The "impact" of teacher professional development is often considered a linear process linking professional learning to changes in teachers' knowledge and practices, and to student outcomes. While policy and evaluation frameworks frequently rely on this conception of "impact", this approach can oversimplify professional learning as a stable input–output mechanism and underestimate the role of design, mediation, and context. This contribution critically revisits impact in professional development by focusing on a neglected but fundamental aspect: the pedagogical architecture of the learning environment in which teachers enact innovation. We draw on a national eTwinning mixed-methods study carried out across 14 Italian secondary schools, where each implementation context included two matched classes taught by the same teacher in the same subject (eTwinning vs. control). In this context, we focus on the teacher and project layer to explore how "impact" may operate through a structured project scaffold. Using a dedicated project-analysis protocol applied to Quality Label-awarded eTwinning projects, we characterised pedagogical quality along multiple dimensions (such as authenticity of joint tasks, intensity of international collaboration, epistemic use of technology, student agency, and curricular integration). In our research, these qualitative descriptors were triangulated with implementation evidence from teachers' monthly logbooks, cross-case patterns at school level, and quantitative evidences extracted from the analysis of pre-post students' self-evaluation questionnaires and pre-post teachers' evaluations. A key pattern emerges: even within a sample of highly experienced teachers - eTwinning ambassadors with strong professional profiles - project quality varies substantially and aligns with systematic differences in implementation density, visibility of competence-related episodes, and the coherence of the learning workflow. The findings suggest that impact in teacher professional development cannot be exclusively reduced to teachers' baseline expertise. Rather, the eTwinning ecosystem functions as a powerful accelerator and scaffold structure: it provides a pre-architected framework that supports teachers in designing collaborative routines, generating observable evidence of learning processes, and sustaining reflective cycles of planning, documentation, and iterative improvement. In this sense, "impact" appears as an emergent property of a learning ecosystem in which professional competence is surely relevant, but structured design and shared quality criteria strongly condition what can be enacted in practice, documented as evidence, and transferred across contexts.

RETHINKING "IMPACT" IN TEACHER PROFESSIONAL DEVELOPMENT: A SCOPING REVIEW PROTOCOL AND CONCEPTUAL MAP

Laura Parigi (INDIRE, Italy) · **Maurizio Gentile** (CRESPI - "Centro Interuniversitario di Ricerca Educativa sulla Professionalità dell'Insegnante", Italy) · **Elisabetta Cigognini** (INDIRE, Italy) · **Elisa Truffelli** (CRESPI - "Centro Interuniversitario di Ricerca Educativa sulla Professionalità dell'Insegnante", Italy) · **Margherita Di Stasio** (INDIRE, Italy) · **Alessandra Rosa** (CRESPI - "Centro Interuniversitario di Ricerca Educativa sulla Professionalità dell'Insegnante", Italy)

Teacher professional development | impact | teacher agency

The "impact" of Teacher Professional Development (TPD) has become a central policy imperative and a frequent object of evaluation, yet its meaning remains contested and often reduced to linear, measurable effects on teacher knowledge, classroom practices, or student outcomes. Recent developments in impact evaluation of TPD shift the focus from linear effects to contextualized and hierarchical models, linking professional learning to changes in teacher attitudes, practices, and student outcomes (Guskey, 2002; Bubb & Earley, 2010). This approach aligns with the European Commission frame-

works, which emphasize broader contextual effects in teacher training, including institutional and community outreach. This contribution reports the design and early findings of an INDIRE–CRESPI collaborative scoping review aimed at mapping how "impact" is conceptualised and operationalised in recent review-level literature on in-service TPD, and at identifying methodological and political tensions embedded in prevailing evaluation models. Methodologically, the study adopts a PRISMA-informed scoping approach, explicitly oriented to detect conceptual "grey areas", competing definitions, and evaluation blind spots, rather than to estimate a single pooled effect. Following a multi-database search strategy and deduplication workflow, the corpus was progressively refined from a broad pool of records to a manageable subset for abstract screening, with a deliberate focus on review-based studies (systematic reviews, meta-analyses, scoping reviews) and on K–12 contexts. The analytic framework is organised around six mapping questions: (1) definitions of impact (as change, transfer, transformation, sustainability); (2) units of analysis (teacher, school, system) and students as indirect beneficiaries, in K-12; (3) types of effects measured (e.g., impact on teachers' attitudes, conceptions, knowledge, skills, practices; impact on students' perceptions, attitudes, achievement); (4) temporal assumptions (short-term gains vs lasting effects/fade-out); (5) measurement logics (standardised indicators, self-report, observational/artefact-based evidence, multi-level models); (6) role of context and agency (how organisational conditions, professional cultures, and teacher decision-making mediate or re-define "what counts" as impact). By making explicit how review studies frame attribution, causality, and "evidence", the contribution speaks to the panel's call to interrogate the epistemological and methodological implications of impact-driven evaluation, and to propose more contextualised and participatory perspectives. We conclude by outlining a preliminary conceptual map that distinguishes impact-as-accountability from impact-as-professional learning ecology, and by proposing implications for future research designs and policy uses of evaluation in large-scale TPD.

EXPLORING THE IMPACT OF SCAFFOLD CARDS ON TEACHERS' DESIGN PRACTICES FOR COMPETENCE-BASED EDUCATION: A MIXED-METHODS STUDY

Elena Luppi (University of Bologna, Italy) · **Flavio Brescianini** (University of Bologna, Italy) · **Veronica Mobilio** (Fondazione per la Scuola) · **Maria Chiara Pettenati** (INDIRE) · **Aurora Ricci** (University of Bologna, Italy) · **Alexandra Tosi** (INDIRE)

teacher professional development | transversal competences | mixed methods

The growing emphasis on competence-based approaches has increased pressure on education systems to translate European key competences into curricula and everyday practices (Council of the European Union, 2018). This shift calls for effective forms of Teacher Professional Development (TPD) that can support teachers' engagement with competence-based education. TPD is widely recognised as a key lever for fostering innovation and improving teaching quality (Council of the European Union, 2014; OECD, 2019). However, the "impact" in TPD is frequently conceptualised as a linear and measurable effect on teachers' knowledge or classroom behaviour, overlooking the situated, mediated, and context-dependent nature of professional learning (Opfer & Pedder, 2011). Building on the assumption that teachers' professional development is shaped by multiple professional and personal experiences, this contribution explores the potential impact of SCAFFOLD on teachers' ability to design learning activities for competence-based education. SCAFFOLD is a card-based tool developed by the European Training Foundation with the Joint Research Centre and grounded in research operationalising the European key competences for educational design (Bacigalupo, 2022). It is intended to support teachers in designing competence-oriented learning experiences characterised by learners' active engagement with real-world

problems (Bacigalupo et al., 2024). This paper presents the research design and preliminary results of the ongoing Italian adaptation and experimentation, promoted by Fondazione per la Scuola, INDIRE, and the University of Bologna. The study addresses three research questions: (1) whether the use of SCAFFOLD can foster teachers' knowledge of transversal competences, their awareness of their relevance, and their design practices; (2) which factors facilitate or hinder the adoption of the cards; (3) whether design practices initially supported by SCAFFOLD can evolve into autonomous design competences over time. The study adopts an exploratory sequential mixed-methods design (Creswell & Creswell, 2018). An initial qualitative phase, based on semi-structured observations of a SCAFFOLD workshop involving 18 teachers, informed the formulation of the research questions and the subsequent quantitative, questionnaire-based experimentation. A further qualitative phase (interviews and focus groups) will deepen the quantitative findings and reconstruct differentiated teacher profiles and patterns of adoption. The quantitative phase relies on pre- and post-questionnaires and adopts a hybrid design. For teachers who complete both questionnaires, it takes the form of a quasi-experimental non-equivalent groups design, comparing teachers who attended a dedicated webinar with teachers who completed the pre-test but did not attend it. For teachers entering only at the post-test stage, it takes the form of a post-test-only pre-experimental design (Cohen et al., 1980/2018). The questionnaires investigate teachers' profiles, familiarity with competence frameworks, the importance they attribute to key competences, and self-perceived readiness for competence-based design and assessment; the post-test also explores modes of use, perceived usefulness, and facilitators and barriers to adoption. At the time of writing, the study is ongoing; however, the pre-test questionnaire has already collected approximately 800 responses. In conclusion, the experimentation contributes to the debate on TPD by investigating impact not only in terms of observable effects, but also in relation to the conditions, practices, and trajectories through which professional learning takes shape.

TEACH-AI: A MULTIDIMENSIONAL ANALYSIS OF TEACHERS' PERCEPTIONS OF ARTIFICIAL INTELLIGENCE ACROSS THE CONCEPTS OF AFFORDANCE-IN-PRACTICE, PROFESSIONAL CAPABILITY, AND SENTIMENT

Matteo Adamoli (eCampus University, Italy) · **Federica Emanuel** (eCampus University, Italy) · **Michele Marangi** (eCampus University, Italy) · **Marco Rondonotti** (eCampus University, Italy) · **Paolo Raviolo** (eCampus University, Italy)

Artificial Intelligence | Affordance-in-practice | Professional Capability

The paper investigates how Italian teachers perceive and use Artificial Intelligence (AI) in their professional practice. The research, part of the TEACH-AI project, uses the PAIR-S questionnaire (Adamoli et al., 2026) to analyse the responses of over 4500 teachers, focusing on three key theoretical concepts: Affordance-in-Practice (Costa, 2018), Professional Capability (Nussbaum, 2011) and Sentiment (Bing, 2012). The research also identified aspects in relation to the recent "Guidelines for the introduction of Artificial Intelligence in schools" issued by the Italian Ministry of Education and Merit for the introduction of Artificial Intelligence in schools (MIM, 2025). These were incorporated into the survey tool and subjected to detailed analysis in this study. Cluster analysis identified four distinct profiles (Receptives, Adaptives, Oppositionals and Indifferents) based on their technological preparedness and perception of AI, revealing a gap between current predominantly operational use and perceived potential for professional practices in the future (Adamoli &

Emmanuel, 2025). The research aims to understand whether and to what extent AI is perceived not only as a technical tool, but as a professional "capability" capable of promoting integration that enhances professional autonomy and the relational dimension of teaching.

FORMATIVE ASSESSMENT AS A LEVER FOR TEACHER PROFESSIONAL DEVELOPMENT: EVIDENCE FROM THE ITALIAN TEACHER SELF-ASSESSMENT FRAMEWORK

Sara Martinelli (INDIRE, Italy) · **Maria Chiara Pettenati** (INDIRE, Italy)

formative assessment | teacher self-assessment | professional standards

In recent decades, teacher professional development (TPD) has increasingly been framed in terms of measurable impact on teaching practices and student outcomes. While such approaches aim to strengthen accountability and evidence-based policy, they often rely on simplified causal models that overlook the complex and reflective nature of professional learning. Within this debate, formative assessment can be interpreted not only as a pedagogical strategy for supporting student learning, but also as a key dimension of teachers' professional development. This paper explores formative assessment as a potential lever for teacher professional learning through the analysis of a large-scale professional self-assessment device used in the Italian teacher induction programme. The study examines the Bilancio delle competenze, a national framework for teacher self-assessment developed by INDIRE and completed by more than 95,000 newly appointed teachers during their probationary year in 2024/25 and 2025/26. The instrument is structured around three professional domains (Teaching, Institution and Community, and Professional Development), eight standards and thirty-six competence indicators designed to support reflective practice and professional growth. The analysis focuses in particular on the Teaching domain, investigating teachers' self-perceived competence in relation to formative assessment practices. Results show that teachers report relatively strong confidence in communicating learning objectives and assessment criteria to students. However, significant challenges emerge in the operational use of formative assessment as a tool for monitoring learning processes and regulating teaching practices in progress. Approximately half of the respondents position themselves as still "in training" in the implementation of formative assessment strategies during instruction. These findings reveal a persistent gap between instructional design and the use of assessment as an ongoing regulatory process within teaching. While teachers perceive themselves as competent in planning and supporting students' learning processes, the integration of formative assessment into everyday instructional decision-making remains less consolidated. The paper argues that professional competence frameworks and self-assessment tools such as the Bilancio delle competenze should not be interpreted merely as monitoring instruments, but as reflective devices capable of fostering teacher agency and supporting professional learning. From this perspective, the study contributes to ongoing discussions on how the impact of TPD should be conceptualised and evaluated, suggesting that greater attention should be paid to reflective processes and to the role of professional standards in shaping teachers' understanding of assessment as part of their professional practice.

Teachers and Principals in Contemporary Education Systems: Working Conditions, Professional Dynamics and Effectiveness

PANEL CONVENORS: Gianluca Argentin (Università di Milano Bicocca, Italy); Ivan Blancato (Università di Milano Bicocca, Italy); Iacopo Moreschini (Università di Milano Bicocca, Italy)

PANEL KEYWORDS: teachers, principals, effectiveness

For many years, research on school systems has focused mainly on institutional features (funding arrangements, tracking, ..), paying less attention to teachers and principals. Recently, large national and international surveys on teachers clearly highlighted the importance of these professional groups and the ways in which they both shape and are shaped by the school system (OECD, 2025a). Indeed, teachers and principals inhabit and enact schooling on a daily basis, making the difference in students' achievement and related inequalities. Teachers also account for the largest share of public expenditure in education in every country, and the effectiveness of each school system depends on them to a considerable extent (OECD, 2025b). At the same time a crucial mediator between teachers and the education system are school principals, another pivotal category for the school functioning. Placing teachers and principals at the centre of analysis, with their professional identity and experience, allows us to better grasp how educational policies and organisational structures are translated into daily practice and helps overcoming stereotypical views on these professions. For these reasons, this panel aims to foster reflection on teachers and school principals' living and working conditions and on the consequences on their professional quality (Kelly et al 2018), hence on pupils' achievment and inequalities. We invite empirical, theoretical and comparative contributions that investigate teachers and school principals focused on: - Motivation and pathways into the profession; - Professional well-being and interpersonal relations; - Self-efficacy and perceived competences; - Instructional and educational practices; - Schools and teachers Effectivness.

MIDDLE LEADERSHIP AND THE POLITICAL DIMENSION OF TEACHING: INSIGHTS FROM THE ITALIAN SCHOOL SYSTEM

Valerio Ferrero (University of Turin, Italy)

Middle Leadership | Teaching | Italy

This paper advances a theoretical-conceptual reflection on teachers' professional identity by positioning middle leadership (Lambert, 2003; Lieberman & Miller, 2011; Lipscombe et al., 2023; Murphy, 2005) as a structural and constitutive dimension of contemporary teaching in decentralised and autonomous school systems (Altrichter, 2015; Cheng et al., 2016; Keddie, 2015), with particular attention to its implications for equity and social justice. Moving beyond managerial and hierarchical understandings, middle leadership is conceptualised as a constellation of situated professional practices through which teachers connect classroom pedagogy, organisational processes and institutional responsibility (Frost, 2008; Hunzicker, 2022). Thus, it becomes an integral component of teachers' professional work, contributing to the educational project and public responsibility of the school. The Italian context provides a revealing lens: school autonomy has deeply reshaped governance while leaving teachers' leadership roles largely informal, fragmented and weakly recognised (Marsili et al., 2021). Within this configuration, teachers' engagement in coordination, curriculum development, inclusion policies, professional learning and relationships with local communities marks an expansion of professional practice beyond the classroom. This expansion is not interpreted as a functional add-on, but as a distinctive mediation through which autonomy is translated into everyday organisational choices and pedagogical priorities consequential for students' educational opportunities. Thus, middle leadership is interpreted as distributed leadership (Gronn, 2008; Harris,

2009), enabling teachers to negotiate the interplay between pedagogical intentions, organisational constraints and policy demands (Bufalino & Barattucci, 2020; Lupoli, 2017). Such mediation is consequential for professional quality and for how schools address educational inequalities. Middle leadership can strengthen agency, self-efficacy and motivation by opening spaces for responsibility, professional learning and influence over institutional processes (Farchi & Tubin, 2019; Mincu, 2022). At the same time, it can produce tensions, such as workload intensification, role ambiguity and limited recognition, especially where organisational cultures are weak and contractual frameworks fail to sustain these forms of engagement (Di Martino, 2024). These ambivalences are treated as constitutive features of teachers' lived working conditions in autonomous school systems. A further step is to reframe middle leadership beyond organisational effectiveness alone. It is approached as a pedagogical and civic practice (Cong-Lem, 2021) through which teachers participate in governance and contribute to shared educational orientations. In doing so, they influence how inclusion, curriculum coherence and student support are enacted in everyday school life, with direct implications for the reproduction or reduction of educational inequalities: leadership practices may consolidate existing asymmetries or foster more equitable learning conditions (Priestley et al., 2015). From this perspective, teaching appears as an inherently political profession, in which leadership practices express responsibility toward both the institution and the broader social context. Middle leadership emerges as a crucial space where professional practice, ethical commitment and institutional engagement intersect, enabling teachers to act as agents of social transformation rather than mere implementers of externally defined policies. Thus, middle leadership can be recognised and sustained as a collective, equity-oriented dimension of teachers' professional identity within decentralised school systems, provided that organisational conditions, professional recognition and pedagogical understandings of leadership support teachers' agency beyond the classroom.

