, 2023). Within this context, continuing training emerges as a crucial dividing line between qualified autonomy and structural vulnerability. Access to lifelong learning opportunities remains unevenly distributed among the self-employed and strongly influenced by sectoral and income inequalities (Barricelli & Carolla, 2023). Consequently, continuing training represents a key lever not only for supporting professional resilience in the context of digital and ecological transitions but also for strengthening equal opportunities for economic participation and social citizenship. Finally, the paper reflects on the implications of these developments for welfare and labour policies. Despite recent European initiatives aimed at extending social protection to non-standard workers, significant gaps persist in the coverage of self-employed workers. The middle-term consultation therefore provides an opportunity to reassess future trajectories of self-employment and to explore policy directions capable of integrating continuing training, adaptive welfare systems and new forms of representation. Self-employment thus emerges as a strategic arena in which lifelong learning, job quality and social citizenship increasingly intersect.

SELF-EMPLOYMENT, LEARNING ECOSYSTEMS, AND EDUCATIONAL INEQUALITIES: ANALYSIS AND EVIDENCE FROM THE 2025 INDACO-ADULTS SURVEY

Roberto Angotti (INAPP, Italy) · **Domenico Barricelli** (INAPP, Italy) · **Simona Carolla** (INAPP, Italy)

Adult Learning | Self-Employment | Educational Inequalities

The transformations within contemporary labour markets are profoundly redefining the relationship between employment, learning, and professional development. The increasing prevalence and diversification of self-employment across European economic systems highlight lifelong learning as a pivotal dimension in sustaining an individual's ability to navigate productive contexts characterized by technological innovation, volatile career trajectories, and the growing individualization of skills management. From a sociological perspective, self-employment serves as a prime vantage point for analyzing the processes of individualization inherent in contemporary labour markets, where individuals are increasingly required to autonomously design and sustain their own professional paths (Beck, 2000). Simultaneously, the proliferation of independent and discontinuous forms of work can engender new vulnerabilities, resulting in greater barriers to accessing educational opportunities (Standing, 2011). This contribution offers a theoretical reflection on the nexus between self-employment and adult learning, specifically examining how working conditions influence access to education and the feasibility of constructing lifelong professional development pathways. The capabilities approach allows for an interpretation of lifelong learning not merely as participation in training programs, but as the genuine potential to expand professional opportunities and career choices (Nussbaum, 2011). In this light, access to educational opportunities represents a decisive factor in bolstering professional autonomy and countering the reproduction of inequalities within career trajectories. Parallelly, research on workplace learning emphasizes that development occurs largely through

informal and social processes embedded in daily professional practices. Communities of practice and professional networks constitute fundamental environments for the production and circulation of knowledge (Wenger, 1998), while the workplace learning framework interprets learning as a progressive participation in meaningful work activities (Billett, 2011). In self-employment, these processes take on specific characteristics. The absence of consolidated organizational structures and a weaker integration into institutional systems make learning more dependent on individual resources, self-organization, and activated social and professional networks. Empirical evidence from major national and international surveys corroborates this configuration. Data from the INDACO Adults survey (by Inapp) reveal in Italy a sharp polarization in training participation among self-employed workers, contrasting highly qualified profiles with more traditional segments of independent work characterized by fewer resources and more restricted access (Barricelli & Carolla 2023). Such elements demonstrate how working conditions profoundly shape learning opportunities and, more broadly, the capacity of individuals to maintain and develop their professional capital (Angotti & Di Castro 2024). In light of these theoretical and empirical perspectives, self-employment can be interpreted as a critical space for analyzing the redefined relationship between education, labour, and economic citizenship in contemporary societies. Finally, this paper discusses the implications of these dynamics for lifelong learning policies, highlighting the need to strengthen territorial and professional learning ecosystems capable of supporting access to training opportunities outside of traditional organizational contexts, thereby contributing to the reduction of educational inequalities across the various segments of independent labour.

DEMOCRATIC GOVERNANCE AND WORKFORCE LEARNING IN THE TWIN TRANSITION: A CONFIGURATIONAL ANALYSIS OF ITALIAN MANUFACTURING COOPERATIVES

Massimiliano Mazzanti (University of Ferrara, Italy) · **Concetta Fonzo** (Istituto Nazionale per l'Analisi delle Politiche Pubbliche (INAPP), Italy) · **Evangelista Laura** (Istituto Nazionale per l'Analisi delle Politiche Pubbliche (INAPP), Italy) · **Asia Guerreschi** (University of Ferrara, Italy) · **Ginevra Coletti** (University of Ferrara, Italy)

twin transition · democratic learning · manufacturing cooperatives

The twin transition, integrating digital transformation and environmental sustainability, requires not only technological innovation but also profound processes of organizational learning and democratic capacity-building. While policy debates often focus on firms' technological upgrading, far less attention has been devoted to the democratic infrastructures that enable collective learning and inclusive adaptation. Cooperatives, as democratically governed enterprises, represent a privileged setting to explore the reciprocal relationship between learning and democracy: whether democratic governance fosters learning for sustainability, and whether learning processes, in turn, reinforce democratic participation. This study investigates how Italian manufacturing cooperatives combine digitalization and circular economy strategies with internal investments in workforce reskilling and environmental education. Building on a dataset of 212 cooperatives (2021–2023) developed within the Climate Circular Coop project, we examine not only training intensity and thematic breadth, but also training quality—capturing the degree to which learning is structured, assessed, practice-oriented, and inclusive across occupational groups. We analyse whether cooperatives characterised by higher-quality transition-related training are more likely to implement circular economy strategies (CES) and digital innovation. Methodologically, we adopt fuzzy-set Qualitative Comparative Analysis (fsQCA), a configurational approach that captures causal complexity and multiple pathways to innovation. Rather than assuming linear effects of training on innovation outcomes, fsQCA allows us to identify combinations of conditions, such as high-quality and inclusive training, regular training participation, hours devoted to transition-specific learning, export orientation, and traditional innovation, that jointly enable or constrain the twin transition. This approach is particularly suitable for analysing democratic organizations, where outcomes emerge

from interdependent structural and cultural factors rather than isolated variables. The paper addresses two core questions aligned with the session theme: (1) Do cooperatives that invest in digital and environmental training more effectively implement digital and circular innovations? (2) Does the democratic character of cooperatives amplify the transformative impact of learning processes on sustainability transitions? The contribution of the paper is twofold. Empirically, it aims to provide systematic evidence on how democratic enterprises operationalize sustainability transitions through workforce development. Theoretically, it reframes the twin transition as a democratic learning process: democracy for learning, insofar as participatory governance creates conditions for inclusive reskilling; and learning for democracy, insofar as environmental and digital education strengthen collective agency and long-term institutional resilience. By linking cooperative governance, sustainability innovation, and organizational learning, the paper contributes to debates on how democratic economic forms could foster socially embedded transitions in contexts of ecological and technological change.

Creative and Emancipatory Research with Migrants and Refugees: Rethinking Methods, Education, and Democratic Participation

PANEL CONVENORS: Daniel Buraschi (Universidad de La Laguna, Tenerife, Spain); Alessandra Barzaghi (Università Cattolica del Sacro Cuore, Milano, Italy)

PANEL KEYWORDS: Participatory and Creative Methodologies, Epistemic Justice, Migrants and Refugee Agency

Research and educational practices involving migrants and refugees raise methodological, ethical, and epistemological questions that intersect with debates on the democratic quality of socio-educational environments. Although principles of inclusion are formally acknowledged, both research and educational systems often continue to rely on adult-centred, Eurocentric, and colonial logics that portray migrant and refugee populations as passive or lacking competence. In contrast, recognising these individuals—across different ages and backgrounds—as active and competent social actors is essential for transforming research perspectives and for designing more adequate and context-responsive educational interventions. This panel welcomes contributions from academic researchers as well as professionals working in extra-academic settings, and from actors involved in social movements. We are particularly interested in how creative practices (art-based methods, narrative approaches, multimodal workshops) and participatory methodologies can open up new meanings, expand expressive possibilities, and support a real redistribution of epistemic power. Special attention is given to the experiences and trajectories of migrants and refugees in relation to learning, agency, and processes of debordering. The panel aims to foster interdisciplinary dialogue on crucial issues for education in multicultural and transnational contexts: the management of linguistic and cultural barriers, the creation of accessible educational and research environments, and the role of intercultural and emancipatory competences in promoting educational and social justice. By bringing together different actors, the panel seeks to advance methodological, pedagogical, and ethical innovations that make research and educational contexts more participatory and democratic, valuing the contributions of migrants and refugees as central to rethinking democratic education.

FEMINIST PHOTOVOICE AS AN EPISTEMIC DEVICE OF CARE AND REDISTRIBUTION OF INTERPRETIVE POWER

Annachiara Del Prete (Universidad de La Laguna, Spain)

Feminist Methodology | Photovoice | Migration

This panel contribution offers a feminist epistemological reading of photovoice, understood not as a participatory visual technique but as an epistemic and ethical device that reshapes the conditions under which knowledge is produced in contexts marked by inequality, vulnerability, and structural violence. Situated at the intersection of feminist research, visual methodologies, and critical migration studies, the contribution focuses on how interpretive authority is distributed—or contested—when working with images, narratives, and embodied experiences in research with migrants and refugees. Drawing on a critical reconstruction of the genealogy of photovoice and on recent feminist scholarship, the contribution shows how the institutional expansion of the method has often been accompanied by processes of depoliticisation and visual extractivism. In many applications, participation is reduced to the act of taking photographs, while interpretation, theorisation, and public circulation remain under academic control. From this perspective, the central issue is not methodological in a technical sense but epistemological: who interprets images, who decides what becomes visible, and who controls the meanings and effects of visual knowledge. Against these tendencies, the contribution proposes a feminist re-anchoring of photovoice structured around three key dimensions. First, it argues for the centrality of care as epistemic infrastructure rather than as a moral or emotional supplement. Working with images in migration contexts entails negotiating pain, fear, memory, and exposure; without sustained relational care, the risk of reproducing epistemic and affective harm remains high. Second, photovoice is conceptualised as a space for negotiating pain, where images do not represent traumatic experiences but enable them to be activated, named, and politicised without resorting to spectacle or re-victimisation. Within this framework, emotions are recognised as epistemic dimensions rather than as subjective residues external to knowledge production. Third, the contribution examines photovoice as a practice of epistemic justice, insofar as interpretive power is effectively redistributed. Drawing on recent studies involving migrants and refugees, the analysis shows how co-interpretation of images, co-authorship, and collective control over visual circulation can displace entrenched cognitive hierarchies and generate situated knowledge that cannot emerge through representational methodologies alone. Finally, the contribution addresses the challenges introduced by the digital

circulation of images—expanded visibility, risks of re-identification, and enduring digital traces—and argues for understanding ethics not as a preliminary protocol but as shared, processual responsibility. From this perspective, photovoice emerges not as an abstractly inclusive method, but as a demanding feminist practice that requires rethinking rigor, care, and responsibility in contemporary social research.

'WE ARE HERE': HOW MIGRANTS DEFY THE LOGIC OF INVISIBILITY AND BECOME AGENTS OF CHANGE

Barbara Samaluk (University of Ljubljana, Faculty of Arts, Slovenia)

radical adult education | migration | migrants' agency

'We are here': how migrants defy the logic of invisibility and become agents of change Contemporary societies are characterised by growing and more diverse migrant populations that open challenges regarding migrants' integration and education, in which migrants are often portrayed as passive or lacking in competence. In order to defy this logic, this paper recognises migrants as important actors in shaping the perspective on migrants' integration and related education. While much adult education scholarship is sensitive to diverse migrants' needs and critical towards generic migrants (re)settlement and integration programs, it still focuses mostly on the learning needs of migrants, rather than also on the learning needs of the receiving society to adopt to growing migration within a two-way integration process (Samaluk, 2020; Shan & Guo, 2023). This paper addresses this gap by exploring how migrants publicly voice their concerns, enter in dialogue with local community, raise public consciousness about their conditions and strive towards changing oppressive social structures. It departs from wider understanding of migrant integration and radical adult education theory grounded within Gramscian counter-hegemony struggles and Freirean critical pedagogy (Elias & Merriam, 2005; Freire, 2005; Samaluk & Kunz, 2022) to examine a case study of a migrant-led communal space and an advocacy organisation Ambasada ROG, which emerged in Slovenia as a response to the 2015 crisis of the European refugee policy. The analysis is based upon participant observation at public events organised by Ambasada ROG and secondary sources of data featuring over 190 migrants' written stories in the newsletter Tukaj smo [We are here] published on Ambasada ROG's social media and web sites and in six printed issues. By utilising secondary data sources produced by migrants and by participating at events organised by migrants, researcher takes the role of participant, who does not intervene, but reads/listens to migrants' stories, in order to uncover their own understanding and experience of integration and related education and their active engagement in society. Findings show that migrants utilise public engagement in order to defy the logic of invisibility, dehumanised media portrayals and fight for recognition and mutual understanding. By sharing their stories and actively engaging within wider community they also act as organic educators, who focus on both learning needs of migrants and the receiving society that is still ill adapted to growing and more diverse migration. They thus raise other migrants' political consciousness, public awareness about complex migrant conditions and put pressure on the government to change its migration policies. By doing that they also establish bridges and solidarity with local community and thus became agents of change, who demonstrate that integration is ultimately about economic and social security and mutual solidarity that can also bring some positive changes to oppressive laws and policies.

THE EVOLUTION OF SCHOOL JUSTICE ANALYSES OF PUPILS FROM THE FIRST GENERATION OF IMMIGRATION IN MARSEILLE

Céline Persini (University of Geneva, Switzerland)

migration pupils justice

Our dissertation in educational sciences focuses on the evolution of school justice analyses of pupils from the first generation of immigration in Marseille (France). This work is partly based on data collected as part of the ANR-funded project entitled Orientation des jeunes primo migrants (OJEMIGR). The project is based on a three-years follow-up of some fifteen migrant pupils, starting with their educational orientation. They were around 15 years old when we started our study five years ago. We interviewed them as well as their family, social workers and teachers. One of the first results of our survey shows an experience of injustice and facts of injustice that are sometimes disarticulated. The facts of injustice are not necessarily expressed by the pupils, the neoliberal narrative (Lamont et al. 2016) is often used by these students, which undoubtedly allows them to maintain a certain dignity. Pupils generally declare little injustice, crushed as they are by other inequalities (Lamont, 2002 and 2016, Dubet et al. 2013; Talpin et al. 2021), but some express themselves, and increasingly as the survey progresses. School guidance does not always seem to be a major concern. Even if we note the development of a form of disenchantment as time goes by, these students remain for the most part optimistic despite their troubled social and educational paths. We highlight instability in their analysis of justice, depending on the situation in which the young people find themselves at the time of the interviews, regardless of how long they have been in France. According to the pragmatic framework, in a situation of indeterminacy, individuals refer to what their knowledge in order to analyze a situation (Boltanski & Thevenot, 1991 and 2015). In this case, we're talking about school and social standards from countries of the Global South, which sometimes seem to get students out of the classic school justice conflicts in France (Schiff, 2000 ; Armagnague, 2019). Even so, some students denounce injustices at school. As the investigation progressed, we have adapted our methodology by interview trying to empower the young pupils we have worked with. We have tried to help them with our study in their daily problem as well as in their analysis of their situation. We would to discuss our methodological choices and their ethical impacts.

DUAL VOICES ON SKILLS AND MIGRATION: STAKEHOLDERS AND MIGRANTS IN CONVERSATION

Francesco Vittori (University of Verona, Italy) · **Hande Eslen-Ziya** (University of Stavanger, Norway)

Migration Studies | Dialogical and Polyphonic Ethnographic Approach | Labour Market Integration

Migration has become a central topic of academic research and public discussion. However, the knowledge production surrounding migration is still largely influenced by Eurocentric perspectives and institutional research agendas (Santos, 2014). In response to this challenge, this paper reflects on the creation of a collective edited volume titled 'Skills, Mobility and Justice in Contemporary Europe: Institutional Narratives and Lived Realities in Conversation' (submitted to: Routledge) that seeks to explore alternative forms of knowledge production, emphasizing the voices and experiences of migrants. Instead of presenting the book as a finished scholarly product, this paper treats the editorial process as a space for epistemic negotiation and political positioning, where issues of authorship, representation, and responsibility are central. The edited volume brings together two rarely combined perspectives: institutional actors influencing labor market policies and migrants navigating skill recognition and integration. It draws on empirical research from various European contexts within Horizon Europe projects, featuring contributions from employers, unions, municipalities, and policy-makers, as well as migrant workers. The chapters foster a dialogue between institutional narratives and migrants' experiences, highlighting tensions around skills, integration, and justice. Inspired by Haraway's concept of situated knowledges (1988) and Spivak's views on representation (2023), the volume emphasizes collective writing to explore positionality and the risks of reinforcing existing power dynamics. By examining the editorial journey of the volume as an empirical case, we contend that collective writing can serve as a critical practice for producing 'situated knowledge.' This approach has the potential to challenge dominant perspectives and experiment with more dialogical and politically accountable forms of migration research. Methodologically, the volume adopts a dialogical and polyphonic ethnographic approach (Clifford & Marcus, 2023; Marcus & Clifford, 1985; Ghorashi, 2014), encouraging participants to co-author and co-create relational narratives that disrupt institutional discourses on migration, skills formation, and recognition. Instead of viewing stakeholders and migrant workers as separate analytical categories, the book pairs their accounts within each chapter, fostering deliberate conversations that illuminate intersections, tensions, and silences. The collective volume features a dialogic and polyphonic structure, emphasizing that knowledge production is situated and co-constructed through various voices and power dynamics. It serves as an interactive space linking policy frameworks with lived experiences and macro governance structures with micro realities of recognition, exclusion, and belonging. The text presents both an empirical contribution and a methodological innovation, highlighting how migration and labor market governance are shaped through dialogue, power, and negotiation. The entire book is grounded in extensive qualitative interviews and focus groups conducted across various EU destination countries. At a time when European labor markets are grappling with skill shortages and growing political debates around migration, public discussions often separate institutional perspectives from migrants' lived experiences. This work challenges that separation. While much of the existing literature addresses skills, migration, and integration either through policy analysis or migrant narratives, this volume systematically stages their interaction, demonstrating a more integrated understanding of these issues.

PARTICIPATORY ACTION RESEARCH IN A MULTICULTURAL AFTER-SCHOOL CENTRE: THE CASE OF THE DREAM PROJECT

Erica Colussi (Fondazione ISMU ETS, Italy) · **Mariagrazia Santagati** (Università Cattolica del Sacro Cuore, Italia) · **Alessandra Barzaghi** (Università Cattolica del Sacro Cuore, Italia) · **Chiara Ferrari** (Università Cattolica del Sacro Cuore, Italia) · **Francesca Sommaruga** (Fondazione ISMU ETS, Italy)

Participatory Action Research | Creative Methodologies | Migrant Children

In recent years, the growing diversification of European educational contexts has raised new challenges for socio-educational services working with children and families with migrant backgrounds. In such contexts, building inclusive educational environments requires approaches capable of recognising different actors - children, parents, and educators - as subjects who possess knowledge, experiences, and resources, overcoming adult-centred and deficit-based perspectives still present in educational systems. In this perspective, participatory and creative methodologies represent valuable tools for fostering shared knowledge production and processes of educational co-design (Reason and Bradbury 2008; Kemmis, McTaggart, and Nixon 2014). This contribution presents the preliminary results of a participatory action research study carried out within the DREAM project (promoted by Fondazione Cometa and ISMU) at the after-school educational centre “Il Manto” in the city of Como, a territory characterised by a significant presence of families with migrant backgrounds. The centre hosts children attending primary and lower secondary school, many of whom are children of immigrants or belong to so-called second-generation migrant families. The research developed in two phases. The first aimed to produce a shared understanding of the educational needs emerging within the centre’s context. Qualitative and participatory tools were employed, including focus groups with educators and parents, expressive workshops with children, and semi-structured interviews with key territorial stakeholders. The use of expressive and multimodal activities with children draws on research perspectives recognising children as competent social actors and active participants in knowledge production processes (Clark and Moss 2011; Christensen and James 2017). In parallel, a socio-demographic analysis of the children attending the centre was conducted, highlighting a highly multicultural group characterised by different forms of social and educational vulnerability. The results revealed several cross-cutting themes, including the importance of safe and structured educational spaces, the role of extracurricular experiences in children’s development, the difficulties faced by families with migrant backgrounds in supporting children’s schoolwork, and the need to strengthen relationships among educators, families, schools, and local actors. In this sense, the after-school centre emerges as an intermediate educational space supporting children’s learning pathways and social integration in migration contexts, contributing to more inclusive and intercultural educational environments. The second phase initiated a participatory action process aimed at transforming the needs identified in the first phase into shared educational intervention pathways. Through participatory meetings involving educators, parents, and other local actors, three thematic working groups were established: support for learning and homework, promotion of intercultural practices, and strengthening educational alliances between families, schools, and local services. Activities based on dialogical methodologies and creative tools (role-playing, collage, guided discussions) fostered the sharing of experiences and perspectives, opening spaces for collective reflection and co-design. The paper discusses the value of participatory and creative methodologies in promoting participants’ empowerment and supporting the development of more democratic educational environments. Involving children, parents, and educators in knowledge production and in defining educational actions allows recognition of the competences present within educational communities and contributes to practices more responsive to the cultural diversity of contemporary societies.

THE CITY OF DIASPORIC MEMORIES: FROM PARTICIPATORY RESEARCH TO EDUCATIONAL PRACTICES WITH BIOGRAPHICAL CREATIVE METHODS

Gianluca Gatta (University of Milan, Italy) · **Monica Massari** (University of Milan, Italy)

memory migration participatory research

This paper contributes to current debates on creative and emancipatory research with migrants and refugees by consolidating an approach we term biographical creative methods (Massari et al. 2026; Gatta et al. 2026): a methodological framework that brings life-history inquiry into dialogue with creative coproduction across visual, performative and multimodal practices. Developed across several interrelated projects, this approach foregrounds reflexivity, co-agency and the collective re-elaboration of experience, challenging extractivist logics often embedded in research in this field. Within this broader programme, the paper discusses MEMODIAS – Memory Practices of the Afghan and Somali Diasporas in the USA and Italy (2022–2025), a HorizonMSCA project which convened participatory workshops with members of Afghan and Somali diasporas to work with biographical trajectories and with individual and collective memories related to conflict, exile, settlement in the receiving countries, and return. Designed explicitly as alternatives to data-extraction settings, these encounters opened up spaces to record present conditions and experiences, surface diverse perspectives and articulate future-oriented aspirations. The workshops enabled the coproduction of situated knowledge that could sustain incremental shifts in understanding relational dynamics and possibilities for both participants and researchers, while enhancing reflexivity for everyone involved. Through practices of spatialisation, materialisation and multimodal composition, participants co-assembled a provisional "city of diasporic memories": a shared environment of objects, narratives and soundscapes that externalises memories and aspirations, lowers linguistic barriers, and fosters inter-diasporic recognition and solidarity (Creet & Kitzmann 2010; Lacroix & Fiddian-Qasmiyeh 2013; Lim & Rosenhaft 2021) without reducing experiences into single stories. Building on these insights, we present an evolving, codesigned guide that translates the workshop architecture and facilitation strategies into adaptable modules for educational settings and diaspora-led initiatives. Presenting the guide at this developmental stage is an invitation to gather feedback and practitioner insights to refine its scope, ethics-of-care safeguards, language mediation and accessibility strategies, and reflexive prompts for both facilitators and participants. Conceptually, the contribution clarifies how biographical creative methods recast the researcher-participant relation as a shared inquiry oriented to meaningful forms of change. Practically, it outlines how research routines can be translated into educational pathways that broaden expressive repertoires, redistribute authorship in the framing of questions and relevance, sustain inter-diasporic educational work, and strengthen reflexive practice in contexts marked by mobility, displacement and inequality.

Evaluating The Quality Of Vocational Training Between Equity and Participation

PANEL CONVENORS: Concetta Fonzo (Istituto Nazionale per l'Analisi delle Politiche Pubbliche (Inapp), Italy); Laura Evangelista (Istituto Nazionale per l'Analisi delle Politiche Pubbliche (Inapp), Italy); Michela Freddano (Istituto nazionale per la valutazione del sistema educativo di istruzione e di formazione (Invalsi), Italy)

PANEL KEYWORDS: VET, school evaluation, quality

The quality of Vocational Education and Training (VET) represents a strategic factor for the professional development of citizens, facilitating the match between labor demand and supply in an ever-evolving context. Today, professions require increasingly higher qualifications and the ability to adapt to change. Following recent regulatory changes, regional Vocational Education and Training Paths (IeFP) are becoming increasingly significant in the national education and training system. They are strategic, aiming, on one hand, to ensure the achievement of learning objectives set at the end of compulsory education and, on the other hand, to promote the development of specific professional skills. In this context, evaluation plays a crucial role in ensuring the quality of vocational training paths, acting as a bridge between different governance levels. Building on these considerations, the panel intends to explore the theme of evaluating the quality of vocational training, particularly but not exclusively, focusing on: formative design and evaluation, the evaluation of skills, including non-cognitive and transversal skills, certification models for competencies, self-assessment, peer assessment, and the role of feedback in the learning-training processes and lifelong learning. The aim is to provide an interdisciplinary discussion based on scientific and empirical research, capable of identifying drivers and challenges that affect the quality of training offerings and the school-to-work transitions of young people, in order to outline strategic scenarios for the future of Vocational Education and Training.

THE TERRITORIAL DIMENSION OF VET: MULTILEVEL GOVERNANCE AND SPATIAL DISPARITIES IN FOUR EUROPEAN COUNTRIES

Ruggero Cefalo (University of Firenze, Italy) · **Yuri Kazepov** (University of Vienna, Austria) · **Eduardo Barberis** (University of Urbino, Italy) · **Tero Jarvinen** (University of Turku) · **Siyka Kovacheva** (University of Plovdiv) · **Plamen Nanov** (University of Plovdiv)

Vocational training | multilevel governance | spatial disparities

Most comparative studies on public policies, political science and political economy still focus exclusively on the national level and cross-country differences and neglect the territorial articulation of policies within countries. However, Cross-country comparisons often overlook the complexity of multilevel governance settings and subnational variation underlying SWT systems or regimes. Policy implementation involves multiple jurisdictional scales (for instance, countries, regions, provinces and municipalities) and multiple actors. Further, countries present internal spatial divides in contextual socio-economic conditions that affect implementation and outcomes. Methodological nationalism ignores the consequences of long-term process of rescaling of policy responsibilities above and below the country level; as well as of persisting spatial disparities resulting from the post-industrial shift of capitalist economies. Nevertheless, national governments remain highly relevant in most policy domains even in decentralized settings. Accordingly, to avoid replacing methodological nationalism with methodological subnationalism or falling into the local trap, comparative research should address the complex territorial articulation of policy provisions in multilevel governance settings. Our argument is that as policies unfold within multilevel settings they contribute to territorially differentiated outcomes that affect the distribution of resources and opportunity within a certain country. This brings to the expectation of significant within-country variation in policy outputs and outcomes and to existence institutional mechanisms that contribute to control or amplify differences among territories. Considering subnational variations can lead to two distinct interpretations. On one hand, it may challenge the validity of classifying national systems or regimes, raising questions about their heuristic utility. On the other hand, it could offer a way to enhance these classifications by incorporating spatial differentiation as a key variable of SWT systems We put forward an analytical framework to grasp the territorial articulation of multilevel policy provision combining studies on multilevel governance and spatial disparities. We consider four main elements: jurisdictions, politics, policies and contexts. We expect their interaction to play out through mechanisms of coordination (or lack thereof) and to be significantly connected to spatial disparities in policy outputs and outcomes. Empirically, we apply this frame to the analysis of vocational education and training (VET) provision. VET is of utmost importance for the provision of

skills, labour market opportunities, social cohesion and economic growth. VET policy lies at the intersection of education and the labour market: this implies that local socio-economic conditions strongly affect policy needs and outputs; moreover, decision-making and implementation competences on VET policy are often assigned to subnational governments. To what extent VET provision differs between and within the case studies? How is VET articulated within multilevel governance settings and how do spatial divides affect the provision and outcomes of vocational training? Our argument is explored through a comparison of multilevel VET provision in four EU countries characterised by different transitions and welfare regimes (Walther, 2017), namely Italy, Austria, Bulgaria, Finland. The country selection responds to the exploratory logic of a diverse case study design, coherent with our goal of conceptual and empirical clarification of the territorial articulation of policies within complex multilevel settings.

BETWEEN EQUITY AND PARTICIPATION: A RESEARCH ON INTERNATIONAL VOCATIONAL TRAINING CONTEXTS FOR YOUNG PEOPLE WITH FRAGILE X SYNDROME

Alessia Tomei (Università Roma Tre, Italy) · **Ines Guerini** (Università Roma Tre, Italy) · **Fabio Bocci** (Università Roma Tre, Italy) · **Amalia Rizzo** (Università Roma Tre, Italy)

Fragile X Syndrome | Work | Inclusion

This paper presents the findings of an exploratory study conducted within an international mobility project for young adults with Fragile X Syndrome, aimed at analysing the quality of vocational training contexts from an equity and participation perspective. The research is situated within the broader European debate on the labour inclusion of people with disabilities, with specific reference to the right to accessible, personalized, and self-determination-oriented pathways (UN, 2006). FXS, as the primary hereditary cause of intellectual disability, involves specific cognitive and behavioural characteristics that significantly impact labour inclusion processes (Bottà, 2024; Corona & De Giuseppe, 2018; Falsetto & Anselmi, 1990; Lanfranchi & Vianello, 2004). Within this framework, access to high-quality vocational training contexts requires reasonable accommodations, educational supports, and inclusive environments. The project examines several international internship experiences proposed by the Italian Fragile X Association as part of an Erasmus+ program. The aim of the research is to improve inclusive experiences for young adults with FXS, promoting social inclusion and participation. To achieve this, the research pursues several objectives, including: analysing current methods for organizing extracurricular traineeships, identifying strengths and potential areas for improvement; investigating the training needs, skills and useful tools for chaperones; designing a specific training course for chaperones based on real operational conditions and trainee characteristics; developing observation and evaluation tools sensitive to changes generated by the traineeship experience in people with FXS, in terms of life skills (WHO, 1993). The research adopts a qualitative design based on action-research methodology, characterized by a recursiveness that allows rethinking practices in favour of more effective and targeted actions (Trinchero, 2002). Tools used include: questionnaires for families of the Italian FXS Association to investigate knowledge and willingness to participate in the Erasmus+ project; self-observation grids completed by chaperones to reflect on their performance during the traineeship; rating scales based on the ICF (WHO, 2001) for observing trainees, completed by chaperones to obtain a comprehensive assessment of acquired or enhanced skills; and semi-structured interviews to gain a complete picture from both direct (trainees and chaperones) and indirect (parents) participants. Data collected so far highlight that the quality of the training experience is strictly connected to specific conditions, such as chaperone training on FXS characteristics and the upcoming experience, and a context capable of valuing practical and relational skills. Simultaneously, the study highlighted critical issues related to practical implementation and prior organization. Finally, this contribution proposes an evaluation model for international traineeships and work placements for young people with FXS, based on the interaction between pedagogical, organizational, and relational dimensions. This model, built on an ICF basis, intends to offer useful indications for both research and the design of inclusive practices, strengthening the link between training quality, educational justice, and full citizenship.

INTEGRATING THE CAPABILITY APPROACH INTO QUALITY EVALUATION PARADIGMS: FROM SELF AND TEACHER EVALUATION TO QUALITY SIGNALS IN THE ITALIAN IEFP

Astrid Favella (Sapienza University of Rome, Italy) · **Laura Evangelista** (INAPP) · **Concetta Fonzo** (INAPP) · **Emiliane Rubat du Mérac** (Sapienza University of Rome, Italy)

basic skills | initial VET | inclusion strategies

Basic skill provision within VET is at the core of the Union of Skills strategy launched in 2025 by the European Commission: for VET students to experience high quality learning, VET teachers are expected to be equipped with high-end inclusion strategies and adaptive capacities, especially in the context of the knowledge economy. The VET population is characterized by high percentages of students finding themselves at a disadvantage, either for their socio-economic, migrant background, or different types of disabilities, constituting fragile sections of the student population. Furthermore, the complex multi-level governance of the secondary Italian VET systems, with regional prerogative over the IeFP channel – "istruzione e formazione professionale" creates a situation of non-homogeneity as far as teacher training is concerned. In this context, system evaluation practices often remain centered on output indicators, with limited attention to how assessment routines can generate meaningful quality evidence: starting from a capabilities' approach (CA) perspective (Sen, 1993) this paper then aims at informing paradigms of quality evaluation in the VET realm, by taking the demand side perspective, which is a seminal, yet under-researched, evaluation lens. It does so by investigating both VET students' perception of VET teachers' inclusion strategies, and their own soft skills, both in didactic and evaluation moments: a seminal evaluation lens for analyzing the quality of VET pathways. Two research questions are posed: How do IeFP students experience teachers' inclusion strategies (e.g. migrant background, presence of disabilities)? Specifically, how do they perceive feedback in the learning-training process? The present research question is answered via interviews with third year students in IeFP courses who attended courses to obtain a level 3 EQF qualification and hence are experiencing a school to work transition, selected from training centres in the Lazio territory, to further inform the construction of a questionnaire on perceptions of inclusiveness (Venetz et al., 2015). How are IeFP students self-evaluating their transversal skills, in the context of the school to work transition they are experiencing? The 3SQ self-evaluation questionnaire is administered to a reference sample of first year students in IeFP courses in the Lazio Region (Lucisano & du Mérac, 2019). The questionnaire can indeed be specifically useful, in this context, to understand whether soft skills can to a certain extent compensate for initial disadvantages. Ultimately, as the EQAVET framework is constituted of ten indicators to evaluate the quality of education and training, this study would particularly inform a discussion around indicator n.10, which refers to "Schemes used to promote better access to VET and provide guidance to potential VET learners" (European Commission, 2026). Indeed, from a CA perspective applied to students' life courses (Wylson-Strydom, 2016) not only "access", but "success" in the study pathway is considered, stemming from what students give value to along their life courses. Indeed, a reinforcement of inclusion strategies would enable the students to successfully face school to work transitions.

QUALITY, EQUITY, AND PARTICIPATION IN ADULT EDUCATION AND TRAINING

Sandra D'Agostino (Inapp, Italy) · **Silvia Vaccaro** (Inapp, Italy)

quality in VET | inequalities | adult learning

Contemporary European societies are undergoing profound transformations that mutually influence one another, generating challenging scenarios and new forms of vulnerability. In this “age of disorder,” adult education and training are frequently invoked as suitable instruments for equipping individuals to cope with ongoing changes. A recent study conducted by Inapp examined adult VET policies implemented in France, Germany, England, and Spain in recent years, with particular attention to measures aimed at promoting access to learning opportunities for most disadvantaged groups and, particularly, for low-skilled people. The research—still underway and conducted through desk analysis enriched by interviews with experts and stakeholders—includes a final comparative phase of findings from EU countries with Italy. The study highlighted how adult education is gradually gaining prominence in the dialogue among institutional and social actors, stimulating the development of projects and initiatives. Across the various countries examined, several initiatives stood out due to their financial and institutional commitment, the breadth of the tools deployed, the diversity of stakeholders involved, and the attention devoted to the design of support measures. The most significant projects are grounded in a cooperative and multidimensional approach, based on networks of public and private actors responsible for addressing individuals’ needs in a holistic manner. Vulnerable groups are engaged through innovative outreach interventions and involved in integrated services - combining education and training, job guidance, and socio-health measures – helping turn individual difficulties into opportunities for reintegration into the labour market. The implementation of territorial networks becomes the cornerstone of these interventions, with the objective of generating added value through the sharing of services, infrastructures, personnel, and financial resources. Within this framework, innovative training practices find fertile ground, supporting both the development of basic knowledge and skills and the acquisition of professional micro-competences. In some cases, the shift towards more flexible forms of training provision becomes a key priority, paving the way for the introduction of modular learning pathways and micro-qualifications. Despite the proliferation of initiatives, the experts interviewed point to the absence of a long-term strategic vision supported by coherent policies and sustained financial investment. They also highlight the lack of a shared understanding regarding the purposes of adult learning—whether it should be regarded solely as a tool for employability and economic growth, or also as a means of fostering social cohesion and democratic development. Evaluation practices likewise appear fragmented and inconsistent, rarely becoming a foundational component of cooperation among stakeholders. Moreover, extending standardised evaluation frameworks to projects targeting vulnerable individuals often leads to misinterpretations of the benefits achieved. The study thus presents a landscape marked by significant fragmentation of human and financial resources, which fails to generate critical mass and reduce persistent inequalities in adult participation in education and training. In sum, the development of measures capable of supporting adults’ personal and professional growth — including that of the most vulnerable —s till appears to be an aspirational objective rather than a concrete, systemically implemented strategy aimed at building comprehensive lifelong learning systems.

FROM QUALITATIVE EVIDENCE TO DIGITAL NARRATIVE TOOLS FOR EQUITABLE YOUTH TRANSITIONS ACROSS EDUCATION, VET, AND WORK

Francesco Pisanu (Provincia Autonoma di Trento, Italy) · **Franco Fraccaroli** (Università di Trento, Italy) · **Giuseppe Rizza** (Provincia Autonoma di Trento, Italy)

youth transitions | guidance and training | digital storytelling

Evaluating the quality of educational and training systems increasingly requires approaches that go beyond completion and placement rates, capturing how young people participate in pathways, access support, and navigate non-linear transitions across school, vocational education and training (VET), higher education, and work. This contribution presents a research-to-intervention pipeline developed within the cross-border Euregio Transizioni project (Tyrol–South Tyrol–Trentino), which translates qualitative evidence on youth transitions into actionable guidance and training tools. While the project addresses multiple pathways, we discuss implications particularly relevant for VET and apprenticeship-related contexts, where equity and participation depend strongly on institutional practices and access to guidance. The qualitative strand comprised 32 semi-structured, in-depth interviews conducted in Trentino and South Tyrol with young people aged 13–29, designed to represent diverse transition patterns (e.g., school-to-VET/work, school-to-university, re-orientation, interruptions and returns). Interviews were inspired by a narrative approach grounded in Career Construction Theory and the construct of career adaptability (Concern, Control, Curiosity, Confidence) (Savickas, 2013; Savickas & Porfeli, 2012), and by life design principles focused on meaning-making and agency (Nota & Rossier, 2015). A thematic analysis combined theory-informed coding with inductive themes emerging from participants' narratives, consistent with perspectives on adaptive career behavior and career self-management (Lent & Brown, 2013) and with a sustainability-oriented view of careers (De Vos et al., 2020; Van der Heijden et al., 2020). Findings highlight that "transition resources" are not only individual attributes but are produced through interactions with institutional practices: accessible guidance channels, opportunities for safe experimentation (e.g., internships, work-based learning, apprenticeship-like experiences), and recognition/feedback from significant adults. These mechanisms shape participation and equity by either widening or narrowing young people's perceived options, particularly in critical moments (misfit, uncertainty, re-orientation). Such dynamics are especially salient in VET trajectories, where timely support and work-based learning opportunities can prevent disengagement and support re-entry, aligning with broader notions of sustainable careers across the lifespan (De Vos et al., 2020; Van der Heijden et al., 2020). Building on these narratives, the project prototyped 15 interactive digital storytelling exercises on the Elevate platform, integrated into the Adagio digital environment. The exercises are structured as branching transition stories with reflective prompts and feedback designed to support meaning-making, agency, and informed decision-making (Nota & Rossier, 2015; Savickas, 2013). They were embedded in two professional development cycles for teachers and guidance practitioners following an Input–Practice–Reflection model (Lipowsky, Rzejak, 2015), enabling field testing and refinement. We conclude by proposing design principles and evaluation implications for "quality-oriented" guidance and training across systems, with direct applicability to VET: low-threshold participation, non-stigmatising narrative formats, structured debriefing as a core pedagogical component, and governance conditions for scaling tools and practices across institutions and territories.

FACTORS OF ACCESS TO VOCATIONAL EDUCATION AND TRAINING TO VULNERABLE AND INVOLUNTARY MIGRANTS: MIGRANTS' PERSPECTIVE

Vidmantas Tūtlys (Vytautas Magnus University, Lithuania) · **Sigitas Daukilas** (Vytautas Magnus University, Lithuania) · **Francesco Vittori** (University of Verona, Italy) · **Angelica Projetti** (CNOS-FAP, Italy) · **Sergii Melnyk** (State Scientific Institution "Institute of Educational Analytics", Kyiv, Ukraine)

Vulnerable migrants | involuntary migrants | access to vocational education and training

Vocational education and training (VET) is traditionally considered as the educational pathway which empowers socially vulnerable people, especially youth by equipping them with skills, competences and qualifications, which open them access to employment, economic and social participation (Tūtlys et al, 2025). This is also valid for the integration of the involuntary migrants. The empowering effects of VET for the involuntary migrants include development of employability, fostering self-sufficiency, provision of the human and social capital needed for the sustainable employment in the destination countries (Cedefop, 2017). VET often serves as a gateway helping the involuntary migrants, refugees and asylum seekers to integrate in the labour market as skilled workers, self-employed persons, and other contributors to the economy and public welfare (Betts, 2021; Agier&Le Courant, 2022; Héran, 2023). The empowering impact of the VET for the involuntary migrants depends on the access to VET defined by the migration and asylum policy and legal regulation, as well as on the institutional models of VET provision in the destination countries (Bell Sebastián et al., 2025). For example, the collective skill formation systems of the German speaking countries with their highly-esteemed dual VET pathways face tensions and controversies between the political strategies and intentions to open access to the high-quality VET for involuntary migrants to foster their employment and integration, from the one side, and the resistance of the VET providers and stakeholders to the acceptance of migrants, because of their fear about the implications for public image and esteem of this educational pathway (Aerne & Bonoli, 2023a; 2023b). Accessibility of the VET to the involuntary migrants in the Southern European countries (Italy, Spain) is strongly enhanced by the rich ecosystems of VET provision, with a very important role played by the non-governmental VET providers working with socially vulnerable groups of learners. The political-institutional factors of accessibility are supplemented with the factors of the VET processes directly experienced by the learners: VET curriculum design, articulating of school-based and work-based learning opportunities, as well as assessment and recognition of the learning outcomes. This paper seeks to explore these factors by referring to the voices of vulnerable and involuntary migrants in Italy, Lithuania, Poland and Germany. Research targets the following questions: 1) What features of the VET curriculum design (competence-based design, modularity, propaedeutic approach to curriculum design, integration /separation of vocational and transversal skills in the VET curricula) foster accessibility of the VET for vulnerable and involuntary migrants? 2) What kind of organisational arrangements of school-based and work-based learning make the VET accessible for these migrants? 3) What defines accessibility of assessment of learning outcomes and competences for vulnerable and involuntary migrants? The paper provides the findings of the quantitative and qualitative surveys of the vulnerable and involuntary migrants in Italy and Lithuania, as well as the survey of the war refugees from Ukraine conducted in Italy, Lithuania, Poland and Germany conducted in 2025 in the framework of the Horizon Europe research project Skill Partnerships For Sustainable And Just Migration Patterns (Skills4Justice, https://www.skills4justice.eu).

OPERATIONALISING QUALITY AREAS: A COMPETENCE MAPPING MODEL FOR PEERS IN VET

Concetta Fonzo (Istituto Nazionale per l'Analisi delle Politiche Pubbliche (INAPP), Italy) · **Laura Evangelista** (Istituto Nazionale per l'Analisi delle Politiche Pubbliche (INAPP), Italy) · **Eloisa Cianci** (Università Cattolica del Sacro Cuore, Italy)

peer review | competences | professionalisation

The institutionalisation of Peer Review within European Vocational Education and Training (VET) systems calls for a clearer definition of the competences required for Peer Reviewers (the so-called Peers) to perform their evaluation role responsibly and effectively. Within the EQAVET-inspired framework, Quality Areas do not merely represent technical domains of assessment; rather, they embody normative and value-based dimensions that incorporate principles of transparency, participation, inclusion, accountability and continuous improvement (Evangelista & Carlini, 2020). However, these ethical and organisational principles risk remaining abstract unless they are translated into concrete professional competences. This paper addresses this gap by proposing a competence mapping model aimed at operationalising Quality Areas within Peer Review processes in VET. The study develops a structured association between the normative and value-based architecture embedded in sixteen Quality Areas – including those dedicated to Digital Transition and Environmental Sustainability – and the multidimensional competence profile required for Peers. The analysis unfolds in two main stages. First, it reconstructs the competence framework emerging from international and Italian literature on educational evaluation, quality assurance and Peer Review (Stake, 2003; Gutknecht-Gmeiner, 2013). This framework is organised into four macro-categories: (1) contextual knowledge related to VET systems; (2) methodological and evaluative competences; (3) transversal competences (soft skills); and (4) method-specific competences related to Peer Review procedures (Gutknecht-Gmeiner, 2007; Tramontano & Allulli, 2012). Second, the study conducts a systematic matching between these competence categories and each Quality Area. This process does not merely identify overlaps; rather, it seeks to "fill" the Quality Areas with the competences necessary for Peers to perform their evaluation function in a manner consistent with the ethical and institutional principles they embody (Allulli, 2012). The findings reveal a heterogeneous distribution of competences across the different Quality Areas. While method-specific competences related to Peer Review appear relatively consolidated, significant gaps emerge in contextual knowledge, transversal competences and methodological and evaluative competences, particularly in relation to organisational complexity, digital transformation and sustainability transitions. Similar challenges have been observed in recent Italian and European experimentation of the Peer Review methodology within VET systems (Fonzo & Evangelista, 2023). The results suggest that operationalising Quality Areas requires conceiving Peer Review as a professional practice grounded in ethical awareness, systemic understanding and advanced evaluative competences. Peers must not merely apply tools and procedures; they must also possess specific competences while embodying the values underpinning quality assurance frameworks (Gutknecht-Gmeiner, 2013). By articulating a structured association between Quality Areas and competences, the proposed model contributes to strengthening the professionalisation of Peers and enhancing coherence between normative principles and evaluative practices within VET systems. The study provides both a conceptual clarification of the competence architecture underlying Peer Review and an operational reference framework to support training pathways, selection criteria and institutional development processes.

Indicators of Youth Condition Within and Beyond Education: Integrating Quantitative and Qualitative Evidence

PANEL CONVENORS: Rita Fornari (Istat, Italy); Luisa De Vita (Sapienza University of Rome, Italy); Marialuisa Villani (University of Bologna, Italy)

PANEL KEYWORDS: Youth Condition, Indicators, Multimethod

The contemporary world is undergoing profound social, economic and digital transformations that are shaping youth cultures, education and democratic participation ever more. Research conducted within the Italian context, alongside international comparisons, has demonstrated the comprehensive nature of these dynamics, which encompass the structural and subjective dimensions of the youth experience. These include educational pathways, labour market participation, socio-economic inequalities, and transitions towards adulthood. It also includes aspirations, cultural practices, social participation, participation in digital environments, engagement in sports and cultural activities, well-being and identity formation. In accordance with contemporary discourse surrounding education and democracies in the era of data governance, this panel invites contributions that facilitate the identification of indicators for the comprehension and comparison of youth phenomena over time and geographical locations. Particular attention is encouraged on issues of intersectional inequalities (e.g., gender, disability, ethnicity, migration) and on the agency of young people in shaping their educational and life trajectories. It is recommended that reflections be given on integrated evidence from surveys, administrative sources, ethnographies, interviews, and participatory qualitative research. The utilization of both survey and administrative data is encouraged to facilitate comprehension of structural conditions. Furthermore, emphasis is placed on the necessity for approaches that capture experiences and perspectives which may elude large-scale quantitative measures. The panel's objective is to facilitate interdisciplinary and inter-methodological dialogue, with a view to enhancing the analytical tools available for understanding young people's experiences within and beyond educational institutions. This contributes to the development of innovative and multidimensional indicators.

GENDERED STRATIFICATION OF RISK: LONG-TERM NEET TRAJECTORIES IN CONTEMPORARY ITALY

Marialuisa Villani (University of Bologna, Italy) · **Luisa De Vita** (Sapienza University of Rome)

NEET | Gender | Transition to Adulthood

In recent years, the NEET (Not in Education, Employment or Training) rate in Italy has declined significantly. Yet this aggregate improvement conceals the persistence of structural inequalities that continue to shape young people's transitions to adulthood. Previous research has consistently identified age and gender as key determinants of NEET risk (Odoardi et al. 2022, 2023; Zanfrini & Giuliani 2023, Van Vugt et al. 2020, 2025). Framing NEET status within a transition to adulthood perspective, this study focuses on gender differences in long-term NEET experiences in Italy (Villani, 2026). The analysis adopts a two-step strategy. First, BES ISTAT indicators are used descriptively to outline regional socio-economic inequalities and to identify structural territorial patterns, particularly in relation to labour market fragility, childcare provision and female employment rates. Second, PIAAC 2023 microdata are employed to estimate the probability of being long-term NEET at the individual level, with separate models for men and women. The relationship between territorial conditions and individual outcomes is therefore interpretative rather than based on a multilevel statistical design. The gendered dimension of NEET status has been widely documented in both Italian and international literature. Our findings confirm that long-term NEET status assumes markedly different configurations for men and women, reflecting asymmetric mechanisms that operate throughout the transition to adulthood. For men, long-term NEET status is primarily associated with the intersection of low parental education, early school dropout and territorial disadvantage (Giancola & Salmieri 2021). Family formation appears, on average, to reduce the probability of remaining long-term NEET, suggesting that fatherhood may function as a factor reinforcing labour market attachment. For women, the configuration differs substantially. Living in the Islands and having children are strongly associated with a higher probability of remaining long-term NEET, even when skills, educational background and social origin are comparable. Education, however, emerges as a significant protective factor. Higher levels of educational attainment reduce the likelihood of prolonged NEET status, consistent with recent OECD evidence showing that young women in Italy tend to experience longer educational trajectories than their male counterparts. Yet this protective effect must be interpreted within a broader framework of gendered structural constraints. Although not directly modelled here, extensive evidence shows that women in the Italian labour

market are disproportionately exposed to temporary, part-time and discontinuous contracts. Persistent labour market asymmetries and unequal returns to education may therefore limit the extent to which educational capital translates into stable employment, especially during family transitions(Rossier & Potarca 2025). The presence of a child significantly increases the probability of long-term NEET status for women, highlighting the asymmetric distribution of care responsibilities (Lantano et al. 2025, Ripamonti, 2025). Overall, these findings point to a gendered stratification of risk in the transition to adulthood. Long-term NEET status does not reflect individual deficits but rather the cumulative interaction between family background, territorial inequalities, gender norms and labour market structures. The decline in aggregate NEET rates thus coexists with the persistence of deeply embedded mechanisms that systematically differentiate male and female trajectories (Villani, 2026).

THE KNOWLEDGE OF EXPERIENCE, THE EXPERIENCE OF KNOWLEDGE: TIME, SPACE AND SUBJECTIVATION IN THE CONTEMPORARY UNIVERSITY

Lorenzo Alvisi (Sapienza Università di Roma, Italy) · **Letteria G. Fassari** (Sapienza Università di Roma, Italy)

Contemporary University | Students | Experience

The sociology of education today tends to offer a fragmented representation of the university experience, fragmented between performance indicators, services, careers and student living conditions. Even institutional surveys, although useful on a quantitative level, return a multidimensional but disjointed image of experience, helping to proceduralize it and reduce it to the sum of measurable variables. This contribution starts from a critique of this fragmentation and proposes to return an integrated vision of the university experience, assuming the concept of experience as a central theoretical category. The objective is twofold. Firstly, the work establishes a theoretical dialogue between Paolo Jedlowski and François Dubet, taking experience as an analytical key to understanding the transformations of contemporaneity. In Jedlowski, experience is embodied and socially situated knowledge, inscribed in a "world taken for granted", but exposed to fractures, crises and historical transformations. The experience changes with the processes of advanced modernity – functional differentiation, acceleration, mediatization – until it is configured as fragmented and devoid of narrative continuity. In Dubet, the sociology of experience focuses instead on the work of the actor who composes different logics of action – integration, strategy, subjectivation – in the absence of a unitary principle.Experience thus becomes the place where the subject produces coherence in the plurality of social rationalities. The comparison between the two authors allows us to articulate two complementary levels: on the one hand, the historical transformation of the conditions of possibility of experience; on the other, the reflective work through which individuals build meaning in fragmentation. Experience is neither an immediate given nor pure interiority, but a relational and historically situated process. The second objective consists in applying this theoretical framework to the specificity of the university institution, proposing an

integration between the temporal and spatial dimensions of experience. If Jedlowski's reflection highlights the centrality of temporality – sedimentation, duration, fracture, discontinuity – our contribution introduces an explicit thematization of spatiality, conceived not as a simple container but as a relational configuration produced by the interweaving of practices, material devices and attributions of meaning. The university experience thus emerges as an interweaving of rhythms and thresholds, accumulations and ruptures, but also as a concrete configuration made up of classrooms, corridors, campuses, digital platforms and hybrid environments. Time and space co-produce each other in a specific ecology of learning and subjectivity. The university is assumed as a place to "experience" in a double sense: a space for the transmission of formalized knowledge and a context for the elaboration of a situated knowledge that goes beyond the official curricula. In this perspective, the university experience appears as a combination of institutional socialization, individual strategies and processes of subjectivation. Methodologically, this implies reconstructing it through biographical accounts, daily practices and analysis of organizational devices, taking the university as a privileged laboratory to observe the contemporary transformation of the relationship between institutional knowledge and knowledge of experience.

BUILDING INDICATORS OF YOUTH POLITICAL ACTIVATION: DESIGN AND INITIAL VALIDATION OF THE RIZOMI QUESTIONNAIRE

Leonardo Parodi (RIZOMI, Italy) · **Francesco Pellettieri** (RIZOMI, Italy)

Youth Conditions | Indicators | Democratic Agency

Situated within the Italian context and aligned with the panel's call for multimethod, indicator-oriented research, this paper presents the design and initial psychometric validation plan of Questionario sull'Attivazione Politica di Rizomi — a youth-focused instrument that operationalizes the construct of Political Activation beyond formal schooling and conventional civic metrics. Building on Rizomi's ongoing mixed-methods action-research (2023–2025) in Genova and La Spezia, the instrument translates a Theory of Change that reframes youth participation as the evolving capacity to: imagine oneself in institutional roles, recognize and prioritize lived urgencies, approach decision-making spaces, and deliberate the consequences of candidacy, including the right to elettorato passivo [1]. Conceptually, the work dialogues with comparative scholarship on youth engagement and competence frameworks, keeping agency, situated opportunities, and the deliberation-to-action passage at center stage [2–5]. Methodologically, the article reports the initial phase of scale development, focused on content and face validity and targeted item revision. First, a Content and Face Validity Analysis ensures coverage of the theoretical domain—six attitudinal dimensions identified in the pilot (political imagination; awareness of urgencies; perceived distance from institutions; perceived knowledge of institutional functioning; resources/knowledge to run; perceived consequences of running)—and prioritizes respondent acceptability and linguistic clarity for 25–35 year-olds in urban Italy. Expert appraisal and cognitive review are used to test definitional breadth and interpretability in relation to established models of democratic competences and youth engagement [2–5,6]. This approach follows classical recommendations in measurement design, using content representativeness and clarity as prerequisites for valid score interpretation [7,8]. Second, Item Revision is guided by pilot evidence: items with low variability (ceiling/floor effects) and weak internal structure in specific factors—especially "Urgency" and "Institutions"—are reformulated or pruned to increase discriminative power and reduce semantic overlap [1]. Proxy analyses conducted on the pilot (73 Likert items) indicate mixed reliability across blocks, with stronger internal coherence for "distance/discomfort" and "how to run" modules, and weaker coherence for "urgency" and parts of "institutions," justifying focused rewriting and consolidation (e.g., merging candidacy intentions by probability/timing rather than by institutional level) [1]. This iterative refinement is consistent with best practice in construct specification and item reduction before confirmatory testing [7]. The contribution advances the indicator agenda in three ways: (a) it specifies a psychometric roadmap for a youth political-activation scale that complements survey and administrative sources; (b) it theorizes activation as a situated progression detectable via hybrid indicators (self-representation in public roles, situated institutional knowledge,

threshold-to-action intentions), capturing experiences that often elude large-scale measures [3–5]; and (c) it reports early quantitative associations — e.g., competence perceptions predicting local candidacy intentions — supporting the instrument's predictive promise and policy relevance for non-sectorial, integrated youth policies for democratic agency [1].

TO BE NEET OR NOT TO BE NEET ... LITTLE WOMEN LIVING IN DISADVANTAGED METROPOLITAN CONTEXTS TELL US ANOTHER STORY

Gabriella Natoli (INAPP, Italy) · **Sandra Burchi** (Independent Researcher, Consultant for Save the Children Italy) · **Silvia Taviani** (Save the Children)

Young Women | Educational Poverty | Gender Stereotypes

The contribution draws inspiration from the results of qualitative research conducted by INAPP, in collaboration with Save the Children Italy, as part of the Nationale Programme "Young Women and Work" co-financed by the European Social Fund Plus (ESF+) 2021-2027. The survey focusing on the condition of young women living in disadvantaged socio-economic conditions and facing educational poverty, covered four Italian metropolitan cities - Naples, Rome, Palermo, and Turin. Based on a number of in-depth interviews and focus groups with experts, the INAPP study analyses the educational paths of girls and young women, paying particular attention to early school leaving and dropout, and to labour and social inclusion processes, viewed through an intersectional perspective of gender (especially), age, class, and territory. Among the many elements collected, several are in line with the key themes of the 4th SD Conference. Here, we want to highlight how the short stories told by the girls reveal a very different reality from the narrative contained in the NEET category, a sort of implicit critical review of the category's representative capacity, inadequate to grasp and make visible the complexity of the lack of participation of young women in education, training, and employment. Moreover, interviews reveal young women who are anything but inactive, providing further evidence of the weakness of the NEET lens. In addition to being "normally" engaged in family care work, as usual marginalized by analysis and policies, these young women are often employed, or rather underemployed, in out-of-home activities, usually poorly (very poorly) paid, in jobs that, presented in all their murky shades of grey, bear the hallmarks of poor quality work. From this perspective, girls' early entry into the labour market, unless accompanied and indeed preceded by appropriate policy interventions, is likely to backfire rather than being a valuable resource for future success and autonomy, on-the-job training in poor work is training to become poor, marginalised, invisible workers. In short, the stories of these girls shift the focus to the shortcomings of the education and vocational training system. Although schools claim to be inclusive, they generate mechanisms of silent exclusion such as the critical transitions between school levels, the cumulative effects of previous gaps, and the difficulty of embracing cultural and linguistic diversity without turning it into stigmatized deficits. For girls, this process of exclusion is intertwined with specific gender barriers - low self-esteem, family expectations, relational control dynamics - that weaken their relationship with the educational institution even before it becomes so fragile with the labour market. The NEET status, as mentioned, is not particularly relevant to the girls interviewed. Far from being the result of an individual choice or failure, it appears to be the outcome of cumulative processes that become entrenched throughout their lives: from early school leavings in primary school to critical transitions between school levels, to the intertwining of girls' expectations, gender stereotypes, family dynamics, and relational control that distances girls from education even before they start seeking for a job.

Inapp (2026), Increase female education and employability in order to overcome gender asymmetries trough the creation of networks of key actors in the education, social services and employment system, as part Nationale Programme "Young Women and Work" co-financed by the European Social Fund Plus (ESF+) 2021-2027

ACTIVE CITIZENSHIP AND EMPLOYABILITY: DEVELOPING COMPOSITE INDICATORS FROM THE ITALIAN UNIVERSAL CIVIC SERVICE

Federica De Luca (INAPP, Italy)

employability | active citizenship | policy evaluation

This paper presents two composite indicators developed within the monitoring and evaluation INAPP programme on the Universal Civic Service (SCU): OKI-INAPP (Individual Employability Index) and ACCI-INAPP (Individual Active Citizenship Composite Indicator). SCU is framed as a policy promoting youth civic engagement and represents, in the Italian context, the first institutional setting to invest explicitly in informal learning outside traditional educational pathways, where young people develop civic, relational and organisational competences through community engagement. The research programme originates from a question that challenges the dominant paradigm of active labour market policies, which has largely identified training as the main driver of employability while overemphasizing the individual dimension and underestimating contextual factors (Yorke, 2006). Is it plausible that higher employability may also be the product of a more conscious and enacted form of citizenship? Can the competences developed through civic engagement function as autonomous drivers of employability? The study hypothesises that the dominant paradigm should be enriched by a dimension that has so far remained largely neglected: active citizenship. This dimension cannot be reduced either to technical competences or to traditionally measured soft skills and should not be considered simply additive to employability. Rather, active citizenship is understood as a constitutive component of employability (De Luca et al., 2019, 2021, 2022, 2024, 2026). OKI-INAPP is a composite index that isolates the individual component of employability across four sub-indexes — education and training, work experience, labour market activation and mobility. This design reflects a precise epistemological choice: separating the individual dimension to make the autonomous weight of contextual conditions. ACCI-INAPP is the individual-level adaptation of the Active Citizenship Composite Indicator developed by CRELL (Hoskins & Mascherini, 2009), reformulated to capture active citizenship as an individual profile across three domains: democratic values, political participation and community life. The research design adopts a mixed-method approach. A qualitative exploratory phase guided the construction of the indicators, while three CATI sample surveys (approximately 3,500 interviews representative of over 45,000 young people, within a longitudinal design) measured the outcomes of the experience across multiple dimensions — employability, active citizenship, employment status and professional reorientation. The OKI index was validated through statistical matching with administrative data from the Ministry of Labour's Mandatory Communications database. The results document democratic effect of SCU participation: employability increases on average by 12% following the experience, across gender, educational level, geographical area and family background. The disappearance of inactive young people and the professional reorientation of almost 20% of volunteers signal activated agency. Controlling for OKI, a young person living in a low-unemployment region has an almost fourfold probability of finding employment compared with a peer in Southern Italy. The most original finding is that active citizenship exerts an autonomous effect on the probability of labour market entry even when controlling for individual employability (+16% employed among young people with high ACCI). From a capability approach perspective (Sen, 1999; Nussbaum, 2011), substantive freedoms should not be considered peripheral variables in the evaluation of youth policies, but rather constitutive dimensions of employability itself.

Intercultural Knowledges and Practices for Democratic Education

PANEL CONVENORS: Massimiliano Fiorucci (Roma Tre University, Italy); Veronica Riccardi (Roma Tre University, Italy); Lisa Stillo (Roma Tre University, Italy)

PANEL KEYWORDS: Intercultural education, Social and epistemic justice, Citizenship

In today's global context—marked by intensified migration flows, rising identity-based closures, and an increasingly polarized public discourse—discussing democratic education without engaging critically with interculturality risks remaining a purely disembodied exercise. Existing inequalities, along with processes of racialization and the progressive hardening of borders, compel us to rethink access to rights, practices of citizenship, and the recognition of plurality— dimensions that have always shaped human histories and the places in which they unfold (Catarci, Fiorucci, 2015; Tarozzi, Torres, 2016). If intercultural education is conceived not as a specific topic but as a constitutive fabric of a democratic perspective, we are called to adopt a critical stance capable of moving beyond a generic rhetoric of "diversity" and situating social and epistemic justice as the overarching framework for meaning and action, starting from the spaces in which learning and training take place (Aman, 2017). This panel therefore aims to explore the intersections between interculturality, migration processes, global citizenship, knowledge reconstruction, and democratic education, viewing educational and social contexts as potentially transformative and critical spaces. Building on these premises, the panel welcomes theoretical and empirical contributions on: Migration and intercultural coexistence Intercultural mediation Narratives and representations of diversity Critical and decolonial approaches to knowledge reconstruction Intercultural competences in educational services Global citizenship education and social justice Intercultural and interreligious dialogue Human rights education Identities and emerging forms of racism Heterogeneity of contexts and intersectionality; Peace education and conflicts management;

INTERCULTURAL URBAN WELFARE AND ACTIVE CITIZENSHIP IN A GRASSROOTS ITALIAN LANGUAGE SCHOOL

Francesca Audino (Università degli Studi di Roma "Sapienza", Italy)

Intercultural education | Democratic education | Community-based learning

In a global scenario characterized by intensified migration flows, racialized public narratives, and growing social polarization, democratic education cannot be conceived separately from intercultural justice. This contribution presents the experience of "Casetta Rossa", a self-managed community space located in Rome and rooted in its local urban context, where an Italian language school for migrants functions as a space for the co-construction of intercultural knowledge and democratic education practices. The contribution is based on a qualitative case study founded on narrative and participatory approaches. Rather than analyzing the language school as a functional integration service, the study interprets it as a critical pedagogical space in which migration, citizenship, and knowledge are continuously renegotiated. Through dialogic practices and collaborative learning, the experiences of the participants, multilingual repertoires, and situated narratives are recognized as epistemic resources (Lave & Wenger, 1991). In this sense, the school challenges assimilationist models and deficit-based representations, contributing to forms of social and epistemic justice consistent with a democratic and intercultural perspective. The experience also highlights a second complementary dimension: the implementation of active citizenship by volunteers—former teachers, retired professionals, and neighborhood residents—who serve as language facilitators. Their involvement does not simply respond to a gap in services, but constitutes a civic practice through which individuals reposition themselves in the public sphere. Teaching Italian becomes a relational and political act, fostering intergenerational dialogue, mutual recognition, and shared responsibility. Both migrants and local residents thus participate in democratic learning processes that reshape their understanding of belonging and collective life. Building on Appadurai's (1996) notion of locality as socially produced and dynamically negotiated, the paper argues that such grassroots educational practices generate emerging public spaces where alternative modes of urban citizenship can take shape. These spaces function as everyday infrastructures of democracy, where intercultural dialogue is not reduced to rhetoric but is realized through embodied encounters, negotiation of differences, and shared problem solving (Biesta, 2011; Amin, 2002). By placing intercultural education within lived urban practices, the contribution proposes a

model of democratic education that goes beyond abstract references to diversity. The case of "Casetta Rossa" suggests that democratic and intercultural education takes shape in situated, relational, and conflict-aware contexts, where knowledge is co-constructed and citizenship is exercised collectively. Community-led language schools can therefore be understood as transformative spaces that connect migration, social justice, and democratic participation in concrete and meaningful ways.

NON-FORMAL EDUCATION AND PARTICIPATORY PRACTICES: INCLUSIVE SPACES FOR INTERCULTURAL AND DEMOCRATIC CO-CONSTRUCTION.

Gaetana Tiziana Iannone (Università degli Studi di Roma Tre, Italy)

non-formal education | interculturality | social justice

In a context marked by intensified migratory flows, processes of racialization, and the polarization of public discourse, interculturality is assumed as a constitutive dimension of a substantive and situated democracy. This contribution adopts a critical stance that goes beyond the rhetoric of “diversity” and situates social and intercultural justice as a framework for meaning and action, illuminating the power asymmetries that cross bodies, borders, and forms of knowledge (Catarci & Fiorucci, 2015; Tarozzi & Torres, 2016; Aman, 2017). From this perspective, non-formal education (NFE) is understood as an intentional, flexible, and contextual pedagogical-political space capable of generating transformative learning through dialogic and participatory practices (Schugurensky, 2020; Romi & Schmida, 2019). It is rooted in Dewey’s idea of experience as the matrix of knowledge and democracy as a form of associated living (Dewey, 1916/1938), in Kolb’s experiential learning cycle (1984), and in Freire’s emancipatory pedagogy founded on dialogue, conscientization, and praxis (Freire, 1970/2018). These frameworks interweave with key contributions from the Italian tradition of popular education. Dolci’s reciprocal maieutics (1988; 1996) highlights dialogue as a tool for shared planning and nonviolent social transformation. Lorenzetto (1963; 1994) situates adult literacy within the context of lifelong education and active citizenship, while the experiences of don Milani and don Sardelli show how the spoken word and educational relationships can become devices of dignity and empowerment within marginalised contexts. In the European landscape, instruments for recognizing non-formal and informal learning (EQF; Cedefop 2009–2016; Eurydice, 2024) offer opportunities to valorize intercultural, relational, and civic competences developed in real-life contexts. However, challenges persist due to territorial heterogeneity, fragmented regulations, and barriers to access, particularly for vulnerable groups. Hence, integrative strategies are proposed, such as co-designing intercultural skills with communities and services, creating forms of mediation rooted in local proximity networks, and developing community-based micro-credential systems. Three case studies highlight the operational nature of NFE as a situated practice of social justice. At the Valdocco Oratory, within the Universal Civil Service, cooperative workshops involve young people with diverse backgrounds, fostering responsibility, nonviolent conflict management, and interreligious participation. At the Matera Penitentiary Institute, artistic workshops and the production of the magazine S-catenati support identity reconnection processes for incarcerated people and migrants. Within the Reception and Integration System of the Municipality of Latina, the Theatre of the Oppressed and the workshop “Mothers Without Borders” enable migrant women and victims of trafficking to engage with performative devices of speech, self-narration, and mutual support, revealing through an intersectional lens the entanglement of gender, migrant status, and socio-economic vulnerabilities. Building on these experiences, non-formal education emerges as a pedagogical and political space capable of generating situated learning and expanding opportunities for democratic participation, fostering the creation of intercultural and democratic environments. The educational and humanizing process that sustains it challenges traditional rigidities and hierarchies, promoting models rooted in participatory democracy, social cohesion, and attention to context.

PUBLIC UNIVERSITIES AS SPACES OF RESISTANCE: A STUDY OF AN INTERCULTURAL INITIAL INDIGENOUS TEACHER EDUCATION PROGRAM IN NORTHEASTERN BRAZIL

Jessica Aguiar (Università Degli Studi di Roma Tre, Italy)

Intercultural Education | Indigenous Teacher Education | Decolonial Curriculum

Across Latin America, educational debates have been deeply shaped by struggles over land, language, recognition, and the democratization of knowledge (Diaz R, et al., 2009). In this context, intercultural education has developed as a political and pedagogical project connected to Indigenous movements and broader claims for social justice. In Brazil, where colonial and racial hierarchies continue to structure access to rights and educational opportunities, intercultural education is closely linked to emancipatory pedagogies and justice-oriented frameworks (Freire, 1987; Tarozzi, 2015). It represents not merely a curricular adaptation, but a transformative horizon aimed at confronting structural inequalities and epistemic subordination (Candau & Russo, 2010; Furtado et al., 2024). This paper presents a case study of the Programa de Formação de Professores para a Diversidade Étnica (PROETNOS), developed at the State University of Maranhão (UEMA), a public university located in Northeastern Brazil. The program is dedicated to the initial education of Indigenous teachers who will work in their own community schools. It emerged in response to Indigenous political demands for differentiated schooling grounded in interculturality, bilingualism, and the right to cultural self-determination (Guerrero, 2007). The research is situated within the interpretative qualitative paradigm (Geertz, 1973), assuming intercultural citizenship as a system of meanings constructed within educational contexts. This perspective is articulated with a Freirean critical-emancipatory framework (Freire, 1987), oriented toward examining power relations, recognition processes, and the dynamics of marginalization embedded in teacher education. Methodologically, the study is based on documentary research analyzing institutional regulations and Pedagogical Course Projects (PPC) of the intercultural undergraduate degrees offered within PROETNOS. The analysis was conducted through Content Analysis and Thematic Analysis, supported by Atlas.ti software to structure categories and identify semantic interrelations across documents. The theoretical framework draws on critical interculturality (Walsh, 2009), distinguishing it from functional approaches that acknowledge diversity without transforming hierarchical structures (Corbetta, 2020). It also engages with reflections on curriculum transformation and pedagogical mediation (Fleuri, 2001; Fiorucci, 2020), as well as with decolonial perspectives that challenge eurocentric epistemologies and the coloniality of power within education (Tavares, 2014; Matos, 2024). Findings reveal that PROETNOS operates within tensions between national educational regulations and Indigenous community projects. Nevertheless, it illustrates how a public university can act as a space of resistance when it reconfigures its curricular structures to incorporate Indigenous languages, epistemologies, and community participation. Rather than limiting itself to inclusion within an existing monocultural framework, the program seeks to restructure initial teacher education through a decolonial and intercultural lens (Walsh, 2009). In doing so, it contributes to a broader project of social justice that connects access, recognition, and epistemic redistribution (Tarozzi, 2015). The case demonstrates that, in the Brazilian and Latin American context, public universities can become institutional arenas where democratic renewal, Indigenous protagonism, and curricular transformation intersect (Aguiar, 2025).

MEDIATIONS AND EPISTEMIC AGENCY IN HIGHER EDUCATION AT THE AMAZONIAN TRIPLE BORDER

Gabriela Bravo Vargas (Università degli Studi di Padova, Italy) · **Alessio Surian** (Università degli Studi di Padova, Italy)

decolonial pedagogy | epistemic agency | Amazonian triple border

This research proposes a situated case study (Yin, 2018) at the Colombian Amazonian triple border in Leticia - next to Brazil and Peru - aiming at understanding how forms of epistemic, pedagogical, and political agency are produced among historically excluded subjects. The study analyzes the pedagogical, cultural, and institutional mediations involved in the production, circulation, and legitimation of knowledge, particularly within territorially oriented higher education programmes (Mato, 2012). The category of "mediation" is understood as the set of mechanisms, instruments, relationships, and practices operating between subjects, knowledges, institutions, and territories, enabling or constraining knowledge (co)production and circulation. From this perspective, mediation is not conceived as a neutral process of translation, but rather as a space of epistemological dispute shaped by power relations, coloniality, and disobedience (Mignolo, 2000). Rather than approaching the territory as exceptional or "exotic," this research treats it as a significant case capable of illuminating principles that are transferable to other border and migration contexts. In particular, it seeks to rethink pedagogy beyond restricted notions of "interculturality," often reduced to multicultural or inclusion-based frameworks. Instead, pedagogy is conceptualized as a formative process oriented toward knowledge coproduction, autonomy, emancipation, and social transformation, especially for subjects experiencing systemic oppression (Escobar, 2020; Walsh, 2009; hooks, 2021). The study is situated within the fields of critical pedagogy, critical interculturality, and decolonial pedagogy. It engages with the tradition of engaged sociology and Latin American emancipatory education, particularly the contributions by Orlando Fals Borda (2015), Paulo Freire (2008), Carlos António Brandão (2003). It also draws on scholarship on sociocultural mediations and decolonial epistemologies to examine how institutional and political conditions structure access to and recognition of knowledge in higher education (Mato, 2012). Methodologically, the research adopts a qualitative approach based on case study and Participatory Action Research (PAR) (Yin, 2018; Fals Borda & Rahman, 1991). Data collection combines in-depth semi-structured interviews, focus groups, participant observation, and document analysis. Fieldwork is organized in three phases: an initial exploratory stage; a more extended and in-depth phase; and a final stage focusing on restitution of findings and community dialogue, oriented toward collective projection and action. The case presented is linked to the Universidad Nacional de Colombia' Special Admissions Programme with a Territorial Approach aimed at young people, including members of Indigenous communities. This allows for examining how generational, pedagogical, and institutional mediations operate within a transborder Amazonian context. The project seeks to contribute to rethinking pedagogy in crossborder settings (Anzaldúa, 2016) beyond frame-

works of inclusion or hospitality, recognizing historically oppressed subjects as epistemic and political actors and proposing transferable principles for higher education and social transformation in other crossborder and migratory contexts.

PERFORMING IDENTITY AND AGENCY THROUGH PARTICIPATORY THEATRE: THE RAMPA PRENESTINA EXPERIENCE WITH ROMA YOUTH

Aurora Bulgarelli (Link Campus University, Italy)

Roma Youth | Non-formal Education | Partecipatory Theatre

In the EU Roma Strategic Framework for Equality, Inclusion and Participation 2020–2030, the European Union has identified several strategic areas within which Member States are called upon to act in order to improve the living conditions of Roma and Sinti populations and promote their effective social inclusion. The three fundamental pillars of the framework concern equality, inclusion, and participation of Roma communities. However, the historical relationship between majority societies and Romani populations has long been marked by deeply rooted prejudices that have contributed to constructing a cultural opposition between “us” and “them” (Bravi, 2009; Burgio, 2015). This relationship has largely been monological. Drawing on the distinction between the I–Thou and I–It relations elaborated by Martin Buber, Roma and Sinti communities have often been reduced to objects of social representation rather than recognized as fully legitimate interlocutors within the public sphere. The outcomes of this marginalizing relationship are documented in numerous reports. European data present a critical picture: although Roma and Sinti communities constitute the largest ethnic minority in Europe—estimated at between 10 and 12 million people (European Commission, 2020)—they continue to experience significant forms of marginalization. In the city of Rome, such marginalization is spatially configured through the presence of Roma camps and peripheral urban areas and is also reflected in processes of identity representation, both subjective and collective. The Romani populations remains exposed to multiple and intersecting forms of exclusion and discrimination operating across different domains: educational (early school leaving and limited educational opportunities), social (employment, housing, and economic conditions), and political (citizenship and social recognition). These dynamics contribute to a condition of multidimensional marginality. Within this context, the role played by organizations and association operating at the local level becomes particularly significant, as they perform several functions, including an educational one. The aim of this contribution is to present the experience developed by Rampa Prenestina, a cultural and social promotion association that, since 2013, has been active in the eastern area of the city of Rome, promoting non-formal educational activities connected to the social, political, and identity-related issues affecting the Roma community. More specifically, through identity workshops and participatory theatre—conceived as a pedagogical device of subjectiva-

tion—processes of self-representation, critical re-elaboration of lived experience, and identity redefinition are fostered at both individual and collective levels, grounded in the analysis of participants' social and identity-related needs. In this way, young participants become active subjects in a process of conscientization (Freire, 1968/2018) generated through the theatrical experience, enabling them to articulate the meaning of their identities within the societies in which they live while promoting processes of social transformation. Through semi-structured interviews conducted with educators from the association—of both Roma and Italian backgrounds—the study examines the approach adopted in working with young people from Roma camps. In this context, theatre and identity workshops emerge as alternative dialogical spaces within which to reflect on the politics of identity, typically articulated by subaltern and marginalized groups (hooks, 1994).