SOCIAL RECOGNITION, PROFESSIONAL DEVELOPMENT, CAREER AND EVALUATION OF TEACHERS, THE VIEWS OF LOMBARD TEACHERS AND EXPERTS

Marcello Soprani (Ministero dell'Istruzione e del Merito - Unibz, Italy)

Career | Professional Development | Enhancement And Evaluation

The issue of enhancing the teaching profession, through the introduction of an evaluation and career system, has been at the centre of academic and political debate for several years without, to date, any significant achievements having been made. In the meantime, however, the social recognition of the role of teachers has undergone a major downsizing. If we

add to this the progressive ageing of the teaching body (among the oldest internationally), a strong process of feminisation of the profession and the low attractiveness of teaching – according to the required course of study – for the brightest new graduates, a critical picture emerges for the future of the education system in our country. With the study presented in this Thesis intends to develop a novel approach that, starting from the analysis of the sector's literature and thanks to the contribution of renowned experts, can give voice to those directly concerned (questioned through the administration of an online questionnaire) in order to find out the point of view of Italian teachers on the social recognition of the category, professional development, the evaluation of their work and career, thus providing important elements for evaluation and decision-making to policy makers in order to a change of the legal status of teaching staff, for which there is an increasing sense of urgency and need. A change that could start a virtuous path to restore prestige to the profession and also improve school organisation and teaching-learning processes.

TEACHERS' PROFESSIONAL NARRATIVES AND EDUCATIONAL INEQUALITIES: CONSTRUCTING MIGRANT STUDENTS' TRAJECTORIES IN ITALIAN SCHOOLS

Francesco Camattini (Università La Sapienza, Italy)

teachers' narratives | migrant backgrounds | educational inequalities

This contribution engages with the socio-pedagogical debate on educational inequalities by focusing on teachers' professional cultures and narratives as central elements in the co-construction of differences between students and in the differentiation of educational trajectories. In particular, the paper investigates how teachers' professional narratives, expectations, and discursive practices may contribute, in the absence of intentionality, to the reproduction or interruption of educational inequalities affecting students with migratory backgrounds. Teachers' narratives represent a privileged lens through which to understand how inclusion policies and discourses on equality are translated into everyday educational practices. Through these narratives, processes of recognition, evaluation, and orientation are shaped, influencing students' opportunities. The research is guided by the following question: how do teachers' narratives and expectations contribute to shaping the educational trajectories of students with migratory backgrounds, particularly in institutional moments such as school orientation? The analysis adopts the concepts of structural and cultural violence as its theoretical lens, highlighting how educational inequalities may be produced and legitimized through institutional practices, expectations, and seemingly neutral representations. From this perspective, teachers' agency represents a crucial space in which such dynamics may either be reproduced or challenged. The contribution also emphasizes the researcher's dual positioning as both a school principal working in educational contexts characterized by high social complexity and a doctoral researcher in Peace Studies. This positioning makes it possible to combine an insider perspective on organizational processes of schools with a critical approach attentive to issues of justice and recognition in educational contexts. The research is situated in the province of Parma, a territory characterized by a significant presence of students with migratory backgrounds and by a tradition of inclusive educational policies that coexist with persistent dynamics of school stratification. From a methodological perspective, the study adopts a qualitative research design combining sources of data. Semi-structured interviews are conducted with teachers and school staff to explore narratives, representations, and expectations toward students with migratory backgrounds. The research also collects biographical narratives from university students with migratory backgrounds who reconstruct their school trajectories, highlighting experiences of discrimination or downward orientation. Data collection is further complemented by a territorial focus group conceived as a space for professional reflexivity. Specific attention is devoted to comparing teachers' narratives across different segments of the school system, particularly between primary school and lower secondary school. Preliminary analyses suggest that primary schools tend to value students' personal stories more strongly, whereas in lower secondary school teachers' discourses interpret a presumed reluctance among students to share their stories. Particular attention is also devoted to the institutional moment of school orientation at the end of lower secondary education, where expectations, evaluative judgments, and representations of students' potential assume a performative role in shaping their future trajectories. The contribution invites reflection on whether teachers' professional cultures constitute a decisive terrain for advancing democratic education and how transforming the narrative frameworks through which educators interpret students' migratory experiences might contribute to more equitable education systems.

PATHWAYS INTO TEACHING: RECRUITMENT, TIMING, AND CAREER STABILIZATION

Ivan Blancato (Università degli Studi di Milano Bicocca, Italy)

Teachers | Professional trajectories | Teacher Recruitment

This contribution examines pathways into the teaching profession, focusing on the trajectories teachers follow before and during their entry into the school system as workers. Pathways into teaching are shaped by broader labour market dynamics and socio-cultural contexts, which define both opportunities and constraints, as access to professional jurisdictions is institutionally regulated and socially negotiated (Abbott, 1988). From this perspective, the institutional features of the profession – particularly recruitment rules and training requirements – play a decisive role in structuring individual careers (Santiago, 2004). In Italy, teacher recruitment has undergone repeated reforms and has been widely debated for its peculiar institutional configuration and continuous transformation (Gremigni, 2013; Magni, 2019). The coexistence of overlapping entry mechanisms over time (Carbone & Gargiulo, 2022) has influenced not only formal selection procedures but also the timing, stages, and conditions through which individuals move from training to stable employment. Overall, the combination of heterogeneous recruitment logics and extraordinary measures has fostered structural precariousness within the school system (Argentin, 2018): at the systemic level, it affects educational stability and school organization (Barbieri & Sestito, 2017; Argentin & Pavolini, 2020; Abbiati et al., 2021); at the individual level, it has consequences for teachers' professional and personal lives (Berton et al., 2009; Colucci & Gallo, 2017; D'Onofrio, 2017). Drawing on recent data from the Quarta Indagine sulle Condizioni di Vita e di Lavoro degli Insegnanti Italiani, this study investigates both the trajectories and the timing of access to teaching, examining how they have evolved over time in relation to broader systemic transformations. The findings show that entry into teaching generally takes the form of a long and multifaceted pathway, with first appointments occurring at increasingly later stages of working life. Moreover, a teaching career often follows prior work experiences rather than serving as a first occupational destination; many teachers enter the profession after accumulating substantial experience in other sectors. At the same time, initial school appointments rarely coincide with immediate tenure; instead, they are followed by extended periods of temporary or fixed-term employment, during which teachers often face several years of contractual uncertainty before achieving stability. The analysis also shows that different professional trajectories are associated with distinct patterns of declared motivations for entering teaching, suggesting that pathways into the profession are linked not only to objective career sequences but also to the meanings individuals attribute to their occupational choice. Overall, these results portray a system in which entry into the profession and subsequent stabilization unfold through prolonged and differentiated trajectories, with significant implications for the composition of the teaching workforce and the integration of new cohorts into schools. Furthermore, the heterogeneity of access pathways is associated with differences in how teachers experience their professional role: for example, teachers with distinct entry trajectories report varying levels of job satisfaction, as well as different ways of interpreting and practicing school life. These findings suggest that recruitment patterns shape not only structural career opportunities but also teachers' motivations, professional orientations, and their subjective relationship to their work.

BETTER ENVIRONMENT, BETTER TEACHING: THE POWER OF TEACHERS' NETWORKS

Teodora Uberti (Università Cattolica del Sacro Cuore, Italy) · **Giulietta Zanga** (Università degli Studi di Milano, Italy)

Italian teachers | networks perception | job satisfaction

Research consistently shows that positive and functional collaboration among teachers improves the quality of classroom practices and is associated with higher job satisfaction and well-being. These benefits extend to students, fostering participation, motivation, learning, and the development of social skills. In the Italian context, teacher collaboration is shaped by organisational features such as school structure, staff stability, and the overall quality of professional relationships (Aquario et al., 2017). Studies highlight that teachers' positions within professional networks influence key work-related attitudes, including self-efficacy and job satisfaction. Teachers who are more centrally connected tend to feel more confident and satisfied, benefitting from greater opportunities for exchange, feedback, and support (Uberti and Zanga, 2026). Moreover, the literature shows that students of well-integrated teachers often obtain better academic outcomes, indicating that collaboration can enhance both teaching quality and student achievement (Moolenaar, 2012; Siciliano, 2016; Daly et al., 2010). For the first time in Italy, a large-scale survey explored how teachers perceive networking within their school environment. A total of 4,822 teachers answered questions on the perceived organisation of collaboration, their own position within working networks, the availability of trusted colleagues with whom to discuss work-related challenges, and the climate of cooperation or conflict within the school. The study addresses the following research question: how is teachers' job satisfaction linked to their perception of professional relationships with colleagues and the organisation of the school? Preliminary findings confirm earlier evidence. Teachers who perceive their school networks as integrated, open, and non-hierarchical report the highest levels of job satisfaction. Those who instead perceive rigid hierarchies, fragmentation, and limited communication between organisational levels tend to report lower satisfaction. Regarding personal positioning, teachers who see themselves as part of cohesive groups show the greatest satisfaction, whereas isolated teachers report the lowest. The presence of at least one trusted colleague with whom to discuss professional issues is strongly associated with higher satisfaction. These patterns remain robust after controlling for a wide range of individual and contextual characteristics. The analyses include controls for personal socio-demographic factors (gender, age, caregiving responsibilities), professional factors(career mobility, union membership, previous work experience, current and past roles, motivations, perceived job security, and subject area), and school-level characteristics (geographical location, infrastructural conditions of school buildings, and the availability of facilities). The study also replicates the analyses using measures of teachers' self-efficacy, finding similar associations between perceived network integration and positive professional outcomes. These results underscore the importance of supportive professional environments and suggest that strengthening collaboration may contribute to improving both teacher experience and school functioning.

HOW TEACHERS EVALUATE THEIR WORK: A MULTIDIMENSIONAL ANALYSIS OF ITALIAN TEACHERS' JOB SATISFACTION

Giorgio Piccitto (Università degli Studi di Milano Bicocca, Italy) · **Ivan Blancato** (Università degli Studi di Milano Bicocca, Italy)

Teachers | Job Satisfaction | Professional Well-being

Studying teachers' job satisfaction is crucial for understanding not only the quality of their work - an issue of increasing political and scientific concern - but also the broader quality of the education system. The way teachers perceive their work offers valuable indications about school functioning, organizational climate, and the sustainability of the profession itself. Since schools largely depend on those who inhabit and shape them on a daily basis, teachers' job satisfaction becomes a strategic lens through which to assess the strengths and weaknesses of the system. Moreover, their well-being

is closely intertwined with interpersonal dynamics within schools and with students' learning experiences. More generally, job satisfaction represents the subjective dimension of job quality (Rose, 2003; de Bustillo Llorente & Macías, 2005). For this reason, it has gained increasing attention in public debate and policy agendas concerned with promoting individual well-being (Clark, 2015). The existing literature suggests that satisfaction is a multidimensional construct. Classic need-based approaches, such as the Two-factor theory (Herzberg et al., 1959), distinguish between extrinsic aspects of work (e.g., pay, job security, working conditions) and intrinsic or motivational dimensions (e.g., autonomy, recognition, responsibility). At the same time, interactionist perspectives (Edwards, 1991; Schneider, 2001) emphasize that job satisfaction results from the interplay between job characteristics and individuals' values and socio-demographic traits. Together, these insights provide a framework for analysing how teachers interpret and evaluate their professional experience. Drawing on recent data from the Quarta Indagine sulle Condizioni di Vita e di Lavoro degli Insegnanti Italiani, this study explores how teachers assess their job and the conditions under which it is carried out. The findings portray a professional group that, while operating within a context marked by structural constraints and limited external recognition, expresses an overall positive evaluation of its occupational position. Satisfaction appears to rest primarily on intrinsic dimensions of teaching – such as its perceived social usefulness, its relational component, and the opportunity to engage in meaningful work – whereas more strictly extrinsic aspects, including pay and career prospects, remain critical yet do not undermine the general assessment of the profession. Importantly, teachers' job satisfaction emerges as a relative and dynamic construct: it is shaped by comparison processes involving personal expectations, prior experiences, alternative career paths, and different stages of the life course, as well as by broader transformations in the labour market. This perspective highlights the importance of the interactionist approach in studying job satisfaction of Italian teachers.

TOWARDS A HISTORY OF SCHOOL LEADERSHIP PROFESSIONALISM. THE CASE STUDY OF GIANCARLO CERINI, PRIMARY SCHOOL HEADTEACHER IN ITALY IN THE 1980S

Mirella D'Ascenzo (University of Bologna, Department of Education Studies) · **Gabriella Pagnotta** (University of Bologna, Department of Education Studies)

Educational leadership | Primary School Headteacher | Giancarlo Cerini

The increasing attention devoted by educational research to school leaders—now widely recognised as strategic actors in the functioning and innovation of educational systems—suggests the importance of a historical re-examination of their role. From this perspective, a diachronic approach invites us to consider how, even prior to the full establishment of school autonomy, certain leadership figures exerted a significant influence on the organisational and managerial structures of educational institutions, on the construction of teachers' professional identity, and on the development of democratic teaching practices. Reinterpreting these experiences from a historical-educational perspective therefore means not only reconstructing past organisational models, but also understanding how particular pedagogical visions, leadership styles and forms of coordination have contributed over time to the shaping of democratic professional cultures within a dialogical relationship between past and present.For these reasons, this paper focuses on the figure of Giancarlo Cerini, who served as a primary school teacher, headteacher, researcher at the Regional Institute for Educational Research, Experimentation and In-Service Training (IRRSAE) of Emilia-Romagna, technical inspector at the Italian Ministry of Education, and was undoubtedly among the key protagonists of the season of school reforms from the 1980s onwards. Among his most notable contributions are the drafting of the National Guidelines for the Curriculum (2012) and the Pedagogical Guidelines for the Integrated 0–6 Education System (2021). In the current national context, characterised by an intense debate on democratic schooling, analysing Cerini's contribution may prove particularly relevant. This study aims to provide a historical and theoretical overview of the formative role played by Cerini during his tenure as headteacher between 1979

and 1984, a period during which he developed democratic operational practices characterised by a deeply open and participatory leadership style, fostering cooperation among teachers, families and local institutions. Through the analysis of printed and archival sources—many of which have so far remained unexplored—the paper examines several specific experiences that highlight the democratic practices implemented during Cerini's leadership. Although the role and professional identity of school leadership have evolved over time, these experiences may still represent a valuable point of reference today, as they embody an anticipatory and innovative conception of school governance.

FROM LECTURING TO ACTIVE LEARNING? TEACHING PRACTICES AND PROFESSIONAL SELF-EFFICACY AMONG ITALIAN TEACHERS

Giulia Pastori (UNIVERSITY OF MILAN-BICOCCA, Italy) · **Valentina Pagani** (UNIVERSITY OF MILAN-BICOCCA, Italy)

Teaching practices | Teacher self-efficacy | Active learning

In recent years, research on education systems has increasingly emphasized the role of teachers as key actors shaping learning environments and student outcomes. Within this perspective, understanding how teachers teach, and which professional and contextual factors support different instructional practices, is crucial for interpreting educational effectiveness. This paper investigates teaching practices in Italian schools, focusing on the diffusion of active methodologies, teachers' professional representations, and the role of perceived self-efficacy and school context. The analysis is based on data from a national survey (Fourth Italian Teachers' National Survey, Argentin, 2026) conducted in 2025 among teachers across school levels in Italy. The study examines the frequency of use of instructional practices, ranging from traditional lecturing to interactive approaches such as dialogic teaching, active learning strategies, laboratory-based activities, and cooperative learning. These approaches are widely discussed in the literature as important for improving instructional quality and promoting students' engagement in learning (OECD, 2019; Strachan & Liyanage, 2015; Vergara et al., 2020). The analysis also considers teachers' professional culture and perceptions of their work environment, including views on professional preparation, opportunities for in-service training, school capacity for innovation, and teachers' self-efficacy in different domains of educational practice (Le Donné et al., 2016). Descriptive results show that Italian teachers tend to adopt a hybrid teaching repertoire. Traditional lecturing remains widespread: 56.1% of teachers report using frontal lectures frequently, while 30.8% use them sometimes. However, dialogic teaching appears even more common, with 72% of teachers declaring that they use it frequently and 24% sometimes. Active methodologies are also widely present, although often used alongside traditional approaches: between 40% and 43% of teachers report frequent use of active learning strategies, laboratory activities, and cooperative learning, while a similar proportion report using them occasionally. A comparison with data collected in 2008 reveals a substantial transformation in teaching practices over time. The frequent use of traditional lecturing has decreased significantly (from 75.3% in 2008 to 56.1% in 2025), while active and collaborative practices have expanded considerably. In particular, frequent use of cooperative learning has risen from 12.8% to 43.1%, active learning strategies from 23.9% to 40.9%, and laboratory-based teaching from 25.9%

to 40.1%. To better understand factors associated with these practices, principal component analysis identified underlying dimensions of teaching methodologies and professional competences. Results highlight two main dimensions: one related to active teaching practices, one associated with teachers' perceived self-efficacy. Regression analyses indicate that adoption of active methodologies is strongly associated with higher levels of self-efficacy, particularly in student-oriented teaching tasks such as motivating students, supporting inclusion, and fostering critical thinking. At the same time, teachers report lower perceived efficacy in influencing the organizational and cultural dimensions of their schools. This gap suggests that pedagogical innovation often remains linked to individual initiative rather than being embedded in collective professional cultures. Strengthening collaborative professional environments, opportunities for shared instructional planning, and supportive leadership therefore appears crucial to make innovative teaching practices more systematic and sustainable within schools.

TEACHERS' OCCUPATIONAL HEALTH AND ORGANISATIONAL SUPPORT IN ITALIAN SCHOOLS: EVIDENCE FROM THE "4TH TEACHERS' LIVING AND WORKING CONDITIONS" AND "HBSC TEACHERS" SURVEYS

Marta Branda (University of Milano-Bicocca, Department of Psychology, Health and Sustainability Lab) · **Luca Piero Vecchio** (University of Milano-Bicocca, Department of Psychology, Health and Sustainability Lab) · **HBSC Lombardy Research Group** (DG Welfare Lombardia (Italy)) · **Veronica Velasco** (University of Milano-Bicocca, Department of Psychology, Health and Sustainability Lab)

school-based health promotion | teachers' health and well-being | school organizational support

Schools face growing pressures to deliver on learning, inclusion, equity, and innovation with constrained resources (European Commission, 2008). As teachers' work expands beyond instruction, administrative and compliance demands contribute to time poverty and limited recovery (Creagh et al., 2025; OECD, 2025). Teachers' occupational health is central to promoting wellbeing across the whole school community (World Health Organization, 2022), and school-based relational conditions (e.g., supportive leadership and collegial relationships) are key protective resources in high-demand contexts (Schaufeli et al., 2006; Skaalvik & Skaalvik, 2009; Velasco et al., 2013). This study aims to describe teachers' burnout, engagement, and perceived need for psychological support across sociodemographic and professional groups, and to examine how these outcomes vary by satisfaction with relationships with school leaders and colleagues. This study is part of the Quarta Indagine sulle Condizioni di Vita e di Lavoro degli Insegnanti Italiani, which aims to provide a comprehensive overview of the living and working conditions of the Italian school system. The survey involved a representative sample of 9,671 teachers, based on a stratified sampling design. The analyses presented here focus on a random subsample (N = 4,699) who completed a dedicated battery on teachers' occupational wellbeing. Self-report measures of burnout (BAT-12) and engagement (UWES-9) were administered. Teachers were also asked whether they considered a dedicated psychological support service at school useful for supporting teachers' wellbeing. In addition, teachers' satisfaction with perceived support from school leaders and colleagues was examined. To further contextualise these national findings, additional analyses will benchmark results against the HBSC Teachers Survey 2022 (Lombardy, Italy), which involved 5,847 teachers from lower and upper secondary schools. Overall, Italian teachers reported low-to-moderate burnout (M = 1.95; SD = 0.53), with 18.3% in the high range and 1.5% in the very high range. Exhaustion was the highest burnout component (M = 2.54; SD = 0.82), and 60.2% reported scepticism about the meaning and value their work has for others. Engagement was high (M = 3.98; SD = 0.62): 77.5% reported feeling enthusiastic often/always and 83.6% feeling immersed often/always. Group differences were modest: burnout was lower and engagement higher in

Central/Southern Italy than in the North, and primary teachers reported lower burnout and higher engagement than secondary teachers. Regarding support needs, 59.9% considered a school-based psychological support service useful for themselves. Finally, greater satisfaction with support from school leaders and colleagues was associated with lower burnout and higher engagement, most strongly for school leadership, consistent with HBSC Teachers evidence linking higher principal support to lower burnout. Findings indicate that, alongside generally high engagement, a non-negligible share of teachers experience elevated burnout and report concerns about the meaning and value their work has for others. Reported needs for psychological support are widespread. Satisfaction with school-based relational support, especially from school leaders, shows the clearest and most consistent association with both lower burnout and higher engagement, highlighting the relevance of strengthening supportive leadership and collegial environments in efforts to promote teachers' occupational health.

SELF-EFFICACY AND ORGANIZATIONAL LEVERS IN ITALIAN TEACHING: PROFILES, RESOURCES, AND PROFESSIONAL OUTCOMES

Iacopo Moreschini (Department of Sociology and Social Research, University of Milan–Bicocca, Italy) · **Paolo Guandalini** (Department of Psychology and Cognitive Science, University of Trento)

Teacher self-efficacy | school organizational resources | professional well-being

Over the past decades, the teaching profession has become increasingly complex. Classrooms are more heterogeneous in terms of educational needs and migrant backgrounds; digital technologies have become pervasive; and opportunities for professional development remain limited. In this context, teachers' self-efficacy represents a crucial professional resource. In line with Bandura's (1991) social cognitive theory, teacher self-efficacy refers to teachers' beliefs in their capability to teach effectively, engage students, and foster learning (Tschannen-Moran & Woolfolk Hoy, 2001). International research shows that higher teacher self-efficacy is associated with greater job satisfaction, stronger professional commitment, lower burnout, and improved student outcomes. In the Italian context, data from the OECD Teaching and Learning International Survey (2025) indicate levels of self-efficacy above the OECD average, despite limited mentoring, career pathways, and professional feedback mechanisms. It is therefore important to better understand how perceived self-efficacy is distributed among Italian teachers in order to design effective organizational interventions. Using data from the Fourth Survey on the Living and Working Conditions of Italian Teachers, this study analyzes a representative sample of teachers across all educational levels (n = 9680) through latent profile analysis. Self-efficacy is measured through a 20-item four-point Likert scale articulated into four subdimensions: efficacy in student engagement, instructional strategies, classroom management, and influencing the school context. The study has a twofold objective: first, to examine which teacher characteristics (socio-demographics, working conditions, and teaching level) are associated with the four profiles identified; second, to investigate the relationship between self-efficacy and organizational resources within schools—such as professional development opportunities, peer relations, organizational hierarchies, and teachers' inclusion in decision-making processes—as well as outcomes highlighted in the literature, including work-related stress, job satisfaction, and other indicators of professional well-being. This framework helps identify resources "within reach" of schools that may improve teachers' working conditions and the quality of teaching. Four distinct profiles of teachers' perceived self-efficacy

emerged from the latent profile analysis. The first profile (management-struggling teachers) was characterized by very low classroom management efficacy alongside slightly above-average levels of instructional strategies and student engagement. This group included relatively more younger and substitute teachers, as well as teachers working in upper secondary education and support roles. The second profile (moderately confident teachers) showed balanced levels of self-efficacy across all domains, generally close to the sample average, and a composition similar to that of the overall sample. The third profile (highly confident teachers) reported above-average self-efficacy across all dimensions and included relatively more experienced teachers, teachers working in primary education, and a higher proportion from southern regions. Finally, the fourth profile (management-oriented teachers) showed very high classroom management efficacy but lower levels in the other domains, particularly in influencing the school context, and included more tenured and older teachers working in upper secondary schools. Regression analyses based on the proposed framework provide further insights into the organizational and professional factors associated with different patterns of teacher self-efficacy.

DIGITAL TECHNOLOGIES IN ITALIAN CLASSROOMS: PRACTICES, ATTITUDES, AND EMERGING CHALLENGES

Giovanni Maria Abbiati (University of Brescia, Italy) · **Gianna Cappello** (University of Palermo) · **Emiliano Grimaldi** (University of Naples) · **Marco Gui** (University of Milan-Bicocca)

educational technology | teachers | AI

Over the past two decades, digitalization has been regarded across OECD countries as the primary vehicle for school modernization (Selwyn, 2021). This has translated into growing public investment in digital innovation in schools, alongside increasing pressure on teachers to become active participants in the digital re-infrastructuring of learning environments and to embrace a radical vision of pedagogical innovation through digital technologies (OECD, 2025). Against this policy backdrop, research efforts have multiplied to understand how the integration of digital technologies into teaching practices is evolving, and how teachers' opinions and attitudes toward both established and emerging digital tools are changing (Sarra et al., 2025; Wijnen et al., 2023). This paper examines the evolution of digital technology use and related attitudes among Italian teachers, drawing on data from the IV Italian national teachers' survey conducted on a national sample of teachers during 2025. The analysis takes place against the backdrop of a profound transformation in the technological landscape since the previous wave of data collection (dated 2008). This survey provides a rich set of questions devoted to investigate the use of ed-tech in classroom activities, the agency of students in managing digital devices during school hours, and attitudes towards the impact of the technological trasformation undergone by the school system in the last 20 years. Findings reveal that certain teaching practices — particularly those involving the use of interactive whiteboards (IWBs) under direct teacher control — have become fully mainstream, no longer showing significant differences related to teacher age and only marginal disciplinary variation. By contrast, practices that require continuous, active technology use by students, such as collaborative tasks or content creation activities, remain less widespread, albeit growing. The paper also highlights a shift in teachers' attitudes toward the defining technological innovation of the current moment — artificial intelligence — which, compared to the reception once given to the Internet in the previous survey (Gui, 2010), appears markedly more cautious and reflective. This measured stance suggests a greater awareness of both the potential and the risks associated with the rapid integration of new tools into educational settings. To explore whether technology users can be grouped into meaningful profiles, the paper employs cluster analysis, aiming to identify distinct types of teachers based on their patterns of use and their underlying attitudes. Overall, teachers express a broadly positive view of the role that digital technologies have come to play in their professional lives. At the same time, they voice considerable concern about students' use of social media and its potential effects on their well-being.

EDUCATION FOR DEMOCRACY IN THE CIVICS CLASSROOM – EFFECTS OF TEACHER TRAINING COURSES AND CLASSROOM INTERVENTIONS

Marvin Masella (Goethe University Frankfurt, Germany) · **Monika Oberle** (Goethe University Frankfurt, Germany)

Education for Democracy | Teacher Training | Intervention Study

Across Europe, democracies are facing increasing pressure from radical right-wing and anti-democratic forces. In recent years, young people in particular have become a key target group for anti-democratic actors, especially in the digital sphere. Social science research now encompasses numerous studies on radicalization and extremism, including development-oriented models of radicalization processes (e.g., McCauley & Moskalenko, 2017, Kruglanski et al., 2019, Borum, 2011), research on individual risk and protective factors (e.g., Borum, 2014), and analyses of the ideological foundations of radical-right and anti-democratic movements and their societal effects (e.g., Mudde, 2014, Mudde & Kaltwasser, 2017). In the field of radicalization prevention and education for democracy (CoE, 2018), studies indicate that interventions can promote resilience, foster democratic values, and enhance participants' self-efficacy and empathy (e.g., Feddes et al., 2015, 2019). However, methodologically sound evaluation studies are still rare (Wolfowicz et al., 2022). While teacher training is seen as key for radicalization prevention and democracy education at schools, there is a lack of empirical studies regarding the effects of training courses for democracy education in the civics classroom. To address these research deficits, we present the results of a scientific evaluation of multi-module training courses for civics teachers and related teaching units, implemented in Lower Saxony, Germany. Both were developed, piloted, and implemented in the project "Empowering Civics Teachers to Prevent Radicalization" (2022-2025) at University of Goettingen and Goethe University Frankfurt, Germany (funded by the Ministry of Justice of Lower Saxony). The teacher training courses were designed to enable educators to address the foundations and challenges of liberal democracy in civic education. They aimed to support teachers in using topics such as conflicts between fundamental rights, the state's monopoly on the use of force, civil disobedience, and the question of legitimate limits of tolerance as meaningful teaching and learning opportunities, and in addressing these issues in a cognitively activating, action- and student-oriented way in the classroom. Using semi-standardized questionnaires, a total of N=65 civics teachers, who participated in three multi-module training courses, were surveyed at two measurement points (pre-test, post-test). Furthermore, N=61 students from grammar schools and vocational schools were surveyed at pre- and post-test in order to assess changes resulting from the specially designed teaching units. For teachers, the evaluation focused on subjective (pedagogical) content knowledge regarding education of democracy and on their perceived self-efficacy in addressing and countering anti-democratic positions in the classroom. For students, the evaluation focused on their attitudes and motivations towards pluralistic democracy. The empirical results indicate that the teacher trainings had a positive impact on teachers' self-efficacy regarding the integration of democracy education into their civics lessons and fostered their willingness to address anti-democratic views in the classroom. The classroom interventions resulted in significant changes in students` democratic orientations, showing positive effects on their attitudes toward fundamental features of pluralistic democracy and a stronger rejection of authoritarian positions. The presentation concludes with a discussion of methodological limitations of the study and offers an outlook for civic education practice and future research on democracy education in schools.

TEACHERS' WORKING CONDITIONS AND PERCEIVED EFFECTIVENESS IN HETEROGENEOUS CLASSROOMS: EVIDENCE FROM A FACTORIAL SURVEY EXPERIMENT

Elisa Manzella (Università degli studi di Milano-Bicocca, Italy) · **Valentina Tobia** (Università Vita-Salute San Raffaele, Italy)

working conditions | teacher effectiveness | classroom heterogeneity

Teachers' working conditions are increasingly recognised as a key factor shaping the effectiveness of education systems, as well as students' learning outcomes and educational inequalities (Hanushek & Rivkin 2012; OECD 2025). While a large body of research has examined institutional features of school systems, growing attention is now being devoted to teachers' working conditions, professional well-being, and perceived effectiveness (Darling-Hammond 2017). Understanding how teachers interpret the challenges of everyday teaching is crucial for analysing how educational policies and school structures are translated into practice. Student heterogeneity is a structural feature of contemporary classrooms, encompassing differences in socio-economic background, language, learning needs, and educational trajectories. In Italy, recent policy developments — such as legislation on learning disorders (L. 170/2010) and the extension of the category of Special Educational Needs — have increased institutional attention to diversity in schools, making the management of heterogeneous classrooms a core component of teachers' professional role. At the same time, research and policy debates often address diversity through specific categories of students rather than considering heterogeneity as a systemic condition of everyday teaching (Ianes et al. 2020). This paper investigates how classroom composition and organizational conditions shape teachers' expectations of professional stress and teaching effectiveness. The analysis draws on data from a large survey of Italian teachers (N ≈ 9,500) that includes a factorial survey experiment. Respondents were presented with vignettes describing hypothetical classroom compositions varying across several dimensions: class size (18 vs 24 students), gender composition, presence of students with migrant background, presence of students with specific learning disorders (SLD), and level of family collaboration. In a second stage, an additional organizational factor was introduced: the composition of the teaching staff, distinguishing between classes with a stable teaching team (mostly tenured teachers) and classes with a high presence of substitute teachers. Teachers were asked to evaluate how stressful teaching in the described class would be and how effective they expected their teaching to be. Results show that teachers generally report moderate expected stress and relatively high confidence in their teaching effectiveness, which aligns with previous research highlighting the cumulative nature of risk and protective factors shaping teachers' well-being (Zagni et al. 2025). However, both outcomes are significantly shaped by structural and organizational conditions. Larger classes, low family collaboration and instability in the teaching staff substantially increase expected stress and reduce perceived teaching effectiveness. In several cases, organizational features such as the stability of the teaching staff appear to have an impact comparable to, or greater than, the characteristics of students themselves. These findings suggest that teachers' professional experience cannot be fully understood by focusing only on student diversity. Instead, the organizational environment in which teachers work plays a crucial role in shaping both professional well-being and expectations of effectiveness. By highlighting the interaction between classroom heterogeneity and school organizational conditions, the paper contributes to current debates on teachers' working conditions and their implications for school effectiveness and educational inequalities.