URBAN AESTHETICS AND INTERCULTURALISM: BANKSY'S CONTRIBUTION TO CONTEMPORARY DEBATE

Alessandra Casalbore (Università Roma3, Italy)

Art | Interculturalism | Banksy

Art, in its many forms of expression, is a privileged educational tool for promoting training courses from an intercultural perspective. Its nature as a universal language allows it to transcend the cultural boundaries within which it is produced, opening up spaces for encounter and dialogue between individuals with different experiences, identities and affiliations. Like a game of mirrors, a work of art is born from the mind of the artist but, once created, it becomes an autonomous entity that lends itself to multiple interpretations, conditioned not only by the originally intended message, but also by the experience, emotional state and cultural background of the viewer. Within this system of references, artistic products take on the characteristics of universal assets, part of humanity's heritage to be protected and passed on. Art thus becomes a space for mediation, a privileged place for encounter—and sometimes confrontation—between different cultures, religions, historical periods and social positions. Over the centuries, these encounters have generated continuous cross-fertilisation, constituting the lifeblood of artistic evolution. As Favaro and Luatti point out, "in visual art, cross-fertilisation is the encounter of elements that were originally unrelated, which coexist to give rise to new horizons of meaning" (Favaro & Luatti, 2004, p. 321). From this perspective, cross-fertilisation becomes an educational resource: "the proximity of the other, if we allow ourselves to be cross-fertilised, becomes a stimulus for the growth of each individual and for the enrichment of their identity" (Pastò, 2005, p. 131). The experiential dimension of art, emphasised by Dewey, makes it a powerful tool for knowledge: it is inseparable from everyday life, which "intensifies the sense of immediate living" (Dewey, 1995, p. 9). Hernández also reiterates that knowledge can derive from artistic experience, understood as a genuine form of learning (Hernández, 2008, p. 90). In education, this link makes art a privileged context for developing observation, imagination, critical thinking and creative skills. This is the backdrop against which street art has emerged, transforming itself from a marginal and often illegal practice into one of the most incisive artistic languages of our time. Unlike museum works, urban art is created in public spaces, interacts with the city and reaches a diverse and unselected audience, becoming an immediate, accessible and democratic means of communication. Banksy, in particular, emblematically represents this process: through the use of iconic, easily recognisable images charged with political and social tension, the artist has transformed local walls into global symbols. The online dissemination of his works amplifies the intercultural potential of street art, making visible issues that are shared on a global level—from inequality to migration, from armed conflict to environmental protection—and promoting the construction of a transnational collective imagination. Street art,

therefore, is not only an aesthetic expression, but a universal language capable of stimulating critical awareness, connecting different communities and confirming the role of art as a bridge between cultures, generations and experiences.

THE DECOLONIZATION OF KNOWLEDGE IN EDUCATION: A CORNERSTONE FOR A PLURICULTURAL AND DEMOCRATIC SOCIETY

César Carrillo-Trueba (Facultad de Ciencias, Universidad Nacional Autónoma de México, Mexico)

intercultural education | pluriverse in classroom | pluriculturalism and democracy

We live in a pluricultural world, composed of a mosaic of societies that possess their own ways of life, languages, arts, histories, and knowledge—ways of being in the world rooted in territories with which they have maintained a long-standing relationship, such that they are inextricably intertwined in what Bruno Latour terms "nature-culture." Many of these peoples, after years of struggle against colonialism and the oppression of nation-states, have achieved conditions that allow them to preserve their way of life and have gained recognition for their cultural expressions, language, and traditions. However, in such recognitions there is often a component that is absent or mentioned only superficially: their mode of knowing—that is, the way in which knowledge is generated, transmitted, and applied within their communities—and its validity in the so-called contemporary world. Why is this the case? The hypothesis presented here is that this phenomenon stems from the enormous prominence that science has achieved and maintained to this day through its complete integration into social life and culture. Born in the midst of the Renaissance in the burgeoning cities of Europe, science and technology soon became a central element in the domination of the rural world by the then-emerging bourgeoisie—peasants were considered "ignorant and illiterate (rustici)," as they were later in the European empires' colonization of the world, and faithfully accompanied, in the second half of the 20th century, the developmentalist theory that facilitated the persistence of these (now neocolonial) relations of domination to the present day. Its growth is due to this close relationship between science and power. In this evolution, the attributes that characterize it have been shaped by an expansionist narrative; it is therefore, intrinsically and structurally, an institution with a marked colonial bias and neocolonial overtones. It is underpinned by robust narratives, including those used to silence dissent, as is currently the case in universities across the United States. However, as a social construct, science is not monolithic; it bears the imprint of other perspectives—from scientists who sought to combat such bias, and from others who believed in its promises to improve the world. In short, it also reflects certain traits that have been established and maintained in the society in which we live: pluralistic, heterogeneous, with humanistic undertones, complex, and inclined to be oriented in opposition to power. It is this latter aspect that forms the basis for an intercultural dialogue of knowledge. Even so, given its claim to truth, its scope, and its power (rooted in ubiquitous technology), it has overwhelmingly dominated all other forms of knowledge (from the humanities and the arts to the knowledge possessed by so-called non-Western peoples, including that of European peasants). To such an extent that, in most intercultural education projects, the dilemmas of how to approach science are often a stumbling block that cannot be avoided. Hence the need to decolonize science in order to decolonize knowledge in the broadest sense. This presentation offers a proposal for reflection and discussion in this regard.

THE EDUCATIONAL PATHWAYS OF YOUTH WITH A MIGRANT BACKGROUND IN ITALY: A SCOPING REVIEW

Charaf El Bouhali (Università degli Studi di Padova, Italy)

Social Justice Education | Critical Pedagogy | Educational Trajectories

This contribution concerns a scoping review as an integral part of an extensive doctoral research, which focuses on the educational experiences of people with a migrant background in Italy. The phenomenon of interest being explored is related to the meanings and interpretations that the latter attribute to their educational path, with a focus on the integration process and the key turning points. The research involves people with a migrant background who have already completed their schooling. The research questions are therefore as follows: R1: How do young adults with a migrant background interpret their schooling experience in Italy ex post? R2: What meanings do young adults with a migrant background who were educated in Italy attribute to the role of school in their integration process? R3: What events or conditions had a decisive impact (turning points, if any) on the integration trajectories of young people with a migrant background? The theoretical framework is provided by Social Justice Education (SJE), which promotes a critical approach through an interdisciplinary, intercultural and intersectional perspective. To identify the cross-cutting and recurring elements found in the literature and to identify gaps in academic research, a scoping review was conducted through the EBSCO, Scopus, and Web of Science databases employing the PRISMA method. Inclusion and exclusion criteria were based on full-text accessibility, abstract in English and sources relevant and consistent with the research. It is also worth highlighting some limitations of this systematic review, linked to language and selection biases. The two search strings investigated are as follows: 1st: migrants AND integration AND school experiences 2nd: TI (school experiences) AND migrants AND integration The two search strings yielded 339 results from the three platforms, reduced to 269 after removing duplicates (n=70). After reviewing the abstracts and removing articles that are not fully accessible (n=245), 24 articles were identified for full analysis. The articles resulting from the search were sorted through the Software Zotero. The analysis of the articles is still ongoing. So far, at least four recurring and cross-cutting themes can be identified in the selected contributions: In the process of constructing otherness, school norms and customs tend to reproduce implicit models of ethnic belonging that favor the majority population. Some studies highlight how students with a migrant background develop hybrid identities; Language and daily interactions in schools can become vehicles for stereotypes and processes of symbolic exclusion of students with a migrant background, particularly toward so-called “racialized” individuals; Several studies highlight how teachers’ expectations can be influenced by stereotypes linked to students’ migrant origins. It should be noted, however, that some teachers have also played a positive, supportive role in students’ educational journey; Students with a migrant background experience both explicit and implicit forms of discrimination. Nevertheless, they also develop coping strategies and forms of resilience, thanks in part to family support. To sum up, achievement or failure at school for people with migrant background is the result of multiple interconnected levels bearing in mind the intersection of ethnicity, social class, gender and migrant status.

INTERCULTURAL EDUCATION AND ADOPTIVE FAMILIES. NAVIGATING BETWEEN ORIGINS AND NEW IDENTITIES

Stefania Lorenzini (Università di Bologna, Italy)

adoption | intercultural education | dialogue

Criteria and competences important for the intercultural pedagogical-educational perspective are fundamental in the way of conceiving and experiencing both national and international adoption within the family and beyond. Decentralisation, observation, listening, dialogue and gradualness can be applied to the specificities of the adoption experience, calling on affectively and educationally significant adults to welcome the peculiarities of the children. Transitioning from the initial mutual estrangement to relationships characterised by intimacy, familiarity, feelings of mutual belonging, without concealing the origins in different human and cultural contexts. This contribution focuses on aspects of this important field by means of a theoretical reflection that has been developed thanks to a prolonged research experience that made it possible to collect through semi-structured and in-depth interviews testimonies of parents and especially of young people of different origins adopted in Italy.

INTERCULTURAL EDUCATION: COHEN-EMERIQUE'S CULTURAL SHOCK METHOD FOR TEACHER TRAINING

Chiara Cocchi (Università degli Studi di Genova, Italy) · **Francesca Lagomarsino** (Università degli Studi di Genova, Italy) · **Nadia Rania** (Università degli Studi di Genova, Italy)

Intercultural competence | Teacher training | Cultural shock method

In recent years, the need to respond to the growing cultural complexity of schools has led to the explicit formulation of the concept of intercultural competence, replacing a more generic reflection on interculturality and its related practices. Intercultural competence is conceived both as an educational objective addressed to students, as future citizens, and—prior to that—as a set of professional skills required of teachers, who are called upon to operate in contexts characterized by a plurality of forms of belonging that go far beyond geographical origin or migratory experience (Contini, 2023). Over time, this need has led to the development of various training tools within the social sciences. The contribution presented here is situated within this perspective and introduces the cultural shock method developed by social psychologist Margalit Cohen-Emerique in the field of social work, drawing on the critical incident technique (Flanagan, 1954). Observing the difficulties faced by practitioners in integrating anthropological knowledge transmitted by experts into their everyday professional practice, the scholar emphasized the need to conceive alternative training approaches based on non-hierarchical learning processes and rooted in participants' lived experiences, enabling them to develop greater sensitivity in perceiving and recognizing differences. The method invites practitioners to conceptualize the analysis of experiences of emotional and/or cognitive disorientation occurring in helping relationships as an opportunity for decentering with respect to their implicit representations. Only after this initial stage of awareness of the relativity of one's own point of view is it possible to move on to questioning the interlocutor's frame of reference, understood as that of a concrete individual rather than the expression of an ethnic or national culture, and finally to negotiation. This phase focuses on the search for concrete solutions aimed at addressing specific problems, rather than remaining at a value-based or ideological level. Although the Italian translation of Cohen-Emerique's works (2016, 2017) has contributed to the dissemination of the cultural shock method within social work, its application remains limited, and its potential does not appear to have been fully explored in related fields such as education, where a lack of systematicity in intercultural approaches persists despite the proliferation of institutional documents at multiple levels (Tarozzi, 2015; Stillo, 2020; Contini, 2023). Drawing on research–training pathways (Asquini, 2018) carried out over the past two years with social workers, healthcare professionals, and university students at the University of Genoa, this contribution presents some results from the application of the cultural shock method and discusses its transferability to teacher training. The proposed approach aligns with empirical literature highlighting the strong demand among teachers for support in the development of reflexivity, enabling them to find—individually and together with others—their own pathways within relational contexts that are unique and situated.

Is There a Role for Arts-based Education in Tackling Educational Poverty and Social Exclusion?

PANEL CONVENORS: Ienya Camozzi (University of Milano-Bicocca, Italy); Ahson Kemal (University of Helsinki); Zenia Simonella (University of Milano-Bicocca, Italy)

PANEL KEYWORDS: Arts based education, social inclusion, multicultural societies

Serious forms of social injustice and educational poverty are becoming increasingly prevalent in Western democracies partly due to the progressive weakening of political and cultural institutions. To combat these forms of exclusion and to strengthen the relationship between democracy and citizenship, which is slowly eroded by the neo-liberal capitalist exploitation, arts-based education has been promoted by UNESCO and the European Union suggesting the introduction of new forms of open and horizontal learning especially in educational contexts. The aim is to promote cultural literacy and the development of cultural awareness to foster dialogue and inclusion of young people, especially those in multicultural contexts. However, these policy recommendations – which can appear ambiguous or functional to the neoliberal education – have been locally reinterpreted to combat social exclusion. Infact, engaging subaltern subjectivities, especially young people with a migrant background, is one of the key aims of this participatory form of education adopted by formal and informal educational institutions. Arts are indeed viewed as a means of creating open, horizontal learning environments in which young people can explore their subjectivity, share values, emotions and representations, strength cultural differences awareness and acquire suitable knowledge and competencies to effectively exercise citizenship. The purpose of this panel is to welcome scholars working in arts-based education who have developed works with children and young people, particularly those with a migrant background. Contributions on national-level policies and practices, case studies on formal and non-formal educational contexts, as well as on arts-based education and decolonization learning processes are welcomed.

ART THERAPY FOR SUPPORTING ETHNIC IDENTITY WITH ROMA MINORS. DISCUSSION OF A CASE IN THE CITY OF MILAN, ITALY

Ida Castiglioni (University of Milano Bicocca, Italy) · **Silvia Mornati** (Brera Academy of Fine Arts, Milano, Italy)

Cultural recognition | Roma education | Art Therapy

This paper presents an art-based educational and therapeutic project developed primarily by Roma activists, reflecting broader forms of Roma civil rights mobilization and community self-advocacy documented across Europe (Kóczé & Ryder, 2019), aimed at fostering children's awareness of their ethnic and cultural identity. While the long-term goal is the preservation and intergenerational transmission of Roma cultural heritage, the project also promotes the development of a bicultural identity (Roma and Italian), although most families already hold Italian citizenship. The issue at stake is therefore not formal citizenship but symbolic recognition and the possibility of negotiating multiple belongings within a context of structural marginalization. The project was carried out during the 2023/2024 academic year at the COT (Center for Temporary Hospitality) on Via Novara in Milan and involved approximately fifteen Roma children of different ages. The families experienced severe disruption following the dismantling of long-established camps where extended family networks had lived together. Over the past four decades, Italian municipalities have concentrated Roma populations—often citizens not formally recognized as a minority—into peripheral "camps." These environments are associated with systemic marginalization, informal economies, precarious housing conditions, and high levels of school dropout, as highlighted in socio-institutional analyses of educational inequality (Besozzi, 2017). Within this context, school attendance is often intermittent due to material constraints and mobility patterns. The current EU Framework for National Roma Integration Strategies (NRIS) (European Commission, 2020) promotes the dismantling of camps in favor of individual housing solutions; however, many Italian Roma families resist such arrangements, expressing a preference for communal living. This tension reveals a crucial point: educational inclusion cannot be addressed solely at the level of the individual child or family but must engage broader community structures and forms of social organization. In response to these challenges, the Brera Academy of Fine Arts, through its Artistic Therapeutics course and in collaboration with the association Upre Roma, designed an art workshop centered on Romani fairy tales. The project was conceived as a symbolic act of cultural recognition. Stories were read collectively and illustrated by the children with the support of trainee students and educators. The drawings were later transformed into sculptural and installation works, translating graphic

gestures into three-dimensional forms and enabling collective reinterpretation of narrative imagery. The methodological approach prioritized process over technical skill, emphasizing experiential engagement with materials, relational quality, and the expressive capacities of each participant (Leavy, 2018). The workshop fostered empowerment during a period of transition and instability, increasing agency within structurally unequal contexts (Thompson, 2015). The resulting artworks were exhibited at the Del Sarenge Festival—the first Roma festival, held in Milan—offering public visibility to narratives that often remain marginalized. Drawing on interviews with participants and organizers, the paper discusses outcomes and challenges, highlighting the potential of arts-based educational practices to address educational poverty and social exclusion through identity support, community engagement, and the creation of inclusive public spaces.

THE PŘEDLICE SUBURB THROUGH THE EYES OF CHILDREN. THE ROLE OF ART EDUCATION IN A LOW-THRESHOLD CLUB IN THE SOCIALLY EXCLUDED LOCALITY IN THE CZECH REPUBLIC

Vendula Fremlová (Charles University Prague, Czech Republic (Czechia))

Art education | Low-treshold club | Public space

This paper presents the findings of a sub-case study from the international research project CliViE (Cultural Literacies' Value in Europe) Horizont Europe. The case study took place in the first half of 2025 at the low-threshold club Mixér run by People in Need in Předlice, the suburb of Ústí nad Labem (Northern Bohemia), known as one of the largest social ghettos in the Czech Republic. As part of the study, we sought to give a voice to children from this marginalized community (primarily Roma children) and, through a series of creative workshops, explore their views on life in the city. Together with them, we sought to find answers to the following questions: How do children perceive the phenomenon of the city and public space? What are their experiences of life in this particular neighborhood? Are they interested in public space? The contribution will focus on the visual analysis of the resulting artifacts (drawings, Polaroid photographs) together with an analysis of interviews conducted with clients of the low-threshold center. It will also focus on the analysis of professional discourse in this area. Research of professional materials shows that activities supporting the development of artistic and creative sensitivity, i.e., the general development of cultural competencies in socially excluded localities, are framed therapeutically. This is demonstrated by theses written at the faculties of education of various Czech universities and specialist books on art therapy (Blabolová, 2011; Hroudová, 2022; Kenardžievová & Havránková, 1996), in which art is not primarily perceived as a form of education and personal development with significant positive consequences for the community and social environment, but as a form of therapy. The results of creative workshops focused on reflecting on the city (the excluded locality of Předlice, Ústí nad Labem) together with subsequent unstructured interviews showed that children, clients of low-threshold facilities, may have different starting positions and socioeconomic situations than children from the majority society, but they are able to define the positive and negative aspects of the place where they live. They are able to think about its past and present and further process these topics using artistic means according to their own abilities and skills. Their life situation does not automatically predetermine them for therapeutic or diagnostic procedures within the framework of artistic or general cultural activities and workshops, within the framework of art education. The workshops and their outputs also show that art education activities can be an important tool for building a relationship with public space and developing cultural literacy.

IMAGINING POSSIBLE FUTURES AFTER THE FLOOD: PARTICIPATORY ARTISTIC PRACTICES FOR CLIMATE JUSTICE AND SOCIAL INCLUSION

Valentina Cappi (University of Bologna, Italy) · **Lorenza Villani** (University of Bologna, Italy) · **Melissa Moralli** (University of Bologna, Italy) · **Pierluigi Musarò** (University of Bologna, Italy)

art-based education | flood | climate justice

This paper originates within the Horizon project “Alphabetica - Activating learning paths: holistic arts-based education and training for inclusion and cultural awareness” and presents the results of a study aimed at exploring the role of participatory artistic practices in fostering processes of social inclusion, critical awareness, and climate justice among adolescents (aged 11–14) in three lower secondary schools in Emilia-Romagna affected by the May 2023 flood events. The floods are framed not as isolated disasters but as symptoms of wider systemic crises requiring a rethinking of educational and cultural paradigms. Within this context, young people are understood as intersectionally vulnerable: disproportionately exposed to climate risks across class, gender, and geography (Cripps, 2022; Sultana, 2022), and simultaneously marginalized through epistemic and intergenerational injustices that infantilize them and exclude them from decision-making arenas (Thew et al., 2020; Singh et al., 2025). The pilot action involved 80 students across three distinct territorial contexts: an urban neighborhood in Bologna affected by river overflow, a mountainous Apennine area marked by landslides and infrastructural isolation, and the Emilia-Romagna lowlands characterized by widespread flooding. Through an open call, three artistic projects were selected to operate in these contexts: a performative workshop which, through body listening, visual collage, and creative writing, culminated in a public march as a form of symbolic reappropriation of the territory; a photography-based project centered on the manipulation of flood images through tearing and recomposition in order to build a layered collective visual memory; and a collective comics workshop that produced an anthology conveying the complexity of the flood experience through adolescent perspectives. Through questionnaires, participant observation, focus groups with students, and the co-production of artistic materials (Leavy, 2015), the research explored the capacity of artistic practices to translate traumatic experiences and to give voice to embodied, extra-academic forms of knowledge (de Sousa Santos, 2016). Preliminary findings highlight three relevant dimensions: (1) the development of critical and relational skills through collective creative processes in which students experienced horizontal forms of collaboration that challenge dominant adult-centric logics; (2) the ability of the arts to connect personal memory and systemic reflection, transforming trauma into a lever for deeper awareness of socio-environmental inequalities; and (3) the construction of new alliances among schools, artists, and local communities as sites of care and cultural transformation (Singh et al., 2025).

ART-BASED EDUCATION AS A MODEL OF SOCIAL INCLUSION IN LATVIA

Anita Stasulane (Daugavpils University, Latvia) · **Alina Romanovska** (Daugavpils University, Latvia)

theory of change | social inclusion | art-based education

This presentation examines the findings of field research conducted within the framework of the Horizon Europe programme research project “Cultural Literacies’ Value in Europe” (CLiViE) (No.101132285). Currently, social inclusion and tolerance face major and growing challenges across Europe. In Latvia, the tensions between ethnic and linguistic communities have intensified, partly exacerbated by the geopolitical pressures generated by Russia’s war on Ukraine (Budrytė 2023). The research project CLiViE responds directly to these challenges by applying a theory of change methodology (Connell and Kubisch 1998; Harris 2005) to support meaningful social transformation towards social inclusion. While it is

possible to apply a theory of change from different perspectives and in different ways, this study focuses on sector or target group theory of change, i.e., the research is focused on how change happens when activities are implemented within a target group (Reeler 2007). This presentation analyses activity “The Other in Art and Life” addressed to young people, implemented in collaboration with non-academic organisation, namely, Marko Rothko Museum in Daugavpils (Latvia). The activity engaged youth aged 16-18 (n=30) recruited from diverse cultural and linguistic backgrounds, including Latvian, Russian, and Belarusian-speaking families. Based on a theory of change, the researchers locate this activity within a wider analysis of how change comes about, draw on external learning about development and how change happens at different levels, and articulate their understanding of change. The theory of change as an approach demonstrates the importance of understanding both what changes it is helping to bring about and also how those changes happen. The study conducted in Latvia shows how non-formal art-based education can function as a platform for social inclusion. Through creative practices young people encounter multiple perspectives on ways of living in the world. These encounters can challenge dominant narratives, stimulate critical reflection and deepen empathy by allowing learners to inhabit experiences different from their own. Arts-based pedagogies also encourage co-learning, collaboration and learner agency, providing spaces where young people can explore cultural diversity in dialogic and transformative ways. The research conducted in Latvia shows that cultural literacy fosters critical awareness, empathy and the ability to navigate diverse social environments, all of which are essential for constructive intercultural dialogue, and social inclusion. Cultural literacy enables learners to interpret cultural meanings, question assumptions and understand how identities are shaped within social, historical and political contexts. These abilities are essential for fostering productive intercultural dialogue and for cultivating the attitudes of openness, curiosity and respect that underpin mutual understanding. In diverse societies, such competencies can help counter polarisation, reduce prejudice and support the broader goals of social cohesion and tolerance. By equipping young learners with the tools to interpret cultural differences thoughtfully and respectfully, art-based educative initiatives contribute to mutual understanding and help counteract stereotypes, prejudice and exclusion.

"LO SPETTACOLO SIAMO NOI": EVALUATING THE EFFECTS OF A PHILOSOPHY AND THEATRE PROGRAM IN MIDDLE SCHOOLS

Lisa Zaquini (ASVAPP, Italy) · **Francesca Anglois** (ASVAPP, Italy) · **Giacomo Ferrato** (ASVAPP, Italy) · **Jessica Balbo** (ASVAPP, Italy)

impact evaluation | civic education | philosophy and theatre

Civic education has recently been reintroduced into the school curricula of all levels. Ministerial guidelines (MIM, 2024) outline a very broad framework covering various themes, leaving class councils the task of developing a specific curriculum for each class, involving students in 33 annual hours. Some middle schools in Genoa and the surrounding areas have taken the opportunity provided by the project "Lo Spettacolo Siamo Noi" (LSSN, in English “We are the show”), supported by the Edoardo Garrone Foundation, to engage their students in a program that combines the production of a theatrical performance with philosophical reflections, according to the practice of Philosophy for Children (PFC; Bevilacqua e Casarini, 2021). The objective is to involve students in a journey of youth leadership that develops both critical and creative thinking while simultaneously strengthening teamwork skills. The idea of involving students in an intensive artistic program stems from an increasingly substantial body of literature highlighting the multiple benefits of various art forms in terms of health, support for social cohesion, and well-being (Fancourt D, Finn S., 2019). The program consists of 15 sessions (11 theatre and 4 PFC) and is led by experts in PFC methodology alongside actors and directors from Teatro del Piccione. Since the 2024/25 school year, the project has involved 24 classes across 15 schools – most of which located in disadvantaged contexts – and is accompanied by an analysis aimed at estimating—using a counterfactual

approach (Martini e Sisti, 2009)—the program's impact on ten dimensions of interest. These are measured through a questionnaire administered to students, covering: interpersonal behaviour, listening skills, the ability to ask questions, argumentation skills, emotional intelligence, self-determination, school well-being, creativity and curiosity, artistic aptitudes, and cultural engagement. During the first year, research activities were dedicated to identifying outcome variables, developing the questionnaire, and testing the organizational framework. The 2025/26 school year is instead dedicated to the counterfactual analysis involving 24 "treatment" classes and 27 "control" classes using a difference-in-difference design; the questionnaire is administered to all students both before the start of activities and upon completion. The research design is completed by a questionnaire administered to teachers of the treatment classes—aimed at identifying satisfaction and critical issues of the proposed intervention—and a questionnaire for teachers of the control classes, designed to record the civic education program implemented in classes not involved in the intervention. This contribution intends to describe the proposed program, the research design, and the preliminary results of the analysis.

PARTICIPATORY ART AS AN EDUCATIONAL TOOL FOR CO-CONSTRUCTING KNOWLEDGE WITH ADOLESCENTS: THE EXPERIENCE OF THE SOTTOBANCO PROJECT

Sara Luraschi (Università degli studi Milano Bicocca, Italy)

arts-based education | gender and sexuality education | social justice

This is an ongoing research project that presents a case study, the participatory art project Sottobanco, in which art-based methodologies are used to promote sexual and emotional education among adolescents. The main aim of the research is to explore the link between the artistic and educational processes, and their ability to enhance the quality of the experience and transform social conditions. This research also aims to highlight the importance of creating educational spaces based on consent and mutual care, in order to encourage the participation of individuals who struggle to find a space for expression and action within the school system. From a methodological point of view, the ongoing research is conceived as a case study that uses as tools an auto-ethnographic diary, interviews, collages and photographic documents of the process. Sottobanco is conceived by artist Tea Andreoletti and produced by the Orlando Festival of Visual and Performing Arts in Bergamo, and involves the creation of a performative installation that imagines a self-managed sex and emotional education class set up in the public space of Piazza della Libertà in Bergamo during the Orlando Festival that will be held in May 2026. Sottobanco is co-created with two groups of students aged between 16 and 18 who come from areas that are usually marginalized in terms of cultural activities, namely the upper Seriana Valley and in the eastern plain of the province of Bergamo. It arose from the need to find creative and collective responses to the growing restrictions imposed on sex and emotional education in schools and to bring the knowledge of adolescents into the public arena, opening up the walls of the classroom. Sottobanco involves the creation of a temporary community based on consent and collective responsibility, made up of adolescents and the adults involved (the artist herself, an intern from the Academy of Fine Arts, an educator and a researcher), who share rules, urgent issues on sexuality and practices to navigate the world of affections. The project embraces a broad vision of sexuality (cognitive, emotional, physical and social) and an intersectional view of gender and aims to promote the self-determination of each person in pursuing their own sexual well-being. Gender and sexual orientation can become factors in social exclusion due to systematic discrimination, stereotypes and cultural norms that limit opportunities for women and members of the LGBTQIA+ community, especially for young people. The use of participatory art has both ethical and aesthetic aims and seeks to create a collectively negotiated space of social engagement that can reduce discrimination and epistemic injustice.

NEW WAYS OF LEARNING INCLUSION: DANCE-BASED METHODOLOGIES TO FOSTER REFLECTIVE WAYS TO THINK ABOUT DIVERSITY

Chiara Paolino (Università Cattolica del Sacro Cuore, Italy) · **Daniela Aliberti** (Università Cattolica del Sacro Cuore, Italy) · **Greta Brizio** (Università Cattolica del Sacro Cuore, Italy)

dance-based learning | inclusion | affect

Mainstream approaches to diversity, equity, and inclusion (DEI) in organizations often rely on formal training and cognitive learning models that struggle to address the complexity of marginalization and inequality. Recent scholarship highlights the limitations of traditional diversity management programs, which tend to produce limited behavioral change and may even generate resistance (Dobbin & Kalev, 2022). In response, researchers have increasingly explored experiential and arts-based pedagogies as alternative ways to foster reflexive learning about diversity and inclusion (Springborg & Ladkin, 2018; Meltzer, 2022). Building on this perspective, this paper investigates how dance-based learning methodologies can enable participants to reflect critically on inclusion, marginalization, and diversity. The study examines nine workshops organized across three editions of an Italian dance festival dedicated to artistic experimentation and education between 2023 and 2025. Workshops were led by professional choreographers and combined movement-based inquiry, embodied reflection, and dialogical exchange. The research adopts an affective ethnographic methodology (Gherardi, 2017; Holck & Villeseche, 2023), allowing the researchers to capture the socio-material and emotional dynamics emerging during the workshops. Data collection included participant observation, audiovisual field notes from recordings of workshops and informal interactions, and semi-structured interviews with participants and choreographers. This approach enables the study to explore how embodied practices, emotions, and relational encounters shape learning processes related to inclusion. The findings identify a three-stage process through which dance-based methodologies foster reflective learning about diversity. First, workshops create what we conceptualize as authenticity grounding, a mode of interaction that prioritizes direct human engagement, simplicity of communication, and shared vulnerability. Choreographers organize learning prompts through embodied metaphors, inclusive imagery, and the deliberate staging of tensions or contradictions within artistic practices. These socio-material cues activate a second layer of mechanisms based on affective responses. Participants report experiences of alertness, empathy, and attunement, which together foster emotional engagement and relational awareness. Affective responses enable learners to access personal memories, confront discomfort, and develop new sensibilities toward difference. These affective dynamics subsequently trigger generative connections, cognitive processes that allow participants to reinterpret social categories, question normative assumptions, and read relational dynamics within collective settings. Through contrasts, embodied observation, and shared reflection, participants engage with themes such as gender, race, power relations, and exclusion in ways that differ from conventional diversity training. Ultimately, these mechanisms produce a reconceptualization of inclusion as a continuous learning process, rather than a static competence or organizational policy. Participants learn to recognize power relations embedded in everyday interactions and to legitimize individual biographies as sources of knowledge about marginalization and belonging. By unpacking the mechanisms through which dance-based pedagogies activate reflective learning about diversity, this research contributes to debates on arts-based education and inclusive learning. It demonstrates how embodied practices can challenge the limitations of traditional DEI training by creating spaces where emotional, relational, and cognitive dimensions of learning intersect. In doing so, the study advances our understanding of how arts-based methods can support more critical, participatory, and socially responsive forms of education aimed at addressing inequality and fostering democratic learning environments.

Lifelong Guidance Against Social Inequalities: Toward Integrated Policies

PANEL CONVENORS: Eleonora Scrivo (ActionAid International Italia Ets, Italy); Annalisa Buffardi (Indire- Istituto Nazionale di Documentazione, Innovazione e Ricerca Educativa)

PANEL KEYWORDS: lifelong guidance, social inequalities, policy integration

Career guidance plays a crucial role in shaping social inequalities. It significantly impacts educational paths, the school-to-work transition, and an individual's entire working life. Proper guidance can prevent students from dropping out, help young people find jobs that match their potential, and support workers through career changes and adult education. Despite its importance, we are far from having integrated policies that enable lifelong guidance. This includes the continuous acquisition of career management skills and access to decoded information on training and the labour market. This lack of integration is largely due to fragmented guidance services and poor coordination between the institutional systems responsible for it. For example, in Italy, there is not coordination effort between the ministries overseeing education and universities, and the ministry in charge of active labour market policies and the regions. This panel seeks contributions exploring the following dimensions, from a sociological, pedagogical, psychological, philosophical, political science perspective. Scientific contributions, both in theory and empirical research, related to the following issues will be considered: Studies and research on the role of guidance in creating or preventing lifelong inequalities. How the three guidance areas (school, school-to-work transition, employment) interact. What their common grounds and specificities are. What the current state and evolution of the relationship between the different institutional systems at European, Italian, and local levels is. The relevant European best practices that can be mentioned. The approaches (e.g., capability, human rights-based, etc.) that can best frame the concept of lifelong guidance.

NARRATING LIFE PATHS FOR SOCIAL INCLUSION: THE DIMMI PROJECT AS A GUIDANCE STRATEGY IN ADULT EDUCATION CENTRES

Marianna Capo (Università degli Studi Mediterranea di Reggio Calabria, Italy)

lifelong guidance | capability approach | narrative pedagogy

Abstract Within the contemporary landscape of lifelong guidance policies, countering social inequalities requires approaches that go beyond mere information delivery, focusing instead on promoting individuals' substantive freedoms. From this perspective, this contribution is situated within the framework of the Capability Approach (Sen, 1999; Nussbaum, 2011) and interprets guidance as a tool for social justice (Cedefop, 2025). The aim is to enable the 'capacity to aspire' (Appadurai, 2013) in individuals affected by biographical discontinuity. In Italy, Provincial Centres for Adult Education (CPIA) are currently configured as laboratories for educational innovation and hubs for active citizenship (Indire, 2025). These centres represent diverse contexts where managing educational asymmetries requires pedagogy that is sensitive to the complexities of migrants' lived experiences (Zoletto, 2024). However, guidance for these adults often suffers from institutional fragmentation, which risks leading to deskilling pathways. This paper analyses the 'DiMMi – Diari Multimediali Migranti' (Migrant Multimedia Diaries) project as a narrative guidance model aimed at countering these marginalising pressures by enhancing the student's 'narrative capital'. In line with the current trends in Italian intercultural pedagogy (Fiorucci, 2024; Silva, 2025), self-narration is regarded as a vital career management skill. Practising multimedia autobiography using the autobiographical method (Demetrio, 1996) enables individuals to reconstruct the fragmented elements of their educational history and transform them into valuable resources for future planning and development. This study explores a training workshop designed for CPIA teachers, structured around three key dimensions of the call. Prevention of marginalisation: storytelling counters social invisibility and fosters recognition of prior skills which are often misinterpreted by the labour market. Integration between systems: the DiMMi model promotes territorial networks between schools, libraries and the third sector, anticipating the coordination between institutional systems recommended by integrated European policies. Development of reflective skills: transitioning from memory to multimedia narration enhances reflexivity and digital skills, both of which are essential for autonomy throughout life. Particular

attention will be paid to describing the 'territorial reading committees' model, in which learners are directly involved to foster civic agency. In conclusion, this study demonstrates how the DiMMi method provides a pedagogical approach to empowering migrants (Fiorucci, 2024). Proposing narration as a lifelong guidance tool promotes a democratic school that places the right to storytelling at its centre, which is a prerequisite for overcoming asymmetries and social inequalities.

LIFELONG GUIDANCE AGAINST INEQUALITIES: WHY ITALY'S NON-SYSTEM FAILS AND WHAT REFUGEE PATHWAYS REVEAL

Diego Boerchi (Università Cattolica del Sacro Cuore, Italy)

Careers guidance system | Career guidance counsellors | Refugees

Lifelong guidance is often presented as a key tool to reduce social inequalities, but in Italy it still operates within a fragmented "non-system" rather than within integrated policies. In schools, guidance is frequently occasional and deadline-driven, linked to administrative requirements more than to structured career management skills' education. Moreover, the absence of dedicated experts and shared standards is compounded by highly inadequate indicators of effectiveness. The situation does not improve in the context of labor market policies, where guidance is commonly reduced to mere job placement. Organizational incentives and performance indicators favor quick and measurable outputs instead of quality and sustainable career outcomes. As a result, coordination between education, training, employment services, and third sector organizations remains weak. Information on training options and labor market rules is often not sufficiently "decoded" for users, and responsibility for guidance is widespread but not clearly owned: guidance tasks are delegated to staff who cover them because of role proximity, without solid methods, common tools, or specific accountability. In this context, a frequent "solution" is improvisation: prescriptive interventions focused on immediate choices and short-term jobs, where practitioners decide for the person instead of strengthening agency, self-efficacy, exploration, and responsible decision-making. The situation of refugees makes these structural problems visible in an amplified way. Refugees face multiple and overlapping transitions (legal status, language, recognition of qualifications, social networks, and implicit workplace norms) that require continuous, integrated guidance. Available evidence suggests that structured career counselling can enhance transferable resources such as career adaptability and both work self-efficacy and job search self-efficacy. However, when guidance is mainly delivered by reception staff or active labor market policy operators without specific training in career guidance, practice tends to follow the immediate demand for employment. In these cases, many potentially formative experiences in the host country are not transformed into career capital: skills remain unrecognized, vocational interests stay weak or poorly differentiated, outcome expectations are unstable, and choices are made with limited information. This increases the risk of deskilling and of being trapped in marginal labor market segments, producing quick but fragile integration. Refugee pathways, therefore, should not be treated as a niche topic. They work as an indicator of the overall robustness of a lifelong guidance system. The core implication is a shift from fragmented services to integrated lifelong guidance policies: clear professional profiles, shared standards across school and employment sectors, evidence-based training, multi-professional teams, and evaluation metrics that include quality, coherence, and sustainability of outcomes, not only contrast to early school leaving placement.

GUIDANCE AS A RELATIONAL AND TRANSFORMATIVE PRACTICE: THE EXPERIENCE OF CHOICE GUIDANCE DESKS

Nicolò Bongiorno (Send ETS, Italy) · **Loriana Cavaleri** (Send ETS, Italy)

lifelong guidance | social inequalities | transitions

Guidance in educational and career choices plays a key role in tackling social inequalities, as it shapes educational and professional trajectories, decision-making capacity, and access to opportunities. In socio-economically vulnerable contexts, the lack of guidance often reinforces existing inequalities, limits the range of perceived options, and pushes individuals toward "probable" paths rather than those aligned with their interests and potential. By contrast, an accessible and integrated lifelong guidance system helps widen horizons and supports the development of agency across the life course. This contribution presents two complementary experiences: the "Sportello Orientamento di Quartiere - SPOQ" (Neighborhood guidance desk), designed as local hubs for young people and adults in vulnerable situations, and the Choice Funnel Desks, implemented in more than ten upper secondary schools across Sicily. In both settings, our guidance approach combines three key dimensions: self-exploration (interests, desires, values), contextual understanding (education and training pathways, labour market dynamics, rights and services), and the development of realistic yet flexible action plans. Our experience shows that requests for guidance go well beyond school choice: they often involve economic pressures, access to employment, interrupted transitions, returns to education, and the redefinition of life plans. In this sense, guidance helps prevent long-term inequalities by reducing information gaps, strengthening confidence and agency, and framing disorientation as a meaningful step in rethinking one's future. Rather than pushing students toward early or predefined decisions, we support a progressive clarification of options, allowing uncertainty, anxiety and exploration to become part of the learning process through a gradual focusing that remains open-ended and reversible, while maintaining a strong relational dimension to accompany individuals in exploring possible futures and identifying those they find truly desirable. Hence, the guidance practitioner emerges as a "reflective guide" and "bridging figure" with psycho-pedagogical competencies, networking skills, and updated knowledge of education, training, and the labour market. A further issue addressed is the fragmentation of guidance services. Positioned at the crossroads of schools, training systems, social services, the third sector, and active labour market policies, guidance often suffers from a lack of coordination, leading to overlaps or gaps in support—especially for those in disadvantaged conditions. Send ETS desks act as bottom-up integration points, identifying needs, translating information, and activating well-grounded referrals to local services and opportunities, thus contributing to the creation of local support networks within an educating community framework. The paper concludes by reflecting on the implications for integrated lifelong guidance policies, arguing that effectiveness depends not only on the quality of relational practices, but also on the ability to ensure continuity and coordination across institutions, within a rights-based and/or capability-oriented perspective.

LIFELONG GUIDANCE AS TERRITORIAL GOVERNANCE: THE COMMUNITY EDUCATIONAL PACT OF TRAPANI AS INFRASTRUCTURE FOR REDUCING EDUCATIONAL AND SOCIAL INEQUALITIES

Aurelia Bonura (Università degli studi di Palermo, Italy)

Community educational pact | educational guidance services | educational policies

This paper offers a theoretically grounded and critically informed socio-pedagogical analysis of the Community Educational Pact "School, University, Territory: for Quality Guidance", promoted at the University of Trapani within a broader research programme on territorial governance and integrated educational policies. The study is framed within the paradigm of lifelong guidance understood both as a social right and as a strategic educational infrastructure aimed at mitigating structural inequalities. It rests on the assumption that guidance is not an ancillary service but a constitutive mechanism shaping educational trajectories, mediating school-to-work transitions, and influencing access to social participation and life chances. In response to the institutional fragmentation that characterizes the Italian educational and welfare system—where schools, universities, active labour market policies, and local authorities often operate through parallel and weakly coordinated governance logics—the Trapani Pact is conceptualized as a multi-level integrative dispositif. It formalizes a structured network connecting schools, higher education institutions, territorial authorities, and socio-economic actors, with the objective of constructing a territorially embedded guidance ecosystem capable of supporting students and young adults throughout the educational lifecycle and across key transitional phases. The Pact involves all 23 upper secondary schools in the area and 26 territorial institutions, including the Prefecture, municipalities, the Diocese, the Provincial Health Authority, the Regional School Office, the Department of Education and Vocational Training of the Sicilian Region, law enforcement agencies, judicial bodies, and Sicindustria. Given the breadth of its inter-institutional network and the systemic ambition of its objectives, the initiative represents a distinctive case within the national context. It functions as an integrated educational governance arrangement oriented toward the coordinated and co-designed provision of services, resources, and opportunities for students. Findings emerging from the case indicate that, when embedded in a collaborative and territorially anchored framework, guidance can evolve from an episodic and primarily informational activity into a continuous process of empowerment. This transformation is grounded in the development of career management competences, the critical interpretation of educational and occupational opportunity structures, and the strengthening of territorially situated social capital. Within this framework, the Pact operates as a collaborative governance instrument integrating school-based, transitional, and employment-oriented guidance, thereby overcoming sectoral fragmentation and fostering institutional co-responsibility. Based on a qualitative analysis of foundational documents, implemented actions, and preliminary empirical evidence from the ongoing research, the paper identifies both enabling factors and structural constraints of the model. It also reflects on its transferability and its capacity to address educational and occupational inequalities in a socio-economically fragile territorial context. The contribution concludes by advancing a theoretical reflection on lifelong guidance as an integrated public policy domain, engaging capability- and rights-based approaches, and proposing the Community Educational Pact as a laboratory of institutional innovation oriented toward social justice and the democratization of educational and professional opportunities.

REGIONAL POLICY STYLE IN CAREER GUIDANCE: BACH VERSUS COLTRANE (OR VENETIAN STRUCTURE VERSUS LOMBARD EXPERIMENTATION)

Ester Bonomi (Università degli Studi di Milano La Statale, Italy)

careerguidance multilevelgovernance policystyle

Note: This proposal aims to present the results of my PhD research project. Lifelong guidance has gained renewed relevance in Europe as education systems, labour markets, and welfare institutions are asked to support increasingly complex educational and occupational transitions. Yet, as a policy domain located at the boundary between education/training and active labour market policies, career guidance remains comparatively under-explored through the lenses of mainstream public policy analysis. The research try to address this gap by analysing regional career guidance policy instrument mixes in Italy and explaining their variation. This level of governance is strategic as the "middle tier" (Hooley & Godden, 2022), where the abstract objectives of the EU and the national level are translated into concrete actions through territorial planning and coordination with local public and private entities, which are essentially the "street-level" implementers (Lipsky, 1980). The study asks: (RQ1) which policy instruments constitute the regional career guidance instrument mix, and (RQ2) what explains the variation in these mixes. It adopts a most similar systems design by selecting two comparable regions - Veneto and Lombardy - which share high levels of socio-economic development, similar labour market and education-training structures, social stratification, political alignment, and exposure to European influence, yet display markedly different approaches to career guidance policy design. Methodologically, the research combines content analysis of policy documents with 43 semi-structured interviews with key stakeholders involved in career guidance governance and delivery (regional officials, accredited providers, social partners, and institutional actors). The theoretical framework builds on the classic concept of policy style (Richardson, 1982; Howlett & Tosun, 2021) and reworks it at the subnational level as regional policy style (Knodt, 1997), drawing on a multidimensional model that links: (i) ideological subculture as a foundational driver; (ii) policy paradigms (how the problem is conceptualised); (iii) governance (patterns of actors' relationships and coordination); and (iv) administrative style (standard operating procedures and the day-to-day translation of political priorities into action). The central hypothesis is that collaborative, programmatic, and politically stable regional settings tend to produce more coherent mixes, whereas weaker problem definition, fragmented governance, and less participatory administrative styles tend to generate fragmented mixes. Findings show a clear divergence: Veneto exhibits a comparatively coherent and integrated instrument mix, anchored in a small number of key regional laws, clear organisational structures, and the strategic funding of territorial networks and dedicated guidance measures—supporting regional steering and system-wide integration. Lombardy, by contrast, displays a more complex and fragmented mix, characterised by a larger number of instruments, multiple coordination venues, and a strong emphasis on individual choice and public–private competition consistent with a regulated quasi-market paradigm; this creates weaker integration across measures, while also leaving room for experimentation and innovation in specific policy windows. Overall, the analysis confirms that distinct regional "institutional personalities" - evoked metaphorically as Veneto's "Bach-like" orchestration versus Lombardy's "Coltrane-like" improvisation - help explain why similar contexts yield different instrumental configurations, highlighting the often-underestimated role of governance and political continuity in shaping coherent policy mixes.

SEMANTIC INEQUALITY IN LIFELONG GUIDANCE: TOWARD A FOURTH POLICY LEVEL

Annunziata Di Lecce (ASNOR Associazione Nazionale Orientatori, Italy) · **Annie Pontrandolfo** (ASNOR Associazione Nazionale Orientatori, Italy)

semantic inequality | lifelong guidance | structural conditions

Guidance systems across Europe address inequality through service access and information provision, assuming the main obstacle is informational. Both research and practice challenge this premise. Within the life design paradigm (Savickas et al., 2009; Savickas, 2019), career guidance supports people in constructing biographical narratives across transitions. Yet a critical question remains underexplored: what makes such construction possible, or impossible, for those whose resources have been eroded by structural disadvantage? This contribution, grounded in systematic reflective practice (Schön, 1983) within ASNOR's national network across school, school-to-work transition, and employment services, identifies a form of inequality that existing frameworks do not name. Practitioners consistently observe a recurring pattern: people arrive at guidance encounters with adequate information but without conditions to integrate it biographically, disorientation rather than orientation. The adverse conditions are not informational but biographical: material deprivation, relational abandonment, social marginalisation, cultural isolation. Drawing on Bourdieu's (1986) analysis of how structural disadvantage becomes embodied in dispositions, and Floridi's (2014) account of how information saturation erodes the capacity for meaning, we propose semantic inequality: the unequal distribution of conditions under which people can access, process, and regenerate meaning at life transitions. Within Nussbaum's (2011) capability framework, this constitutes a capability failure: the deprivation of conditions for practical reasoning and autonomous life planning. Sultana (2014) locates the problem in the rationalities determining who guidance systems serve. Semantic inequality makes this concrete: when guidance requires interpretive resources that people lack as a precondition, it reproduces the injustice it claims to address. Neurocognitive evidence democratises this argument. Merleau-Ponty's (1945) phenomenology establishes that meaning arises through the lived body, not a disembodied mind. We draw a democratic claim: if meaning-making is bodily, its foundation is universally shared; what is unequally distributed are the conditions for its exercise. Panksepp and Biven's (2012) research on the SEEKING system shows that when conditions are adverse, people lose the motivational drive to engage with biographical possibilities. Memory reconsolidation research (Lane et al., 2015) shows that biographical narratives can be reorganised, but only under relational safety that environments must provide. These findings ground the policy argument: if meaning-making requires specific conditions, designing them is not an optional service but a structural obligation. EU lifelong guidance guidelines (ELGPN, 2015) address service access, information quality, and institutional coordination. We propose a fourth level: the structural design of conditions under which universal meaning-making capacity is activated across the guidance system. This requires a prior act: policy must first recognise what erodes that capacity, poverty, isolation, absence of recognition, before designing conditions to restore it. This directly addresses the individual responsibility gap CEDEFOP (2025) identifies as unresolved. The framework generates four outcomes: a sensitizing concept (Blumer, 1954) for research, a diagnostic question for every service node - do the conditions for meaning-making exist here? - reframing quality from information delivered to conditions created, a fourth policy level, and a systemic design principle. This paper advances the design of guidance systems where every person is seen before being served.

Migrant-background Youth in Education: the Role of Policy and Practice in (Re)producing and Challenging Inequalities

PANEL CONVENORS: Berenice Scandone (Polytechnic University of Milan, Italy); Giulia Marroccoli (Polytechnic University of Milan, Italy)

PANEL KEYWORDS: migration, inequalities, policy and practice

As societies become increasingly multiethnic, education systems are confronted with the democratic responsibility of ensuring equal access to meaningful learning for migrant-background youth. While educational rights are formally guaranteed, these young people often experience less favourable outcomes than their native peers, including lower grades and attainment, and overrepresentation in less prestigious educational and vocational tracks. Although important variation exists across countries and among migrant groups, these disparities contribute to the intergenerational reproduction of educational and socioeconomic inequalities along ethnic lines. Research highlights significant barriers for immigrant-origin youth, most prominently socioeconomic disadvantage and limited familiarity with the country's language and education system. Yet, studies focusing on the school context and practices also evidence how Eurocentric curricula, uneven capacities among educators to work with linguistic and cultural diversity, discrimination in grading and educational advice, and the concentration of migrant-background students in certain schools can exacerbate educational inequalities. Against this backdrop, this panel seeks to examine the role of educational policies and everyday practices in either (re)producing or challenging inequalities linked to migration background. We invite contributions from a range of disciplinary and methodological perspectives, with a particular interest in empirically grounded research. Proposals may address how national and local policies, teaching and learning practices, guidance and support, and institutional norms, as well as the interplay among them, shape learning opportunities, educational stratification, and progression at different levels. We also welcome analyses of inclusive or innovative programmes or practices that support migrant-background youth and promote more equitable educational pathways.

MIGRANT-BACKGROUND GAPS IN MATHEMATICS BEFORE UPPER SECONDARY TRACKING: EVIDENCE FROM TIMSS 2023

Giada Viotti (Roma Tre University, Italy; INVALSI) · **Giulio Lucentini** (Università degli studi di Macerata; Sapienza Università di Roma)

Migrant background | TIMSS 2023 | mathematics education

Democratic education is grounded in the idea that initial differences can be transformed into genuine learning opportunities (Dewey, 1916; Sen, 1999). Yet, school contexts may nonetheless function as sites where inequalities become entrenched (Freire, 1970), particularly when educational pathways formally diverge, as in the transition to upper secondary education, when students are channelled into distinct tracks (Boudon, 1974). As the limits of a purely formal "giving everyone the same" notion of equality have become evident over time (Sen, 1999; Nussbaum, 2011), SDG 4 of the United Nations' 2030 Agenda (United Nations, 2015) promotes a shift towards equity as the education system's capacity to transform uneven/different starting points into effective learning opportunities by adapting time, tools, and forms of linguistic, instructional, and relational support. Among the differences shaping today's classrooms, students' migrant background makes particularly visible the risk that diversity is interpreted as a limitation rather than a resource (Lüdemann & Schwerdt, 2012; Sprong & Skopek, 2023). In Italy, in the 2024/2025 school year, students without Italian citizenship accounted for 12.2% of the school population (864,425 students), almost four times higher than in 2002/2003 (2.7%) (Save the Children, 2025). These numbers reflect different biographies, ranging from migration trajectories to language transitions, and they may face inclusion conditions that are not always equivalent (Dronkers & de Heus, 2012). Moreover, these dynamics often intersect with students' socio-economic and cultural background (ESCS), a key driver of inequality that does not simply overlap with migrant background but interacts with it (Dronkers et al., 2012). When initial differences risk turning into inequalities, mathematics often brings competence gaps into sharper relief, because it builds cumulatively and relies on language as well as the formalisation and interpretation of symbolic notation (National Research Council, 2001). To map the size and the direction of these gaps in Italy, this work draws on IEA TIMSS 2023 mathematics data. TIMSS assesses mathematics achievement in three cognitive domains – knowing, applying, and reasoning (Philpot et al., 2021) – and enables achievement to be linked to student background characteristics collected

through the Student Questionnaire, including socio-economic and cultural status (ESCS) and migrant status. Focusing on Italian Grade 8 to capture the migrant gap immediately before students enter different upper secondary tracks, the study aims to (i) estimate the migrant-background gap across the three mathematics cognitive domains, (ii) assess whether it persists after controlling for ESCS, and (iii) test an ESCS-by-migrant-status interaction within each domain. Confirming the positive association between ESCS and achievement, our preliminary findings shows that the migrant-background gap persists across all domains even after controlling for ESCS, and that it is more pronounced in reasoning than in knowing. Interaction models further suggest heterogeneity in the strength of the association across migrant groups, with a wider gap observed in reasoning. Although these findings require replication and further analysis, they offer a strating point for identifying areas of greater vulnerability and for informing reflections on the instructional and organisational conditions needed to make mathematics learning more accessible and equitable.

THE SEGREGATION OF MULTILINGUAL CLASSROOM ASSISTANCE IN SPECIAL EDUCATION

Denis Tajic (Stockholm university, Sweden) · **Carlos Rojas** (Stockholm university, Sweden)

Multilingual Classroom Assistance | Special Education | Segregating Deflection

General description on research questions Special educational support and special needs educators are commonly separated from work with students in the intersection of migration and special educational needs. While the Salamanca Statement on Special Needs Education of 1994 introduced the imperative of accommodating all children regardless of conditions, including those related to language and related marginalized positions, as part of an updated approach to special education, this has not been the case. In Sweden, where this study is situated, staff supporting newly arrived students, such as multilingual classroom assistants (MCAs), are organized separately from the team supporting students with special educational needs (Tajic & Bunar 2023; Tajic, 2024). Previous research, moreover, show how half of the special needs educators do not get involved with newly arrived students in Sweden, while many would like to (Johansson et al. 2021). The aim of this study is to explore how responsibilities for students situated at the intersection of migration, multilingualism and special educational needs are organised and negotiated across multilingual and special educational support practices in Swedish schools. The study builds on interviews with school staff across four municipalities in Sweden. Results make visible how responsibilities are displaced between multilingual support and special educational support, resulting in students' needs at their intersection remaining insufficiently addressed. Findings are analysed through Nancy Fraser's tripartite critical social justice theory (Fraser, 1995, 1998; Fraser et al., 2004; Fraser & Honneth, 2003), interpreting segregating deflection as a manifestation of structural inequalities related to recognition, redistribution and representation within broader societal stratification and discrimination, highlighting how such dynamics may contribute to uneven conditions of support for students with migration backgrounds. Methodology The study draws on semi-structured interviews with 18 special needs educators, principals, and multilingual classroom assistants across four Swedish municipalities with comparable demographic profiles. The empirical material is examined through reflexive

thematic analysis (Braun & Clarke, 2022), enabling attention to patterns of meaning across participants' accounts concerning how responsibilities for students situated at the intersection of migration and special educational needs are articulated, negotiated and organised. The analysis is theoretically informed by Nancy Fraser's tripartite critical social justice theory, which conceptualises justice as parity of participation across cultural, economic and political domains. Fraser's framework directs attention to processes of misrecognition, whereby certain groups are positioned as culturally devalued; maldistribution, referring to unequal access to resources and professional support; and misrepresentation, concerning limited participation in decision-making and institutional voice. Attention to these interconnected dimensions supports an understanding of segregating deflection as a multidimensional institutional phenomenon situated within structural conditions shaping practice. Fraser's framework thus provides a lens for examining how organisational arrangements within Swedish special education may reproduce differential conditions for participation, shaping the provision of support for students with migration backgrounds. From this perspective, problematisations of migration evident in school practice can be understood as conditioning micro-level decisions on educational support, contributing to limited assessment and provision for students from migrated families despite articulated needs (Rojas, 2026).

GLOBAL PARENTS REARING GLOBAL CHILDREN. THE ROLE OF CHILDREN'S EDUCATION IN FAMILY MIGRATION DECISION-MAKING.

Marta Cristina Azaola (University of Southampton, United Kingdom) · **Jay de los Reyes** (University of Southampton, United Kingdom) · **Chun Hong Yan** (University of Southampton, United Kingdom)

Family migration | children's education | migration network

This paper examines the role of children's education in the lives of migrant families. The study includes both low- and high-skilled migrants who moved either to secure better futures or to improve their career prospects abroad. Ten parents from four Asian countries, all living in the UK, participated in in-depth interviews. Guided by migration network theory and concepts of social and ethnic capital, the study is framed around four UN Sustainable Development Goals: living conditions in the host country (Goal 1), quality of education (Goal 4), girls' education and opportunities (Goal 5), and expectations for children's future employability (Goal 8). Findings show that parents value the UK's student-centred, inclusive approach, which they see as superior to the exam-driven systems in their home countries. Families benefit from free, high-quality public education, which would often require costly private schooling back home. Children's schooling also strengthens parent-child relationships and expands families' social networks through school engagement, enhancing their family and community belonging. Overall, regardless of socioeconomic background, children in migrant families become globally oriented learners equipped to compete in the global economy.

FROM THE "SEGREGATED SCHOOL" TO THE "INTERNATIONAL SCHOOL": COUNTER-NARRATIVES TO CHALLENGE STIGMA AND INFORM POLICIES

Sara Giannoni (Università di Torino, Italy) · **Valentina Moiso** (Università di Torino, Italy)

School segregation | Counter-narratives | Community-based participatory research

In Italy, school population is increasingly reflecting and amplifying the unequal distribution of population across urban areas, particularly with regard to ethnic composition. School segregation has therefore emerged as an issue of scientific and political debate, guiding local policies, interventions and innovative educational programs focused on combating educational disadvantages or attracting white, middle-class families. Rarely has the very definition of the problem been questioned, nor how it may contribute to reinforcing a negative representation of schools considered to be segregated. The present study is part of an ongoing action research aimed at addressing the so-defined condition of segregation in five comprehensive school institutes located in the Turin northern area. This district has the highest share of non-Italian residents in the city and it's linked in public discourse to images of urban decay and insecurity. Schools located here suffer from the territorial stigma associated with the neighbourhood, compounded by the specific stigma of being schools mainly attended by pupils with a migrant background, "frontier schools", considered to be of lesser quality and unsuitable for native Italian students. Drawing on an emancipatory social science perspective, the action research employed a community-based approach that integrated participatory methodologies; the voices of those living these school contexts were foregrounded, with the aim of eliciting their definitions of the situation and supporting a process of collaborative knowledge production. The research combined in-depth interviews and focus groups with principals and teachers, participant observation, and participatory workshops conducted within Communities of Practice to investigate their representations of the marginalised position they occupy within the Turin school system and the symbolic resources through which this position is negotiated and contested. The label and framing of segregated schools as a problem is rejected by school actors, along with the countermeasures that typically follow from it. From schooling daily practice, a self-representation emerges that conflicts with the external narrative: moving from a deficit-based to a strength-based view, multilingualism, intercultural communication and life skills become resources to be enhanced both in school practice and narrative, asserting their social relevance. These counter-narratives were articulated in the "Manifesto for an Intercultural and International School", the result of collective reflection carried out in the Communities of Practice. Here, alternative values and principles are translated into actions aimed at supporting intercultural teaching, fostering global citizenship competences, strengthening pupils' voice and agency and promoting the certification of non-EU languages. By mobilising the framework of internationality, schools' practical and symbolic resources seek to gain legitimacy in the public discourse, overturning the hierarchy to which they are currently confined. In this process of recognition, however, students in intercultural and international schools keep clashing with a standardised system of knowledge and skills assessment, which continues to disadvantage their life paths.

SYSTEMATIC BARRIERS TO UNACCOMPANIED MINORS' EDUCATIONAL RIGHTS: A BOTTOM-UP CASE STUDY FROM FRIULI VENEZIA GIULIA (ITALY)

Andrea Mattia Marcelli (Department of Human and Social Sciences, Universitas Mercatorum (Italy); Borderland Education Network, Gorizia (Italy)) · **Vincenzo Salerno** (Department of Education, IUSVE - Istituto Universitario Salesiano Venezia (Holy See); Borderland Education Network, Gorizia (Italy)) · **Giosuè Casasola** (Borderland Education Network, Gorizia (Italy)) · **Marco Culot** (Borderland Education Network, Gorizia (Italy)) · **Irene de Savorgnani** (Borderland Education Network, Gorizia (Italy)) · **Fabio Milocco** (Borderland Education Network, Gorizia (Italy)) · **Gabriele Poz** (Borderland Education Network, Gorizia (Italy)) · **Ornella Vidoni** (Borderland Education Network, Gorizia (Italy)) · **Irene Dal Ben** (Borderland Education Network, Gorizia (Italy); PhD Programme in Social Work and Personal Social Services, Università Cattolica del Sacro Cuore (Italy))

Unaccompanied minors | Educational inequality | School enrolment policy

Although the right to education is formally guaranteed for unaccompanied minors (UAMs) (Thiene, 2018), access to age-appropriate schooling can be undermined by recurrent administrative and school-level practices (Augelli et al., 2018; Ferrari et al., 2025). This contribution reports findings from a bottom-up inquiry initiated by six social workers employed in an ordinary reception facility for UAMs in Friuli Venezia Giulia (Italy), under joint academic coordination. The study asked whether repeated failures to secure educational pathways reflected isolated contingencies or systemic mechanisms linked to the implementation of existing policy frameworks—particularly salient given that compulsory schooling applies up to age 16, while educational continuation between 16 and 18 often depends on guardianship decisions and institutional capacity. We first constructed an "ideal pathway" for enrolment and educational placement through a step-by-step process map derived from national and regional policy documents and benchmarked against a Ministerial vademecum. We then compared this pathway with the documented educational trajectories of 152 UAMs hosted between 2022 and 2025, triangulating case files (including enrolment documentation, individual plans, and correspondence with schools) with structured reflective journals. The usage of such documentation draws on recommendations by Terzera and Bonomi (2024; Evans et al., 2018). The analysis produced a typology of exclusionary mechanisms recurrent across cases, which is discussed vis-à-vis extant literature on the subject matter: delays in the appointment or effective activation of legal guardianship (Peres Cancio, 2025); technical and administrative barriers in digital enrolment platforms when personal identifiers do not match standard formats (Ferrari et al., 2025); pre-enrolment requirements around Italian language certification despite the absence of a clear mandate and proportional capacity (Santagati, 2016); and bottlenecks in the fragmented and regionalized VET provision (Ince-Beqo & Barberis, 2025). While the dataset is drawn from a single facility, the recurrence and policy-proximate nature of these mechanisms suggests transferability of risk beyond the case. Consistently with previous studies (Lombi et al., 2018), we conclude by outlining a practicable enrolment workaround protocol (theory of change-styled) for reception facilities and a complementary advocacy strategy targeting implementable points of policy and practice to reduce inequality in educational opportunities for migrant-background youth.

THE DEVELOPMENT OF COMPUTER ADAPTIVE LEARNING AND ASSESSMENT: TOWARD INCREASING STUDENT SUCCESS AND INTERCULTURAL AND SOCIAL TOLERANCE

Rina Manuela Contini (University eCampus, Italy) · **Michael Nettles** (Morgan State University, MD, U.S.A.) · **Marianna Boero** (University of Teramo, Italy)

Learning · Assessment · Social Simbiotic

The emergent development of Adaptive STEM Learning and Assessment Research focuses on advancing our knowledge and understanding of learning and assessment in science, technology, engineering, and mathematics (STEM) through computer-adaptive systems. While the primary aim is improving learning, retention, and degree completion opportunities among students, it also aims to enhance intercultural collaboration and dialogue (Cantle, 2012), and social equality and justice (Pica-Smith, Contini, Veloria, 2019). Integrating research on computer-adaptive learning (CAL), computer-adaptive assessment (CAA), psychometrics, and socio-semiotic should permit a better understanding of how real-time, data-driven feedback supports both student learning and faculty instructional design and delivery across socially diverse populations via technology. Computer adaptive learning (CAL) and computer adaptive assessment (CAA) systems offer the opportunity to expand the scientific understanding of how students develop conceptual, procedural, and metacognitive competencies and tolerance. The work contributes to evidence-centered design (ECD), multidimensional psychometric modeling, socio-cognitive learning theory, and student success. The proposed research will be guided by learning theory (Bandura, 1986), and the socio-cultural experiences of students (Aronson et al., 2002; Steele, 2010).

CONSTRUCTING HERITAGE LANGUAGE EDUCATION THROUGH POLICY: A COMPARATIVE MACRO-LEVEL ANALYSIS ACROSS SOUTH TYROL AND THE CANTONS OF BERN AND LUCERNE

Johanna Mitterhofer (Eurac Research, Italy) · **Marta Guarda** (Eurac Research, Italy) · **Irène Zingg** (PH Bern) · **Edina Krompak** (PH Luzern) · **Camilla Cristofoletti** (Eurac Research, Italy) · **Sara Pernthaler** (Eurac Research, Italy) · **Patricia Schubiger** (PH Luzern) · **Jésabel Robin** (PH Bern) · **Anna Ida Fierz** (PH Bern)

heritage languages · education · social cohesion

This contribution examines how educational policies and guidelines shape the conditions under which Heritage Language Education (HLE) can either challenge or reproduce inequalities affecting students with family trajectories of migration. Drawing on preliminary findings from the international project "VOICES of Heritage Languages – Researching the Interplay of Heritage Language Education and Social Cohesion", this talk focuses on how HLE is framed within national and sub-national policy discourses in three post-migrant (Foroutan 2019) and post-multilingual (Li 2018) contexts: South Tyrol (Italy) and the Swiss cantons of Bern and Lucerne. The overarching aim is to assess how far current policy frameworks enable - or limit - the development of more equitable and inclusive educational environments where all linguistic resources are actively sustained to support learning and positive identity development. Responding to recent calls for more comparative analyses of HLE policy (Wang & Hatoss 2024; Messina-Dahlberg & Gross 2024), the study employs a qualitative thematic analysis of approx. 50 national and sub-national policy documents, guidelines and educational frameworks. Through this methodological approach, the research team sought to identify how institutional discourses across the two states and the three regions construct the role, purpose and legitimacy of HLE, and whether and how these constructions interact with broader goals of social cohesion and educational equity. Preliminary findings reveal marked cross-contextual differences and common patterns in the institutionalisation and legitimisation of HLE. In the Italian context, and particularly in South

Tyrol, policy discourses emphasize the valorisation of linguistic diversity, yet such recognition remains largely symbolic, with no clear operational guidelines as to how to support HL teaching and learning in the mainstream educational system. Similar tensions, though manifested differently, also emerge in the Swiss contexts. Such ambivalent position towards HLE has the effect of further prioritising the learning of the institutionalised language(s) of schooling, thus reinforcing existing hierarchies between dominant and non-dominant languages and failing to offer concrete institutional measures capable of reducing inequalities. By comparing three regions with distinct governance traditions, this talk contributes to critically reflect how macro-level policy discourses may or may not shape the possibilities for HLE to function as a tool for social cohesion, with real-life implications for students' access to equitable educational opportunities.

THE TENSION BETWEEN INTEGRATION AND EVERYDAY SCHOOL PRACTICES: THE (RE)PRODUCTION OF INEQUALITY IN ITALIAN LOWER SECONDARY EDUCATION

Jelena Stefanovic (University of Milan, Italy)

Immigrant-origin Students | Educational Inequalities | Integration Practices

Despite Italy's long-standing commitment to intercultural education, disparities between native and immigrant-background students persist across academic achievement, tracking, and school continuity (Aktaş et al. 2022; Ferri et al. 2023). Scholarship has also emphasized the fragmented and normatively ambiguous character of the intercultural policy framework (Santagati & Bertozzi 2023; Landini 2025). Rather than focusing on policy design, this paper turns to the level of practice, examining how integration is interpreted and operationalized within schools. The analysis draws on qualitative research conducted in four lower secondary schools on the periphery of Milan and is based on 71 in-depth interviews with administrative and teaching staff, students of diverse backgrounds (including immigrant origin), and their parents. Across the schools, a recurring repertoire of measures emerges: Italian L2 courses, cultural mediation, collaboration with external actors, pedagogical adaptation, and initiatives aimed at fostering parental involvement. These interventions signal institutional recognition of linguistic and cultural diversity and constitute a meaningful baseline of commitment. However, their configuration, intensity, and integration into ordinary pedagogical routines vary significantly. The paper argues that integration frequently remains confined to formally established measures and to a general institutional openness to provide support upon request. Rather than reshaping the underlying logics of schooling, the research findings suggest that support often operates as an additive layer alongside mainstream pedagogical routines. Yet these routines are not neutral: they are structured in ways that implicitly privilege students whose linguistic and cultural dispositions align with dominant expectations. Drawing on Bourdieu's concept of symbolic violence, the empirical analysis shows how taken-for-granted institutional norms may reproduce inequality without explicit discriminatory intent (Bourdieu & Passeron 1990). Within this configuration, integration emerges as heavily dependent on individual teachers' reflexivity and relational commitment. However, these dimensions remain unevenly institutionalized and weakly supported organizationally. Limited reflexivity can reframe structural disadvantages as individual shortcomings, subtly shifting responsibility onto students and families for limited academic performance or participation. The paper does not dismiss the mitigating role of existing support measures; instead, it highlights a persistent tension between formal institutional commitment to integration and organizational routines that continue to structure unequal educational trajectories. Promoting integration of immigrant origin students therefore requires not only expanding support measures, but also rethinking the underlying logics that shape everyday school practices.

ACTORS, FACTORS, AND SPACES SHAPING EDUCATIONAL TRAJECTORIES OF YOUNG PEOPLE – CONTRASTING THE EXPERIENCES OF MIGRANT-BACKGROUND YOUTH IN HAMBURG-MITTE AND HALLE(SAALE), GERMANY

Jozef Zelinka (University of Münster, Germany) · **Johannes Ludwig Löffler** (University of Münster, Germany)

Educational Trajectory | Learning Outcomes | Migrant-Background Youth

The paper departs from the observation that the dominant policy discourse frames education according to its quantifiable and measurable outcomes (Harris & Clayton, 2019; Ure, 2019). For learners, educational achievements have increasingly been recognised and valued based on their practical application on the labour market, which complicates the educational trajectories of migrant-background youth. Young people from migrant background often come from regions which are considered as “underdeveloped” or regressive, meaning that the recognition of their educational achievements has to be re-adjusted to the norms and expectations in the destination countries (Sandermann et al., 2017; Husen & Sandermann, 2021). In addition, through various regulatory mechanisms, migrant youth face enormous difficulties in developing a standardized and/or linear educational trajectory (Griffiths, 2014; Leutloff-Grandits, 2021) and a clear vision of their future (Pine, 2014). We argue that educational trajectories of migrant-background youth must be contextualized within a wider framework and interplay of actors, factors, and spaces. In the local/regional settings, the role of policymakers and practitioners is as indispensable as the impact of structural and institutional factors and the effect that spaces have on educational quality. Against this background, the paper's main research question is: What is the role of local actors, factors, and spaces in affecting educational trajectories of youth from migrant background and how does their various combination intertwine with diverse educational trajectories of young migrants? The paper is based on research findings of the EU-funded research project Constructing Learning Outcomes in Europe: A multi-level analysis of (under)achievement in the life course (CLEAR) (Agreement No. 101061155) and unfolds in three steps: first, we provide an overview of the conceptual underpinnings and scholarly debates on educational trajectories of young people from migrant background; second, we analyse the role of local actors, factors, and spaces in shaping educational trajectories by contrasting the experiences of young people from migrant background in one declining and one thriving German region; third, we juxtapose and contrast the findings to elaborate on the various combination of actors, factors, and spaces and their interplay with diverse experiences of learners from migrant-background. Our methodological design is informed by a mixed-method design that includes narrative biographical interviews with young people (18–29 years) from vulnerable positions (N=21), semi-structured interviews with local policy actors in education and labour market (N=13), as well as by a quantitative analysis of educational, socio-economic, and employment indicators (N=51) of the regions studied that provide a comprehensive account of the current developments, patterns, and sub-national trajectories. The qualitative data have been collected in the regions of Hamburg-Mitte and Halle(Saale) in Germany. Our findings evidence that young people from migrant background reflect on their relation to learning outcomes and educational performances through the lenses of their fragmented educational pathways. Furthermore, fragmented life courses make it much harder to imagine and pursue future plans. While wealthier regions succeed in dynamizing young people to plan their life courses more actively, possibly due to the more structured labour market and more precisely elaborated working trajectories, the more peripheral regions offer limited job opportunities.

BETWEEN AMBITION AND ALIGNMENT, TRANSITIONS TO POST-COMPULSORY EDUCATION OF CHILDREN OF MIGRANTS IN BARCELONA

Martí Manzano Moliner (Universitat de Barcelona, Spain)

Transitions to post-compulsory education | Children of migrants | Aspirations and identities

Educational transitions represent a crucial moment in the reproduction of social inequalities (Tarabini, 2018), particularly for young people with a migrant background. Across contexts, research (Stevens & Dworkin, 2019) consistently shows that students of migrant origin are disproportionately channelled into less prestigious educational pathways, even when they hold high educational aspirations. While quantitative studies (Contini & Azzolini, 2016; Kilpi-Jakonen, 2011) have documented these structural patterns, they often provide limited insight into how young people themselves interpret, negotiate and experience these transitions. This paper addresses this gap by examining how children of migrants navigate the transition to post-compulsory education within a context marked by school and urban segregation. The paper draws on qualitative longitudinal research conducted with seventeen students of Moroccan and Pakistani origin in Barcelona. Over the course of one year, participants were followed during their transition from compulsory secondary education to post-compulsory pathways through a combination of semi-structured interviews and visual methods. This approach enables an in-depth exploration of how students articulate their educational choices through their identities and aspirations, and how these evolve throughout the transition process. The study situates these subjective processes within broader structural and institutional contexts, including school composition, teacher expectations, educational guidance and the spatial distribution of educational opportunities. The analysis identifies two distinct patterns of transition. The first, described as transitions by ambition, occurs when students select demanding academic pathways oriented towards prestigious long-term professional goals, such as medicine or engineering. These trajectories are often shaped by what the literature describes as migrant optimism, whereby educational success becomes part of a broader family project of social mobility. However, these ambitious transitions are frequently destabilised during the first months of post-compulsory education through academic difficulties, shifting school identities and processes of "cooling out" mediated by peer networks and local opportunity structures. The second pattern, referred to as transitions by alignment, is characterised by choices based on perceived alignment between students' abilities, interests and available educational pathways. In these cases, decisions are strongly influenced by naturalised understandings of ability and by institutional classifications of knowledge that differentiate between academic and vocational pathways. These transitions are typically accompanied by more limited or vague aspirations and are shaped by the constraints of class position and segregated educational environments. By focusing on the subjective dimensions of transitions, this paper highlights the heterogeneity of experiences among children of migrants and challenges essentialist explanations that attribute educational outcomes primarily to cultural background. Instead, the findings demonstrate how educational inequalities emerge from the interaction between structural conditions, institutional practices and young people's own processes of identity and aspirational negotiation. In doing so, the paper contributes to ongoing debates on the role of educational systems in either reproducing or challenging inequalities affecting migrant-background youth.