VOCATION, CHOICE OR SERENDIPITY? BIOGRAPHICAL PATHS TOWARDS SPECIAL EDUCATION PROFESSION

Anna Carola Freschi (University of Siena, Italy, Department of Social, Political and Cognitive Sciences) · **Mario Giampaolo** (University of Siena, Italy, Department of Social, Political and Cognitive Sciences) · **Francesca Bianchi** (University of Siena, Italy, Department of Social, Political and Cognitive Sciences)

special education teachers | biographical and career transitions | social representations

This article presents the preliminary findings of a qualitative, exploratory research conducted by an interdisciplinary team comprising sociologists and educators. The study's objective is to analyse the biographical and professional trajectories of participants in the Training Course for Specialization in Support Activities for Pupils with Disabilities (2023-2024 edition), which was organized by the University of Siena. The research is based on an analysis of the internship reports of the 305 course participants (90% of whom were women). From these texts, it was possible to extract information on their biographical, educational and professional backgrounds and on the reasons that led them to choose to specialize. Other areas taken into consideration were their perception of their professional role, the social representations associated with it and how these could be changed. In particular, the following information can be extracted from the documents collected: socio-demographic data, with reference to educational and professional history and a particular focus on motivations, training, profession (jobs held, their duration), and significant events in the individual's personal history; social and individual representations of the profession, significant actors, territorial context; expectations regarding one's role as a teacher for inclusive education in the community of reference; possible ways of changing critical and/or negative representations of the profession. The picture that emerges seems to highlight bumpy paths and composite professional identities, an aspect that is well known in the literature (Fondazione Agnelli 2021; Frison et al. 2023a, 2023b; Giaconi et al. 2021; Ianes 2016; Paccagnella 2025). There are frequent cases of professional careers from very different backgrounds: often, in these cases, it is biographical events or institutional opportunities that, in the participants' accounts, bring them closer to the world of care or lead them to seek greater meaning in their work. The search for economic stability and, even more so, for a work-life balance is also important, especially for those coming from highly flexible and precarious jobs. There are also more linear paths in which teaching is not a "discovery" but an original ambition. Since the sources used are texts created for educational assessment, it should be noted that these may be affected by a bias generated by the intention to enhance one's own learning outcomes. At the same time, the texts analysed reflect how subjects reconstruct their professional paths, giving them meaning. Ultimately, life stories are very rich and complex and paint a more nuanced and complex perspective than that presented in the most widespread social representations, according to which being a teacher, especially a teacher for inclusive education, is only a fallback option or an opportunistic choice. Similarly, the picture that emerges from these documents regarding social representations of the profession of teacher for inclusive education is far from obvious, with a fairly widespread rejection of a limited role, of mere support, and therefore of being "second-class". The analysis, in fact, allows for a better understanding of the relationship between biographical and professional paths on the one hand and social representations of the profession on the other.

SCHOOL LEADERSHIP AS AN ENABLER OF TEACHERS' DIGITAL COMPETENCE FOR INCLUSIVE AND DEMOCRATIC SUPPORT FOR PUPILS WITH SPECIAL EDUCATIONAL NEEDS

Joacim Ramberg (Department of Special Education, Stockholm University, Sweden)

school leadership | teacher´s digital competence | democratic education

Across contemporary education systems, teachers and principals play a decisive role in shaping both the quality and the democratic character of schooling. Research shows that digitalisation has reshaped pedagogical and organisational demands on teachers (Selwyn, 2016) and that digital tools can enhance accessibility, participation, and learning for pupils with special educational needs (SEN) (Eady & Lockyer, 2013; Duque et al., 2024). Yet limited attention has been given to how organisational conditions, particularly school leadership, shape teachers' digital competence in ways that matter for inclusion, equity, and democratic participation. This study examines how teachers' perceptions of school leadership relate to their self-reported digital competence to support students with SEN. The analysis draws on cross-sectional data from 285 in-service teachers enrolled in Swedish special education training programmes, using the SELFIE survey (European Commission, 2025), grounded in the DigCompOrg framework (European Commission, 2022) and complemented with a SEN-specific digital competence module. Findings show a consistent and significant positive association between school leadership and teachers' digital competence in supporting students with SEN, robust after adjusting for teacher collaboration, infrastructure and equipment, and demographic variables. Teacher collaboration contributes positively, aligning with research on collegial cultures (Castaño Muñoz et al., 2023), while the nonsignificant effect of infrastructure reflects the uniformly high digital access in Swedish schools (Munoz et al., 2018). These results indicate that teachers' digital competence develops through organisational conditions shaped by school leadership rather than through individual efforts alone. Prior research highlights principals' roles in setting direction, allocating resources, and fostering innovative pedagogical cultures (Hallinger, 2011; Leithwood et al., 2020; Dexter, 2011). Consistently, teachers who perceive that school leaders articulate a clear digitalisation strategy, involve staff in its development, and support experimentation with technology report higher competence in designing accessible digital learning resources, assessing SEN-related needs, and promoting participation for all students. The study contributes to debates on teacher professionalism, working conditions, and school effectiveness by showing that school leadership is more strongly associated with teachers' SEN-focused digital competence than material conditions or demographics. This aligns with findings that competence development is most effective when embedded in whole-school strategies supported by leadership (Joya et al., 2025) and with research emphasising digital competence as essential for inclusive teaching (Cabero-Almenara et al., 2022; Instefjord & Munthe, 2016). A further contribution is the link to the democratic mission of schooling. Inclusive digital practices expand participation, communication, and agency for pupils with SEN, dimensions central to democratic education. Digital technologies can strengthen communication, motivation, and engagement (Holmgren, 2024; Mukhtarkyzy et al., 2025), but only when teachers have both competence and organisational support to use them meaningfully. By promoting adaptive instruction, accessible communication, and active involvement, school leaders help ensure that pupils with SEN can exercise their right to equitable and democratic learning opportunities. Taken together, the findings highlight school leadership as crucial for enabling teachers to translate digitalisation into pedagogically meaningful and democratically oriented practices for pupils with SEN.

ASSESSING LEARNING: TEACHERS' ASSESSMENT CULTURES ACROSS SUBJECT AREAS AND SCHOOL LEVELS

Franco Passalacqua (University of Milan-Bicocca, Italy) · **Orazio Giancola** (Sapienza University of Rome)

Assessment practices | Teacher beliefs | Assessment cultures

Assessing learning is one of the most relevant and contested dimensions of teacher professionalism, as it is shaped by a structural tension between formative and summative functions (Brown, 2019). While the former acts as a regulatory device for teaching and learning, grounded in feedback, co-assessment, and metacognitive practices the latter primarily serves certification and selection purposes (Hattie & Timperley, 2012). International research has widely documented the effectiveness of formative strategies in supporting meaningful and lasting learning, while also highlighting the limitations of an exclusive or distorted use of summative assessment, including its implications for students' motivation and well-being (Colasanti, 2022; Scipione & Zini, 2025). Despite this broad scientific consensus on the value of formative assessment (Heritage, 2010) many studies show that both teachers' beliefs and their actual classroom practices remain only partially aligned with this approach, often maintaining a strong connection with summative strategies (Brown, 2004; Pastore, 2020). Against this theoretical background, the paper analyses data from the "IV insegnanti" survey in order to explore teachers' declared assessment strategies in the light of two structuring dimensions of the profession: subject area and school level. The underlying assumption is that the combination of disciplinary domain and school level should not be regarded as a mere organizational background, but rather as a factor that shapes both teachers' conceptions of assessment and their actual practices, thus contributing to the construction of specific assessment cultures. The analysis focuses on three main areas: teachers' sense of self-efficacy in assessment and their willingness to engage in professional development on this topic; the functions and purposes they attribute to assessment; and their declared practices, with particular attention to the tools they use, the criteria they adopt for student promotion, and the difficulties they encounter in assessment processes. Through a comparative and multivariate approach, the paper investigates whether, and to what extent, the imbalance between formative and summative functions takes different forms across subject areas (for example, humanities and language studies, scientific subjects, and technical-vocational fields) and across school levels, thereby redefining the relationship between assessment, teaching, and selection. From this perspective, assessment strategies are not interpreted as a mere repertoire of techniques, but as the expression of pedagogical and cultural principles that orient the ways in which teachers assign value to learning and support, or at times constrain, students' educational trajectories. The paper ultimately aims to provide empirical evidence on whether, and in which disciplinary and school contexts, practices more consistent with research on formative assessment are becoming consolidated.

TEACHING MATHEMATICS IN PRIMARY SCHOOL: TEACHERS' PROFILES, ATTITUDES, AND EARLY EDUCATIONAL INEQUALITIES

Giulio Di Cicco (Università degli Studi di Napoli Federico II) · **Mariagrazia Santagati** (Università Cattolica del Sacro Cuore) · **Erika Uberti** (Università Cattolica del Sacro Cuore)

Primary Teachers | Mathematics | Educational Inequalities

This paper investigates primary school teachers who teach mathematics, focusing on the characteristics and specificities of these professional figures and on their crucial role in shaping children's early relationship with mathematics at the beginning of compulsory schooling. The study is part of the broader research project PRIN 2022 "Coming to terms not only with the pandemic. Mathematics learning loss in primary school: underlying factors and intervention" (pi University of Milano-Bicocca), which examines early difficulties and inequalities in mathematical learning during the first years of primary education. While much of the existing literature focuses primarily on students' cognitive abilities through quantitative approaches, this research adopts a mixed-methods perspective and considers the viewpoints of the main actors involved in the educational process - students, teachers, and parents. The contribution presented here specifically focuses on teachers, exploring their professional biographies and their attitudes toward mathematics. Who are the teachers who teach mathematics in primary school? What are the key features of their educational and professional trajectories? And how do they relate to the discipline they teach? The empirical basis consists of eight focus groups conducted with 55 primary school teachers - 95% of whom are women - in the metropolitan areas of Milan and Naples, complemented by a survey administered to 475 teachers in 2025. The qualitative analysis highlights polarized narratives about mathematics, often framed in terms of "love" or "fear," rooted in teachers' own school experiences and in the influence of former teachers. These biographical experiences contribute to shaping teachers' professional identities and their teaching practices. In several cases, teachers report having been assigned to teach mathematics not by personal choice but due to organizational needs within schools, a factor that may influence their confidence and attitudes toward the subject. Across the focus groups, participants emphasize the importance of teachers' attitudes in shaping students' experiences with mathematics. According to the teachers, negative attitudes or anxiety toward the subject may be unintentionally transmitted to students, while enthusiasm, confidence, and pedagogical strategies - such as games, problem-solving activities, and creative approaches - can significantly enhance students' motivation and learning outcomes. Survey data further enrich these findings by showing that many teachers recall having experienced difficulties in learning mathematics at school or perceive their past mathematical abilities as average compared to their classmates. Nevertheless, a large proportion of teachers report enjoying teaching mathematics. This suggests that teachers' relationships with the discipline can evolve throughout their professional trajectories and that teaching mathematics in primary school often involves educators whose attitudes toward the subject have been reshaped through training, teaching practice, and professional experience. Overall, the findings highlight how teachers' discourses reflect broader cultural narratives about mathematics, gender, and ability, while also underscoring the importance of professional socialization processes and institutional contexts in shaping teaching practices and educational opportunities.

MAPPING TEACHERS' ATTITUDES TOWARDS SCHOOL–FAMILY RELATIONSHIPS: SOCIAL DETERMINANTS AND LINKS TO WORK-RELATED WELL-BEING

Iacopo Moreschini (Department of Sociology and Social Research, University of Milan–Bicocca, Italy) · **Brunella Fiore** (Department of Sociology and Social Research, University of Milan–Bicocca, Italy)

school-family relationships | teachers' attitudes | work-related well-being

The relationship between schools and families is now recognized as a crucial aspect of educational processes, both for its effects on student learning and well-being and for its role in building more inclusive and cooperative school environments (Epstein, 2001; Stefanski, Valli, & Jacobson, 2016). The literature has long shown that family involvement can be a resource for academic success and the quality of the educational experience, but it has also highlighted that this relationship is never neutral or linear. School-family relationships are in fact marked by ambivalence, divergent expectations, role asymmetries, interpretative conflicts over educational responsibilities, and tensions related to communication, mutual trust, and professional recognition (Hornby & Lafaele, 2011; Epstein, 2018). From this perspective, the partnership between schools and families appears less as a given and more as an unstable balance, continuously negotiated in everyday practices. Starting from this framework, the contribution takes teachers' attitudes towards their relationship with families as a way for analyzing the quality, tensions, and meanings attributed to this relationship. The underlying hypothesis is that these attitudes reflect not only individual orientations but also organizational conditions, professional cultures, and differentiated social positions. The analysis of this study is based on a sample of 4,822 teachers surveyed as part of the fourth Survey on the living and working conditions of Italian teachers, who were asked to complete a 15-item Likert scale questionnaire on their attitudes towards their relationship with families. The items were subjected to PCA with varimax rotation, which revealed three main components: a first component of criticality in the school-family relationship, marked by relational difficulties, mistrust, and a perception of parental invasiveness; a second component of shared educational responsibility, which expresses openness to collaboration between teachers, families, and the wider educational community; a third component of delimitation of the teaching role, which refers to a more limited conception of the boundaries of the relationship with families and the educational mandate of the school. Starting from these three components, the analysis is divided into two successive steps. First, the paper analyzes the main socio-demographic and professional determinants of teachers' attitudes towards the relationship with families, considering characteristics such as gender, age, length of service, school type, subject area, and working environment. Second, it explores the association between these attitudinal components and certain dimensions of work well-being, with a particular focus on stress, burnout, and professional self-efficacy. The first expected contribution is to provide an empirical mapping of teachers' attitudes toward their relationships with families. Second, it seeks to demonstrate the association between these attitudes and various work conditions, well-being, and professional sustainability.

EDUCATIONAL LEADERSHIP, TEACHERS' MOTIVATION AND PATHWAYS TO THE PROFESSION IN DEMOCRATIC SCHOOLS

Arianna Lodovica Morini (Roma Tre University, Italy) · **Barbara Ambu** (Roma Tre University, Italy) · **Maria Grazia Giovanna Chillemi** (Roma Tre University, Italy)

educational leadership | newly hired teachers | principal

This contribution analyses the relationship between educational leadership, teachers' motivation and pathways to the profession, with a particular focus on the dynamics that characterise the interaction between principals and newly hired teachers in the context of democratic schools. In an increasingly complex educational ecosystem, the relationship

between principals and newly hired teachers is a determining factor in the functioning of the school organisation and the quality of learning (Moretti & Alessandrini, 2015; Rosa, 2017). International literature has highlighted how distributed and situated leadership is a key element in building collaborative professional environments that can support entry into the profession and promote multi-level improvement processes (Spillane, 2006; Harris, 2014). Research conducted at national level shows that entry into the profession requires a training ecosystem capable of integrating organisational and relational dimensions. It also emphasises that the essential conditions for organisational well-being and teachers' motivation require participatory decision-making processes and the development of professional communities (Barzanò, 2008; Guerra, 2018; Moretti, 2022; Moretti & Fiorucci, 2022). Within this framework, the principal plays a strategic role in supporting newly hired teachers through guidance, mentoring and providing formative feedback (Hobson et al., 2009). From this perspective, effectiveness is measured through a multi-actor and multi-level approach, emphasising the strategic role of the university in qualifying the professional practices of tutors for newly hired teachers and in strengthening the link between academic institutions, regional education offices and local schools (Crozier & Friedberg, 1978; Scheerens, 2018). The contribution focuses on the complexity of the school system, exploring the relational dynamics among the actors involved and the implications they have on the quality of the education system. The study of professional identity and teachers' reflections on educational practices provides an in-depth understanding of how educational and organisational structures influence daily teaching, contributing to a clearer understanding of teachers' professional development processes. The unit of analysis considered includes tutor teachers and newly hired teachers assigned to them in the provinces of Frosinone-Latina-Rome-Rieti-Viterbo who enrolled in the tutor teacher training course organised by the Department of Education Sciences of Roma Tre University in the year 2025/2026 in collaboration with the Lazio Regional Education Office of the Ministry of Education and Merit. Two semi-structured questionnaires were used to collect data, with the aim of gathering and analysing the different perspectives of the teachers belonging to the two groups considered. The questions concerned educational leadership, motivation and access to the profession, including elements relating to the educational environment and the relationship with the principal within the scope of the training programme for tutors of newly hired teachers. The analysis highlights the importance of considering the transition of newly hired teachers as a complex and multidimensional process, in which educational leadership, motivation and pathways to the profession play a positive role in building an inclusive, innovative and sustainable learning environment. The main findings of the research make it possible to reflect on the strategic role of principals and tutor teachers in enhancing the quality of the training experience from a systemic and multi-level perspective.