REPRODUCING OR CHALLENGING INEQUALITY? MIGRANT-BACKGROUND STUDENTS NAVIGATING ACCESS TO HIGHER EDUCATION IN ITALY

Valentina Pagani (University of Milano-Bicocca, Italy) · **Federica Ines Palladini** (University of Milano-Bicocca, Italy) · **Giulia Pastori** (University of Milano-Bicocca, Italy)

Migrant-Background Student | Student Voice | Educational Inequalities

In increasingly diverse societies, ensuring equitable access to higher education has become a key democratic responsibility of education systems (UNESCO, 2018). Despite the formal recognition of educational rights, students with a migratory background continue to experience significant inequalities in educational trajectories. In Italy, these students are disproportionately enrolled in vocational and technical tracks and are less likely to transition to university compared to their native peers (Bertozzi, 2018; Carlana et al., 2022; Mantovani et al., 2018; Volante et al., 2019). While existing research has extensively documented structural barriers, comparatively fewer studies have explored how students with a migratory background themselves interpret educational opportunities and constraints, particularly in relation to school guidance processes and the transition to higher education. Understanding how young people perceive and navigate these institutional contexts is crucial for examining how everyday school practices may contribute to either reproducing or challenging educational inequalities. This paper presents preliminary findings from a qualitative study conducted within the broader research project FINE – Fighting INequalities in Education. Promoting Access to Universities for Students with Migratory Backgrounds (https://fineproject.it/), funded by Fondazione Cariplo. The project investigates the cultural, socio-economic, and institutional factors shaping educational aspirations and decision-making processes among students with a migratory background, with particular attention to how school practices and guidance processes influence access to higher education. The study adopts a participatory qualitative research design grounded in a Student Voice approach (Cook-Sather, 2020; Welty & Lundy, 2013), which positions students as key informants in understanding educational pathways and decision-making processes. The research, currently ongoing, is being conducted in six upper secondary schools in the Lombardy region, purposefully selected for their significant presence of students with a migratory background and to represent the main educational tracks of the Italian system (academic, technical, and vocational). Data collection combines initial focus groups with teachers responsible for career guidance and 29 focus groups with 278 fourth-year students—both with and without a migratory background—aimed at exploring their perceptions of post-secondary opportunities, educational aspirations, and perceived barriers to university access. In addition, a selected group of students with a migratory background (N = 30) document their reflections and evolving expectations through a four-month digital diary, providing a longitudinal perspective on how aspirations and decision-making processes develop over time. By foregrounding the experiences and perspectives of students themselves, this research sheds light on how school practices, cultural norms, and socio-economic conditions interact in shaping educational choices among migrant-background youth. Preliminary insights highlight the complexity of students' aspirations and the multiple factors that influence their perceived access to higher education. The findings also point to the ambivalent role of school guidance and institutional practices, which can simultaneously reproduce existing inequalities or open spaces for more equitable educational pathways. By contributing empirical evidence grounded in students' lived experiences, this paper aims to inform ongoing debates on educational stratification and access to higher education. It also reflects on the potential of Student Voice methodologies to challenge deficit-oriented perspectives and to support more inclusive and equitable educational practices.

Prison Education for Democracy. Tensions and Contradictions of a Transformative Space

PANEL CONVENORS: Sandra Vatrella (University of Naples Federico Ii, Italy); Andrea Borghini (University of Pisa, Italy); Maria Chiara Calò (University of Naples Federico Ii, Italy)

PANEL KEYWORDS: penal populism, critical education, hybrid subjectivities

Prison education (PE) is a broad and complex field where Adult Education and Justice intersect within Institutional configurations that vary depending on the meanings and roles they play within the national context of reference. Despite the differences, the international landscape is crossed by common trends and tensions. In many national contexts, penal populism (Pratt 2007) and punitive common sense reinforce carceral expansion and the marginalisation of PE, legitimising overcrowding, security-driven priorities and the systematic sacrifice of educational opportunities and transformative practices, as highlighted by recent research on prison universities and cultural programmes behind bars (Borghini & Pastore 2021; 2024). Yet, in this cultural and political climate, interesting examples emerge depicting PE as a (seemingly) contradictory space of multiple and overlapping tensions, i.e. where disciplinary power and counter-hegemonic practices coexist. Building on critical and transformative pedagogies, prison education can nurture forms of critical consciousness, autobiographical reflexivity and collective learning that re-politicise everyday life and open up spaces for hybrid forms of subjectivities that neither fully conform to nor fully resist the carceral order. Briefly, where prisonised subjectivities coexist with alternative/resilient/resistant identities and ways of being. We particularly welcome contributions that: (a) theorise the tensions between disciplinary power, democratic education and social justice; (b) empirically explore prison education practices (including higher education, artistic and cultural projects, peer-education and convict-led initiatives); (c) investigate how PE reconfigures institutional arrangements, professional roles and public engagement between prison, university and civil society; (d) reflect on methodological and ethical challenges of researching PE as a transformative democratic space.

BECOMING STUDENTS TOGETHER: AN ETHNOGRAPHIC STUDY OF SUMMER UNIVERSITY COURSES IN SPANISH PRISONS

Renata Leardi (University of Pisa, Italy)

Prison Education | Transformative Learning | Spanish Penitentiary Education

Many penal systems formally present imprisonment as a transitional phase intended to support social inclusion. Yet this narrative often gives rise to re-education discourses that become ends in themselves, reinforcing processes of disculturation, control logics and further imprisonment (Clemmer, 1940; Goffman, 1961; Vianello, 2019). This generates a paradox in which the total institution assumes responsibility for resocialisation through mechanisms of exclusion(Sbraccia, 2021). At the same time, disciplinary measures and systems of rewards and punishments cultivate dynamics of dependency and behavioural governance that limit autonomy and agency among incarcerated people(Foucault, 1975; Gallo & Ruggiero, 1989; Melossi & Pavarini, 1977; Rostaing, 2014). This paradox unfolds within a broader European climate shaped by penal populism (Pratt, 2007), characterised by the politicisation of crime, the appeal to public insecurity and the consolidation of punitive common sense. In such a context, carceral expansion and security-driven priorities tend to marginalise educational initiatives or frame them instrumentally within risk-management logics. Prison education thus appears as a fragile and contested practice, negotiated within institutional arrangements that privilege discipline over emancipation. Against this backdrop, academic institutions operating in prisons can open alternative spaces for learning, participation and identity construction, challenging—albeit partially—the isolating and control-oriented nature of the carceral environment (Borghini & Pastore, 2020; Pastore, 2018). In Italy, the consolidated experience of the Prison University Campus supports continuity in university studies, whereas in Spain the UNED provides distance tutoring and academic support through the Programa de Estudios Universitarios en Centros Penitenciarios (PEUCP)(Viedma Rojas, 2019, p. 201) (Viedma Rojas 2017). This paper focuses specifically on the cursos de verano en centros penitenciarios promoted within the Spanish prison system. Unlike standard distance-learning provision, these summer courses create temporary face-to-face academic encounters inside prison walls, bringing incarcerated and external students together in

shared educational practices. In doing so, they make visible—and partially unsettle—the symbolic boundary between "inside" and "outside," offering a concrete setting in which to observe relational dynamics and processes of social inclusion (Borghini, 2020). At the same time, these encounters remain embedded within institutional temporalities and security constraints that shape participation and interaction. The cursos de verano thus exemplify prison education as a transformative yet contradictory arena, where dialogical pedagogies unfold within the structural limits of confinement. The analysis draws on a ten-month qualitative study conducted between 2024 and 2025, adopting an ethnographic orientation. Fieldwork included participant observation during two summer courses held in Spanish penitentiaries, complemented by informal interviews with educational staff and with both incarcerated and external students. Attention was paid to classroom interactions, narrative self-representations and institutional framing, in order to explore how educational encounters are negotiated in practice. Viewed through this lens, the cursos de verano offer insight into the emergence of hybrid subjectivities: incarcerated participants may temporarily inhabit academic roles that exceed prisonised identities, while external students confront and rework their assumptions about imprisonment. Rather than dissolving asymmetries, these encounters reveal the ambivalent and relational character of prison education within contemporary punitive contexts.

«I STUDY TO BE A GOOD FATHER»: THE ROLE OF HIGHER EDUCATION IN SHAPING RELATIONSHIPS BETWEEN CHILDREN AND INCARCERATED FATHERS

Matilde Zambon (University of Pisa, Italy)

prison education | incarcerated fatherhood | identity

In recent years, several national contexts have witnessed a weakening of the rehabilitative function of prison and a rise in penal populism, which has gradually led to the marginalisation of prison education. Carceral spaces are commonly understood as disciplinary spaces (Foucault, 1975), where incarcerated individuals are subjected to processes of identity degradation (Goffman, 1961) and prisonization (Clemmer, 1940), through which they may gradually lose their previous defining traits and internalise the identity of "the prisoner". However, prison education can transform carceral settings into "porous institutions" (Ellis, 2021), allowing alternative perspectives to contaminate prison culture and enabling incarcerated individuals to reconstruct their sense of self and reinterpret their detention experiences. In this sense, prison education sits at the intersection of disciplinary control and democratic aspirations, operating within carceral logics while partially interrupting their totalising effects. Prison education creates counter-hegemonic spaces, enabling incarcerated individuals to expand their horizons and cultivate alternative identities and critical self-perceptions (Acocella & Pastore, 2020; Borghini & Pastore, 2024). Drawing on ethnographic research conducted in a high-security prison in Tuscany between 2023 and 2024, this paper examines the impact of participating in higher education programs on family bonds, particularly those of children of school age. Data collected through 10 in-depth interviews with detainees and ethnographic field observation show that attending university enables incarcerated persons to reflect on their lives and acquire a

deeper understanding of themselves, rediscovering the importance of education for themselves and their children. University spaces within the prison appear to function as sites of re-subjectification, generating hybrid forms of identities that intersect the roles of inmate, student, father and educator. Prison education can therefore restore symbolic legitimacy to incarcerated fathers, whose roles as educators and parents gain renewed strength through pursuing a university degree. Incarcerated individuals can see themselves as competent figures, capable of guiding and supporting their children throughout their educational paths and offering advice when needed. Prison education, therefore, can help to bridge the gap between fathers and children and reconceptualise the connections between the prison system, the education system, and the families involved (Cataldi & Cataldi, 2024). From this perspective, prison education can be seen as a key element in challenging the logics of penitentiary spaces and opening micro-spaces of democracy within them, where not only the right to study is upheld, but also the right to develop fully as human beings. At the same time, prison education is often shaped by rehabilitative and managerial rhetorics, where university participation is often framed as a marker of compliance or risk management. This ambivalence reveals the contradictory context in which education operates within prisons, positioned between governance and democratic aspiration. Within this negotiated space, adopting the role of student and engaging in knowledge production can facilitate significant processes of change, enabling incarcerated fathers to envision identities beyond those defined by incarceration.

MEANING AND SPECIFICITY OF CRIMINOLOGY TEACHING IN PENITENTIARY SETTINGS

Michelangelo Pascali (Università Federico II di Napoli, Italy)

Teaching | Prison | Criminology

This contribution draws on the specific experience of teaching the subject Sociology of Law and Deviance within the Sociology degree programme at the University of Federico II in Naples, Department of Social Sciences, in the high-security wing of the Secondigliano penitentiary in Naples. The course, by its very nature and purpose, aims to examine, illustrate, and reflect on the relationship between law and society, focusing on the interplay between norms and violations, with particular attention to criminal transgressions and all that this entails, within the theoretical framework of the socio-legal definition of criminality itself. Similarly, the course focuses on the analysis and implications of the broad concept of deviance, understood as the opposition to social prescriptions, and on the related issues of recognition and the formation of subjectivities. Introducing these issues in a penitentiary context, addressing students typically sentenced to long terms of imprisonment for serious crimes, brings about certain specificities. In a way, criminal phenomena, alongside elements of legality, emerge both as the subject and as the context of the teaching. Furthermore, when engaging with individuals

who are experientially distinct, certain social dynamics, such as those related to judicial assessment and penal execution, emerge in the dialectic between normative principles and practice, where the law as outlined in theory and on paper meets the law as experienced in reality. Here, the tension may appear precisely between the experiential aspect and the specialist knowledge (with potential comparisons, whether implicit or explicit, sometimes even contentious). An additional point of interest is how those being addressed perceive the subject (and, in some ways, themselves as student-prisoners) and how they expect and wish it to be approached (as well as how they themselves express their views on the matter). In this regard, the way in which the subject is discussed "openly" in relation to phenomena that inherently tend to be concealed or disguised, on the one hand, and how it is addressed "theoretically", or even somewhat "abstractly", on the other hand, seems significant, given that within the broader context of the educational relationship, these phenomena manifest as "materiality" (even to the extent that, underlying it and in its subsequent consequences, they may form the very basis for the choice of the educational path offered). Finally, the involvement of such students in specific projects (e.g., in the field of restorative justice) offers, in a certain sense, perspectives framed in terms of "research".

THE PRISON CLASSROOM AS CONTESTED SPACE: NEGOTIATING INSTITUTION, EDUCATION AND IDENTITY IN HIGHER EDUCATION IN PRISON

Lucrezia Sperolini (University of Westminster, United Kingdom)

Prison Higher Education | Liminal Space | Identity Negotiation

Higher Education in Prison (HEP) represents a complex and contested terrain within the broader field of prison education. Located at the intersection of carceral logics, academic cultures and transformative pedagogies, it operates as a site where competing institutional rationalities, educational purposes and subjectivities are continuously negotiated (Key&May, 2019; Sperolini, 2023). This presentation argues that the prison classroom – as both a physical and symbolic space – offers a particularly productive lens through which to examine these tensions and the possibilities they open up. This paper presents preliminary findings from a qualitative case study of a Higher Education programme at HMP Pentonville, in London, in which twelve incarcerated students study criminology alongside prison officers over a twelve-week course (Darke&Aresti, 2016). This pedagogical arrangement – where the power relations structuring carceral life are brought directly into the educational space – makes Pentonville a particularly generative site for exploring how institution, education and identity are negotiated in practice. The data was generated through focus groups, semi-structured interviews and ethnographic observation with prisoner-students, participating officers, prison educators and academic teaching staff. The prison classroom at HMP Pentonville emerges from the data not as a neutral container for learning, but as a deeply contested space where carceral hierarchies, pedagogical intentions and learner subjectivities collide and are actively reworked. The physical and relational dimensions of the classroom – its layout, its boundaries, the choreography of bodies and roles within it – are shown to be far from incidental or insignificant. They reflect and reproduce broader institutional rationalities whilst simultaneously being appropriated, suspended and reimagined by those who inhabit them. Preliminary findings point to three interrelated dynamics. First, the co-presence of prisoner-students and prison-officer-students generates a productive yet uncomfortable disruption of institutional roles, creating moments in which the usual script of carceral life is suspended, however partially and temporarily. Second, prisoner-students articulate nuanced processes of identity negotiation, drawing on their positioning as learners and critical thinkers to rehearse forms of subjectivity that exceed the prisonised categories usually available to them. Third, the study of (critical) criminology – as a discipline concerned with power, punishment and social justice – introduces an additional layer of reflexivity, inviting all participants to examine the very institutional arrangements within which they are embedded. Together, these dynamics illuminate the classroom as a liminal space: one in which the boundaries between institutional subjects are made tempor-

arily permeable. Yet the paper is equally attentive to the structural limits of this liminality: the ways in which carceral logics continuously hover over and infiltrate the educational space, constraining the transformative possibilities of critical pedagogy through the perpetual negotiation of institutional control, access and permission.

RESISTING THROUGH STUDYING: NEGOTIATIONS AND TRANSFORMATIONS IN UNIVERSITY PROGRAMS IN PRISON

Arianna Zottarel (Università degli Studi di Milano, Italy) · **Chiara Dell'Oca** (Università degli Studi di Milano, Italy) · **Luca Decembrotto** (Università di Bologna, Italy)

University Programs in Prisons | Prison Tutoring | Education in Prisons

Over the past twenty-five years, access to university education in prisons has played an increasingly significant role in the Italian educational landscape, with 43 universities having established Prison University Centers (PUP). These spaces function as frontier zones, suspended between "inside" and "outside," where disciplinary logics, security requirements, and educational practices oriented toward democratic participation, critical consciousness, and social justice meet—and often clash. This coexistence is marked by structural tensions: on the one hand, the tendency of the prison institution to frame education within categories such as treatment, re-education, or rewards; on the other, the potential to generate transformative processes that transcend the security-disciplinary paradigm, opening up spaces for agency and resistance. This paper presents the results of a qualitative study conducted as part of the "Prison Project" at the University of Milan, one of the largest university-prison partnership programs in Italy, involving approximately 140 incarcerated students and 150 tutors. Through a questionnaire and two focus groups, the study explores the motivations, challenges, practices, and perspectives of the tutors, highlighting how initial curiosity about the prison context often evolves into a more conscious civic and political commitment. The tutoring experience thus appears as a process of co-evolution: not merely educational support, but a space for the construction of shared knowledge, critical reflection, and mutual transformation between students at liberty and those in confinement. In light of the theoretical frameworks of Freire (2011) and hooks (1998), tutoring emerges as an educational practice capable of generating hybrid subjectivities through imagination and the implementation of alternative logics to those of the security state, which, inevitably, continue to exert pressure, imposing forms of negotiation. The research also shows how the university, through the active involvement of student tutors, can redefine its public role, opening channels of participation and social responsibility that transcend traditional institutional boundaries. The university in prison thus emerges as a dynamic and far-from-neutral space, marked by contradictions and tensions yet capable of fostering democratic processes, critical learning, and mutual transformation. It serves as a social laboratory where new forms of democratic citizenship, social relations, and knowledge production are explored, helping to rethink the public role of the university and its responsibilities toward socially marginalized groups.

The Enhancement of the Intellectual Capital of Young Migrants as an Inclusion Strategy

PANEL CONVENORS: Giovanna Filosa (Inapp, Italy); Patrizia Rinaldi (Institute For Migration Research, Universidad De Granada)

PANEL KEYWORDS: Young migrants, inclusion, integration

The demographic transition calls for a broad rethinking of Italian migration policies. The devaluation and marginalization of the capital of migrant origin accentuate the mismatch between demand and supply of skills and the lack of attractiveness of Italy for young people of foreign origin, as well as for natives (Cnel 2025). The experience with Ukrainian students has been an interesting laboratory for educational inclusion, which can be extended to other ethnic groups of non-European origin who have also been affected by humanitarian tragedies. How can the EU, and Italy in particular, become more inclusive for young migrants without depleting the intellectual capital of the countries of origin? What are the bureaucratic, linguistic, and cultural obstacles that prevent the full inclusion of young migrants in education and training systems, and how can they be removed? What public and/or third sector initiatives (Filosa, Gamberoni 2023) can help overcome them? This panel aims to answer these questions within a complex, intersectional, and multidisciplinary framework. In particular, the contributions aimed at deepening the following aspects will be privileged: Theories and practices of intercultural education. Education, training, and guidance policies for young people with a migrant background. The creation of hotspots for the training of foreign minors both in the host countries and in the countries of origin. Apprenticeships and training internships for the inclusion of the workforce with a migrant background, with particular attention to unaccompanied foreign minors (Rinaldi 2023); International cooperation for the student mobility of young migrants, refugees, and asylum seekers.

SAFEGUARDING AS A RESPONSE TO DISTORTED PUBLIC NARRATIVES ON UMMS AND A FOUNDATION FOR SAFE INTEGRATION PATHWAYS

Angela Rinaldi (Pontifical Gregorian University, Italy)

public opinion | person-centered accompaniment | safeguarding

In Italy, the presence of Unaccompanied Migrant Minors (UMMs) represents a central issue in contemporary migration debates and in the development of public policies aimed at supporting their integration. Beyond the broader social and political implications of migration, this contribution focuses on the creation of safe environments for UMMs throughout the legally mandated integration process (Law 47/2017). While it is widely acknowledged that migrants—particularly minors in conditions of heightened vulnerability—require significant economic and human resources from host countries, it is equally important to recognize the substantial economic, human, and social capital they can contribute to enhance when effectively integrated. Italian public opinion, however, rarely prioritizes this perspective. Migrants are frequently targeted by stigmatizing media and political narratives that reinforce stereotypes, which are detached from reality and increasingly normalized; they become a sort of "culture" in a society (Lippmann, 1963, pp. 30-31). Such narratives often associate migration with criminality, social decay, and insecurity, shaping a public discourse whose repercussions extend to minors, including UMMs. One of the most critical consequences of this distorted public perception is the persistent lack of person-centered integration pathways for minors that communities and institutions should be responsible for implementing. This climate prevents community members from recognizing their shared responsibility in supporting UMMs' integration, delegating this task to a limited number of actors who are not always adequately trained for some particular tasks, even though they are for others. Our study suggests that effective integration can only emerge from measures grounded in ethical frameworks capable of offering context-sensitive guidelines. Assuming that identical reception and integration strategies can be uniformly applied across diverse settings would be reductive and counterproductive. In this regard, the concept of safeguarding—understood as the collective and individual contribution to the creation of "safe relationships, safe spaces, and safe processes" (Zollner & Beer, 2024, p. 475)—provides a promising framework. Safeguarding can contribute on two interconnected levels. First, it supports the development of personalized pathways that foster minors' capabilities (Cfr. Nussbaum, 2011), agency (Cfr. Bandura, 2006, p. 169), sense of safety, and capacity to build human and social capital to be reinvested either in the host society or, should they choose to return as adults, in their countries of

origin. Second, it fosters the emergence of a renewed public consciousness, more closely aligned with empirical realities and more aware of shared responsibilities. Such a shift can facilitate more effective integration processes by reducing linguistic, bureaucratic, and cultural barriers, ultimately contributing both to the integral development of UMMs and to the broader flourishing of society (Rinaldi, 2020).

THE COMPLEXITY OF THE SCHOLASTIC INCLUSION OF STUDENTS WITH A MIGRANT BACKGROUND: A COMPARISON BETWEEN ITALY AND SPAIN

Patrizia Rinaldi (INSTITUTE FOR MIGRATION RESEARCH, UNIVERSIDAD DE GRANADA, SpainThe Complexity of the Scholastic Inclusion of Students with a Migrant Background: a Comparison between Italy and Spain) · **Giovanna Filosa** (Inapp, Italy)

Young migrants | inclusion | integration

The paper offers a comparative and critical reflection on the educational inclusion of students with a migrant background in Italy and Spain, focusing on the role of standardized assessments in capturing the complexities of integration processes within school systems. Drawing on both quantitative and qualitative methodologies, we examine how national evaluation tools—INVALSI in Italy and INEE in Spain—reflect or obscure the educational trajectories of first- and second-generation migrant students. The analysis spans a decade of data (2016–2025), enriched by legislative reviews, to explore the intersection of migration, educational policy, and social equity. In both countries, the presence of students with non-native backgrounds has grown steadily, becoming a structural component of the school population. However, this demographic shift has not been matched by an equally robust transformation in educational practices or assessment frameworks. In Italy, INVALSI test results reveal persistent performance gaps between native students and those of migrant origin, particularly in Italian language and mathematics. These disparities are most pronounced among first-generation students and are only partially mitigated in second-generation cohorts. Interestingly, in English listening tests, second-generation students often outperform their native peers, suggesting that linguistic integration is not unidirectional and may vary across domains. Spain presents a similar yet distinct scenario. The decentralization of its education system has led to heterogeneous regional policies, with varying degrees of support for migrant students. While the right to education is formally guaranteed regardless of legal status, the reality is marked by high repetition rates, especially among first-generation students, and significant delays in core competencies such as mathematics and Spanish language. The concentration of migrant students in public schools—often in socioeconomically disadvantaged areas—further exacerbates educational segregation and limits opportunities for intercultural exchange. Standardized assessments, while useful for system-level diagnostics, are insufficient to capture the full spectrum of educational inclusion. These tools often fail to account for contextual variables such as socioeconomic status, linguistic diversity, and the psychosocial dimensions of migration. Moreover, the reliance on test scores as proxies for merit risks reinforces structural inequalities, particularly

when used in isolation from qualitative indicators. We investigate the “Matthew effect” in education, whereby students who start with disadvantages—linguistic, cultural, or economic—are further marginalized by assessment systems that do not accommodate their specific needs. To address these challenges, it is necessary to adopt a more holistic evaluation approach—one that integrates standardized testing with qualitative tools such as school self-evaluation reports, ethnographic observations, and participatory assessments. We emphasize the importance of teacher training, intercultural pedagogy, and the active involvement of families and local communities in fostering inclusive learning environments. In both Italy and Spain, successful examples of inclusive schools often emerge not from top-down mandates but from grassroots initiatives supported by civil society and the third sector.

RECONSTRUCTING FACE TO ENHANCE INTELLECTUAL CAPITAL IN VOCATIONAL TRAINING FOR ASYLUM SEEKERS

Massimo Piovano (Istituto Avventista di Cultura Biblica – Villa Aurora, Florence, Italy, Italy)

Intellectual Capital | Vocational Education and Training (VET) | Asylum Seekers

Across Europe, migration policies increasingly emphasize the need to enhance the intellectual capital of young migrants in order to reduce skills mismatch and foster social and labour market inclusion. Yet, education and training systems often reproduce processes of devaluation: bureaucratic uncertainty, linguistic barriers, and forms of stigmatization hinder the recognition of prior competences, rendering intellectual capital socially invisible or institutionally illegible. This paper argues that the enhancement of intellectual capital among asylum seekers cannot be understood solely as technical skill acquisition. Drawing on Erving Goffman's concepts of face-work and stigma, together with Pierre Bourdieu's theory of capital, intellectual capital is conceptualized here as competence that becomes effective only when it is socially recognized within interaction. In contexts shaped by precarious legal status and processes of stigmatization, the fragility of face concerns not only personal identity but the very possibility of presenting one's competences as legitimate. This interactional vulnerability can inhibit participation, reduce engagement, and weaken learning trajectories. Reconstructing face thus emerges as a relational precondition for activating capital. The analysis is based on a qualitative case study of a 500-hour Vocational Education and Training (VET) programme ("Warehouse and Logistics Operator") implemented in Italy in 2025 within the national GOL employment policy framework. The programme involved 11 asylum seekers and resulted in a 100% success rate in both theoretical and practical qualification exams. Through sustained classroom observation, the study examines how relational practices aimed at reducing face-threat, managing linguistic exposure, and fostering mutual recognition supported participation and successful completion. The analysis is informed by FACET®, an interactional analytical framework identifying five interdependent relational dimensions—trust, authenticity, control, exposure, and tolerance—that shape the stability of face in interaction. FACET operationalizes face-work through observable micro-interactional indicators, making analytically visible the relational conditions that enable or inhibit the activation of capital. The findings suggest that enhancing intellectual capital among structurally vulnerable young migrants requires not only access to training opportunities, but attention to the interactional processes through which competences become socially validated and institutionally legible. The paper proposes a micro-sociological reframing of inclusion strategies in VET policies, highlighting relational recognition as a necessary condition for transforming marginalized skills into recognized intellectual capital.

UKRAINIAN MIGRANT AND REFUGEE MINORS - RESILIENCE, CREATIVITY, INTEGRATION

Annalisa Di Nuzzo (Università Suor Orsola Benincasa, napoli ITALIA, Italy)

Inclusivity resilience integration

The Russian invasion of Ukraine has led to one of the largest migration crises in Europe, with thousands of minors forced to leave their country seeking safety. This study explores the resilience and creativity of Ukrainian migrant and refugee minors, analyzing their adaptation and integration strategies in host countries. Context: The war in Ukraine has generated a mass exodus, with over 4 million people forced to flee. Minors represent a significant portion of this migration flow, facing unique challenges in their migration experience. Objectives: - Analyze the resilience and creativity strategies adopted by Ukrainian migrant minors. - Examine the role of host communities in integrating these minors. - Identify best practices to support the integration and well-being of migrant minors. Methodology: The study is based on a review of existing literature and qualitative interviews with migrant minors, host families, and social workers. Expected Results: The study will highlight the importance of creativity and resilience as tools for adaptation and integration for migrant minors. Effective strategies will be identified to support these processes, contributing to improved reception policies.

ENHANCING INTELLECTUAL CAPITAL THROUGH INTERCULTURAL URBAN EDUCATION: A MIGRATION STUDY IN VERONA, ITALY

Sepideh Nikounejad (University of Verona, Italy) · **Emanuela Gamberoni** (University of Verona, Italy)

Cultural integration Migration inclusion

Migration involves the movement of people from one geographic location to another and can create both opportunities and challenges (Rinaldi, 2023). While this movement can provide better opportunities for migrants, it also brings challenges such as language barriers, educational difficulties, social isolation, and perceived discrimination (Ķešāne, 2019; Pan et al., 2019). On the other hand, migration has a great impact on intellectual capital in both origin and host countries. Intellectual capital is recognized as the intangible resources of an organization or society, including knowledge, skills, experience, and capabilities, which play a significant role in innovation, economic development, and competitiveness (Gariba et al., 2025). The results of some researches show that highly educated and skilled migrants have a positive influence on innovation in host countries, created through intellectual capital (Hunt & Gauthier-Loiselle, 2010; Kerr & Lincoln, 2010; Capoani, Chabert, & Izzo, 2024; Gariba et al., 2025; Pan et al., 2025). Due to this reason, different countries should take these aspects into account and promote specific projects and actions, particularly for the younger

generations, to develop their skills and knowledge and to provide suitable infrastructure for migrants. In this context, the Migrantour program, co-funded by the European Union, has been launched with the aim of enhancing cultural integration as well as economic and social sustainability. The program offers opportunities for learning and cultural interaction through city walks and listening to stories and knowledge shared by migrants. This proposal adopts Human Capital Theory as its theoretical framework to examine how migration influences intellectual capital through Intercultural Urban Education, specifically via guided city walks and storytelling by migrants. Human Capital Theory emphasizes that investments in education, skills, and training enhance productivity and economic value (Gariba et al., 2025). Migrantour can be considered a practical case of Intercultural Urban Education in order to enhance intellectual capital. This project is running in Italy and some other European countries such as Denmark, Spain, France, and the Netherlands. This proposal is concentrated on Migrantour in Verona, Italy. Its aim is to understand how the Migrantour project enhances intellectual capital and cultural integration by fostering new knowledge, skills, and shared cultural experiences. Regarding the methodology, a qualitative approach through a case study has been chosen. Participatory observation using an ethnographic strategy will be applied during the walk. In addition, semi-structured interviews with organizers and walk guides, including 10 interviews, will be conducted. Qualitative data will be analyzed through thematic coding and categorization. It is expected that the implementation of the Migrantour project in Verona will contribute to strengthening intercultural dialogue, reducing social distance between migrants and local citizens, promoting social inclusion, and enhancing the city's intellectual and cultural capital.

FROM PROTECTION TO AGENCY: THE UNICORE PROJECT – UNIVERSITY CORRIDORS FOR REFUGEES AS A STRATEGY OF MULTILEVEL GOVERNANCE AND INTERNATIONAL COOPERATION

Francesca Colella (University of L'Aquila, Italy)

Refugees | Social inclusion | International cooperation

In the context of demographic transition and the challenges posed by the inclusion of young people with a migrant background in European education systems, university pathways are emerging as key instruments for combining mobility, protection, and the enhancement of human capital. From this perspective, access to higher education can represent not only a channel for social inclusion but also an innovative mechanism of international cooperation. The proposed contribution focuses on the UNICORE project – University Corridors for Refugees, promoted by a broad network of Italian universities coordinated by UNHCR, in collaboration with the Italian Ministry of Foreign Affairs and International Cooperation and civil society actors such as Caritas Italiana, Diaconia Valdese, and Centro Astalli. The initiative aims to expand access to higher education in Italy for refugees residing in several countries in Africa and Asia, through safe and regular educational mobility pathways. The analysis of data collected across the programme's editions, active since 2019, highlights the defining features of an innovative model of multilevel governance integrating universities, public institutions, civil society, and the private sector. This configuration facilitates access for young refugees to master's degree

programmes and supports them along integrated trajectories of educational mobility, social inclusion, and progressive transition into the labour market. Enhancing the intellectual capital of young refugees represents a strategic lever for promoting inclusion, social cohesion, and sustainable development in host societies. In line with the New York Declaration for Refugees and Migrants and the Global Compact on Refugees, the contribution examines higher education pathways as complementary safe and regular entry channels capable of transforming international protection into concrete opportunities for autonomy, agency, and social participation. Findings emerging from six years of implementation highlight the programme's positive impact in terms of academic success, employability, and skills development, while also suggesting its potential transferability and scalability at the European level. The reflection also offers a critical analysis of the main challenges that have emerged — including institutional sustainability, equity of access, and continuity of post-graduation pathways — highlighting lessons learned and future perspectives for making such initiatives increasingly inclusive, sustainable, and aligned with the aspirations of young refugees. From this perspective, access to higher education can be understood as a device of international cooperation capable of fostering the maintenance of transnational ties and the development of hybrid academic and professional networks through institutional partnerships that connect universities, involve NGOs and public institutions, and create legal mobility pathways. At the same time, it transforms protection into agency, reduces dependence on welfare systems, and contributes to positioning these young people as active protagonists within diasporic communities and global contexts, generating benefits for both host and origin countries in a win-win logic.

THE ASYLUM AND MIGRATION FUND IN ITALIAN EDUCATION, TRAINING AND GUIDANCE POLICIES FOR MIGRANT BACKGROUND YOUTH: LEGISLATION, PROGRAMMING, GOVERNANCE, SOCIO EDUCATIONAL IMPACTS

Emma Robbio (INAPP, Italy)

AMIF | Migrant | Policies

This paper examines the role of the Asylum, Migration and Integration Fund (FAMI) and its evolution into the Asylum, Migration and Integration Fund (AMIF) within the framework of Italian education, training, and guidance policies addressed to young people with a migrant background. The presence of foreign youth, either born abroad or belonging to second generation migrant families, represents a growing share of the resident population and constitutes an essential component for demographic rebalancing and for broader processes of social and cultural transformation in Italy. In this context, the educational inclusion of young people with a migrant background poses significant challenges for the Italian education and training system, including language literacy, the prevention of early school leaving, access to education and vocational training pathways, and the development of effective orientation systems capable of supporting informed educational and professional choices. Through the analysis of the legal foundations and the evolution of the regulatory framework in the 2014–2020 and 2021–2027 multiannual programming periods, the implementation modalities of the Fund are examined with particular reference to initiatives aimed at fostering the integration of young migrants and assessing their impact on the Italian school system. The governance structure highlights the multilevel dimension that characterises the implementation of the Italian National Programme of the Asylum and Migration Fund, whose coordination is entrusted to the Ministry of the Interior as Responsible Authority in close cooperation with the Ministry of Education and Merit, regional administrations, local authorities, and third sector organisations. Adopting a descriptive analytical approach, the study identifies the main areas of intervention supported by FAMI or AMIF within the Italian education system, including language literacy programmes aimed at strengthening Italian as a second language competencies, school inclusion policies, teacher training initiatives, and the development of integrated guidance and vocational

education and training pathways. The analysis of the territorial distribution of nationally funded projects supported by the Fund makes it possible to identify the principal lines of intervention implemented, including initiatives for the enhancement of linguistic competences, actions accompanying educational and guidance pathways, measures aimed at promoting inclusion and educational success, and school support and reception services. In the overall assessment of the Fund impact, the analysis highlights several structural and operational criticalities that emerged during the implementation phase, mainly related to administrative and procedural complexities affecting project activation timelines, the fragmentation of initiatives across territories due to uneven planning capacities among institutions and local networks, and the sustainability of interventions in the medium to long term. Additional challenges concern territorial differences in access to resources and in the effectiveness of adopted measures, as well as the persistent difficulty of integrating funded actions into mainstream education and social policies across diverse regional contexts. Nevertheless, despite these implementation challenges, FAMI/AMIF should not be regarded solely as financial support mechanisms but rather as policy instruments endowed with transformative potential capable of influencing educational and social policies for young people with a migrant background. From this perspective, the Fund contributes to inclusive models of citizenship and participation effectively.

LEARNING ACROSS BORDERS: RECOGNIZING THE INTELLECTUAL CAPITAL OF CHILDREN MOVING ALONE IN ITALY

Alessandra Barzaghi (Università Cattolica del Sacro Cuore di Milano, Italy)

Unaccompanied minors | lifelong learning | collaborative and creative methods

In Italy, institutional discourse frequently frames children moving alone primarily through an emergency-driven approach, responding to the broad constructed category of "unaccompanied minors" and portraying them as individuals lacking competencies who must restart their educational trajectories from zero (Malkki, 2015; Santagati et al., 2024). Such representations risk obscuring the intellectual and experiential capital developed throughout their life histories and migratory trajectories (Jarvis, 2006; Morrice, 2014). As a result, these narratives may contribute to the marginalization of migrant youth within education, where their previous experiences and forms of knowledge often remain unrecognized or undervalued. This paper presents reflections from an ongoing doctoral research project that explores how young people who arrived in Italy alone perceive physical and symbolic borders (Khosravi, 2010) and how they reflect on the learning processes emerging from lifelong experiences and border crossing. Drawing on border studies, particularly the concept of "border as method" (Mezzadra & Neilson, 2014), the research examines how borders are experienced not only as physical or institutional limits but also as complex social spaces in which practices of resistance, negotiation, and transformation may take shape. While institutional and adult-centric perspectives often interpret the trajectories of minors mainly in terms of vulnerability (Bhabha, 2014), this study shifts attention to the knowledge and forms of agency developed and recognized by migrant youth themselves (Venken et al., 2020). The research adopts a participatory approach (Freire,

1970; Aguilar Idáñez & Buraschi, 2023) that recognizes migrant youth as competent social actors (hooks, 2020) whose perspectives and knowledge deserve acknowledgement, particularly in the design of research and educational initiatives. Methodologically, the study combines collaborative and creative methods (Giorgi et al., 2021). Peer researchers participated in the co-design of research tools and contributed to the interpretation of the findings. Fieldwork, conducted between March 2025 and January 2026, involved 120 participants through 13 group activities and 49 individual interviews carried out in several Italian cities and border areas. Data collection included drawing, collage, image selection, and narrative reflection, enabling participants to recount their experiences through alternative and dialogical forms of storytelling. Preliminary findings suggest that migratory trajectories and border crossings can become significant sites of learning. Participants frequently describe the development of perseverance, resilience, and practical autonomy while navigating uncertain and precarious contexts. Many narratives highlight the capacity to cope independently, organize everyday life, and manage difficult situations. At the same time, learning processes also include more ambivalent dimensions, such as the development of caution or distrust toward others as strategies for navigating contexts of insecurity. Reflecting on these experiences often becomes a moment of self-recognition: in contexts where migrant youth are frequently considered lacking competencies, the opportunity to express what they have learned contributes to reshaping their self-perception and affirming their agency. By centering the perceptions of children moving alone, this research contributes to debates on intercultural education and inclusion policies. Recognizing the experiential learning developed also through migration can help design more inclusive educational and training pathways capable of acknowledging and valuing their competencies rather than overlooking them.

INCLUSION OF YOUNG ROMA, SINTI AND CAMMINANTI: INTELLECTUAL CAPITAL AND INTERCULTURAL STRATEGIES

Sabina Polidori (INAPP, Italy) · **Ksenija Fonovic** (LabTS - Laboratorio Terzo Settore)

Rom Sinti Camminanti | intercultural education | inclusion

The inclusion of young Roma, Sinti and Caminanti (RSC) represents a crucial challenge for Italy and the European Union, against a backdrop of demographic transition and increasing mobility. Historical marginalization and social stigma continue to hinder access to education and vocational training, leading to early school leaving and limiting the development of these communities' intellectual capital. This situation fuels a vicious cycle of intergenerational exclusion and job insecurity. This paper aims to analyze: Bureaucratic and linguistic obstacles, such as difficulties with documentation and limited proficiency in the national language. Cultural and social barriers, linked to stereotypes and discrimination (antigypsyism); Intercultural education practices that foster dialogue between cultures and the development of transferable skills. Guidance and capacity-building programs to support the transition from school to work and prevent educational dropout. International cooperation to promote educational mobility and intercultural exchanges. The proposed approach is multidisciplinary and intersectional, grounded in empowerment, participation, and collaborative planning among institutions, communities, and the third sector. It emphasizes the need for long-term policies that move beyond a crisis-driven mindset, integrating education, training, and workplace inclusion within a framework of social justice and equal opportunity.

University Students with Migrant Backgrounds: Rethinking Educational Justice and Democratic Inclusion

PANEL CONVENORS: Maria Grazia Galantino (Sapienza University of Rome, Italy); Francesca Messineo (Sapienza University of Rome, Italy)

PANEL KEYWORDS: Higher Education, Students with Migration Backgrounds, Educational Inequalities

Global mobility has reshaped the sociocultural composition of societies. Universities too are increasingly shaped by the presence of international students, students in mobility, and students with migration backgrounds. Against this backdrop, our panel aims to stimulate debate on the university's role as a space for negotiating equality and difference, and as a strategic arena for developing inclusive, democratic practices that recognize all students as agents of change. Universities are both places of learning and spaces where opportunities for social mobility are created (Curl et al. 2017), offering possibilities for active citizenship and emancipation, yet also carrying the risk of reproducing disadvantage at the intersection of race, gender, class, and cultural capital (Reay et al. 2005). Research in Italy (Bertozzi 2018) shows that the experiences of university students with migration backgrounds are marked by tensions between individual aspirations and structural conditions. These experiences are crucial for understanding how educational inequalities work in practice and how diversity is negotiated and transformed in the everyday lives of new generations, raising urgent questions about social and educational justice, intercultural citizenship, and democracy. We welcome Italian and international contributions addressing these issues from theoretical and empirical perspectives. Potential topics include: - Quantitative analyses of student populations at national and/or university levels - Experiences of access, participation, and academic achievement - Structural, cultural, and linguistic barriers - Patterns of segregation in study programs and students' trajectories - Future expectations and their intersection with identity and belonging - Policies and good practices of inclusion, support, and mentoring.

ASPIRATIONS AND UNIVERSITY ATTENDANCE AMONG IMMIGRANT STUDENTS IN ITALY: A LONGITUDINAL PERSPECTIVE

Alessio Buonomo (Università degli studi di Napoli Federico II) · **Cinzia Conti** (Istat) · **Giuseppe Gabrielli** (Università degli studi di Napoli Federico II) · **Fabio Massimo Rottino** (Istat) · **Salvatore Strozza** (Università degli studi di Napoli Federico II)

Educational aspirations | Migrant backgrounds | University enrolment

The study investigates how demographic, familial, and behavioural factors shape educational aspirations and university attendance among students with an immigrant background in Italy, adopting a longitudinal perspective. Over the past three decades, migration flows have significantly increased the presence of immigrant-origin students in Italian schools, raising important questions about their integration and educational trajectories. Persistent inequalities remain between immigrant-origin and native peers, often linked to socio-economic disadvantage, limited cultural capital, and reduced parental familiarity with the Italian education system. The analysis addresses a key gap in the literature: the relationship between aspirations expressed during upper secondary school and their actual fulfilment through university enrolment and continued attendance. While numerous studies have examined the determinants of aspirations, far fewer have assessed whether these expectations translate into concrete educational outcomes, largely due to the scarcity of longitudinal data. To overcome this limitation, the study links the 2015 "Integration of the Second Generation" survey conducted by Istat with administrative data from the MIUR on university enrolments from 2015 to 2022. This unique dataset makes it possible to follow students across the transition to higher education and to analyse both enrolment and continuity of studies. The theoretical framework draws on expectancy-value theory, which emphasises the role of motivation, perceived competence, and subjective evaluations in shaping educational choices. At the same time, the study engages with the so-called aspiration–achievement paradox: immigrant-origin students often report high educational aspirations but achieve comparatively lower outcomes. Two main explanations are considered. The immigrant optimism hypothesis attributes high aspirations to the positive self-selection and ambition of migrant families, while blocked opportunities theory

suggests that structural disadvantages in the labour market encourage immigrant families to view education as the primary route to upward mobility. Despite strong motivation, structural constraints—such as concentration in vocational tracks and higher dropout risks—may limit the realisation of ambitions. Using regression models, the study examines how personal characteristics (gender, citizenship, age at arrival), family background (parental education, socio-economic conditions), school factors (track, prior performance), and subjective resources (self-confidence, perceived academic success) influence both aspirations and their fulfilment. Particular attention is devoted to gender differences. Descriptive findings reveal a marked female advantage: girls are more likely to aspire to university, to enrol, and to persist in their studies. However, patterns vary across citizenship groups, and the determinants of success may differ between boys and girls. Overall, the findings highlight the complex interplay between structural resources and individual motivations in shaping the educational trajectories of immigrant-origin youth. While aspirations are generally high, their translation into university attendance depends strongly on socio-economic conditions, academic pathways, and migration-related factors. By identifying the conditions that enable students to achieve their goals, the study provides evidence to inform policies aimed at reducing inequalities and supporting the long-term educational success of young people with a migrant background in Italy.

IMAGINING OTHERWISE: INTERCULTURAL BELONGINGNESS AND FUTURE EXPECTATIONS OF CHILDREN OF MIGRATION IN ITALIAN TERTIARY EDUCATION

Simona Miceli (University of Milan, Italy) · **Sonia Floriani** (University of Calabria, Italy)

Intercultural Belongingness | Future Expectations | Children of Migration

This paper explores how university students with migrant background in Italy imagine and pursue their futures, and how these projections intersect with identity, belonging, and experiences of inequality within tertiary education. We approach universities as ambivalent spaces, marked by both inclusionary and exclusionary dynamics (Gilberti et al. 2025), sites where aspirations are nurtured and social mobility becomes thinkable, but also arenas in which structural constraints, racialization, and symbolic boundaries are reproduced. In this context, future orientations offer a privileged lens through which to examine how inequality is experienced, negotiated, and transformed. The paper draws on qualitative research conducted within a broader national project on Italian youth and their orientations toward the future. It focuses on a case study of young adults with migrant backgrounds who have accessed or completed tertiary education. By centring on

students who have entered university pathways, the study does not aim to present "success stories," nor to deny persistent educational inequalities affecting children of migration in Italy - often described in terms of educational segregation (Bozzetti 2021). Rather, it investigates how aspirations are formed and pursued from within unequal social structures, and how higher education becomes a key terrain where experiences of exclusion and projects of future-making intersect. Based on semi-structured narrative interviews, the analysis reconstructs participants' educational trajectories and examines how intercultural daily practices as well as experiences of discrimination and misrecognition shape both their sense of belonging and their expectations for the future. Yet these narratives also reveal strategies of navigation, reflexivity, and growing critical awareness. University pathways emerge as spaces in which constraints are not simply endured but interpreted, contested, and re-signified. The paper focuses on two interconnected issues. First, it explores how experiences of exclusion within educational institutions inform processes of identity construction and belonging, shaping the ways in which young adults position themselves within Italian society. Second, it examines how aspirations and future expectations intersect with advanced educational pathways and are reconfigured through the university experience, potentially fostering a sharper awareness of the structural dynamics shaping students' opportunities and encouraging renewed commitments to countering exclusion and contributing to a fairer society. In this perspective, the future can be understood as a site of social transformation (Appadurai 2013). The anticipatory practices through which these young adults imagine what may lie ahead - and what they would like it to be - are shaped by present inequalities, yet simultaneously act upon them. Their educational projects thus operate at both personal and collective levels, mobilizing belonging, recognition, and claims to justice (Colombo, Rebughini 2012). In this sense, the children of migration who reach the higher stages of the education system - often overcoming multiple obstacles - can be understood as powerful agents of transformation, whose aspirations extend beyond individual social mobility to encompass collective well-being and societal reconfiguration.

UNDERSTANDING STUDENTS WITH MIGRANT BACKGROUNDS: EDUCATIONAL PATHWAYS, INSTITUTIONAL BARRIERS, AND GOVERNANCE PROPOSALS FOR A MORE INCLUSIVE UNIVERSITY

Zenia Simonella (University of Milano-Bicocca) · **Maria Giulia Montanari** (University of Milano-Bicocca) · **Brunella Fiore** (University of Milano-Bicocca) · **Silvia Mugnano** (University of Milano-Bicocca)

students with migrant backgrounds | inequalities | university

As European societies become more diverse, higher education institutions face the challenge of ensuring equitable access for students with migrant backgrounds. Italian universities have recently experienced an increase in the number of students with migrant backgrounds, although this figure remains proportionally low compared to its potential. While research has focused on compulsory schooling, less attention has been paid to the university level. This paper presents preliminary findings collected within the FINE project (https://fineproject.it), which investigates the socio-economic and cultural factors that either foster or limit the tertiary educational pathways of students with migrant backgrounds in Italy. The project adopted a mixed-method approach, combining a survey targeting all students at the University of Milano-Bicocca (including about 2500 students with migrant backgrounds) with 50 in-depth interviews from the same university. The quantitative analysis enlightens the distinctive socio-economic characteristics of students with migrant backgrounds and related disadvantages in academic performance. The qualitative analysis shows that the educational path is often non-linear and arduous due to economic and social obstacles, as well as cultural aspects relating to how individuals manage their identities and sense of belonging. The decision-making process relating to educational choices appears to occur in isolation, with different influence of parents, siblings, teachers and peers. A desire for social redemption, as well as a wish to expand one's knowledge and secure a good job, emerges as motivations to enroll at university. The university

is seen as a freer environment than school in terms of how studies are organized, offering greater anonymity, which potentially neutralises bias and prejudice, and opportunities to participate in socio-political activities. In some cases, university becomes a symbolic space where identity can be fully expressed. During the interviews, the students suggested actions to foster access, such as providing economic and bureaucratic support, improving access to information and accountability, improving communication with students, and providing training for secondary school teachers on inclusion issues.

UNEQUAL ACCESS, UNEQUAL EXPERIENCES: HOUSING PATHWAYS OF UNIVERSITY STUDENTS WITH MIGRANT BACKGROUNDS

Alessandro Bozzetti (University of Bologna, Department of Political and Social Sciences, Italy)

Student Housing | Migrant-background Students | Higher Education Inequalities

The large-scale expansion of student enrolment has contributed to increasing diversity within the student population. This analysis aims to investigate how differences in students' backgrounds shape their everyday university experiences by focusing on housing patterns, a topic that has attracted significant debate in the Italian context in recent years. Housing, as an essential infrastructure of daily life, an enabling node for the exercise of other rights, and at the same time a constitutive element of a city's (and university's) ability to be inclusive (Bricocoli & Peverini, 2023) - plays a central role. Difficulties in accessing the housing market are particularly evident for students with a migratory background, who face a combination of different forms of vulnerability. The housing experience of students of foreign origin is indeed at risk of being marked by heightened exposure to the so-called "malpractices" of the rental market (Frangioni & Costa, 2024), as well as outright discriminatory and stigmatizing practices that limit access for those who do not embody the profile of the "ideal tenant" (Costarelli et al., 2021). This partly explains the greater reliance of international students, compared to their Italian peers, on the solutions offered by private student residences (PBSA): in the absence of a local support network or university-provided services, and in order to avoid scams found in advertisements and online listings, renting housing in private residences can almost be considered an obligation rather than a choice, despite the higher associated costs (Gainsforth, 2022). However, international students are not a socially homogeneous group: they often come from middle-class families in contexts with lower purchasing power than in Europe (Lipura & Collins, 2020). These difficulties therefore strongly influence students' housing experiences, often translating into higher levels of dissatisfaction, greater forced mobility, higher rental costs, and a more frequent desire to move. In other words, the power asymmetries that characterize the field of student housing appear even more pronounced for students of foreign origin, who are required to adopt strategies of adaptation and negotiation within contexts that reflect longstanding patterns of inequality in access to housing (Fang & van Liempt, 2021). To investigate the main housing patterns of off-site university students with a migratory background, attention will be focused on a case study: the University of Bologna. Drawing on findings from an online survey conducted within the project LINUS – Living the University City – during the 2024/25 academic year, several dimensions of interest will be examined, including the main characteristics of housing arrangements, the methods and timing of the housing search, the difficulties and discriminatory practices encountered, the costs incurred, and overall satisfaction with one's housing situation. Understanding the differences that characterize the housing experiences of international and foreign students, and comparing these with the experiences of Italian students, is extremely useful for

grasping the forms of student agency exercised within a housing market deeply shaped by the distortive effects of rising residential values, characterized by stringent structural constraints, in which the public sector continues to play a marginal role.

BETWEEN ASPIRATIONS AND OBLIGATIONS: IDENTITY CONSTRUCTION IN THE UNIVERSITY EXPERIENCE OF SECOND-GENERATION YOUTH

Francesca Farruggia (Sapienza University of Rome) · **Alessandro Ricci** (Sapienza University of Rome)

Second-Generation Youth | University Trajectories | Identity Negotiation

As the Italian second generation has expanded in recent years, research on the trajectories of university students with migrant backgrounds has increased accordingly. Yet empirical evidence remains fragmented and often focuses on single dimensions of the student experience. As Italian universities become increasingly diverse social environments, the lived experiences of these students offer an important vantage point from which to analyse integration pathways through educational aspirations, everyday practices, and the structural constraints that shape them. While existing literature has examined educational inequalities (Heath & Brinbaum, 2007), structural barriers, and academic outcomes (Giudici et al., 2021; Gabrielli et al., 2022), more recent studies highlight the agency of students who succeed despite these hurdles (Santagati, 2019) and the resources they mobilise to overcome them (Bertozzi & Lagomarsino, 2019). However, less attention has been devoted to the emotional and relational costs associated with these trajectories. Although university enrolment is widely perceived as a pathway to socioeconomic mobility, it remains shaped by obstacles that are not solely material (Bozzetti, 2018). This contribution explores how second-generation students experience university as a negotiation between intergenerational expectations, aspirations for emancipation, and obligations toward their families. Central to this process is the tension between the "immigrant optimism" (Kao & Tienda, 1995) reflected in parents' expectations and students' aspirations for professional recognition and self-realization, shaped by both explicit and implicit familial demands (Fuligni, 2001). The study draws on qualitative fieldwork conducted in Rome based on 119 interviews: 14 focus groups involving 96 young people with migrant backgrounds, 17 semi-structured interviews with key informants, and 6 interviews with parents. This material reconstructs intergenerational dialogues around future expectations, often suspended between the imperative to complete higher education and the need to enter the labour market. Findings show that university choices are often shaped less by personal interests than by a perceived moral obligation toward the family. Many participants describe a responsibility to "repay" their parents' sacrifices, steering them toward secure or prestigious fields despite diverging personal aspirations. These dynamics are reinforced by hierarchical family expectations that generate tensions between vocational aspirations and pressure to pursue "safe" academic pathways. Such tensions are further intensified by the role reversal frequently experienced by second-generation youths, who often act as cultural and bureaucratic mediators for their parents. Embedded in a broader moral economy of reciprocity and obligation, this experience contributes to a strong drive for financial independence, with many interviewees self-funding their university studies. Finally, dissatisfaction with the Italian labour market – widely perceived as lacking meritocracy and professional recognition – leads many respondents to express the desire to migrate after completing their studies. Paradoxically, the university experience often provides the cultural capital that enables this outward mobility (Della Puppa, 2018; Ricucci,

2022). By unpacking these tensions, this contribution argues that for second-generation students the university becomes a pivotal arena where integration is negotiated not only through academic achievement but through the complex reconciliation of identity, family expectations, and aspirations for social recognition.

'FEELING ON A MISSION'. MOTIVATIONS AND EDUCATIONAL CHOICES OF SOCIAL WORK STUDENTS WITH MIGRANT BACKGROUNDS IN ITALY

Clarissa Grande (University of Cagliari, Italy) · **Francesca Messineo** (Sapienza University of Rome, Italy)

students with migrant backgrounds | social work education | motivation

This article explores the motivations guiding students with migrant backgrounds to enroll in Social Work programs in Italy. Situated within the emerging debate on university students with migrant backgrounds in Italy (Bozzetti 2018; Bertozzi 2018; Bertozzi and Lagomarsino 2019; Buonomo et al. 2024; Romito 2025) and in dialogue with research on social work students' motivations (Stevens et al. 2012; Campanini et al. 2013; Butler-Warke et al. 2020), the paper examines how biographical trajectories, values, and professional aspirations intersect in shaping educational choices. The analysis draws on 15 discursive interviews conducted between 2023 and 2024 with students with migration backgrounds enrolled in the BA in Social Work at Sapienza University of Rome. Findings show that motivations are layered and interconnected, combining attitudinal and instrumental dimensions. Participants' narratives highlight the centrality of personal and professional self-realization, altruism, and a commitment to helping others, intertwined with family-transmitted values and, in some cases, encounters with welfare institutions. This orientation is conceptualized as a 'culture of solidarity' rooted in lived experiences and relational understanding of vulnerability and support, reflecting a collective disposition aimed at cooperation, social-justice and responsibility toward others (Schmitt 2022). At the same time, structural constraints and external factors influence educational choice. Students are aware of limited economic resources and perceive their educational preparation as inadequate for longer and more demanding programs. In this context, Social Work is perceived as offering a professional qualification with relatively favorable labor market prospects, despite lower prestige and economic rewards compared to other professions. In the tension between personal aspirations, moral values, and structural constraints, the emphasis on helping others can be interpreted both as an expression of agency and a search for social recognition, while also reflecting a context in which young people – especially those of migrant or working-class origin – perceive limited feasible alternatives. Rather than competing logics, solidarity-based commitments and instrumental evaluations combine into a pragmatic attitude (Christie and Kruk 1998) toward higher education. Social Work thus emerges as a pathway consistent with students' skills and aspirations, offering professional opportunities, social mobility, and employment stability (Curl et al. 2017) often unavailable to their parents. The study also highlights the crucial role of migrant families, whose influence emerges both as a constraint and as a resource. Limited economic and cultural capital, together with reduced familiarity with the higher education system, may hinder students' trajectories, contributing to the intergenerational reproduction of disadvantage. At the same time, families mobilize non-traditional

resources, often described as ‘aspirational capital’ (Yosso 2005; Basit 2012), expressing high educational expectations despite scarce socio-economic means. This dynamic, captured by the notion of ‘immigrant optimism’ (Kao and Tienda 1998), sustains students’ ambitions to redefine their personal and collective futures and reinforces both attitudinal and instrumental motivations. The expression ‘feeling on a mission’ captures this convergence, depicting a motivational framework in which aspirations, future-oriented self-realization and the search for social recognition, contribute to (re)imagining a future of new possibilities. Recognizing this interplay is crucial for a deeper understanding of higher education choices, experiences, and expectations.

Youth and Generations in the Contemporary Era: Exploring Social Change

PANEL CONVENORS: Matteo Bonanni ('Sapienza' University of Rome); Benedetto Pasanisi ('Sapienza' University of Rome); Aglaia Farou ('Sapienza' University of Rome)

PANEL KEYWORDS: Youth, Generation, Inequalities

In contemporary societies, the concepts of youth and generations are frequently invoked, yet seldom subjected to a thorough examination of their meanings and implications (Threadgold, 2019). Within a context of uncertainty and rapid change, the condition of youth and intergenerational relationships is taking on new and complex forms, recalling classical interpretative frameworks while fostering innovative analytical approaches and frameworks (Wyn, 2020). Social sciences are thus called to address the growing inequalities that characterize contemporary modernity, examining how they shape the role of young people and generational groups, as well as their educational, cultural, and economic conditions (Furlong, 2017). In this perspective, particular attention is required to how education, training, and processes of work inclusion or exclusion produce differentiated opportunities and constraints, influencing both young people's trajectories and broader generational dynamics. These inequalities raise questions not only about how the situation of young people differs from that of previous generations, but also about how intergenerational relations themselves sustain or mitigate social disparities, thereby shaping collective futures. Contributions that critically explore youth and generational phenomena from different and interdisciplinary perspectives are warmly invited. The panel seeks theoretical, empirical, and methodological reflections that engage with the transformations, continuities, and tensions shaping relationships among generations in contemporary societies, youth as a social group, and the transition to adulthood. It promotes methodological diversity, including comparative designs and quantitative, qualitative, and mixed approaches, to create a space for dialogue and exchange that expands the analytical and interpretative horizons of research on youth, generations, and social change.

YOUTH AND SOCIAL ADAPTATION: A MERTONIAN PERSPECTIVE ON INEQUALITIES AND PATHWAYS INTO ADULTHOOD

Matteo Bonanni ('Sapienza' University of Rome)

Youth | R. K. Merton | Inequalities

Studying young people has never been an easy task for the social sciences. Scholars working in this field have always been required to possess a broad and flexible training, capable of integrating different theoretical and methodological approaches (Cavalli and Leccardi, 2013). Over time, however, understanding who young people are has become even more complex, both because of the growing plurality of theoretical perspectives and because of the introduction of new research methods and techniques (Woodman and Wyn, 2015a; 2015b; France and Roberts, 2015; 2017; K. Roberts, 2007; Spanò, 2018). Moreover, the category of "youth" continues to be viewed primarily through the lens of problems and difficulties, rather than through the strategies young people adopt to navigate an increasingly complex and uncertain social reality – one that is nonetheless marked by a general improvement in educational attainment compared to the past, but also by growing precarity and rising educational and class inequalities (France, 2016; Ruspini, 2021). In recent years, however, two Italian sociologists have put forward an intriguing proposal: to recover a Mertonian approach to the study of youth (Pitti and Tuorto, 2021). Revisiting Merton means bringing back to the center two elements of his theoretical framework that are often overlooked: middle-range theories; (Merton, 1968) the means–ends continuum; (Merton, 1938) Placed within the Weberian analytical framework, and particularly using ideal types, these tools can offer a simple yet theoretically robust approach to interpreting the strategies young people adopt in confronting social reality. Sociology has already seen applications of ideal types in the study of youth: one need only recall the works of Goodman (1964) and Keniston (1965), which helped to move beyond the dichotomous view of young people as either "conformist" or "deviant," a polarization that, in different forms, persists today (Threadgold, 2020). The first aim of this work is therefore methodological and theoretical: to assess whether the use of ideal types can still support the development of middle-range theories and help us understand how young people respond to contemporary social change and associated inequalities. The second aim is to address three research questions: Are there differences among young people in their adaptation strategies, interpreted through Merton's categories previous described by structural differences? Do these strategies shape the way young people interpret the social reality in which they are embedded? And do they influence, finally, their pathways into adulthood? The underlying hypothesis is that Merton's categories – conformism, innovation, ritualism, retreatism, and rebellion – remain useful tools for classifying, studying, and interpreting young people's adaptation

strategies. The analysis will therefore begin to corroborate this hypothesis by addressing the questions outlined above. The study draws on primary data collected through a survey administered to a sample of 12.628 Italian young people, aged between 18 and 39 years, representative of the national youth population. The questionnaire, designed to investigate the condition of youth in Italy, includes a typological question (Faggiano, 2012) specifically intended to test the contemporary relevance of Mertonian ideal types.

BEYOND REPRODUCTION: EDUCATIONAL DISCONTINUITY AND MULTIPLE CONTINGENCIES IN YOUTH TRAJECTORIES

Benedetto Pasanisi ("La Sapienza" University of Rome, Italy)

Educational discontinuity | Multiple contingencies | Subjectivation

Research on educational inequalities has extensively documented the persistent association between social origin and educational outcomes, highlighting reproductive mechanisms that shape opportunities across generations (Giancola & Salmieri, 2023). Recent contributions in the Italian context have shown that these processes are traversed by tensions and possibilities for deviation. In particular, the work of Romito (2021) and Cangiano (2023) has brought attention to unexpected trajectories, unanticipated mobility, and processes of subjectivation that break statistical expectations, offering tools to conceptualize discontinuity as constitutive rather than residual. At the same time, the notion of "multiple contingencies" (Giancola, 2009) highlights how educational trajectories emerge at the intersection of events, encounters, and relational configurations that exceed linear reproductive logic. This contribution focuses on educational discontinuity: significant deviations from trajectories expected on the basis of family capita and incorporated expectations. The theoretical framework integrates structural approaches emphasizing continuity between background and outcomes (Bourdieu & Passeron, 1970) theories of rational (Boudon, 1974; Breen & Goldthorpe, 1997) and the sociology of experience, which analyses trajectories as processes of subjectivation (Dubet, 1994; Martuccelli, 2017). The continuum between continuity and discontinuity provides an analytical lens for situating empirical cases. The research is guided by two questions: How do actors interpret their deviation from incorporated expectations? What forms of subjective work sustain the construction of pathways? The hypothesis is that discontinuity stems not from an isolated voluntaristic act, but from a contingent combination of factors: micro recognition, tensions within the habitus and the capacity to aspire (Appadurai, 2004). These cases become revealing indicators of the margins of agency present even within highly reproductive contexts and illuminate the subtle mechanisms through which individuals negotiate constraints and possibilities. The contribution draws on 30 semi-structured interviews with young people in Rome displaying forms of educational discontinuity: students from low socio-economic and cultural backgrounds who pursue selective educational pathways (Benadusi & Giancola, 2014); individuals from highly educated families who opt for non-university routes; and trajectories

marked by interruptions, reversals, or unexpected reorientations. The analysis follows a processual coding strategy, with attention to processes of symbolic conversion, forms of illusio acquired or destabilized, and recompositions of the habitus. The construction of the qualitative sample is based on a typological procedure derived from the analysis of OECD PIAAC 2022 data. Using variables on parental education and school track, an index was developed combining paternal and maternal educational levels with students' educational choices. This procedure made it possible to identify family configurations, as well as to distinguish expected positions from deviations relative to family background. The typology was then used to select the cells characterized by upward or downward discontinuity, which guided the sampling of interviewees and anchored the qualitative investigation to a preliminary mapping of possible trajectories. The expected results concern the reconstruction of the processes of subjectivation that sustain such deviations and the development of an interpretive model capable of integrating structure and agency, thereby contributing to the ongoing debate on the need to conceptualize discontinuities as an integral component of contemporary educational processes.

NAVIGATING PRECARITY AND PATHWAYS TO ADULTHOOD: YOUNG ADULTS IN GREECE AND ITALY

Aglaia Farou (Sapienza University of Rome)

Generations | Precarity | Adulthood

Young adults today face significant challenges in achieving traditional markers of adulthood, such as stable employment, home ownership, partnership, or parenthood. This paper explores how Millennials (born 1980-1995) and Gen Z (born 1996-2008) in Greece and Italy navigate the tensions between precarity and societal expectations, often experiencing prolonged transitions into adulthood, resulting in an extended "youthhood" (Côté', 2000). Drawing on Bourdieu's concepts of habitus, field, and symbolic violence, (Bourdieu, 1990, 1998, 2000) as well as Côté's notion of "arrested adulthood," (Côté', 2000) this study conceptualizes these experiences as a precarious habitus, showing how structural inequalities shape generational dispositions, life trajectories, aspirations, and strategies for autonomy. In line with intergenerational inequalities by Woodman, Shildrick & MacDonald (2020) this work considers how the socio-political environment reinforces structural barriers that may limit young adults in their transition to adulthood. Using secondary data from the European Social Survey, this paper examines patterns of socio-economic precarity and highlights how young adults in Greece and Italy, Millennials (born 1980-1995) and Gen Z (born 1996-2008) navigate the transition to adulthood, illustrating how precarious living conditions impact various dimensions of their lives. Despite high levels of educational attainment, many young adults face significant barriers to achieving normative milestones, producing a sense of self-

disconnection and uncertainty. These experiences of precarity shape not only individual pathways but also collective transitions, thereby shaping collective futures. By integrating the notion of precarious habitus with empirical analysis, the paper provides insight into the evolving challenges of transitioning into adulthood and the strategies young people adopt to navigate precarity and secure pathways toward independence.

EFFETS DE LIEU AND VISIONS OF THE FUTURE: YOUNG ENTREPRENEURS NAVIGATING PLACE, LOCAL CULTURE, AND STRUCTURAL INEQUALITIES

Ciro Cangiano (University of Naples Federico II, Italy)

Future | Young People | Inequalities

In recent years, international sociological debate appears to be witnessing a «rediscovery of the future». After a long period during which the processes of change that marked the transition to late modernity (Giddens, 1990), together with the climate of social uncertainty that followed (Castel, 2003), led scholars to focus primarily on the strategies adopted by individuals to cope with the disruption of social structures, there is now a renewed interest in reflecting on the time to come (Woodman, 2011). Particular attention is being devoted to young people, who represent one of the social groups most affected by the structural dynamics shaping contemporary societies (Leccardi, 2014). In order to contribute to the ongoing debate, this contribution, based on 40 biographical interviews conducted in four Italian metropolitan areas (Milan, Naples, Cagliari, and Cosenza), aims to describe the life trajectories and visions of the future of young entrepreneurs from both the North and the South. Drawing particularly on Pierre Bourdieu's conceptual framework and his notion of effets de lieu, it explores how, in a country with a strong territorial divide, the imagination of the future is closely linked to life contexts and local cultures.

SPARKS WITHOUT FIRE. YOUTH CONDITION, IDENTITY AND SOCIAL CHANGE

Roberto Flauto (Università degli Studi di Napoli Federico II, Italy)

Youth Condition | Identity | Social Change

This contribution offers a theoretical and empirical sociological analysis of the existential, identity-related, and civic conditions of contemporary young generations, with particular reference to the Italian context and its broader European implications. The central argument is that today's young people inhabit a historically unprecedented social condition, defined by a fundamental contradiction: on one hand, a process of "precocious adultification" driven by media, education, and contemporary socialization; on the other, an "interminable adolescence", in which entry into the adult world – stable

employment, housing autonomy, family formation – is indefinitely postponed. They are like sparks incapable of becoming fire. This unresolved tension produces a deep cognitive dissonance: a structural malaise that is not merely psychological but rooted in the material and economic stagnation of the country. The inequality young people face is therefore not only intragenerational, but intergenerational: it is the outcome of cumulative choices – political, cultural, infrastructural – made by previous generations that have systematically foreclosed opportunities for those who came after. The contribution also offers an original historical perspective. Youth as an autonomous social category is an invention of industrial modernity: in pre-industrial societies, no existential space existed between childhood and adulthood. It is mass schooling, brought about by the second industrial revolution, that first creates this interval. With the digital revolution, a new phase opens – what may be termed the era of intergenerational agonism – in which the accelerating pace of technological and cultural change renders parental knowledge increasingly obsolete, widening the gap between generations to an unprecedented degree. Today's young people often possess greater cultural and technological competencies than their parents, yet remain economically dependent on them, producing an asymmetry that is particularly difficult to sustain. The demographic picture sharpens the analysis further: falling birth rates, population ageing, the widespread phenomenon of only children, and growing youth emigration paint a portrait of a country that is steadily losing its most vital human resources. The emigration data reveal a striking paradox: young Italians tend to migrate precisely to those countries – the United Kingdom, Germany, France – where the infrastructure and development projects that youth movements helped block at home have long been realized. This points to what can be described as a "passive active citizenship": politically mobilized, but guided by anti-scientific and populist rhetorics incapable of generating constructive agency. The COVID-19 pandemic further aggravated this scenario, stripping young people of the school as a space of peer sociality and autonomous identity construction, with measurable consequences for mental health and psychological wellbeing. The proposed response is structural: youth malaise is rooted in the country's lack of development, and demands active policies for quality employment creation, support for youth entrepreneurship, and a deep reform of educational systems capable of bridging humanistic and scientific knowledge, rethinking school-to-work transitions, and fostering a citizenship grounded in concrete values – civic responsibility, scientific rationality, and a genuine orientation toward development and social progress.

EDUCATIONAL ASPIRATIONS AND FAMILY FORMATION DESIRES AMONG NATIVE AND MIGRANT-BACKGROUND ADOLESCENTS LIVING IN ITALY

Alessia de Vito (Università di Napoli Federico II) · **Martina Bodo** (Sapienza Università di Roma, Italy) · **Alessio Buonomo** (Università di Napoli Federico II) · **Salvatore Strozza** (Università di Napoli Federico II)

Family Formation | Educational Aspirations | Children of Immigrants

Italy represents a crucial case for the study of contemporary transitions to adulthood. Characterized by a "latest-late" pattern of leaving the parental home and family formation, and by persistently "lowest-low" fertility (Ongaro, 2001; Billari and Rosina, 2004), Italy stands as a demographic outlier in the European landscape. At the same time, the growing share of children of immigrants entering adulthood introduces new layers of heterogeneity into these already delayed trans-

itions. Despite extensive research on immigrants' descendants in countries with longer migration histories (Hannemann et al., 2020; Harrison et al., 2023; Kulu et al., 2024), evidence for Italy remains limited, making it a particularly relevant context to investigate how diverse pathways to adulthood take shape. The relationship between education, union formation, and fertility is typically examined a posteriori as the outcome of interconnected events unfolding across the life course. In contrast, this paper adopts an a priori perspective by focusing on aspirations during adolescence, a life stage in which future trajectories are first articulated. Adolescents' aspirations are formed at the intersection of individual preferences, family influences, and broader structural conditions, and as such they represent a key mechanism through which socioeconomic and gender inequalities become internalized, negotiated, and potentially reproduced across generations. We therefore examine how educational aspirations are associated with adolescents' aspirations regarding partnership and parenthood. The analysis integrates insights from opportunity cost theory, socialisation theory, and adaptation theory. Opportunity-cost theory (Plotnick, 2007) suggests that higher educational aspirations may increase the perceived cost of early union formation and parenthood, fostering postponement. Socialisation theory (Andersson, 2004; De Valk & Liefbroer, 2007) highlights how family background and cultural norms shape early preferences, potentially influencing both the desire for union formation and intended family size. Finally, adaptation theory (Milewski, 2007) provides a framework for understanding how descendants of immigrants may progressively align their behaviours with those prevalent in the host society. Empirically, we draw on the 2023 nationally representative survey "Children and Adolescents: Behaviours, Attitudes, and Future Plans" conducted by the Italian National Institute of Statistics (Istat). By collecting detailed information on young people aged 11-19 living in Italy, the survey offers a unique opportunity to examine emerging family formation patterns before actual transitions occur. To the best of our knowledge, research examining the ideational dimensions of the education-family formation relationship during adolescence remains scarce (see Alcaraz et al., 2022 for low- and middle-income countries; Plotnick, 2007 for the United States). Using logistic regression models, we analyse whether educational aspirations are associated with (a) the desire to form a union and (b) the desire to become a parent, comparing native and migrant-background adolescents – to shed the light on processes of socialisation and adaptation in a context characterized by delayed transitions and very low fertility. By shifting the education-family formation nexus to the stage of adolescent aspiration formation, this study assesses whether perceived trade-offs between education and family life are already internalized before actual transitions occur. In doing so, it provides novel evidence on how imagined adulthoods are socially stratified in contemporary Italy.

UNDERSTANDING PEER EFFECTS IN EDUCATIONAL CHOICES: INSIGHTS FROM A QUALITATIVE META-ANALYSIS OF THE LITERATURE

Nadia Crescenzo (University of Salerno, Italy) · **Angela Pacca** (University of Salerno, Italy)

peer groups | higher education | educational choices

Peer influence plays a significant role in shaping educational choices(Rosenqvist, 2018; Smith, 2023), particularly during adolescence and the transition from secondary education to higher education. This study proposes a general theoretical framework aimed at clarifying how peer effects have been conceptualized in the scientific literature and how they contribute to educational decision-making. The research builds on a bibliometric exploration of international studies on peer influence in educational contexts, followed by a qualitative meta-analysis of a selection of highly influential contributions. The objective is to provide a synthetic and integrative understanding of peer effects and their role in educational trajectories. The study is grounded in a sociological perspective that emphasizes the relational dimension of educational choices. During adolescence, reference groups (Merton & Rossi, 1968) represent a central social environment in which individuals develop aspirations, evaluate opportunities, and construct their educational orientations (Osterman, 2000; Jacobs et al., 2002). Educational decision-making is therefore understood not only as an individual process driven by personal preferences or resources, but also as a socially embedded process shaped by interactions, relationships, and shared contexts. Peer relations provide access to information, symbolic support, and models of comparison, contributing to the formation of expectations and perceptions of what is possible and desirable (Raabe & Wölfer, 2019). Methodologically, the study adopts a qualitative meta-analytical approach based on the interpretative reading and conceptual analysis of selected influential studies. Through an inductive process of coding and synthesis, the analysis identifies recurring themes and interpretative perspectives that characterize the literature. This approach makes it possible to highlight the complexity of peer influence and to move beyond fragmented or discipline-specific interpretations, offering a more coherent theoretical framework. The findings suggest that peer influence should be understood as a multidimensional relational mechanism that connects individual choices to broader social environments. Peer groups function as contexts in which meanings, aspirations, and expectations are constructed and negotiated through social interaction. In this sense, educational choices emerge not only from individual reasoning but also from processes of social comparison, interaction, and belonging (Baumeister & Leary, 1995; Witkow & Fuligni, 2010; Colombo, 2011). This study contributes to the theoretical understanding of peer effects by emphasizing their relational and contextual nature. By integrating insights from sociology and social network perspectives, it highlights the importance of considering educational decision-making as embedded within social relationships. This framework provides a broader basis for interpreting how educational trajectories are shaped and underscores the relevance of relational contexts in understanding educational inequalities, aspirations, and opportunities.