Working in Schools Today: Between Public Space, Mediatization, New Managerialism and Inclusion

PANEL CONVENORS: Antonietta De Feo (Università degli studi Roma Tre); Gabriele Pinna (Università degli studi di Cagliari)

PANEL KEYWORDS: the teaching profession, school organization, New Public Management

This panel examines contemporary transformations in schools as a professional field, with a focus on teachers and their relationships with other professionals. It invites contributions that reconnect classic research on the teaching profession—recruitment, careers, training and socialisation, classroom management and teacher–student relations (Lortie, 1975; Waller, 1961)—with developments that have emerged in recent decades: transformations of organisational contexts linked to New Public Management (Apple, 2001; Ball, 2003; Evetts, 2009), labour-market dualisation and precarious careers (Bertron et al., 2024; Carter, Stevenson, 2012), teachers' malaise and lack of recognition (Barrère, 2017; Burrow et al., 2020; Garcia, 2023), and broader social changes associated with a "decline of institutions" and the loss of legitimacy of school professionals (Dubet, 2002). A second focus concerns the growing division of labour in schools (Bois, Jacquot, 2022) and the emergence of new roles (psychologists, educators, nurses, etc.) with whom teachers are required to collaborate, notably within multiprofessional configurations around inclusion and diversity policies. From a multidisciplinary perspective, the panel also welcomes research on how these evolutions intersect with contemporary phenomena that strongly affect teaching: the civic and political engagement of teachers and their public positioning, as seen in recent joint teacher–student mobilisations against the genocide in Palestine; new forms of heteronomy linked to the mediatization of education, such as teacher-influencers and YouTubers; and technological innovations, especially AI, which are reshaping teachers' work and school organisational structures. Overall, the panel examines the tensions between professional autonomy and institutional, media, and political heteronomies that are reshaping educational work in schools today.

TEACHING ON DEMAND: MAD TEACHERS IN ITALY AND THE EROSION OF PROFESSIONAL BOUNDARIES IN ITALY

Valerio Ferrero (University of Turin, Italy)

Teaching | Informal Recruitment | Italy

Across many national contexts, school systems are currently facing a persistent and structural teacher shortage (Dupriez et al., 2016; Ingersoll, 2003), increasingly framed in international debates as a consequence of demographic change (Grimmett & Echols, 2000; Wiggan et al., 2021), declining attractiveness of the profession (Ashiedu & Scott-Ladd, 2012; Thomas Dotta et al., 2025), intensified workloads, and the long-term effects of market-oriented reforms in education (Blanco et al., 2023). While much of the literature has focused on policy responses such as alternative certification routes or incentives for recruitment and retention (Ingersoll et al., 2018; Van Houten, 2009), less attention has been paid to the informal and semi-formal mechanisms through which schools manage staffing shortages. These mechanisms raise important questions about the transformation of teaching as a professional field and the conditions under which professional norms, identities, and careers are constructed. This paper examines the Italian case (Bryson et al., 2022; Magni, 2025; Magni & Capriotti, 2025) through the lens of the growing use of "Messa a Disposizione" (MAD), an informal recruitment device allowing schools to hire teachers outside official channels such as competitive examinations and national or provincial ranking lists (Blancato & Argentin, 2025; Lagomarsino & Pandolfini, 2025). Originally conceived as an exceptional solution to cover temporary vacancies, MAD has progressively become a routine instrument for coping with chronic shortages, especially in specific geographical regions, subject areas, and in special needs teaching. As a result, increasing numbers of teachers enter classrooms without stable contracts, standardized training paths, or clear prospects for professional continuity. The analysis situates the MAD phenomenon within broader debates on the transformation of professions and educational work. First, it engages with research on labour-market dualisation and precarious careers (McGrath-Champ et al., 2023; Seo, 2021), highlighting how MAD contributes to the fragmentation of the teaching workforce and differentiated professional statuses within schools. Second, it shows how informal recruitment mechanisms disrupt professional socialisation, weaken classroom authority, and destabilise teachers' professional identities (Wilson et al., 2004). Finally, the paper connects the spread of MAD to wider discussions on the decline of institutional legitimacy and the growing heteronomy of educational work (Adams, 2018; Imig & Flores Fernandes, 2025), as schools reconcile professional norms with organisational urgency and managerial constraints. Empirically, the paper draws on a qualitative

study based on semi-structured interviews with formally trained teachers following standard recruitment paths and teachers employed through MAD. The interviews explore trajectories into teaching, classroom experiences, relations with colleagues and school leaders, perceptions of professional recognition, and career expectations, enabling a comparative analysis of structural inequalities and subjective experiences. The findings show that MAD teachers often experience accelerated but fragile entry into the profession, marked by weak institutional support, limited recognition, and heightened exposure to uncertainty. At the same time, their presence reshapes organisational dynamics and challenges professional boundaries. The paper concludes that MAD should be understood not merely as an emergency response to teacher shortages, but as an indicator of deeper transformations affecting the governance, legitimacy, and professional foundations of teaching today.

TEACHERS' PERCEPTIONS OF A CHANGING PROFESSION UNDER NEW PUBLIC MANAGEMENT AND INCLUSIVE EDUCATION REFORMS

Serge Katz (Curapp/Upjv, France) · **Frédéric Charles** (Curapp/Upjv, France) · **Florence Legendre** (Université Reims Champagne Ardenne)

Teachers' perceptions | New Public Management | Inclusive education

Our presentation examines contemporary changes in the primary school teaching profession in France. From a socio-historical perspective and based on data from a national study conducted for the Ministry of Education in 2017-2018, we show how this group has undergone profound changes since the end of the 20th century, affecting its morphology, mandate, and professional license (Hughes, 1996). These changes are taking place in a regulatory environment marked by instability, regulatory inflation, and the growing influence of new public management reforms (Broccolichi & Garcia, 2021; Grimaud, 2024; Levasseur et al., 2020). At the same time, the expansion of the division of labour in schools and the increasing involvement of other educational professionals — in particular those mobilised in the context of inclusive education — (Charles et al., 2023) are reshaping the boundaries of teachers' work. Based on a mixed methodology combining a representative survey of 3,263 primary school teachers and 43 in-depth interviews, our contribution analyzes how teachers perceive their working conditions and how these perceptions intersect with the managerial injunctions

circulating within the school institution (Connan et al., 2025). Our analysis of regulatory texts shows that the rhetoric of New Public Management is indeed present, albeit in a partial and diffuse form, contributing to the redefinition of institutional expectations regarding teachers' practices, accountability, and pedagogical individualisation framed around "educational needs". In practice, these developments translate into intensified work, an accumulation of "new" tasks, and an increased administrative burden. Teachers describe an invisible and demanding workload, fueled by a rapid succession of reforms, which even the least experienced perceive as a source of tension. They identify the regulatory environment as a major factor in the growing complexity and intensification of their mandate, often without compensation or recognition. These findings echo broader analyses of teacher malaise, the decline of institutional legitimacy, and the tensions between professional autonomy and organizational, political, and media heteronomies that are reshaping educational work today.

FROM CARE TO WEAR AND TEAR. REPRESENTATIONS OF STRESS AND BURNOUT IN TEACHER EDUCATION

Giorgia Coppola (University of Palermo, Italy, Italy)

community pedagogy | teacher education | burnout

As is well known, schools today are configured as increasingly complex environments, shaped by profound social, cultural and political transformations that have redefined their structures, functions and meanings over time. Against this backdrop of change, the role of the teacher is also evolving, with teachers facing an increasing array of demands, overlapping tasks and roles, and a growing diversity of educational needs. These factors have a significant impact on teachers' personal and professional well-being. The complexity of contemporary school institutions contributes to the intensification of stress and burnout experiences among teachers, particularly with regard to emotional exhaustion and depersonalisation. A longitudinal study conducted in 2021 and 2023 highlighted an increase in these dimensions among a sample of 196 upper secondary school teachers in Palermo. Building on these findings, this paper aims to broaden the perspective on teacher burnout by exploring representations of stress related to care work in initial and in-service training programmes for adult educators. Specifically, the paper presents data from an open-ended questionnaire administered to students enrolled in the 10th cycle of the Specialisation Course for Educational Support Activities at the University of Palermo. The aim was to examine how professional stress is conceptualised, anticipated and narrated during the training phase. The study is situated within the paradigm of fundamental pedagogy, adopting a phenomenological–hermeneutic approach. The aim is to identify potential meanings in education that could inform the design of educational and training practices aimed at preventing burnout in schools. From this perspective, teaching is recognised as a form of care work. Without adequate educational and community-based support, it can become an exhausting experience.

TEACHERS AS INTELLECTUALS IN THE AGE OF PLATFORMS: MEDIATIZATION AND THE REDEFINITION OF PROFESSIONAL LEGITIMACY IN THE ITALIAN SCHOOL SYSTEM

Antonietta De Feo (Università Roma Tre, Italy) · **Marco Pitzalis** (Università di Cagliari)

Teacher-intellectuals | Mediatization | Educational field

In recent years, the Italian school system has been subject to increasing media coverage that directly involves teachers. Alongside the traditional representation of the magister teacher (Hirschhorn, 1993), new hybrid figures are emerging, such as teacher-influencers or digital creator teachers on YouTube and other social platforms, who accumulate visibility and symbolic capital outside institutional circles. At the same time, we are witnessing a renewed reinvigoration of the figure of the teacher as a critical intellectual, capable of exercising reflexivity and intervening in the public debate. This contribution focuses on these transformations, analyzing them through the perspective of Pierre Bourdieu (1984) as a process of redefining the poles of legitimacy in the contemporary school system. While historically, teaching authority was based on institutionalized cultural capital (educational qualifications, certifications) and relative autonomy from other social spheres, today we are witnessing growing interference from the logic of the media field, which introduces new forms of heteronomy. Digital visibility, content monetization, and the construction of a "personal brand" are becoming resources for symbolic competition within the educational field. These dynamics add to and intertwine with transformations that have already been underway in recent decades, linked to the spread of New Public Management and neoliberal logics of accountability, evaluation, and performativity, which have progressively changed the modes of regulation and criteria for recognition of the teaching profession (Ball, 2003; Pitzalis 2006). Through an exploratory analysis of the Italian case – which includes the observation of public figures active on social media – the paper shows how mediatization is not only a peripheral phenomenon, but a possible factor in the restructuring of the professional field of teaching. On the one hand, it can be interpreted as a response to the loss of recognition and institutional devaluation of teaching work; on the other, it contributes to redefining the criteria of professional legitimacy, rearticulating the tension between different principles of authority – in particular between pedagogical authority, critical knowledge production and public visibility.

MORAL WORK AND EMOTIONAL LABOUR IN MARGINAL SCHOOLS: TEACHERS' ENGAGEMENT IN ITALIAN VOCATIONAL EDUCATION

Gabriele Pinna (Università degli studi di Cagliari, Italy)

emotional labour | ethics of care | vocational education and training

Drawing on a qualitative study conducted in vocational upper secondary schools in Italy, this article examines teachers' work as a form of moral and emotional practice in socially and symbolically marginal educational contexts. Situated within international debates on the transformation of educational work under New Public Management reforms, the study focuses on a largely underexplored dimension: how teachers morally sustain schools predominantly attended by students experiencing social vulnerability, low academic achievement, and limited prospects of upward mobility. Based on 29 in-depth interviews with teachers and school leaders, the analysis shows that teaching in vocational schools involves intensive moral and emotional labour, in which knowledge transmission is inseparable from practices of care, listening, and the management of suffering. Teachers face ethical dilemmas related to inclusion, discipline, and educational justice, balancing the need to adjust expectations against the refusal to "mislead" students already shaped by exclusionary trajectories. The findings further reveal that women and teachers from working-class backgrounds tend to assume a disproportionate share of emotional and relational work, often under conditions of institutional invisibility and moral overload. The article argues that, in marginal segments of the educational field, emotional labour is not a residual or vocational dimension of teaching, but a core moral infrastructure that makes educational relationships possible.

Learning on the Margins: Early School Leaving, Educational Inequalities and the Politics of Place

PANEL CONVENORS: Claudia Cicciotti (ActionAid Italia); Luca Fanelli (ActionAid Italia); Gianfranco Zucca (IREF - Istituto di Ricerche Educative e Formative, Italy)

PANEL KEYWORDS: early school leaving, territorial inequalities, educational governance

In recent years, early school leaving has re-emerged as a key indicator of the deep social and territorial inequalities shaping urban life. Its persistence in the metropolitan peripheries of Italy reflects not only the limits of the educational system but also the changing relationship between school, territory, and citizenship. As research on spatial and educational inequalities has shown (Benadusi & Giancola, 2016; Wacquant, 2008), peripheral areas are not merely geographic spaces but social formations where exclusion, stigma, and institutional weakness converge, affecting both access to and the quality of education. Schools located in such contexts often act as welfare institutions of last resort, compensating for fragile family networks and weakened public infrastructures (Ballarino & Checchi, 2006). This generates a growing tension between the educational and the social mandates of schooling—one that risks overburdening educators while narrowing the school's emancipatory potential. The Workshop explores this tension from a sociological and policy perspective, analyzing how early school leaving is defined and governed within contexts of urban marginality. It focuses on three key questions: how spatial segregation and territorial deprivation affect educational trajectories; how schools, often stigmatized or isolated, can become spaces of civic resistance and social innovation; which forms of multi-level governance—linking institutions, the third sector, and local educational communities—can sustain inclusive and democratic education in fragile territories. Drawing on the case of Rome's VI Municipality, the project BELLA! Fateci spazio (promoted by ActionAid International Italia ETS) and IREF - Istituto di Ricerche Educative e Formative) offers an empirical lens on the interplay between inequality, school orientation, and educational wellbeing. The findings feed a broader reflection: school dropout is not merely an individual failure but a structural manifestation of territorial injustice (Dubet, 2011), calling into question the capacity of democratic systems to guarantee both the right to education and social cohesion. The Workshop, held in Italian, builds on the participatory learning process promoted through ActionAid's educational inequalities programme, and invites a transdisciplinary dialogue between empirical research, public policy, and civic engagement to reimagine educational justice policy in peripheral urban contexts. Workshop agenda (provisional titles) Chair: Claudia Cicciotti (ActionAid Italia), Luca Fanelli (ActionAid Italia), Gianfranco Zucca (IREF) Introduction – Education, Territory and Democracy: Why Early School Leaving Is a Political Issue Claudia Cicciotti (ActionAid Italia) and Gianfranco Zucca (IREF) Learning on the Margins: Educational Inequalities and School Trajectories in Rome's VI Municipality Leonardo Piromalli (IREF), Sabina Licursi (University of Calabria), and Emanuela Pascuzzi (University of Calabria) Building Educational Communities in Fragile Territories. BUILDING EDUCATIONAL COMMUNITIES IN FRAGILE TERRITORIES. LOCAL POLICIES AND THE MULTI-LEVEL GOVERNANCE OF EARLY SCHOOL LEAVING

Maria Sole Piccioli (ActionAid Italia, Italy) · **Federico Neri** (Scaro Community)

Educational inequalities | student voice | distributed leadership

This contribution conceptualizes early school leaving (ESL) as a structurally produced and territorially embedded phenomenon rather than an individual deficiency or failure. Drawing on a place-based perspective (Gruenewald, 2003), educational inequalities are understood as spatially configured and institutionally mediated. Vulnerable territories thus emerge as arenas where social injustice is reproduced but can also be contested through reconfigured forms of educational governance. Within this framework, the educational community is defined as a territorial infrastructure of shared educational responsibility. In line with UNESCO's (2021) whole school approach, the school is conceived as a democratic public institution embedded in a broader civic ecosystem where public authorities, civil society organizations, families, and youth co-produce educational processes. This view resonates with theories of multi-level governance, which frame education policy as the outcome of negotiated interactions across institutional levels and between state and non-state actors. Governance, therefore, is relational and distributed rather than hierarchical. These issues will be addressed by the three speakers from their respective domains of expertise: Piccioli will focus on the role of the third sector and provide evidence on multi-level governance in territories with different characteristics, highlighting the responsibilities of each actor within the educational community; Pratelli will reflect on the role of local public policies and multi-level institutional

coordination; and Neri will present empirical evidence of how community-based spaces can function as transformative devices. At the school level, this paradigm is operationalized through distributed leadership (INDIRE, 2021). School improvement stems from collaborative professional agency and shared responsibility among principals, teachers, and the wider school community. Such leadership reinforces institutional autonomy while strengthening territorial embeddedness, enhancing schools' capacity to act as mediating institutions within fragile contexts. Educational alliances, often formalized through institutional agreements, institutionalize this cooperative governance. Rooted in shared administration and horizontal subsidiarity (Arena, 2015), they enable local authorities, schools, and third-sector actors to co-design educational and social interventions. Their formalization establishes accountable frameworks for resource allocation and collective responsibility, consistent with commons governance and collective action theory. Alliances thus reconfigure the relationship between public institutions and community actors, repositioning education as a shared territorial resource. A defining dimension of the educational community is youth protagonism, framed through student and youth voice. Participation is treated as a structural component of democratic quality rather than symbolic inclusion. Research demonstrates that meaningful student involvement strengthens agency and belonging (Fielding, 2004; Cook-Sather, 2006). Lundy's (2007) model—space, voice, audience, and influence—offers criteria for assessing whether alliances generate genuine decision-making power. Extending this lens to local governance, scholarship on youth participation stresses the importance of institutional conditions that prevent tokenism (Hart, 1992) and highlights the civic and policy benefits of youth engagement in local decision-making (Checkoway, 2011). The role of local institutions is crucial in transforming alliances into stable public policy architectures. The experience of the Municipality of Rome, including Priority Educational Areas (IEP), illustrates how local governments can coordinate across sectors, integrate educational and social policies, and sustain territorial co-design processes. Local governance thus becomes a mediating arena capable of translating community needs into structural strategies for preventing ESL. Finally, the case of Scaro Community in Agrigento exemplifies the development of an education hub in a peripheral Southern context, where urban regeneration evolves into territorial educational infrastructure. By intertwining formal and non-formal education, civic activism, and youth participation, the initiative demonstrates how community-based spaces can function as transformative devices. Local policies that strengthen formal youth participation bodies—such as youth councils—and connect them to educational governance processes are essential for embedding youth voice beyond school boundaries and consolidating participatory democratic practices at the territorial level.