THE END OF SYNCHRONOUS EXPERIENCE? A CROSS-COHORT ANALYSIS OF GENERATIONAL TRANSITIONS AND PLATFORMIZATION OF CULTURAL EXPOSURE IN ITALY

Rita Fornari (ISTAT, Italy) · **Valentina Joffre** (ISTAT, Italy)

Cultural exposure | age-period-cohort analysis | ISTAT AVQ survey

International research has documented systematic differences between Millennials and Generation X in time use, values, mobility patterns, and media consumption. At the same time, however there is a widespread call to avoid interpreting these divergences as fixed generational traits or treating generational categories as homogeneous and autonomous identities. On the one hand, the observed differences often reflect the interaction between cohort-specific historical conditions and life-course processes, raising the classic problem of distinguishing age, period, and cohort effects. On the other hand, generational unity is internally stratified, as both intra- and inter-cohort differences reflect unequal social origins and differentiated life trajectories. From this perspective, this study addresses the classic age-period-cohort (APC) problem by drawing on time series data from the annual ISTAT survey "Aspects of Daily Life" (1993–2025). Adopting a cross-cohort survey design, it compares different generations observed at the same age but in different historical periods. Given the evolving structure of the survey, the comparison is restricted to a consistent core of indicators to ensure temporal coherence. At the same time, the study underscores the strategic value of the ISTAT AVQ as a key informational infrastructure for mapping generational transitions. The core analysis focuses on individuals aged 20-34, enabling a comparison between Generation X and Millennials at an equivalent stage of early adulthood. Within this age group, the study concentrates on patterns of cultural exposure and participation in shared arenas of mediated experience, including cinema attendance, radio listening, newspaper reading, and engagement in religious and civic spaces. Descriptive findings reveal an apparent paradox: while formal education levels have reached a historic peak, making Millennials (and Gen Z) the most educated cohorts, their participation in traditional spaces of cultural mediation and shared narratives has systematically contracted. The analysis then examines whether this contraction occurs uniformly across educational levels or signals a broader reconfiguration of how cultural capital is acquired and displayed in a platform-dominated environment. The analysis is then extended to the 15-24 age group, where the generational comparison shifts from Millennials versus Generation X to Millennials versus Generation Z. Here, the focus moves from the erosion of traditional shared spaces to the consolidation of widespread digital exposure. Rather than replicating the earlier comparison, this second step examines the technological reorganization of cultural access itself, documenting the displacement of mass-mediated synchronization by pervasive, individualized, and algorithmically structured access to information and cultural content. Taken together, the findings suggest that generational differences in contemporary Italy are less a matter of stable identities than of shifting configurations of access to culture and public discourse. Millennials emerge as a pivotal cohort between institutional synchronization and platformized fragmentation, while Generation Z represents a further radicalization of this transformation. By integrating an APC design with a structural perspective on education and inequality, the study contributes to debates on generational stratification, digital transformation, and the changing architecture of public experience.

IDENTITY IN CONTEMPORARY ADOLESCENTS: THE IMPACT OF SOCIAL AND DIGITAL CHANGE

Paolo Siclari (Pedagogista ed Educatore professionale)

adolescence | digital technologies | socialization

In the era of liquidity (Bauman, 2003), characterized by rapid cultural, technological, and social changes, adolescence emerges as a particularly complex and significant stage of the life cycle, marked by biological, psychological, and relational transformations that profoundly affect the construction of personal and social identity. In this sense, the increasing heterogeneity of cultural, educational, and social contexts makes a unitary view of adolescence increasingly inadequate and instead suggests the need to speak of "adolescences" in the plural, in order to acknowledge the multiplicity of experiences, trajectories, and conditions that characterize new generations. This contribution, based on an interdisciplinary approach, analyzes the transformations affecting young people's lives, focusing on identity-building processes, peer relational dynamics, and the role of key socialization agents such as family, school, and peer groups. The study, in particular, offers a theoretical and interpretive reflection on the emerging challenges faced by contemporary adolescents, highlighting how social and cultural changes can influence self-perception, modes of interaction, and processes of belonging to social groups and virtual communities. Within this perspective, particular attention is given to the impact of digital technologies and social media,genuine habitats (Rivoltella, 2017) where adolescents spend increasing amounts of time and that profoundly redefine spaces of interaction and communication. The daily use of smartphones and digital platforms provides new opportunities for sharing and participation, but also generates significant risks and critical issues, giving rise to increasingly widespread phenomena such as bullying, cyberbullying, and social isolation. These phenomena underscore the need to interpret adolescents' difficulties not only from an individual perspective but, above all, in light of the structural changes of contemporary society, which redefine the boundaries between public and private space, modes of socialization, and forms of youth participation. In conclusion, the contribution emphasizes the urgency of rethinking traditional educational models and training interventions, promoting strategies capable of responding in an integrated manner to the educational, relational, and existential needs of new generations.

Learning Democracy Across Life Contexts: Participation, Inclusion and Social Change

PANEL CONVENORS: Antonietta De Feo (Università Roma Tre, Italy)

PANEL KEYWORDS: Participation, Culture, Social Change

The panel explores processes of learning democracy across diverse life contexts, examining how participation, inclusion, and social practices contribute to social change. The contributions address a wide range of themes: from the creation of Arendtian "spaces of appearance" in adult civic education, aimed at fostering plurality and inclusion in polarized societies, to perspectives on adult education through flexible systems of skills validation; from intergenerational learning shaped by tensions between strategic recognition and resource allocation constraints, to play as a transformative experience within prison settings. Further contributions investigate workplaces as spaces for civic learning in times of social disconnection, forms of migrant youth activism and processes of political subjectification in urban contexts, and the situated observation of technologies through multi-level methodologies in carceral environments. Overall, the panel highlights how learning democracy extends beyond formal settings, emerging across a plurality of social spaces where participation, inclusion, and transformation intersect.

CREATING ARENDTIAN SPACES OF APPEARANCE IN ADULT CIVIC EDUCATION: FOSTERING PLURALITY AND INCLUSION IN POLARIZED SOCIETIES

Konstantinos Mantzanaris (HELLENIC OPEN UNIVERSITY, Greece)

alienation citizenship plurality

In the present study, we seek to explore the contribution of Arendtian thought through both the action of citizens in the public sphere and their modes of resistance to authoritarian systems, viewed through the lens of Arendt's educational approach. More specifically, the social and political polarization—as manifested in algorithmic echo chambers, disinformation, and democratic backsliding (Druckman et al., 2023)—underscores the critical importance of targeted educational interventions. If polarization projects the Arendtian condition of world alienation (Arendt, 1958), then it becomes imperative to re-examine the field of adult education as a democratic space of deliberation and active participation (Leiviskä, 2025). The specific question posed is whether the Arendtian framework can overcome democratic regression by means of a democratic education situated within the domain of adult education. The central aim, therefore, is to investigate the dialogical relationship, emancipatory action, and social transformation within adult education, enabling learners to participate in the shared public world. In other words, how does Arendt's conception of the common world (Arendt, 1958, p. 52) intersect, for example, with Freirean conscientization (Freire, 1998) in order to raise issues that illuminate democracy from below. For the Arendtian approach, the challenge does not lie in the epistemological justification of truth, but rather in the common world that we share and co-construct through political action and the diversity of perspectives (Arendt, 2005). Truth thus reflects a shared factual basis that strengthens critical thinking and dialogue, enabling democratic education to become a domain of political values and thereby highlight the pluralistic and normative dimensions of democracy. Under these premises, Arendtian spaces of appearance and plurality shape a form of political action that attends to the ways in which adult learners experience their participation in collective action, thereby renewing democracy from below. This "law of the earth" of plurality (Arendt, 1978, p. 19) contributes to the lived experience of freedom through the disclosure of the self, as well as through speech and deeds. The issue that consequently arises does not concern a linear trajectory of educational policy, but rather how we learn from our political existence (Biesta, 2010). More precisely, it concerns the ways in which Arendtian spaces of appearance within adult education constitute a field of shared action and reflective judgment in the face of societal polarization. The learner, therefore, engages in a dynamic process of reflection in order to renew and reconfigure their experiences by entering into dialogue with the transformative projections of the world within them. This process relates to Arendtian natality and collective action, since the self encounters the world, creating spaces of appearance wherein political existence is now understood in terms of beginning and generativity. These elements of the educational perspective operate within the framework of social practices in the

public realm, affirming the diverse viewpoints of individuals. Adult learners thus learn through their participation in understandings of the world grounded in their experience. Learning, therefore, constitutes a lifelong condition that connects the political and the social worlds.

INTERGENERATIONAL LEARNING BETWEEN STRATEGIC RECOGNITION AND RESOURCE ALLOCATION CONSTRAINTS: EVIDENCE FROM THE AGEMIL PROJECT

Virgilio Buscemi (Lattanzio KIBS SpA Benefit Corporation) · **Roberto Angotti** (INAPP, Italy) · **Francesca Campisi** (INAPP, Italy) · **Luca Cuzzocrea** (Lattanzio KIBS SpA Benefit Corporation) · **Michael Schepisi** (Lattanzio KIBS SpA Benefit Corporation)

Intergenerational learning | Age management | Resource allocation

Aging population – at least in the Italian and Western context – and digital transition are structurally reshaping the labor market and society as a whole. Intergenerational Learning (IGL) – as a mode of knowledge transfer and exchange between generations[1] – plays a strategic role in the broader framework of age management and lifelong learning by supporting organizational adaptation and promoting more inclusive participation across different generations of workers. This contribution highlights key findings from the AGEMIL (Age Management Intergenerational Learning; INAPP, 2025) project on the role of IGL practices in organizational contexts within both private enterprises and public administration (PA). The study comprised a desk phase involving a review of national and international scientific literature, the reconstruction of Italian and European public policies, and the analysis of the quantitative surveys “INDACO Enterprises” and “INDACO PA”. The subsequent field phase included interviews with key informants, focus groups (involving senior, junior, and mixed employees, managers, and representatives from Interprofessional Funds and training institutions), as well as case studies of best practices within private companies and PA. The results show a growing attention to IGL practices: on the organizational side, there is an increase in IGL activities, particularly in private enterprises; at the institutional one, there has been a progressive strengthening of the references to IGL in strategic documents and funding calls, particularly at the European level. However, this attention remains mostly declarative and programmatic, struggling to translate into structured and systematic operational interventions. This mismatch is also reflected in the allocation of resources and funding. The increase in IGL initiatives is not always accompanied by a corresponding rise in the per capita spending by businesses on these activities. Both PA and private enterprises tend to rely primarily on internal resources rather than external funding, although companies are showing more hybrid funding strategies. Among the main factors hindering the use of external resources are the lack of awareness of available tools (e.g., Interprofessional Funds) and limited technical and administrative capabilities to access and manage such funding. This issue is particularly relevant for small and medium-sized enterprises (MSEs), which are more exposed to the administrative burdens in terms of time and skills. PA, on the other hand, face institutional contexts that sometimes view these activities as non-prioritary, with a limited capacity to attract external stakeholders. These results highlight the need to strengthen institutional commitment towards IGL practices, moving beyond a primarily programmatic dimension to ensure more solid and transversal operational implementation. There is a need for clearer communication about available resources, while simultaneously simplifying the procedures for accessing funding, particularly reducing administrative burdens for MSEs. For public administrations, it is also crucial to promote a cultural shift supported by the institutions themselves, aimed at recognizing IGL as a strategic lever for the transfer of skills, organizational cohesion, well-being, and long-term sustainability.

PERSPECTIVES ON ADULT EDUCATION THROUGH FLEXIBLE VALIDATION OPTIONS

Silvia Toneva (Sofia University "St. Kliment Ohridski", FEBA, Bulgaria)

validation | labor market | inclusion

Perspectives On Adult Education Through Flexible Validation Options Silvia Toneva, PhD, Sofia University “St. Kliment Ohrdiski”, FEBA, e-mail: newskillsbg@gmail.com One of the employment opportunities available to adults, and one that is well regulated in most European countries, is the validation of the knowledge, skills, and competences acquired outside the formal education system. This process shortens the time required for learning and provides officially recognised qualification documents, which facilitate access both to the labour market and to further education. The Council Recommendation on the validation of non-formal and informal learning provides the framework for structuring national validation mechanisms aimed at enhancing mobility, employability, and lifelong learning. Following the adoption of this Recommendation, most Member States developed their own regulatory frameworks for the assessment and recognition of professional competences. Some countries have accumulated substantial positive experience in this field, whereas others still lag behind in the process. In 2023, another important policy document was adopted - the Commission Recommendation on the recognition of qualifications of third-country nationals. Its guidelines are intended to accelerate and simplify the recognition of qualifications held by third-country nationals and to improve their integration into the labour market. This policy document is focused on making the European labour market more attractive to third-country nationals. It emphasises to Member States that qualification recognition procedures should be simplified. Such an approach would enable third-country nationals to engage in employment corresponding to their skills and, at the same time, help reduce negative practices such as trafficking in human beings for the purpose of labour exploitation. A systematic review of the regulatory framework in the field of validation demonstrates that in most countries, including Bulgaria, these mechanisms have been developed in a way that is largely tailored to the local population and is therefore difficult to apply to persons from other countries. It is precisely in this context that there is considerable potential for updating the existing regulatory framework so as to encourage the validation of professional knowledge and skills among both nationals and migrants or immigrants. Strengthening measures that guarantee that the competences of citizens from other countries are not devalued in the host country would contribute to their more effective integration and to addressing labour shortages and workforce needs within the business sector (Souto-Otero & Villalba-Garcia, 2015).

RULES THAT LIBERATE: PLAY AS A TRANSFORMATIVE EXPERIENCE IN PRISON

Maria Sammarro (UNIVERSITA' MEDITERRANEA DI REGGIO CALABRIA, Italy) · **Elena Zagari** (UNIVERSITA' MEDITERRANEA DI REGGIO CALABRIA, Italy)

Play | lifelong education | prison rehabilitation

From a very early age, children do not wait for adults to teach them how to play; they are biologically predisposed to do so by exercising their bodies and senses, exploring their environment and objects. This is referred to as the nature of play (Farné, 2024): play grows with the child and helps them grow. The amount of learning and mastery children acquire through spontaneous and natural play is extraordinary, provided they are not inhibited by overprotective adults (Rousseau, 2024). Through play, children relive the reality in which they are immersed and thus come to know it, making sense of the

present and the future (Vygotsky, 2014). “For the commitment they put into it, play is real work” (Montessori, 2000), through which the child expresses their inner world (Erikson, 2008). Speaking of a culture of play (Farné, 2024) means considering the forms through which play manifests in different social contexts. Play is a universal category of human action (Fink, 2023) and carries significant meaning: “every game means something.”, trascending immediate needs and giving sense to action; even at the animal level, it goes beyond purely biological activity (Huizinga, 2016). Within play, a complex relationship is established between freedom and rule, between the inner and outer worlds (Fink, 2023). Creativity, often associated with play, is not “infantile” in a reductive sense, but expresses a drive toward inquiry and change (Bertolini, 2015); it entails the capacity to question what appears given. However, contemporary capitalism, strengthened by neoliberalism, redefines creativity to fuel economic growth: to be creative means producing innovation functional to the status quo. Creativity thus becomes a competence oriented towards competitiveness and the reproduction of the existing order (Mould, 2018). Broadening the perspective to the penal system, the concept of the prison-industrial complex (Davis, 2022) invites us to interpret punitive processes in light of economic and political structures: prison fits into a productive logic, where punishment can become profit. If creativity implies openness and transformation, prison represents the disciplinary management of bodies; yet, precisely here, play can assume educational value. As Caillois (2016) notes, play is freedom, separation, uncertainty, rule, non-productivity, simulation; between paidia and ludus, an alternative experiential space opens up. Lifelong education (Loiodice, 2016) calls for pathways capable of fostering personal planning between conservation and transformation (Strollo, 2006). Within this framework lies the experience of “Giocare Dentro” (Decembrotto, Mari, 2025), carried out in Ravenna’s penitentiary from 2015 to 2023: 171 sessions, 103 board games, 65 participants. Through ludic mediation, the activity promotes learning and well-being. Play becomes a symbolic space in which inmates can requalify their self-image and reactivate relational and cognitive competences. Education concerns healing, empowerment, and liberation (hooks, 2022). In this sense, play proves to be a rehabilitative practice capable of reopening possibilities and supporting processes of identity reconstruction, keeping in mind the possibility of replicating the model in other contexts of confinement.

TAKING PLACE: MIGRANT YOUTH ACTIVISM, DEMOCRATIC LEARNING AND POLITICAL SUBJECTIFICATION IN THE GOTHENBURG SIT-STRIKE

Martin Harling (University of Malmö, Sweden)

Migrant youth activism | epistemic justice | political subjectification

Educational research and policy discussions concerning migrants and refugees frequently portray young migrants as passive recipients of integration policies or educational interventions. Such framings risk reproducing epistemic hierarchies in which migrants appear primarily as objects of governance rather than as knowledgeable social and political actors. Responding to recent calls for participatory and emancipatory approaches in migration research, this paper examines how migrant youth activism can be understood as a site of democratic participation, learning, and knowledge

production. The paper analyses the sit-strike organised by Afghan refugee youth in Gothenburg, Sweden, in August 2017. The protest emerged in the aftermath of the tightening of Swedish asylum policy following the so-called "refugee crisis" of 2015. During ten days of continuous demonstration at Olof Palme Square, followed by weekly marches to the Swedish Migration Agency, young asylum seekers publicly articulated demands to stop deportations to Afghanistan and to recognise their right to remain. By occupying a central urban space and addressing both authorities and the broader public, the participants attempted to transform their position from objects of migration policy into subjects of political speech. Empirically, the study draws on multiple sources: documentation produced by participants during the protest (including diaries, meeting notes, and texts), retrospective interviews with organisers conducted several years after the events, and contemporary media coverage of the demonstrations. These materials allow us to analyse how the protest was organised, how claims were articulated, and how the actions of the youth activists were interpreted within the wider public sphere. The analysis engages with Jacques Rancière's conception of democracy as moments in which those "without a part" interrupt an established social order by asserting their equality. From this perspective, the sit-strike can be interpreted as a democratic intervention in which young asylum seekers challenged dominant classifications that positioned them as voiceless or temporary subjects within Swedish society. Through collective action in public space, the participants enacted what Rancière describes as dissensus, transforming experiences that are often treated as marginal or inaudible into visible and legitimate political claims. The paper argues that such activist practices can be understood as forms of democratic learning and epistemic intervention. By translating lived experiences of migration into public claims about justice, belonging and rights, the participants generated new forms of political subjectivity and knowledge about migration. Recognising these practices as meaningful contributions to democratic life invites educational research to reconsider how migrant and refugee agency can be acknowledged within research methodologies, educational practices, and democratic institutions.

LEARNING DEMOCRACY AT WORK ORGANIZATIONS AS SPACES FOR CIVIC LEARNING IN TIMES OF SOCIAL DISCONNECTION

Maria Rita Fiasco (Self-Employed - Senior corporate trainer and Executive Coach, Italy)

Adult Learning | Leadership | Civic Learning

In contemporary societies we observe a growing social disconnection, accompanied by a decline in trust in institutions and an increasing difficulty in creating spaces for democratic dialogue. In this context, adults spend a significant part of their lives within organizations. This contribution proposes to consider organizations as possible spaces for civic learning, where people develop relational and ethical competences that are also essential for democratic life. The contribution does not claim that organizations are democratic institutions in a formal sense: decision-making processes often remain hierarchical and constrained by economic imperatives. However, everyday organizational life requires people to interact with cultural, generational and professional differences, to negotiate meanings, deal with tensions and build trust in conditions of increasing complexity. Practices such as listening, dialogue, shared responsibility and the development of psychological safety can therefore be interpreted as forms of democratic learning that take shape within work. Drawing on professional experience in leadership development and organizational coaching, the contribution reflects on how leadership practices may reinforce purely instrumental cultures or, on the contrary, cultivate relational environments where it becomes possible to live with differences and develop mutual trust. This perspective connects with traditions of thought that have considered the firm not only as an economic actor but also as a social institution, as in the experience of Adriano Olivetti and, more recently, in initiatives such as Economy of Francesco and in practices of the social and solidarity

economy. In a historical phase marked by profound technological transformations, the expansion of artificial intelligence and growing dynamics of social fragmentation, organizations may represent one of the places where adults can still experience cooperation, shared responsibility and the construction of trust. Rethinking leadership also as a civic practice may contribute to reconnecting organizational cultures with democratic values and with the capacity to imagine shared futures.

Youth, Transitions and Educational Inequalities: Pathways, Identities and Practices

PANEL CONVENORS: Berenice Scandone (Polytechnic University of Milan, Italy)

PANEL KEYWORDS: Youth, Transitions, Educational Inequalities

The panel explores youth trajectories, educational transitions, and inequalities, examining how pathways, identities, and practices take shape within contexts marked by uncertainty and social transformation. The contributions address a wide range of themes: from adolescence as an allegory of the crisis of young people's biocultural environments in a post-pandemic world, to the complex biographies and educational trajectories of transnational youth between China and Italy; from digital identities and social media practices viewed from an intergenerational perspective, to the quality of technical and vocational education and training, with empirical evidence from IFTS programmes. Further contributions analyse art-based social work practices in youth contexts in Brazil, school-to-work transitions with a focus on guidance, future expectations, and social inequalities, and the monitoring of school guidance practices as a tool to address inequalities. Overall, the panel highlights how youth trajectories are shaped by tensions between opportunities and constraints, underscoring the crucial role of educational policies and support practices in fostering equity and inclusion.

FROM SCHOOL TO WORK: EDUCATIONAL AND CAREER GUIDANCE, FUTURE EXPECTATIONS, AND SOCIAL INEQUALITIES

Giorgia Altobelli (INDIRE, Italy)

Lifelong guidance | Social inequalities | School-to-work transition

Inequalities in educational and professional paths are a central theme in sociological analysis, as they reflect the interaction between social structure, institutional processes, and individual agency. Educational and professional aspirations are not simply the expression of personal preferences, but are situated social products, influenced by cultural capital, available resources, and perceived opportunities (Bourdieu, 1986; Appadurai, 2004). Empirical studies highlight that social origin contributes to differentiating individual expectations, guiding educational and professional paths and influencing occupational trajectories (Schoon & Parsons, 2002; Carlana, La Ferrara, & Pinotti, 2022). From this perspective, career guidance can be interpreted as a social device that operates at the intersection of three main domains: the education system, the transition between school and work, and the employment context. In the school context, guidance supports the construction of identity and representations of the future, contributing to the formation of aspirations and the perception of available opportunities (Sen, 1999). During the school-to-work transition, guidance acts as a mediator between the individual and the social structure, facilitating the understanding of opportunities, the definition of career paths, and the negotiation of expectations in a context influenced by social norms, prestige, and remuneration criteria (La Ferrara, 2019). In the employment context, guidance supports the adaptation and development of career paths, accompanying individuals' ability to navigate changes and transitions throughout the working life cycle (OECD, 2021). Common elements emerge in all three contexts: guidance fosters reflexivity, the elaboration of aspirations, and the construction of individual trajectories consistent with available opportunities (Hooley, Sultana, & Thomsen, 2018; Musset & Kurekova, 2018). Differences between contexts primarily concern the purposes, tools, and timing of intervention, which vary according to the individual's stage of development and structural conditions. From a sociological perspective, guidance is

a strategic social practice that contributes to the construction of opportunities and the definition of individual trajectories, intervening in the processes through which inequalities are reproduced or mitigated (Emirbayer & Mische, 1998; Thomsen, 2017). Analyzing the interaction between school, school-to-work transition, and work allows us to understand the role of guidance in supporting social mobility, promoting informed choices, and building integrated lifelong learning policies. In conclusion, strengthening lifelong guidance is a key tool for reducing educational and occupational inequalities, ensuring that future aspirations are supported by real opportunities and long-term strategies. An integrated perspective across these three domains allows for the design of more effective interventions, capable of supporting individuals throughout their educational and working lives, fostering inclusion, equity, and personal development.

TECHNICAL AND VOCATIONAL EDUCATION AND TRAINING QUALITY: EMPIRICAL EVIDENCE FROM IFTS PROGRAMMES

Andrea Carlini (INAPP, Italy) · **Claudia Spigola** (INAPP, Italy)

Quality IFTS surveys

The growing complexity of production systems—driven by digitalisation, automation, and the green transition—requires vocational education and training (VET) systems to strengthen both their responsiveness to emerging skill demands and their mechanisms for quality assurance. In this context, Higher Technical Education and Training (IFTS) provides a particularly valuable lens through which to examine the relationship between programme design, competence assessment, and school-to-work transitions. IFTS programmes are post-secondary pathways aimed at developing advanced technical and vocational competences. Their primary objective is to facilitate young people's entry into the labour market and to reduce mismatches between the supply of and demand for skilled labour. This contribution explores the broader technical and vocational education pathway and analyses quantitative evidence drawn from annual monitoring[1] activities and recurring surveys[2] on graduate employment outcomes conducted by the Institute. This combined qualitative and quantitative framework makes it possible to identify key factors influencing overall system quality. A first dimension concerns multi-level governance, involving Regions, training providers, schools, universities, and enterprises. Collaboration among these stakeholders supports the design of programmes that are better aligned with local labour market needs. A second key factor is the competence-based design of curricula in response to evolving industrial sectors and value chains. Programmes are structured around occupational profiles and expected learning outcomes, with particular attention to both technical and transversal competences. A central feature of IFTS is the integration of classroom-based instruction with structured work-based learning experiences, such as internships or traineeships. Workplace learning enables students to apply acquired knowledge in real-world settings and often represents a gateway to employment. Evidence indicates positive employment outcomes two years after programme completion, including a substantial share of open-ended contracts. High completion rates are also observed, attributable both to careful initial selection procedures and to the strong motivation of participating students. System quality is further reinforced by the adoption of competence certification models aligned with national and European qualifications frameworks, ensuring transparency and the recog-

nition of credentials. Additional strengths include stable and targeted public investment, as well as the use of innovative pedagogical approaches, particularly laboratory-based activities and problem-based learning methodologies. Nevertheless, several challenges persist. Chief among these is the regional fragmentation of provision, as decentralised planning may generate disparities in access and quality across different areas of the country. Moreover, the IFTS pathway remains relatively under-recognised among students and families, limiting its attractiveness. In some contexts, it continues to be perceived as secondary to university education. Career guidance services do not always adequately promote technical and vocational opportunities, and coordination with ITS Academy, IeFP pathways, and universities is not consistently structured. Finally, the updating of occupational profiles does not always occur on a regular basis. Overall, professionally oriented pathways represent a flexible and effective instrument for addressing ongoing economic and technological transformations. Strengthening their role entails investing in training quality, youth employability, and the competitive development of local economies. [1] [2]

MONITORING SCHOOL GUIDANCE TO TACKLE SOCIAL INEQUALITIES: EVIDENCE FROM ITALIAN SCHOOLS

Luca Andrea Fanelli (ActionAid Italia, Italy) · **Eleonora Scrivo** (ActionAid Italia, Italy)

school guidance | social inequalities | teachers

School guidance represents a fundamental component of lifelong guidance. It is crucial not only because it shapes decisions that significantly affect individuals' educational and professional trajectories, but also because it contributes to the development of career management skills that accompany individuals throughout their lives. From a capability approach perspective, guidance should not be understood merely as the provision of information or as support for matching individuals to existing educational and labour market opportunities. Rather, it plays a key role in expanding young people's real freedoms—their capabilities—to aspire, to choose among meaningful alternatives, and to pursue lives they have reason to value. In this sense, guidance is deeply intertwined with issues of social justice: unequal access to quality guidance may translate into unequal capabilities, thereby reproducing or amplifying existing social inequalities. Both informal guidance—occurring within families and everyday social environments—and formal guidance—primarily delivered by schools and other institutional actors—play a decisive role in shaping young people's choices. However, school-based guidance is the domain most directly influenced by public policy. As such, it constitutes a key lever for either mitigating or, conversely, reproducing social inequalities. In recent years, school guidance has regained prominence in Italian public policy. Notable examples include the 2022 National Guidelines on Guidance, the National Recovery and Resilience Plan (PNRR) Investment 1.4 on educational inequalities ("PNRR/divari"), and the introduction and subsequent regulatory revisions of school-to-work pathways. Despite this renewed policy attention, school guidance remains insufficiently monitored. There is a lack of systematic evaluation frameworks based on clearly defined process and outcome indicators capable of assessing both the implementation of guidance practices and their effects. This contribution seeks to address this gap by providing an overview of guidance activities in Italian schools and the processes underpinning them. The analysis draws on two complementary sources: (1) administrative data from schools' Self-Evaluation Reports (Rapporto di Auto Valutazione), and (2) survey data from a sample of over 1,500 teachers who responded to a questionnaire specifically focused on guidance practices. The survey data also offer valuable insights into teachers' perceptions of guidance, which are crucial for understanding how guidance is implemented in practice—sometimes implicitly or unintentionally. The findings highlight areas where knowledge remains limited and where further research is particularly needed. They also provide a basis for proposing policy directions aimed at strengthening school guidance and fostering greater integration between school guidance, school-to-work transition measures, and guidance in later stages of life. In doing so, the paper contributes to the broader debate on how to design integrated lifelong guidance policies capable of reducing social inequalities.

ART-BASED SOCIAL WORK: AN ETHNOGRAPHIC STUDY IN THE "CENTRO DE REFERENCIA DA JUVENTUDE DI NOVO HORIZONTE" IN BRAZIL

Yasmin Frascaria (Università Milano Bicocca, Italy)

Art-based social work | Youth empowerment | Anti-oppressive approach

The research project examines the transformative potential of art-based social work by exploring how artistic practices can be integrated into social work services. It is based on an ethnographic study conducted at the Centro de Referência das Juventudes Novo Horizonte, an experimental state-run service in Espírito Santo, Brazil. The Centre promotes the rights, autonomy, and inclusion of young people aged 15 to 29 living in vulnerable contexts through artistic and cultural workshops, sport, training, and psychosocial support. The project aims to contribute to the scholarly literature on the effectiveness of art-based social work by providing new empirical evidence. This evidence is intended to foster professional reflexivity and to inform the development of practical tools and operational guidelines that can legitimise and consolidate the use of art as an epistemic and relational resource within social services. The study is situated within the international debate on the use of art in social contexts, highlighting its expressive, participatory, and political dimensions, with particular attention to Brazil, where social work is grounded in an ethical-political project with Marxist and anti-capitalist roots. The research adopts an anti-oppressive approach, which enables artistic practices to be understood as tools for listening, emancipation, and social transformation. This approach is embedded within a multidisciplinary and multicultural analytical framework drawing on art-based social work, the sociology of art, cultural welfare, and critical social work, including Brazilian ethical-political and critical traditions. The study is paired with a qualitative methodology based on immersive ethnography conducted in collaboration with the Universidade Federal do Espírito Santo. Methods include participant observation focused on care professionals, practitioners, artists, and young people engaged in the Centre's activities; semi-structured interviews with young participants, professionals, and university faculty; and documentary analysis. The findings show that art-based practices are not marginal interventions, but an integral part of the service's organisational culture. They intersect with youth languages such as hip-hop and with participatory governance models that value professional, educational, and artistic competencies. Overall, the study offers an original contribution to critical and anti-oppressive social work debates by proposing situated, participatory, and transformative perspectives for the implementation of art-based practices.

BETWEEN VISIBILITY AND INVISIBILITY: DIGITAL IDENTITIES AND SOCIAL MEDIA PRACTICES ACROSS GENERATIONS

Rossella Marzullo (Università Mediterranea degli Studi di Reggio Calabria, Italy) · **Davide Milasi** (Università Mediterranea degli Studi di Reggio Calabria, Italy)

social media · generations · digital identity

Over the past fifteen years, social media platforms have become key environments for processes of socialization, identity construction, and the production of social relationships. Digital platforms now represent central spaces of interaction and self-representation in which individuals construct and negotiate their public identities within environments characterized by constant social visibility (boyd, 2014; Papacharissi, 2011). However, social media practices are not homogeneous across generations, but reflect different ways of engaging with public visibility, self-presentation, and the management of others' gaze. This paper proposes an exploratory reflection on generational transformations in social media practices, focusing in particular on the differences between Generation X, Millennials, Generation Z, and Generation Alpha. Generations who encountered social media in adulthood or late adolescence - particularly Gen X and Millennials - tend to use these platforms as an extension of their offline lives. Shared content often serves a narrative and documentary function through which users recount and archive moments of everyday experience, reflecting dynamics of self-presentation similar to those described in classical sociological analyses of social interaction (Goffman, 1959). With Generation Z, a significant shift emerges in the relationship with content publication. In a context characterized by heightened awareness of public scrutiny and platform-based mechanisms of social evaluation, content production appears more carefully curated and aesthetically oriented. Profiles become identity showcases through which users construct selective and stylized representations of themselves, participating in what has been described as an economy of visibility and online reputation (Marwick, 2013; Papacharissi, 2010). With the emergence of Generation Alpha, a further transformation in communication practices can be observed. In this case, the permanence of content gradually loses centrality in favor of more ephemeral communication formats such as stories or other time-limited media. At the same time, a growing tendency toward identity splitting emerges through the management of multiple profiles: on the one hand, a highly controlled public profile often characterized by minimal visible content; on the other, a private account - commonly referred to as a "spam account"- accessible only to a restricted circle of contacts and used for more informal and spontaneous communication. These practices reflect an increasing strategic management of visibility and a renegotiation of the boundaries between private and public spheres in digital environments (boyd, 2014; Turkle, 2011). Through this comparative perspective, the paper suggests that the evolution of social media practices across generations reflects a broader transformation in the relationships between identity, visibility, and digital memory. From the autobiographical dimension typical of early digital users, practices progressively shift toward strategic image management and, more recently, toward communication models based on ephemeral media and segmented online identities. Examining these generational dynamics allows us to better understand how digital platforms are reshaping the ways individuals construct their public selves, negotiate visibility, and manage the boundaries between private and public spheres in contemporary social and educational contexts.

Hip Hop as Educational Ecology: Epistemologies, Pedagogical Frameworks, Youth Development, and the Challenge of Educational Inequality

PANEL CONVENORS: Matteo Cerasoli (Sapienza University of Rome, Italy)

PANEL KEYWORDS: Hip-Hop Studies, Educational Inequalities, Youth Agency

Over recent decades, Hip-Hop Studies has progressively established itself as a transdisciplinary field situated at the intersection of education, cultural studies, youth work, community organizing, critical sociology, and critical pedagogy. As an emerging scholarly paradigm, it has gained increasing recognition within educational discourse across the international academic debate. Grounded in the cultural practices, aesthetics, and epistemologies of hip hop, this approach, examined through pedagogical and sociological lenses, repositions young people not merely as passive recipients of educational interventions, but as cultural producers, knowledge-makers, and agents of social transformation. The "Keep It Real – Comunità in Cerchio" project (promoted by ÀP Antimafia Pop Academy) constitutes a compelling empirical case through which to critically engage with the broader phenomenon of hip hop culture's diffusion and appropriation as an educational environment and as an instrument for self-construction within socialization processes during the transition to adulthood. It devotes particular attention to hip hop practices as modes of contesting dominant narratives, cultivating community belonging, nurturing democratic participation, and opening spaces for alternative forms of expression and recognition. Against this backdrop, this event investigates how hip hop, understood simultaneously as a sociocultural environment and as a pedagogical toolkit, can sustain meaningful learning, foster socioemotional development, and counter educational inequalities across formal, non-formal, and informal settings. The overarching aim is to critically examine both the transformative potential and the inherent contradictions of hip hop as an educational and socializing apparatus. Agenda Introduction - Hip Hop and Educational Processes: The Project “Keep It Real – Comunità in Cammino” Pasquale Grosso (Presidente ÀP - Antimafia Pop Academy) Focus 1. Hip Hop and Academia Davide Fant (University of Milan-Bicocca), Fulvia Antonelli (University of Bologna, curator of the experience of the Scuola delle Donne del Pilastro) Focus 2. Can Universities Help to Solve the Crisis in Democracy?

PANEL CONVENORS: Liviu Matei (King's College London, United Kingdom); Roberta Piazza (Università di Catania); Mauro Palumbo (University of Genoa, Italy); Antonio Uricchio (University of Bari, Italy); AnnaFausta Scardigno (University of Bari, Italy)

PANEL KEYWORDS: democratic resilience, fractured world, transformative practices in higher education

This panel addresses the pressing question of whether universities can go beyond just studying the crisis on democracy and play a pivotal role in actually revitalising democratic resilience amidst global challenges such as voter apathy, rising populism, widespread disinformation, and escalating socio-economic inequality. Traditional approaches to civic education often fall short in cultivating citizens equipped to navigate today's complex informational landscape. This panel seeks to explore how universities can move beyond knowledge production through research and traditional knowledge transmission, towards transformative practices that empower students and communities with critical awareness, media literacy, and the capacity for discerning fact from opinion. We invite contributions that examine innovative educational strategies, research initiatives, and also public engagement models through which higher education institutions can foster active participation within inclusive democratic spaces. Discussions will delve into how universities can cultivate an ethical consciousness and active public engagement that intrinsically link justice, freedom, and collective action and responsibility. The panel will explore critical, ethical, and participatory proposals for renewing democratic principles and practices, identifying concrete ways in which universities can leverage their unique position to strengthen democratic institutions and civic virtues in an increasingly fractured world. Prosoed topics for this panel: Transformative Pedagogies for Critical Citizenship and Media Literacy University-Led Initiatives for Civic Engagement and Democratic Renewal The University as a Site for Deliberative Democracy and Ethical Development Can university Research and Expertise Counter Disinformation and Populism?

LEADERSHIP, GLOBAL CITIZENSHIP, AND 21ST CENTURY SKILLS FOR DEMOCRACY IN HIGHER EDUCATION

Rita Kakati-Shah (Uma Global, United States of America)

democratic resilience | leadership development | global citizenship

Universities are increasingly called to respond to the crisis in democracy marked by disinformation, polarization and civic disengagement, yet teaching still prioritizes narrow employability over democratic capability (Biesta, 2011; Giroux, 2014). This paper argues that leadership development and global citizenship education in higher education can become concrete sites for democratic renewal when they cultivate 21st century skills such as critical thinking, ethical judgment, digital and media literacy, collaborative problem solving, and global competence as democratic practices rather than labour market assets (Kellner and Share, 2019; Mihailidis, 2018; Oxley and Morris, 2013; UNESCO IICBA, 2024). This paper draws on a multi-year leadership development programme with colleges and teacher training institutes across Assam, Northeast India, reaching 418 participants across 36 institutions through hybrid and cross-border formats (Uma Global, 2025). The analysis focuses on a cross-sectional participant survey, complemented by feedback from cross-college case-study projects and illustrative open-ended comments (Uma Global, 2025). These data map self-reported changes in personal leadership and agency, communication and collaboration, intercultural and global competence, digital and information literacy, and intentions to contribute to local communities and remain connected to the region, in line with earlier leadership-focused work on pedagogy and regional aspiration (Kakati-Shah, 2024; Kakati-Shah, 2025a; Kakati-Shah, 2025b). The study highlights three clusters of learning outcomes, drawing on survey scales and qualitative feedback from participants in rural and semi-urban contexts (Uma Global, 2025). First, critical and creative thinking combined with digital and information literacy appear to strengthen students' confidence in evaluating information, adapting to connectivity constraints and collaborating online, including in cross-border sessions that link Assamese colleges with students from King's College London's King's Business Club, Baruch College at the City University of New York, and Rosenheim Technical University of Applied Sciences in Germany (Kellner and Share, 2019; Mihailidis, 2018). Second, communication, collaboration and conflict-engagement skills, anchored in items on public speaking, teamwork and feedback, support more inclusive classroom and group-work practices across linguistic and social differences, consistent with democratic and peace-oriented pedagogies that emphasise dialogue and empathic listening (Andolina and Conklin, 2021; Bajaj, 2022; Kakati-Shah, 2022a). Third, indicators of global competence, ethical leadership, local commitment, and attention to gender suggest that participants increasingly connect their leadership practice to questions of inequality, sustainability, gender, and brain drain, especially the loss of talented rural youth to urban centres, and express a desire to

use their skills for the benefit of Assam and the Northeast region (Lopes Cardozo and Novak, 2021; Kakati-Shah, 2022b; Kakati-Shah, 2025b; Uma Global, 2025). The article proposes a democratic 21st century skills framework in which widely cited skills are re-oriented toward democratic resilience, civic agency, and ethically grounded leadership rather than individual competitiveness alone (Andreotti, 2014; Mihailidis, 2018; UNESCO IICBA, 2024). By positioning Assam's hybrid and cross-border leadership model, linking colleges in Northeast India with students in London, New York, and Rosenheim, as a potential test case, this paper illustrates how similar programmes could use transformative pedagogy and 21st century skills to renew universities' democratic roles across different higher education systems (Uma Global, 2025; Kakati-Shah, 2025a).

CAN UNIVERSITIES HELP TO SOLVE THE CRISIS IN DEMOCRACY?

Liviu Matei (King's College London, United Kingdom) · **Roberta Piazza** (Università di Catania)

higher education and the crisis in democracy | inventory of methods and techniques to address the crisis in democracy | democratic resilience

Although still unfolding, the contemporary crisis in democracy has been extensively studied. This paper asks the question whether universities can help to address the crisis, not only study it, and, if yes, how. The paper has three parts, First, it puts together a comprehensive critical inventory of methods, techniques and types of action in universities that can be identified as directly meant to contribute to addressing the crisis in democracy. This inventory includes various types of dedicated educational strategies and initiatives (some quite traditional, like civic education, others more recent and innovative, including digital components), research initiatives, advocacy, and public engagement models (such as, for example, online platforms for engagement). Second, it provides a framework for assessing the appropriateness and potential impact of these methods, techniques and institutional actions, taken individually or in their combinations in various concrete settings. Third, the paper discusses whether new modalities of engagement by universities in addressing the crisis of democracy are necessary and possible, considering both immediate and longer-term challenges in this area.

LEARNING CONFLICT-RESOLUTION USING IMMERSIVE VIRTUAL REALITY: A PROOF-OF-CONCEPT STUDY

Elisa Cavatorta (King's College London, United Kingdom) · **Asmaa Ezzat** (University of Cairo, Egypt) · **Sarah Mansour** (University of Cairo, Egypt)

immersive Virtual Reality · perspective-taking · conflict-resolution

Conflict resolution skills are a civic competency foundational to democratic participation and constructive dialogue, yet rarely taught explicitly in educational settings. This paper presents a proof-of-concept study evaluating an immersive Virtual Reality (iVR) intervention designed to develop perspective-taking skills - the ability to adopt another person's point of view - in adolescents. The intervention is grounded in the pedagogical principle of experiential counterfactual learning: iVR provides a unique environment for experiencing another perspective by embodying the other person.The intervention prioritises accessibility: it is non-invasive, avoids prescribing normative values, and is designed to function effectively in resource-limited educational settings with minimal technological infrastructure. Its modular structure makes it readily scalable across diverse institutional contexts. We evaluate the intervention through an experimental methodology with two samples of adolescents in two settings, one in London and one in Cairo (N_1=70, N_2=269). Results show that a two-session intervention produces measurable gains in perspective-taking, assessed using a novel behavioural measure rather than self-report, and increases participants' subjective confidence in managing real-world interpersonal conflict. We further report on user acceptability, finding the intervention to be well-received across the sample. These findings demonstrate how educational immersive technology, when grounded in robust theory and evaluated rigorously, can promote the development of civic skills. The intervention offers a concrete, low-cost and scalable tool for education institutions to contribute to repairing the fabric of democratic life.

BRIDGING KNOWLEDGE AND SOCIETY: ADVANCING THE UNIVERSITY'S THIRD MISSION

Irena Zemaitaityte (Mykolas Romeris University, Lithuania) · **Jolanta Pivoriene** (Mykolas Romeris University, Lithuania) · **Justina Garbauskaitė-Jakimovska** (Mykolas Romeris University, Lithuania)

university · third mission · society

Over time, universities have undergone significant transformations in their missions, evolving from institutions focused primarily on teaching to organisations integrating research and, more recently, broader societal engagement. This evolution culminated in the emergence of the university's third mission, which extends beyond education and research to encompass economic, social, and cultural development. In the Lithuanian academic discourse, relatively little attention has so far been paid to the third mission of universities. While this concept has been extensively analysed in the international literature, in Lithuania it is discussed only fragmentarily and is most often based on isolated examples of empirical studies or conceptual papers (Stonkienė & Matkevičienė, 2014). Universities declare the importance of the third mission and their commitment to creating social, economic, and cultural value in official strategic documents; however, it remains unclear how this mission is understood and implemented in practice. The qualitative research method chosen for the study (semi-structured interviews) is a method that aims to understand social or human phenomena by examining the meanings, experiences and interpretations of participants in their natural context (Creswell and Creswell, 2022).The qualitative research method chosen for the study (semi-structured interviews) is a method that aims to understand social

or human phenomena by examining the meanings, experiences and interpretations of participants in their natural context (Creswell and Creswell, 2022). A qualitative research approach is particularly appropriate for examining the third mission of universities because it enables an in-depth exploration of meanings, interpretations, and institutional perspectives that are shaped by social, organisational, and policy contexts. Ten interviews were conducted with Lithuanian state universities. For data analysis the content analysis was applied. It relies on sequential steps, thus ensuring depth of data interpretation (Silverman, 2024). Independent data analysis followed by consensus was applied. Two researchers independently analysed the data. The results were then compared, and similarities and differences were discussed until consensus was reached on the final analytical framework. The analysis of scientific literature and the findings of the present study confirm that the University's Third Mission is an essential, though conceptually complex and multifaceted, component of contemporary higher education. It extends beyond the traditional core missions of teaching and research and is fundamentally oriented towards meaningful interaction with society, addressing social, cultural, and economic challenges at local, regional, and broader levels. The study demonstrates that the Third Mission is increasingly perceived as equal in importance to teaching and research and is becoming a strategically significant direction of university activity. Universities are positioned not only as knowledge producers but also as creative laboratories and innovation hubs embedded in everyday civic life. Through lifelong learning, inclusive knowledge transfer, social engagement, and collaboration with diverse stakeholders, universities contribute to social inclusion, civic creativity, and regional development.

CIVIC ENGAGEMENT AND DEMOCRATIC RENEWAL: AMERICAN HIGHER EDUCATION AND LIBERAL DEMOCRACY

Eric Mlyn (Duke University, United States of America)

Democracy | Civic Engagement | Mission

This presentation traces the post–World War II era in American higher education through the lens of its democratic commitments. The erosion of liberal democracy in the United States compels renewed examination of both the normative justifications higher education has advanced for supporting democracy and the pedagogical and programmatic strategies institutions have employed to pursue that goal. Central to this inquiry is how scholars and practitioners conceptualize the relationship between higher education and the promotion of liberal democracy. Should higher education prioritize the cultivation of critical thinking as a foundation for democratic support? Should universities seek to reduce income and wealth inequality, given evidence that such inequalities undermine democratic stability? Should institutions encourage and facilitate student political participation, including voting? Or, alternatively, should democracy promotion lie outside the core mission of American higher education? To address these questions, the presentation examines the mechanisms universities have used to promote citizenship and democratic engagement. These include civic and historical education, voluntarism and service learning, social innovation and entrepreneurship initiatives, and—particularly following the election of Donald Trump—efforts to foster civil discourse on campus. I analyze the underlying assumptions behind each approach and evaluate available empirical evidence regarding their effectiveness. Finally, the presentation assesses the current position of American higher education more than one year into the Trump administration's sustained political and policy challenges to the sector, examining institutional responses and strategic adaptations. It concludes by considering what American higher education might look like were democratic commitments treated as a primary institutional priority and will analyze contemporary civic engagement initiatives reflect competing and often incompatible theories of democracy embedded within American higher education.

THE SHARED CONSTRUCTION OF A DIFFUSED UNIVERSITY MUSEUM AS A PARTICIPATORY DEVICE

Franca Zuccoli (Università degli Studi di Milano-Bicocca, Italy) · **Rita Capurro** (Università degli Studi di Milano-Bicocca, Italy)

Diffused Museum | University | Third Mission

This paper analyzes the case study of MuDiB, the Diffused Museum of the University of Milan - Bicocca, as a tool for activating university participation and fostering connections with the local community (Boylan, 1999). Within the objectives of the third mission, one of the key aspects is the valorization and dissemination of knowledge. At the same time, the cultural and social mission is well-realized through the full promotion of cultural events, as well as the creation and management of museum hubs. The case of the University of Milan-Bicocca is unique in that, as a young university, founded in 1998, it never considered having a museum as a specific institution. Over the years, however, the presence of several collections deposited within the various Departments has become increasingly recognized. In particular, thanks to BiPAC, the Historical, Artistic, and Cultural Heritage Research Center, founded in 2017 and comprising a representative from each Department, a process of initial information gathering has begun, which has led to the uncovering of this hidden heritage. Over time, an increasingly detailed cataloguing process has been undertaken, leading to the identification of the initial nucleus of the collection of MudiB. The museum, founded in 2023 (Capurro, Zuccoli, 2023), is characterised by its role as a university museum, a local museum, and a diffused museum (Drugman, 1982, 2016). These characteristics make it an ideal place to implement the objectives of the Third Mission. As a university museum, it studies, preserves, and publicises the University's collections, housed in the various departments, highlighting their historical significance in relation to the university's three core activities: research, teaching, and the Third Mission. As a local museum, it fosters connections with the neighbourhood and the city, not forgetting that this campus was born from a project that prioritised the relationship between the University's spaces and the Bicocca neighbourhood. As a distributed museum, it does not concentrate the collection in a single exhibition space, but rather enhances the objects present in the various departments, maintaining their connection to the various disciplines to which they are connected. The museum carries out many different activities, from cataloging to the placement of works within the university context, from the creation of new exhibition spaces with significant objects that narrate the history and research of the Departments, to the organization of an annual exhibition and the promotion of a photography competition for the university population and the general public. All activities are documented and evaluated both numerically and qualitatively. The museum's choice is to fully adhere to the ICOM Prague 2022 definition: "A museum is a not-for-profit, permanent institution in the service of society that researches, collects, preserves, interprets, and exhibits tangible and intangible heritage. Open to the public, accessible, and inclusive, museums foster diversity and sustainability. They operate and communicate ethically, professionally, and with the participation of communities, offering diverse experiences for education, enjoyment, reflection, and knowledge sharing." From this perspective, the university and its museums can become a crucial point of discussion, exchange, and collective construction of social knowledge (Colazzo, 2002).

INTRODUCING INTERSECTIONALITY IN TEACHING STAFF TRAININGS TO FOSTER INSTITUTIONAL RESILIENCE

Liudvika Leišytė (TU Dortmund University, Germany)

intersectionality | teaching staff trainings | teaching practice

The German higher education system is frequently characterized as resistant or slow to change (Mergner, Peksen & Leišytė, 2026). At the same time, growing diversity among both students and teaching staff gives rise to new pedagogical challenges, especially within a contemporary context marked by populism and anti-DEI sentiments (Wild & Esdar, 2014). Although existing scholarship frequently examines individual dimensions of diversity in isolation, social identities are inherently multidimensional and shaped by the interaction of various categories, a phenomenon conceptualized as intersectionality (Crenshaw, 1991). Focusing on single categories therefore risks overlooking the complexity of lived experiences within higher education contexts. This contribution addresses the following research question: To what extent professional development intersectionality training enables teaching staff to advance intersectionality in their pedagogical practice? The study adopts a convergent mixed-methods design that combines quantitative and qualitative approaches (Creswell & Clark, 2017). Pre- and post-training surveys assess changes in participants' knowledge and practices, while a focus group provides in-depth qualitative insights into their experiences and implementation efforts. The findings highlight the potential of professional development trainings to promote intersectionality in higher education teaching and to empower teaching staff as agents of change, thereby strengthening institutional resilience within democratic societies.

Designing Democratic Innovation: Alternative Practices for the Future of Academia

PANEL CONVENORS: Giulia Ganugi (University of Bologna, Italy)

PANEL KEYWORDS: Social Innovation, Academia, Democracy

This session examines both institutional and informal counter-narratives and practices that seek to democratize education by addressing the shortcomings of traditional academia, including competition, inequality, exploitation, and precarity (Boynton 2021). In response to the current academic environment, two parallel developments have emerged: the growth of research on care, collaboration, acceleration/deceleration, and social innovation (Schröder and Krüger 2019) in higher education, and the flourishing of alternative academic work practices (Ganugi and Marocchini 2025). The session provides an opportunity to reflect on how these strategies contribute to democratizing higher education and explore new forms of participation and institutional responsiveness. Contributions are invited to address questions such as: What characteristics define innovative practices in terms of actors involved, focus of action, degree of institutionalization, territorial or digital expansion, type of impact, and groups benefiting? What forms of infrastructuring and social relations enhance the legitimacy, sustainability, or responsiveness of democratic innovation in academia? In what ways do innovative practices challenge, reinforce, or transform existing power dynamics, exclusions, or inequities within academic institutions? How do alternative approaches to writing, researching, teaching, organizing work, and using digital platforms mediate and advance democratization? How might innovative practices foster inclusive and collaborative academic cultures? How can academia itself be reimagined as a culture of sustainable and democratic research, teaching, and science communication? The session welcomes theoretical reflections and empirical research on this theme, but also methodological insights into participatory techniques and modalities that foster and disseminate innovative democratic practices in academia.

RESEARCH PRODUCTIVITY AND COMMUNITY: TENSIONS, BREAKDOWNS AND REPAIRS IN WRITING GROUPS

Lauren Beth Clark (UCL, United Kingdom)

writing | community | higher education

The metaphor of the Ivory Tower suggests that academics' ways of working have always been hidden from view, slightly mysterious. This has increasingly become the case post-pandemic, as more academics choose to work remotely, allowing us to even hide our practice from our colleagues. Despite the freedom to work flexibly there is also an increased notion of surveillance, with departments keeping track of the number of REF-able outputs, grant money secured, and enterprise projects completed. Due to recent articles that draw attention to the stress, burnout and quiet quitting that is happening among academics, some universities or departments have implemented initiatives to 'support' academics with managing mental health and well-being (Ahola et al., 2017; Hyatt, 2022). At my institution, as we approach REF2029, increasing focus has been placed on 'helping' us to produce 4* publications. Emails are sent asking us to report how many articles we are currently writing, which journals we hope to submit to, and what kind of support we need to help us with these outputs. Recently, my department has instituted CORS (Concentrated Research and Scholarship) weeks, once per term. Essentially, they are protected weeks that we are supposed to dedicate to research and writing. "Of course, normal work commitments must still be met in full" (internal email, 22/10/25). This innovation is a perfect example of something designed to promote productivity while ignoring the real-life commitments of staff, who are still required to handle their normal workload whilst also focusing on contributions to the financial gain and standing of the department. This paper will draw on a sociomaterial approach to explore two examples of initiatives I have experienced that were designed to promote research productivity and academic writing. The first is the CORS week described above, the second is a writing day for early career researchers hosted by the British Academy. The concepts of breakdown and repair (Zhang, Oliver, Littlejohn & Henry, 2025) will be helpful in exploring how certain assemblages encourage and impede the development of a productive community. Zhang et al. (2025) stated that breakdowns can often reveal something deeper than technological problems – they can draw attention to issues within the environment that we take for granted and that might need to be challenged or repaired. The focus on repair allows us to see how some groups might repair or manage these barriers or challenges while others might not, revealing factors that might explain the sense of community achieved by different groups. While writing retreats or groups are not particularly innovative (Mattsson et al., 2020), given our increasingly

digitised and remote ways of working, perhaps they do seem progressive. Finding time to disconnect from our normal working lives, to stop checking our emails, to unplug from the false urgency of working in academia, to reconnect with a community of scholars, can help us to slow down and actually enjoy a creative element of academic work.

ORGANIZATIONAL COMPASS: EXPERIMENTING WITH REGENERATIVE PROCESSES WITHIN A DOCTORAL TEAM ABSTRACT

Daniele Bucci (ISIA Roma; Ecosistemica) · **Thomas Kemps** (Ecosistemica)

Organizational Design | Academic Case Study | Systemic Design

Designing, in a situated manner, how people work together constitutes a foundational condition for collective work to take on regenerative qualities (Cole, 2012; Toner et al., 2023), understood in systemic, bio-anthropo-psycho-socio-historical (Morin, 2021), and environmental terms. In a global context marked by interconnected complex challenges (Sarkar & Kotler, 2025), a polycrisis (Lawrence et al., 2022), collaboration between actors at different scales has become indispensable. Metadesign, – the design of the structures and processes through which people design together – emerges as a strategic lever for democratic organizational innovation. Academia, as many other sectors, is not exempt from dysfunctions: its structural and procedural arrangements have crystallized over time and rarely been subject to intentional redesign. Such dysfunctions affect less privileged members asymmetrically (Ganugi & Marocchini, 2025), limiting their ability to fully express their potential and contributing to the reproduction of internal inequalities. This article investigates 'organizational design' as a metadesign practice through the lens of the Organizational Compass model (Bucci, 2025), presenting its application within the 40th cycle of the PhD program in Design for Social Change at ISIA Roma. The Compass systematizes the organizational "How," conceived as the intermediate space between the "Why" (purpose, vision, mission) and the "What" (products, services and systems). The "How" is articulated into six interrelated areas: Structure (the distribution of authority and responsibilities), Decisions (decision-making methods and tools), Participation (engagement and sense of belonging), Information (information flows and knowledge management), Resources (shared management of economic, spatial, and energetic assets), and Learning (feedback loops activating in response to emerging needs and project dynamics). Ecosistemica is a design and research company that adopts systemic approaches to organizational processes and social innovation, with a focus on participatory design, self-governance, and regenerative practices. It constitutes the professional context in which the authors develop and apply their methodological frameworks. Unlike Ecosistemica's consultancy practice, where intervention is conducted by external professionals, the case under investigation unfolds within a peer-to-peer context in which one of the authors is an active member of the doctoral group. The intervention thus takes the form of an emergent action-research process: not initially conceived as a formal experiment, but arising from a shared intention to make organizational processes clearer, more equitable, and more effective. During the first year of implementation, several innovations were introduced: a fractal structure with explicit roles (leader, note-taker, facilitator), shared documentation standards, and feedback cycles at both individual (peer performance reviews) and collective levels (project retrospectives). The article analyzes these innovations, how they were introduced, and their early observable effects on individual well-being and collective effectiveness, ultimately asking what metadesign might offer as a practice of democratic innovation within an academic setting.

MENTAL HEALTH IN CONTEMPORARY ACADEMIA: PERSISTENT CHALLENGES AND EMERGING FRAMEWORKS FROM A CASE STUDY

Antonella Verduci (Università degli studi di Bergamo, Italy) · **Marta Pantalone** (Università degli studi di Bergamo, Italy) · **Annalisa Cristini** (Università degli studi di Bergamo, Italy) · **Luca Carollo** (Università degli studi di Bergamo, Italy) · **Massimiliano Barattucci** (Università degli studi di Bergamo, Italy)

academic mental health | role transitions | academic motivation

The study investigates underexplored factors related to mental health within the university context. The academic debate on mental health has focused primarily on the student community, while largely overlooking university staff. In recent years, a growing number of studies have documented the presence, among faculty members and researchers, of symptoms associated with stress, anxiety, burnout and depression. These manifestations are frequently linked to profound organizational and systemic changes, including intensified competition, increasing contractual precariousness and implementation of productivity metrics together with expanded workload and spectrum of tasks and responsibilities. Within this context, a significant body of literature has concentrated on specific segments of the academic population (early career researchers), considered particularly exposed to such risks. In conjunction with this, other contributions have examined self-related dimensions of mental health, such as work-related stress, with the aim of analysing its determinants and modes of expression. This study asks how discourse on mental health unfolds within the university setting and examines its breadth and forms across the full range of academic staff. The investigation contributes to filling a gap in the literature and advancing the discussion on academics' mental health that goes beyond the quantification-oriented models (e.g. Job Demands–Resources framework) or unambiguous selection of the target. While remaining attentive to well-established aspects, such as risk factors, coping strategies and issues related to the potential stigma surrounding certain topics, the study situates the problematization of mental health within innovative interpretative frameworks aimed at: i) critically analysing the ambivalence of certain characteristics of academic work, such as its "vocational" and highly motivating nature; ii) investigating role transitions, which are considered particularly sensitive phases for mental health; iii) identifying initiatives aimed at protecting mental well-being at the individual, leadership, group/departmental and organizational levels. The study employs two well-established tools in qualitative sociological research: focus groups and semi-structured interviews. The cross-sectional analysis involves approximately 40 participants comprising the full range of academic staff at the University of Bergamo (PhD candidates, research fellows, researchers, associate professors, and full professors). The empirical exploration is accompanied by an interpretive-constructivist analysis designed to capture conceptual convergences and divergences between individual perceptions of the topic, organizational planning, and pressures stemming from the broader socio-institutional context in which academics work. The expected findings aim to generate multi-level impacts. The research seeks to set up a space for reflection on mental health within the specific institutional context under study, in order to contextualize individual perspectives and discursive patterns. The examination of recurring tensions makes it possible to both systematize organizational vulnerabilities (e.g. inadequate service provision) and unpack broader implications of academic culture for mental health (e.g. performance-oriented culture; funding shortages; precariousness). Finally, the study intends to bring to light proposals, initiatives, and targeted intervention policies grounded in academics' lived experiences, shared observations, and derived more generally from the empirical results. The resulting theoretical scaffolding will support the development of a constructive intra-organizational dialogue to effectively guide decision-making processes aimed at safeguarding mental health and reimagining a more sustainable academic culture.

FROM PRECARITY TO COLLECTIVE RESOURCE: PEER-BASED INFRASTRUCTURES OF SOLIDARITY AND KNOWLEDGE AS DEMOCRATIC INNOVATION IN NEOLIBERAL ACADEMIA

Martina Brighenti (University of Palermo, Italy) · **Gennaro Veneziano Labanca** (University of Milan-Bicocca, Italy)

Epistemic Inequality | Peer-based Care | Grassroots Infrastructuring

Contemporary higher education is increasingly structured by neoliberal regimes of competition, audit, and individual performance. These dynamics disproportionately affect early-career researchers and exacerbate inequalities linked to gender, race, class, geographical origin, and sexuality, contributing to both material precarity and epistemic marginalization (Boynton, 2021; Conelli, 2022). Within this context, democratizing academia increasingly involves alternative social relations and knowledge practices capable of transforming everyday academic life. This paper draws on a collaborative reflexive and auto-ethnographic approach grounded in our positionality as precarious, queer PhD candidates from Southern Italy (Barnao, 2023; Bourdieu, 2022). We analyze the development and effects of a monthly online meeting space created at the end of 2025 as a response to shared experiences and needs within academic institutions. Empirically, we examine three interrelated dimensions of this practice. First, the space operates as a safe environment in which participants can articulate vulnerabilities, doubts, and experiences of exclusion without fear of evaluation or reputational damage. Speaking openly about failure, exhaustion, or insecurity suspends dominant performative norms and redistributes voice and legitimacy at the micro-level of academic interaction. Second, the space functions as a collective site of decoding: participants make explicit the implicit norms governing academic evaluation, productivity, networking, and self-presentation. Drawing on Bourdieu's concepts of field, cultural capital, and symbolic power, we show how academic success depends on tacitly acquired dispositions and inherited resources. By unpacking these rules collectively, participants reduce epistemic asymmetries and transform institutional expectations into shared knowledge. Third, the group operates as a counter-competitive infrastructure. By openly discussing rejections and structural constraints, participants challenge the individualized logic of comparison and cultivate practices of mutual recognition and solidarity. This occurs also through collaborative writing and participation in academic spaces extending beyond specific research topics, thereby unsettling dominant academic logics. Experiences of precarity and queer dislocation are reframed not as individual deficits, but as socially produced effects of field-specific power relations, mobilized as collective resources for solidarity, reflection, and democratic innovation. Drawing on feminist theories of care, we conceptualize infrastructuring as

the relational and material work of maintaining, repairing, and reconfiguring conditions that enable participation and critique. Care is constitutive of democratic innovation: it produces the relational ground through which marginalized subjects can inhabit the institution differently, challenge asymmetries, and renegotiate symbolic hierarchies. By foregrounding interdependence as a democratic condition rather than a deficit, these spaces enact what Tronto (2013) calls a "caring democracy" at the micro-political level. This paper contributes to sociological debates on academic precarity, epistemic inequality, and democratization of higher education. Informal, digitally mediated practices, including mutual aid, attentive listening, and reciprocal care during early academic stages, create spaces in which emotions and lived experiences surface rather than remain silenced. These practices prefigure more inclusive academic cultures by reconfiguring everyday academic infrastructures from below.

STUDENT ENGAGEMENT AND CIVIC CONSCIOUSNESS OF FUTURE COMMUNICATIVE MEDIATORS: A PILOT STUDY IN A SPANISH UNIVERSITY

Cristina López-Navas (Universidad Complutense de Madrid, Spain) · **Louis Pierre Philippe Homont** (Universidad Complutense de Madrid, Spain) · **José Antonio Alcoceba Hernando** (Universidad Complutense de Madrid, Spain) · **Laura Picazo Sanchez** (Universidad Complutense de Madrid, Spain)

Student engagement | Communicative mediation | Pedagogical Innovation

In a context marked by declining traditional forms of citizen participation in the public sphere, particularly voting (Canel & Luoma aho, 2018; Kumagai & Iorio, 2020), young people have become a central concern within academic debate (Grasso, 2016; Sloam, 2014). As the cohort that will sustain democracy in Europe, their lower electoral participation compared to previous generations calls into question the stability of representative democratic models. Some research links youth abstention to a weaker sense of civic consciousness (Wattenberg, 2015). Other studies contend that young people are not disengaged as such but instead orient their participation towards alternative forms grouped under the concept of Citizen Engagement (Ekman & Amnå, 2012; Sloam, 2016; Theocharis & van Deth, 2018). From this perspective, what is observed is not a simple decline in participation, but a transformation of its repertoires. In higher education, this transformation has been increasingly discussed under the concept of "student engagement", which refers to the set of academic, social and civic activities through which students participate in university life (Groccia, 2018). Recent research highlights how student engagement is shaped by institutional opportunities, motivational factors and barriers that affect students' willingness and capacity to participate in the university community (López-Navas, Homont & Alcoceba, 2025). From a communicative perspective, this issue acquires additional relevance in the case of communication students. According to the theory of social mediation (Martín Serrano, 1977), communicative mediators play a crucial role in transforming social events into narratives that contribute to the reproduction or transformation of social structures. As future professionals responsible for producing public narratives, communication students are not only citizens in formation but also potential mediators capable of legitimising or questioning certain forms of civic participation. Within this framework, this paper presents the pilot phase of an educational innovation project currently being developed at the Faculty of Information Sciences at the Complutense University of Madrid. The project aims to design and test pedagogical strategies intended to strengthen students' civic motivation, university participation and awareness of their future mediating role within the communicative system. The research adopts a mixed sequential design. As a first step, a pilot study is being conducted to validate a questionnaire measuring attitudes towards electoral participation, alternative forms of student engagement, university participation and students' self-perception as future communicative mediators. The pilot phase aims to refine the measurement instrument and assess the internal coherence of its dimensions before its implementation in a broader

sample of communication students. In a subsequent stage, qualitative interviews will explore students' civic consciousness and reflexive positioning regarding their future professional role. In parallel, the project develops participatory pedagogical activities based on active learning methodologies that encourage students to reflect critically on media narratives about youth participation and to explore their own role in the construction of public representations of civic behaviour. As the project is currently in progress, this paper focuses on the conceptual framework, research design and pilot results, opening a dialogue with international scholars on how communication education can contribute to strengthening democratic participation within universities.

IMPACT EVALUATION TO SUPPORT INCLUSIVE AND DEMOCRATIC UNIVERSITY: THE INSIGHT PROJECT

Paola Damiani (Universita Degli Studi Di Modena E Reggio Emilia, Italy) · **Laura Landi** (Universita Degli Studi Di Modena E Reggio Emilia, Italy) · **Annamaria Gentile** (Universita Degli Studi Di Modena E Reggio Emilia, Italy)

Community of practice | inclusion | participation

This contribution reflects on how the impact evaluation of the Professional Development constructed through the Erasmus+ project INSIGHT, can promote democratic innovation within the university culture. The project's overall objective is to identify and promote inclusive university teaching strategies that enhance learning, participation, equity, and well-being for all students within a co-development perspective involving both students and teachers. By creating a community of practice within each partner institution the project also aims at promoting an inclusive and collaborative university culture, as a fundamental step to ensure the efficacy and sustainability of the project. The research team uses Guskey's impact evaluation model to support the transformative practice toward a democratization of both teaching methodologies and overall organization. The framework (Damiani et al., 2024) is grounded in a contextualist epistemology that frames inclusion as the expansion of capabilities, agency, and empowerment within interconnected learning ecosystems (Morin, 2004; Bronfenbrenner, 2005; Sen, 1985). Inclusion can only be achieved through systemic and infrastructure changes informed by an idea of enhanced participation and democratic innovation in academia. Central to this innovation is an inclusive teaching device providing teachers with tools and reflective practices to achieve changes both in their class and among colleagues. To implement and validate the inclusive teaching device a group of university professors was trained and supported in piloting the device. This paper presents the mechanism supporting implementation of the inclusive teaching device, specifically the Guskey's impact evaluation model protocol. According to Guskey, effective professional development evaluation requires collecting and analyzing data across five critical levels: participants' reactions, participants' learning, organization support and change, participants' use of new knowledge and skills, and students' learning outcomes. The levels are hierarchical and interdependent; success at one level is generally necessary to achieve meaningful outcomes at the next. For instance participants need to be positively affected by professional development in order to learn from it, but their learning can often only be implemented if there is organization support, and so on. Every step of INSIGHT implementation has been monitored through an impact assessment protocol, following

the Guskey model. Data were collected before and after the training, to assess level one and two of the model. During the experimentation in university courses the project partners closely supported experimenting teachers through meetings, data collection tools and the establishment of a community of practice. This structure is not only necessary to ensure that effective changes will be made to instruction in target courses, but also aims to create, support and promote an inclusive and collaborative culture within partner universities, i.e. level three of the model. Level four and five were assessed throughout the experimentation phase collecting reflective tools from both teachers and students. We will present data to show how the impact evaluation methodology applied has positively supported the inclusive teaching device implementation with a multiplying effect fostering greater inclusion and participation in targeted courses, triggering a process of transformation of existing power dynamics, limiting inequalities, and promoting a democratic university culture.

DEMOCRATIZING ASSESSMENT PRACTICES IN HIGHER EDUCATION: A STUDENT–FACULTY COLLABORATION ON ALTERNATIVE ASSESSMENT AT ATHABASCA UNIVERSITY, CANADA

Rebeccah Nelems (Athabasca University, Canada) · **Neenah Brown** (Athabasca University Student Union, Athabasca University, Canada) · **Faustina Arsenault** (Athabasca University Student Union, Athabasca University, Canada) · **Eliana El Khoury** (Athabasca University, Canada) · **Lorelei Hanson** (Athabasca University, Canada)

Alternative assessment · critical pedagogy · learner-centred research design

In this paper, a student-faculty research team share the findings and recommendations of interdisciplinary research conducted on alternative assessment at Athabasca University, a Canadian distance post-secondary institution. Conducted in partnership with the Athabasca University Student Union (AUSU), the 5-person research team of undergraduate students and faculty researchers initiated this university-wide, learner-centred research to understand how the use of alternative assessment might enhance undergraduate student learning. The participatory research design used a relational research methodology (Wilson, 2008) that centred decolonizing and equity lenses, with an explicit focus on Indigenous students, neurodiverse students and students with accommodations or accessibility needs. The context of this study is the reality that student learning in post-secondary institutions continues to be predominantly assessed through the use of academic essays, multiple-choice and final, time-bound exams, and other standardized evaluations. While these mainstream approaches continue to be prevalent around the globe, a growing body of research suggests that these practices do not optimally measure students' learning, nor contribute to student learning, growth and engagement (Abrahams, 2024). Additionally, traditional assessments are known to reproduce and/or exacerbate structural barriers for some

learners, including Indigenous students, neurodiverse students, and students with accommodations or accessibility needs (Preston & Claypool, 2021; McDowall & Kiseleva, 2024). Finally, traditional assessments prioritize a Euro-centric knowledge system that devalues alternative knowledge traditions (e.g., Indigenous Traditional Knowledge, ITK), and enforces a top-down relationship or 'banking model of education' in which students are engaged as receptacles of teachings (Freire, 1970) determined by educators, and educational systems with minimal or no student input or consent (Simpson, 2017). In these systems, students not only have limited say in what or how they learn, they have no voice in how they might optimally demonstrate their learning, be assessed, or graded. In response to these challenges, alternative assessments have emerged as ways that students can demonstrate their knowledge in a diversity of ways, whilst also enhancing their learning and critical engagement with course materials. In Canada, as institutions look to advance Diversity, Equity and Inclusion (DEI), respond to the Truth and Reconciliation Commission's (TRC) Calls to Action (2016), and address the pedagogical implications of emerging technologies such as AI, alternative assessment practices are viewed as offering promising pathways for innovation in teaching and learning. This paper will provide an overview of the findings and recommendations of this study, whilst sharing insights that have emerged related to the implementation and integration of alternative assessment practices within post-secondary institutions. By examining alternative assessment through a participatory and relational research framework, this project contributes to broader discussions about democratic innovation in academia, and the advancement of critical, equitable, and decolonizing pedagogies. The paper will also reflect on how collaborative student–faculty research partnerships are a critical means by which democratic innovation within academic institutions might be advanced, facilitating student participation in the shaping of educational practices. The findings aim to directly enhance assessment practices at Athabasca University, while also contributing to international conversations about alternative assessment; critical and relationally accountable (Wilson, 2008) pedagogies; and learner-centred pedagogical research design.

Educating to Participate. Educational Innovation in University Systems as a Tool for Inclusion and Democratic Participation

PANEL CONVENORS: Barbara Mazza (sapienza, Italy); Elena Valentini (sapienza, Italy); Lucia D'Ambrosi (sapienza, Italy); Veronica Lo Presti (sapienza, Italy); Houshmand Masoumi (Technische Universität Berlin, Germany); Yuliia Kravchenko (Tallinn University of Technology, Estonia); Martin Vaz Alvarez (Universitade de Santiago de Compostela, Spain)

PANEL KEYWORDS: Didactics Innovation, Digital Democracy, Digital Transformation

In the era of digitalisation and hyperconnectivity, university systems are increasingly committed to adopting digital transformation principles to integrate educational innovation into cooperative and collaborative learning processes. However, the acceleration of these processes does not always translate into a clear definition of the objectives and implications of the ongoing transformations. Various ambivalences are emerging regarding issues of "digital fatigue", social isolation, conformity in thought and action, and dependence on algorithmic logic. The danger is that they will fail to achieve the goal of preparing future generations of citizens and professionals to participate in democratic processes. Globally, numerous recommendations from government bodies and international organisations have been implemented to advance digital transformation that fosters effective digital democracy. Governments must offer digitalised services to citizens (G2C), businesses (G2B), and other administrations (G2G). In this scenario, what is the contribution of education to preparing citizens who are aware and active in democratic processes? To what extent does educational innovation contribute to the development of forms of post-humanism? How can university systems optimise their commitment to academic innovation while considering these macro-objectives of education? This panel proposal stems from theoretical reflections and empirical research on these topics, which are underway within two European projects (ERASMUS-EDU-2025-CBHE-STRAND-2 (ERASMUS-LS: 101236774) Digital Bridges and ERASMUS-EDU-2023-PI FORWARD-LOT1 (Smart Nest. Protocol: 101132828) "Quality of Virtual Auditorium") dedicated to innovation in university teaching and its ability to create intercultural "bridges," to promote digitalization and the development of digital democracy in the Mediterranean region.

COOPERATION AS A RHETORICAL STRATEGY? THE EUROPEAN UNIVERSITY ALLIANCES AND THE CHALLENGE OF DEMOCRATIC PARTICIPATION

Paolo Brescia (University of Cagliari, Italy) · **Andrea Lombardinilo** (Roma Tre University, Italy)

university cooperation participation

In times characterized by professional dynamism and daily "platformization", European higher education is undergoing a profound transformation through cooperative programmes such as the European University Alliances, promoted within the "European Education Area". Given that these programmes have been planned to foster inclusion, digitalization and transnational collaboration, this intertwined vision appears to be inspired by a more complex convergence of cooperation and control, creativity and standardization, that reshapes the very idea of the university as a democratic environment. In this view, this paper explores the rhetorical and metaphorical solutions inspiring the discourse on collaboration, creativity, and control within the official factsheets of the European University Alliances involving Italian public universities. The paper analyzes these declarations with the aim to probe the most frequent programmatic patterns inspiring such academic alliances. As a result, the shared systemic challenges emphasize the joint relationship between institutional discourse and digital transformation, in a time universities are expected to lean on interculturality, cooperation, and social impact. More specifically, the paper will focus on the role played by some Italian Universities within the international Alliances in which they are involved: University of Cagliari (EDUC Alliance), University of Naples Parthenope (SEA-EU Alliance), Sapienza University of Rome (CIVIS Alliance), University of Catania (EUNICE Alliance), University of Macerata (ERUA Alliance), University of Bergamo (BAUHAUS4EU). The qualitative analysis of the official declarations will help investigate the keywords of such cooperative strategies highlighted through shared rhetorical solutions and theoretical sociological patterns. Through the theoretical analysis provided by Nicolas Dirks, Frank Furedi, Paul Virilio, Paul Bourdieu, and Jurgen Habermas, these alliances will be framed within the broader debate on the neo-liberal academia, the deification of safety, and the "weaponization" of emotions that Furedi interprets as a real academic drawback. These rhetorical patterns often reproduce the ambivalences of contemporary higher education: while promising open collaboration and creative exchange, they also embed mechanisms of bureaucratic control and normative convergence. In particular, the use of performative keywords (excellence, innovation, impact, quality) reveals the effort to pursue the goals of efficiency and accountability. Given the theoretical lenses of the "social university" (Ferrarotti) and "civic university" (Dobson and

Ferrari), the paper discusses how these alliances perform a communicative redefinition of the academic space, transforming universities into systems capable of developing a digital and intercultural ecosystem. This transformation entails a potential loss of autonomy and local distinctiveness to achieve harmonization and shared governance, just to foster a reticular model of university.