INTRODUCTION. EDUCATION, TERRITORY AND DEMOCRACY: WHY EARLY SCHOOL LEAVING IS A POLITICAL ISSUE

Claudia Cicciotti (ActionAid Italia) · **Gianfranco Zucca** (Istituto di Ricerche Educative e Formative - IREF)

Early school leaving | Educational inequalities | Educational poverty

The institutional definition of school dropout only partially captures the breadth of its implications and consequences. While it is generally understood as the lack or irregular use of education and training services during school age, the phenomenon in practice reflects the interaction of individual, familial, social, political, economic, and territorial factors. Moreover, the long-term consequences of high dropout rates are often underestimated, despite their systemic effects on individuals, social cohesion, and economic development. This raises a key question: is school dropout primarily a matter of educational system performance, or does it entail broader political implications? Drawing on empirical evidence collected in Rome's Municipality VI through the project BELLA! Fateci spazio, coordinated by ActionAid Italy in partnership

with local organizations and in collaboration with IREF, this paper examines the structural conditions that reproduce educational disadvantage in peripheral urban contexts. These areas are characterized by multidimensional poverty and by vulnerabilities that increase the likelihood of the intergenerational transmission of educational inequality. Based on an integrated set of quantitative and qualitative data, the analysis explores how the local configuration of policies and institutional arrangements can either mitigate or reinforce existing inequalities. Within this framework, early school leaving is interpreted not simply as an individual or family outcome, but as the manifestation of broader mechanisms of social and territorial inequality that traverse educational institutions and local communities. Through a cross-cutting analysis of interventions implemented in contexts of vulnerability and marginality, the paper proposes a broader operational understanding of early school leaving that accounts for its causes, reinforcing and mitigating factors, and long-term consequences. By doing so, it seeks to reposition the issue within a political perspective that acknowledges the central role of educational inequalities, moving beyond a purely technical or administrative approach. Finally, the discussion highlights the relationship between community dynamics and educational processes, emphasizing the need for integrated, high-impact public policies aimed at prevention and at the progressive construction of an education system approaching the goal of “zero dropout”.

LEARNING ON THE MARGINS: EDUCATIONAL INEQUALITIES, DROPOUT RISK, AND SCHOOL WELL-BEING IN ROME'S SIXTH MUNICIPALITY

Leonardo Piromalli (IREF - Istituto di Ricerche Educative e Formative, Italy) · **Sabina Licursi** (University of Calabria) · **Emanuela Pascuzzi** (University of Calabria)

Early school leaving | Educational inequalities | School well-being

This contribution presents findings from a quantitative survey conducted within BELLA! Fateci spazio, promoted by ActionAid International Italia ETS and funded by Fondazione CDP, investigating early school leaving risk, educational transitions, and school well-being in Rome's Sixth Municipality, a large and densely populated peripheral district marked by significant socio-economic inequalities. The study draws on an integrated theoretical framework combining structural and interactionist perspectives. Building on Bourdieu and Passeron's (1970) theory of social reproduction, Bernstein's (1975) analysis of pedagogic devices, and relational approaches to educational inequality (Barone, 2009; Van Zanten, 2009), school choice and dropout risk are conceptualized not as individual outcomes but as socially stratified processes embedded in symbolic dynamics that unfold within everyday school life. Dropout is accordingly understood as a structural manifestation of territorial injustice (Dubet, 2011), shaped by the micro-interactional processes through which institutional recognition — or its absence — constructs students' identities and aspirations (Honneth, 1995; Dubet & Martuccelli, 1996). The empirical basis is a standardized questionnaire administered in autumn-winter 2025-2026 across final-year lower secondary and upper secondary classes in 12 schools, drawn from a universe of 28 institutions in the municipality. Over 2,000 students were sampled through a two-dimensional stratified design: the first variable captures early school leaving incidence among 18–24 year-olds by urban area, from ISTAT data on urban deprivation; the second captures school type and level. Weights reflect the ratio of target students per stratum to the total population. Preliminary findings from 374 valid student responses are organized around the study's two research axes. On the structural dimension, over a third of fathers hold at most a lower secondary diploma and 39% of students have at least one parent born outside Italy. Students with a migrant background are more than four times as likely to have repeated a school year (6.0% vs 1.3%, $p<.05$) — a direct indicator of dropout risk at the lower secondary transition. On the interactional dimension, three findings stand out. First, peer victimization is strikingly prevalent: 77% report at least one episode since the start of the year — most commonly social exclusion (41%) and offensive mockery (51%) — and it is significantly associated with lower school

comfort (rho=−0.24, p<.001). Second, student-teacher relationship quality is the strongest predictor of both school comfort (rho=0.22) and satisfaction (rho=0.35, p<.001), and mediates guidance access: students perceiving supportive relationships are far more likely to discuss their future with teachers (3.99 vs 3.36, p<.001). Third, gender structures experience along two lines: female students report both greater future anxiety (55% vs 26%, p<.001) and higher perceived daily school difficulty (2.59 vs 2.36, p<.01) — a compounded, not merely transitional, disadvantage. These patterns reveal a territory where relational quality — not socioeconomic composition alone — is the proximate factor shaping unequal trajectories. The findings engage a broader challenge: moving from an ethics of probability, in which futures are assigned by social position, toward an ethics of possibility (Appadurai, 2013), where expanding horizons of aspiration becomes itself an object of institutional effort.

ROUNDTABLE. BEYOND EARLY SCHOOL LEAVING: EDUCATIONAL JUSTICE, NEW FORMS OF CITIZENSHIP AND POLICY RECOMMENDATIONS

Marco Rossi-Doria (Con i Bambini Impresa Sociale S.r.l.) · **Giuseppina Rita Jose Mangione** (INDIRE, Italy) · **Katia Scannavini** (ActionAid International Italia E.T.S.) · **Fabrizio Barca** (Forum Diseguaglianze e Diversità)

Spatial Inequality | Educational inequalities | Multi-level Governance

Space plays a key role in shaping individual life trajectories at least at two distinct levels: as an endowment of resources (structural, institutional, and in terms of social capital), and as a context that generates aspirations, worldviews, and specific modes of action. Addressing the role of space in relation to educational careers raises a further challenge, situated at the intersection between emancipation from one's place of origin—primarily an individual process—and the transformation of those places, which instead has a collective dimension. Establishing a hierarchy between these two levels is implicitly moralizing. The BELLA! project appropriately seeks to engage with all these dimensions—not out of strategic ambiguity, but precisely because it seems impossible to commit to the improvement of neighbourhoods without simultaneously enabling young residents to test themselves beyond their immediate contexts. Likewise, it seems impossible to foster innovation within local communities without at the same time strengthening their cohesion. The guiding theme of this roundtable discussion builds on this intuition in order to reflect on public policy. What enabling policies can foster change in complex contexts? How can we manage the complexity of acting on multiple fronts, where coordination and synergy across different sectors are required? More specifically: Marco Rossi-Doria, currently President of Con i Bambini, formerly a "street teacher" and a pioneer of various "second-chance school" initiatives, will be invited to reflect on how schools must change structurally in order to fulfil their mandate of removing obstacles to equality, and on how territorial contexts can contribute to—rather than hinder—this transformation. Giuseppina Jose Mangione (INDIRE), researcher and head of units on organizational models, methodologies, and curriculum, as well as coordinator of innovation networks (Avanguardie Educative, Small Schools), will be asked to address the role of the school as a civic hub radiating educational opportunities at the local level, and to consider which other public policies are required to support such a role. Katia Scannavini, Co–Secretary General of ActionAid Italia will be invited to speak on the role of the third sector in relation to public policies. Fabrizio Barca, economist and former Minister for Territorial Cohesion, currently co-coordinator of the Forum for Inequalities and Diversity (ForumDD), will be prompted to reflect on the "politics of place" and on how to weave together different policy domains in an integrated approach.

Economic Constraints in Educational Participation and the Design of New Policies

PANEL CONVENORS: Raffaella Dispenza (Acli – Associazioni Cristiane Lavoratori Italiani); Luca Andrea Fanelli (ActionAid International Italia Ets); William Revello (Fondazione Ufficio Pio Ente Filantropico)

PANEL KEYWORDS: cost of education, dropout, financial support policies

Over recent decades, research and policy debates on educational participation (including vocational education and training) have emphasized non-economic barriers – educational pathways, cultural background, and soft skills. In many continental European systems, low fees and the presence of scholarships shape the view that financial barriers are contained. Yet economic constraints persist and may be intensifying amid broader societal impoverishment. These constraints are often indirect, as hidden expenses (materials, transport, digital access, rent, etc.), foregone earnings and time, and unequal capacity to navigate services. Moreover, economic hardship shapes mental frameworks and decision-making— through constrained time horizons, limited information, and reduced planning capacity—affecting educational choices even where formal support exists. While existing financial support policies are substantial, they often assume stable take-up, homogeneous needs, and frictionless access. A growing body of innovation and evaluation is therefore exploring more integrated approaches that combine monetary support with measures addressing the above-mentioned issues. This panel invites sociological, economic, and political science contributions addressing: The full cost of educational participation, including indirect and "hidden" expenses and opportunity costs. Empirical evidence on the relationship between poverty-reduction measures—especially unconditional or quasi-unconditional cash transfers—and educational participation and learning outcomes, in Italy and comparatively. Contributions focusing on Italian schemes (e.g., Reddito di Inclusione, Reddito di Cittadinanza, etc.) are welcome. Policy designs that target indirect costs and access frictions, including international best practices and asset-building approaches (e.g., education savings or matched accounts). We welcome theoretical and empirical work that can inform more nuanced policy design and implementation.

ESTIMATING THE COST OF COMPULSORY EDUCATION: HOUSEHOLD EXPENDITURE, PERCEIVED BARRIERS, AND POLICY IMPLICATIONS

Luca Andrea Fanelli (ActionAid Italia, Italy) · **Maria Sole Piccioli** (ActionAid Italia, Italy)

educational inequality | household educational expenditure | compulsory schooling

The availability of public schooling across educational levels, generally sufficient to meet demand, together with the consolidation in the scientific literature of growing attention to non-economic determinants of access to education—often more incisive than strictly financial constraints—and the increase in disposable household income despite overall income stagnation, have contributed to marginalising the issue of the direct costs of education within the debate on educational inequalities. Moreover, weak labour demand, which particularly disadvantages younger cohorts, has reduced the opportunity cost of remaining in education, thereby reshaping the cost–benefit calculus associated with continued participation in the educational system. However, in light of theoretical approaches that interpret inequalities as the outcome of the interaction between material resources, socio-cultural capital, and structures of opportunity, the economic dimension cannot be considered residual. First, while the costs of education may not constitute a barrier to access when considered in isolation, they can operate in combination with other constraints, reinforcing cumulative mechanisms of disadvantage. Second, they may shape educational choices, particularly in inner or peripheral areas, where certain tracks entail high transportation costs or the need to study away from home, as well as in the case of schools requiring the purchase of costly materials. Third, the significant gap between the minimum and maximum expenditures associated with school attendance—even when limiting the analysis to expenses strictly related to public education (e.g., school trips, additional textbooks, materials, digital devices, etc.)—may affect not only effective opportunities but also the symbolic and motivational dimensions of the educational experience. From this perspective, costs contribute to shaping the set of

educational capabilities effectively available to students. This paper aims to conduct a systematic review based on secondary sources in order to estimate the cost of education throughout the period of compulsory schooling (ages 4–18), considering different scenarios—geographical location, use of school meals, full-time attendance, chosen field of study, etc.—and different types of households. In a subsequent phase, the study intends to explore, through qualitative research directly involving upper secondary school students, the real and perceived economic barriers that influence educational choices and persistence. The findings are expected to provide an empirical basis for further investigation, both in terms of strengthening the robustness of the evidence and of analysing more closely the mechanisms through which economic constraints interact with other dimensions of inequality. More directly, they aim to contribute to a theoretically informed reflection on the policies most likely to enhance equity in educational opportunities and to reduce the impact of economic factors on access to and outcomes of education.

GRANTS AS BRIDGE TO UNIVERSITY ACCESS: THE IMPACT OF AN INFORMATION INTERVENTION

Federica Laudisa (IRES Piemonte) · **Samuele Poy** (Università del Piemonte Orientale)

Randomized controlled trial | information | higher education access

In Italy, student grants represent the principal policy mechanism for removing financial barriers to higher education among students from low-income backgrounds. However, insufficient information among potential beneficiaries substantially limits their effectiveness. Previous analyses conducted by IRES Piemonte using administrative data revealed that a considerable proportion of first-time tertiary education entrants at universities in Piedmont do not apply for student grants, despite meeting the eligibility criteria. The phenomenon of eligible students failing to apply for financial aid is not unique to Italy, although its magnitude and underlying determinants vary across national contexts. In the United States, students report several reasons for not completing the FAFSA, including the perception that they are not eligible or do not need aid, reluctance to incur debt, the perceived complexity of the application process, and limited knowledge about how to apply (Ifill, 2016). In Germany, misconceptions about eligibility and debt aversion - often linked to overestimating repayment obligations - emerge as key barriers (Riedmiller and Strobl, 2025). Additional obstacles include administrative complexity and co-residence with one's family (Herber and Kalinowski, 2016). Against this backdrop, our study, conducted on a sample of 6,500 randomly selected high school seniors in Piedmont during the 2022/23 school year, identified a substantial information gap regarding university grants. Most students interviewed lacked basic knowledge about application procedures, eligibility requirements, and even the identity of the grant provider - only 9% were able to correctly identify EDISU Piemonte as the awarding body. We also observed a significant correlation between knowledge of grants and individual characteristics, including gender, grade point average, school track, family background, and participation in guidance activities. Building on these findings, we implemented a randomized controlled trial (RCT) to assess the causal impact of increasing awareness of financial aid on students' intentions to enroll in higher education and to apply for grants. The intervention consisted of a 30-minute information session covering eligibility criteria, application procedures, and award amounts. Results indicate that even this relatively modest intervention generated a positive and statistically significant effect on both university enrollment and the probability of submitting a grant application. The effects were particularly pronounced among students who reported economic uncertainty as a factor in their educational decision-making. Within the Italian context, this study contributes to a relatively underexplored field. Although a related RCT has

been conducted (Abbiati et al., 2017), that study was based on partially different research questions and a more complex intervention design. Internationally, the literature is more extensive and predominantly US-based. Herbaut and Geven (2020) provide a comprehensive review of more than twenty RCTs conducted across different countries to estimate the impact of information and guidance interventions on university enrollment. Their findings underscore the need for additional evidence across diverse national contexts, given the heterogeneity of results. By examining the role of information in post-secondary educational choices, this study contributes to the debate on higher education access. Importantly, it also carries policy implications: timely and targeted dissemination of financial aid information may represent a lever to increase university participation in Italy.

MISSED OPPORTUNITIES AND BARRIERS TO PARTICIPATION IN INCENTIVISED SAVING PROGRAMMES AMONG MIDDLE-TO-LOW-INCOME FAMILIES IN ITALY

Davide Azzolini (Research Institute for the Evaluation of Public Policies (FBK-IRVAPP)) · **Olga Gorodetskaya** (Research Institute for the Evaluation of Public Policies (FBK-IRVAPP)) · **Luigina Jessica Montano** (Research Institute for the Evaluation of Public Policies (FBK-IRVAPP)) · **Silvia Salier** (Research Institute for the Evaluation of Public Policies (FBK-IRVAPP))

incentivised saving programmes | educational inequality | financial fragility

Absolute poverty affects over 9.7% of the Italian population, with higher incidence in the southern regions and among households with at least a foreign member and the presence of minors (ISTAT, 2023). Poverty together with low financial inclusion influences social mobility. Research has consistently shown that Italy ranks among the lowest in the European Union for intergenerational mobility, meaning that children from low-income families have fewer opportunities to improve their socioeconomic status compared to their peers in other European countries (Balestra & Ciani, 2022). Low levels of financial inclusion such as limited access to financial products and services paired with low financial literacy further exacerbate financial fragility (Artisei et al., 2025) and families' capacity to make informed economic decisions (Lusardi, 2019) about household budgeting, savings, and long-term planning, even more so when it comes to savings to cover their child's future education. Social mobility and education are interlinked: a family's financial prosperity plays an important role in shaping a child's education opportunities. Wealth grants families a range of benefits, including the ability to draw upon stable resources for school provisions and extracurricular activities, as well as greater peace of mind when committing to long-term endeavours. Increasing access to educational opportunities for youth from disadvantaged backgrounds is thus pivotal to tackle issues of educational inequality and social mobility. Within this context, programmes of incentivised saving inspired by US 'children's savings accounts' (Chen & Elliot, 2020) have emerged in Italy as valid instruments to act on disadvantaged families' capacity to save and offer their children adequate support for their education and extra-curricular activities. PUOI is a programme of incentivised saving that targets middle-to-low-income families in the province of Cuneo with the aim of supporting academic and personal development of students aged 12-16 through a dedicated savings account that includes a savings match rate mechanism and educational guidance support for the student and their family. Inspired by similar national programmes such as "Will" and "Will-To", PUOI provides an ideal context to investigate families' attitudes towards these types of programmes in Italy. Despite PUOI offering to multiply participants' savings, recruitment rates have been lower than expected. This may be because families affected by poverty are far from homogeneous, differences in demographic and personal circumstances may generate distinct barriers. For some families, the requirement to contribute a small amount on a regular basis may prove financially burdensome, particularly when income is unstable, the perceived complexity of navigating a new programme amid the pressures of everyday

financial hardship, and the sustained commitment demanded of both students and their families to partake in project educational activities. Beyond these practical barriers, fear of fraud or financial loss also plays a relevant role. When implementing these types of programmes, targeting matters. In this study, we explore attitudes of families towards incentivised savings programmes as well as possible barriers hindering participation. We also explore how despite the shared economic challenges diversity amongst families experiencing financial hardship exists, underscoring the complexity but also the need to provide tailored support.

MEASURING SCHOOL-RELATED ECONOMIC DIFFICULTIES: DEVELOPMENT AND VALIDATION OF A PARENT-REPORTED SCALE IN ITALY

Alessandro Concas (Università degli Studi di Cagliari, Italy) · **Mariano Porcu** (Università degli Studi di Cagliari, Italy) · **Isabella Sulis** (Università degli Studi di Cagliari, Italy) · **Cristian Usala** (Università degli Studi di Cagliari, Italy)

Educational choices · Item Response Theory · Socioeconomic inequalities

School-related economic difficulties represent a critical yet underexplored dimension of educational inequality, with parental perceptions of financial strain related to school playing a pivotal role in shaping adolescents' educational trajectories and pathway choices. Despite growing interest in the socioeconomic determinants of educational decisions, the literature has predominantly relied on general measures of economic hardship, lacking domain-specific instruments capable of capturing the specific financial pressures families face within educational contexts [1]. This study addresses this gap by developing and validating a novel psychometric measure of school-related economic difficulties tailored to the Italian educational system. Data were collected from 2,215 parents of children aged 12–16 through a structured online questionnaire administered between July and August 2025 as part of the EduCAR Youth project. Quota sampling based on geographical area and municipality size ensured national representativeness. The sample comprised 55.6% women and 44.4% men, predominantly aged 45–54 years. Educational attainment was relatively high, with 51.3% of families including at least one university graduate. Children were predominantly enrolled in upper secondary school (62.6%), with academic tracks (licei) being the most common choice (64.2%). We employed Item Response Theory (IRT) to construct the measurement scale, specifically utilizing a two-parameter logistic (2PL) model to assess dichotomous responses capturing whether families had experienced financial strain across specific school-related domains [2, 3]. An initial pool of eight items was subjected to exploratory factor analysis, which revealed a clear unidimensional structure. One item was removed due to local dependence. The final seven-item scale covers domains including the purchase of textbooks and school supplies, access to private tutoring, digital equipment for studying, participation in school trips, foreign language courses, and school choice. The instrument demonstrated excellent internal consistency reliability ($\omega = 0.94$), with all items exhibiting high discrimination parameters (a range: 2.22–3.16), satisfactory item-level fit statistics (S-χ2 non-significant; RMSEA well below 0.08 for all items) and a high TIF = 12, on the moderate-to-high difficulty range (b range: 0.39-1.25). Yen's Q3 statistics confirmed the absence of problematic local dependence across all final item pairs. The distribution of latent trait estimates showed moderate positive skewness ($M = 0.29$, $SD = 0.66$, skewness = 0.77), with the majority of families reporting relatively low school-related economic difficulties, while a substantial minority experienced significant financial strain. Systematic group differences emerged across a range of sociodemographic and educational characteristics. Younger parents, residents of Southern and Central Italy, single-parent households, larger families, and those with lower occupational status and educational attainment reported significantly higher levels of difficulty. Regarding educational variables, higher difficulty levels were associated with enrollment in technical institutes and use of educational support services. The validated seven-item scale offers a concise, psychometrically robust instrument for identifying families at risk of educational deprivation and for supporting the design of targeted educational policies and

interventions. Future research should examine longitudinal relationships between perceived economic difficulties and actual educational outcomes, assess cross-cultural validity beyond the Italian context, and integrate objective socioeconomic indicators to complement self-report data.

ECONOMIC INSECURITY AND EDUCATIONAL DECISION-MAKING: THE STUDY OF EDUCATIONAL PARTICIPATION AMONG THE TRIBAL COMMUNITIES OF KARNATAKA, INDIA

Mahima Raj C (Central University of Karnataka, India) · **Rupa Rani Sonowal** (Central University of Karnataka, India)

Education | Tribal Population | Socio-economic Conditions

Education is considered as a significant parameter in Human Development Index (HDI) according to the United Nations Development Programme (UNDP) that measures the development of a particular nation's education policy and its implementation at the grass root level. It is a key indicator in measuring the knowledge and skills attained by the larger population, leading to employment opportunities that furthers an individual's or a household's standard of living and upward social mobility. Karnataka, as a state in India, prides itself upon its highest school enrolment rates in the country along with an overall literacy rate of 75.6% as per the 2011 census. Despite these considerable achievements, the state paints rather a gloomy picture with regard to the educational participation of the tribal populations of the state. Individuals belonging to the tribal communities often have to face multiple challenges in their path to secure a decent education. The economic factor becomes a major determinant in their decision and desire to be part of the institutionalized education system, that promises stable income and a secure life. The paper aims to examine the role and influence of economic factors in decision-making regarding one's education among the tribal communities in Karnataka. The study is derived from the primary data collected through personal interviews with the tribal community members across Karnataka (1057 respondents). The analysis is structured from a variety of variables that are intersectional in nature and provide a wholistic socio-economic conditions of the tribal population. The study employs descriptive statistical analysis along with cross-tabulation in understanding the relationship between educational participation and socio-economic conditions of the group. Initial trajectories of the study indicate towards that hypothesis that economic conditions significantly factor into educational decision-making of the population, despite the state's efforts to ensure free education till matriculation for all. Households with low annual income exhibit greater difficulties in their path to attain education that involves direct as well as hidden costs of education. In many instances, education is considered an activity that doesn't aid their immediate living conditions since the household loses on daily wages when a family member decides to go to school instead of choosing to work either as a daily wage labour or as an unskilled labour either temporarily or on contract basis. The analysis also considers occupation as a significant variable that factors into educational participation of the community members. Further, the study contributes towards the discussion on education in a democratically driven society wherein education policy and its execution often meet the needs of only a select few. Tribal individuals who have multiple hurdles to cross in their paths to education do not form the primary stakeholders in state's education policy. The study underscores the importance of financial constraints in shaping the tribal households' aspirations. Acknowledgement: The authors appreciate the financial assistance provided by the Indian Council of Social Science Research to conduct the field data survey as part of the minor research project.

DETERMINANTS OF EDUCATIONAL INEQUALITY: A SYSTEMATIC FRAMEWORK FOR UNDERSTANDING SOCIOECONOMIC, DEMOGRAPHIC, AND SPATIAL DISPARITIES

Nicola Pontarollo (University of Brescia, Italy)

education · inequality · opportunities

Educational inequality remains one of the most persistent and structurally embedded forms of social disparity, with long-term consequences for individual life chances, social mobility, and regional development (Hanushek and Woessmann, 2008). This study aims to systematize the main determinants of educational inequality by developing an integrated analytical framework that brings together socioeconomic, demographic, and spatial dimensions. Drawing on interdisciplinary theoretical and empirical contributions, the study identifies five core drivers of unequal educational access and outcomes: socioeconomic status, parental education, ethnicity, gender, and geographical location. Socioeconomic status emerges as a central mechanism shaping access to educational resources, school quality, and extracurricular opportunities (see Lou at al., 2022). Parental education influences not only material conditions but also cultural capital, aspirations, and educational support within households (Biagi et al., 2022). Ethnicity and gender introduce additional layers of structural disadvantage, often operating through discrimination, social norms, and differential expectations that affect both access, performance and educational trajectories (Borgna & Contini, 2014; Tsai, Smith, & Hauser 2018). Geographical location—whether defined in terms of urban–rural divides, regional disparities, or neighborhood effects—further amplifies inequalities by influencing school infrastructure, peer environments, and local labor market prospects (see, for example, Acciari, Polo, and Violante, 2022). Rather than treating these determinants as isolated factors, the paper emphasizes their interaction and cumulative effects. Educational inequality is conceptualized as the outcome of overlapping disadvantages that reinforce one another across spatial and social contexts. Particular attention is devoted to the territorial dimension of inequality, highlighting how regional and local dynamics shape the distribution of opportunities and contribute to persistent intergenerational disparities. By organizing and synthesizing the main explanatory mechanisms, this study provides a coherent structure for future empirical research and policy design. Understanding the multifaceted and spatially embedded nature of educational inequality is essential for developing targeted interventions aimed at promoting equal opportunities and fostering inclusive socioeconomic development.

EFFECTS OF A MATCHED SAVINGS PROGRAM TO TACKLE SCHOOL DROPOUT IN ITALY

Davide Azzolini (FBK - IRVAPP, Italy) · **Antonina Mazara** (FBK - IRVAPP, Italy) · **Loris Vergolini** (FBK - IRVAPP, Italy; Università di Bologna)

School · dropout · savings

Italy has historically experienced high levels of school dropouts, with significant social disparities persisting to this day. According to Istat (2025), in 2024 the upper secondary non-completion rate among children of low-educated parents was nearly twenty times that of children of university graduates (22.8% vs. 1.2%). This study evaluates the effectiveness of WILL, a savings-based financial aid program for high school education. Implemented by philanthropic organizations, the program ran in four areas (Torino, Firenze, Teramo, South Sardinia) from 2019 to 2023. Inspired by Children's Savings

Accounts (CSA) and Child Development Accounts (CDA), the program drew on asset-building theory, which posits that even modest savings can foster expectations, planning, and long-term investment in education (Elliot 2024). It targeted first-year lower-secondary school students from low-income families, offering a digital savings wallet for educational expenses, with deposits (up to €1,000) multiplied by four. Beneficiaries also received financial education, guidance, and educational support. We run a randomized controlled trial which included 576 students (293 treated, 283 control). Outcomes were collected with survey data collected 20, 36 and 60 months after randomization. The program increased family savings without leading to greater material deprivation. On average, households saved €718 and spent €3,080 on educational expenses. Although savings and spending were lower among families with lower incomes, the program had a significant impact on these families in terms of increased educational aspirations and expectations, as well on students' middle school final grade. Additionally, the program positively influenced students' regular school attendance by reducing instances of skipping school days, missing classes, or arriving late. It also increased the likelihood of students being enrolled in the expected grade and not falling behind 60 months after randomization. The findings show the potential of matched savings accounts to enhance financial aid policies. However, the financial mechanism's regressivity could be addressed through targeted program adjustments.

WHO PAYS FOR PUBLIC EDUCATION? HIDDEN FUNDING MECHANISMS AND TERRITORIAL INEQUALITIES IN ROMAN SCHOOLS

Paola Villa (IREF, Italy) · **Cecilia Ficcadenti** (IREF, Italy) · **Gianfranco Zucca** (IREF, Italy) · **Leonardo Piromalli** (IREF, Italy)

Educational participation | Socio-economic constraints | School–community partnerships

Public education systems are formally designed to guarantee universal access and equal educational opportunities. Yet the actual resources available to schools often depend on a plurality of funding channels. In the Italian context, one of the most debated mechanisms concerns the so-called "voluntary contributions" requested from families. Although formally optional, these contributions frequently finance activities and infrastructures that are central to everyday school life. At the same time, schools increasingly rely on project-based funding and partnerships with external actors to complement public resources. These dynamics raise a broader question: who actually finances the everyday functioning and enrichment of public schools? If public education is formally funded by the state, the concrete availability of resources often depends on the economic capacity of families and on the ability of schools to mobilize additional funding through projects and partnerships. This leads to a second crucial question: to what extent do territorial inequalities shape the financial resources available to schools? Constitutional principles guarantees equal access to free public education. If the availability of educational resources increasingly depends on the socio-economic conditions of local communities and on their capacity to mobilize additional financial contributions, these mechanisms may inadvertently reproduce territorial inequalities within the public school system. In such a scenario, schools located in more affluent areas may benefit from a broader set of resources, while schools operating in economically fragile contexts may face structural constraints in sustaining educational activities and opportunities. This paper investigates these dynamics in the city of Rome by analysing the composition of school resources and their territorial distribution. The research draws on data contained in the Self-Evaluation Reports (RAV – Rapporti di Autovalutazione) produced by Italian schools within the National Evaluation System. These documents include standardized information on voluntary family contributions as well as on the broader composition of school resources, including state funding and financial resources obtained through projects and collaborations with external actors. The study reconstructs the relative weight of different funding sources and explores how schools combine public funding, family contributions and project-based resources to sustain their activities. The analysis adopts a territorial comparative perspective, focusing on schools located in the different municipalities of Rome. Through spatial comparison and mapping, the research investigates how the balance between public funding, family contributions and project resources varies across different areas of the city. This approach makes it possible to identify

patterns of territorial stratification in the economic resources available to schools and to assess whether schools located in socio-economically disadvantaged areas rely on different funding mixes compared to those operating in more affluent contexts. A qualitative analysis is complemented by qualitative insights from a broader research project conducted in Municipio VI of Rome, one of the most socio-economically fragile districts of the city. Within this project, semi-structured interviews were conducted with school leaders, teachers and representatives of third sector organizations. These qualitative materials help to contextualize the statistical patterns and to better understand how schools operating in vulnerable contexts cope with limited family contributions and mobilize alternative forms of support.

PROMOTING TERTIARY EDUCATION THROUGH ASSET BUILDING: IMPACT EVALUATION OF THE PERCORSI PROGRAMME

Valentina Battiloro (ASVAPP - Associazione per lo Sviluppo della Valutazione e l'Analisi delle Politiche Pubbliche, Italy) · **Luca Mo Costabella** (ASVAPP - Associazione per lo Sviluppo della Valutazione e l'Analisi delle Politiche Pubbliche, Italy)

tertiary education · asset building · randomised controlled trial

The costs of tertiary education represent a significant barrier for many families (Elliott and Lewis, 2018). Among the many types of interventions aimed at supporting students from these families, one possible solution is asset building. Unlike measures such as scholarships or honour loans, which provide a fixed amount of resources at specific points in time, asset building promotes the habit of gradual saving among families, so that a sum for covering education expenses is accumulated in the medium to long term. Beyond facilitating the accumulation of financial resources with minimal effort, asset-building programmes - often involving participants in training on topics such as financial literacy - may also improve future outcomes by strengthening both students' and their families' self-efficacy and planning capacity (Dynarski and Scott-Clayton, 2013). Percorsi is a programme promoted by Fondazione Ufficio Pio. Active since 2010 in Turin, Italy, Percorsi supports low-income families by enrolling them in a saving programme one or two years before their child completes upper secondary education. The resources accumulated are then quadrupled by the programme to support education-related expenses. The impact evaluation of Percorsi is based on a randomised controlled trial, and involves about 1500 students who applied for the programme between 2014 and 2017 (Martini et al., 2021). Our study, based on students' follow-up up to ten years after entry into the programme, shows that participation substantially increased student's likelihood of enrolling in university. Moreover, for some categories of participants there is a significant increase in the probability of obtaining a university degree. Finally, Percorsi proves to be particularly effective for those who seem to be more likely to abandon studies after high school.