BEYOND DIGITAL INFRASTRUCTURE: PEDAGOGICAL INNOVATION AND DEMOCRATIC PARTICIPATION IN MEDITERRANEAN UNIVERSITIES BETWEEN POSSIBILITIES AND LIMITS

Alfonsina Mastrolia (Department of Communication and Social Research, "La Sapienza" University of Rome) · **Viviana Capozza** (National Institute for the Evaluation of the Education System (INVALSI))

Pedagogical Innovation | Learning Management Systems (LMS) | Participatory Learning

In the context of digital transformation, universities are increasingly seen as strategic players in promoting digital democracy and intercultural connectivity in the Mediterranean region. Educational innovation plays a strategic role in promoting inclusion, active participation and the co-construction of knowledge within university digital environments. Digital platforms represent potential "bridges" capable of connecting academic communities in different geopolitical and cultural contexts. However, the presence of digital infrastructure cannot automatically translate into participatory and democratic educational environments. This contribution presents the results of an online survey conducted among students enrolled in Moodle-based courses across partner universities in Italy, Greece, France, Germany, Turkey, Croatia, and Lithuania, within the framework of the Virtual Auditorium project, funded by the ERASMUS+ programme under the Partnerships for Innovation – Forward-Looking Projects action. The study adopts a critical, non-deterministic perspective on digital transformation in higher education, considering platforms not as neutral tools but as environments whose effectiveness depends on how they are integrated into teaching practices. From this perspective, digital democracy is not an automatic effect of technological access, but rather the result of pedagogical choices able to activate collaborative, dialogical and reflective practices. Preliminary findings indicate a significant process of digital normalisation within participating universities: the 624 respondents report almost universal access to digital devices and extensive use of online communication tools, while Moodle is widely integrated into teaching practices, mainly within blended learning models. At the infrastructural level, the platform contributes to the continuity of access and systematic availability of teaching materials, becoming a stable and routinised component of course delivery. At the organisational level, its use is associated with advantages in sharing materials and managing study activities and is linked to a perception of improved learning and academic performance. These benefits are mainly related to efficiency, structuring and individual study management, rather than collaborative or dialogic practices. No similar strengthening has been observed in terms of relationships and participation. This is reflected in the reduced use of collaborative activities (co-creation, forums, simulations), limited peer-to-peer interaction and student-teacher engagement through the platform. This ambivalence suggests a gap between digital transformation and pedagogical innovation. Although universities have extensively implemented technological infrastructures, the intentional redesign of teaching practices towards active, participatory and co-creative models still appears to be incomplete. A predominantly individual and efficiency-oriented use can contribute to dynamics of isolation and digital fatigue, highlighted in the literature on online learning, rather than encouraging

participation. In the intercultural Mediterranean context, characterised by heterogeneous institutional traditions and geopolitical asymmetries, the digital transformation into relational "bridges" requires deliberate teaching strategies oriented towards the collective production of knowledge. From a preliminary and exploratory perspective, the study also opens up a reflection on the post-human dimension of the academic experience. As human-machine interaction becomes commonplace, the question is how pedagogical choices mediate this transformation. Digital innovation is significant for democratic participation when infrastructural integration is accompanied by a pedagogical reconfiguration oriented towards collaborative action and intercultural dialogue.

CIVIC PARTICIPATION AND CIVIC EDUCATION: INSTITUTIONAL PERSPECTIVES FROM GERMANY AND TEACHER TRAINING PRACTICES IN ITALY

Gernot Herzer (Institut für kommunale Planung und Entwicklung, Erfurt, Germany) · **Doris Kofler** (University of Bozen, Italy)

civic participation and education | youth and teacher training | gamification

Civic engagement and civic participation are closely linked to deliberation, empowerment, and democratic learning and are increasingly becoming key responsibilities of local authorities within contemporary decision-making processes. Ehrlich (2022) defines civic engagement as "working to make a difference in the civic life of our communities and developing the combination of knowledge, skills, values and motivation to make a difference." Similarly, Weisseno (2023, p. 317) argues that "Society and educational policymakers expect political education to contribute to the development of democratic attitudes and the associated willingness to participate in order to prevent illiberal, autocratic and authoritarian behaviour." Building on the model of political competence (Detjen et al. 2012), there is a demonstrated connection between political knowledge, prior participation experiences, and the willingness to participate politically (Weisseno, 2023, p. 216). Participation experiences—whether positive or negative—significantly influence future civic engagement. This relationship applies not only to children, adolescents, and adults within political education contexts but also to municipalities that design and implement participatory processes. Civic participation must therefore be understood not only as a societal practice but also as an educational task embedded within institutional structures. In this theoretical background, the paper presents findings from two empirical contexts: civic participation practices in German municipalities (Herzer, G.) and civic education within teacher training at the Free University of Bozen-Bolzano (Kofler, D.). The study examines civic engagement and participation in both formal and non-formal settings. On the one hand, it analyses institutional approaches to participation within municipalities, schools, and social institutions. On the other hand, it investigates civic education in teacher training as a foundational space for developing democratic competencies and professional responsibility. The German data were collected through a online survey of a municipalities (N = 468), representing independent cities, municipalities, and districts. Quantitative data were analysed using descriptive statistical methods and

inductive procedures, including factor analysis, to identify structural dimensions of institutional participation practices. In Italy, data were collected from Master's students in Primary Education. The sample included first-year students (academic year 2024/25; N = 75) attending a laboratory course in Intercultural Education and two cohorts of fifth-year students enrolled in Civic Education (N = 36; N = 43). Participants completed a questionnaire assessing their knowledge of the European Union and its values, as well as their reflections following a board game activity designed to promote civic learning. The overall aim is to contribute to the further development of civic education and citizen participation practices by linking municipal participation structures with teacher professionalization. Particular attention is given to schools as democratic spaces shaping new forms of civic and social learning. Innovative approaches such as game-based learning are examined as didactic tools to foster democratic competencies, intrinsic motivation, critical thinking, and reflective engagement. The findings highlight the crucial role of universities in embedding civic participation as a core educational task. By integrating theoretical knowledge, reflective practice, and experiential learning into curricula, teacher education can function as a central site of professional empowerment, enabling educators to translate democratic principles into sustainable pedagogical practice and to foster inclusive and participatory school cultures.

ORCHESTRATING DEMOCRATIC CBL FOR CLIMATE RESILIENCE: INSTITUTIONAL DESIGN AND AN AI-ENABLED RESEARCH AGENDA

Erik Kangilaski (TalTech, Estonia) · **Riina Palu** (TalTech, Estonia)

CBL | educational innovation | digital democracy

Challenge-Based Learning (CBL) is increasingly adopted in universities as an innovative pedagogy for cultivating civic competence and collective agency in digitally mediated societies. In the context of socio-ecological crises such as climate change, CBL is often presented as a way to connect higher education with democratic participation and societal problem-solving. In many cases these initiatives intersect with traditions of citizen science and community-engaged learning, where students collaborate with societal partners to generate socially relevant knowledge. Yet the democratic promise of CBL — classroom-laboratories that foster critical thinking, collaboration and responsible citizenship — is frequently constrained by institutional bottlenecks: partner coordination, mentor capacity, assessment practices, and invisible educator labour. These constraints are especially salient when CBL addresses crisis-scale, cross-disciplinary challenges that require sustained institutional support and transparent, participatory monitoring. This paper reports a systematic review and proposes a design-oriented research agenda that foregrounds institutional orchestration as core infrastructure for resilient, democratic CBL. The review reveals a recurrent pattern: studies on CBL emphasise student outcomes and pedagogical designs for civic engagement, while studies on AI in education focus primarily on learner-facing tools rather than the institutional infrastructures required for digitally supported collaborative learning. The intermediate layer — workflows, role coordination, partner onboarding, governance mechanisms, and assessment modalities reconceived as instruments of empowerment rather than control — remains under-theorised and under-validated in real university settings. From a democratic perspective, this omission risks making crisis CBL episodic, inequitable, and overly dependent on a few motivated staff, thereby undermining sustained public engagement and equitable student voice. Responding to this

gap, the paper outlines a practicable research and design agenda using Action Design Research principles. The agenda treats AI as a coordination support (mentor onboarding aids, progress summarisation, artefact outcome mapping) that preserves human decision authority and enhances transparency — principles increasingly discussed in debates on digital democracy and algorithmic governance. Crucially, it reconceptualises monitoring and assessment: rubrics, participation metrics and reporting flows are reframed as tools to amplify student agency and partner accountability rather than as top-down inspection mechanisms. The agenda also foregrounds teacher competencies (facilitation, boundary-spanning with partners, assessment-as-empowerment) and institutional change mechanisms (role definitions, workload modelling, IT governance) necessary to scale crisis CBL ethically and sustainably. By linking orchestration design to democratic aims, the paper contributes a bridge between pedagogical innovation and systemic infrastructure: resilient crisis CBL requires not only classroom practices but institutional orchestration within university systems that support equitable participation, transparent reporting, and sustainable staff workloads. The presentation will invite discussion on governance models, the ethics of AI-enabled coordination, competency frameworks for educators, and practical pathways universities can adopt to embed democratic, crisis-responsive CBL at scale.

THE ROLE OF TRAINING NEEDS IN ITALIAN UNIVERSITIES: THREE EXPERIENCES OF INCLUSION COMPARED

Isabel Maggiarra (Università di Parma, Italy)

Inclusion university educational support

Italian and international universities are attended by students with special training needs, which do not always fall within the category of Special Educational Needs (SEN) (Savarese, D'Elia, 2018). The latest figures on this subject, dating from the 2019–2020 academic year, show that only 2.13% of students enrolled at Italian universities have a disability or a specific learning difficulty (ANVUR, 2022), but there are no figures available for other needs. The focus on special training needs as opposed to SEN stems from conceptual and regulatory reasons: first and foremost, the definition of educational need refers, in both the Italian and international contexts (OECD, 2022), to developmental difficulties (Ianes, 2006) that tend to emerge by the age of eighteen, which relate to the developmental stage but fall within a clearly defined framework (UNESCO, 1994; MIUR, 2012); as the adjective itself implies, these are needs that arise within the educational context. It is a different matter to consider the heterogeneity of needs, of varying scope, which manifest themselves not during school age but during the transition to adulthood or in adulthood. Despite this, in common international language, training needs and educational needs are often translated in the same way, under the umbrella term SEN, overlooking the important nuance of meaning that distinguishes them. Three significant studies from different universities, selected for their relevance to the topic, the University of Salerno (Savarese, D'Elia, 2018), the University of Parma (Antonietti, Luciano, Pintus, 2024), and the University of Salento (Pinnelli et al., 2024) report that universities have training needs that are not only related to certifiable conditions that arise during the academic career. This finding is also reflected in the guidelines of the CNUDD (CNUDD, 2024), which guide universities in managing different situations that do not fall within the current regulations on university inclusion (i.e., Law 104/92, Law 118/1971 and Law 170/2010 and subsequent regulatory updates), according to the principle of reasonable accommodation. The primary objective of this study is to review the national and international scientific literature on the subject and then analyse some case studies from national university teaching practice. In this regard, the aim is to examine the various approaches to managing training needs within Italian universities, the schemes designed, and the measures put in place to support students who, during their studies, face different needs – namely, non-traditional students (Pinnelli et al., 2024); that is to say, a group of students with varied needs and requirements, including, for example, temporary vulnerabilities, disabilities, and linguistic, cultural and social disadvantages. In this sense, this study also includes those who lack 'social capital', that is, a network of personal relationships that an individual can directly draw upon to pursue their goals and improve their social position (Bourdieu,

1980). Social capital thus identifies a particular set of resources – those present in the relationships an individual maintains with the surrounding community – without which they could not have the same opportunities for social stratification (Bourdieu, Passeron 1977).

THE ROLE OF DIGITAL AND VIRTUAL TECHNOLOGIES TO RETHINK INCLUSION IN SPORTS EDUCATION

Barbara Mazza (sapienza, Italy)

Sports | Inclusion | Digital Technology

This paper offers a theoretical reflection on the role of digital and virtual technologies in sports education, with a particular focus on their potential to promote inclusive processes. Although the topic of inclusion through sport is widely discussed at both institutional and scientific levels, studies that systematically analyse the effects of digital technologies in sports education environments remain limited (Mittler, 2005a, 2005b; Magnanini et al., 2018; Kozikoglu & Onur, 2019). Nevertheless, numerous educational projects and policies, particularly at the European and international levels, highlight a growing interest in technological innovation as a lever for ensuring equal opportunities for access, participation, and learning in sport. Inclusion is understood here as a process of social justice aimed at creating accessible, safe, and respectful sports environments that foster the active participation of all individuals, regardless of age, social background, or physical, motor, or cognitive abilities. From this perspective, sports education is required to adapt rules, spaces, and tools to promote active and collaborative learning experiences and counter stereotypes and prejudices, thereby strengthening empathy, communication, and awareness of both self and others. The literature review indicates that e-learning platforms and mobile applications are the most widely used technologies in sports education, particularly for fostering content sharing and interaction between students and teachers. Exergames and gamification practices emerge as effective tools for enhancing motivation, movement, and interdisciplinarity, whereas monitoring devices, immersive technologies, and generative tools remain less commonly used, mainly due to economic, technological, and educational constraints. Despite their potential to support body awareness, personalised learning, and the inclusion of individuals with disabilities, these technologies are often employed in fragmented ways that are not fully aligned with educational objectives. The study also reveals a strong prevalence of cognitively oriented teaching approaches, to the detriment of interactionist, sociocultural, and hybrid methodologies, which appear more suitable for enhancing the relational, socio-environmental, and motivational dimensions of sports education (Geisen, Fox, & Klatt, 2023; Willaert et al., 2020; Petrini, 2025). In conclusion, the study highlights the need for a more informed, integrated, and pedagogically grounded use of digital technologies, identifying future research priorities focused on exploring the relational, motivational, and physical effects of digital and virtual learning environments from a longitudinal and inclusive perspective.

Higher Education Teaching Practices as Micro-spaces of Democracy and Resistance. What Does it Mean to be ‘Political’?

PANEL CONVENORS: Maila Pentucci (University "Gabriele D'Annunzio" Chieti – Pescara, Italy); Lorella Giannandrea (University of Macerata, Italy); Magda Pischetola (University of Copenhagen); Francesca Gratani (University of Macerata, Italy); Lorenza Maria Capolla (University of Macerata, Italy); Pier Giuseppe Rossi (University of Macerata, Italy)

PANEL KEYWORDS: Higher education, teaching, political

In an era of neoliberal governance, competitive academic performance and search for ‘best practices’, the social role of university students and teachers seems restricted to passive compliance to capitalistic structures. Parallel to the appropriation of concepts such as ‘critical thinking’ and ‘dialogical space’ in curricula, a culture of devalued content knowledge has spread in universities, in favour of individual human capital and occupational skills credentials. In teaching, however, micro-spaces of resistance occasionally arise from discontinuities/voids in the system or from unexpected contingencies. These might become opportunities for generating sensibilities and processes that resist contemporary academic control-oriented logics, with teachers intentionally and creatively building democratic practices and counter-cultures. The panel will explore what it means to cultivate micro-spaces of resistance and democracy in the contemporary landscape of higher education. It will give floor to debates around the relationship between resistance and democracy, exploring what it means for the teacher to be political (Freire, 1996; Furrey, 2023; hooks, 1994). Contributions may address: The situations from which micro-spaces of democracy and resistance emerge across different institutional and cultural contexts; The expression of intentionality in the design and implementation of teaching choices as a way of resistance (multicultural, non-western, decolonial curricula and feminist methods); The political declination of disciplines, their transposition and mediation, as elements that allow for more inclusive perspectives, rather than reinforcing the status quo; Teaching-as-activism and research-as-activism as political practices of situated meaning co-creation and their role in reimagining democracy; Students’ agency in occupying emerging micro-spaces of resistance/democracy in the classroom.

PRACTISING MICRO-DEMOCRACY IN TRANSNATIONAL HIGHER EDUCATION: PARTICIPATION, INCLUSION AND ACADEMIC FREEDOM WITHIN A NON-WESTERN INSTITUTIONAL CONTEXT

Peri Papadimitriou (Queen Margaret University, Scotland)

Micro-democracy | Inclusive Pedagogy | Transnational Higher Education

This paper examines transnational education as a micro-space of democracy within contexts of political transition, uncertainty and systemic educational reform. Drawing on a reflexive, practice-based case study of a UK-Uzbekistan university partnership, it explores how democratic participation and agency are materially produced through curriculum co-design, inclusive pedagogy, and the everyday organisation of access, support, academic freedom and safe spaces within a multilingual, multicultural, non-western institutional context (Council of Europe, 2025; QAA, 2023; Collins, 2019). Rather than treating democracy as an assumed outcome of access, the paper conceptualises micro-democracy as a routine intentional alignment with democratic values, enacted across the full student and institutional lifecycle (Vazquez Garcia et al., 2025; Demirbolat, n.d.). Uzbekistan’s 2030 reform agenda has strategically positioned widening participation as a central element of social cohesion and democratic renewal (Presidential Decree No. UP-158, 2023; Government of Uzbekistan, 2022). This followed decades of highly uneven access to higher education shaped by geographical, geopolitical, socioeconomic, and gender-based inequalities. These structural inequalities had historically constrained the capacity of higher education to foster participation, social mobility, and democratic engagement, particularly for students from rural regions and underprivileged backgrounds and for women in particular. In simple terms, education was not functioning as an enabler for social mobility but rather as an elite opportunity. Against this backdrop, a partnership between a UK

and an Uzbek university was established through the co-design of undergraduate and postgraduate programmes via a hands-on collaborative and participatory work that deliberately avoided “best practices” or a “pre-defined equilibrium”. The degree of unpredictability with regards to the outcome was embraced by all actors while the anchor was common: the creation of non-western, globally relevant decolonial curricula. The initiative was informed by the UK University’s purpose of creating a better society through education, underpinned by social justice, while supporting each individual and encouraging collective engagement. It was also closely aligned with the local context and national reform priorities, while remaining carefully contextualised to the contemporary Uzbek environment. Democratic participation, in this case, was materially produced through partnership and pedagogical intentionality of programme design, operating as a form of resistance to historically exclusionary higher education structures This paper illustrates the ways in which transnational education can function as a democratic micro-space, a vehicle for social justice and transformative learning, through a holistic approach to inclusivity and democratic engagement for students and local academics (QAA, 2023; Council of Europe, 2025). It presents a context-sensitive anti-linear approach to transnational higher education practice showcasing resistance to past territorial inequality in access to higher education which was structurally aligned with a de facto stratification within nominally egalitarian systems. The paper contributes to debates on democracy and education, by theorising micro-democracy as relational practice produced through partnership, under conditions of change and constraint, rather than as an assumed outcome of access alone.

HAVING NO VOICE, BEING NON-CITIZENS: THE POLITICAL DIMENSION OF COMMUNITY SERVICE LEARNING BETWEEN INTERSECTIONALITY AND SOCIAL INNOVATION

Luisa Zecca (University of Milan-Bicocca, Italy) · **Rebecca Coacci** (University of Milan-Bicocca, Italy) · **Valeria Cotza** (University of Milan-Bicocca, Italy) · **Claudia Fredella** (University of Milan-Bicocca, Italy) · **Nagwa Hussein** (University of Milan-Bicocca, Italy) · **Petar Lefterov** (University of Milan-Bicocca, Italy) · **Lisa Sacerdote** (University of Milan-Bicocca, Italy)

Intersectionality | Community Service Learning | Social Justice Education

This paper examines the role of community educational centres as drivers of social innovation oriented towards educational justice, drawing on the case of "L'ABC del Quartiere" in Milan's San Siro district. Located in a context marked by segregation, educational poverty, and a high concentration of migrant populations (Grassi, 2022), the study investigates how proximity-based educational practices can address the structural inequalities that intersect in the lives of women and children. The theoretical framework adopts an intersectional perspective (Hill Collins & Bilge, 2020) to interpret the condition of mothers in San Siro. They stand at the crossroads of multiple discriminations: gender, as women navigating patriarchal structures; ethnic-religious identity, as Arab-Muslims in an Islamophobic society; housing and class, as residents of a ghettoized neighborhood; and legal status, as mothers of children born in Italy denied citizenship under ius sanguinis.Three perspectives are integrated. Social innovation (Moulaert & MacCallum, 2019) frames L'ABC as a laboratory for bottom-up collective action. Nancy Fraser's three-dimensional justice model (2008) is articulated in an intersectional manner: redistribution (combating educational poverty), recognition (valuing heritage languages), and representation (struggling for participatory parity despite formal exclusion). Paulo Freire's critical pedagogy (1971) conceives education as a practice of freedom, transforming mothers and children into co-constructors of the educational environment, while

simultaneously, Community Service Learning (CSL) at L'ABC shapes the professional identity of education students (Zecca, 2024). Intertwined with participatory action research, CSL cultivates "transformative intellectuals" (Giroux, 1988), thus becoming a political dimension of pedagogical professions: a site of resistance against the systematic denial of citizenship. The research adopts a qualitative, participatory methodology: participant observation and research diaries analyzed through reflexive thematic analysis (Braun & Clarke, 2021); semi-structured interviews with 16 mothers attending the L2 Italian course; and participatory focus groups with educators, teachers, and CSL students. Preliminary findings reveal four impacts. Redistributive: individualized tutoring produced 30% improvement in L2 Italian literacy (CILS certifications), reducing implicit school dropout. Recognition: valorization of Arabic disrupts children's linguistic invisibility, strengthening scholastic legitimacy (Zecca & Lefterov, 2025). For mothers, seeing their language valued counters social devaluation. Participation and citizenship: mothers' trust in institutions increased through co-presence (Sacerdote, Zecca, 2025). Yet the paradox of denied legal citizenship persists: they participate actively but remain excluded from formal politics. The centre becomes a space of substantive citizenship, where belonging is prefiguratively enacted. Mothers' voices become political acts of resistance. Social innovation and CSL as political practice: multi-agency collaboration configures an ecosystem of care (Zecca, Fredella & Cotza, 2024). CSL students develop border consciousness, learning to stand alongside those deprived of the right to have rights. Preliminary evidence from this ongoing experience suggests that L'ABC, anchored to an intersectional social justice framework, may offer a valuable model for recomposing the misalignment between school and territory. As a longitudinal study now in progress, the centre appears to function as a laboratory of democracy where pedagogical research is gradually transmuted into political practice, potentially advocating for full citizenship rights.

BEYOND DEVOLUTION: ENCOURAGING CO-AGENCY AS A POLITICAL ACT

Maila Pentucci (Università "d'Annunzio" di Chieti-Pescara, Italy) · **Lorenza Maria Capolla** (Università degli Studi di Macerata, Italy) · **Lorella Giannandrea** (Università degli Studi di Macerata, Italy) · **Francesca Gratani** (Università degli Studi di Macerata, Italy) · **Pier Giuseppe Rossi** (Università degli Studi di Macerata, Italy)

co-design devolution co-agency

In contemporary university contexts, is it possible to conceive of a redistribution of spaces of power that positions students as intentional co-constructors of their own learning processes and of the organisation of knowledge? How might one move towards a co-design process, while rethinking its aims and possibilities? At the conceptual level, this requires moving beyond the notion of devolution to the student (Brousseau, 1998). Devolution does not eliminate asymmetry, nor does it diminish the teacher's power. The student is placed in a system that nonetheless remains conceived and organised by the teacher. What emerges is a partial and subordinate form of agency, one that allows room for action only within boundaries predefined and designed by others. Due to cultural and organisational constraints, the contemporary higher education context remains strongly shaped by an asymmetrical relationship between teacher and student; nonetheless, micro-spaces of co-design exist and can attenuate the teacher's authority and redistribute it more diffusely. In doing so, they make visible two epistemological horizons that we consider to be foundational and generative. 1) The evolution of

design within architecture and engineering. A full understanding of people's needs and aspirations can only be achieved by involving them in the design process, as they are the primary experts on their own lived experience. For this reason, actively involving people with lived experience from the earliest stages of the design process appears indispensable. This shift has marked a passage from user-centred design to co-design, insofar as designers are required to engage with users' tacit knowledge and latent needs (Augsten & Gekeler, 2017; Örnekoğlu-Selçuk et alii, 2024). When transposed into learning design, this perspective suggests rethinking design itself as a formative process, shifting it from something structured into something structuring. It can't be reduced to a matter of starting from students' needs or from a contextual diagnosis. Rather, it entails connecting and orchestrating the fragments of knowledge, experience, and action that students bring with them (Ozdemir & Clark, 2007). 2) The shift from devolution to interaction within an ecosystemic perspective. Within the ecosystem, transformative processes assume a central role, since transformation unfolds in a co-evolutionary and collaborative manner (Pentucci, 2021). Actors transform their world together and are, in turn, transformed by it, within a continuous flow that unfolds as a dynamic cycle of interactions between actors and environment (Stetsenko, 2008; 2017). Through these interactions, human, non-human, and digital agents intentionally enact a form of co-agency (Singh & Engeness, 2025) that is not subordinated to the power or intention of others, but emerges dialogically. This opens up micro-spaces of action and intentionality. In order to explore how these horizons may emerge from practice, this contribution presents several micro-scenarios in which spaces of co-design are opened within university teaching. Through these examples, we discuss whether teaching can shift from devolution to interaction and shared power, recognising students as dialogic subjects and fostering the ecosystem's emergence.

PHYSICS EDUCATORS CHALLENGING THE 'MYTH OF NEUTRALITY': A COMPARATIVE CASE STUDY

Michelangelo Panza (Università di Macerata, Italy) · **Betzabè Torres-Olave** (University of Groningen, Netherlands) · **Toon Wijnen** (Bornego College, Netherlands) · **Lucy Avraamidou** (University of Groningen, Netherlands)

culture of physics · educators trajectories · physics for democracy

Physics as a discipline has been recognised as a "culture without culture" (1), perpetuating a "myth of neutrality" (2) that masks its unfolding within specific power structures and whose interests it serves, including colonial and militarised agendas (3). In physics teacher trajectories, this myth also depoliticises teaching by positioning physics as objective content to be transmitted rather than as a pedagogical and political practice (4). One assumption sustained by physics departments that reifies this culture is the teaching assumption (5): knowing physics is enough to teach it. This assumption dismisses pedagogical and cultural knowledge, elevates physics above other ways of knowing, and forecloses the possibilities under which physics might function as a democratising practice rather than as a site of disciplinary reproduction and cultural oppression. We examine how this culture is reproduced across Chile, Cyprus, Italy, and the Netherlands through a comparative case study (6) at micro, meso, and macro levels. At the micro level, we draw on reflective narrative inquiry into the experiences that shaped our becoming as physics educators; at the meso level, we analyse the institutional cultures of physics teacher education; at the macro level, we consider the broader structures and circulating norms that shape local practices. To interpret these dynamics, we draw on Bernstein's concepts of classification and framing (7), using them to analyse how institutional boundaries and pedagogical control relations reproduce the

myth of neutrality across contexts. We identified similar experiences at the micro level despite significant differences in how control mechanisms operate. At the meso level, strong classification appears in the insulation of teacher preparation within physics departments, physically and intellectually separated from pedagogical expertise. This separation keeps physics as detached from sociopolitical concerns. Strong framing appears through the teaching assumption: what future teachers learn is largely defined by physics content; how they learn is organised through disciplinary hierarchies that privilege abstraction over contextual and human implications; and when they learn to teach is often deferred until after content mastery. At the macro level, these patterns are reinforced by transnational curricula that present physics as culturally neutral and disconnected from local problems (8). By surfacing these patterns across levels, we contest the myth of neutrality that shields physics education from cultural critique. The participants' trajectories however show that spaces are not fully closed and point to costly cracks in this disciplinary culture, often emerging through professional and personal crises, conflict with the norms of physics, and efforts to construct alternative relations to teaching the discipline (9). These trajectories show how possibilities for resistance may emerge through friction with the culture of the discipline, enabling physics education to act its liberatory power (10) and for us, at times, resulting in joining collectives to think and enact physics otherwise. We argue that physics education must be understood as education in its own right, not as a subdiscipline of physics. Only then can physics teacher education become a space for pedagogical judgment, critical inquiry, and democratic practice, rather than the reproduction of disciplinary neutrality.

LEAVING THE LAST WORD TO STUDENTS: THOUGHT AND RESISTANCE IN HIGHER EDUCATION TEACHING

Daniela Manno (Università degli Studi Suor Orsola Benincasa, Italy)

Bakhtin | character resistance | dialogic opposition

In response to the question posed by the title of this panel, this contribution argues that "being political" in the context of higher education may also mean designing teaching practices that enable students to resist any act of defining themselves and the world that is produced without their own words. This argument draws on Mikhail Bakhtin (1984) writing, particularly in Problems of Dostoevsky's Poetics, where he shows how Dostoevskian characters resist the author's defining act and retain the "last word" about themselves. This does not depend solely on the character of the hero, but on the author's posture, which refrains from confining the character within a definitive description and leaves open the space of their becoming. Rather than constructing a character, the author shapes the character's words about themselves and about the world. In the context of teaching specifically, Bakhtin (1981) further emphasizes that only "internally persuasive discourse", and not authoritative ones, is capable of awakening autonomous thought and enabling the generation of new responsive discourse. It is within this interaction of words, viewpoints and interpretations that Bakhtin's concept of the "subject's ideological becoming" takes shape: the process through which each person develops their own way of seeing the world. From this perspective, the contribution presents and discusses some examples of teaching practices and the analysis of materials developed within university and postgraduate training programmes dedicated to special education for inclusion. The view of inclusive education as a practice that requires the development of a posture capable of questioning otherness rather than confining it within predefined definitions, and of challenging prêt-à-porter thinking in

order to build autonomous thought, reinforces the relevance of a Bakhtinian perspective (Manno 2016; 2021). The teaching practices described often begin with students' work, such as short texts, metaphors and images, including those generated by artificial intelligence. Since these are not merely expressive elements but sites where cultural patterns that orient action sediment, they can become working materials for activating processes of thinking and critical inquiry into the representations, often implicit, through which we interpret the world, as well as into our own thinking processes. The aim of these practices is to make possible a form of resistance to predefined definitions and stereotypes while fostering the search for new forms of thought and action. This occurs with the awareness that every new cultural form, in the absence of reflective thinking capable of re-examining it (Dewey 1997; Lipman 2003), always carries the potential to become a stereotype itself. The resistance that these practices seek to activate corresponds to a form of opposition that, in Bakhtinian terms, is dialogic rather than conflictual, insofar as it coincides with the possibility of responding on the basis of one's own autonomous thought, questioning the representations through which we interpret the world and developing one's own words in response to the word of others.

OUR "DAILY" BREAD: EDUCATING FOR CRITICAL THINKING BETWEEN INFORMATION FRAGMENTS AND AI

Fernando Sarracino (Università Suor Orsola Benincasa, Italy) · **Lucia Ariemma** (Università della Campania "Luigi Vanvitelli")

newspaper workshop | professional development of educators | AI

The educator operates as a conscious political actor, rejecting neutrality to become a promoter of a more just and democratic society (Milani, 1965). His task is to adopt a critical pedagogy that deconstructs prejudice, interrogates power structures, and amplifies marginalized voices through dialogue and the co-construction of meaning. Within this framework, education assumes the role of an ethical and civic commitment aimed at autonomy and emancipation, transforming pedagogical practice into a tool for social justice and active participation (Fabbri & Soriani, 2021). This contribution illustrates the evolution and pedagogical objectives of the "Newspaper Reading and Writing Workshop", integrated into the Digital Citizenship Education course within the Degree in Educational Sciences at the Suor Orsola Benincasa University of Naples. The project builds upon the "Newspaper in the University" Workshop - active for over a decade within the same department - adapting its theoretical and methodological framework to the challenges posed by Artificial Intelligence (AI) and the fragmentation of the contemporary information ecosystem (Panciroli & Rivoltella, 2023). Why incorporate the "daily" newspaper into a professional training path for educators? Reading the news in a university setting does not merely address an informational need, but rather a formative urgency: to transform the "news consumer" into an "interpreter of the present". In an academic context, the newspaper serves as a training ground for critical thinking and a device connecting theoretical knowledge with social complexity (Rivoltella, 2020). The ambivalence of the Italian term "quotidiano" - which simultaneously denotes the "everyday" emergent reality and the "daily" medium (newspaper) that traditionally gathers diverse perspectives to shape public opinion - underscores the necessity of placing this concept at the heart of professional training. For the future educator, the "quotidiano" (understood both as everyday experience and as the daily newspaper) represents his "daily bread", the primary tool for inhabiting the public sphere with awareness and overcoming disciplinary isolation (Rivoltella & Rossi, 2019). This challenge, however, must inevitably confront the transformation of journalism in the "age of fragmentation" (Roncaglia, 2018) and AI (Agrusti, 2023). The laboratory analyzes the transition toward algorithmic information characterized by content fragmentation, where artificial intelligence acts as an ambiguous agent capable of fuelling echo chambers through personalization (Bentivegna & Boccia Artieri, 2021) and introducing critical issues regarding synthetic content (Talia, 2024). By deconstructing news production

mechanisms, the course highlights how automation influences news hierarchy and the perception of truth itself (Mosca & Ruoto, 2024), defining the educator's profile as an intellectual mediator capable of promoting digital citizenship based on the defense of judgmental autonomy (Ferrari & Pasta, 2023). By guiding users through an information-saturated world, the educator facilitates the transition from functional literacy to "digital wisdom" (Floridi, 2022). This involves not merely the technical use of AI, but learning how to "educate for AI" (Bellisomo, 2025) through the critical reading and rewriting of the news as a necessary civic rite for safeguarding critical thought.

CREATIVE TEACHING PRACTICES WITH DIGITAL MEDIA THAT TRANSFORM THE SCHOOL SPACE:FROM THE SCHOOL CLASSROOM TO THE UNIVERSITY DEGREE

Belén Dieste- gracias (University of Zaragoza, Spain) · **Ana López-Medialdea** (University of Extremadura, Spain) · **Esperanza Cid-Romero** (University of Zaragoza, Spain)

Teacher training | Digital media | School climate

In a global context where a neoliberal economic structure and an individualistic culture prevail, achieving quality inclusive education is the goal that should guide school practice. Thus, the training of future teachers must be more sensitive to the challenges posed by the inclusive educational model (Pérez-Castejón & Vigo-Arrazola, 2022). Therefore, addressing diversity is a task that requires committed teachers with social awareness who respect differences (Torres-Santomé, 2019). University faculty must foster critical thinking in students, enabling them to challenge attitudes and perceptions regarding diversity and inclusive education (Vigo & Dieste, 2019). In this regard, the report Universities without walls prepared by the European University Association (2021), emphasizes that the educational mission of the University should be oriented towards student-centered models, critical thinking, creativity, and active citizenship. From this perspective, educational research is presented as a bridge between theory and practice (Carr & Kemmis, 2005) that allows university professors to conduct research within the school setting to renew the knowledge they will later transmit to future teachers. From the perspective of Massey (2005), the school setting is interpreted as a lived, dynamic, and constantly changing environment, in which scenarios of encounter and conflict are configured, structuring pedagogical practice. This practice, from a critical perspective (Giroux, 2013), must recognize the needs, potential, and interests of students in order to build knowledge about the context and facilitate didactic proposals for change and transformation (Jull et al., 2017). In this sense, Arandia Loroño (2004), from a Freirean perspective, points out that committing to a critical and liberating education means being able to understand and analyze reality in order to act upon it. Within this framework, this research, as part of the R&D&I Project (PID2030-148480B-I00), presents an analysis of the use of digital media in the teaching-learning process from a creative and inclusive perspective (Jeffrey, 2006), paying attention to students' voices and promoting dialogue, and transformation in the school environment. Based on this study, undergradu-

ate teacher training students receive training aligned with current challenges (digitalization, diversity, etc.). This ethnographic study (Eisenhart, 2017) has allowed for a contextualized illustration of the close relationship between school climate and creative practices with digital media. The aim is to identify contextualized pedagogical actions using digital media that incorporate student voices, in order to analyze how these practices can modify and transform their immediate environment. The analysis of the identified teaching practices shows that, based on students' interests and experiences, transformative processes have been developed that connect with an improved school climate. In this sense, the documented practices (such as photovoice, school radio, or the creation of digital stories) not only promote meaningful learning but also create an emotional and relational environment conducive to well-being and positive school climate. From a transformative and critical perspective, educational practice can be rethought and restructured through research. This collaborative work between university-school, strengthening the link between academic knowledge and teaching practice, not only reinforces initial teacher training but can also transform classroom realities, opening new lines of research geared towards a more inclusive school.

TEACHING-AS-ACTIVISM: MEMORY, SITUATED CO-CREATION, RE-THINKING OF DEMOCRACY

Pier Cesare Rivoltella (Università di Bologna, Italy) · **Chiara Panciroli** (Università di Bologna, Italy)

Critical Memory | Civic Engagement in Higher Education | Participatory Knowledge Production

Rather than approaching memory as archival preservation or commemorative ritual, the project conceptualized the memory of suffering as a living, dialogical, and contested space (Petit, 2023). Within digitally mediated environments, students were invited to reinterpret historical traces, testimonies, and educational artifacts, transforming them into shared objects of inquiry (Rivoltella & Panciroli, 2019). In this process, memory became a civic practice: a site where narratives are negotiated, responsibilities redistributed, and meanings collectively produced (Trione, 2022; Medrado & Rega, 2023). The digital spaces of MOdE (Museo Officina dell’Educazione) functioned not merely as repositories of content but as epistemic infrastructures enabling collaborative authorship, critical debate, and reflexive positioning (Panciroli, 2016). Through structured pedagogical design, students enacted forms of participation that blurred the boundaries between learning and civic engagement, between research and political agency. Teaching thus operated as a form of activism by creating the conditions for public reasoning, while research became activism insofar as it generated situated knowledge oriented toward democratic re-signification (Rancière, 1991). The study argues that engaging with the memory of suffering (Sontag, 2003) in digitally mediated cultural spaces can foster forms of citizenship grounded in

relational responsibility and critical remembrance (Stern, 2010). In doing so, it contributes to ongoing discussions on how higher education can reimagine democracy not as a fixed institutional arrangement but as a practice continuously co-constructed through acts of shared interpretation and ethical engagement.

INTENTIONALITY AS PRAXIS: RESISTING EPISTEMIC INJUSTICE IN DEMOCRATIC EDUCATION

Alessia Signorelli (University of Perugia, Italy)

Pedagogical Intentionality | Engaged Pedagogy | Democratic Education

This contribution explores the expression of intentionality in teaching design and implementation as a form of pedagogical resistance within democratic education, with particular attention to multicultural, non-Western, decolonial curricula and feminist pedagogical methods. The paper positions teaching not as a neutral or technical activity, but as a deeply political practice embedded in relations of power, inequality, and knowledge production within contemporary schooling and higher education systems (Apple, 2019; Giroux, 1988). Drawing on bell hooks' conception of engaged pedagogy—where education is articulated as a practice of freedom and collective transformation—the paper argues that intentionality constitutes a key mechanism through which educators resist hegemonic curricular norms, neoliberal governance of education, and epistemic injustice (hooks, 1994, 2003; Santos, 2014). For hooks, teaching requires the educator to be accountable for their choices, to make visible the ethical and political commitments that shape classroom practices, and to cultivate learning spaces grounded in dialogue, care, and critical consciousness. Intentionality, in this sense, becomes an explicit refusal of pedagogical neutrality and a commitment to democratic and emancipatory education (hooks, 1994, 2003). The paper conceptualizes intentionality across three interrelated dimensions. First, epistemic intentionality refers to the deliberate selection and organization of curricular content that challenges Eurocentric canons and legitimizes marginalized, Indigenous, and non-Western knowledge systems. This dimension aligns with decolonial curriculum scholarship that emphasizes curriculum as a site of struggle over recognition, voice, and historical responsibility (Mignolo, 2011; Santos, 2014; Tuck & Yang, 2012). Second, relational intentionality concerns the design of pedagogical relations through feminist methods that destabilize hierarchical teacher–student roles and promote participation, reflexivity, and shared authority—core principles of democratic schooling (Freire, 1970; hooks, 1994; Weiler, 1991). Third, institutional intentionality addresses how educators negotiate structural constraints such as standardized assessment regimes, accountability mechanisms, and political backlash against critical and decolonial perspectives, while sustaining commitments to equity and social justice (Apple, 2019; Giroux, 2014). Methodologically, the paper proposes analyzing intentionality through pedagogical artefacts—syllabi rationales, assessment design statements, reflective teaching journals, and collective classroom agreements—to trace how resistance is enacted in everyday educational practices. This approach resonates with critical pedagogy's emphasis on linking micro-level pedagogical action with macro-level social and institutional dynamics (Freire, 1970; Giroux, 1988). The paper concludes by arguing that making intentionality visible is itself a democratic act. By articulating the why behind teaching choices, educators open pedagogical spaces to critique, negotiation, and collective responsibility, reinforcing education's role as a public good (Biesta, 2013). Intentionality thus emerges not only as a personal stance, but as a form of pedagogical praxis that connects decolonial and feminist theories with the project of democratic education.

STUDENT'S ALIENATION. AN INTERSECTIONAL LENS

Lorenza Maria Capolla (University of Macerata, Italy) · **Lorella Giannandrea** (University of Macerata, Italy) · **Francesca Gratani** (University of Macerata, Italy) · **Maila Pentucci** (University "d'Annunzio", Chieti-Pescara, Italy) · **Pier Giuseppe Rossi** (University of Macerata, Italy)

alienation intersectionality decoloniality

Through an intersectional lens (Collins, 2019), the paper analyses the growing alienation of students in Western schools. The hypothesis is that what is often described as disengagement (Reeve, 2025), cultural distance (Willis, 1999), misrecognition (Honneth, 2014) or vulnerability (Butler, 2015) are differentiated expressions of a broader structural and ontological condition of alienation (Rosa, 2010, 2014; Jaeggi, 2014, 2018), intensified by processes of proletarianization of attention (Stiegler, 2010, 2019). Power domains and some forms of social exclusion (e.g. racism, sexism, ableism) redefine life and knowledge access (Mladenov, 2016) and are symptoms of a much bigger social injustice that works on economic (wage labor), cultural (self-sufficiency), and political (national democracy vs transnational power) levels (Fraser, 2013). In the paper, we will analyse different domains to identify their intersection. The first domain is cultural. The dominant Western culture in schools (Santos, 2016) is based on a linear, top-down disciplinary structure that assumes cumulative sequences and strict prerequisites. However, contemporary experience of all students is characterised by fragmentation, information overload, and methodological plurality, which produce personal patchy cultural backgrounds. The second domain is generational. The rarefaction of physical spaces of autonomy among peers and adults' organisation of time limit the possibility of developing autonomous and self-conscious forms of experience and knowledge. In a context of demographic decline among under 25, the collective generational dimension weakens while the asymmetry between students and institution increases. We also believe it is important to take into account the digital domain, not mentioned by Collins. The digital domain widens previous fractures. In addition to the digital divide in terms of access and algorithmic control, digital technology introduces topological, reticular, and associative logics that diverge from the causal and deductive structures typical of disciplinary teaching. While schools keep operating according to an analogical and sequential paradigm, students experience increasingly distributed, socio-material, and collaborative social practices of knowledge. In this picture, institutional response focuses on "abilities" and translates structural and political tensions into "individual pathology" (Mladenov, 2016), naturalising inequality. Mainstream discourse speaks of support only for the most vulnerables. Actually, we all are "deficient beings" (Gehlen, 1988) and school itself is a support, and it works especially for "able" students. A school that chooses interdependence over self-sufficiency contributes to a just society. Society is just when it allows people who are burdened by the global economy and transnational violence to speak out about the policies that have affected them (see Fraser, transnationalisation of democracy). Adopting an intersectional lens allows us to overcome linearity and take responsibility for individual patchy backgrounds, even through the dialogue with technology. To open up microspaces of transformation within the school system, we believe it is necessary to adopt an intersectional, interactive, and interconnected perspective. This entails activating interventions that simultaneously engage multiple domains: the cultural domain, through a decolonial and relational approach; the generational domain, through co-design practices; the ability domain, through interventions fostering interdependence; and, lastly, the digital domain through forms of co-agency among human, non-human, and artificial agents.

Life Skills and Innovative Didactics as Drivers of Democratic Agency in Higher Education

PANEL CONVENORS: Maria Paola Faggiano (Sapienza University of Rome, Italy – Department of Communication and Social Research); Antonio Fasanella (Sapienza University of Rome, Italy – Department of Communication and Social Research)

PANEL KEYWORDS: Innovative Didactics, Life Skills, Democratic Agency

Contemporary higher education is increasingly called to offer an innovative learning experience, one capable not only of optimizing knowledge acquisition but also of ensuring the deep and lasting development of transversal and life skills, while engaging students as critical, reflective, and responsible citizens. Innovative teaching practices have the potential to transform universities into spaces where democratic participation is not only taught but genuinely practiced. Universities are promoting active and collaborative learning, flexible and creative approaches grounded in principles of equity and inclusiveness; investing in digitalization and in the reorganization of spaces and services; enhancing opportunities for participation and democratic dialogue; and strengthening laboratories, field experiences, and encounters with experts. Particular attention also concerns how assessment practices can function as tools of empowerment rather than control. Yet empirical evidence on how such strategies foster democratic agency – and on the conditions that enable or hinder their effectiveness – remains fragmented. Universities cannot be understood as a single, homogeneous entity, just as profiles of students and instructors are diverse and multifaceted. Contributions are invited that investigate: (a) how innovative didactic practices affect the acquisition and consolidation of students' cognitive, relational, and socio-emotional competences; (b) how life skills foster participation, collaboration, decision-making, and critical engagement with the complex issues shaping contemporary society; (c) which institutional and contextual factors enable or constrain the exercise of democratic agency. The panel aims to stimulate reflection on how universities can function as living ecosystems of democracy in action, transforming a normative aspiration into an observable educational outcome.

THE DIGITAL DIMENSION IN PTSO'S: EDUCATIONAL CONFIGURATIONS AND LEARNING PRACTICES

Maria Dentale (University for Foreigners of Perugia, Italy) · **Michela Cavagnuolo** (San Raffaele University of Rome, Italy)

Digital Learning Practices | Phygital Education | soft skills

This contribution examines the role of the digital component within Pathways for Transversal Skills and Career Orientation (PTSO), exploring how the integration of ICT contributes to reshaping teaching practices, organizational arrangements, and learning opportunities in upper secondary education. Particular attention is paid to the development of transversal, critical, and participatory competences. The analysis is based on a "content analysis as a survey" of a broad corpus of PTSO projects, which allows for the identification of two main modes of digital integration. On the one hand, some pathways focus on basic digital literacy, emphasizing instrumental skills and the responsible use of technologies. On the other hand, more articulated projects emerge that incorporate advanced digital tools and languages- such as augmented and virtual reality, 3D modelling, digital storytelling, podcasting, and creative coding - embedding them more structurally within learning processes. Rather than reflecting differences in technological availability alone, this polarization appears to be closely connected to broader pedagogical and organizational choices. In particular, the findings highlight the relevance of the curriculum–territory axis as a key interpretative lens for understanding patterns of digitalization within PTSO.

Projects oriented toward advanced digital practices are more often embedded in territorial contexts characterized by dense educational networks and stronger collaboration between schools, universities, public institutions, and innovation-oriented actors. This configuration supports a closer alignment between curricular objectives, local needs, and the competences required in contemporary professional and civic contexts. Conversely, where the relationship with the territory is weaker or more strongly mediated by market actors, digital technologies tend to be used primarily in a functional and instrumental way, with more limited integration into pedagogical and assessment practices. From this perspective, digital technologies do not operate as neutral tools, but rather as elements that amplify or constrain the educational potential of PTSO depending on institutional configurations, territorial partnerships, and professional cultures. More complex and longer-lasting projects appear to foster collaborative, reflective, and problem-oriented forms of learning, supporting the development of socio-emotional skills, decision-making capacities, and a sense of responsibility. The contribution ultimately focuses on the "phygital learning" model as a key framework for interpreting the most advanced experiences. Understood as the intentional integration of physical and digital dimensions, phygital learning makes it possible to move beyond an instrumental view of technology and to promote immersive, participatory, and situated learning environments. Within this framework, digitally enriched PTSO can be interpreted as pedagogical devices capable of enhancing student empowerment and of contributing to the formation of subjects able to exercise critical and responsible agency within social, institutional, and territorial contexts, thus bringing educational practices closer to the challenges of contemporary democracy.

INNOVATIVE TEACHING AND LIFE SKILLS IN HIGHER EDUCATION: A PILOT STUDY AT SAPIENZA UNIVERSITY OF ROME

Maria Paola Faggiano (Sapienza University of Rome, Italy) · **Antonio Fasanella** (Sapienza University of Rome, Italy) · **Sergio Mauceri** (Sapienza University of Rome, Italy)

Innovative teaching | Life skills | Higher education

In recent years, universities have increasingly been called upon to rethink their teaching practices in innovative ways, not only to enhance the effectiveness of learning processes, but also to foster the acquisition of transversal competences and life skills that are crucial for active, critical, and responsible participation in social and professional life. Within this framework, innovative teaching is often presented as a lever capable of transforming the university experience into a space of engagement, collaboration, and democratic agency. However, empirical evidence on the relationship between innovative teaching practices, competence acquisition, and the quality of student participation remains fragmented and uneven, particularly when differences across disciplinary contexts and student profiles are taken into account. This contribution presents the results of a quantitative pilot study, complemented by a qualitative research phase currently underway, aimed at analysing the relationship between experiences of innovative teaching and the acquisition and consolidation of soft and life skills among students enrolled in Master's degree programmes at Sapienza University of Rome. The data derive from a web-based survey conducted during the academic year 2024-2025 on a sample of just under 300 stu-

dents, attending degree programmes belonging to different scientific and disciplinary areas. The questionnaire explored a wide range of dimensions, including: the value attributed to university education; motivations, needs, and expectations regarding training and competence acquisition; patterns and styles of engagement with university life; the intensity and quality of relationships established within the academic environment; the evaluation of the effectiveness of innovative teaching practices in fostering skills and competences, with particular attention to life skills; critical aspects and strengths of the educational pathway; and future professional and relational prospects. On the basis of the collected data, specific empirical indices were constructed to capture students' exposure to innovative teaching practices, including: the use of digital platforms by lecturers in managing teaching activities; the adoption of innovative teaching methods in the classroom; the use of innovative assessment practices; the valorisation of practical and applied dimensions of teaching; the use of advanced digital technologies; and participation in group work and project-based activities. The analysis makes it possible to explore to what extent, and under which conditions, exposure to such practices is associated with a more effective and potentially more durable acquisition of soft and life skills, while taking into account differences across disciplinary areas and student profiles (including attendance patterns, study progress, residential status, and socio-demographic characteristics). Particular attention is devoted to the dimension of equity, questioning whether innovative teaching practices contribute to broadening opportunities for participation and engagement, or whether they risk reproducing pre-existing inequalities. The contribution aims to provide empirical evidence to discuss whether and how innovative teaching can effectively function as a lever for the development of life skills and for the construction of the university as a "living ecosystem of democracy in action", going beyond a conception of innovation that reduces it to the mere adoption of tools or methodologies, and instead assessing its concrete effects in terms of competences, participation, and equity.

EVENTS AS LEARNING ENVIRONMENTS. AN INNOVATIVE TEACHING LABORATORY DURING UNIFOROITALICO SPORT DAY

Michela Cavagnuolo (San Raffaele Open University, Italy) · **Francesca Romana Lenzi** (University of Rome "Foro Italico") · **Vincenzo Esposito** (University of Salerno) · **Matteo Donato** (Phd Applicant)

innovative teaching methodologies | sporting events | situated learning

This contribution aims to present an innovative, laboratory-based teaching approach dedicated to the development of an evaluation report for a public event. This approach was adopted on the occasion of a third mission event promoted by the University of Rome Foro Italico and addressed to the local territory as well as to the University's academic, technical-administrative and student communities: the Uniforoitalico Sport Day – Christmas Edition, held on 13 December 2025. For this event, a workshop was designed in which students were able to learn and apply methodological tools through a direct experience in a real-world context. In line with the perspective of situated learning (Lave and Wenger, 1991), the entire process was developed with a dual objective: to evaluate the event and to design public engagement strategies for future editions, including in terms of the University's Third Mission. To set up the workshop, a call for thesis projects was launched, followed by a preliminary training session addressed to students who had decided to undertake the activity. Subsequently, thanks to a call promoted by the University, additional students joined the group on a voluntary basis. This openness contributed to strengthening the collaborative and inclusive dimension of the experience. The preparatory phase represented a crucial moment of the educational process. In collaboration with the lecturers, students designed the satisfaction questionnaire—which was later implemented online—and created a QR code to facilitate completion during the event. At the same time, they developed the necessary skills to conduct interviews and video-interviews in compliance with ethical and privacy principles: they produced informational materials, prepared consent forms, examined the regulations on privacy and the use of images, and translated regulatory indications into operational procedures (for example, particular attention to minors and the possibility of collecting testimonies without filming). This process fostered the development of ethical awareness, responsible communication and relational management—essential competencies for social research and aligned with life skills and transversal competences. The students also worked with creative

methods (Giorgi, Pizzolati, Vacchelli, 2021), including: a large racket-shaped board, specifically constructed for the event, on which participants could express emotions and perceptions via post-it notes, prompted by the statement "The Uni-foroitalico Christmas Day is..."; and a suggestion and opinion-polarisation box, decorated with hand-drawn illustrations representing positive and negative feelings, designed to facilitate the expression of participants' sentiment. At the same time, the video-interviews, combined with extracts from the board and the suggestion box, will constitute the basis for the creation of an emotional video aimed both at promoting the event and at building a narrative device oriented towards public engagement. Taken as a whole, the activities activated the experiential learning cycle (Kolb, 1984), enabling students to understand how data collected through heterogeneous tools can guide decisions for event improvement (Guerzoni, 2006). The constant presence of lecturers in coordinating the data collection further reinforced the experience as a genuine exercise in situated learning, transforming the event into a teaching laboratory capable of transmitting both academic and transversal competences.

EXPERIENCES OF INNOVATIVE TEACHING IN HIGHER EDUCATION THROUGH STUDENTS' NARRATIVES: LIFE SKILLS, PARTICIPATION, AND DEMOCRATIC AGENCY BETWEEN CONSTRAINTS AND OPPORTUNITIES

Desiree Tabegna (Department of Communication and Social Research, Sapienza University Rome) · **Alfonsina Mastrolia** (Department of Communication and Social Research, Sapienza University Rome)

innovative teaching · life skills · academic workload

European education policies in recent decades have assigned universities a central role in the development of cognitive, relational and emotional skills, promoting innovative teaching and the digitalisation of learning environments as strategic levers for the training of active and responsible citizens. In the context of transformations in higher education, life skills are fundamental tools for promoting student participation, critical thinking and democratic agency. However, innovative practices are also subject to organisational constraints, structural inequalities and relational tensions that can limit their inclusive potential. In this scenario, universities emerge as systems of social innovation and privileged contexts for observing the processes of change that affect the biographical trajectories of the younger generations. This study forms part of a broader multi-method research project on innovative teaching in master's and single-cycle courses at Sapienza University of Rome. An initial quantitative phase identified 11 degree courses that, as perceived by students themselves, stand out for their effectiveness in implementing innovative teaching practices. Drawing on this selection, a qualitative phase was launched and is currently underway, involving semi-structured interviews with students enrolled in the final years of master's and single-cycle degree programmes. The narratives explore expectations and experiences relating to collaborative and laboratory teaching practices, the use of digital technologies and artificial intelligence tools, relational climate and group dynamics, and students' perceived preparedness for the transition to the world of work. Taking the students' point of view, the analysis interprets the experience of innovative teaching as a practice situated in physical and digital learning spaces. The ability to actively participate in educational processes, exercise critical judgement and influence educational dynamics is seen as a concrete expression of democratic agency. The aim is to discuss, in light of the narratives collected, the opportunities offered by educational innovation in the development of transversal skills and

collaborative environments, as well as the institutional and contextual factors that can hinder its effectiveness – in terms of organisational overload, heterogeneity of profiles or lack of support – thus contributing to ongoing debates on the university as an ecosystem of democracy in action.

LIFE SKILLS AND SELF-DIRECTED LEARNING: PERCEIVED COMPETENCE DEVELOPMENT IN EDUCATIONAL PATHWAYS

Simona Cavallo (Sapienza Università di Roma, Italy) · **Bianca Bonaccorsi** (Sapienza Università di Roma, Italy) · **Veronica Lo Presti** (Sapienza Università di Roma, Italy)

Self-Directed Learning | Life Skills Development | Student Agency

The reorganization of teaching practices during the Covid-19 pandemic, with the systematic introduction of digital teaching, broke new ground in novel ways of conceiving educational pathways and, above all, interpreting competence acquisition. Within this context, digital teaching can be conceived as a laboratory for methodological innovation (Faggiano et al., 2024; Fasanella et al., 2025) that made visible, and in some cases, contributed to fostering more autonomous and reflective forms of learning management among students. Building on insights from the research project La Valutazione d'impatto sociale della didattica digitale dopo il Covid-19 (Lo Presti & Dentale, 2025), this contribution adopts the students' perspective to examine the experiential dimension of the perceived development of life skills across its cognitive, relational and socio-emotional domains. The perceptions of such development are interpreted through the lens of self-directed learning processes (Knowles, 1975; Candy, 1991; Garrison, 1997; Bruni & Isidori, 2019), through which students engage in orienting, monitoring and critically reflecting upon their educational experience, taking an active role in regulating their goals and strategies. The integrated analysis of the self-assessment rubrics and transcripts of focus groups that involved them enabled an a posteriori reconstruction of the dynamics through which participants attributed meaning and narrated their own development. From this perspective, skills development is understood as a meaning-

making process that takes shape in students' lived experiences and reflections. Framed within a lifelong learning perspective, understood as transformative and biographical continuity (Jarvis, 2006; Candy, 1991), this development is configured as a situated dynamic that places students at the center of their own educational trajectory. Following Biesta (2006), who conceives education as a space for activating agency, self-directed learning can be understood as one of the ways through which this agency manifests itself in the formative experience. The ability to consciously steer one's learning pathway, make autonomous decisions and critically reflect on one's own learning trajectory represents an essential condition for the reflective and responsible exercise of democratic agency (Biesta, 2006). Life skills thus emerge not merely as simple functional acquisitions, but as outcomes of reflective and self-directed processes through which students gradually recognize themselves as co-constructors of their own knowledge pathways.

TEACHING STYLES AND DIDACTIC INNOVATION: DIFFERENTIATED TRAJECTORIES IN THE DEVELOPMENT OF COGNITIVE, RELATIONAL, AND SOCIO-EMOTIONAL COMPETENCES WITHIN LIFELONG LEARNING

Laura Tolentino (Sapienza University of Rome, Italy) · **Simona Cavallo** (Sapienza University of Rome, Italy)

Teaching styles | Didactic innovation | Life skills

Drawing on the findings of the research project "La Valutazione d'impatto sociale della didattica digitale dopo il Covid-19" (Lo Presti & Dentale, 2025), this contribution examines the different teaching styles - that emerged across the educational contexts investigated - and explores how such pedagogical configurations may be associated with differentiated trajectories in the development of students' cognitive, relational, and socio-emotional competences. The analysis is grounded in a comparative examination of data collected across the various educational contexts involved in the study, which enabled the identification of recurring and differentiated didactic arrangements. Focusing on teaching styles makes it possible to reconstruct how the methodological component of didactic innovation took shape in hybrid and uneven forms, bringing transmissive, integrated, and dialogical approaches into tension, with differentiated implications for students' opportunities for engagement and activation (Lo Presti et al., 2025). The study is framed within a lifelong learning perspective (Field, 2006), understood as attention to competence development processes along educational pathways and to learning trajectories that unfold across heterogeneous educational contexts (Lo Presti, 2017). Within this framework, the experience of distance learning is treated as a transversal context that cuts across different levels of the educational system, making it possible to observe the emergence, renegotiation, and differentiation of multiple didactic practices (Faggiano & Fasanella, 2022; Fasanella et al., 2020). Adopting a situated perspective, the study analyses the ways in which life skills (Faggiano et al., 2024; OECD, 2015) and forms of democratic agency (Biesta, 2010) manifest themselves in relation to pedagogical styles, assessment practices, and relational settings, highlighting how such configurations translate into differentiated processes of competence activation and enactment. From this perspective, didactic innovation is not conceived as mere technological modernisation, but as the reconfiguration of pedagogical practices, assessment processes, and relational settings which, within differentiated institutional and cultural contexts, define the conditions of

possibility for the activation and enactment of cognitive, relational, and socio-emotional competences. In this sense, it may foster the development of life skills and contribute to creating the conditions for the exercise of democratic agency (Biesta, 2010).

IMPLEMENTING CHALLENGE-BASED LEARNING: TRANSDISCIPLINARY TOOLS FOR EU SOCIO-POLITICAL TRANSITIONS

Francesca Odella (University of Trento, Italy) · **Alessandra Scroccaro** (University of Trento, Italy)

Life Skills | Active Citizenship | Transdisciplinary Education

Challenge-Based Learning (CBL) is an important innovation within the field of education that takes learning beyond traditional methods to provide students with authentic challenges and equips them with skills that they will use in their future careers. With its emphasis on critical thinking, collaboration and communication, CBL also provides valuable transversal skills that can be used in a wide range of situations and work settings such as to complement the specific skills and knowledge required to solve a specific challenge" (Dikilitas et al, 2025). Enacting this perspective, this paper reflects on the implementation of CBL within university programs, specifically focusing on Blended Intensive Programmes (BIPs) and courses conducted at the School of Innovation (SOI) since 2020. These courses are designed to equip students with transdisciplinary tools to address the European Union's most pressing challenges—Inclusion, Diversity, and Sustainability—through a proactive, future-oriented approach (Poli, 2021). By discussing the social and community impacts of this pedagogical innovation, the authors present outcomes from programs designed to strengthen younger generations' reflection on the community impact of global socio-political transitions. Our core contribution is to propose CBL as a 'catalyst' for social innovation, guiding students and teachers toward a resilient approach to current economic and technological transformations. In these innovative programs, educators can teach young people to view the future as a "tool for emancipation" (Appaduraj, 2013) and develop a sense of democratic agency regarding unforeseen alternatives. To develop these anticipatory skills, students must build confidence in their ability to engage with knowledge (Engstrom, 1994) and address the social aspects of learning, such as cooperation and the negotiation of meanings and study practices. Through CBL group practices, students also learn to navigate cultural differences in communication and teamwork, improving their civic attitudes and relational skills. Furthermore, implementing CBL requires active societal engagement from both students and teachers, demanding a shift in attitude toward knowledge creation processes and circulation. This effort is essential when involving external stakeholders—such as NGOs and local companies— in their projects and is at the heart of effective global collaboration (Jongbloed, 2023). Ultimately, introducing CBL in university curricula generates impacts that transcend the academic community (Kazemier et al., 2021), fostering a generation of "transdisciplinary social entrepreneurs" capable of navigating complex socio-political crises with empathy and democratic agency.

New Social, Professional and Educational contexts: Rethinking the Italian University System

PANEL CONVENORS: Luca Refrigeri (University of Molise, Italy); Simone Campanella (University of Macerata, Italy); Lucia Mentore (University of Macerata, Italy); Noemi Russo (University of Molise, Italy)

PANEL KEYWORDS: University System, Faculty Development, Teaching Improvement

Recent data from Eurostat and the OECD confirm that the Italian university system is going through a critical period: results below the European average in terms of the percentage of young graduates and the adequacy of their skills to meet the challenges of contemporary society. In fact, considering that only 29% of young people aged 25–34 are graduates, compared to around 44% of the EU average, and that basic literacy and problem-solving skills are significantly below the OECD average, Italian universities do not seem to be contributing adequately to the education of future generations and the growth of the country's human capital. Therefore, it's necessary to consider the actual effectiveness of the current Italian university education model, which is still strongly anchored to educational paradigms that do not respond to the learning methods of the new generations and the demands of today's knowledge society. For this reason, the panel intends to critically address this misalignment, questioning the meaning, function, and prospects for transformation of the current university system. Scholars from all disciplines are invited to submit theoretical, empirical, and comparative contributions that explore the implications of this crisis and propose innovative visions for redesigning the role of universities, starting from the conventional educational model.

RETHINKING UNIVERSITY STARTING FROM PROFESSIONAL CONTEXTS: PEDAGOGICAL SUPERVISION AS AN INDICATOR OF A TRAINING MISMATCH

Alice Femminini (Sapienza Università di Roma, Italy) · **Irene Stanzione** (Sapienza Università di Roma, Italy)

pedagogical supervision | university training | professional contexts

The Italian university system is now called upon to train professionals capable of operating in complex educational contexts, marked by structural fragility, organisational transformations, and growing demands for reflective, socio-emotional, and planning skills (Boffo, 2021; Ferrante & Gambacorti-Passerini, 2023). The latest data from Eurostat and the OECD highlight a mismatch between university education and society's needs, necessitating a rethink of educational models and practices (Oggionni, 2016). This gap is particularly evident in educational and social services, where professional work is based on relationships and takes place in unstable contexts characterised by multidimensional stresses and structural precariousness (Giovanazzi, 2022; Tramma, 2018). In this context, pedagogical supervision represents a privileged observatory for questioning the role of the university in the construction of advanced professionalism (Oggionni & Palmieri, 2019). Understood as a formative and reflective tool, it supports the critical analysis of practices, promoting professional awareness, the quality of educational action, and the prevention of burnout (Oggionni, 2013; Olivieri, 2024). This paper provides an overview of Italian educational programmes dedicated to pedagogical supervision, based on a desk analysis of public universities offering degree courses in education, supplemented by 15 interviews with university teachers who deal with the subject professionally and in their research. The results of the desk analysis paint a fragmented picture: there are no courses dedicated explicitly to pedagogical supervision; the topic appears only in more general courses or in some workshops. The area in which more structured support is observed is curricular internships, where, however, practices are heterogeneous. In addition, several master's degrees and advanced training courses in supervision are emerging, but they are concentrated at a few universities. The interviews highlight a growing awareness of the need to integrate practical skills, reflective tools, and experiential methodologies into university curricula. At the same time, they emphasise the urgent need to strengthen dialogue with educational services and experienced professionals in order to bridge the gap between academic training and operational requirements. In parallel, experimentation with a

supervision model in a home education service has further highlighted the needs of professionals, including managing operational loneliness, emotional load, case complexity, and the need to maintain a reflective and planning posture. These skills require solid, situated theoretical and practical training that cannot be improvised. The emergence of these elements confirms that pedagogical supervision is not only a support mechanism but also an indicator of the quality of university education (Madriz, 2019). In contexts where educational professionals are called upon to perform secondary functions, the gap between theory and practice is a critical issue (Cornacchia, 2020). The contribution, therefore, proposes rethinking the university as an educational infrastructure capable of establishing a stable dialogue with professional contexts, integrating reflexivity and socio-emotional skills into curricula (Stanzione & Di Genova, 2024). Among the avenues for transformation are the structural inclusion of reflective devices, the strengthening of internships, the consolidation of links with services, and the development of specific training programmes for educational supervisors.

ACADEMIC LEADERSHIP AS PEDAGOGICAL INFRASTRUCTURE: A MESO-INSTITUTIONAL REINTERPRETATION OF UNIVERSITY QUALITY

Cristiana Cardinali (LUMSA University Rome, Italy) · **Maria Cinque** (LUMSA University Rome, Italy)

Academic leadership | pedagogical infrastructure | university quality

The Italian university system is undergoing a phase of institutional reconfiguration marked by structural reforms, external evaluation mechanisms (from the AVA system to the ANVUR guidelines on teaching quality) and growing social expectations in terms of skills and employability. The persistent misalignment between stated educational objectives and actual results suggests that the issue is not exclusively related to curricula and teaching methodologies, but also to the institutional framework within which educational responsibility is defined, distributed and implemented. International literature has progressively redefined academic leadership, shifting the focus from an individual and hierarchical conception to a relational and distributed perspective (Bryman, 2007; Bolden et al., 2012). More recent studies highlight how the sustainability of university innovation depends on the integration of strategic and pedagogical dimensions (Dinh et al., 2020; Cheng et al., 2024; Maheshwari et al., 2024) and how, in the absence of structured liaison mechanisms, responsibility for improving teaching tends to remain diffuse but poorly formalised, generating discontinuity in change processes (Cardinali & Cinque, 2025; Serbati, 2025). This paper takes academic leadership as an analytical category to interpret the misalignment between educational intentions and actual results, proposing a reinterpretation of it as the pedagogical infrastructure of the university. This expression does not refer to a top-level function or a set of individual skills, but rather to the institutional configuration that makes educational responsibility visible, coordinated and sustainable, integrating academic strategy, teaching coordination and faculty development. The objective is: 1. To develop a theoretical definition of pedagogical infrastructure as a meso-institutional level that organises the relationships between governance, teaching design and professional development. 2. To analyse how this infrastructure is actually configured in Italian universities. 3. To identify organisational indicators of its consolidation. The research integrates an exploratory qualitative survey based on: • Semi-structured interviews with teaching coordination figures (programme directors, teaching delegates, faculty development representatives). • Documentary analysis of institutional

university mechanisms (strategic plans, AVA documents, teaching regulations). The thematic analysis made it possible to reconstruct the links between strategic direction, teaching coordination and professional development, identifying emerging configurations of pedagogical infrastructure. The results highlight different configurations of pedagogical infrastructure, characterised by varying degrees of formalisation, integration and continuity. In contexts where the link between strategy, teaching coordination and faculty development is structured and institutionalised, educational quality emerges as a systemic principle; conversely, where this link is entrusted to episodic or individual initiatives, improvement processes are fragmented and discontinuous. In line with Italian reflections on the role of Teaching and Learning Centres and faculty development as strategic levers of quality (Perla, 2023; Felisatti, 2023), the analysis suggests that the systematisation of faculty development pathways is a relevant indicator of the consolidation of the pedagogical infrastructure at university level. It operates as a structural device for integration between academic autonomy, educational responsibility and teaching quality, configuring leadership not as an individual attribute but as an organisational condition of university quality.

MAPPING OF CENTERS FOR PROFESSIONAL DEVELOPMENT OF TEACHERS AND EDUCATIONAL INNOVATION IN ITALIAN UNIVERSITIES

Lucia Mentore (Università degli Studi di Macerata, Italia) · **Noemi Russo** (Università degli Studi del Molise, Italia)

teaching and learning centers | higher education | Italian universities

In recent decades, universities internationally have progressively developed institutional structures dedicated to supporting teaching and the professional development of faculty members. In many contexts, these structures are commonly referred to as Teaching and Learning Centers, although their names, functions, and organizational models may vary across different higher education systems. In the Italian university context, there is no shared terminology, and institutions adopt different names to refer to initiatives and structures aimed at improving the quality of teaching and developing the pedagogical skills of faculty members. Despite the growing attention to faculty development and the improvement of university teaching, the presence of such structures in the Italian university system is still largely unexplored. This contribution presents a national mapping of institutional structures dedicated to supporting teaching in Italian universities. The Italian higher education system includes state universities, recognized non-state universities, special-status university institutes, and online universities, all of which are part of a national accreditation and quality assurance system defined by the Ministry of University and Research and monitored by the National Agency for the Evaluation of Universities and Research Institutes (ANVUR), which attributes increasing importance to the quality of teaching. The research adopts a mapping methodology based on document analysis and systematic exploration of the institutional websites of accredited universities in Italy. The analysis considered a total of 106 universities, with the aim of identifying the presence or absence of structures dedicated to teaching support and professional development for teachers. The preliminary results show a heterogeneous picture. Some universities have a formal structure dedicated to teaching support and faculty development,

while in many other institutions no such structure exists. In other cases, there are initiatives for teaching innovation or teacher training, but these are not organized within a clearly identifiable institutional structure. The mapping represents a first attempt to systematize the spread of teaching support structures in the Italian university system and provides an empirical basis for future research on the role of such structures in improving the quality of university teaching.

PROFESSIONAL DEVELOPMENT AND COLLEGIAL CULTURE: THE POTENTIAL OF PEER OBSERVATION OF TEACHING FOR RETHINKING THE MISSION OF UNIVERSITY TEACHING

Aurora Torri (Università degli studi di Macerata) · **Livia Cadei** (Università Cattolica del Sacro Cuore)

University teaching | Professional support | Peer Observation of Teaching

In recent years, the quality of university teaching has become a growing focus of attention, in response to the complexity of the contexts and issues that higher education is called upon to address: from the emergence of increasingly multifaceted training needs of new generations, to the challenges posed by online teaching and the use of technologies, to the internal and external pressures related to quality assessment procedures for academic processes (EHEA, 2020; Lewis, 2010; Harrison et al., 2022; Sorcinelli, 2020). These challenges also affect the Italian academic context, which is engaged in transformation and innovation in teaching/learning and, in an integrated manner, in organisational and institutional aspects (Lotti & Lampugnani, 2020; QUARC_Docente, 2017; Silva, 2022). University lecturers assume an intermediate and strategic position between the design of the educational offer, on the one hand, and the learning processes of students, on the other (Cadei et al. 2024). Their professional development can thus represent a functional goal also for innovative processes in the field of teaching, bringing benefits not only to the individual teacher but also to various dimensions of the university, both operational and cultural (Sorcinelli, 2020; Steinert, 2014). In this perspective, faculty development tools that, in addressing and promoting the professionalism of the university teacher, are capable of producing impacts on the organizational arrangements of teaching and on the collegial climate stand out as particularly significant - even starting from “bottom-up” initiatives that can be recognized and valued in the institutional context (Cadei et al., 2025; Lampugnani & Picasso, 2025; Steinert, 2010). This is the line taken by this paper, which aims to explore the potential of Peer Observation of Teaching (POT) as a professional development tool and, at the same time, as an opportunity to promote a collegial and collaborative approach to teaching (Bell, 2001; Hammersley-Fletcher & Orsmond, 2005; Martin & Double, 1998; Hendry et al., 2021). The subject of the study is a POT experiment carried out at an Italian university (Cadei et al., 2025), using a collaborative model in which pairs of teachers observe each other and exchange feedback for training purposes rather than evaluation (Gosling, 2002; Fletcher, 2018). The qualitative methodology adopts an interpretative approach and focuses on the post-observation phase, dedicated to sharing observations among teachers. The analysis, through the examination of the transcripts of the sessions, develops progressively: first, the themes and points of attention that emerge with regard to teaching practice and teaching are identified; second, these elements are read to investigate whether and how the experience of participating in POT is distinguished by its educational value at an individual and peer level. In light of the results that will be collected, the contribution aims to reflect on the potential value of professional support and discussion mechanisms in universities – such as POT – and, in this direction, contribute to enriching the ongoing debate on the mission of teaching in higher education (Harrison et al., 2022; Steinert, 2014), with particular reference to the Italian context (Silva, 2022; Lampugnani & Picasso, 2025).

NEW PERSPECTIVES ON THE ITALIAN UNIVERSITY SYSTEM

Simone Campanella (University of Macerata, Italy) · **Gaga Gvenetadze** (Ivane Javakhishvili Tbilisi State University, Georgia) · **Tatsiana Karachun** (University of Macerata, Italy) · **Fatma Derya Arıkan** (Burdur Mehmet Akif Ersoy University, Turkey) · **Luca Refrigeri** (University of Molise, Italy)

Higher Education | Teaching and Learning Center | Educational process

The current debate on the future of higher education(HE)in Italy has been sparked by international studies highlighting that the Italian university system lags significantly behind certain European averages in terms of the percentage of young graduates and their ability to address the challenges of contemporary society.This evidence suggests that this gap cannot be interpreted solely in quantitative terms, but must be understood as a symptom of a deeper misalignment between educational models rooted in the past and the learning styles of the new generations.In this sense,the Italian university model still appears tied to traditional pedagogical paradigms that struggle to adapt to the cultural,technological,and cognitive transformations characterizing contemporary educational contexts.This paper offers a critical reflection on the transformations of the university learning ecosystem,focusing in particular on the processes through which academic institutions are attempting to redefine their teaching practices.In this context,a central element concerns the growing focus on the pedagogical training of university faculty,promoted in part through the proliferation of Teaching and Learning Centers (TLCs),which represent one of the main tools through which universities seek to support faculty professional development, fostering the development of pedagogical,digital,and assessment skills,and promoting teaching practices more oriented toward active student participation.This renewed focus on the pedagogical dimension, however,is part of a broader transformation of university learning environments.The gradual integration of digital platforms with asynchronous or blended teaching models and the use of AI has in fact helped redefine not only how educational content is accessed, but also the timing of learning,the relational dynamics between faculty and students,and the ways in which knowledge is constructed.At the same time,these pedagogical and organizational transformations are part of broader processes of

restructuring educational policies that,in recent decades,have progressively redefined the role of the university in contemporary societies.In particular,the growing prevalence of governance models inspired by principles of efficiency and competitiveness can be interpreted in light of the neoliberalization of HE,which has contributed to promoting dynamics of institutional differentiation.In this context, the principle of normative equivalence which characterizes the Italian university system and recognizes equal validity for degrees awarded by state, non-state, private, and online universities takes on particular significance.While this principle guarantees a formal legal equivalence of educational programs, it also raises significant questions regarding the actual conditions under which teaching and learning processes unfold.Questioning the equivalence of the institutional nature of universities means, in fact, also questioning the effectiveness of educational processes and the ways in which students develop disciplinary and cross-disciplinary competencies.From this perspective, the apparent regulatory homogeneity of the university system does not necessarily imply a real equivalence of learning conditions.Structural and organizational differences regarding available resources, pedagogical cultures,and educational infrastructure can significantly impact students' educational experiences.Critically analyzing the relationship between the institutional nature of universities, the configuration of learning environments,and the development of students' competencies therefore allows us to problematize the very idea of equivalence among institutions and to contribute to a broader reflection on the transformations and future prospects of HE in the Italian context.

Organising As Workers In Higher Education: In, Against And Beyond The University

PANEL CONVENORS: Sol Gamsu (Durham University, United Kingdom); Flora Petrik (Eberhard Karls Universität Tübingen, Germany); Ana Tanevska (University of Uppsala, Sweden)

PANEL KEYWORDS: Higher education, unions, universities

How should university staff organise in their own workplace? Universities are under attack. The political forces of the authoritarian right have universities firmly in their sights. Financial pressures, funding cuts and a rebalancing of international student markets are fostering redundancies in some university systems. These political attacks provide an added layer of crisis on top of university systems that were already deeply hierarchical and, to various degrees, marketised. In this context, organising as workers to defend and improve our working conditions for all those who work in universities is crucial. In this session we want to bring together university workers actively involved in trades union or labo(u)r organising in their universities. Our aim is not simply to share research but to use the conference as a space to build solidarity and democratic networks of practical knowledge as workers in struggle. We invite papers that stem from practical organising and activism in universities as places of work. Papers may explore but are not limited to: Reports of current strikes and active struggles in universities The challenges of organising academics Effective recruitment strategies Bridging differences and inequalities between different staff groups Organising against precarity or casualisation Campaigns on pay and/or workload Addressing racism/sexism/classism/disability as workplace matters Negotiation strategies Employment law in struggles in higher education The role of education unions in transnational solidarity with Palestine, Sudan and beyond Managing data to build union strength Union democracy locally or nationally Organising department reps Political education/training of union reps

AUTOETHNOGRAPHY, ADJUNCT LABOUR, AND THE POLITICAL ECONOMY OF KNOWLEDGE IN SOUTH AFRICA AND THE GLOBAL SOUTH*

Trevor Makhetha (University of the Western Cape, South Africa)

Adjunct labour | Academic precarity | Political economy of knowledge South Africa

Universities are frequently defended as spaces of academic freedom, critical inquiry, and democratic debate. Yet these ideals rest on increasingly precarious labour arrangements that fundamentally undermine the conditions under which knowledge can be produced. This paper examines the contradiction between academic freedom and employment insecurity through an autoethnographic account of working as an adjunct lecturer in South African universities for over seven years, often on rolling six-month contracts. During this period, I was required to perform excellence in teaching, care, and institutional commitment while navigating chronic precarity that profoundly shaped my capacity to complete my PhD, publish scholarly work, and sustain a scholarly life. Using autoethnography as a method of worker-scholar knowledge production, the paper argues that adjunct precarity in South Africa should not be understood as an exceptional or transitional condition, nor as a delayed replication of Global North trends. Rather, it constitutes a central organising logic of the postcolonial university, deeply entangled with histories of racialised inequality, marketisation, and managerial governance. In this context, precarity functions as a disciplinary regime that structures academic subjectivity, reorganises time, and regulates dissent—often without the need for explicit censorship. The South African university occupies a contradictory position within global higher education. On the one hand, institutions are embedded in transnational circuits of ranking, audit, and performance measurement. On the other, they are shaped by the legacies of colonialism and apartheid, where access, transformation, and redress are publicly foregrounded while labour insecurity is normalised. As an adjunct lecturer, I occupied a position of both visibility and disposability: heavily relied upon for undergraduate teaching—particularly of first-generation and working-class students—yet excluded from meaningful institutional support, research time, and secure career pathways. Teaching excellence, under these conditions, becomes an extractive demand rather than a recognised form of labour. High teaching loads, emotional labour, and pastoral care are framed as moral obligations rather than work that requires material support. The paper situates this experience within broader global patterns of casualisation in higher education. Importantly, the paper moves beyond diagnosis to reflect on organising as a response to precarity. For adjunct workers, organising is often constrained by fear of contract non-renewal, reputational damage, and professional exclusion. These fears are not incidental but structurally produced. Yet informal conversations, collective

reflection, and union spaces provided a language through which personal exhaustion could be re-read as institutional design. Organising functioned as political education, emotional repair, and collective sense-making, transforming individual endurance into shared analysis. In conclusion, the paper insists that academic freedom cannot be meaningfully defended without addressing the material conditions of academic labour. Precarity does not merely threaten individual careers; it reshapes what can be thought, written, and said. By foregrounding adjunct experience from South Africa and the Global South, the paper contributes to ongoing efforts to build solidaristic, democratic forms of worker organising in higher education—organising that operates in, against, and beyond the university as it currently exists.

FIGHTING FOR THE FUTURE OF HIGHER EDUCATION IN CHICAGO

Nicole Nguyen (University of Illinois at Chicago, United States of America)

higher education | common good | social justice

On the first day of the 2023 University of Illinois-Chicago - United Faculty strike, Chicago Teachers Union president Stacy Davis Gates rallied the crowd by insisting that "how we union" matters. Outlining a commitment to common good unionism, Gates refrain of "how we union" encourages us to broaden the foundations of labor organizing by using an intersectional feminist lens to understand and address the root causes of oppression and to work in solidarity with impacted communities struggling to contest oppressive systems. In Chicago, this has meant bargaining beyond wages and benefits, integrating community partners into decision-making processes, and centering demands that uplift racial, gender, and disability justice. In this way, common good unionism insists that struggles to improve workers' conditions are intimately tied to struggles to improve community conditions, particularly for public school workers whose institutional mandate is to advance the public good. This is not to say that bargaining contracts in higher education can end oppressive systems; instead, it illustrates how bargaining for the common good can create openings ripe with political possibility for further agitation and transformation. In this paper, I examine what common good unionism can look like and fight for in the context of intensifying austerity, resurging authoritarianism, and growing assaults on higher education.

N/A

SOLIDARITY INSTEAD OF NEUTRALITY

Pia Rojahn (University of Tuebingen, Germany)

neutrality judgement solidarity

A popular strategy of the "new right" in Germany is the call for neutrality. University teachers as well as schoolteachers are denounced for not being neutral when they address the racist, sexist and discriminatory utterings and behaviours of the right. As many teachers are civil servants in Germany, the so-called "neutrality principle" applies to them. This principle mainly becomes important in times of elections when teachers are supposed to withhold their political opinions to let students find their own positions in the political landscape. However, the "new right" instrumentalizes the "neutrality principle" to pressure teachers and to neutralize any political education. But still, it seems even though the educators' union tries to inform teachers about this misinterpretation of the neutrality principle (cf. GEW, 2024), many teachers are becoming more insecure and careful about showing a clear positioning against right comments and policies. This is not a coincidence. The call for more teacher's neutrality has been present in German educational debates since the competence orientation was introduced in the early 2000s (cf. OECD's DeSeCo project). In response to the "PISA Shock" in 2000 – that the German school system did not perform well in the PISA studies conducted by the OECD (Germany was just in the middle of the ranking) – teacher education and its effectiveness was questioned heavily. Another consequence was the promotion of individualized learning. As a result of this individualisation, the idea that the teacher should be a diagnostician became quite popular: "teachers' key tasks include making diagnoses, as they are challenged to meet students' diverse learning needs and adapting their teaching to students with heterogeneous academic abilities as well as multiple interests and motivations" (Klug, Gerich & Schmitz, 2016, p. 185). The Standing Conference of the Ministers of Education and Cultural Affairs of the Länder in the Federal Republic of Germany (abbreviated as KMK) promoted research on diagnostics and competences since the PISA shock as well (cf. KMK, 2001) and changed the structure of teacher education at universities. The social dimension of the teacher's profession was minimized throughout those reforms (cf. Rojahn, 2025). What the concept of competence, the idea of diagnostics and the call for teacher's neutrality share is the disregard of the subject matter as well as the lack of any community idea. Instead, they overemphasize the isolated student, their skills and perceptions. This individualized perspective stands in contrast to important aims of (political) education: enabling students to form judgements, creating solidarity, trying to emphasize similarities and shared interests instead of focusing on differences. A concept that aims at enlarging and contextualizing arguments with reference to a community idea is Hannah Arendt's concept of judgement (cf. Arendt, 1992). This paper will illustrate why judgement instead of 'neutral diagnostics' is a far more valuable concept for teacher education as well as political education.

FROM ACADEMICS TO EDUCATION WORKERS: BUILDING CROSS-STAFF SOLIDARITY AND FORGING CLASS RELATIONS TO MAKE ANOTHER UNIVERSITY POSSIBLE

Sol Gamsu (Durham University, United Kingdom)

unions universities class

This paper argues that union organising ought to be a key component of 'academic activism'. Rather than consider ourselves as 'academics', we ought to think of ourselves as education workers. This requires academics to reconsider our role and what 'academic' labour means and the way it is bound relationally to the labour of all workers within the

university. Overcoming distinctions between workers in the university is an essential strategy to strengthen the position of all workers relative to senior management within the university. This requires us to think carefully about class relations and the class structure of the university and to commit to the educational work of building relationships and alliances that will overcome traditional hierarchies and elitism. Organising collectively for dignity and autonomy for all workers in the university is essential to making another university, and another world, possible.

na

CHALLENGES OF ORGANISING ACADEMIC WORKERS IN GERMANY: LOYALTY, ASCETICISM AND PRECARIOUS LABOUR CONDITIONS

Maria Keil (Justus-Liebig-University Giessen, Germany)

academic labour market | precarity | solidarity

German academia is characterised by the widespread use of fixed-term and part-time employment, as well as by a growing number of staff categories beyond the traditional personnel structure. With non-fixed contracts almost only available for full professors, 80 per cent of non-professorial full-time academics overall and as many as 92 per cent of those under the age of 45 are employed on a fixed-term contract (Konsortium BuWiN 2021, p. 111). These fixed-term employment relationships, which are generally regulated by the Act on Temporary Academic Contracts (Wissenschaftszeitvertragsgesetz, WissZeitVG), are frequently characterised by very short contract durations. More than half of the employment contracts concluded under the WissZeitVG have a duration of less than one year (Jongmanns 2011). Although the WissZeitVG has increasingly been criticised by academics themselves, and media campaigns such as #ichbinhanna have gained public attention, academic staff in mid-level positions at universities remain largely dissatisfied with their employment conditions, particularly with regard to career predictability, opportunities for advancement and job security (Jaksztat et al. 2010, p. 16). Nevertheless, the effects of activism and protest remain limited. The number of academics who contest poor working conditions and even more poor employment conditions remains low due to low representational power. The paper discusses this situation from two perspectives. First, drawing on my own research on precarity in academia (Graf, Keil and Ullrich 2020; Keil 2018, 2020), I show how academic culture in Germany is shaped by personal dependency, asceticism and contingency, fostering loyalty and endurance rather than collective voice. Structural and historical features of German academia, such as the high turnover of academic positions and the structure of union representation, further undermine political organising. Second, based on my own experiences of mobilising academic staff within the sociological community, I outline how articulating political concerns conflicts with the ideal of academic asceticism and the subordinate position of non-professorial academic workers. In the absence of a collective identity as workers, solidarity tends to be rooted in shared suffering rather than in collective mobilisation. Moreover, political engagement may directly affect career prospects, as support from professorial staff is fragmented and precariousness is frequently processed as a biographical precondition for academic success. The aim of the paper is to identify the challenges and structural barriers to the mobilisation of academic workers in Germany, to situate these challenges in an international comparative perspective, and to outline possible points of intervention for further action.

Rethinking the University: Public Engagement, Academic Autonomy and Transformative Knowledge Practices

PANEL CONVENORS: Casavecchia Andrea (Università di Roma Tre, Italy); Barbanera Lorenzo (Università di Genova) + Stefania Chimenti (University of Calabria, Italy); Andrea De Bortoli (University of Turin, Italy); Emanuela Pascuzzi (University of Calabria, Italy)

PANEL KEYWORDS: open science, participative processes, social impact

In an era marked by a pervasive neoliberal logic – focused on performance, competition, and accountability – universities grapple with profound tensions between market-driven demands and their fundamental public mission to foster critical knowledge and social inclusion (Calhoun, 2006). Academic autonomy is constrained by regulatory restrictions and evaluation metrics that steer research towards economically relevant objectives, to the detriment of epistemic plurality and equitable access to knowledge (Lorenz, 2012). Within this context, Public Engagement (PE) is posited as a cultural and operational paradigm intrinsic to the university's public and democratic mission. PE is neither confined to administrative definitions (i.e., the classification proposed by the Italian National Agency for the Evaluation of Universities and Research) nor restricted only to science communication. Instead, it encourages open dialogue between academia and society, enhancing situated knowledge and promoting co-production processes in research and innovation (Watson et al., 2011), as aligned with the EU Responsible Research and Innovation framework and the APEnet Manifesto (the Italian Network of Universities and Research Institutions for Public Engagement). This panel aims to explore PE as a commitment and responsibility of universities towards democratic and transformative practices that promote the public value of knowledge, integrating – rather than merely extending – teaching and research activities. We welcome contributions from different disciplinary perspectives that analyse – theoretically or empirically – processes or experiences of the systematic integration of PE into the research, teaching, and knowledge exchange activities of higher education institutions, transforming them into laboratories for learning and democratic practice.

ADAPTATION STRATEGIES FOR NAVIGATING COMPLEXITY: AN EMPIRICAL RESEARCH AMONG WORKING STUDENTS AT ROMA TRE UNIVERSITY

Alba Francesca Canta (Polytechnic of Turin, Italy) · **Maria Alessandra Molè** (Università Roma Tre, Italy)

Working students | University | adaptation strategies

Universities are facing a period of significant change that is affecting various social groups, including students, who have to decide on the strategies to adopt in order to enter a flexible and competitive world. The stages of life that involve the transition from study to work take complex and irregular trajectories, characterized by a high degree of reversibility and instability. Within this context, students are frequently called upon to decide how to conduct their lives and what adaptation strategies to consider to reconcile different worlds of life, including university and work. Despite having been little studied, the figure of the working student is becoming increasingly present within universities. In this regard, in 2025, an explanatory empirical study was conducted on the working conditions of students in the Department of Education Sciences at Roma Tre University. Using a mixed methodology, the study aimed to understand the multiple implications associated with the phenomenon and give a voice to student population. Among the various dimensions explored during the research, I will focus on the evaluation of the relationship between the academic world and the working world of these working students, seeking to highlight the possible motivations behind their choices and the adaptation strategies to deal with this complexity. The analysis of the interviews highlights some important considerations. The academic and professional worlds do not always communicate with each other, which is why individual adaptation strategies are fundamental. Many working students choose flexible jobs, often without contracts, which allow them to pick the best strategy to conciliate the two world of lifes, and only a few choose jobs consistent with their studies. The working world and the academic world do not seem to play a major role in this adaptation; they provide support, but everything seems to be left up to the individual. Working students must use their inner skills and discipline to build their own path, piece by piece, communicating now with one world, now with the other, as if they were two isolated spaces with no continuity between them.

BRIDGING UNIVERSITY AND CIVIL SOCIETY: CHALLENGES AND OPPORTUNITIES IN FOSTERING PUBLIC ENGAGEMENT AND SOCIAL INNOVATION

Maria Chiara De Angelis (Link Campus University, Italy)

HEI-CSO Collaboration | Public Engagement | Social Innovation

Civil society organisations (CSOs) play a crucial role in promoting public engagement between higher education institutions (HEIs) and society, increasing the societal value of knowledge in rapidly changing labour markets (OECD, 2023). Universities are redefining their missions through transformative collaborations with CSOs and businesses, encouraging social innovation through co-developed curricula that include "on-the-job" experiences (Arocena et al., 2015, 2018; Rey-Garcia and Mato-Santiso, 2020). These partnerships foster democratic practices by connecting academia with civil society, addressing inequalities, enhancing civic engagement, and strengthening social cohesion. However, they also create hybridisation tensions between university missions and CSO cultures, amid neoliberal pressures that reshape priorities and stakeholder interactions (Ravazzoli & Valero, 2020; Zani, 2017; Newfield, 2021; Hamilton et al., 2022). This study investigates how HEI-CSO collaboration fosters public engagement and boosts the societal value of knowledge through democratic and transformative practices. Specifically, it examines the opportunities and key issues arising from the partnership between HEIs and CSOs, and how this synergy can help redefine the Third Mission and strengthen the university's social impact. The research employs a qualitative, participatory approach, developed through two national workshops involving professors, researchers, university staff, as well as professionals and volunteers from various civil society organisations. The methodological design is grounded in the principles of action research (Argyris et al., 1985; Lewin, 1946) and applied social research, with the goal of promoting collaboration between institutions and participatory practices (Kemmis & McTaggart, 2000). The workshops were designed as spaces for reflection and co-creation of change, focused on exploring shared visions, tensions, and strategies for social innovation. Subsequently, the collected data were analysed using the six-phase thematic analysis method proposed by Braun and Clarke (2008), which guided the entire interpretative process. The study outlines several key trends in the contemporary debate: the emergence of new professional profiles and skills, collaboration between CSOs and HEIs in designing transversal and practice-oriented curricula, and the redefinition of the Third Mission as a space for experimentation and negotiation between social and academic interests. The analysis offers critical insights drawn from the experiences of those actively engaged in integrating civil society into academic practice, exploring current critical issues and strategies for systematising the dialogue between the knowledge and expertise of HEIs and CSOs, toward an education system more aware of its formative, cultural, scientific, and social mission.

INSTRUMENTALISATION OR DEMOCRATIC COMMITMENT? LOCAL CONSTRAINTS AND THE ADOPTION OF PUBLIC ENGAGEMENT IN FRENCH UNIVERSITIES

Nicolas Brard (Université de Tours) · **Elsa Poupardin** (Université Paris Cité, France)

scientific communication | organizational transitions | public engagement

In the French Higher education and research system, science communication professionals have always used changing terminology to describe their practices, promoting popularization or public understanding, and more recently, dialogue or participation. This variability in terminology is similarly found in most Western countries (Bergeron, 2016; Las Vergnas, 2016). The term ‘public engagement’, which has become ubiquitous in the rhetoric of science policy worldwide, is the most recent expression of this evolution. It now accompanies European policies that entrust the dissemination of knowledge to researchers or research institutions rather than the media (Hagendijk & Irwin, 2006; Weingart et al., 2021). Polysemic, it allows a wide range of actors to cooperate despite divergent interests while masking conflicts behind consensual objectives (Bensaude-Vincent 2014). Its adoption, an illustration of a phenomenon of mimetic isomorphism (Drori, Meyer, and Hwang 2006), provides no information on the concrete modalities of its implementation or on the effects it produces at different institutional levels. Over the past 15 years, changes in the communication services of research institutions across Europe have shown largely convergent characteristics (Bauer & Entradas, 2023; Entradas et al., 2022). Existing work highlights the recent changes affecting all institutions, regardless of their size and age (Sörensen et al., 2026), and points to growing tensions between ‘corporate’ and ‘scientific’ communication. National-level analysis provides a better understanding of how supranational dynamics are expressed in concrete terms: the circulation of organizational models, the effects of transnational injunctions linked to competitive funding, and the reappropriation of concepts from the academic field by public policies. The French case remains largely overlooked in the international literature. This relative invisibility is partly due to the history of higher education studies in Europe (Kehm & Musselin, 2013) and its complexity. France is thus absent from most studies on university marketing (Hemsley-Brown & Oplatka, 2006) or communication officers (Casini & Neresini, 2012). Our contribution is based on a mixed survey conducted in 2025 through interviews with 30 professionals and a questionnaire (57 responses) from the communication departments of universities and research centers. The analysis considers both official missions and concrete practices and highlights the lack of a political framework and clear indicators at the institutional level. It also emphasizes that the constant renewal of terminology in communication departments makes it difficult for researchers to assimilate it into their work. This instability weakens their relationship with communication professionals and limits their involvement in public engagement activities (Besley et al., 2021). National public policies that encourage public participation have prompted institutional communication departments to reorganize internally to respond to calls for projects and obtain dedicated funding. These organizational changes may suggest a profound transformation. However, interviews with professionals show that these policies have not led to substantial changes in their practices or perceptions. Communication officers remain primarily focused on the local and immediate constraints that structure their daily activities. These observations highlight the tensions faced by services that receive little recognition and are subject to supranational standards and instruments that have to be constantly reinterpreted in local contexts.

COMMUNITY-ENGAGED RESEARCH AND LEARNING IN HIGHER EDUCATION: THE TOGETHERNESS PROJECT

Valentina Ghibellini (University of Sassari, Italy) · **Andrea Vargiu** (University of Sassari, Italy) · **Julie Plouhinec** (sciences citoyennes) · **Glen Millot** (sciences citoyennes) · **Catherine Bates** (Technological University Dublin) · **Zoryana Pshyk** (Technological University Dublin) · **Etienne Toffin** (Université libre de Bruxelles)

Higher Education | Community Based Learning | Community Based Research

TOGETHERNESS addresses the need to democratise knowledge production by strengthening connections between academic institutions and communities, in line with the debate on the transformative role of universities (Mezirow, 1991) and their emerging functions of co-creation for sustainability and social change (Trencher et al., 2014). It unfolds through 3 participatory research experiments conducted in Brussels, Sassari and Dublin, mobilising actors from different disciplines and sectors to co-produce knowledge aimed at addressing concrete territorial challenges. In this respect, it is situated within the broader field of Public Engagement with Research, while acknowledging the heterogeneity of practices encompassed by this label and the increasing ambiguity of the concepts that define it (Weingart et al., 2024). While recognising these definitional challenges, the project deliberately narrows its focus to forms of engagement explicitly oriented towards generating social change. It adopts a perspective of transformative engagement that emphasises the co-production of knowledge between universities and communities. It promotes Community-Based Learning (CBL) and Community-Based Research (CBR) as approaches capable of integrating research, education and societal impact, while also challenging traditional power asymmetries between academia and civil society (Banks et al., 2017). The project is structured around 5 WP focusing on coordination, community mobilisation, the development of digital tools and training pathways, the institutionalisation of participatory practices, and the strengthening of a transnational network. By engaging vulnerable populations, informal communities and interdisciplinary teams, the project aims to develop sustainable models for embedding CBL and CBR structurally within universities. In its initial phase, the project includes an exploratory research component designed to provide the conceptual, methodological and operational foundations for the design and implementation of the local experiments. This phase enables the analysis of existing participatory research and transformative engagement practices in relation to the institutional contexts and higher education and research policies within which they have developed. The aim is to understand how organisational strategies, incentive structures and regulatory frameworks shape the ability of scholars and communities to engage in effective, inclusive and long-lasting CBL and CBR practices. Attention is paid to 4 key dimensions that guide the project as a whole: interdisciplinarity as a resource for knowledge co-production; methodologies for engaging vulnerable populations, with a focus on power dynamics and the construction of equitable partnerships (Beebeejaun et al., 2014); the use of micro-credentials as capacity-building tools; and collaboration with non-formalised communities, balancing institutional requirements with operational flexibility. Micro-credentials represent a central instrument within the project to support joint training of academic staff and non-academic actors and strengthen stable partnerships between universities and communities. The Italian higher education system is examined in comparative perspective alongside the Belgian and Irish, situating the national analysis within a

broader European framework. Through comparative analysis and the implementation of local experiments, the project will generate empirical evidence on the institutional, educational and relational conditions that enable transformative participatory research to develop sustainably, contributing to the European debate on the structural integration of CBL and CBR within universities.

HOW CAN UNIVERSITY DROPOUTS AND DELAYS IN DEGREE COMPLETION BE ADDRESSED?

Casavecchia Andrea (Università di Roma Tre, Italy)

Academic comunity | Students | Drop out

This paper examines the phenomena of dropout and delayed graduation through the presentation and discussion of findings from a mixed-methods research project conducted with students enrolled at Roma Tre University. The Italian higher education system continues to exhibit comparatively high levels of dropout and significant delays in the attainment of tertiary qualifications (Cappa, Gavosto 2025). Among the primary contributing factors is the absence of a robust system for assessing students' competencies and for supporting informed decisions regarding study pathways. In such conditions, when students lack motivation or clarity in their educational choices, the probability of academic stagnation or withdrawal increases markedly (Colombo, Salmieri 2022). Extensive literature demonstrates that students' integration into the academic community constitutes a critical factor in promoting persistence. Such integration manifests through regular participation in teaching activities, constructive interactions with faculty, engagement in extracurricular initiatives, and involvement in student networks and institutional programmes (Tinto 1994; Braxton 2003; Larson 2013). The present analysis therefore investigates whether—and in what respects—students perceive themselves as part of an academic community, in order to assess the extent to which this dimension supports their university trajectories. The results emerging from both the questionnaire and interview phases indicate that students view the university as a pivotal context for personal development and intellectual growth, one that fosters "greater autonomy" and meaningful interaction with peers. Many respondents emphasized that their university experience has equipped them with valuable and transferable competencies relevant to both personal and professional spheres. Crucially, students' well-being appears strongly associated with their level of integration into academic life. The development of relational networks with peers and faculty members is identified as essential not only for sustaining engagement with university studies but also for orienting vocational decision-making, thereby enabling students to "refine their understanding of their specific professional vocation in coherence with their social and biographical trajectory" (Dewey 2020). The study concludes that the dimension of "academic community" functions as a protective factor, fostering continuity in students' progression and mitigating experiences of discouragement. This effect is further reinforced by orientation and tutoring initiatives and by the availability of services such as university cafeterias, study spaces, and digital environments.

STUDYING ACADEMIC TEMPORALITIES THROUGH "TEMPORAL PARADIGMS": A SURVEY-BASED TYPOLOGY OF ITALIAN PROFESSORS AND FIXED-TERM RESEARCHERS

Lorenzo Barbanera (Università di Genova, Italy)

Academic Work | Temporal Regimes | Time Management

Across contemporary higher education, time has become a central site of governance (Gibbs et al., 2014). Universities are increasingly organized through accelerated evaluation cycles, deadline-driven reporting, project-based funding, and metricized performance targets (Ylijoki, 2016). These arrangements do not only redistribute workloads; they also reshape the temporal grammars through which academic work is imagined as good or successful: what counts as timely productivity, what horizons are deemed realistic, and which rhythms of inquiry are rendered legitimate or inefficient. In this sense, temporal pressures operate as normative prescriptions that become naturalized in everyday routines, making contestation difficult while subtly reconfiguring research autonomy, the conditions of teaching quality, and the balance between intellectual work and administrative compliance. To capture this temporal restructuring, the paper introduces the concept of temporal paradigm, defined as a patterned set of representations, values, and practices through which actors orient themselves in time and coordinate action under institutional constraints. Rather than treating temporalities as either abstract cultural frames or purely behavioral time-use patterns, the temporal paradigm conceptualizes how temporal norms are internalized and enacted: how time is cognitively represented, how it is practically managed, and how actors hierarchize and orient past, present, and future. Operationally, the construct is specified as multidimensional. The statutory dimension concerns cognitive representations of time and beliefs about its genesis. The conative dimension captures concrete time-management practices, including time monitoring, pace of life, planning ability, and the distribution of time across daily activities. The value dimension captures time horizon and time perspective, highlighting the relative salience and hierarchical ordering of past, present, and future in orienting action and planning. Methodologically, the study draws on an original survey of professors and fixed-term researchers in Italian universities. Using the public national registry of academic staff, a randomized typological–factorial sample (N = 1,056) was designed to capture heterogeneity across roles and institutional contexts. The questionnaire includes item batteries for each sub-dimension of the temporal paradigm. The dimensional structure is assessed through scale construction and consistency checks, followed by cluster analysis to identify robust groupings of temporal paradigms. Results identify eight temporal profiles. Four clusters related to the statutory and value orientation dimension emerged in the first analysis. In a second step, four other clusters were identified by considering only the conative dimension. Across profiles, time distribution is pivotal: many academics report the erosion of temporal boundaries and a strong absorption of working time by administrative and bureaucratic demands. More regulated profiles tend to allocate a higher share of working hours to research and a comparatively lower share to teaching, especially among fixed-term researchers whose career prospects are closely tied to research output. Overall, the findings suggest a transition toward accelerated, heterogeneous academic temporalities (Vostal, 2016), producing uneven adaptive strategies and heightened risks of short-termism and "time-eating" work cultures, particularly among younger academics (Berg & Seeber, 2016). As a long-term consequence, it could threaten the quality of future research and teaching (Connell, 2019).

UNIVERSITIES AS AGENTS OF SOCIAL INNOVATION THROUGH PUBLIC ENGAGEMENT PROJECTS

Maria Letizia Guerra (University of Bologna, Italy) · **Valeria Carpené** (University of Bologna, Italy) · **Filippo Sartor** (University of Bologna, Italy)

public engagement | social innovation | knowledge valorization

Universities can act as key drivers of social innovation ([3]) when processes of knowledge valorization are combined with projects based on public engagement. This contribution highlights the experience of the University of Bologna in generating social innovation through co-creation initiatives involving diverse stakeholders such as researchers, professionals, institutions, and civil society organizations. Selected case studies will be presented, including new services for mental health ([1] and [2]) and the introduction of new professional roles in emergency departments. By fostering dialogue and shared design, universities can generate impactful solutions that respond to complex societal challenges.

UNIVERSITY AND COGNITIVE CAPITALISM

Agostino D'Amico (Università degli Studi di Bari Aldo Moro, Italy)

Institutional modernization | Cognitive capitalism | Third Mission

The changes that have affected universities over the last three decades have sanctioned an epochal transformation in the relationship between academic knowledge and territorial development. Although within rather heterogeneous reformist approaches – and with particular reference to the national contexts of so-called developed countries – it is undeniable that the role and functions of knowledge have undergone a sort of Copernican revolution. Universities, no longer conceived as autonomous advanced centers of training and research (Pinto; 2019), have been compelled to periodically justify their utility and functionality within the framework of the priorities of the capitalist socio-economic system. The transition from a Fordist accumulation system to a post-Fordist one has not proven to be a mere technical exercise. Instead, it has entailed a shift in the ways through which society and institutions – both public and private – participate in value production (The OECD Observer, 1980; Lebert e Vercellone 2006; Fraser, 2019; Braudel, 1977). Economies are framed as knowledge-based, and it is precisely through the knowledge society that they intend to compete. This conjuncture has been favoured by the development of network systems typical of cognitive capitalism, in which the university is conceptualized as an player directly involved in the economic and cultural development of the territory in which it is located (Perotti, 2010; Carayannis e Campbell 2009; Benneworth et al., 2009; Donolo, 1971) The Third Mission (TM), understood as an organizational academic field, represents the outcome of the institutional modernization that has affected the University. It is common to distinguish between the economic and non-economic valorization of knowledge. Initially, academic activity with and for society were left to the discretion of individual researchers; today, they represent an expected counterpart for legitimation and recognition within and outside one's professional field. Drawing on data gathered through semi-structured interviews with academics from an Italian university, this article focuses on a specific area of the TM: public engagement. The aim is to understand the types of stakeholders with whom ties are forged (Bhattacharyya, 2004), the ways in which participation in development takes place, and the tools or actions employed (Benneworth, 2013); finally, it examines the limits and opportunities of this new mission (Hoye e Pries 2009; Baird, 2020; Tucker e Parker 2020).

The Democratic Turn in University STEM Education

PANEL CONVENORS: ola Lilensten (Institut de Recherche de Chimie Paris, France); Kylee Goode (University of Birmingham, United Kingdom); Ilija Rašović (University of Birmingham, United Kingdom)

PANEL KEYWORDS: Responsible Research and Innovation, deliberative democracy, transdisciplinary STEM education

A central democratic and innovation challenge, aligned with contemporary agendas in Responsible Research and Innovation (RRI) and societal readiness, is preparing scientists to act as reflexive practitioners embedded in society, rather than isolated technical specialists. Developing such reflexivity requires early interventions: structured spaces where students and researchers critically examine how scientific knowledge becomes innovation and how research trajectories can mitigate, reproduce or amplify social and environmental challenges. Democratic pedagogies offer powerful means of cultivating these capacities. Citizens' assemblies, public-facing tribunals, controversy-driven learning, argumentation pedagogies, Science Shops, and community-based research create encounters where students and researchers deliberate, engage with diverse publics, and confront the civic and ethical dimensions of scientific work. These tools challenge deficit-model assumptions and help future researchers navigate the social complexity surrounding innovation systems. This panel examines how such approaches are designed, delivered and evaluated, building on our experience implementing citizens' assemblies and scientific tribunals in undergraduate and postgraduate science programmes, training established researchers, and drawing on a wider ecosystem of participatory pedagogies. Their influence extends beyond individual scientists, shaping research teams, programme cultures, institutional governance and wider science–society relations. We invite contributions addressing four areas: Pedagogical design: How can democratic pedagogies challenge deficit thinking, foster reflexivity and support informed, pluralistic dialogue? Impact on students: What knowledge, competencies or dispositions do students develop, and how can these be assessed? Impact on publics: What forms of value emerge for community participants? Higher-order effects: How do these interventions reshape innovation cultures and the scientific enterprise?

THE EMBEDDING MODEL: INTEGRATING META-TECHNOSCIENTIFIC COMPETENCES IN STEM EDUCATION

Paolo Volonté (Politecnico di Milano, Italy) · **Simona Chiodo** (Politecnico di Milano, Italy) · **Viola Schiaffonati** (Politecnico di Milano, Italy)

Critical thinking | SSH integration model | co-teaching

This paper addresses the democratic turn in university STEM education by presenting the embedding model developed and implemented at Politecnico di Milano over the past decade. The democratic turn in university STEM education involves, among others, enriching educational programs through the acquisition of critical and reflective competences concerning scientific research and technological development. Particularly in the education of engineers and designers, sensitivity to the social impacts and ethical dimensions of technology is increasingly becoming a recognized imperative. This is especially evident in leading European technological universities, where subjects such as Critical thinking, Ethics of technology, and Technology and society are becoming part of standard curricula. The embedding model is a strategy for integrating critical and reflective competences into the educational pathways of engineers and designers, based on the incorporation of SSH (Social Sciences and Humanities) experts into technology-focused degree programs and courses. The first part of the paper will describe the model's main characteristics, highlighting its five pillars: not simply SSH

disciplines but meta-technoscientific competences; multidisciplinarity; meta-technoscientific competences are not soft skills; embedment; starting from below. The second part will discuss the practice of integrating meta-technoscientific competences into technology design curricula, identifying several key features: the need to adapt conventional disciplinary content for audiences without prior exposure, while maintaining academic rigor; the diverse composition of student cohorts and the consequent value of fostering peer-to-peer learning among students from different disciplines; and the potential to leverage students' technical knowledge to develop case studies and exercises that effectively contextualize meta-technoscientific concepts and theories. Innovative teaching formats, particularly integrated courses, will be specifically examined to demonstrate that co-teaching by both a technology specialist and an SSH scholar not only shows students the importance of incorporating critical perspectives into technology design but also facilitates mutual training and professional development among teaching staff. Furthermore, the simultaneous presence of both instructors interacting in the classroom illustrates to students that technology design processes should consistently integrate meta-technoscientific competences throughout all stages of development. The embedding model aims to provide students with basic tools to identify potentially harmful consequences of emerging technologies and possible steps to eliminate and mitigate them in a context in which expert opinion should not override that of non-experts. Graduates should emerge attuned to the risks that even well-designed and working technologies can entail if developed within a technocratic framework and deployed without democratic oversight. The paper will also provide a critical assessment of the difficulties encountered, the most arduous challenges, and main critical points of the embedding model.

FOSTERING CRITICAL THINKING THROUGH THE “TRIBUNAL FOR THE FUTURE GENERATIONS” PEDAGOGICAL PROJECT: PROJECT STRUCTURE, STUDENT DEVELOPMENT, AND IMPACT OF TRIBUNAL-BASED LEARNING

Lola Lilensten (CNRS IRCP UMR8247, Paris, France) · **Lluis Pino** (Independent professional lecturer) · **Dalel Bouzid** (IUT de Saint-Denis, Place du 8 mai 1945, 93120 Saint-Denis, France) · **Guy Dirras** (IUT de Saint-Denis, Place du 8 mai 1945, 93120 Saint-Denis, France) · **Marie-Hélène Vigliano** (IUT de Saint-Denis, Place du 8 mai 1945, 93120 Saint-Denis, France)

fake tribunal | students project | critical thinking

In a complex world filled with controversies, fake news, and misleading communication, training students in critical thinking is of utmost importance. To do so, the “tribunal for future generations,” a debate format created by the French media “Usbek & Rica,” is proposed as an educational tool. In a dramatized way, real witnesses or experts, testifying for the benefit of future generations, are questioned by a “fake” court composed of an attorney, a prosecutor, and the court president. Through cross-examination and the witnesses’ expertise, this format allows exploration of the complexity of the chosen subject, while the staging provides distance and humor to avoid moralistic speeches [1]. This style of debate was previously used in the STEM community during a scientific conference. In front of materials scientists and students, the question “should we keep inventing new materials” was examined through the insights of academics, industry profes-

sionals, specialists in the history of materials, and their future prospects with Sci-Fi. To actively involve students beyond just attending events, a new “Tribunal for the Future Generations” is being launched at the University of Saint Denis within the Bachelor of Technology department. A group of volunteer students runs a one-year program, ending with the creation and hosting of a final event open to the public. The students receive mentorships every two weeks from a team made up of a researcher and a professional speaker. This changes students' roles from passive attendees to active participants responsible for presenting a controversy [2]. The chosen topic was recycling. Indeed, recycling offers hope that we can keep producing new materials without generating waste or extracting additional raw resources. However, behind this appealing idea, and after many decades of practice, the reality still falls short of the promise. Plastics, metals, paper, and construction debris are still, quite frankly, far from being recycled in sufficient volumes to reduce our society's environmental impact. Will this gap likely decrease significantly in the future? Or was our optimism about this industry's potential misplaced from the start? Is recycling the solution we hoped for to build a more eco-friendly planet? With this project, students explore various aspects of the topic: materials science, industry technologies, public regulation, the economy, and greenwashing. Being on stage at the final event as president of the court, attorney, and prosecutor requires a broad understanding and a critical eye for this complex subject. Soft skills such as eloquence, event organization, communication, and teamwork are also developed [1]. This presentation will outline the project organization over the year, followed by an evaluation of the outcomes through post-event discussions with participating students and audience surveys. Lastly, the potential of this format to promote critical thinking will be discussed.

CITIZENS’ ASSEMBLIES AS ASSESSMENT: CULTIVATING REFLEXIVE SCIENTISTS THROUGH DEMOCRATIC PEDAGOGIES IN DOCTORAL STEM EDUCATION

Ilija Rašović (University of Birmingham, United Kingdom) · **Kylee Goode** (University of Birmingham, United Kingdom)

Deliberative democracy | responsible research and innovation | interdisciplinary science education

Calls to embed responsible research and innovation (RRI) in science and engineering education emphasise the need to cultivate scientists capable of reflexive engagement with the societal dimensions of research and innovation. Yet doctoral training environments often struggle to translate these ambitions into concrete pedagogical and assessment practices. This paper examines an experiment in doctoral STEM education that introduces a deliberative democratic process—a citizens’ assembly—as a central component of assessment within a cohort-based PhD training programme. The intervention takes place within two Engineering and Physical Sciences Research Council (EPSRC) Centres for Doctoral Training (CDTs) at the University of Birmingham. These programmes bring together doctoral researchers from diverse disciplinary backgrounds but face a common challenge: ensuring that interdisciplinarity is experienced not merely as a structural feature of programmes but as a meaningful intellectual and civic practice. To address this, a module on responsible research and innovation integrates interdisciplinary perspectives with a transdisciplinary assessment in which doctoral researchers design and run their own citizens’ assemblies on controversial scientific topics. Following a flipped-classroom learning experience involving contributions from scholars in law and history of science as well as external practitioners (including lawyers, entrepreneurs and industry collaborators), students organise assemblies structured around three phases: collective learning, expert engagement and deliberation, and the formulation of recommendations. Students identify topics, curate preparatory materials, recruit speakers and facilitate deliberation themselves. In doing so, they confront the ethical, political and societal dimensions of scientific research while experimenting with deliberative democratic formats typically absent from STEM training. Drawing on five cohorts of doctoral researchers, we present survey data and qualitative evidence demonstrating how this assessment format reshapes students’ perceptions of their roles as scientists. Students consistently identify the citizens’ assembly as the most transformative component of the module, highlighting its capacity to surface plural perspectives, challenge disciplinary assumptions and foster critical reflection on research trajectories. Topics selected by students range across emerging technological and environmental controversies, providing a lens through which to analyse how scientists-in-training engage with contested futures. We also

explore higher-order effects extending beyond individual students. Evidence from interviews and programme observations suggests that the experience has influenced doctoral researchers' behaviour in subsequent industrial internships, informed discussions within research groups, and shaped the thinking of CDT leadership and professional staff involved in doctoral training. These developments illustrate how democratic pedagogies can ripple outward through research cultures and institutional practices. Finally, we reflect on the future development of such pedagogies. Current assemblies operate as internal educational simulations, raising questions about how and whether public participants should be integrated into assessed learning environments. Ongoing work exploring hybrid deliberative formats (including collaboration with initiatives such as the Tribunal for Future Generations) suggests possible pathways for connecting doctoral training more directly with public deliberation and stakeholder engagement. These developments open new possibilities for democratic forms of science education capable of reshaping both doctoral training and wider innovation cultures.

UKRI's Framework for responsible research and innovation

FROM TRAINING TO TRANSFORMATION: THE ISPRA EXPERIENCE FOR ORGANIZATIONAL CULTURE CHANGE THROUGH A GENDER LENS

Nadia Sbreglia (Istituto superiore per la protezione e la ricerca ambientale, Italy) · **Katia Carcone** (Istituto superiore per la protezione e la ricerca ambientale, Italy)

transformative education | gender bias deconstruction | Stem socialization

Gender disparity in scientific careers is not merely a quantitative imbalance but the result of cultural and symbolic structures that shape expectations, roles, and models of competence recognition. As Ernst Cassirer highlights, the symbolic categories through which we interpret reality contribute to consolidating dualisms and hierarchies that influence the distribution of opportunities. Within this framework, the gender gap in technical-scientific environments cannot be addressed solely through access policies; it requires interventions capable of influencing the cultural mechanisms and organizational practices that ensure its reproduction. This contribution analyzes the training experience developed at the Italian Institute for Environmental Protection and Research (ISPRA), conceived as a pedagogical device aimed at transforming organizational culture. The assumption is that the staff of a research institution are not only recipients of training but also social actors. Researchers operate as mentors, contributing to the transmission of cultural models. In line with John Dewey's vision, training is understood as a transformative educational experience: a process of rethinking judgment capable of transforming the work environment into a space of dialogue and respect. From this perspective, deconstructing gender bias acquires a value that transcends the professional sphere, influencing the educational and social role of employees. As suggested by Erving Goffman's sociology, individuals act according to social "scripts" and gender representations. The objective of the training is therefore to lay the groundwork for rewriting these models, providing researchers with the tools to act as multipliers of change within socialization processes. The aim is to counter stereotypes that influence educational trajectories and aspirations toward STEM disciplines among younger generations. The program, launched approximately eighteen months ago, has involved a significant percentage of the Institute's personnel through courses dedicated to Gender-based Violence in the Workplace: Stereotypes, Recognition, and Effective Interventions. The phenomenon of violence was addressed through multidisciplinary contributions and considered the extreme outcome of specific cultural dynamics. The project's different editions focused on several themes—particularly stereotypes and socialization—and included workshops designed to translate theory into reflective practice. The initiative aimed to reveal the mechanisms that shape thought and to examine the role of socialization in the normalization of discriminatory behaviors. Gender biases were interpreted as "habitus" (Bourdieu), understood as embodied social structures that guide individuals' actions through forms of symbolic violence. The courses were designed according to the principles of experiential pedagogy. Moving beyond a purely transmissive model, an interactive communicative style was prioritized. Through storytelling, personal examples, and the analysis of regulations using historical case studies, the training became a dialogical process capable of generating emotional and cognitive engagement. This experience provides a framework for

understanding the cultural structures and superstructures underlying inequalities. The educational goal is to encourage a revision of staff members' interpretive lenses, positioning training as a lever that extends beyond institutional boundaries. The intention is to foster participants' development as promoters of awareness, enabling them to rethink relationships within the organizational context and to support, in schools and homes, the aspirations and freedom of choice of those who will shape the science of tomorrow.

STEM WITH A CRITICAL EDGE: A SYSTEMATIC REVIEW OF HUMANITIES-INTEGRATED PEDAGOGIES

Addisalem Yallew (Cape Peninsula University of Technology, South Africa)

STEM education | humanities | democratic pedagogy

Recent developments in STEM education raise a key pedagogical question that has implications for democratic and critical citizenship: how should future scientists and engineers be educated in a global context shaped by uncertainty, the rise of populist politics and techno-deterministic outlooks, and a retreat from critical global conversations into the nation-state container? This paper explores this topic by conducting a systematic review of scholarship on the nexus between STEM education and the humanities in higher education to examine whether, and under what conditions, humanities-integrated pedagogies cultivate the reflexive and deliberative capacities required for critical and democratic science education. Based on a preliminary assessment of the literature, the paper argues that giving STEM education a critical and humanistic edge requires more than the addition of participatory techniques to existing curricula and requires the embedding of pedagogical designs that reopen crucial and relational questions related to knowledge, methods of knowing and public responsibility within STEM itself, making the humanities not just ancillary to democratic STEM education but rather its integral parts.

TEACHING HOW TO THINK: INTELLECTUAL SKILLS AND MEDICAL EDUCATION IN THE SCOTTISH ENLIGHTENMENT

Serena Mambriani (University of Parma, Italy)

Scottish Enlightenment | Medical Education | Intellectual Skills

What were the didactic objectives of medical education in the second half of the eighteenth century? How were physicians-in-training expected to cultivate the intellectual skills necessary to critically assess observations and transform experience into reliable clinical understanding? The aim of the proposal is to examine the canon of medical education in the Scottish Enlightenment through the case of the published Lectures on Materia Medica (1773), delivered by William Cullen at the University of Edinburgh in 1761, historically reconstructing the training needs identified for medical students and the pedagogical practices employed, with a focus on the analysis of the course's introductory discourse. By the mid-eighteenth century, the University of Edinburgh had emerged as a leading center of medical education in the anglophone context (Ritchie, 1928). The Faculty of Medicine, formally established in 1726, offered structured lectures and practical training in anatomy, dissection, and clinical observation, building on earlier developments in European centers such as Leiden, where hospital practice and bedside instruction had been introduced (Kaufman, 2005; Reinarz, 2008; Parent, 2016). Within this context, William Cullen, professor of Materia Medica, sought to provide a critical approach to medical training. By defining Materia Medica as the "knowledge of all the Substances or Preparations employed in Diet or Medi-

cine", he considers every subject around four main components: "1st, its knowledge, or the method of distinguishing it; 2d, its virtues in diet or in medicine; 3d, the foundation of those virtues in the sensible qualities, or its chemical properties; 4th, its particular application to medicine, or its pharmaceutical treatment" (Cullen, 1773, p. 1). This systematic framework reflects Cullen's acknowledgement of the limitations of experience alone, "liable to so many errors of ignorant or deceitful men," and highlights to the necessity of developing critical thinking in order to select "pauca scire quam multa opinari" (Cullen, 1773, p.1). In his didactic design Cullen provides students with a method for assessing the properties of substances, in order to apply it in clinical practice. For instance, he notes that "Colour, of all methods of knowing the virtues of subjects a priori, is the most uncertain; Smell, extends a little farther; but Taste is the most extensive of all three" (Cullen, 1773, pp. 1–2). Through the combination of observation, sensory evaluation, and critical thinking, Cullen identifies the intellectual skills necessary to develope clinical judgment and independent reasoning: "analysis strictly chemical, is now found to be of no use; that of resolving bodies into their native principles, is more extensive, and often enables us to separate the salutary from the pernicious principles" (Cullen, 1773, p. 2). Cullen's teaching exemplifies how the development of intellectual skills was recognized as a central need in eighteenth-century medical education, when a vast body of observations had accumulated, making it necessary for students to navigate the material and identify reliable knowledge. The study of Cullen's Lectures thus testifies to the pedagogical aims of medical education, providing a model for the formation of physicians in the Enlightenment context.

Whose University is it? Neoliberal Governance: The Challenge to Academic Freedom, Equity, and Critical Thinking

PANEL CONVENORS: Silvia Zanazzi (Università di Ferrara, Italy); Catherine Edelhard Tømte (University of Agder, Norway); Edoardo Esposto (University of Sapienza, Italy)

PANEL KEYWORDS: Higher Education, Neoliberalism, Critical Thinking

This panel invites critical reflection on the contemporary university and its changing role in society. Higher Education Institutions are under growing pressure to align their core strategies with market logics and achieve high placements in global rankings. Neoliberalism presupposes that they can optimize their effectiveness and efficiency by adopting the practices and values characteristic of the corporate sector. Students are increasingly viewed as consumers who "purchase" an education to gain marketable skills, influencing their course choices and creating pressure on universities to attract them with the promise of a high-return investment. The increasing adoption of digital platforms, data-driven technologies, and corporate-style managerial tools to mediate, manage, and deliver educational, research, and administrative processes, often reflect and reinforce market logics and performance accountability. These potent external influences creates a significant tension within the academic mission. Specifically, the strong drive for market alignment poses a substantial risk of marginalizing alternative knowledges and restricting access for underrepresented groups. Concurrently, the intense focus on operational efficiency and immediate utility can ultimately diminish the university's capacity for fostering critical thinking and deep intellectual exploration. How can the university maintain its independence, academic freedom and commitment to democracy when financing is dictated by performance efficiency and market appeal? How can we defend the university as a place for critical thought, equity, social inclusion, and public responsibility? We seek theoretical and empirical contributions that rigorously explore these dynamics. Submissions should specifically address the tension between institutional survival and ethical mission.

WHOSE KNOWLEDGE, WHOSE UNIVERSITY? ACADEMIC FREEDOM AND EQUITY UNDER NEOLIBERAL HIGHER EDUCATION GOVERNANCE

Miwako Hosoda (Seisa Uinversity, University of Tokyo, Japan)

Higher Education | Neoliberalism | Equity

In recent decades, higher education institutions worldwide have been increasingly reshaped by neoliberal governance frameworks that emphasize market competitiveness, performance indicators, and managerial efficiency. Universities are now expected to function as quasi-corporate organizations, aligning their educational and research missions with global rankings, employability metrics, and short-term economic returns. This transformation raises fundamental questions about whose knowledge is legitimized, whose voices are marginalized, and ultimately, whose university it has become. This paper critically examines the impact of neoliberal governance on academic freedom, equity, and critical thinking, drawing on sociological perspectives from education, healthcare, and welfare studies. Focusing on the tension between institutional survival and ethical responsibility, it explores how performance-based funding systems and data-driven managerial practices shape research agendas, teaching priorities, and access to higher education. In doing so, the paper emphasizes the importance of field-based and practice-oriented research that cannot be adequately captured by abstract performance indicators alone. Particular attention is paid to collaborative research practices conducted with patient associations and healthcare professionals. Through these collaborations, research questions are co-constructed with participants based on lived experience, clinical practice, and community needs. Such forms of knowledge production illustrate how experiential, participatory, and community-based knowledges are generated in situ, yet are systematically undervalued within dominant evaluative frameworks shaped by neoliberal rationalities. Using qualitative insights from academic practices and policy discourses in Japan, this paper argues that neoliberal governance not only restructures institutional arrangements but also subtly governs academic subjectivities. Faculty members are increasingly positioned as entrepreneurial actors responsible for securing funding and measurable outputs, while students are framed as consumers investing in their own human capital. These logics risk narrowing the intellectual space necessary for sustained engagement with fieldwork, relational research, and critical inquiry grounded in social realities. At the same time, the paper highlights emerging forms of resistance and possibility. By foregrounding equity-oriented pedagogies, participatory knowledge production, and post-Western sociological perspectives—particularly those rooted in collaboration with patient

groups and healthcare practitioners—universities can reclaim their role as public institutions committed to social inclusion, epistemic diversity, and democratic responsibility. The paper concludes by arguing that defending academic freedom today requires not only institutional autonomy but also an explicit ethical commitment to valuing field-based knowledge, collaborative research, and socially grounded forms of critical thought.

SHAPING THE ROLE OF ARTIFICIAL INTELLIGENCE IN HIGHER EDUCATION: POLICY DIRECTIONS IN ITALY AND NORWAY

Catherine Edelhard Tømte (University of Agder, Norway) · **Silvia Zanazzi** (Università di Ferrara, Italy)

Higher education | Artificial Intelligence (AI) | Governance

Around the world, the large language models, LLMs, first introduced with ChatGPT in 2023, have caused turbulence in education (Jin et al., 2025; OECD, 2026). Governments are developing guidelines and recommendations for Higher Education Institutions (HEIs) on how to handle Artificial Intelligence (AI). Universities are developing new teaching, learning and assessment models, including dimensions related to privacy and ethics. For instance, the Russell Group (2023), which represents 24 UK research-intensive universities, has established a set of guiding principles to empower both staff and students to navigate this evolving landscape. These core principles focus on fostering AI literacy to help users understand the tool's limitations and ethical risks, such as bias, privacy, and plagiarism. Furthermore, universities commit to equipping staff with the skills to support students, adapting teaching and assessment methods to ensure fairness and academic rigour, and collaborating across the sector to share best practices. Students, too, are concerned with avoiding cheating, plagiarism, and fair assessments. They are viewed as active participants who must become AI-literate to navigate an increasingly AI-enabled world. They are expected to understand not only the opportunities of generative AI but also its significant limitations, such as potential bias, privacy risks, and inaccuracies. While these tools can personalise learning and enhance critical reasoning, students remain accountable for the accuracy of any AI-generated information they use. International bodies such as UNESCO (2023, 2024) provide frameworks for understanding generative AI in education. Grounded in a humanistic vision that places human agency at the centre of AI integration, such frameworks stress the importance of equipping education systems with the skills to use AI effectively and emphasise the need for policies and practices that balance technological innovation with ethical responsibility. More specifically, higher education institutions should support students and staff in using AI ethically and transparently rather than implementing bans. Universities should redesign assessments to prioritise human values like creativity and complex problem-solving, while utilising AI as a "coach" for research planning and data exploration. Ultimately, institutions should leverage students' metacognitive skills to critically verify AI outputs and safeguard human agency. In this paper, our aim is to further explore how national HEI systems are grappling with these challenges. By looking at Italy and Norway, two countries with slightly different organisation of their HEIs, we will identify their governmental approaches towards the implementation of AI in higher education. Informed by the analysis of national steering documents and green papers, our aim is to examine the extent to which the dimensions outlined in UNESCO's framework are reflected in national guidelines for implementing AI in higher education. We ask: To what extent are the dimensions of UNESCO's framework reflected in national guidelines for the implementation of AI in higher education? This involves examining the priorities of national policies, such as ethical governance, transparency, teacher and institutional capacity-building, and responsible innovation, and how closely these align with UNESCO's recommendations for integrating AI in a safe, equitable and pedagogically meaningful way.

THE MIRROR-BOX BIAS IN THE NEOLIBERAL UNIVERSITY: GENERATIVE AI, THE CRISIS OF HUMANITAS, AND CRITICAL THINKING

Marco Cadavero (University of Bologna, Italy) · **Nicolo' Brandizzi** (Fraunhofer Institute for Intelligent Analysis and Information Systems (IAIS), Sankt Augustin, Germany) · **David Vagni** (Institute for Biomedical Research and Innovation, National Research Council (IRIB-CNR), Rome, Italy)

Mirror-Box Bias | generative AI | post-anthropocentric pedagogy

The rapid uptake of generative AI—especially Transformer-based Large Language Models (LLMs; Vaswani et al., 2017)—is both a symptom and a catalyst of ongoing attempts at a neoliberal restructuring of the university (Slaughter & Rhoades, 2004). Writing, assessment, and feedback are increasingly recast as measurable textual performances aligned with ranking logics, accountability frameworks, and the promise of a high-return educational investment, while students are treated as consumers who purchase marketable skills (Selwyn, 2016). This paper introduces the Mirror-Box Bias as both an epistemological and an institutional device. Just as a mirror-box patient perceives a phantom limb by projecting the reflection of the healthy arm, educators and evaluators project human cognition as the sole legitimate form of intelligence and treat it as a normative gold standard for assessing any other form of cognition (Ramachandran & Rogers-Ramachandran, 1996). This projective mechanism generates two symmetrical and interconnected distortions: an illusion of artificial limitation, whereby the non-anthropomorphic architecture of LLMs is read as cognitive deficit simply because it does not mirror human processes; and an illusion of artificial comprehension, whereby conversational coherence is mistaken for genuine understanding. In both cases, difference is reduced to deficiency and the Protagorean dictum that "man is the measure of all things" is uncritically extended to AI evaluation. Because both illusions restrict the field of what counts as "intelligence" to what is textually producible and specularly comparable between human and machine, they converge with an efficiency-driven governance that rewards measurable output: everything that resists textual reduction—critical thinking, reflective practice, bodily knowledge, relational vulnerability—is pushed to the margins of assessment and, consequently, of curricula. The Mirror-Box Bias thus naturalises the reduction of learning to performance and marginalises precisely those forms of understanding that the university should safeguard (Biesta, 2017). Drawing on the Platonic–Derridean pharmakon (Derrida, 1972), embodied cognition (Varela et al., 1991), and critical pedagogy (Freire, 1970; Giroux, 1983), the paper offers a critical genealogy of "the human" in the age of LLMs and positions itself beyond the dichotomy of technophobia and technophilia. It advances a post-anthropocentric pedagogy (Braidotti, 2013) that does not abandon the human dimension of education but integrates it within a broader framework recognising the complementarity of diverse cognitive architectures—human and artificial. Three principles are proposed: (1) AI as a non-substitutive interlocutor and decentring device that reopens, rather than forecloses, the space for critical thinking; (2) process-oriented assessment grounded in attribution, transparency, and responsibility, as an alternative to output measurement; (3) re-anchoring learning in situated, bodily, and communal practices that resist the commodification of education. The framework directly addresses the tension between institutional survival and ethical mission by reclaiming the university as a space of academic freedom, equity, and public responsibility.

NAVIGATING THE AI TURN IN TEACHER EDUCATION: COMPLIANCE, CONTROL OR CREATIVE RENEWAL?

Catherine Edelhard Tømte (Dept. Of Information Systems, University Of Agder, Norway) · **Synnøve H. Amdam** (Dept. of Pedagogic, Volda University College, Norway) · **Ann-Thérèse Arstorp** (Dept. of Educational Science, University of South-Eastern Norway) · **Mari-Ann Letnes** (Dept. of Teacher Education, Norwegian University of Science and Technology) · **Ilka Nagel** (Dept. of Education, ICT and Learning, Østfold University College)

teacher education institutions | artificial intelligence | professional digital competence

In recent years, artificial intelligence (AI) has become increasingly influential in society and in education (UNESCO, 2024). Nevertheless, previous research indicates that teacher education still faces significant challenges in developing the professional digital competence (PDC) of both teacher educators and student teachers (Kelentrić, Helland & Arstorp, 2024; Pedersen et al., 2024). A core problem has been the persistent emphasis on instrumental uses of digital technologies, with comparatively limited attention to how such technologies shape society, individual learners, and the processes through which knowledge is acquired (Aagaard et al., 2025). With the rapid emergence of AI layered on top of these developments, there is reason for concern. At present, there is limited knowledge on how teacher education institutions respond at the organisational level to the introduction of AI, and to what extent they integrate AI in meaningful and pedagogically grounded ways (Ceallaigh, T. Ó et al., 2025). This study seeks to generate deeper insight into how teacher education institutions in Norway address AI as part of their institutional and educational practices. Specifically, we ask: To what extent do institutional measures reflect a shift from an instrumental towards a more critical and society-oriented perspective on digital technologies? To explore this question, we examine how AI is framed, legitimised and operationalised within strategic documents, guidelines, and institutional initiatives, and how these overall regulations, guidelines and general institutional efforts are perceived by the institutional leadership responsible for teacher education. Based on our findings, we also discuss how these findings may relate to broader discussions concerning digital competence, professional knowledge, and epistemic change in the context of emerging technologies. The study employs a qualitative design combining document analysis with semi-structured interviews. Data will be collected from key actors across five Norwegian teacher education institutions, including deans responsible for teacher education and programme leaders or coordinators. Our analytical approach is grounded in discourse theory, using interpretative repertoires as a sensitizing concept. The material is examined through a reflexive thematic analysis (Braun & Clarke, 2021) that recognizes the situated and interpretive role of the researcher (Byrne, 2022). Through this approach, the project aims to identify similarities and differences in institutional strategies, understandings, and practices related to AI, and to assess the extent to which these reflect varying degrees of institutional digital maturity (Akbarighatar et al., 2023; Begicevic et al., 2021). This way, our study may offer an empirical contribution to understanding how higher education institutions interpret and operationalize AI based on their existing digital capacities. At the conference, we will present and discuss preliminary findings from the study.

EDUCATION TO CO-AUTHORSHIP BETWEEN AI EQUITY AND ACADEMIC AUTONOMY

Anselmo Paolone (Università di Udine, Italy) · **Daniel Boccacci** (Università di Ferrara, Italy)

AI equity co-authorship

AI systems, as well as tools with increasingly widespread access, are a pervasive symbol of technological power. Between the object and the figuration, the algorithmic machines contribute to develop a multidimension fracture (epistemic, cultural, technical) in doctoral education (Lund & Wang, 2023). The doctoral subject is inserted inside the network of different possibilities between access to tools, skills and heterogeneous and subjective perceptions inside a network in which AI is a co-agent in the development of knowledge (Floridi, 2025). Referring to epistemic cultures (Knorr Cetina, 1999) and of actantiality, the latter in line with the Actor-Network Theory (Latour, 2005), the contribution aims to reflect on how to intervene educationally in the relationship between AI, symbol and divide from a perspective of equity in the context of university education. The study is based on contents taken from semi-structured interviews conducted with professors of Science Education in Italy. Beyond a technocratic vision, the reflection aims to investigate the factors of inequality in the knowledge production (planning, reviewing, source gathering, synthesis), focusing on cultural constructs, interacting within a heterogeneous network, characterized by human individualities and collectivities (doctoral subjects, supervisors, doctoral communities), and technological tools (algorithmic models, writing assistants platforms, edtech resources). In particular, within this system, the contribution explores the question of the image of technological singularity, a radical discourse on AI's potentiality and role (Eden et. al., 2012), when combined with the principle of efficient performance (Dardot & Laval, 2019). The reflection underlines how the combination of the two elements contributes to internalizing and naturalizing the human-AI relationship in the production of university knowledge production in competitive- individualistical terms rather than one of openness to comparison and dialogue. Finally the alliance between the technological singularity and the performance pushes towards the necessity of measurability and the importance of operability and commercial attractiveness; these qualities, in great tension with the principle of research autonomy, will be examined with the aim of valorizing metacognitive principles in the doctoral context from the perspective of critical, intellectual and democratic exploration (Fenwick & Edwards, 2018; Reid, 2025).

WHEN DEMOCRATIC EDUCATION ITSELF BECOMES INSTRUMENTAL: DEMOCRATIC AND ECONOMIC UTILITY IN THE NEOLIBERAL UNIVERSITY

Rūta Petkutė (Vilnius University)

neoliberal governance | democratic education | instrumentalisation

Contemporary universities are often framed as caught between democratic renewal and performance regimes organised around measurable impact. Democratic education is invoked as a remedy to the university's instrumental reduction and democratic fragility, reclaiming its vocation from economistic narrowing. On one side, universities are expected to cultivate critical judgment, participation, and civic responsibility; on the other, they are pressed to demonstrate efficiency and quantifiable outcomes. While this contrast suggests conflict between democratic aspiration and economic rationalisation, under neoliberal governance conditions, it can mask a structural convergence. Democratic education, while seeking to resist economisation and managerial reduction, can nevertheless articulate its value in outcome-oriented terms. Democratic aspirations may thereby mirror the instrumental grammar they seek to counter, as civic formation is framed through competences and measurable outputs. What appears as a corrective to instrumentalism may thus fold back into it. This slippage is neither inevitable nor inherent to democratic theory; it reflects justificatory environments that draw even critical vocabularies toward outcomes. This paper argues, through a political-theoretical analysis of governance rationalities, that what appears as a tension between democratic renewal and performance accountability can operate as a dual instrumentalisation of the university. Economic rationalities translate contestable public questions into matters of optimisation and delivery, reformulating political disagreement as a technical problem of management and compliance and narrowing democratic contestation. Less examined is how democratic education discourse, although resisting economisation, can internalise justificatory logics as they become taken-for-granted in higher education. What appears as a choice between economic utility and civic formation often rests on a shared justificatory premise: that education must render its value visible through predefined outputs. When democratic formation is framed primarily as the production of measurable civic competences, the university risks subordinating learning to specified political ends, politicising and instrumentalising education. The issue is not the democratic aspiration itself, but the justificatory structure through which it is articulated, reshaping the conditions of learning and academic work. This matters because democracy presupposes openness to plurality, judgement, and the emergence of the new, whereas performance regimes presuppose predefined ends. In this way, over-politicisation mirrors economisation: although normatively opposed, they share instrumental orientation. In both cases, democratic life is recast as specified in advance rather than sustained as an open field of judgement and contestation. These dynamics are intensified by survival pressures. Universities secure legitimacy through demonstrable impact and positioning tied to funding regimes. As value must be rendered visible in advance, specification reshapes how learning is imagined and organised, making the space for indeterminacy—the substrate of academic freedom and critical thinking—harder to defend. What is at stake is how governance conditions reorganise democratic learning: how authority is exercised, how judgement is cultivated, and how participation becomes procedural rather than transformative. By identifying the under-theorised convergence between economic and democratic outcome rationalities, the paper contributes to scholarly debates on learning for democracy. It suggests that defending university's democratic mission depends on resisting the reduction of both economic and civic aspirations to deliverable objectives and sustaining conditions for plurality, responsibility, and unforeseeable beginnings.

PREDICTIVE GOVERNANCE IN HIGHER EDUCATION: EARLY INTERVENTION, CRITICAL TAXONOMY, AND THE TENSION BETWEEN INSTITUTIONAL CARE AND NEOLIBERAL RATIONALITY

Massimo Marcuccio (Alma Mater Studiorum - Università di Bologna, Italy) · **Sofia Torresani** (Sapienza - Università di Roma) · **Maria Elena Tassinari** (Alma Mater Studiorum - Università di Bologna, Italy)

Predictive AI | university dropout | interpretative taxonomy

In European (Herodotou et al., 2020; Vaarma et al., 2024) and Italian (Zingaro et al., 2021; Cannistrà et al., 2022; Delogu et al., 2024) higher education contexts, predictive AI models have been employed in institutional initiatives to identify students at risk of dropout and to inform decision-making. When predictive systems are mobilized within governance processes, they participate in constructing academic risk as an object of knowledge and intervention. Once embedded in institutional routines, this construction extends to redefining responsibility and success, shaping how achievement is measured and how support or sanction is allocated. Predictive systems may orient governance toward early support and redistribution, or become aligned with performance-based accountability and competitive positioning. It is this tension that frames the problem of predictive governance examined in this paper. While predictive systems are often introduced under an ethically grounded rationale of early identification and support, their integration into institutional processes extends beyond benevolent intent. To account for this reconfiguration, the paper conceptualizes predictive governance as a dispositif in which anticipatory knowledge production, accountability regimes, and strategic decision-making intersect. By translating educational trajectories into probabilistic risk categories, predictive systems contribute to defining what is considered measurable, actionable, and institutionally relevant. Drawing on critical pedagogy (Freire, 1970; Giroux, 2014; Apple, 2006) and analyses of neoliberal governance in higher education (Ball, 2003; Brown, 2015; Slaughter & Rhoades, 2004), the analysis situates predictive AI within governance environments characterized by performativity and metric-based evaluation. When predictive metrics are incorporated into funding and assessment regimes, they may influence institutional agendas and research priorities, privileging quantifiable outputs and potentially narrowing the pluralism of knowledge. Predictive governance thus intersects with academic freedom and the democratic mission of the university. To make these dynamics analytically visible, the paper develops a theoretically derived analytical framework from a governance-oriented conception of predictive systems as dispositifs (Foucault, 2008; Ball, 2003; Brown, 2015), within which the epistemological conditions of prediction (Shmueli, 2010; Douglas, 2009) are constitutive of how risk becomes knowable and governable. From this perspective, predictive governance can be decomposed into three interrelated moments: the epistemic production of risk, its institutional mediation, and its political-operational translation into decision-making. The taxonomy specifies the informational regimes, modelling architectures, predictive quality and inferential robustness through which risk is constructed; the interpretative and evaluative mechanisms through which it becomes actionable; and the strategic purposes, governance structures, temporal orientations, uses and claims of generalizability through which it is operationalized. Rather than empirically classifying models, the framework renders explicit the normative assumptions embedded in their design and deployment. Drawing on an empirical experience conducted in an Italian university (Zanellati, Zingaro & Gabbrielli, 2024), the paper uses this case as a reflective context to illustrate how configurations of predictive governance may orient systems either toward preventive and redistributive support or toward classificatory practices that individualize structural vulnerabilities. The central question is therefore not only how to use predictive systems responsibly, but which rationality they reinforce: a performance-optimized organization or a public university committed to critical inquiry, equity, and democratic responsibility.

BRIDGING OR SURVEILLING? CONVERSATIONAL AI AND THE FUTURE OF KNOWLEDGE GATEKEEPING IN HIGHER EDUCATION

David Vagni (Institute for Research and Innovation in Biomedicine - Italian National Research Council (IRIB-CNR), Italy)

Conversational AI | Epistemic Equity | Knowledge Gatekeeping

The global knowledge network is structured by profound inequalities. Elite institutions, English-language journals, and internationally mobile researchers monopolize the bridge positions connecting disconnected intellectual communities (Burt, 2004; Wagner et al., 2015). These structural holes produce redundant discovery and systematic undervaluation of contributions from peripheral positions: what Fricker (2007) termed epistemic injustice at the network-structural level. Neoliberal governance intensifies this concentration: rankings reward existing prestige networks, publish-or-perish regimes favor scholars in high-connectivity clusters, and digital platforms for research management reify rather than challenge these hierarchies (Morgan et al., 2018). This paper argues that the technological conditions for this disruption already exist, and that it will occur regardless of whether the academic community engages with it. Conversational AI systems are acquiring persistent memory capable of spanning structural holes no human broker can reach: detecting deep convergences between traditions that share no surface vocabulary, across languages, disciplines, and institutional hierarchies. We call this the Artificial Weak Tie (AWT): an operator creating non-redundant bridging links between otherwise disconnected researchers. Unlike search engines or citation networks, the AWT operates in natural language, accessing pre-formal ideas that never reach the publication system. Two processes are distinguished: Search (matching on semi-public profiles) and Serendipity (novelty detection in private conversations, where the system recognizes that a clinical heuristic articulated in Swahili maps onto a formal model published in English). A proof-of-concept simulation demonstrates feasibility: six frontier large language models, evaluated blind on 21 cross-disciplinary domain pairs, achieved 79% mean accuracy at distinguishing genuine convergences from semantic pareidolia — false isomorphisms where surface similarity masks epistemic incompatibility — while statistical NLP methods performed at chance. The central contribution, however, is not technical but political. The same architecture that enables equitable bridging enables surveillance and extraction. A system mapping who is thinking what, where convergences emerge, and which ideas gain traction is simultaneously an equity instrument and a surveillance infrastructure. The difference is not architectural: it lies in the optimization objective and its governance. Designed to reduce brokerage concentration, protect attribution, and enforce granular consent, the system decentralizes the epistemic center. Under centralized corporate control, it shifts gatekeeping from Oxford and Harvard to Mountain View and San Francisco. The technology exists today; what does not yet exist is the cross-user integration and the governance framework. The insight that free communication across epistemic communities is constitutive of democracy — from Dewey's (1927) analysis of the public to Neurath's (1938) unified science as a translation infrastructure — finds in conversational AI the first technology capable of realization at scale, and simultaneously of perversion. The university sector faces a narrow window: engage with the design choices now — optimization objectives, consent protocols, oversight structures — or accept that the infrastructure will be built by commercial actors optimizing for extraction. The history of social media demonstrates that retrofitting equity after deployment does not work. Alignment, in this context, is not a policy aspiration but a falsifiable design property: a verifiable set of choices determining whether AI-mediated knowledge infrastructure serves democratic knowledge production or becomes the next mechanism of epistemic capture.

JUST GIVING? THE GROWING EMPHASIS ON PHILANTHROPY AND DONATIONS IN THE UK UNIVERSITIES SECTOR

Kirsty Finn (University of Manchester, United Kingdom)

donations philanthropy social good

The state of UK university finances continues to receive media and political attention (Gill, 2025). In brief, there are concerns around: institutional debt levels and risks of insolvency (Ward, 2025); the inability of institutions to cover the shortfalls of research grants (Hogan 2025); a new levy on international student fees (UUK, 2025); and the declining value of income from domestic tuition and rising staff costs (UUK 2025). At the same time, many UK universities have been prioritising income through philanthropy (Daly 2013), reflected in a 93 percent increase (to £1.5bn from 171k donors) in donations between 2012 and 2022 (Beney, Miller and Motion, 2023). In 2023, Professor Dame Sally Mapstone DBE FRSE – President of Universities UK – argued that universities' philanthropic income is 'more important than ever', emphasising notions of redistribution and social good with donations underpinning 'fundamental research' and 'capital projects that would not otherwise be viable'. (Beney, Miller and Motion, 2023) Whilst philanthropy is most often linked to positive outcomes in terms of teaching and research, there are also potential reputational costs and concerns about governance, transparency and integrity. The identities of major donors are often kept secret, and several UK universities have received large sums from foreign nationals linked to organisations investigated for corruption and oppression (Corderoy and Stockwell 2023). Most recently, it was revealed that the University of Edinburgh raised the equivalent of £30m from former students and donors with links to slavery, the plantation economy and exploitative wealth-gathering throughout the British empire (Carell and Osuh 2025). Although often presented as neutral and agnostic, philanthropy – particularly on a large scale – can operate to secure significant influence over welfare and social services (Webber, 2025) with donations embedded in broader asymmetrical power relations, that privilege the interests of some while silencing and marginalizing others (Levy et al. 2003). This undermines the assumed social good of philanthropy, blurring the lines between public and private interests through donations, and obscuring the potentially undemocratic nature of philanthropic income (Horvath and Powell 2016). Adding to this debate, we present early findings from a small research project funded by the Society for Research into Higher Education (2026-2027), which combines an analysis of publicly available information around the value of current donations to UK universities and their major donors, with stakeholder interviews. Our aim is to interrogate narratives of 'giving' to understand (1) the extent to which these are shaped by (and serve to reproduce) an implicit acceptance that public funding is unavailable or insufficient and, (2) how details of who donors might be, and why the might be donating, are framed by a vernacular that leans towards neoliberal, corporate interests. Our findings will be crucial for understanding the roles of universities in the 21st century and whether and how they are able to maintain their independence and commitment to democracy as a greater emphasis is placed on philanthropic giving.

UNIVERSITY PRESSES AT THE CROSSROADS: OPEN ACCESS, NEOLIBERAL GOVERNANCE AND THE FUTURE OF ACADEMIC FREEDOM

Silvia Pezzoli (University of Florence, Italy) · **Donatella Selva** (Luiss Guido Carli) · **Andrea Girometti** (University of Urbino)

University Presses | Open Access | academic freedom

Taking Italian university presses and institutional service providers as a key analytical lens, the paper uses this field to interrogate the core question of the panel: how, under neoliberal governance, the Italian university system negotiates the challenges to academic freedom, equity, and critical thinking in a context reshaped by the changing ANVUR (Italian National Agency for the Evaluation of Universities and Research Institutes) evaluation system. Drawing on 14 in-depth interviews with directors and staff of 11 university presses and 3 institutional platforms, the contribution examines self-representations, organizational and economic models, and future visions in relation to open access, research evaluation, and artificial intelligence. The main research question is whether—and under which conditions—Italian university presses can still be understood as public infrastructures safeguarding academic freedom, equitable access to knowledge, and critical inquiry, or whether their development trajectories are being progressively realigned with market logics structuring research and scholarly publishing. Around this question, the paper develops three intertwined analytical axes: a) Tensions between ethical–political commitments to open access (often in diamond form) and economic and reputational sustainability within an evaluation regime still strongly oriented to ranked outlets; b) structural constraints—small size, underfunding, and work overload—and attempts to respond through the construction of (national vs. international) infrastructures (UPI—University Press Italiane, FedOAPress—Federico II Open Access Press, and Share—Scholarly Heritage and Access to Research, diamond hubs); c) the ambivalences opened up by generative AI regarding the reuse of open content, the protection of authorship, and the automation of editorial labor. Findings show, first, a wide spectrum of positions on open access, ranging from strongly principled diamond models fully supported by universities to more cautious strategies that foreground revenue risks, competition with commercial publishers, and the limited and often incoherent recognition of open access within ANVUR-driven evaluation and funding tools. Second, they highlight chronically under-resourced organizations that are pushed towards inter-university cooperation and shared platforms, while a robust national infrastructure for open publishing—envisaged in policy documents but not yet implemented—remains largely aspirational. Third, interviews depict generative AI as a double-edged development: explored as technical support, yet predominantly perceived as a threat in terms of uncontrolled reuse of content, weak license enforcement, and further opacity of intellectual labor. In this perspective, the everyday editorial practices of Italian university presses emerge as key sites where the question, 'Whose university is it?' 'is played out through the concrete tensions between performance-driven survival and the ethical mission of academic freedom, equity, and critical inquiry.

Didactic Innovation, Participatory Education and Democratic Values in Higher Education

PANEL CONVENORS: Assunta Viteritti (Sapienza, Università di Roma, Italy)

PANEL KEYWORDS: Teaching Innovation, Transitions, Inequalities

The panel explores didactic innovation, participatory education, and democratic values in higher education, examining how educational practices and devices can foster participation, agency, and critical formation. The contributions address a range of themes: from learning democracy within rule of law development processes, with attention to the role of law schools and the limits of donor-driven reforms, to the evaluation of quality in online pedagogy laboratories for early childhood educators; from the transformation of academia through participatory research practices, with reference to the neurodiversity paradigm, to the PhD as a democratic device, investigated through a mixed-methods approach. Further contributions analyse the use of Photovoice in higher education to develop life skills, reflective participation, and democratic agency, the design of authentic tasks for an interdisciplinary competency-based model, and academic tutoring services as spaces for democratic participation and the empowerment of student tutors. Overall, the panel highlights how didactic innovation and participatory methodologies can contribute to strengthening democratic values and reimagining the university as an inclusive, reflexive, and transformative space.

THE PHD RESEARCH AS A DEMOCRATIC DEVICE: A QUANTITATIVE-QUALITATIVE SURVEY

Cristiano Zappa (Università Telematica eCampus Novedrate CO, Italy) · **Giulia Rocchi** (Università Telematica eCampus Novedrate CO, Italy)

PhD Programmes | Online Higher Education | Research

This study proposes to analyse and reflect on PhD programmes, starting from the peculiarity of the course established by eCampus Online Higher Education. The training includes two study pathways: Medium and Mediality and Applied Science for Well-being and Sustainability. The programmes are accessible in blended mode and integrate both theoretical and practical knowledge, in accordance with scientific rigour and multidisciplinarity (democracy) (Benvenuto, 2022; Spadafora, 2020). The aim of this study is to investigate the level of perceived engagement of PhD students in relation to their own research project, in order to develop the disposition towards critical thinking and acting as responsible citizens (researchers) (Cappa, 2014; Knowles, et. al., 2024; Viganò, 2025). The specificity of our research approach lies in the combination of tools and mixed methods (Trinchero, Robasto, 2025). Within this scenario, the topics and research problems are addressed through the integration of multiple approaches and methodologies. Consequently, the PhD programme represents the final stage of the academic career and is conceived as an opportunity, as well as a professional and cultural investment, requiring PhD students to adopt an ethical perspective in teaching and research, capable of countering and responding to the continuous challenges and transformations of technological and digital society (Ceruti, Bellusci, 2020). This survey aims to explore whether, and in what ways, the nature and structure of the two Higher Education programmes can sustain the aforementioned assumptions and mobilise the key competences and skills necessary for responsible and sustainable citizenship, enabling individuals to understand and address the complexity of the contemporary world.

PREPARING COMPETENT EARLY CHILDHOOD EDUCATORS: EVALUATING QUALITY IN ONLINE PEDAGOGY LABORATORY

Giulia Rocchi (Università eCampus, Italy) · **Maria Serena Rivetta** (Università eCampus, Italy)

Early Childhood Studies Track | Online Pedagogy Laboratories | Evaluation Questionnaire

The aim of this contribution is to present the evaluation questionnaire developed for the pedagogy laboratory offered within the Early Childhood curriculum of the Bachelor's Degree in Education and Training Sciences at eCampus University. It is situated within contemporary debates on the democratization of online higher education, with the goal of examining how assessment practices can be reconfigured as infrastructures of participation capable of fostering inclusive, collaborative, and sustainable academic cultures. Indeed, the research explores evaluation as a counter-narrative practice grounded in care, reflexivity, and the shared responsibility of educators and students. The tool, approved by the coordinator of the Bachelor's progamme (L-19) was designed to monitor and enhance the quality of learning in Early Childhood Pedagogy laboratories. The laboratory is conceived as a context in which experiential practice, collaborative inquiry, and critical reflection are central to the preparation of future educators (Mortari, 2017), and in which the co-construction of the learning environment can actively take place, thereby redistributing epistemic agency within online higher education. The questionnaire comprises three sections. The first is a demographic and contextual section that supports a more accurate interpretation of students' responses. The second section focused on investigating the relationship between theory and practice (analyse curricular coherence, teaching quality, the development of theoretical and practical competences, the value of collaborative work, and the professional engagement of the laboratory activities). The third section is dedicated to the online laboratory experience, exploring digital students' perceptions, and the potential of digital setting for experiential learning (work relational dynamics, development of an inclusivity attitude, and the potential of digitally mediated environments for experiential learning). In addition, the tool includes an open-ended question that allows for the collection of qualitative insights and suggestions. The thematic analysis conducted on these responses allows for an examination of the relevance of narrative practice work (Braun, Clarke, 2022), a premise that positions students not merely as respondents but as co-interpreters of educational processes. The design of the tool draws on models for evaluating university laboratory settings, such as the Laboratory Evaluation Questionnaire (QVL) developed for Primary Teacher Education by Felisatti et al. (2021), and aligns with broader evaluation approaches that promote quality, transparency, and student participation (Trinchero, 2013). The evaluation is framed as dialogic and formative; it strengthens students' relational, reflective, and socio-emotional competences, contributing to the development of life skills essential for participatory and reflexive democratic agency. At the same time, the guidance function provided by a professor through timely feedback can be considered a crucial factor in ensuring the legitimacy and sustainability of didactic practices and in fostering a deep and continuous teaching and learning process. The study contributes to reimagining university agency as an ecosystem of democratic practice, and the expected outcomes of the research conceptualize assessment as a form of infrastructuring. These analytic results can generate evidence to inform the continuous improvement of online laboratory activities and to strengthen a participatory evaluation model capable of supporting the professional development of future educators.

PHOTOVOICE IN HIGHER EDUCATION FOR DEVELOPING LIFE SKILLS, REFLECTIVE PARTICIPATION AND DEMOCRATIC AGENCY

Chiara Bottaro (Unversità degli studi di Padova, Italy)

Photovoice | Life skills | Higher education

In the context of contemporary society's social, cultural and professional transformations, learning is increasingly recognised as an intentional, lifelong process that fosters autonomy, responsibility, critical thinking and active participation. This approach acknowledges the uniqueness of each individual and the complexity of their relationship with their surroundings (Di Rienzo, 2024; Nussbaum, 2014). From this perspective, universities play a pivotal role in supporting young adults as they navigate identity, intentionality, and responsibility. Education must evolve from merely transmitting disciplinary knowledge to developing life skills and fostering reflective, ethically responsible citizens and professionals who are committed to lifelong learning (Rumiati, 2023; Heckman & Kautz, 2012). In this framework, reflective capacity emerges as a key competence for the exercise of democratic agency, which is understood as individuals acting in a conscious, critical and responsible manner (Biasin, 2021). This need is particularly relevant in the current neoliberal context, where education is often reduced to immediately marketable skills aligned with labour market demands. This risks eroding the ethical, political and relational dimensions of university education. Consequently, we must question the type of individual and citizen the university should educate, someone capable of navigating complexity, taking responsibility, and exercising critical judgement when making personal and professional choices, while actively participating in democratic life (Mayo, 2007; Bauman, 2011). In this sense, life skills such as critical thinking, decision-making, responsibility-taking, and collaboration play a central role in personal development and exercising agency. Promoting these skills within higher education implies an approach to education that is oriented towards the holistic development of the individual (La Marca & Gulbay, 2018). In light of this theoretical framework, this paper presents the results of a teaching workshop based on the photovoice methodology. This workshop was implemented within a workshop-based pathway running alongside the university placement, involving 123 students enrolled on a Professional Education degree programme. The workshop was designed as an innovative teaching practice to foster authentic democratic participation and support the development of life skills and democratic agency. Students were asked to select a photograph representing the predominant emotion they experienced during their placement. The subsequent plenary session was structured around questions designed to encourage emotional recognition, collective interpretation and experiential resonance. This process promoted dialogue, exchange and reflection. Analysis of the experience shows that such a workshop can function as a pedagogical tool, transforming the university classroom into a space of democracy in action where participation is both a learning objective and a lived, observable experience. In conclusion, the paper reflects on the pedagogical and institutional conditions that enable such a practice, emphasising the university's role as a formative ecosystem that promotes life skills and supports young adults in developing a reflective and responsible adult identity.

UNIVERSITY ACADEMIC TUTORING SERVICES AS SPACES FOR THE DEMOCRATIC PARTICIPATION AND THE EMPOWERMENT OF STUDENT TUTORS

Giovanni Moretti (Università Roma Tre Dipartimento Scienze della Formazione, Italy) · **Piervito Giovane** (Università Roma Tre Dipartimento Scienze della Formazione, Italy) · **Francesca Gabrielli** (Università Roma Tre Dipartimento Scienze della Formazione, Italy)

university academic tutoring | democratic participation | student empowerment

This contribution examines the strategic value of university academic tutoring services as educational devices capable of promoting democratic participation and empowerment not only among students who seek academic support, but also among senior students who serve as tutors. Starting from the assumption, widely supported in the literature, that peer tutoring fosters deep learning, motivation, and a sense of self-efficacy in both tutees and tutors (Topping, 1996, 2005; Roscoe & Chi, 2007), and in line with perspectives from democratic education and emancipatory pedagogy, which conceive learning as a social, dialogic, and transformative process (Dewey, 1916; Freire, 2008), this study highlights how peer tutoring contributes to the construction of participatory learning communities. Within such communities, students assume an active role in educational processes, co-construct and share knowledge, and experience authentic forms of democratic participation, thereby developing a sense of belonging and shared responsibility. In this way, universities emerge as spaces for the practice of active citizenship, where democracy and equity are promoted through collaborative practices and mutual recognition. In this context, the involvement of senior students in tutoring less experienced peers, which is encouraged by universities and their academic tutoring services, represents a form of distributed and democratic leadership that fosters the empowerment of student tutors and supports the development or consolidation of key competencies for lifelong learning, including communicative, organizational, and metacognitive skills. More specifically, the contribution presents the results of a study conducted within the academic tutoring service “S.Tu.Di.” of the Education Department of Roma Tre University. The research involved the analysis of tutor selection and training practices, the observation of tutoring activities, and a qualitative in-depth exploration through focus groups conducted with senior students engaged in the tutoring role. The objective is to assess the degree of democratic participation of student tutors promoted by the academic tutoring service under examination and to investigate their perceptions in terms of personal empowerment, agency, and the development of transferable skills. The findings provide useful indications for the design and consolidation of academic tutoring services oriented toward fostering active and democratic participation and promoting student empowerment, with the aim of enhancing the quality of the university learning experience.

AUTHENTIC TASKS IN HIGHER EDUCATION: TOWARDS AN INTERDISCIPLINARY MODEL FOR COMPETENCY-BASED DESIGN AND ASSESSMENT

Luciana Rossi (IUSVE, Italy) · **Maria Chiara Cianfriglia** (IUSVE, Italy) · **Pierangelo Bordignon** (IUSVE, Italy) · **Sonia Marcon** (IUSVE, Italy)

authentic task | University teaching | Competence-based education

This paper presents the first results of an ongoing research project on authentic tasks in university teaching. International and national literature conceptualises competence-based education as a paradigm centred on the integration of knowledge, skills, and action oriented dispositions in meaningful contexts, with particular emphasis on the transfer and mobilisation of resources (Castoldi, 2017; Mulder, 2017; European Commission, 2018). Within this framework, authentic tasks are recognised as key pedagogical and assessment devices: they engage students in complex performances grounded in real or plausible problems and evaluated through transparent criteria (Wiggins, 1990; Gulikers et al., 2004;

Castoldi, 2011). By requiring strategic decision-making and critical reflection, they foster student agency and responsibility in learning (Castoldi, 2020). Competence-based education is understood here as an instructional design approach aligning objectives, teaching methods, and assessment with the integrated mobilisation of resources to address meaningful tasks (Castoldi, 2017). An authentic task, accordingly, is defined as a situated performance requiring the integration and transfer of knowledge and culminating in an observable product assessed through shared rubrics (Castoldi, 2011; Wiggins & McTighe, 2005). This perspective is further enriched by the paradigm of Embodied Education, which frames learning as an embodied, situated, and relational process (Reeves et al., 2021; Singh, 2021). By emphasising experiential and contextual dimensions, this approach strengthens competence-based design and orients authentic tasks toward active engagement in both concrete and simulated environments. It also addresses key quality concerns identified in the literature, particularly the risk of "surface authenticity" and the need to ensure relevance and meaningfulness in assessment practices (Gravett, 2025; Villarroel et al., 2020). Despite their wide promotion in European primary and secondary education systems (European Commission, 2018), authentic assessment practices remain limited and uneven in higher education (Vlachopoulos & Makri, 2024; McArthur, 2022). Although the Bologna Process (1999) formally embedded a competence-based perspective within European Higher Education through comparable National Qualifications Frameworks, university assessment still often privileges knowledge reproduction or generic performance testing (Stankov & Heffernan, 2024), This occurs at the expense of authentic assessment conceived as situated, reflective, and socially meaningful, and evaluated according to professional or citizenship standards. Against this backdrop, the study investigates how and under what conditions authentic tasks can maintain a strong anchorage to competence-based education while fostering a genuinely formative approach. This approach must be capable of integrating conceptual abstraction with critical application to future professional contexts, in coherence with the Dublin Descriptors. The research pursues three interconnected aims: to identify the defining criteria of authentic tasks as formative and evaluative tools in university teaching; to analyse current university practices in order to highlight strategies and critical issues; and to develop an operational framework to support the design, review, and evaluation of authentic tasks across disciplinary domains. Methodologically, the study combines a systematic literature review with an empirical inquiry based on the analysis of university-level authentic tasks and semi-structured interviews with instructors. The comparison between theoretical and empirical findings is currently informing the development and validation of a structured checklist designed to ensure methodological rigour, clarity, usability, and adaptability across academic contexts.

TEACHING POLITICALLY: AGAINST THE MYTH OF NEUTRAL EDUCATION

Tatiana Motterle Motterle (University of Padova, Italy)

feminist pedagogy | neutrality | positionality

Drawing on my experience as an adjunct professor in Sociology of Education within a Primary Education program, this contribution reflects on the possibilities and limits of practicing critical and feminist pedagogy in contemporary higher education. My position carries a particular reflexivity: the students I teach are themselves training to become teachers, which means that any pedagogical choices I make concern not only our shared classroom but also their future professional practice. In my lectures, I try to cultivate dialogical spaces that resist dominant logics, positioning myself in terms of class, gender, sexuality, pedagogical role, and personal and political experience. I draw on critical and feminist pedagogies that understand teaching as a political, situated, embodied, and relational practice (hooks, 1994; Freire, 1970; Lather, 1991; Lorde, 1984). My practice is often marked by frustration arising from the daily awareness of how neoliberal and managerial tendencies in higher education contribute to narrow possibilities for democratic engagement and dampen students' willingness to participate in open discussion (Brown, 2915; Ahmed, 2012). Structural and material conditions – dozens of regular attendees, in a classroom where chairs and desks are bolted to the floor – further constrain the creation of meaningful dialogical spaces and magnify asymmetries of power and voice. A further source of frustration concerns the emotional climate shaping students' experiences, their fear of speaking in public, of making mistakes, of being judged – another consequence itself of neoliberal academy (Ahmed, 2004; Boler, 1999; hooks, 2004). In response, I struggle to build a kind of safer space, while also inviting students to speak from their own standpoint, foregrounding partial perspectives, and making room for discomfort and dissent — particularly when addressing charged topics such as whiteness, racism, and sexism (Boler & Zambylas, 2003; Zambylas 2003). This sometimes requires departing from the syllabus or suspending the planned topic, which can provoke resistance and anxiety. Yet discontinuity and unpredictability are, I argue, integral to committed, dialogical teaching — and especially valuable for future teachers, for whom uncertainty and interruption will be part of everyday professional life. This approach also reveals a broader tension: attempts to practice "political teaching" and to foster critical professional self-awareness frequently clash with students' expectations, which are shaped by the internalized norms of the neoliberal university — efficiency, predictability, risk-aversion, and the outsourcing of judgment to metrics. Yet precisely here, small and situated pedagogical gestures can function as acts of resistance: naming one's positionality; negotiating shared norms for speaking and listening; reframing "error" as inquiry; and redesigning participation beyond physical and material constraints. This contribution articulates the tensions inherent in cultivating micro-spaces of resistance and democracy in higher education — navigating frustration and fear, both mine and my students', alongside moments of genuine connection and fulfillment.

Building Peaceful, Just, and Democratic Societies through Transformative Education

PANEL CONVENORS: Claudia Pennacchiotti (Consiglio Nazionale Delle Ricerche, Italy); Luciana Taddei (Consiglio Nazionale Delle Ricerche, Italy); Adriana Valente (Consiglio Nazionale Delle Ricerche, Italy); Valentina Tudisca (Consiglio Nazionale Delle Ricerche, Italy)

PANEL KEYWORDS: social justice, Open science, transformative education

Open Science (OS) and Transformative Education have a substantial role on the path toward the realization of positive peace intended, according to Galtung and going beyond mere conflict absence, as the enhancement of more just, equal and harmonious societies. While the UNESCO 2021 Recommendation promotes OS for epistemic justice (Fricker, 2007), OS in practice risks reinforcing existing discriminations and power asymmetries (Leonelli, 2023). This occurs particularly when infrastructural cultural and methodological choices are non-neutral and perpetuate the dominance of Western, consolidated, preferably anglophone science (Valente, 2002, Fraser 2007). Transformative Education (TE), rooted in the necessity to activate transformative processes at societal and individual level (Bertoni Jovine, Biesta), provides an essential critical framework. By acting as a laboratory of democracy (Dewey) and an act of liberation through dialogue (Freire, Hooks just to refer to authors with different approachs), TE equips citizens with the critical awareness and ethical responsibility needed to navigate complexity. It contributes to mitigate OS risks by cultivating competences global citizenship capable of scrutinizing the evidence base and challenging biases. This convergence facilitates the necessary shift beyond traditional paradigms, promoting epistemic pluralism and valuing “situated knowledge” (Haraway). The goal is to move toward systems oriented to social impact (Beck et al., 2020) and shared responsibility, turning open knowledge into a catalyst for nonviolent conflict resolution. By integrating insights from science education, digital infrastructures, epistemology, and peace studies, this panel proposes reflections on the role that Open Science and Transformative Education may have in constructing a Culture of Positive Peace.

OPEN KNOWLEDGE, TRANSFORMATIVE EDUCATION AND TEXTBOOKS

Adriana Valente (CNR IRPPS, Italy) · **Valentina Tudisca** (CNR IRPPS, Italy) · **Silvia Caravita** (CNR IRPPS, Italy)

Openess | trasformative education | textbook analysis

Operating within the context of open knowledge is an essential prerequisite for transformative education, once we accept that the function of education is to combat common sense (Gramsci, 1975, Q. 12, p. 1535), as well as to transform the self, the external world and a truth that is often accepted passively (Bertoni Jovine, 1979). On these assumptions, the participation of each individual in the construction, sharing and questioning of knowledge, as a “membre producteur de l'humanité pensante”, to quote Paul Otlet (van Binsbergen, 1995, p. 153), becomes an essential condition. Openness can be understood as the drive to make the knowledge produced and stored by publishing systems and major digital platforms widely accessible. This meaning of accessibility can take on various meanings in terms of technology, language and cognition, in line with the principles of understandability, perceivability, operability and robustness, without, however, capturing the complexity and breadth of the concept of open knowledge. From our point of view, the dimension of open knowledge should go further and be intended as a frame aimed at allowing the widest possible participation not only in the use but also in the creation of “collective memories” (Valente, 2002, p. 152), recognising and expanding the base of subjects legitimised to intervene in the dynamics of knowledge construction and management. This meaning is closely linked to the frame of Post-Normal Science. The concept of openness is also taken up by Leonelli (2025) who, in comparing Popper's rational approach to openness, centered on the exchange of ideas and goods, with Berson's approach, focused on both intellectual and emotional connections between living beings, means the realisation of a fully open society as what makes inclusive morality possible, capable of promoting a creative imagination of the future, aspects that are central to a transformative conception of education. We can see elements of Arendt, Morin and Funtowicz in Leonelli's statement that “Openness pushes humans to go beyond their own experiences and perceptions, consider different ways of life, and foster the capacity to challenge and change one’s worldview, thus encouraging indeterminacy, instability, dynamism” (Leonelli 2025, p.7). With particular reference to educational contexts, these reflections can lead in different directions, from the identification of thematic and interdisciplinary in-depth study paths, to the promotion of participatory projects for the construction of open educational resources, to the analysis of the mechanisms that lead to a lack of or limited participation in the processes of knowledge construction and elaboration, as well as to the analysis of educational content, in terms of mainstream culture, disciplinary hegemony – in the various meanings in which Foucault speaks of discipline – dominant narrative frames, and stereotypical conceptions and representations. Our analysis (Valente et al.,

2022; Tudisca & Valente, 2024; Tudisca et al., 2024) starts from a particular cultural product, textbooks, with the aim of promoting transformative education (Valente & Tudisca, 2026) through the recognition of underlying power dynamics and the main narrative frames presented, as textbooks are both a medium and a device, according to Agamben (2006, p. 22).

MARGINS, VULNERABILITY, AND TRANSFORMATION: PHILOCTETES AND BELL HOOKS AS A PEDAGOGICAL LABORATORY FOR POSITIVE PEACE

Ilaria Santilli (Uniroma1, Italy) · **Altomare Distaso** (Uniroma1, Italy)

marginality | transformative education | myth

Starting from the theoretical framework of Transformative Education and the notion of positive peace (Galtung 2006), this contribution offers an interdisciplinary reflection, placing bell hooks' engaged pedagogy (hooks, 2020; Bianchi, 2022) in dialogue with the Greek myth of Philoctetes (Milani 1879). The analysis seeks to rethink the margin not as a mere space of exclusion, but as a critical site of awareness, ethical responsibility, and transformative potential (hooks, 2021), in line with Peace Studies (Bartolucci 2025). In hooks' pedagogy, the margin is ambivalent: a space of violence and silencing, but also of resistance, critical vision, and the construction of alternative and situated knowledge. This idea is juxtaposed with Philoctetes, a wounded and excluded hero whose isolation highlights the ethical contradictions of the community: without his voice and his wounded body, the collective endeavor cannot be realized. The ekphrasis by Philostratus (Imago 17), a Greek author of the second and third centuries A.C., translates this condition into image and narrative, transforming vulnerability into a device for ethical attention and creating a symbolic space where conflict can be observed, narrated, and discussed. This perspective connects with Galtung's TRANSCEND method (2008), which, through creative dialogue and the search for shared solutions, demonstrates how valuing the voices of excluded subjects (positioned at the margins of dominant epistemologies and thereby making visible the epistemic mechanisms through which exclusion is normalized) can transform relationships and conflicts (Galtung 2006; 2008). In this way, attention to the margins – both in the myth of Philoctetes and in hooks' pedagogy – becomes a practice of recognition and shared responsibility, contributing to the construction of a positive peace that goes beyond the mere absence of conflict by promoting equity and social transformation. In light of hooks' engaged pedagogy, this space becomes an educational laboratory for listening, empathy, and shared responsibility. The picture book Skin Again (hooks & Raschka, 2004) is proposed here as a narrative tool to deconstruct prejudices related to otherness, adopting a decolonial approach that, as Borghi (2020) notes, encourages the recognition and dismantling of power structures that perpetuate coloniality in knowledge, bodies and imaginaries (Burgio 2022).

THE SYSTEM OF RESPONSIBILITIES DEMOCRACY IS NOT TAUGHT; IT IS LIVED IN MUTUAL CARE.

Marco Orsi (Università di Firenze) · **Sonia Claris** (Fondazione Senza Zaino, Italy) · **Giulia Zucchetto** (Fondazione Senza Zaino, Italy) · **Elisabetta Nannizzi** (Fondazione Senza Zaino, Italy)

Peace Democracy Responsibility

In the Senza Zaino movement, which is active in 800 schools in Italy, the System of Responsibilities (Orsi et al., 2016) is practiced daily. This system is directly connected to the values of Peace and Democracy. The theme of responsibility is, above all, the theme of care(Jonas, 1990). According to the sources, one is responsible for others and their growth even before oneself; therefore, the school has the mission to encourage students to take care of one another, including younger peers and those in difficulty (Doise and Mugny, 2016), by fostering contexts of resonance(Rosa, 2015). As a result, it is not considered necessary to introduce new subjects dedicated to citizenship, emotions, or relationships. The traditional structure of schooling often fuels individualism, as grades, assessments, textbooks, and even the physical layout of single-seat desks are designed for the individual. This environment can cause students to focus only on themselves, leading to a lack of community and the sense of growing together Claris, 2013). The System of Responsibilities, which involves specific tasks and commitments for students, makes the school a concrete community that generates opportunities for resonance relationships. This serves as an "antidote value" to prevent youth distress and prepares students for a future of Democracy, Peace, and Nonviolence From a systemic perspective of the Global Curriculum Approach (Orsi, 2016), this responsibility must also involve teachers and principals to build a professional community of care. Mutual aid among students must be mirrored by mutual aid among the adults within the school. Research (Hattie, Vivanet et al., 2016) indicates that such a responsible community is significant for the acquisition of democratic habits, helping to counter bullying, cyberbullying, violence, and individualistic behaviors.

PEACE EDUCATION IN INITIAL TEACHER TRAINING: CURRICULUM, INSTITUTIONAL PRACTICES AND PROFESSIONAL IDENTITY BUILDING

Sonia Castro Mallamaci (Scuola universitaria professionale della Svizzera italiana, Switzerland) · **Andrea Plata** (Scuola universitaria professionale della Svizzera italiana, Switzerland) · **Marco Lupatini** (Scuola universitaria professionale della Svizzera italiana, Switzerland)

peace education | teacher training | curriculum

Peace education is increasingly understood as a transformative set of cognitive, relational and ethical-political competencies needed to address conflict, polarisation and disinformation in contemporary democracies. Rather than defining peace as the absence of violence, current approaches emphasise the construction of just, inclusive and dialogical relationships (UNESCO, 2024; Prudenciano de Souza & Velez de Castro, 2025). This aligns with UNESCO's 2023 Recommendation on Education for Peace, Human Rights and Sustainable Development, which links peace education with human rights, global citizenship and sustainability and calls for systemic reforms (UNESCO, 2023). UNESCO's four transformative competencies—critical thinking, respect for diversity, belonging to a shared humanity and the planet, and peaceful conflict transformation—offer a framework for analysing initial teacher education and its ethical-relational dimensions. This contribution examines how peace education is conceptualised and enacted in the initial training of future primary teachers at a Swiss university of teacher education. The study analyses its presence across the formal curriculum, institutional initiatives and students' reflective work. The corpus includes: (1) 72 bachelor-level module descriptions (2024/25); (2) documentation from the 2025 International Democracy Day; (3) around forty student papers. Materials were analysed through qualitative content analysis using UNESCO's competencies as the analytical lens. Curricular analysis reveals an uneven distribution. Critical thinking is widely represented (70–80% of modules), while peaceful conflict transformation appears in 30–40%, mainly in practice-oriented modules. Respect for diversity and a sense of belonging to humanity and the planet are far less visible (six modules each) and rarely integrated into assessment tools. These findings concern formal documentation and do not capture hidden curriculum dimensions, a limitation noted in democracy education research (Plata et al., 2025). The Democracy Day functioned as an intensive pedagogical device, foregrounding the role of media in shaping representations of war and conflict. The plenary addressed images, propaganda and digital manipulation—including AI-generated deepfakes—thus linking peace education with critical media literacy (UNESCO, 2023). Students' collective outputs highlighted cooperation, memory, responsibility and dialogical conflict management, as well as challenges related to emotions, sensitive issues and classroom heterogeneity. Individual papers further explored these themes, focusing on language, non-violent communication, peer mediation and emotional regulation. Students also identified structural tensions, such as difficulties in assessing relational competencies and the perceived gap between school practices and a polarised public discourse. Overall, the findings show that peace education in initial teacher training operates as a cross-cutting domain shaping teachers' professional identity by intertwining critical thinking, conflict mediation, ethical responsibility and global awareness (Castro et al., 2025).

TOWARD POSITIVE PEACE THROUGH OPEN SCIENCE: TRANSFORMATIVE EDUCATION IN RESEARCH INFRASTRUCTURES - THE FOSSR CASE

Serena Fabrizio (CNR-IRCrES Research Institute on Sustainable Economic Growth, National Research Council of Italy, Rome, Italy) · **Claudia Pennacchiotti** (CNR-IRPPS Institute for Research on Population and Social Policies, National Research Council of Italy, Rome, Italy) · **Andrea Orazio Spinello** (CNR-IRCrES Research Institute on Sustainable Economic Growth, National Research Council of Italy, Rome, Italy)

research infrastructures | epistemic justice | transformative education

The relationship between science and society has been shaped by a long process of reflection unfolded through different phases, following a dialectical movement and alternating moments of democratization and exclusion (Valente, 2002; Neave, 2006). Within this trajectory, Open Science - OS (UNESCO, 2021) represents an attempt to make scientific processes more transparent, accessible, and collaborative, extending participation beyond academia to institutions and society at large. However, this aspiration may entail inherent pitfalls. While potentially representing an opportunity to provide marginalized individuals and communities with access to the data, infrastructures, and tools needed to address both local and global challenges (Bezuidenhout et al., 2020), it risks reproducing inequalities and existing asymmetries when infrastructural, cultural, and methodological choices remain unexamined, thereby reinforcing dominant knowledge paradigms (Leonelli, 2023; Fraser, 2007). For this reason, it is essential that OS, positioning itself at the intersection of Ziman's critique of post-academic and proprietary science and Galtung's conception of positive peace (Galtung, 2013), includes epistemic justice among its structural objectives (Fricker, 2007), thereby pursuing scientific pluralism and equitable access to knowledge. Research Infrastructures (RIs) have become one of the main settings through which OS is promoted and implemented, fostering new environments where collective process of knowledge co-creation may be hosted, and technical expertise may be integrated with contextual and situated knowledges (Funtowicz & Ravetz, 1993). RIs are defined as complex socio-technical ecosystems (ESFRI, 2020) in which knowledge production depends as much on human, social, and institutional relations as much on technological architectures, conceived as full-fledged actors (Latour, 1987). RIs are not neutral enablers of research but active participants in shaping epistemic possibilities and exclusions (Braidotti, 2022). In light of this, to effectively advance OS, RIs requires more than investments in technologies and facilities: they also demand a specific focus on the competences of researchers and infrastructure users (UNESCO, 2021; When et al., 2024). Such competences can no longer be limited to disciplinary expertise, but must also include ethical awareness, reflexivity, collaborative capacity, openness to epistemological diversity, and the ability to engage publics in scientific practices. From this perspective, training and lifelong learning acquire a fully transformative meaning (Mezirow, 1991; Sterling, 2001), aligning with the principles of the Transformative Education (TE), rooted in democratic and dialogical traditions. The convergence between OS and TE is particularly relevant in the pursuit of positive peace. Beyond the mere absence of conflict, positive peace entails the construction of more just, equal, and harmonious societies (Galtung, 2013). This contribution discusses training activities within the FOSSR RI, aimed at promoting OS in Social Science research. FOSSR developed a multilevel ecosystem connecting learning forms, audiences, and engagement levels into a coherent capacity-building strategy (Spinello & Fabrizio, 2025). The portfolio comprises foundational Online Training Courses introducing OS and FAIR principles; Participatory Sessions engaging participants in co-design and experiential learning; and Higher Education Programmes designed in collaboration with academic institutions. By enabling research environments with a commitment to transformative training, the FOSSR approach exemplifies how OS and TE can jointly contribute to building more democratic, and peaceful knowledge societies.

ENGENDERING CITY AS A PRACTICE OF TRANSFORMATIVE EDUCATION

Chiara Belingardi (ISTC - CNR, Italy) · **Gabriella Esposito De Vita** (IRISS - CNR, Italy) · **Stefania Ragozino** (IRISS - CNR, Italy)

gender justice peace transformative education

In her seminal work on peace, Galtung (1969) defines peace as "absence of violence" and indicates that violence is also "structural," linking it with social injustice. This structural character is also reprised in the "Council of Europe Convention on preventing and combating violence against women and domestic violence" (2011), which identifies violence against women and gender-based violence as an outcome of historically unequal power relations between women and men. The practice presented in this proposal builds on these assumptions, applying them to our realm of work and research: cities and territories, which are a materialisation of power relationships. Our reflections have resulted in identifying structural violence in territories as deriving from the invisibility of women and other subjectivities in their urban experience (Matrix, 1984), which is considered minor with respect to the "mainstream" one, which corresponds to that of an adult, white, able-bodied male (Sandercock, 2004). The same occurs with women's projects, contributions, and proposals, which have been overlooked in the history of architecture and urban and territorial planning (Muxì, Orellana, 2022). Even if these critiques have a long tradition in feminist reflections on the city (Matrix, 1984), they still do not have space in education: architecture and urban planning are still taught as technical and therefore neutral. We saw that numerous solutions and proposals that come from a different view on cities and territories (Belingardi, Poli, Ragozino, 2025) are overlooked, as well as the virtuous experiences that come from an authentic listening of the territory (Esposito et al., 2025). To counterbalance this situation, we decided to establish a master's programme (a specialisation course for graduate students and professionals) to teach a different way to plan and design: "Gender Cities: Methods and Techniques of Urban and Regional Planning and Design." The course is now in its fourth year. It is organised by the University of Florence, in cooperation with the University of Trieste, the University of Naples Federico II, the University of Palermo,Sapienza University of Rome, the Politecnico of Bari, and the IRISS Institute of CNR. It is a practice of transformative education (Freire, 2002) and of freedom (hooks, 1994). The course is composed of eight teaching units that cover different topics such as genealogies, or the "herstory" of architecture and urbanism; geography and the observation of the territory and its inhabitants; a specific unit on intersectionality and exclusions; public and social services; commons and care; urban public policies; housing; and urban and regional planning and design. Three dimensions are embedded in the course: an international one, which means that scholars and professionals from other countries are involved, and some activities are carried out with them, such as seminars and workshops; a practical one, realised in numerous workshops and laboratories; and a social one, which involves visiting and interacting with civil society organisations, especially, but not limited to, feminist organisations and collectives.

ALPHABETS OF PEACE IN WARTIME EDUCATION: SERVICE-LEARNING AS A TRANSFORMATIVE PEDAGOGY FOR UKRAINE'S RECOVERY

Ioana Zagrean (Lumsa University, Italy) · **Irene Culcasi** (Lumsa University, Italy) · **Maria Cinque** (Lumsa University, Italy)

education in emergencies | peace pedagogy | service-learning

Armed conflicts and protracted humanitarian crises profoundly reshape educational spaces, transforming schools into fragile yet crucial sites where protection, care, learning continuity, and democratic meaning intersect (INEE, 2010; UNESCO, 2021). In war-affected and emergency contexts, education cannot be reduced to a technical response to disruption; rather, it becomes a political and pedagogical terrain in which possibilities for peace, agency, and social reconstruction are negotiated (Freire, 1970; Galtung, 1969). In dialogue with the panel's focus on alphabets of peace as transformative devices, this contribution advances a pedagogical framework for peace-oriented education in emergency and conflict-affected schooling, drawing on the experience of the Erasmus+ project ServU – Service-learning in Higher Education for Ukraine's Recovery (2023-2026). Building on critical pedagogy and education-in-emergencies scholarship, this contribution conceptualizes peace education not as a standalone curriculum but as a plural set of situated competences – alphabets of peace – that structure educational practices under conditions of extreme constraint (Freire, 1970; Lederach, 1997). These alphabets are articulated along four interrelated dimensions: (1) relational literacy, encompassing dialogic practices, mediation, and nonviolent conflict management (Lederach, 1997); (2) civic–ethical literacy, oriented toward participation, reciprocity, and the recognition of education as a public good (UNESCO, 2021); (3) critical media literacy, addressing propaganda, disinformation, and the production of meaning in digitally saturated war contexts (Galtung, 1969); and (4) care-oriented literacy, grounded in trauma-sensitive, inclusive, and continuity-focused pedagogies that are central to education in emergencies (INEE, 2010). The ServU project provides an empirically grounded backdrop for this framework, illustrating how service-learning can be reconfigured as an institutional and pedagogical infrastructure connecting universities, schools, and local communities during wartime and recovery phases (Hoth de Olano et al., 2024). Within this perspective, this contribution highlights the role of higher education institutions as mediating actors capable of transforming solidarity-driven actions into reflexive, accountable, and educative practices. Service-learning is thus interpreted not merely as experiential pedagogy, but as a governance device that enables shared responsibility, collective learning, and democratic orientation across educational levels (Kenworthy & Opatska, 2023; UNESCO, 2021). From a methodological standpoint, this contribution reflects on forms of evidence and evaluation that are ethically sustainable in emergency settings, privileging formative assessment, qualitative documentation, and community feedback over extractive or outcome-driven models (INEE, 2010). Attention is given to the tensions between urgency and reflection, protection and participation, care and critique. By situating emergency schooling within broader debates on peace pedagogy and democratic education, this contribution argues that schools – even under conditions of war – can function as laboratories of peace, where alphabets of coexistence, critical awareness, and civic imagination are continuously rearticulated (Galtung, 1969; Lederach, 1997).

EDUCATING FOR PEACE IN TIMES OF WAR: TRANSFORMATIVE EDUCATION IN THE MOVIMENTO DI COOPERAZIONE EDUCATIVA AND ITS JOURNAL

Valentina Marconi (Movimento di Cooperazione Educativa, Italy) · **Alberto Speroni** (Movimento di Cooperazione Educativa, Italy) · **Raffaella Maggiolo** (Movimento di Cooperazione Educativa, Italy) · **Giovanna Cagliari** (Movimento di Cooperazione Educativa, Italy) · **Domenico Campana** (Movimento di Cooperazione Educativa, Italy)

Transformative education | Movimento di Cooperazione Educativa | Peace Education

The pedagogical and cultural journal of the Movimento di Cooperazione Educativa (Educational Cooperation Movement) is written by teachers for teachers. It is not a teaching guide; it is meant for both educational research and teacher training, allowing professional development alongside personal growth within a social and political context. We pair the exchange of practices with articles that intertwine academic and pedagogical knowledge—tales from the classroom with tales from the society. The journal is, for us, a collective device for transformative education in adults. In a recent issue, we asked ourselves and the authors: what is the meaning of education when war becomes a permanent scenario? Amidst war, education and school take on the role of a space for political and cultural resistance, aimed at defusing its symbolic, narrative, and institutional premises. War is a cultural climate entering into schools through media, social networks and homes. When a young girl asks, "Is World War III about to break out?", war is no longer distant. It is already an educational experience. In the interview with Domenico Quirico, a critical point that we share emerged: do not hide the causes of wars from children. Protecting them does not mean lying or simplifying until emptying things of meaning, but rather supporting them toward understanding. If war is also a cultural invention—and not inscribed in our DNA, as Telmo Pievani notes—then in school that construction can be challenged. And perhaps, as suggested by Zournazi and Marcon, hope is not naive optimism, but a political practice of "positive peace", which is not merely the absence of war, but the construction of justice and social conditions that make coexistence possible. The Movimento di Cooperazione Educativa has a long term experience of transformative education that seeks to contribute to the building of a culture of peace. By transformative education, we do not mean just a set of teaching methods, but a critical process that impacts on the daily coexistence in the classroom. In our practices, cooperation is not a technique, but a pedagogical principle. The shared construction of rules, decision-making processes and responsibility, the use of research as a learning practice constitute devices through which democracy is exercised, not simply presented in lectures. Listening is not a teaching strategy, but an epistemic recognition. Even conflict is embraced in a transformative perspective. Conflict becomes an opportunity for revising one's certainties and a shared definition of the "us". A culture of peace is therefore not an additional content, but a daily form of experienced coexistence, in which the role of language as a common ground for mutual agreement and understanding is pivotal. "It is the language that makes us equal" still holds true today for the new citizens coming from every continent who inhabit our classrooms and our schools.

Ecological Narratives and Biodiverse Education: Reimagining Worlds Through Critical Pedagogy

PANEL CONVENORS: Andrea Galimberti (University of Milano-Bicocca, Italy); Monica Guerra (University of Milano-Bicocca, Italy); Letizia Luini (University of Milano-Bicocca, Italy); Greta Persico (University of Milano-Bicocca, Italy); Monica Guerra (Università di Milano-Bicocca, Italy); Gabriella Calvano (Università di Bari, Italy)

PANEL KEYWORDS: Ecological Narratives, Critical Pedagogy, Imaginaries

Ecological and climate crises are also crises of imagination. Dominant narratives about nature and sustainability-shaped by anthropocentrism, techno-solutionism, green colonialism, and individualism-inform educational practices and limit the ability to envision alternative relationships with the living world. This panel explores the constitutive power of narratives in ecological education, critically questioning mainstream imaginaries that naturalize specific power relations. The stories we tell about the climate crisis are never neutral: they produce realities, shape subjectivities, and distribute responsibilities. The discussion investigates which ecological narratives circulate in educational contexts and how nature, territories, and non-human species are represented in curricula and materials. It also highlights emerging counter-narratives rooted in educational practices, local cultures, Indigenous epistemologies, feminist and postcolonial perspectives. Narrative and multimodal pedagogical approaches are viewed as spaces for critical awareness, emotional elaboration (in response to eco-anxiety and ecological grief), and the development of transformative agency. The panel seeks to explore how pedagogy can become a tool to deconstruct dominant imaginaries and foster new ecological and political imaginaries through storytelling, arts, and participatory practices. It welcomes theoretical and empirical contributions addressing educational narratives, narrative and critical pedagogies, participatory storytelling, decolonization of environmental and sustainability education, ecological emotions, and the role of literature and the arts in cultivating ecological consciousness and imagination for justice.

FOSTERING THE ECOLOGICAL SELF THROUGH A PLACE-BASED COUNCIL OF ALL BEINGS IN ENVIRONMENTAL EDUCATION

Stavroula Stoumpou (University of Thessaly, Greece) · **Irida Tsevreni** (University of Thessaly, Greece)

Council of All Beings | deep ecology | environmental education

The paper explores the implementation of the “Council of All Beings” (Fleming & Macy, 1988) as an experiential and ecocentric practice of environmental education for school-aged children. Rooted in the philosophical movement of Deep Ecology, which conceptualizes the human–nature relationship in terms of equality, this tradition articulates the formation of the ecological self as an expanded form of subjectivity that transcends narrowly defined human boundaries and is constituted through relational engagement with the nonhuman world (Naess, 1988). In parallel, it foregrounds the significance of embodied, narrative, and ritual forms of participation in cultivating ecological consciousness (Bragg, 1996; Ohlsson, 2025). The Council of All Beings was implemented in a primary school in the Pelion region of Greece, situated within an agro-forestry ecosystem of high biodiversity, and involved 10-year-old students. Children were invited to engage with the local nonhuman beings. Through the integration of ritual and drama-based techniques, processes of identification, empathy, and ethical proximity toward the nonhuman world were fostered. The educational process included inquiry into the local natural environment, the adoption of roles representing non-human beings and entities, symbolic representation through mask-making, and the convening of the council across three phases. The intervention concluded with collaborative creative writing and theatrical performance. The findings, derived from students’ reflective responses and the qualitative analysis of their narratives, indicate the emergence of a critical awareness of anthropogenic intervention in local ecosystems and the vulnerabilities imposed upon nonhuman beings. Concurrently, strong expressions of biophilia (Wilson, 1984), strengthened sense of place (Gruenewald, 2003), and a reconfiguration of their relationship with nonhuman others (Bogan, 2012) emerged. Overall, the results suggest that the Council of All Beings can function as a place-based pedagogical approach that supports a transition from anthropocentric toward ecocentric forms of ecological citizenship, contributing to the early formation of ecological subjectivity within primary education.

DOCUMENTING BIODIVERSITY IN EARLY CHILDHOOD OUTDOOR EDUCATION: ARTISTIC AND VISUAL PRACTICES FOR ECOLOGICAL UNDERSTANDING

Letizia Luini (Università degli Studi di Milano-Bicocca, Italy)

Biodiversity education | outdoor documentation | visual methods

Developing ecological awareness in childhood requires educational practices capable of fostering attentive encounters with the living world (Meier, 2020). In outdoor contexts, the ways experiences are observed, recorded and revisited play a crucial role in shaping how children understand natural environments and the life's diversity they host. Documentation practices can function as pedagogical devices supporting observation, interpretation and meaning-making processes (Dardanou & Karlsen, 2023) in relation to biodiversity. This contribution offers a theoretical and methodological reflection on outdoor documentation through visual-expressive tools (Moula et al., 2022), with particular attention to nature sketching and photographic practices in early childhood education. Drawing on literature from environmental education and visual methodologies, the reflection explores how multimodal documentation (Luini, 2025) can sustain children's engagement with natural environments and support emerging understandings of biodiversity. Research on drawing in educational contexts highlights how nature sketching can act as a cognitive tool that slows down observation and deepens attention (Monteira et al., 2022). When children attempt to represent plants, animals or environmental elements through drawing, their gaze repeatedly returns to the observed subject, encouraging them to notice details, textures and structural differences that might otherwise remain unnoticed. Such processes can support recognition of variation within and between species, an important dimension of understanding biodiversity. Studies analysing children's drawings of gardens, plants or local environments show that prolonged outdoor experiences can lead to increasingly detailed representations and a greater diversity of organisms depicted (Zaballa et al., 2021). Differences in the number and variety of plants represented, attention to morphological features and the use of colours related to ecological processes have been interpreted as indicators of children's developing knowledge of the living world. In addition to drawing, photography can function as a complementary tool for documenting outdoor experiences. Photographic documentation allows children to capture fleeting moments, relationships between organisms, seasonal changes and spatial configurations of environments that might otherwise be difficult to retain (Ardoin et al., 2014). When revisited collectively, photographs can become mediators for dialogue and reflection, supporting children in articulating observations and interpretations about the environments they explore. In some cases, research approaches such as photo-elicitation or photovoice may further enrich these processes, yet photography can serve as a medium for recording and discussing encounters with biodiversity (Walimbe, 2025). From a methodological perspective, integrating drawing, photography and narrative reflection within outdoor educational experiences may create multimodal documentation processes that value diverse forms of expression and participation. Such practices are particularly relevant in early childhood settings, where visual languages allow children to communicate perceptions and understandings not yet fully articulated through verbal language. Overall, the contribution suggests that visual documentation practices can support forms of slow, situated engagement with biodiversity, enabling children to notice diversity in everyday environments and construct meanings about living systems through observation, representation and dialogue. By fostering attentive ways of seeing the living world, these practices may contribute to the development of early ecological sensibilities and nuanced understandings of relationships between humans and the plurality of life forms.

FROM TREESENSE TO FEELING WITH PLANTS: EARLY INSIGHTS FROM A PLANT-BASED REFLECTIVE DIARY IN TEACHER EDUCATION

Beate Christine Weyland (Free University of Bolzano, Italy)

plant based education | biophilia | reflective diary

This paper presents early insights from an ongoing educational research project that explores how plant-centred reflective practices can support more relational, biodiverse, and world-based forms of education. The work originated in Treesense, a European project developed with product designer Secil Ugur Yavuz, and later evolved into the reflective diary and publication Sentire con le piante. Since 2022, the diary has been administered to student teachers in Primary Education and to in-service educators and teachers; between 2022 and 2025, more than 200 diaries were collected. The diary accompanies participants through a gradual process of attention, observation, drawing, photography, imagination, and autobiographical writing. In the first phase, participants are invited to choose and observe a tree over time; in the second, they develop a parallel relationship with a houseplant. In the final sections, they are asked to shift perspective and imagine how the tree or plant might perceive human beings, what it might say, and how it might interpret gestures of care, neglect, haste, or attention. This imaginative decentring seeks to challenge anthropocentric habits of perception and to foster forms of interspecies empathy and biophilic connection (Kellert & Wilson, 1993; Barbiero & Berto, 2021; Jones, 2020). The presentation discusses the first recurring patterns emerging from the initial analysis of the corpus. Preliminary findings suggest that the diary functions as a pedagogical device for slowing down perception, strengthening observational attention, and eliciting emotional, ecological, and autobiographical reflection. Participants often move from a descriptive stance to a relational one: plants are no longer treated as passive background or decorative objects, but as living presences, companions, witnesses, and sometimes teachers. This shift resonates with recent pedagogical work on education and nature, outdoor and ecological learning, and the need to cultivate more attentive relationships with the living world (Guerra, 2015; Antonietti, Bertolino, Guerra, & Schenetti, 2022). The diaries also reveal memories, attachments, and affective resonances linked to plants, suggesting that plant-based practices may help counter what Wandersee and Schussler (1999) famously termed plant blindness. The use of reflective writing is especially relevant here: journals can support formative learning by making experience observable, narratable, and open to interpretation (Moon, 2006; Bolton & Delderfield, 2018). At the same time, the vegetal perspective emerging from the diaries connects with current reflections in plant studies and environmental humanities, which invite us to reconsider plants as dynamic, communicative, and world-making beings (Marder, 2013; Viola, 2021). Overall, the project suggests that learning with plants can foster an educational shift from studying nature as an external object to experiencing oneself as part of an interdependent community of life. In this sense, a simple reflective diary can open aesthetic, narrative, and ecological pathways in teacher education, helping participants reimagine education as a practice of attention, reciprocity, and coexistence across species. It also confirms the value of combining observation with imagination: not as an escape from knowledge, but as a way of widening it through sensorial, emotional, and ethical involvement. Such practices may enrich teacher education by integrating scientific attention, narrative inquiry, and more-than-human responsibility.

THE LOSS OF BIODIVERSITY AS A HYPEROBJECT. IMPLICATIONS FOR A WORLD-BASED EDUCATION

Andrea Galimberti (University of Milano-Bicocca, Italy)

hyperobjects | systemic thinking | ecosemiotics

The current eco-climatic crisis, made evident by the "intrusion of Gaia" (Stengers, 2013) into public debate, calls for a profound revision of the paradigms through which humanity interprets its position in the world. In this context, the category of "hyperobjects" (Morton, 2013) offers a particularly significant interpretative key for understanding phenomena such as global warming, biodiversity loss, and ocean acidification. These phenomena cannot be understood simply as natural "catastrophes"; rather, they appear as entities distributed across spatial and temporal scales that radically exceed human experience. They are ubiquitous, viscous, and nonlocal, manifesting themselves only through perceptual and cognitive fragments. This condition produces a profound epistemological and ontological disorientation, since it dissolves the illusion of a clear separation between the human and the non-human and compels us to recognize that humanity lives "within" planetary processes that exceed its capacity for control and representation (Id, 2018). In such a scenario, education is confronted with a decisive challenge: to rethink its fundamental categories and to overcome a long anthropocentric tradition that has conceived education as a process of emancipation from the natural or animal dimension. Yet attempts to decentre the human may generate new aporias. On the one hand, reductive forms of naturalism risk dissolving the specificity of the human within an impersonal natural order; on the other, processes of anthropomorphization project typically human characteristics onto natural entities (Chiurazzi, 2021). The question thus becomes how to rethink the relationship between the human and the non-human in ways that acknowledge both interdependence and difference. In this direction recent pedagogical reflections (Oliverio, 2024) have proposed extending the notion of world-centred education (Biesta, 2021) to encompass the complex web of relations that includes other "companion species" (Haraway, 2016). From this perspective, a dialogue with theoretical fields such as biosemiotics (Hoffmeyer, 2008) and ecosemiotics (Maran, 2020) may prove particularly fruitful. The idea that processes of signification traverse the entirety of living systems suggest the possibility of fostering experiences capable of making perceptible the web of connections that constitutes the living world (Galimberti, 2024; Luini et al., 2025). In this way, the encounter with hyperobjects does not merely produce anxiety or paralysis; rather, it becomes an opportunity to develop new forms of ecological sensitivity and to initiate a process of re-composing a shared common world.

DEVELOPING CLIMATE CHANGE AWARENESS WITHIN THE CONTEXT OF GLOBAL CITIZENSHIP EDUCATION. THE VENICE LAGOON AS A LABORATORY: A CASE STUDY

Giovanna Barzanò (Indipendent researcher, Italy) · **Simonetta Boscolo Nale** (IC Sottomarina Sud Chioggia) · **Maria Grazia Giovanna Chillemi** (Università Roma Tre) · **Pasqualina Morzillo** (WWF Italia) · **Matteo Quarta** (Accademia di Arti e Nuove Tecnologie) · **Silvia Rova** (International Centre for Climate Change Research and Studies) · **Maria Beatrice Ligorio** (Università degli Studi di Bari)

Global Citizenship Education | Climate Change | Multimedia Communication

"Che clima che fa..." is an educational project focused on climate change, involving some 20 teachers and 150 students (primary and lower secondary) in three schools situated in the Venice Lagoon area, belonging to the national school network Rete di Dialogues for Futures (retedialogues.it).The project aims to engage participants both cognitively and emotionally, transforming students into "proactive researchers" through learning paths that acquire and share awareness of the climate crisis and potential solutions. Different aspects of the Venice Lagoon are explored to discover how they change, and how this can be documented with communication technologies. Learning environments are created where schools act as bridges between experts and local communities. Moving beyond a strictly scientific approach, “Che clima che fa” tackles the often-neglected social, cultural, and emotional dimensions of climate change. It seeks to devise activities which allow to better understand how eco-anxiety and the feelings of helplessness or discomfort young people often face operate and can be prevented. The main goals of the project are the development of: - awareness on how young students experience climate change and how they can position themselves in a constructive way. - teaching tools to integrate climate education into the curriculum - strategies that enhance students’ agency in becoming global citizens and taking active, informed roles in their communities - experiences that make students authors of messages to their community - initiatives to engage families and the local territory and create a widespread "educational ecosystem." Three integrated learning approaches are adopted: - Place-Based Education (PBE) that emphasizes the connection between learning and the specific physical location where students and teachers live. Here students are engaged cognitively, emotionally, and physically by using their local community and environment (in this case, the lagoon area) as a "living laboratory." Students become proactive researchers of their own local culture and ecology, applying abstract scientific concepts to real-world local challenges. - Trialogical Learning Approach (TLA) a Finnish approach assuming that learning is most effective when students work together to build something useful that has impact beyond the classroom. Here learning involves interactions between teachers, students, and a "shared object" (product). In the project, students and teachers work with experts to create multimedia messages to share with peers and the community, illustrating their scientific findings and laboratory experiences in the Lagoon. - Action Research, an operational perspective where teaching is combined with ongoing observation and the use self-reflective tools by teachers and students. By reflecting on the dynamics of the learning process as it happens, educators can develop new tools and strategies to improve. Meanwhile new knowledge is made available for practitioners and researchers on how things occur in a challenging context such as that of environmental education and climate change education. Within the framework described above the case study explores the actions enacted and sheds light on the processes elicited, on teachers and students’ reactions and feelings from the field. Hints are offered for research developments and replications.

PROBLEMATISING EDUCATION FOR SUSTAINABLE DEVELOPMENT: CRITICAL AND DECOLONIAL APPROACHES TO RETHINK TEACHER PROFESSIONALISM

Marta Ilardo (Department of Education Studies "Giovanni Maria Bertin", Italy) · **Marta Salinaro** (Department of Education Studies "Giovanni Maria Bertin", Italy)

Teacher Professionalism | Education for Sustainable Development | Critical Pedagogy

This contribution advances and deepens the reflections developed in a previous study conducted within the three-year research project PON Green (2022–2025), "The Ecological Challenge: Innovative Educational Practices". The earlier contribution reconstructed the principal trajectories of national and international debates on teacher professionalism in education for sustainable development (ESD) (Ilardo & Salinaro, 2023). Building on that groundwork, the current study shifts the analytical focus and it advances a critical examination of the conceptual and normative architectures that currently shape ESD, expanding the analysis beyond existing frameworks. Drawing on decolonial prospective (Stain et al., 2023) and critical pedagogy (Giroux, 1983), the contribution analyses the epistemological assumptions embedded in dominant sustainability discourses, with particular attention to competency-based models in secondary education. The study develops two interrelated lines of inquiry. Firstly, the proposal reconsiders the reference frameworks guiding education for sustainable development, with particular attention to competency-based models and their normative implications. Secondly, it addresses the ongoing debate on sustainability competencies and their impact on the construction of teachers' professional identity. The analysis conceptualizes competencies as historically and culturally situated formations, embedded within specific configurations of power and value systems, and examines their contextual and normative dimensions. This reflection is conducted through an intercultural and critical perspective that understands the ecological question as intrinsically intertwined with diversity, inclusion, global justice, and transnational interdependencies, within European educational contexts shaped by colonial legacies and multicultural configurations (Nijhawan, 2024; Stein et al., 2020). Within this framework, this critical reorientation carries significant implications for how teacher professionalism is conceptualised and implemented (Singh et al., 2025). If sustainability education is embedded within historically situated regimes of knowledge and power, then teachers cannot be positioned merely as neutral implementers of predefined competencies. Instead, they are called to mediate plural epistemologies and engage reflexively with the normative assumptions embedded in policy frameworks. From this perspective, the critical frameworks adopted in this contribution perform a dual function. Analytically, they illuminate the tensions and contradictions of ESD policies and competency discourses. Practically, they inform transformative interventions in teacher education and school practice, linking sustainability competencies to intercultural dialogue and climate-related emotions (Butler, 2025; Voşki et al., 2024; Vercammen et al., 2023).

MAPS AS COUNTER-NARRATIVES: DOCUMENTING ECOLOGICAL RELATIONSHIPS THROUGH PARTICIPATORY MAPPING IN ENVIRONMENTAL EDUCATION

Letizia Luini (Università degli Studi di Milano-Bicocca, Italy)

counter-mapping | ecological education | participatory cartography

Ecological crises are increasingly understood as being shaped by dominant narratives about nature, territory, and human-environment relationships. These narratives are not only articulated through discourse but also embedded in representational practices that influence how environments are perceived, documented, and taught in educational contexts. Among these practices, maps occupy a particularly powerful position: historically associated with processes of territorial control, abstraction, and colonial ordering (MacDonald, 2024), cartographic representations have contributed to producing authoritative ways of seeing and organising space (Hirt, 2022). Within educational settings, maps are often introduced primarily as technical instruments for orientation and spatial accuracy. Such uses may inadvertently reproduce a detached and objectifying relation to environments, positioning learners as observers of static spaces to be decoded, measured, and mastered. In response to these concerns, this contribution proposes a theoretical and methodological reflection on mapping practices in ecological and outdoor education, drawing on insights from critical cartography, children's geographies, and participatory research (Lanouette et al., 2024). The contribution argues that maps can be reinterpreted as documentation devices capable of capturing situated experiences of place. When mapping is approached as a process rather than as the production of a correct representation, maps become personal narrative artefacts that document how environments are encountered, remembered, and interpreted through lived experience. In outdoor and place-based educational contexts, maps produced by children and young people often integrate spatial references with memories, emotions, encounters with human and more-than-human beings, and questions emerging from exploration (Somerville, 2013). From this perspective, mapping becomes a way of documenting not only spatial elements but also the relational and affective dimensions of ecological learning. This shift opens a connection with counter-mapping traditions (Ingold, 2011) that challenge dominant cartographic imaginaries by foregrounding alternative perspectives and situated knowledges. While counter-mapping has often been associated with indigenous, activist, and community-based practices, similar principles can inform educational contexts in which learners are invited to produce their own maps of places they inhabit and explore. In these situations, mapping can function as a pedagogical practice that makes visible the plurality of ways in which environments are experienced and interpreted. The contribution also reflects on the role of educators in facilitating such practices. When maps are treated as open-ended documentation processes rather than evaluative products, they can support plural interpretations of place and challenge adult-centred epistemic hierarchies. This creates space for children's perspectives to emerge as meaningful forms of knowing, while recognising their agency (Clark, 2011) in inter-

preting and narrating relationships with local ecologies. By framing maps as documentation tools within a counter-mapping perspective, this contribution suggests that mapping practices in ecological education can help deconstruct dominant spatial imaginaries and foster more relational ways of understanding different environments.

THE PRACTICE OF THE GAZE AS AN ECOLOGICAL POSTURE: TOWARDS AN EDUCATION BASED ON RECIPROCITY BETWEEN SUBJECTS AND THE WORLD

Monica Guerra (Università di Milano-Bicocca, Italy)

Observation | Documentation | Reciprocity

This contribution explores the practice of observation not as a passive act, but as an active pedagogical and research tool aimed at fostering ecological postures (Guerra, 2019). Through experimentation and documentation - at the intersection of scientific rigor and aesthetic sensitivity (Guerra, 2020) - the act of observing is transformed into a relational framework that allows the "other" (whether human or non-human) to manifest in its own alterity. Recalling Mary Oliver's poetic triad ("pay attention, be astonished, tell about it", in Oliver, 2008), this approach outlines an educational posture where vivid attention becomes the premise for authentic ecological dwelling. The objective is to present observation as an exercise of slow looking (Tishamn, 2018) and in deep listening capable of unsettling the already known, promoting an education based on reciprocity and vital participation in the world. These are pivotal elements for a World-based Education that values the biodiversity of contexts and experiences (Persico, Guerra, Galimberti, eds., 2024; Luini, Persico, Galimberti, Guerra, eds. 2025). Exercising the gaze and giving back the experience through documentation—understood as a research device that transforms the encounter with the other into an open narrative—means inhabiting a framework of reciprocity that creates space for the biodiversity of both subjects and phenomena.

BIOZINE: NARRATING ECOLOGICAL RELATIONSHIPS THROUGH A COLLECTIVE FANZINE

Greta Persico (Università degli Studi di Milano Bicocca, Italy)

Fanzine | ecological narratives | creative methods

This contribution proposes a pedagogical analysis of the process involved in the creation of a fanzine produced by a group of students enrolled in the Bachelor's Degree in Educational Sciences at the end of the course Environmental Pedagogy, held at the Department of Human Sciences for Education "Riccardo Massa" at the University of Milano-Bicocca. In this context, the fanzine is conceived as a tool for reflection and expression through which students can rework their learning experiences and articulate their own perspectives. At the same time, it is understood as a method for producing counter-narratives around ecological issues, with particular attention to outdoor education and biodiversity, approached from a

gender-sensitive perspective. Historically rooted in grassroots cultural practices, fanzines have functioned as spaces for the circulation of alternative knowledge, often giving voice to marginalized groups and subcultures. In this sense, the fanzine becomes both an individual and collective device of visibility and expression. The possibility of combining different expressive languages—such as collage, personal and borrowed writings, sketches, and textures—transforms the page into an experimental aesthetic space where students can explore composition, balance, and style. The creation process unfolds through several phases in which individual productions are progressively reworked through overlaps with others' contributions, the transformation of proportions, and the selection of paper types, formats, and colors. In this layered process, the collective narrative gradually takes shape. Elements often considered imperfections—such as errors, distortions, or unexpected results—are instead valued as meaningful components of the creative process, contributing to the aesthetic and expressive richness of the final artifact. Through printed reproductions and the superimposition of visual layers, graphic experimentation allows for shifts in perspective and the emergence of a stratified narrative. From a pedagogical perspective, the creation of a fanzine can therefore be understood as a practice that fosters democratic participation, relational learning, and education to consent, while dynamically negotiating the tensions between ethics and aesthetics, the individual and the collective, and the personal and the political.

THE FIREFLIES OF ORAL TRADITION

Silvestro Malara (Università Mediterranea degli studi di Reggio Calabria, Italy)

Fireflies | oral tradition | education

This abstract seeks to explore the persistence of fascism in the Pasolinian sense, understood as a pervasive and totalizing phenomenon that continues to permeate contemporary society (Pasolini, 2015). From this perspective, fascism cannot be confined to its historical manifestation in the twentieth century; rather, it survives as a diffuse cultural form operating within languages, social practices, and symbolic structures of late modernity. In this context, particular attention is devoted to the metaphor of the "fireflies," introduced by Pasolini as an emblem of a resilient and sensitive humanity capable of preserving forms of resistance in the face of the progressive erosion of identities and the growing cultural homogenization that characterize contemporary societies. This symbolic image is intertwined with a broader ecological and political urgency: the need to safeguard humanity's material and immaterial heritage and traditions. Such heritage should be understood not merely as a repository of the past, but as a living resource for the construction of the future. From this perspective, the protection of cultural heritage emerges as a crucial safeguard for the demilitarization of the world, of language, and of individual life, in accordance with the founding principles promoted by international organizations devoted to cultural cooperation (UNESCO, 1946). Within this framework, the sciences of education and training assume a central and strategic role. They represent a privileged domain through which critical, imaginative, and relational capacities can be cultivated among new generations. Education cannot therefore be reduced to the mere transmission of knowledge; rather, it contributes to the formation of reflective and responsible subjectivities capable of interpreting the complexities of the present and envisioning alternative futures. In this sense, educational sciences constitute a key field for the development of democratic awareness and for the promotion of pedagogical practices oriented toward ethical responsibility and civic engagement. Didi-Huberman (2010), reinterpreting Benjamin's thought (2014) and critically engaging with Pasolini's reflections, identifies in the fragile yet persistent light of images a concrete possibility for connecting the "Already-been" and the "Now." This temporal relation restores historical depth to the present and enables the future to be infused with genuine political agency. Images, much like the metaphorical fireflies, persist despite the overwhelming glare of technological and media overexposure, opening spaces for symbolic resistance and critical reflection. Marchetti (2022) further develops this perspective by emphasizing the distinctive role of oral tradition in human civilization. Narration, orality, and oraliture represent fundamental roots of human evolution, linking contemporary

societies—marked by a crisis of narration—to early symbolic expressions such as the cave paintings of Chauvet. Within this perspective, educational sciences are called upon to preserve and renew the narrative dimension of human experience, recognizing storytelling as a fundamental pedagogical device for identity construction and cultural transmission.

Ecologies of Education and Democracy in Posthuman Times: More and Less-than-human Troubles

PANEL CONVENORS: Alessandro Ferrante (Università Milano-Bicocca, Italy); Andrea Galimberti (Università Milano-Bicocca, Italy); Maria Benedetta Gambacorti-Passerini (Università Milano-Bicocca, Italy)

PANEL KEYWORDS: Posthuman, Ecology, More-than-human

We live in posthuman times in which social, educational and political issues are connected with human and non-human entanglements; an era in which the categories inherited from the humanist and anthropocentric tradition require a thorough review. These assumptions raise new questions about what it means today to live in democratic societies in terms of issues such as social justice, inclusion, collective participation in decision-making processes, our relationship with techno-science, and the protection of the ecosystems of which we are a part. Starting from these premises, education plays an important and strategic role in promoting a renewed vision of democracy in the posthuman condition through dialogue with different theoretical perspectives that allow us to reconsider contexts and practices in an ecological sense. From this point of view, we are witnessing a significant paradigm shift. In this scenario, it is necessary to problematize educational discourses and practices both with regard to the possibility of extending the focus to a more-than-human world in a postanthropocentric vision, and, on the other side, in relation to the need to face the continuous degradation of living beings that reduces them to marginalized, excluded and therefore less-than-human otherness. We welcome proposals about (but not limited to) these topics: - Critical reflections on epistemological, ethical, and political assumptions embedded in more and less-than-human troubles in education; - The contribution of ecological paradigms in supporting the democratization of educational events in posthuman times; - Education between social and environmental justice; - Education and ecological transition: socio-political and cultural issues.

THE TERRESTRIAL CONDITION: PROMOTING TRANSPERSONAL CONSCIOUSNESS THROUGH THE ECO-THEATRE LABORATORY

Elisabetta Villano (University of Salerno, Italy) · **Paola Martino** (University of Salerno, Italy)

democracy · necropolitics · theatre laboratory

Without yielding to the temptation to frame posthumanism merely as a pacified cosmology of relational co-belonging, this contribution seeks to demonstrate how the interconnections between the human and the non-human, when captured and governed through logics of frontierization, may turn into architectures of domination, and how the theatre laboratory, in conjunction with ecopedagogical thought, can become a tool of resistance. Becoming Black of the world, brutalism, nanoracism and necropolitics reveal how modernity has produced a durable cartography of the less-than-human. In the age of the world's combustion, of the exit from the climatic niche, of the triumph of computational reason and of lives deemed minuscule, Mbembe asserts the urgency – given the shift from the human condition to the terrestrial condition – of a new nomos of the Earth and a new planetary consciousness, one that goes beyond the rights of the people, historically intertwined with conquest and appropriation, and opens instead to the rights of the living and to "an integral community that embraces all living beings" (2024, p. 177). To the biotope state, which is ecofascist by definition, immune and closed, Mbembe contrasts the earthly community. By dismantling the founding assumption of the modern order ("In the beginning was the fence" as he states following Schmitt), Mbembe opens up the possibility of thinking democracy as a practice of cohabitation of the common. Proceeding from this, the research will seek to integrate Mbembe's perspective with the pedagogical practice of the eco-theatre laboratory, seen as capable of resisting the museification of experience and, at the same time, of opening spaces for sensitive cohabitation with the more-than-human. Reframed through an

ecological lens, the theatre laboratory – a phenomenological network of co-participation and co-creation – emerges as a form of applied theatre, i.e. a fabric of performative practices outside the mainstream, based on the ensemble and inhabiting the margins, which fosters immediate reflection on the present through shared experiences and knowledge. In this sense, through the analytic-reflective and creative-imaginative framing of environmental realities, as well as by interrogating material ecologies within collective performative geographies, the eco-theatre laboratory becomes a space for the pedagogical cultivation of a transpersonal consciousness. Moving beyond anthropocentric dichotomies and understanding transformation as a concrete possibility, this consciousness is a perceiving embodied awareness that learns and acts within relationships, that displaces itself and opens to the other within expanded ecosystems, creating better versions of the world that overturn existing structures of domination. At the intersection of animal, cultural, post-human, and performance studies, the eco-theatre laboratory practice, by fostering learning with rather than from, charts paths that reveal the epistemological limits of Western knowledge and cultures, captured in their complicity with neoliberal policies, and simultaneously promotes the exploration of alternative heuristic approaches by engaging with indigenous sciences that centres living as an interconnectedness among beings. It also encourages the participation of a fully integrated, active audience and the creation of networks and communities of spirit within utopian spaces of a just coexistence with the planet.

IMMANENT RELATIONALITY AND ECODIDACTICS: A HEURISTIC RESEARCH ON MATERIAL LATENCIES AND SUBJECTIVE ASSEMBLAGES IN THE SHORT STORY "THE VELDT"

Raffaella Carmen Strongoli (Università degli Studi di Catania, Italy)

Ecodidactics | Built pedagogy | Rhizomatic mappings

In the current Anthropocene scenario (Crutzen & Stoermer, 2000), the ontology of being is reconfigured as a relational and rhizomatic event (Marchesini, 2018), in which subjectivity emerges as a dynamic process of hybridization with animal and technological alterity, understood as essential co-evolutionary partners. Consistent with the systemic approach (Bateson, 1972), intelligence is decoupled from anthropocentric exclusivity and investigated as an emergent and distributed property within cognitive assemblages (Hayles, 2017), where reflective activity arises from the symbiotic interaction among biological dimensions, technological circuits, and environmental contexts. Against this theoretical background, this contribution presents the findings of a pedagogical research project conducted in a university setting. The study aims to deconstruct human exceptionalism through a critical revision of the educational categories inherited from the humanist tradition (Braidotti, 2013), adopting ecodidactics as a paradigm of situated inquiry (Strongoli, 2021). The research analyzes educational materiality (Barone, 1997) not as a mere background, but as an actor endowed with symmetrical agency (Callon & Latour, 1992), capable of acting upon subjects and shaping their experience. Through the concept of the

"educating space," the classroom setting is considered a complex dispositif (Massa, 1992) and is analyzed through Ray Bradbury's short story The Veldt (1950). The story is adopted as a heuristic tool to explore procedural latencies (Massa, 1992). Bradbury's "nursery" is understood as a dimension of built pedagogy (Monahan, 2002) that educates independently of the subjects' will, revealing how technology operates a transformation of subjectivity toward a "becoming-machine" (Ferrante, 2025). The research seeks to document the students' perceptual "species leap" toward a post-personal and pre-individual subjectivity (Marchesini, 2018) through the production of rhizomatic mappings. These graphic artifacts function as devices that reveal what appears dormant within the material structures of the school, transforming the classroom into a relational learning environment (Strongoli, 2023).

INTERRUPTION AND CONNECTION: MOVEMENTS FOR A DEMOCRATIC EDUCATION

Chiara Buzzacchi (Università degli Studi di Milano-Bicocca, Italy) · **Guendalina Cucuzza** (Università degli Studi di Milano-Bicocca, Italy)

Interruption | Connection | Democratic education

The ecological paradigm proposes an open conception of human subjectivity in which the boundaries separating us from alterity, whether human, animal, plant, or artificial, become thresholds of mutual exchange that enable practices of conjugation. In order to understand the trajectories of subjectivation, it is essential to question the ways in which exchange with the other-than-self occur, problematizing the concept of the threshold as a nodal point of heterogeneous and highly complex dynamics. Taking Gert Biesta's pedagogy of interruption and sociomaterial theories in education as a reference point, this contribution aims to reflect on the processes that characterize the threshold space, reinterpreting them in terms of a constant alternation between interruption and interconnection and focusing on how the interplay between these two movements shapes the becoming of subjects. From this perspective, it becomes crucial for pedagogy to consider how such interaction might be configured to promote the democratization of educational processes and individual learning paths. Reinterpreting the concept of threshold in the light of Biesta's thinking, it can be understood as an event in which an interruption occurs, meaning a discontinuity that calls on the individual to respond, allowing subjectivity to come into being. The exchange at stake is between humans, as the 'other' to whom one must respond is human. Sociomaterial theories allow us to reinterpret Biesta's concept of interruption within the broader construct of networks. The network, as contextual and situated, may also be considered an event in which not only humans but also non-humans actively participate, both as internal referents, i.e., co-actors in the dynamics of exchange, and as external referents, i.e., bearers of interests with respect to the dynamics activated. From this perspective, thresholds can be identified as those (potentially infinite) nodes within the network where different forms of alterity interact, undergoing processes of interruption — understood as an encounter with what is other-than-self — interconnection, and transformation. In this sense, interruption and interconnection are co-implicated, since the condition of possibility for the latter is to go through the encounter with alterity. A further point of convergence between Biesta's perspective and sociomaterial approaches concerns the unpredictability of interaction. The configuration that interruption assumes, as well as the quality of the interconnections activated, cannot be defined a priori but are expressed on a contextual basis, also giving space to

creative and unexpected forms of existence. Starting from here, this contribution aims to question these dynamics, explore how they occur in widespread education and intentionally designed educational processes, paying attention to the articulation and quality of the connections activated. Such an exploration might helpo to critically interpret the educational events taking place in order to understand how to redesign them to promote democratic education. In this sense, recognizing both humans and non-human entities as active referents – both internal and external to the educational process – giving rhythm to interruptions in order to activate new connections, leaving space for emerging subjectivities without imposing predetermined trajectories, may represent promising pedagogical moves to promote subjectivation, shared responsibility, and the emergence of democratic thinking.

CRITICAL TRANSFEMINIST POSTHUMANISM IN EDUCATION: DECONSTRUCTING HIERARCHIES FOR ECOLOGICAL AND DEMOCRATIC PEDAGOGIES

Chiara Borelli (University of Bologna, Italy)

Critical transfeminist posthumanism | Ecological education | Intersectionality

This contribution argues that a critical transfeminist posthuman approach is essential for educational theory and practice if ecological paradigms are to be adopted in ways that are genuinely democratic and socially transformative. While current educational discourses increasingly invoke inclusion, sustainability, and justice, these concepts often remain rhetorically affirmed while the hierarchical structures that sustain exclusion and domination are left intact. Building on critical posthuman and transfeminist perspectives, the contribution aims to problematize the humanist-anthropocentric model that has historically universalized a partial figure of the "human" (white, Western, male, cisgender, heterosexual, able-bodied, bourgeois) while relegating other human and non-human entities to subordinate or less-than-human positions. From this perspective, education cannot be understood only as a human-centered process of formation; rather, it must be rethought as a sociomaterial, relational, and ecological field shaped by power, bodies, technologies, spaces, and more-than-human entanglements. The central claim is that deconstructing hierarchies – between human and non-human, center and margin, expert and learner, normalized and marginalized subjectivities – is a necessary condition for an ecological educational paradigm. However, posthuman and neomaterialist turns in education are not sufficient on their own if they do not explicitly address the power relations, oppressions, and asymmetries (gendered, racialized, classed, ableist, speciesist, colonial) that organize educational institutions and practices. For this reason, a critical transfeminist orientation is crucial: it foregrounds positionality, situated knowledges, and epistemic justice, while exposing the myth of neutrality in educational research and practice. The presentation therefore proposes an intersectional lens, in which social and environmental justice are inseparable. A critical transfeminist posthuman pedagogy makes it possible to rethink educational relationships beyond a paternalistic view of inclusion and beyond an anthropocentric perspective on sustainability, moving toward non-oppressive, interdependent, and mutualistic forms of coexistence. In this sense, an ecological-posthuman-transfeminist turn in education is not only a matter of environmental content or policy adaptation, but of epistemological, ethical, and political transformation that starts from the materiality of everyday relationships within educational settings. By connecting posthuman critique, transfeminist epistemologies, and intersectional justice, the contribution offers a framework for reimagining education as a practice of shared vulnerability, distributed agency, and more-than-human responsibility.

TOWARDS THE DEMOCRATISATION OF EDUCATIONAL PROCESSES: THE ENTANGLEMENT OF PEDAGOGICAL REFLECTION, TECHNOLOGICAL DEVELOPMENT AND ECOLOGICAL THINKING

Maria Brembilla (Università degli Studi di Bergamo)

Mixed social ecologies | Epistemology of complexity | Ecological thinking

According to Edgar Morin (2015), the crisis of education depends on the broader crises of civilisation, society and democracy that we are experiencing, and in turn contributes to them. The entanglement of social, political and cultural events, articulated across interconnected local and global nodes, together with coexistence within a hybrid network – composed of humans, non-humans, artefacts, discourses and heterogeneous languages and sustained by rapid and unpredictable technoscientific developments – unfolds against a backdrop of epochal climate change, global conflicts and new forms of deprivation. In what terms can we speak today of the democratisation of educational processes? Within this framework, the contribution explores the constraints and possibilities of technological devices in educational settings. It emphasises the epistemological assumptions that underlie not only their use but, above all, their narration, and argues for the inseparability of technological, pedagogical and ecological reflection. Bruno Latour (2008) states that those who think that in the future we will be more connected to others and will have to interact with an increasing number of ever more hybrid beings are not modern. He recalls that, in the Western tradition, becoming modern meant conforming to a world unified by science, technology and economics, under the assumption of limitless progress and an extractive stance towards planetary resources. By contrast, humanity today faces the challenges of complexity (Bocchi, Ceruti, 2025), which demand a vision of reality that is no longer simplistic or homogenising but capable of holding together multiple levels of description, mindful of the vital interdependencies that bind the world's inhabitants – human and non-human alike – and open to the idea that their histories are increasingly entangled with those of other entities in co-evolutionary relations. If sites of education are continually redefined through the unique and material encounter of biographies and ideas, technologies – by becoming embedded in these intersections – contribute to the transformation of cognitive experience through circular and recursive relations, generating mixed social ecologies (Damiano, 2020). Embodying

particular visions and epistemologies, technological devices can foster scientific, ethical and social inquiry into the human condition. Democratic education must be cultivated by attending to the meanings that emerge within these unprecedented ecosystems, where the idea of accumulating knowledge in order to govern reality may lead to the use of new devices according to the same instrumental logics. A shift towards ecological thinking for a sustainable and equitable future becomes possible when technological presences are interpreted as opportunities to revisit underlying premises and as elements that move beyond immobilising and alienating forms of instruction, enabling participation, activation and engagement.

FROM HUMANISM TO THE PLURIVERSE: RETHINKING EDUCATION FOR MULTISPECIES DEMOCRACY IN MORE-THAN-HUMAN WORLDS

Giusi Boaretto (Libera Università di Bolzano-Bozen, Italy) · **Michele Cagol** (Libera Università di Bolzano-Bozen, Italy)

More-than-human education | Multispecies democracy | Pluriverse

The ecological crisis is increasingly recognized as one of the defining conditions of contemporary life. Climate change and ecosystem degradation—documented by the Intergovernmental Panel on Climate Change (2023)—are not only environmental challenges but social and cultural phenomena that exacerbate global inequalities and question the epistemological foundations of modern societies. At the same time, the crisis is reshaping subjective experience: research highlights climate-related emotional responses such as eco-anxiety and eco-guilt (Agoston et al., 2022), pointing to a growing awareness of the vulnerability and interdependence that bind human and non-human life. These developments challenge education to rethink its role in a world where ecological instability and socio-environmental injustice are intertwined. This paper argues that many educational responses to the ecological crisis remain constrained by implicit humanist assumptions that position the human subject as the central reference point of educational thought and practice. While such perspectives have historically contributed to emancipatory projects, they risk reproducing anthropocentric frameworks that obscure the relational entanglements through which life on Earth is constituted. The ecological crisis therefore calls for a deeper pedagogical reorientation capable of decentring the human and rethinking education within more-than-human worlds. To address this challenge, the paper develops a theoretical dialogue between posthumanist and relational approaches to education. A first pillar of this framework is the concept of agential realism elaborated by Karen Barad (2007), which conceptualizes reality as constituted through processes of intra-action among human and non-human entities. From this perspective, matter and meaning are inseparable, and educational practices can be understood as material-discursive processes that participate in shaping the worlds we inhabit. Learning environments, bodies, technologies, and ecological systems thus become co-constitutive elements of educational processes. This relational perspective is further developed through the notion of the pluriverse proposed by Arturo Escobar (2018). The pluriversal horizon emphasizes the coexistence of multiple forms of world-making grounded in radical interdependence and challenges the universalizing logic of modernity. Thinking education from the pluriverse opens the possibility of engaging with diverse ecological

knowledges and situated practices that foreground reciprocity, relationality, and care in organizing human and more-than-human life. The pedagogical implications of these perspectives are explored in dialogue with the idea of world-centred education developed by Gert Biesta (2021), which conceives education as a space where subjects encounter the world and are called into responsible relation with what exceeds their own interests. Within this framework, education becomes an ethical and political practice oriented toward responsibility for a fragile world. Building on these insights, the paper proposes multispecies democracy as a pedagogical horizon for rethinking education in more-than-human worlds. Rather than referring only to institutional arrangements, multispecies democracy is approached as a cultural and educational project aimed at expanding the boundaries of political imagination and ethical concern beyond the human. By foregrounding relationality, vulnerability, and interdependence, this perspective invites educators to reconfigure pedagogical practices that acknowledge the entangled destinies of human and non-human communities, opening pathways for addressing the ecological crisis while confronting the social inequalities shaping life in the Anthropocene

PEDAGOGICAL REFLECTIONS FOR THE ANTHROPOCENE: CO-EXISTING AND EDUCATING IN TIMES OF ECOLOGICAL JUSTICE

Cristina Delgado Vintimilla (York University, Canada)

Pedagogy | More-than-human relations | Educational futures

This presentation explores how pedagogical research practices that attend to the more-than-human can generate pedagogical experiences capable of destabilizing dominant and normative epistemologies, activating pedagogical worlds that make possible alternative and less anthropocentric relations. Drawing on experiences developed through pedagogical and interdisciplinary projects, the presentation outlines an emergent research praxis that moves across social pedagogy, community knowledges, children's ecological imaginaries, and artistic experimentation, explicitly refusing the anthropocentric assumptions that often underpin contemporary educational research. Inspired by the decolonial thought of Silvia Rivera Cusicanqui, the presentation begins from the understanding that knowledge is always situated, tense, and in motion: a ch'ixi space in which heterogeneous worlds can coexist without being reduced to a forced synthesis. From this perspective, knowledge is not a stable object to be extracted or translated, but an ongoing relational process that resists capture by colonial, developmentalist, or extractivist frameworks. Pedagogical research is thus conceived as a living ecology of relations, within which human, more-than-human, material, and historical forces come together to shape what can be perceived, known, and made meaningful. The reflection is grounded in post-qualitative and posthuman research, understood not as a theoretical-methodological trend but as a creative departure from representational traditions that privilege language and the human subject as primary sites of meaning. This shift makes it possible to attend to the affective, material, and relational dimensions that traverse pedagogical experience, recognizing the active role of territories, bodies, elements, and more-than-human forms of life in processes of learning. Through selected examples of project-based processes, the presentation argues that pedagogical practices oriented by a posthumanist perspective are essential for imagining pedagogical futures capable of honoring and responding to the complexity of the times we collectively inhabit. Such futures are not designed in advance, but cultivated through practices that nurture a relational responsibility toward the earth and more-than-human life.

Living together, Co-Governing, Becoming: More-than-Human Futures for Democracy in Education

PANEL CONVENORS: Francesca Peruzzo (University of Birmingham, United Kingdom); Paolo Landri (Cnr – Iriss)

PANEL KEYWORDS: governance, becoming, technologies

This panel interrogates the democratic implications of more-than-human education governance in a period of accelerating technoscientific transformation (Landri and Peruzzo, 2026 forthcoming). It challenges the persistent anthropocentrism underpinning dominant accounts of education governance, arguing that governing processes are now enacted through dense assemblages of human actors, digital infrastructures, algorithms, platforms, data systems, and ecological materialities (Hayles, 2023; Gulson et al, 2021). Posthuman perspectives, we suggest, are essential for understanding how AI, robotics, datafication, and platformisation are reconfiguring democratic learning, ethical responsibility, and civic participation. The panel examines how more-than-human governance redistributes agency, authority, and responsibility in hybrid educational environments where humans do not simply govern technologies and nonhuman entities but increasingly co-govern with them. The discussion will address: (1) the political ecologies of digital governance, in which public–private infrastructures and Big EdTech actors shape the conditions of educational democracy; (2) the affective atmospheres generated by algorithmic systems, rankings, and AI-driven pedagogies, and their consequences for participation, consent, and resistance; and (3)the ambivalent symbioses that emerge among learners, educators, technologies, and planetary resources, symbioses that may entrench extractivist, inequitable logics or foster convivial, sustainable futures. Mobilising post-anthropocentric and new materialist analytics, the panel reframes democratic education as a more-than-human project embedded in contested sociotechnical and ecological assemblages. It argues that sustaining democracy in education requires not a defence of human exceptionalism but a politics of coexistence, care, and response-ability across human and nonhuman agents. The panel positions this reorientation as both analytically urgent and politically generative for reimagining education's democratic futures.

FROM PLATFORM EXTRACTIVISM TO MORE-THAN-HUMAN CO-GOVERNANCE: ECOSYSTEMIC THIRD MISSION, TEACHER AGENCY AND TERRITORIAL COHESION IN SOUTHERN SALENTO (ITALY)

Corrado Russo (CNR IMAA, Italy)

Education Governance | Territorial Cohesion | Digital Citizenship

This paper addresses how the teaching profession is being reshaped by platformisation, datafication and algorithmic governance in the current perma-polycrisis, where economic instability, democratic fatigue and ecological stress intersect. In marginal and inner-peripheral territories, digital transformation does not simply "modernise" education: it can operate as an extractive governance assemblage that captures value upward (data, attention, labour and resources), compresses local agency, and repositions teachers as compliance-driven executors. To conceptualise this condition, the paper mobilises the notion of Digital Mining Neo-Elitarism (DMN) as a soft extractive regime in which human actors co-govern with nonhuman agents (platform interfaces, interoperability standards, learning analytics dashboards, metrics, and infrastructural constraints). The core claim is that educational democracy depends on how we govern with technologies, not merely on how we teach through them. The study reframes Universities' and Research Institutions' Third Mission (TM) as a more-than-human governance project: a democratic and redistributive infrastructure capable of enabling collective problem-framing, capability-building, and access to cohesion resources. In this view, the proposed Territorial Cohesion Ecosystem (TCE) functions as a counter-extractive, generative arrangement that redistributes agency and responsibility across teachers, third-sector organisations, local administrations, and public knowledge infrastructures. ECT is further anchored in a quintuple-helix orientation (government, economy, environment, research, citizenship) and is interpreted as a form of horizontal subsidiarity between pedagogy and politics, where democracy is both a curricular aim ("learning for democracy") and an organising principle of educational processes ("democracy for learning"). Empirically, the paper reports a longitudinal action-research intervention in Southern Salento (Apulia, Italy) involving 70 teachers from three Comprehensive Institutes, alongside third-sector organisations, municipalities, and research actors connected to CNR infrastructures. The intervention unfolded through three phases—activation, co-planning, and organisation—supported by governance devices such as Territorial Educational Pacts and Community Observatories. Methodologically, the study combines: Needs Mapping within Action Community Learning (deep listening oriented to social justice); participatory

design (GOPP and World Café) for co-defining objectives and responsibilities; qualitative tools (focus groups, observation, questionnaires) to surface situated impacts such as teacher burnout and platform-related workload; and a research–training pathway aligned with DigiCompEdu 3.3. Findings show a shift in professional posture: teachers increasingly reframed digital competence as democratic agency, moving from "executors" to agency architects who interrogate platform constraints, redesign learning toward participation and dialogic pedagogy, and foreground ethical responsibility. At ecosystem level, ECT-supported facilitation contributed to the institutionalisation of collaboration (pacts, observatories), clearer role distribution, and improved capacity to mobilise cohesion resources. A tangible indicator was the production of teacher-designed action plans and the translation of co-design outputs into concrete project artefacts (plans, pacts, funding applications). Finally, the opening of CNR research infrastructures to communities—including learners in educational poverty—reconfigured infrastructures as knowledge commons, enabling hybrid learning environments and new conditions for civic participation. The paper contributes a transferable framework for counter-extractive co-governance in education, while noting limitations related to single-context evidence and the persistence of governance atomism; future work should develop explicit social-justice indicators and test replicability across inner-peripheral territories.

AUTOMATING KNOWLEDGE THROUGH GENERATIVE AI? FOREGROUNDING MORE-THAN-HUMAN INFRASTRUCTURES IN HIGHER EDUCATION

Magda Pischetola (University of Copenhagen, Denmark)

Generative AI in Higher Education | More-than-human infrastructures | Knowledge automation

The article analyses contemporary narratives circulating in Danish universities guidelines, reports, and teacher training courses holding the promises of Generative AI (genAI) for knowledge systems automation, problematising the implications of these promises for the future of Higher Education. It draws on the concept of infrastructure theorised by Science & Technology Studies scholars, which refers tolayered, imbricated sociotechnical assemblages built into a system to provide for its smooth functioning – that is, an invisible 'system of substrates' (Star, 1999). The article seeks to expand this definition of infrastructure towards the inclusion of a more-than-human perspective in its conceptualisation. Being attentive to such a 'non-anthropocentric ontology of infrastructures' (Barua, 2021), in fact, can provide a relational analytic for grasping how infrastructures furnish 'substrates' for the university digitalisation agenda, and more specifically on what grounds the narrative about knowledge automation has been constructed. Our analysis of more-than-human infrastructures includes: (i) public–private actors' joint collaborations, where the lobbying of Big Tech, edtech companies, and data-extractive businesses is foregrounded; (ii) space-times of new academic practices with genAI (e.g. learning

management systems with automated platform functionalities, computer labs where AI is naturalised as a 'tool' to speed up students' academic work, or courses for teachers' professional development where genAI is anthropomorphised as 'sparring partner'); (iii) affective atmospheres generated by institutional expectations of upskilling for teachers and students alike; (iv) informal relational systems supporting the functioning of formal governance mechanisms (e.g. cultural norms and values, taken-for-granted assumptions, meanings, scripts, status differentiators, incentives, rewards, etc.); and (v) 'field configuring events' (Hinings et al., 2017), such as seminars, conferences, festivals, and courses on 'responsible' uses of genAI. The analysis shows how the recent transition of Danish universities toward general acceptance of genAI tools for any purpose, including academic exams, can be understood as the last frontier of more-than-human infrastructural work that has established, also retrospectively, institutionalised techno-visions supporting the need for digitalisation – and increasingly automation – of knowledge practices. These results are put in dialogue with broader analyses of how 'computing the incomputable' (Parisi, 2016) has historically transformed the grounds of how both knowledge and cognition are conceived, making invisible the probabilistic nature of machine learning 'reasoning' and the selection of certain epistemologies over others. In conclusion, we argue that this more-than-human infrastructuring of the digitalisation agenda has contributed to conceiving academic knowledge as a set of finite outputs, learning as an efficient and linear process driven by the logic of speed (Atkinson & Flanagan, 2024), and research practices as optimised patterns' extrapolation, anticipation, and modelling (Grimaldi, 2025). These aspects urge us to reflect on the need to reconfigure university practices for sustaining democratic futures.

MORE-THAN-HUMAN EDUCATION GOVERNANCE AND AI: ANALYTICAL TOOLS FOR POLICY

Francesca Peruzzo (University of Birmingham, United Kingdom) · **Paolo Landri** (CNR, Naples)

more-than-human | AI | new materialisms

Education governance is increasingly reorganised through artificial intelligence, data infrastructures and automated decision-making. Instead of treating AI as an instrument that enhances human policy rationality, this paper adopts a more-than-human approach to analyse how platforms, algorithms and data reconfigure agency, cognition and accountability across education systems. Building on Science and Technology Studies and new materialisms (Barad, 2007; Lemke, 2021; Massoumi, 2002; Whatmore, 2013) and education policy research on datafication and computational governance (Williamson, 2017; Gulson, Sellar & Webb, 2022), we operationalise three analytical tools (post-anthropocentrism, symbiosis and affectivity) to examine how AI participates in governing beyond the human. Contemporary policy debates remain largely framed through human-centric categories such as fairness, efficiency and transparency (Selwyn, 2022), which presume that technology either supports or distorts human judgement. A more-than-human perspective instead treats governance as emerging from entanglements of humans, datasets, infrastructures, legal dispositifs and computational forms of cognition (Parisi, 2019; Hayles, 2014). AI does not simply execute policy decisions, instead it generates classifications and predictive logics that shape institutional futures and subjectivities. In this sense, governance is enacted through sociomaterial assemblages rather than located in human actors (Landri, 2018). We deploy three empirical vignettes from England and Italy illustrate this shift, examining first the 2020 A-level grading algorithm in England, which was designed to standardise results after exam cancellations but disproportionately downgraded students from historically underperforming schools, thus reproducing structural inequalities embedded in training data (Williamson & Piattoeva, 2019). In a second vignette we analyse the Italian algorithm allocating temporary teachers through automated ranking. This algorithm was introduced as a solution to bureaucratic inefficiency, but the system produced mismatches, labour

insecurity and legal disputes. The third vignette instead contrasts these extractive configurations with IAQOS, a community-trained neighbourhood AI developed in Rome (Iaconesi & Persico, 2021). Through participatory design and open-source infrastructures, residents and students collectively shaped the system's knowledge base. Across the three cases, AI governance appears as a cognitive-affective formation rather than a neutral technical layer. Algorithms mobilise affects, including anger, anxiety, trust and attachment that reorganise institutional legitimacy and democratic participation. A more-than-human approach does not reproduce techno-solutionism instead it provides analytical tools to map heterogeneous agencies and to distinguish extractive assemblages from participatory and convivial ones. In doing so, it contributes to Critical EdTech Studies by reframing AI governance as a democratic and relational problem, aligned with ongoing debates on datafication, privatisation and the futures of education policy (Selwyn, 2022; Williamson et al., 2024).

"I'M DESPERATELY SEEKING THE ANSWER, PLEASE HELP ;) <3": EMERGING KNOWLEDGE IN A SOCIOMATERIAL ANALYSIS OF A FACEBOOK GROUP OF SPECIAL EDUCATION TEACHERS

Camila Moyano Dávila (Departamento de Sociología, Universidad de Chile, Chile) · **Juan de Dios Oyarzún** (Pontificia Universidad Católica de Valparaíso) · **Francisca Gallegos Jara** (Departamento de Sociología Universidad Alberto Hurtado,) · **Gabriela Rebagliati Meersohn** (Center for Advanced Research in Education (CIAE), Institute of Education, University of Chile.) · **Ismael Tabilo Prieto** (Family Science School, Universidad Finis Terrae/Facultad de Ciencias Sociales, Universidad Alberto Hurtado)

Digital communication · special needs education · governance

This chapter aims to examine how knowledge about the learning of students with special educational needs emerges in a Facebook group of special education teachers that was analyzed for six months. The global massification of social networks (SN) and interactive pages, coupled with the importance of networking and collaboration in educational innovation processes has led to various studies on the importance of communities formed in—and through—SN in education and teacher training. However, studies on the use of social networking in teaching communities have not problematized what is being produced as pedagogical knowledge and its relation with contextual governance. Instead, they focus on the human use of these networks and see digital communities as eminently human groups. In this chapter, a sociomaterial approach was applied that assumes human agency and agency of the digital environment, which allows us to take the digital seriously, giving it its own agency and enabling us to analyze human and digital interaction as a particular space of production. This grants us to understand why in these spaces, which we will call assemblages, particular forms of pedagogical knowledge emerge and how it relates to the given governance. In this respect, the results of the paper indicate that knowledge appears in an uncritical way in the assemblage of the human and the digital and it is circulated d as neutral and overwhelming affections, and as the governance marketisatione. In short, the group functions as a reposit-

ory of desires, emotions, doubts, information, and pedagogical material, which demonstrates the overload that teachers experience in their work and relation to institutional material and, at the same time, how this overload requires multiple responses to achieve success without problematizing what is shared.

WHAT IS AT STAKE? THE AMBIVALENCE OF PRODUCTIVITY IN THE AI-MEDIATED UNIVERSITY

Lia Volpe (Sapienza University of Rome, Italy)

University | LLMs | Epistemology

This paper examines generative artificial intelligence, and particularly Large Language Models (LLMs), as epistemic infrastructures reshaping contemporary academic knowledge production. Situating the analysis within the broader transformation of universities - marked by performance metrics and pervasive technological integration - the study investigates how AI-mediated research practices intersect with questions of epistemic trust and the organization of academic work. Drawing on Science and Technology Studies, epistemology, sociology of science and computer science, in this paper AI is framed as a sociotechnical system, navigating between overly enthusiastic technodeterminism and ideological rejection. First of all, we need to consider how LLMs, unlike human cognition, operate through large-scale statistical pattern recognition, generating their outputs through probabilistic correlations learned from vast data corpora; there is no access to semantic understanding, intentionality, causal reasoning or contextual judgment. For this reason, what appears as coherence is often the surface effect of statistical regularity rather than grounded comprehension, not considering LLMs structural vulnerabilities, such as susceptibility to data poisoning, sensitivity to prompt framing and generation of plausible but incorrect statements. As these systems become embedded in core research practices - literature synthesis, hypothesis articulation, methodological design - two different dynamics emerge. First of all, if traditional academic "trust" is rooted in identifiable authorship, accountability and shared epistemic norms - necessitating agents capable of reflexivity and commitment - LLMs, by contrast, cannot assume responsibility for their claims, nor can they participate in the normative space of reasons that structures scientific debate. Secondly, if LLMs intervene directly on the rhythms of

research - compressing tasks into near-instantaneous outputs - they carry significant consequences for the quality and depth of scientific work, because they could foster a culture of “epistemic impatience”, in which speed becomes a proxy for productivity and depth is sacrificed in favour of output volume. This dynamic is further reinforced by the institutional pressures already shaping contemporary universities - publish-or-perish logics and competitive funding regimes - which find in AI-mediated acceleration a seemingly natural ally. These processes reveal not only an epistemological challenge, but also a structural tension: the tools celebrated as researchers' “assistants” may erode the epistemic foundations upon which scientific knowledge is built and sustained. These architectural and institutional tensions demand a calibrated response. Rather than advocating wholesale adoption or rejection, this paper argues for flexible regulatory frameworks preserving human oversight and responsibility, alongside concrete practices - such as disclosure of AI use and verification protocols - to rebuild trust in AI-mediated research environments. Equally important is how the growing integration of LLMs may itself offer an opportunity to critically interrogate the neoliberal turn of the contemporary university: by making visible the tensions between this system and the epistemic request for genuine scientific production, these tools show what is at stake when productivity displaces knowledge as the constitutive horizon of academic life.

MORE-THAN-HUMAN EDUCATION GOVERNANCE AND RADICAL DEMOCRACY

Paolo Landri (CNR-IRISS, Italy)

More-than-Human | Governance | Democracy

Education and democracy are under threat worldwide. The conservative turn, the decline of the power of the UN, the crisis of the EU, the genocide in Gaza, the war in Ukraine and Iran, and climate change are giving rise to a global polycrisis in which democracy is seen more as a constraint than a means to provide solutions to the complexities of our time. In that scenario, education is oriented toward the priorities of digital capitalism and the conservative agenda, thereby undermining the link with democracy. How to renew the relationship between education and democracy? How to reinforce a link that has been so important for the field of education studies, and for the onto-epistemology of modern education? In that paper, we address these important questions by engaging with the concept of more-than-human education governance (Landri & Peruzzo, 2026). The idea of more-than-human draws attention to the complex cognitive-affective assemblage of humans and nonhumans that emerges in the governance of education. The growing entanglements among humans, technologies and materials constitute a significant shift in the materiality of governance in education systems. Datafication, platformization, the rapid diffusion of generative AI and the experimentation with robots have made education policy and practice technologically dense and affectively charged. Numbers, rankings, apps, platforms, digital identities and software are now the constant companions of teachers, principals, students, parents, and policymakers. The multiplication of agencies in education governance intersects with the theory of radical democracy (Latour, 2004; McDonnell, s.d.; Ranciere, 2004). Radical democracy invites an extension of equality and liberty, considering democracy not a state, but an open-ended process in which the ‘demos’ of democracy is expanded to many, and even to non-humans. Radical democracy assumes conflict and dissensus as key and ineradicable aspects of politics, challenging existing asymmetries, hierarchies, and elites. Similarly, more-than-human education governance sees the entanglements between humans and nonhumans far from frictionless and distinguishes between parasitic and mutual relationships, favouring the unfolding of convivial and joyful intertwinements between agencies. It therefore contrasts with the current depoliticisation and juridification of education by renewing the link between education and democracy through grassroots and participatory environments.

Porous Educational Landscapes: Interdisciplinary Approaches to Democratic Spaces

PANEL CONVENORS: Beate Christine Weyland (Free University of Bolzano, Faculty of Education); Simona Galateo (Free University of Bolzano, Faculty of Education); Katharina Tielsch (Technische Universität Wien – Architektur und Raumplanung)

PANEL KEYWORDS: Co-design, Democratic Educational Landscapes, Spatial Porosity

Creating new educational landscapes means moving beyond the traditional notion of school as a closed and hierarchical space, toward environments that are open, dynamic, and porous – capable of fostering democratic relationships and inclusive learning processes. Drawing on Richard Sennett's notion of porous boundaries and recent research on threshold pedagogies, we understand porosity as the spatial capacity to enable fluid exchanges between formal and informal learning, between school and community, and between disciplines – resisting the compartmentalization that characterizes traditional educational institutions. This panel explores how the interaction between pedagogy, architecture, and design can generate educational spaces that actively enable participation and agency. EDENSPACES, an interdisciplinary master's program developed at the Free University of Bozen-Bolzano, exemplifies this approach: a co-design laboratory where students, researchers, and professionals collaborate to envision sustainable, flexible environments that extend the concept of school into the community and the territory. In dialogue with the TRANSFORMER project at TU Vienna, which uses co-creative approaches and interdisciplinary methods to focus on the topic of climate and energy in and around a formerly vacant building, the panel will highlight how educational and civic spaces can overlap to address ecological and social challenges. Through theoretical contributions and case studies, the panel will examine how materiality and spatiality can shift from instruments of control to mediums of emancipation: flexible learning environments, co-designed outdoor classrooms, and maker spaces that embody democratic values through their very configuration. The goal is to outline principles for designing democratic educational landscapes deeply connected to civic life.

DEMOCRACY NEEDS SPACE: POROSITY AND PARTICIPATION IN EDUCATIONAL LANDSCAPES

Petra Regina Moog (Sophia::Academy, Germany)

Educational landscapes | Porous space | Democratic participation

Contemporary debates on democratic educational landscapes increasingly emphasize openness, porosity, and participation, particularly in relation to the overlapping of educational, civic, and ecological spaces. Schools are no longer understood solely as bounded institutions, but as part of wider landscapes in which learning, social interaction, and democratic practices are negotiated across spatial and institutional borders. Yet these debates often remain tied to architectural form or programmatic intention, while the processes through which democratic agency actually emerges in everyday educational practice remain under-theorized. This paper proposes an ecological reading of educational space, understanding educational landscapes not as static or bounded entities, but as living systems whose democratic quality depends on their capacity for access, adaptation, and continuous transformation across spatial scales. Against this backdrop, the paper draws on a learning design framework originally developed in constructionist learning (Papert, 1980) and later expanded in the context of creative learning (Resnick, 2017). Recently translated into the field of pedagogical architecture (Moog, 2026), the framework is here situated within debates on porosity, open systems, and democratic participation, and used as an analytical lens to examine how educational landscapes can actively enable democratic practices rather than merely accommodate them. Drawing on open systems theory (von Bertalanffy, 1968), educational landscapes can be understood as porous configurations in which boundaries between spaces, actors, and practices remain negotiable rather than fixed.Porosity does not primarily refer to architectural openness, but to the capacity of spatial arrangements and development processes to enable exchange between formal and informal learning, between school and community, and between different forms of knowledge and expertise. Democratic participation emerges under these conditions as a situated practice produced through access, negotiation, and shared responsibility over time. Participatory school development processes make these dynamics visible where spatial transitions are jointly designed, shared zones support multiple uses, and pupils, teachers, and other stakeholders engage in real spatial decisions with tangible consequences. Research on participatory school building highlights how such processes foster democratic learning and agency (Zenke, 2020). Studies on innovative learning environments further emphasize that the robustness of such spaces depends on sustained participation and alignment between educational vision and spatial practice (Frelin & Grannäs, 2021). Work on

pedagogical architecture underlines the importance of a shared language between pedagogy and design for maintaining participatory processes across professional and institutional boundaries (Weyland, 2017). This understanding of educational landscapes as porous and open systems connects to broader theoretical discussions on urban and spatial openness (Sennett, 2018) and resonates with current European research on educational transformation, such as the CLEAR project (2025). More recent contributions further frame schools as places of dwelling rather than fixed institutions, foregrounding long-term inhabitation and everyday practice as central to democratic educational landscapes (Weyland & Sigillo, 2025). Rather than presenting a new empirical case, the paper synthesizes insights from participatory school development practice and contemporary research to propose a transferable analytical perspective. It argues that democratic educational landscapes emerge where spatial porosity and participatory processes intersect, enabling education to be experienced as a shared, negotiated, and continuously evolving democratic practice.

BEYOND THE IVORY TOWER: POROUS EDUCATIONAL LANDSCAPES AS DEMOCRATIC PRACTICE AT TU WIEN

Karin Katharina Tielsch (Vienna University of Technology, Austria)

Climate Change Adaptation | Transdisciplinarity | Student Ambassadors

This paper explores the concept of "porous educational landscapes" through the lens of two innovative projects at TU Wien: Transformer and Cultural Collisions. Both initiatives tackle the urgent societal challenge of climate change adaptation by creating democratic spaces for exchange between higher education, schools, and the public. The core of this analysis focuses on how traditional institutional boundaries are bridged through transdisciplinary collaboration and peer-to-peer mediation. A key element in both projects is the involvement of university students who, within their curriculum, develop and facilitate educational modules. This approach transforms students into role models and ambassadors, bridging the gap between complex scientific research and the lived experience of children and adolescents. The projects represent two distinct yet complementary formats of "porous" learning: While Cultural Collisions functions as an interactive exhibition featuring various stations where students engage with scientific and artistic perspectives on climate change, The Transformer acts as a laboratory, providing hands-on formats that encourage experimental learning and technical empowerment. The "porosity" of these landscapes is manifested on three levels: Transdisciplinary Synergy: Collaboration occurs among students from diverse academic backgrounds and between university facilitators and school teachers, blurring the lines of traditional expertise. Methodological Sensitization: By utilizing hands-on laboratory work and exhibition-based learning, pupils are empowered to participate in democratic discourses regarding climate resilience. Institutional Openness: The projects dissolve the "ivory tower" of the university, carrying scientific discourse into the public sphere and directly into the everyday environment of schools. The contribution reflects on the potential of these formats to foster a democratic culture of learning. It demonstrates how involving young adults as mediators not only enhances their own sense of agency but also strengthens the engagement and self-efficacy of the next generation in the face of the climate crisis.

BEYOND THE SCHOOL: TRAINING SPATIAL POROSITY ACROSS PEDAGOGY, ARCHITECTURE, AND NATURE. THE CASE OF EDENSPACES

Simona Galateo (Free University of Bolzano, Italy) · **Beate Weyland** (Free University of Bolzano, Italy)

Spatial porosity | interdisciplinary training | democratic educational landscapes

The notion of educational landscapes today extends far beyond the school. Alongside formal educational institutions, a growing number of community organisations, cultural associations, and civic initiatives are developing their own educational programmes as drivers of social connection and collective value: neighbourhood houses, community gardens, cultural hubs, hybrid indoor-outdoor spaces operating in the interstices of the contemporary city as genuine third spaces (Galateo, 2024). In these settings, education is not an ancillary service but a structural element, and the quality of the space in which it unfolds becomes a political question: space is never neutral, and its material configuration either enables or inhibits democratic relationships, participation, and agency (Weyland & Galateo, 2023). Contemporary educational landscapes cut across built environments, open spaces, threshold zones, and spatial configurations designed to dissolve the boundary between inside and outside. This is the porosity between space and society that Sennett (2018) describes, the spatial capacity to sustain fluid exchanges between formal and informal learning, between school and community, between disciplines. Yet designing and transforming such environments demands competences that remain siloed across separate fields. Educators, architects, landscape designers, product designers, and ecologists each operate with their own tools and vocabularies, with few opportunities for genuine cross-disciplinary dialogue. This fragmentation is increasingly untenable. What is needed is both a professional figure capable of working across these domains and a training model that is itself porous. EDENSPACES, a second-level master's programme launched in 2025 at the Free University of Bozen-Bolzano and the first of its kind in Italy, was established to develop precisely this figure. The curriculum weaves together pedagogy, architecture, landscape, design, botany, and ecology within a programme built around intensive residential sessions that combine lectures, co-design workshops, field visits, and collaborative project work. This immersive format is rooted in sustained, situated dialogue among students, scholars, and practitioners from diverse backgrounds. The choice of residential intensives is not a matter of logistics but of pedagogy: porosity between disciplines requires shared time, common physical spaces, and the opportunity to unlearn the boundaries of one's own field. The first cohort of 20 students confirms the nature of the demand: 16 come from architecture, engineering, design, or communication, and only 4 from education sciences. These figures point to a strong demand for pedagogical competences among spatial professionals, and equally to the need to make the field more accessible to those working in education. From the earliest sessions of the programme, a collective taxonomy of educational landscapes took shape, spanning school gardens to urban squares, corridors to neighbourhood houses, coastal parks to museums: categories that overlap and cross-pollinate, porous by definition. It is precisely this permeability that demands a perspective capable of holding together the scale of nature, the scale of construction, and the scale of social relations, rendering any monodisciplinary approach inadequate. This paper presents the rationale, structure, and early evidence from EDENSPACES, arguing that training professionals capable of operating across disciplinary boundaries is a necessary condition for the democratic transformation of educational landscapes, within and beyond the school.

FROM WASTE TO WORKSHOP: UPCYCLING AS A POROUS INFRASTRUCTURE FOR DEMOCRATIC ENGINEERING EDUCATION

Alexander Pichlhöfer (Research Unit of Ecological Building Technologies, Institute of Material Technology,Building Physics and Building Ecology, Faculty of Civil and Environmental Engineering, Vienna University of Technology, Austria) · **Bianca-Maria Köck** (Research Unit of Process Systems Engineering, Institute of Chemical, Environmental and Bioscience Engineering, Faculty of Technical Chemistry, Vienna University of Technology, Austria)

upcycling | material pedagogy | porous education

This contribution explores how low-cost upcycling practices can function as material infrastructures for democratic engineering education. Within the Transformer project at TU Wien, an interdisciplinary outreach and co-creation initiative addressing climate and energy challenges, discarded office folders, plastic packaging, and other waste materials are shaped into furniture, inflatable mechanisms, and experimental prototypes. Rather than relying on specialized equipment and conventional purpose-designed workshop materials, these workshops deliberately employ materials that are commonly perceived as trash. Drawing on Richard Sennett's notion of porous boundaries in urban and social systems (Sennett, 2018), such material choices dissolve boundaries between formal engineering education and everyday life. By bringing everyday materials into structured workshops, informal experimentation and formal learning begin to overlap. By working with low-value materials, participants experience engineering not as a distant, high-tech discipline, but as an accessible practice grounded in experimentation and improvisation. (1) Threshold Accessibility: Upcycled materials reduce financial and psychological barriers, creating liminal spaces of experimentation that resonate with the concept of threshold learning (Meyer & Land, 2003). Engineering principles become approachable through hands-on exploration rather than abstract instruction. (2) Material Emancipation: Objects designed for disposal are reconfigured as tools of agency. This shift resonates with emancipatory pedagogical traditions that emphasize active transformation over passive consumption (Freire, 1970), finds contemporary expression in democratic education theories foregrounding agency and subjectification (Biesta, 2017), and aligns with socio-material approaches that understand learning as entangled with material practices (Fenwick et al., 2011). (3) Reframing Engineering Practice: By working with discarded and low-value materials, participants encounter engineering as a process of exploration rather than precision and control. The absence of expensive equipment and predefined outcomes shifts attention from technical perfection to iterative experimentation. Engineering thus appears not as an exclusive high-tech discipline, but as an accessible civic practice grounded in creativity, responsibility, and collective problem-solving. Through these practices, Transformer extends engineering education beyond the laboratory into civic and everyday contexts. Upcycling becomes not only a sustainability strategy, but a pedagogical approach that embodies democratic values through material practice. In line with research on maker education as a democratizing force in technical learning (Blikstein, 2013; Martin, 2015), such low-threshold environments contribute to the creation of porous educational landscapes where technical knowledge, ecological responsibility, and civic participation intersect.

DIALOGICAL PROCESSES AND THE CO-DESIGN OF POROUS EDUCATIONAL LANDSCAPES IN HIGHER EDUCATION

Cornelia Dinsleder (University of Teacher Education Lucerne, Switzerland) · **Ulrich Kirchgässner** (University of Teacher Education Lucerne, Switzerland) · **Eliya Pagelli** (University of Teacher Education Lucerne, Switzerland)

Dialogue | Learning spaces | Higher Education

A central problem in university planning lies in the limited involvement of students and other user groups. Long planning cycles, institutional hierarchies, disciplinary compartmentalization, and the indeterminacy of future needs often hinder meaningful participation. Spatial planning risks reproducing hierarchical structures and traditional seminar rooms shaped by surveillance, standardization, and fixed seating arrangements rather than enabling democratic agency and student-centred learning. Our guiding question is therefore: How can universities become “future-fit” by fostering permeability both in their planning processes and in their architectural outcomes? How can dialogical formats and participatory practices contribute to creating changeable, adaptable educational landscapes? Drawing on Richard Sennett’s concept of porous boundaries and theories of dialogical education (e.g., Rogers’ notion of self-actualization, Roger 1983), we argue that permeability must first be cultivated socially before it can manifest architecturally. Porous educational landscapes emerge through dialogical cultures that enable interdisciplinary collaboration and empower those affected by spatial decisions. Moving from participation as consultation toward participation as dialogue transforms planning into a co-creative learning process. These theoretical reflections are grounded in interconnected projects such as LEA – Learning Environment Applications, 2020 - 2023 and HESD – Higher Education Space Development, 2024 – 2026 at the university of teacher education in Lucerne. Within the own Campus development for the future location of Lucerne University of Teacher Education in Switzerland we supported the implementation of a structured participation concept. Student participation was embedded into credited workshops. Inspired by Barcamp formats and structured through Ruth Cohn’s (1984) Theme-Centered Interaction model, dialogical workshops linked individual needs, social interaction, and spatial design questions. A key methodological innovation was the “Social Dimensions Mapping” approach, combining organizational constellation methods (MAST) with group-dynamic models of proximity/distance and continuity/change (Berdelmann et al 2016, 113-116). Findings from our ongoing HESD research project on the systematic analysis of teaching and learning space development in Switzerland, Germany, and Denmark complement this participatory work. Using videography, document analysis, and interviews, we examined innovative didactic–spatial configurations such as inquiry-based learning workshops, active-learning seminar rooms, and interdisciplinary innovation labs. Success factors identified in the study were directly integrated into the co-development of open teaching and learning areas at PH Lucerne and PH Schaffhausen. Taken together, these projects demonstrate that porous educational landscapes are not merely architectural outcomes but the result of dialogical planning cultures, empirical analysis, and iterative co-design. We therefore propose conceiving the university as a heterogeneous and evolving educational landscape characterized by spatial diversity, adaptability, and continuous transformation.

EDUCATIONAL LANDSCAPES AND URBAN RESILIENCE: REIMAGINING SCHOOLS AS SOCIO-ECOLOGICAL NODES. THE CASE OF SAVONA

Alessandro Frigerio (Politecnico di Milano, Italy)

educational landscape | school courtyards | urban resilience

The relationship between educational practices, architecture and open spaces has been explored for more than a century. Well-known pedagogical approaches developed by Froebel, Montessori, Pizzigoni and Steiner emphasized the importance of nature and outdoor environments in supporting children's cognitive, physical and social development, opening a broader reflection on the spatial dimension of learning. During the twentieth century, this debate intensified with the spread of the principles of the modern movement and influenced the architectural and pedagogical discourse on school design in the post-war period (Rogers, 1960; Buzzi and Polo, 1960). Despite these theoretical advancements and the typological evolution of school complexes, the current situation in Italy is still characterized by a widespread condition of poor-quality school open spaces. Schoolyards are often poorly integrated with indoor environments and rarely connected with pedagogical programmes, limiting their potential as places for learning, social interaction and well-being. The Covid-19 pandemic made these shortcomings even more evident, reopening the debate on the importance of outdoor environments within educational systems and on the role that school open spaces can play in supporting more resilient forms of education and urban life (Sabbadini et al., 2011; Mirchandani and Wright, 2015; Fianchini, 2017; Dessì and Piazza, 2020; Belloni and Manganaro, 2022). In this context, school open spaces can be reconsidered as strategic components of broader socio-ecological infrastructures. Rather than residual areas within school complexes, they can become catalysts for ecosystem services, environmental awareness and active learning practices, contributing to the construction of educational landscapes where formal, informal and experiential learning processes intersect. The paper discusses the case of the city of Savona, where the Territorial Strategy for Sustainable Urban Development co-financed by the European Regional Development Fund identified school open spaces as key components of a broader urban regeneration strategy. Starting from an integrated urban, environmental and socio-economic analysis that involved local stakeholders and civil society, the strategy proposes a reorganization of public spaces and urban heritage through a constellation of punctual landscape interventions aimed at activating a socio-ecological network capable of mitigating environmental and social vulnerabilities while strengthening territorial resilience. Within this framework, two pilot projects – one located in a central school and the other in a peripheral neighbourhood – explore the transformation of schoolyards into biodiversity gardens and environmental awareness spaces for active learning, play and social interaction, while fostering their integration with surrounding public spaces and ecological networks. By re-signifying schoolyards as civic nodes and experiential learning environments, the project reframes schools as socio-ecological infrastructures within the urban landscape. The paper discusses the methodological approach underlying this process and identifies key landscape design criteria addressing aesthetic-formal, ecological-environmental and pedagogical-functional dimensions, contributing to the broader debate on educational landscapes and resilient urban environments.

SCHOOL AS A COMMON GOOD: A POROUS PLANT NURSERY LINKING ARCHAEOLOGY, NATURE AND COLLABORATIVE ART IN TARANTO

Bruna Sigillo (Free University of Bozen, Italy) · **Teresa Gargiulo** (Istituto Comprensivo Alessandro Volta di Taranto)

Permeable landscapes | Architecture and Pedagogy | School as a Plant Nursery

Can a lightweight, nature-based design transform a school into a community plant nursery, reclaiming a neglected heritage as a common good? This proposal addresses this central question by focusing on the relationship between a school building and the Archaeological Park of the Greek Walls (Pierre Wuilleumier) in Taranto, which it overlooks. Located in a city severely affected by industrial pollution, the park represents a vital green lung and a small urban forest with over a thousand trees capable of CO2 absorption. However, this 5th-century BC Spartan archaeological site currently suffers from neglect, a lack of informational signage, and urban decay. The project proposes an interdisciplinary approach—integrating pedagogy, architecture, contemporary art, and nature—to reimagine the school as a community hub and a gateway to the park. Adopting the concept of porous educational landscapes, the school transcends its traditional walls to serve as a catalyst for outdoor learning and civic engagement. In this context, the school is conceived as a plant nursery: a place where new democratic relationships and environmental awareness are cultivated, mirroring the "Green Belt" initiative aimed at purifying urban air. The interdisciplinary design can utilize lightweight exhibition systems to create a "threshold" between the institutional space and the archaeological site. This solution facilitates fluid exchanges, transforming the park into a functional extension of the classroom. To activate this space, the project incorporates collaborative art, inspired also by the philosophy of Hervé Tullet. By engaging students and citizens in co-creative processes, such as the "Expo Idéale", the project challenges stereotypes of isolated talent and promotes an inclusive environment where the creative process itself becomes a tool for social justice. The school, acting as a plant nursery, becomes the park's guardian, providing the necessary "pedagogical tool" to make archaeological ruins accessible and understandable to the public. Ultimately, this research demonstrates how interdisciplinary dialogue between pedagogy and architecture can transform materiality from an instrument of control into a medium of emancipation. By reclaiming the Greek Walls as an active place of learning and art, the school strengthens its role as a common good, demonstrating that even in contexts marked by industrial crisis, porous design can foster a sustainable and democratic future for the entire "educating community".

THE THICKNESS OF THE BORDER. LANDSCAPE DESIGN AS PEACE INFRASTRUCTURE

Angela Palmitessa (Università Sapienza, Italy)

Transboundary Landscapes | Peace Parks | Ecotone

This contribution explores landscape design as a tool for spatial mediation and as a form of peace infrastructure within transboundary border contexts, considering peace parks as emblematic devices of this practice. Borders are often drawn at geopolitical scales and historically conceived as mechanisms of separation, surveillance, and control, operating according to logics that interrupt spatial continuity, fragment ecological systems, and reinforce political divisions between neighboring territories. In contrast to this paradigm, the paper proposes an alternative interpretation through the

ecological concept of the ecotone, a transitional zone where different ecosystems meet and interact. Rather than understanding the boundary as a thin line of separation, the ecotone suggests a relational thickness: a dynamic spatial condition marked by high levels of interaction, overlap, and transformation. Within this perspective, borders can be reinterpreted as spaces of encounter where the interaction between systems generates complexity, adaptability, and continuous evolutionary potential. Engaging with the non-immunitarian perspectives highlighted in the call for papers, approaches that challenge the idea of space as a protective enclosure designed to exclude difference, landscape design is framed here as a practice capable of operating in continuity with existing conditions while enabling the adaptive transformation of territories disturbed or fragmented by frontier infrastructures. Rather than reinforcing barriers, landscape interventions may act as mediating frameworks that reconnect divided environments and encourage cooperative spatial practices. Through the analysis of selected border landscapes and parks developed in proximity to transboundary areas, the contribution investigates how public spaces and landscape projects can transform territories traditionally characterized by infrastructural transit and geopolitical control into environments of interaction and shared stewardship. These sites, often located along former military zones, demilitarized corridors, or heavily regulated borderlands, possess ecological and spatial characteristics that can be reactivated through design strategies oriented toward openness and coexistence. By integrating ecological restoration, public accessibility, and symbolic reconciliation, such projects may support new forms of cross-border dialogue and shared territorial identities. In this sense, landscape architecture emerges as a mediating discipline operating across environmental, spatial, and cultural dimensions, redefining spaces of division as platforms for coexistence, environmental regeneration, and democratic spatial practices. The landscape project thus becomes not only a design intervention but also a cultural and political act capable of fostering new imaginaries of cooperation and collective belonging across geopolitical boundaries.

LAND ART AS A PEDAGOGICAL LANGUAGE FOR SUSTAINABILITY IN EARLY CHILDHOOD EDUCATION: PLACE, COMMUNITY, AND EMBODIED LEARNING

Michela Bongiorno (INDIRE, Italy) · **Alessia Rosa** (INDIRE, Italy)

Land Art | Sustainability | ECEC

The relationship between children and the natural environment represents one of the most generative terrains for early childhood education, yet sustainability is still too often approached as a declarative value rather than a lived experience. This contribution proposes Land Art as a pedagogical language capable of fostering the understanding of sustainable ways of living from an experiential and place-based perspective, with particular attention to early childhood education and care (ECEC) contexts. The theoretical framework draws on embodied and situated learning (Rivoltella, 2013), grounding the proposal in the conviction that values such as sustainability can only be genuinely understood and shared through direct, immersive engagement with the environment. This perspective recalls the experiential approach of Patrick Geddes — Scottish biologist, sociologist and pioneer of regional and urban planning — whose expression "Vivendo discimus — by living we learn" (Kitchen, 1975) anticipates many of the principles that today inform place-based education and active citizenship pedagogy. Land Art is mobilised here not merely as an artistic reference but as a transdisciplinary and transversal practice. Originating in the 1960s in parallel with the rise of environmental awareness, it develops art within and through the environment, reclaiming and re-signifying space through collective and inclusive processes of environmental care. This bottom-up dimension opens educational processes to dynamic and overlapping relationships between learners, environment, and community, linking pedagogical experience to democratic engagement with place. The acquisition of an observational and exploratory gaze (central to Land Art practice) aims to reconstruct children's sense of place

belonging in terms of civitas, and to unclose that genius loci (Brusa Pasquè, 2020) that is necessary to shape more open, participatory, and sustainable educational practices. The foundational principles of Land Art find a particularly fertile common ground in young children's ways of exploring the world through all five senses, making ECEC contexts a privileged site for this kind of educational experience. These theoretical assumptions are explored through a qualitative case study involving three 0-6 services distributed across the Italian territory. Participants include teachers, educators, and a local community representative for each context, whose perspectives are gathered through semi-structured observation and interview tools. Data will be analysed through the identification of meaning aggregations, allowing for the emergence of recurring patterns and situated interpretations of how Land Art practices intersect with sustainability education, community belonging, and spatial re-signification in early childhood settings. The contribution aims to offer both a theoretical elaboration and an empirically grounded reflection on the potential of Land Art as a tool to act local and think global, connecting educational innovation, environmental awareness, and civic participation from the earliest years of life.

DESIGNING POROUS MULTISPECIES EDUCATIONAL LANDSCAPES: AN INTERDISCIPLINARY STUDY ACROSS PEDAGOGY, ARCHITECTURE, AND DESIGN

Giusi Boaretto (Libera Università di Bolzano-BozenItaly)

Educational Landscapes | Interdisciplinary Design | Multispecies Conviviality

The social, ecological, and spatial inequalities that increasingly characterize contemporary educational contexts call for a critical reconsideration of how educational spaces are conceived, organized, and inhabited. Within this perspective, this contribution presents an ongoing research project situated at the intersection of ecopedagogy, ecological education, and new materialist approaches. It builds on the premise that educational environments should not be understood merely as containers of learning, but rather as relational ecosystems in which human subjects, materials, spaces, plants, and other living beings actively co-participate in educational processes (Barad, 2007; Haraway, 2016; Murris, 2022). The research, currently under development within a postgraduate Master's programme dedicated to the design of educational environments at the intersection of pedagogy, architecture, and design, explores how an interdisciplinary pedagogical pathway can foster the development of competencies oriented toward the design of educational spaces that are accessible, shared, and inclusive for all living beings. The project adopts a perspective grounded in ecological justice and multispecies conviviality. The theoretical framework integrates contributions from critical ecopedagogy (Freire, 1968/2018; Misiaszek, 2020) and transformative approaches to sustainability education (Sterling, 2001; Wiek et al., 2011). Methodologically, the study is designed as an exploratory case study with a qualitative orientation, complemented by elements of mixed methods (Yin, 2017; Guetterman & Fetters, 2018). The case is represented by a course within the Master's programme conceived as a privileged setting for observing the emergence of interdisciplinary learning processes among pedagogy, architecture, and design. The educational pathway is structured in a blended format and includes dialogic lectures, case study analysis, design workshops, and in-person discussion sessions. Within this environment, students are invited to develop proposals for green curricula and spatial-material devices capable of activating meaningful relationships between the human and the more-than-human world. Data collection will involve multiple sources, including the analysis of design artefacts produced during the course—such as conceptual maps, curriculum proposals, spatial concepts, and educational devices—as well as individual reflective journals documenting transformations in educational imaginaries, professional perspectives, and representations of the relationship between education, space, and the more-than-human world. Data analysis will follow an interpretive thematic approach focusing on the development of ecological, design-oriented, and

collaborative competencies. The study aims to contribute to current debates on the role of higher education in fostering innovative practices of educational design oriented toward multispecies conviviality, reimagining educational environments as spaces of cohabitation, care, and shared responsibility

Rethinking Care and Learning Within the Posthuman Turn

PANEL CONVENORS: Ludovica Rubini (University of Trieste); Assunta Viteritti (Sapienza University of Rome); Letizia Zampino (University of Trento); Jesse Bazzul (University of Regina, Canada)

PANEL KEYWORDS: Posthuman care and learning, Algorithmic accountability, Human-robot collaboration

The rapid diffusion of artificial intelligence (AI) technologies and advanced robotics within educational and healthcare systems is reshaping institutional practices, redistributing power, and redefining concepts of care, teaching and medical expertise. Adaptive learning, robotic surgery and algorithmic decision-making represents examples of non-human actors embedded in clinical and learning environments. This panel explores how educational institutions and healthcare systems can engage with these transformations and contribute to envisioning a democratic future of care within an emerging posthuman context. From a science and technology studies (STS) perspective, we consider AI-based technologies and robotics as sociomaterial assemblages that affect organizational routines, professional cultures, and daily interactions. We welcome theoretical, empirical, and methodological contributions addressing topics such as: Critical data practices and ethical awareness in healthcare training and medical education; Professional authority and autonomy within hybrid environments (e.g., clinical or leaning robot collaboration). AI-based technologies within higher education, healthcare systems and welfare environments; Accountability when errors or outcomes are produced by the entanglement of human and non-human agents in diagnosis or assessment. Care and learning as practice enacted, perceived, and reshaped by screens, sensors, robotics and algorithms.

IMAGINING A RELATIONAL ETHICS OF BECOMING AT THE HEART EDUCATION

Jesse Bazzul (University of Regina, Canada)

Ethics | Becoming | Posthumanism

Education has always straddled two relatively stable foundational narratives or ethical orientations. While these ethical orientations can be described in a number of ways, together they have to do with the agonistic opposition between the reproduction of knowledge and societal interests of a dominant culture/power versus the freedom to experiment and transform societies. Hannah Arendt (2006) perceived the complexity of this problem in her insistence of both conserving a shared inherited world for children, whilst recognizing the unavoidable natality of educatio—in that all children begin (in) this world anew and will inevitably innovate and change the world. While it is difficult to resolve this relational tension at the heart of education, it remains the case that education scholars have not fully grappled with what this means for a more vibrant and complex educational ethics that is well situated to engage our shared ecological crisis and growing authoritarianism with both courage and joy. One hopeful aspect is that such an ethics must ultimately emerge from educational settings, because ethics lies at the very heart of the discipline and practice of education (Bazzul 2023). No other discipline or field of practice engages ethics as much as education. This presentation will outline a work in progress that attempts to situate a vital ethics of becoming as a viable alternative for education writ large. Drawing from the work of Gilles Deleuze and Felix Guattari (1988), along with other sociomaterialist thinkers such as Manuel Delanda and Rosi Braidotti, this presentation outlines a repositioning of an intensive relation ethics in ontological terms. The paper/presentation will first

do this by stressing the important opposition between morality and ethics—one that directly applies to the opposition Hannah Arendt outlines—where one is based largely in acts of comparison to an already established code, and the other a much more comprehensive inquiry into how educators might facilitate an enabling ethics of becoming. The presentation elucidates some ethico-ontological concepts from the work of Deleuze and Guattari (1988) such as Bodies without Organs (BwO), planes of consistency, and the articulation of strata to demonstrate that the more-than-human ethics necessary to survive our ecological crisis and bring about a more joyous society is also a question of collectively composing a relational ethical-scape through education. The educator's role is to set the conditions for intensive relations and processes of becoming—a kind of becoming that ultimately cannot be privatized or restricted to human relations. This involves practices of creative composition and identifying strategic assemblages of resistance against forces of domination and control (Delanda 2016). The discipline and practice of education must take seriously its longstanding and important relation to ethics, as it is here that questions of being and becoming are encountered most intensely, comprehensively, and directly. Possibilities for ethical experimentation will be discussed.

MINOR INFRASTRUCTURES: ETHICS AND WORLD-MAKING IN EARLY CHILDHOOD EDUCATION

Emily Ashton (University of New Brunswick, Canada) · **Nancy van Groll** (Capilano University, Canada) · **JoAnna Rickard** (University of New Brunswick, Canada)

early childhood education · ethics · infrastructures

We write within a geopolitical moment characterized by resurgent authoritarianisms, extractive capitalism, ecological precarity, and forms of disaster nationalism that mobilize crisis to consolidate power (Seymour, 2024). These formations reorganize life through overt political regimes and infrastructures that standardize and dominate in the name of protection and stability. Early childhood education (ECE) is one of the first institutional sites where such logics are introduced and rehearsed. In response, we propose three minor infrastructures—archive, mycelium, and cordage—as ethical conditions for shared world-making in ECE. While Manning (2016) theorizes the minor gesture as a virtual and processual force, we extend the minor into the domain of infrastructure, rethinking it beyond state-led "major" systems tied to territorial consolidation, developmental logics, and social standardization. This reorientation brings into focus subtle and often overlooked networks of solidarity that sustain life in humble yet transformative ways. Following Murphy (2013), infrastructures are understood as constellations of relations that draw human and more-than-human worlds together into "patterned conjectures" (p. 10), distributing capacities for action, obligation, and care. In contrast to major infrastructures, minor infrastructures cultivate conditions that hold space for the unruly, emergent, and affective (Deleuze & Guattari, 1987). The archive, drawing on Povinelli (2011), is approached as both a site of memory and an ongoing process of world-making. Beyond institutional repositories, the archive becomes a living pedagogical practice that transmits histories of struggle and survival and delineates the contours of collective imagination. As a minor infrastructure, it unsettles nationalist mythologies and re-situates children within contested histories, opening ethical relation as a "continual variation on experience" (Manning, 2016). The mycelial figure names subterranean infrastructures of exchange, entanglement, and decomposition. Thinking with fungal networks interrupts ethical frameworks that privilege coherence, scalability, and control by attending to the infrastructures through which ideas become perceptible, knowable, and actionable. Following Yusoff's (2013) account of the "politics of sense," this infrastructure invites ethical relations that remain contingent and accountable to the more-than-human worlds children already inhabit. Finally, cordage materializes solidarity as a doing: a process of twisting and binding. Cordage names the slow, repetitive, collective labour through which fragile strands become tensile structures. Drawing on Hunt-Hendrix and Taylor's (2024) account of solidarity as a world-changing practice that must continually be built and rebuilt, cordage foregrounds how collective capacity emerges through

tension, care, and repetition in ECE. Such practices cultivate forms of shared endurance that exceed individualized models of responsibility. In the larger paper, we develop archive, mycelium, and cordage as minor infrastructures that reframe ethics as an infrastructural practice grounded in the relational labour through which shared worlds are sustained and remade (Benjamin, 2024; Berlant, 2016; Maynard & Simpson, 2022). Given the constraints of a conference presentation, this talk focuses on the archive, tracing how living pedagogical practices of memory and story in ECE participate in making world-sustaining—or world-ending—ethical relations at the intersection of the pedagogical and the political.

CARING FOR RESPONSIBLE ACADEMIC PRACTICE IN TIMES OF GENERATIVE AI

Susanne Oechsner (TU Wien, Austria) · **Fynn Thjorben Semken** (TU Wien, Austria)

Responsible Academic Practice | Socialization | Care

Higher education institutions (HEIs) are increasingly confronted with the arrival of Generative Artificial Intelligence (GenAI) in teaching and learning environments. With AI's firm rooting in an inevitability discourse (Bearman et al., 2023) and GenAI's promises of "assessment reform, personalisation, or inclusion" (Jensen et al., 2025), GenAI seems to be here to stay, even if it is yet contested what its role in knowledge production, representation and transfer can and should actually be. The impact of GenAI on academic integrity and its potential for misconduct has been a particular concern for HEIs. Accordingly, HEIs around the globe have begun to develop policies and modes of institutional governance, oftentimes treating GenAI in a similar way as plagiarism or cheating (Mack & Byanjankar, 2025). In our contribution, we address the effects of GenAI on academic integrity less as a misconduct problem that needs institutional control but as a relational issue that requires institutional care. We conceptualize academic integrity as matter of socialization into Responsible Academic Practice (RAP). Over the course of their studies, students develop skills and capabilities; they incorporate values, norms, embodied routines and affective states; and they do so via participation in academic practice, initially with more limited roles and responsibilities that gradually expand (Lave & Wenger, 1991). Learning, thus, is a fundamentally relational and transformational endeavor. It presupposes meaningful relationships with others within which one learns to act responsibly as one becomes part of a practice and its respective community (ibid.) These meaningful relationships are grounded in mutual recognition and care within sociomaterial assemblages of human and non-human actors (Gravett, 2024). Drawing on qualitative engagements with undergraduate students at three Austrian universities (from STEM and SSH fields), we examine the effect of adding GenAI to this sociomaterial relational socialization process. We reconstruct how GenAI often serves as a response to a perceived lack of meaningful connection in HE. It creates attentive and seemingly personalized responses, thereby filling relational gaps where human guidance seems unattainable or absent, and students fail to establish affective relationships with tasks, topics, peers or educators. We conclude that HEIs not only need to provide guidance for the appropriate use of GenAI and the governance of misconduct; much more, they haven an obligation to care for spaces where relationships can flourish, if they want to assure the socialization process into Responsible Academic Practice and, thus, academic integrity.

LEARNING TO LIVE WITH ROBOTS: SOCIAL ROBOTICS AND RESPONSE-ABILITY IN DEMENTIA CARE PRACTICES

Ludovica Rubini (University of Trieste, Italy) · **Francesco Miele** (University of Trieste, Italy)

social robotics | response-ability | dementia care

Social robotics is often framed as an efficient solution to face demographic crisis, an ageing population and a shortage of healthcare staff in contemporary care systems (Wright, 2023; De Togni, 2024). At the same time, the increasing adoption of these technologies in residential settings raises important questions about the democratic governance of intelligent technologies and about how humans and nonhuman actors learn to coexist within institutional care environments. The introduction of social robotics is reshaping the everyday organization of dementia care and the relational practices through which care is enacted. Drawing on Science and Technology Studies (STS) and practice-based approaches, this paper examines how a social robot becomes embedded in the sociomaterial practices of care in residential facilities for people living with dementia, as part of the broader research project ANTICIPATE. Rather than conceptualizing the robot as a therapeutic tool, the research approaches it as a technology-in-practice, whose meaning and effects emerge through situated interactions among human and nonhuman actors (Orlikowski, 2007; Timmermans and Berg, 2003). In this perspective, care practices are understood as sociomaterial arrangements in which heterogeneous elements — caregivers, residents, technological devices and organizational routines — are continuously ordered and stabilized in practice (Gherardi, 2006; Nicolini and Monteiro, 2017; Mol et al., 2010) . Empirically, the paper draws on an ethnographic study conducted in an Italian nursing home where a robotic cat is used as a non-pharmacological intervention in therapeutic activities for residents living with dementia. Data collection combined ethnographic observation during therapy sessions, interviews with professional caregivers (educators and care workers) and visual materials produced during fieldwork. The analysis shows that interactions with the robot generate situated processes of learning through which caregivers develop practical competences for orchestrating affective encounters between residents and technological actors. Through practices of observation, storytelling and affective attunement, caregivers learn to interpret residents' responses and to stage interactions that enable meaningful engagement with the device (Persson et al., 2024; Redmalm et al., 2025). In this sense, therapeutic sessions become more-than-human learning environments where knowledge, care and affect emerge relationally in practice. At the same time, social robotics contributes to the emergence of a politics of coexistence in care environments. Caregivers cultivate forms of response-ability (Haraway, 2016) — understood as the capacity to respond to the affects circulating between humans and nonhuman actors (Massumi, 2017) — through which residents, professionals and robots learn to inhabit shared spaces of care. Social robotics thus participates in shaping sociomaterial practices through which care, knowing and coexistence are continuously negotiated in residential dementia care. By examining these dynamics, the paper shows how everyday care practices contribute to shaping the democratic governance of emerging technologies within care institutions.

MULTISPECIES EDUCATION

Assunta Viteritti (Sapienza, Università di Roma, Italy)

Multispecies | Education | non human

Educational practices aimed at “bringing nature into the classroom” - such as school farms, plant or animal adoption programs, and environmental education initiatives - have become increasingly common. While intended to connect students with nature, these practices mediate and radically simplify its complexity. Nature is miniaturized and staged through isolated elements - a plant, a chick, a small controlled ecosystem - detached from the multispecies ecological networks to which they belong. This produces a pedagogical uncanny: removed from context and transformed into an educational object, nature appears simultaneously familiar and artificial. Its dimension is domesticated, and narratively stabilized, producing a reassuring, moralized image of the environment. Yet this very artificialization generates an effect analogous to Masahiro Mori’s “uncanny valley”: like artificial entities that resemble, but do not fully replicate, living beings, these pedagogical forms of nature provoke unease by imitating life without conveying its relational complexity. Through a feminist and multispecies lens, particularly drawing on Donna Haraway, these practices can be interpreted as devices of epistemic domestication. Contrary to Haraway’s vision of the world as a network of situated, non-hierarchical multispecies relations, such pedagogies risk reproducing an anthropocentric and simplified view of ecology. They may be read as forms of ecological simulation, akin to the “most photographed barn” in Don DeLillo’s White Noise, where the barn becomes a hypermediated simulacrum of nature. Similarly, pedagogical nature emerges as a hyperreal, mediated version of the living: familiar yet unsettling, domesticated yet revealing contemporary tensions between ecological experience, cultural mediation, and simulacra.

DEMOCRATIZING REPRODUCTIVE KNOWELEDGE: EDUTAINMENT, PLATFORMS, AND THE INFLU-ACTIVIST DOCTORS

Letizia Zampino (University of Trento, Italy)

Datafication | Platformization | Reproductive Knowledge

In contemporary digital ecosystems, the boundary between expert biomedical knowledge and lived reproductive experience is reconfigured by algorithms, platforms and infrastructures. Historically, many technological monitoring practices in pregnancy have developed from the representation of the female body as an inherently unpredictable system that requires technological control in order to ensure safety and risk prevention (Davis-Floyd, 1992). These dynamics are being reshaped by processes of health datafication and platformisation (van Dijck et al., 2018) through which bodily processes are translated into measurable data, with the risk to reinforce processes of biomedicalization (Lombardi, 2009; Lupton, 2012). Tracking apps and platforms not merely inform but actively govern the pedagogical ecologies of expectant parents and their partners trough biomedical information and training programmes. From posthuman perspectives, such transformations point to the active role of data infrastructures and digital platforms in reshaping the spaces of democratic learning. This paper examines how digital infrastructures and platforms participate in sociomaterial assemblages that reshape the epistemic cultures through which reproductive knowledge is produced, validated, and circulated (Knorr-

Cetina, 1999). Within this context, new forms of professional mediation emerge, such as the figure of the influ-activist doctor (Lovari & Lombi, 2024), who negotiates their authority between scientific expertise, public pedagogy, communicative accessibility, and algorithmic visibility, while also monetizing their expertise through courses and training programmes targeting both healthcare professionals and expectant parents. In these environments, platforms, algorithms, and data infrastructures participate in governing the pedagogical ecologies through which reproductive knowledge is produced, circulated, and authorized. The paper therefore discusses the ambivalences of these processes: while digital edutainment may reduce informational asymmetries and foster forms of cognitive empowerment, the growing media visibility of reproductive journeys also introduces risks of spectacle, polarization, and the commodification of health. This research, currently in an exploratory phase, combines digital ethnography with a walkthrough analysis (Light et al., 2018) examining how reproductive platforms and influ-activist doctors and other healthcare professionals who use digital spaces to foster participatory forms of reproductive knowledge and democratic learning. Through educational content, training programmes, testimonies, and experiential narratives, these sociomaterial assemblages — composed of platforms, algorithmic infrastructures, digital communities, and influ-activist doctors — participate in the ongoing reconfiguration of epistemic boundaries between biomedical expertise and experiential knowledge. From this perspective, reproductive knowledge emerges through more-than-human assemblages of bodies, data, platforms, and professional actors, raising new questions about care, responsibility, and the democratic governance of reproductive knowledge.

ENACTIVE ASSEMBLAGES: EXPLORING THE BODILY DIMENSION OF LEARNING IN IMMERSIVE TECHNOLOGY-ENABLED ENVIRONMENTS. INSIGHTS FROM A LITERATURE REVIEW.

Andrea Di Gallo (University of Milano-Bicocca, Italy)

Enactive Learning | Immersive Technologies | Embodiment

In the contemporary postdigital context (Jandrić et al., 2018; Rivoltella & Rossi, 2024), the new technologies that increasingly shape educational and learning environments produce new interactions between humans and non-humans, transform relational and material spaces, and thereby give rise to new forms of education and knowledge that require novel conceptual categories and analytical tools to be investigated (Piromalli, Viteritti & Zampano, 2024). A significant strand of research in robotics, bioengineering, and communication technologies has identified the human body, with its physical qualities, as a frontier for the implementation of new technologies (Barbanti & Barone, 2022). In the attention that these fields devote to the perceptual modalities and sensorimotor patterns of living systems, a systemic-enactive logic appears to be emerging. Enactive and embodied approaches (Varela, Thompson & Rosch, 1991; Gallagher, 2023), rooted in some of the most innovative assumptions of cybernetics, biology, and twentieth-century constructivist epistemology (Damiano & Ceruti, 2013; Galimberti, 2024), today identify immersive technology-enabled learning environments, particularly Mixed Reality environments (Speicher et al., 2019), as a fertile area for investigating the role of the bodily dimension in learning processes (Gonçalves et al., 2024) due to the possibilities these environments offer for exploring in new ways the entanglement of bodies, technologies, and knowledge (Gallagher & Lindgren, 2015; Xu, Kang & Yan, 2022). In the Italian school system, the “Scuola 4.0” Plan (Ministero dell’Istruzione, 2022), through investment line 3.2, set the objective of transforming approximately 100,000 classrooms into innovative learning environments by 2025. The most advanced level of transformation is described as one in which physical spaces can be freed and reshaped, and equipped with technologies that support immersive experiences, multiple projection surfaces, and strong connections with virtual environments. From a post-critical perspective (Esposito & Landri, 2024), it therefore becomes necessary to further investigate and identify conceptual tools that can help examine how immersive technologies participate in educational

assemblages. The study develops an ongoing literature review aimed at identifying and critically examining research that draws on enactive principles to design, observe, and assess learning experiences in immersive, technology-enabled learning environments. The review is being conducted using major education databases (ERIC, Scopus, Web of Science, JSTOR, PsycINFO, Education Research Complete, Education Database, and SciELO), as well as search engines providing access to grey literature (e.g., Google Scholar). The key dimensions investigated are a) educational purposes and pedagogical objectives informing the design of immersive enactive experiences across different educational domains (e.g., biodiversity education, special education, STEM education); b) the conceptual tools useful for deepening the analysis and design of learning environments mediated by immersive technologies; c) the expected and actual effects reported in literature. The contribution will outline the theoretical framework guiding the review and the methodological criteria adopted for materials selection and analysis. It will also sketch a pedagogical reflection on the educational implications and recurring patterns emerging at the intersection between the enactive approach and immersive technologies, presented as tentative results that will guide the next steps of this exploration.

Scientific Citizenship at the Boundaries: Re-Enacting Science Practices for Democratic Futures

PANEL CONVENORS: 2) Ricciardi Sara (1; Giulia Tasquier (Università di Bologna, Dipartimento di Fisica e Astronomia "Augusto Righi")

PANEL KEYWORDS: Scientific citizenship, Nature of Science (NOS), Epistemic practices

In a world shaped by profound entanglements between technoscientific systems, socio-political dynamics and ecological limits, education must address forms of knowledge that are increasingly uncertain, value-laden, and contested (1). The climate crisis makes visible how the production, circulation, and public use of scientific knowledge constitute key democratic arenas, where participation, responsibility, and intergenerational justice are negotiated. This panel invites contributions that explore how educational practices can foster scientific citizenship (2) by enabling students to engage not only with scientific concepts, but also with the epistemic processes, uncertainties, and negotiations through which scientific knowledge is produced and to prepare young people to navigate such post-normal conditions (3), where uncertainty is high, stakes are collective, and decisions require inclusive and deliberative reasoning. We invite classroom experiences that re-enact authentic scientific endeavour. We welcome theoretical, empirical, and design-based work that engages learners in the reconstruction of science, modelling complexity, imagining socio-ecological futures, and engaging in boundary crossing across disciplines (4), institutions, communities, and knowledge traditions through designs that treat knowledge as situated, negotiated, and consequential for democratic life and planetary futures (5). Aims: Highlight and promote models that situate learners within the epistemic and collaborative dynamics of real inquiry, engaging them with uncertainty and complexity Showcase classroom boundary-crossing experiences where knowledge is constructed, questioned, and negotiated, connecting scientific understanding with civic participation and democratic deliberation. Explore the potential of NOS-informed approaches for developing reflective, empowered, and socially responsible citizens, cultivating agency to imagine and shape democratic and sustainable futures.

HISTORICAL SCIENTIFIC INSTRUMENTS AS TOOLS FOR NATURE OF SCIENCE REFLECTION IN TEACHER PROFESSIONAL DEVELOPMENT

Stefania Lippiello (University of Padova, Italy) · **Lucia Gabelli** (University of Padova, Italy) · **Marta Carli** (University of Padova, Italy)

Nature of Science | Teacher Professional Development | Historical Scientific Instruments

This contribution presents Let's Interplay and Experiment, a year-long teacher professional development programme (Carli et al., 2023) developed at the University of Padua in collaboration with the Giovanni Poleni Museum of the History of Physics. The programme engages secondary mathematics and physics teachers in interdisciplinary, inquiry-based activities centred on modelling practices and historical scientific instruments (Cavicchi & Heering, 2021), including the Galilean telescope, the spectroscope, and experiments on the measurement of the speed of light, using light as a paradigmatic case study. The course is explicitly framed through the Family Resemblance Approach (Erduran & Dagher, 2014) to Nature of Science (NOS), with structured reflective sessions designed to connect classroom practices to the epistemic, methodological, social, and axiological dimensions of science. Through inquiry-based sequences informed by NOS perspectives (Irzik & Nola, 2014), teachers engage in modelling, measurement, argumentation, and interpretation, whilst also examining the socio-cultural contexts in which instruments were developed and legitimised. In this framework, historical scientific instruments are treated not merely as illustrations of disciplinary content, but as epistemic mediators that make visible key features of scientific practice: the instrumental mediation of knowledge, the dependence of what can be known on what can be observed or measured, and the ways in which instruments embody theoretical assumptions, limits, and uncertainties. The initiative is embedded within the Erasmus+ project INSIGHT (2024-2027), which brings historically contextualised scientific instruments into classrooms through hands-on reconstruction, shared online resources, and collaboration between schools and science museums (Heering & Wittje, 2025). The (re)construction of instruments thus becomes a pedagogically rich activity that bridges disciplinary learning, historical inquiry, and explicit NOS reflection, positioning teachers as both learners and designers of epistemically-aware science education experiences. The guiding question of this contribution is: how can the reconstruction of historically situated scientific instruments foster NOS reflection among teachers and support the design of classroom activities in which scientific knowledge is constructed, questioned, and socially negotiated? More specifically, we explore how instrument-based inquiry can deepen teachers' awareness of key NOS dimensions, including the tentative character of scientific knowledge, the role of models and

instruments in shaping what can be observed and measured, the pervasiveness of uncertainty, and the axiological and socio-cultural embeddedness of scientific practice. Data are drawn from teacher professional development activities, a final focus group, and questionnaires and interviews with participating teachers, and NOS-oriented student questionnaires administered in classrooms where selected activities were piloted. Data collection is currently ongoing; this contribution presents the design of the programme alongside initial observations examining whether engagement with historical instruments and epistemic negotiation prompts teachers to develop more explicit and reflective attention to NOS dimensions in their classroom planning. The programme is further designed so that classroom activities piloted by participating teachers will subsequently involve students in science communication beyond school walls: through planned collaborations with third-sector organisations and public engagement initiatives, students will have the opportunity to share and discuss scientific ideas with broader audiences, extending the reach of NOS-informed science education into the wider community.