FROM TRANSFERS TO ASSETS: ASSET BUILDING TO REDUCE THE INDIRECT COSTS OF EDUCATIONAL PARTICIPATION

Giovanni Vezzoli (Università degli studi di Brescia, Italy; Fondazione Ufficio Pio - Ente Filantropico)

educational inequalities · indirect costs · asset building

Over recent decades, studies on educational inequalities have increasingly emphasized the interplay of economic, social, cultural, and symbolic dimensions. In this context, economic constraint is not reducible to income alone: educational participation entails a total cost that includes indirect and "hidden" expenses (e.g., transport, materials, connectivity) as

well as opportunity costs (time diverted from paid work, forgone income, perceived risks associated with educational investment). This perspective helps explain why predominantly redistributive, short-term policies may alleviate material deprivation without durably reshaping educational trajectories that tend to become entrenched and intergenerationally transmitted (Pfeffer 2008; Ciarini and Giancola 2016). In debates on poverty-reduction measures—including unconditional cash transfers and cash transfers with soft conditionality—the question therefore remains central: how can educational investment be made more manageable and sustainable over time when indirect costs and uncertainty persist? The paper proposes a conceptual framework grounded in asset building, introduced by Michael Sherraden as a policy paradigm oriented toward the intentional accumulation of resources over time and discussed here with specific reference to education (Sherraden 1991; Cramer and Williams Shanks 2014). The core assumption is that participation inequalities require complementing support for immediate consumption with instruments that build stocks of resources that can be activated over time—economic, but also educational, relational, and symbolic—capable of sustaining long-term choices and absorbing shocks that would otherwise disrupt educational pathways (Sherraden 1991; Pfeffer and Waitkus 2021; Nam, Huang and Sherraden 2008; Beverly 2013). The discussion integrates two strands. First, the institutional theory of saving: accumulation becomes more likely when policies shape access, information, incentives, facilitation (automation and procedural simplicity), expectations, use restrictions, and instrument security (Sherraden, Scanlon et al. 2005; Beverly et al. 2008). Second, asset effects capture economic, psychological, and social benefits that exceed monetary value, influencing self-efficacy, planning, and future orientation (Yadama and Sherraden 1996; Shobe and Page-Adams 2001; Scanlon and Page-Adams 2001). In particular, dedicated and restricted accounts can function as protected "containers", activating mental accounting and a commitment device, and strengthening a college-bound identity by making educational trajectories more credible (Beverly 2013; Sherraden et al. 2013; Elliott, Chowa and Loke 2011; Oyserman and Destin 2010; Oyserman 2013). This perspective suggests policy design implications for addressing indirect costs and access barriers: universal-but-progressive schemes combining education-dedicated accounts, initial endowments, automatic enrollment, withdrawal restrictions, and matching contributions, alongside interventions that develop financial skills and planning-oriented practices (Titmuss 1958; Kangas and Palme 2005; Schreiner and Sherraden 2007; Birkenmaier et al. 2016; Sherraden, Huang and Ansong 2017). The paper discusses key trade-offs (regressivity risks, stigma, administrative sustainability) and outlines how asset building can integrate with short-term cash-based measures in a complementary, rather than substitutive, logic (Beverly 2013; Sherraden et al. 2013; Clancy et al. 2016). Finally, the paper notes that Italy has recently seen the emergence of educational pilots consistent with this paradigm, developed in diverse territorial and institutional settings and, in some cases, accompanied by impact evaluations. These experiences provide a useful ground for linking conceptual frameworks and policy choices in the construction of interventions capable of stabilizing educational trajectories over the long term.

Educational Poverty, Symbolic Violence and Democratic Fragility

PANEL CONVENORS: Elena Gremigni (University of Pisa, Italy); Emanuela Susca (Iulm University)

PANEL KEYWORDS: Educational poverty, active citizenship, symbolic violence

Educational poverty is a widespread phenomenon closely intertwined with social inequality, undermining the exercise of active citizenship and the very foundations of democracy. Evidence from OECD assessments of the competences of fifteen-year-olds (OECD-PISA) and adults aged 16 to 65 (OECD-PIAAC) reveals a strong correlation between educational disadvantage and low socioeconomic backgrounds. Individuals who lack the conceptual tools needed to critically engage with information circulating across traditional and social media, as well as with content embedded in AI models, are at risk of being subjected to the mechanisms of symbolic violence enacted by economic and political elites. In this sense, education systems that set modest learning goals may help reduce early school leaving but ultimately deprive low-SES students of the deeper forms of knowledge and competencies that even higher education institutions often fail to guarantee. This panel invites contributors to explore strategies capable of countering the growing tendency within education to simplify forms of knowledge by offering impoverished and standardized content that constrains the development of critical reflexivity, particularly among those from socially disadvantaged contexts who lack alternative cultural resources. Submissions are especially encouraged on the following topics: • Consequences of educational poverty on participation in political life • Educational poverty and difficulties in escaping symbolic violence • Narrowing of school and university curricula and risks for democracy • Impact of cultural deprivation on the use of AI • Role of teachers, professors, and public intellectuals in fostering the critical thinking of low-SES students Both theoretical contributions and empirical research on these topics are welcome.

HABIT, HABITUS AND CONSEQUENCES ON PARTICIPATION IN POLITICAL LIFE: A COMPARISON BETWEEN BOURDIEU AND DEWEY

Andrea Girometti (Università di Firenze, Italy)

habit | habitus | political participation

If educational poverty is a widespread phenomenon closely linked to social inequality, it is clear that one of its main repercussions has political implications in a broader or narrower sense. On the one hand, this can be investigated in terms of politics as a circumscribed field, whose boundaries, according to Bourdieu (1996, 2000), are subject to possible and continuous reconfigurations. On the other hand, there is a broader meaning of politics that informs active citizenship, expressing itself and manifesting itself in different areas and which, with Dewey (2020), we could define as a democratic lifestyle based both on a democratic faith (Dewey 1966) and on the constant experimental monitoring that it requires and presupposes for further innovation (Dewey 1971, 2018, 2023). With regard to the first aspect, if we focus our attention, for example, on the Italian case, the de-democratising nature in terms of the over-representation of the upper-middle classes in elected office alone was already evident in the early 1990s (Mastropaolo 1993), not coincidentally corresponding to the decline of mass parties, which in turn nevertheless had an impact on the political alienation of the subordinate classes (Bourdieu 2001; Girometti 2020). On the other hand, if we take as a relevant criterion of political participation its expression in terms of active citizenship, it cuts across different areas and calls into play a series of constantly redefined

knowledge, skills and competences, whose (at least) tendency towards universalisation is the stakes of an effective democratic politics in progress. In this sense, from a more strictly theoretical point of view, it becomes crucial to try to shed light on the different modes of action and reaction that social actors are able to activate in their confrontation with the (not only) social environment. Precisely for this reason, a comparison between Dewey's and Bourdieu's proposals, focusing mainly on the similarities, not ignored by Bourdieu (Bourdieu and Waquant 1992), between the concepts of habit and habitus (Dewey 2025; Bourdieu 1979; Colapietro 2004; Bogusz 2012; Crossely 2013; Piroddi 2018) could be useful for understanding the processes of differentiation and the related forms of social domination that are established between social groups. By retracing the common and divergent features of the two perspectives, primarily in terms of socialisation and interested life (Santarelli 2019), we will attempt to restore the richness of the two paths and suggest a possible integration. This could prove fruitful both as an analytical tool and as a means for political intervention in the sense of a democratisation of democracy.

EDUCATIONAL POVERTY, SYMBOLIC VIOLENCE, AND DEMOCRATIC FRAGILITY: A GRAMSCI–BOURDIEU PERSPECTIVE

Emanuela Susca (IULM University, Milan, Italy)

educational poverty | symbolic violence | hegemony

Educational poverty cannot be reduced to insufficient schooling or low achievement scores. It designates a structural condition that limits access to the forms of knowledge required for critical participation in democratic life and democratic deliberation. Rather than representing merely an educational deficit, it can be interpreted as a mechanism of cultural domination operating through institutional arrangements, curricular choices, and embodied dispositions shaped by unequal access to cultural capital (Bourdieu & Passeron, 1977). From a Gramscian perspective, education plays a decisive role in the production of consent and in the consolidation of hegemonic projects (Gramsci, 1971; Thomas, 2009). When

curricula are progressively simplified and intellectual ambition is lowered in the name of efficiency or performativity, the issue is not merely pedagogical adjustment but the potential erosion of the cultural capacities necessary for active citizenship. Educational poverty thus becomes a terrain where struggles over cultural leadership, knowledge hierarchies, and the role of intellectuals unfold. Teachers and professors can be understood as potential organic intellectuals whose practices contribute either to the reproduction of dominant cultural hierarchies or to the development of critical reflexivity capable of challenging symbolic domination (Baldacci, 2017). Bourdieu's theory of symbolic violence deepens this analysis by illuminating how inequalities are reproduced through the internalization of objective structures and through processes of misrecognition that transform structural limits into perceived personal inadequacies (Bourdieu, 1977; Bourdieu, 1991). The unequal distribution of cultural capital and the normalization of modest educational expectations may reinforce democratic fragility by constraining individuals' capacity to critically interpret information circulating across traditional media, digital environments, and AI-mediated systems. Bringing Gramsci's theory of hegemony into dialogue with Bourdieu's relational sociology enables a multi-level understanding of educational poverty that connects macro-level power relations with micro-level dispositions and practices. Such a synthesis highlights the political responsibility of educators and public intellectuals in resisting the narrowing of knowledge and in fostering reflexive capacities among socially disadvantaged students, thereby counteracting processes of symbolic domination and contributing to the renewal of democratic participation (Burawoy, 2012; Wacquant, 2004).

THE "TEATE SOLIDALE" PROJECT: AN INCLUSIVE SCHOOL MODEL AGAINST EDUCATIONAL POVERTY IN CHIETI – A CASE STUDY

Luca Santonetti (Università degli Studi "G. d'Annunzio" Chieti-Pescara, Italy)

Educational poverty | School dropout | Teate Solidale

This paper analyzes the phenomenon of educational inequalities in the province of Chieti, located in Central-Southern Italy. The focus is on the active role that schools and educational staff can play in implementing strategies aimed at reducing educational poverty and school dropout. Drawing on Bourdieu's concept of symbolic violence (Bourdieu & Passeron, 1977) and Freire's critical pedagogy (1970), the research examines how schools and educational staff can positively influence the reduction of educational inequalities. The research posits that this can be achieved through a reinterpretation of their role according to new criteria of authoritativeness (Freire, 1970) and methodological awareness. It is argued that educational communities can function as agents of democratic emancipation, rather than merely as transmitters of dominant cultural codes (Haberman, 1991; Bernstein, 2000; Bourdieu & Passeron, 1977). This assertion is supported by the implementation of inclusive policies aimed at mitigating the socioeconomic gap that affects students' academic success and at fostering the critical capacities necessary for informed democratic citizenship. This approach is in line with recent evidence highlighting the urgent need for multidimensional interventions to reduce social exclusion (ISTAT, 2025). The research adopts a mixed-methods case study approach, drawing on the experience of the "Teate Solidale" project promoted by the Convitto Nazionale "G. B. Vico" in Chieti in collaboration with partner organizations. The project stems from an analysis of the needs, learning difficulties and socioeconomically disadvantaged family backgrounds found in the local catchment area, reflecting the most recent critical issues regarding school dropout in peripheral Italian areas (9.8% in 2024; Openpolis & Con i Bambini, 2025). The intervention was structured around the provision of targeted study support activities for students at risk of dropping out and the development of training programs aimed both at career guidance for students and the enhancement of the pedagogical skills of educational staff. The findings draw on quantitative data regarding student outcomes, families supported and staff involved, as well as qualitative interviews with

staff. Analysis of these data illustrates how the application of such community-based educational models and new pedagogical approaches, when adopted in contexts of democratic deficit, not only improves academic outcomes but also leads to significant benefits in terms of perceived relational well-being. It further enables students to develop collective competencies and critical consciousness (Sen, 1999; Biesta, 2007; Nussbaum, 2010). These findings confirm the effectiveness of 'community education' models, as highlighted by research on extracurricular interventions (Durlak et al., 2010; Save the Children, 2025). In conclusion, the "Teate Solidale" experience offers a potentially replicable model for other peripheral contexts characterized by limited institutional resources and high socioeconomic inequality, demonstrating that elements such as collaboration between schools and local partner institutions, training educators in critical pedagogy and developing family involvement protocols can be adapted to different socio-territorial conditions. This experience highlights the importance of a systemic approach to ensure the right to education and to counteract social exclusion in vulnerable local contexts, in line with the European goal of reducing early school leaving to below 9% by 2030 (Openpolis, 2025).

EDUCATIONAL POVERTY AND THE DIGITAL PUBLIC SPHERE: COGNITIVE INEQUALITIES AND DEMOCRATIC PARTICIPATION

Stefania Fragapane (Università Mercatorum, Italy)

Educational Poverty | Civic Participation | Democratic Citizenship

In recent years, the concept of educational poverty, understood as the condition in which individuals and social groups lack the cognitive and cultural resources to critically interpret social reality, has entered sociological and pedagogical debate as a key to interpreting contemporary inequalities. From this perspective, educational poverty does not only concern school education, but also affects participation in community life and the exercise of citizenship. The issue takes particular relevance in the current context, characterized by the growing centrality of digital platforms, social media, and algorithmic systems in the production and circulation of information. Participation in the public sphere requires increasingly complex interpretative skills: navigating heterogeneous sources, assessing the reliability of information, recognizing persuasive discursive strategies, and understanding the logic of digital platforms are fundamental dimensions of civic competence. In this context, the lack of adequate cognitive tools can translate into difficulty understanding complex political content, greater exposure to disinformation and, more generally, reduced opportunities for participation in public debate. This is the context for the reflection proposed in this contribution. The paper starts from the hypothesis that digital educational poverty can be interpreted as a specific form of civic inequality in contemporary societies and aims to discuss how the unequal distribution of the skills needed to understand and interpret digital information ecosystems affects opportunities for participation in the public sphere and political debate. The aim is therefore to relate three closely connected dimensions: educational inequalities, the transformation of digital information environments, and the cognitive

conditions of democratic participation. The available empirical evidence shows that these skills are distributed in a highly unequal manner. Surveys conducted by the OECD emphasize that socioeconomic background is one of the main factors associated with levels of proficiency in reading, numeracy, and problem solving. The results of the PISA and PIAAC surveys show that students and adults from disadvantaged socioeconomic backgrounds are more frequently placed at the lower levels of the competency scales (OECD, 2019; OECD, 2023). The unequal distribution of cognitive skills affects academic achievement and the ability to access interpretative resources necessary to understand how contemporary information environments work. These findings can be interpreted in light of a well-established tradition of sociological studies that have analyzed the role of cultural capital in the reproduction of educational inequalities. Studies by Bourdieu and Passeron (1970) have shown how the unequal distribution of cultural resources contributes to structuring opportunities for learning and social participation. In contexts characterized by the growing centrality of digital technologies, these dynamics intertwine with new forms of inequality linked to the skills needed to inhabit the digital environment. As Van Dijk (2020) observes, the contemporary digital divide concerns less material access to technologies and increasingly differences in skills and ways of using digital resources. Starting from these theoretical considerations, the paper discusses how digital educational poverty can contribute to producing socially stratified forms of political participation. The literature on democratic citizenship has shown how education level and cognitive skills significantly influence civic engagement and the ability to navigate complex political positions.

CULTURAL CAPITAL AND SYMBOLIC VIOLENCE IN ENGLISH EARLY YEARS EDUCATION REGULATION

Juliette Wilson-Thomas (Manchester Metropolitan University, United Kingdom) · **Ruby Juanita Brooks** (Manchester Metropolitan University, United Kingdom)

cultural capital | symbolic violence | early years

In this presentation we discuss our critical documentary analysis of the training documents, and inspection reports of Ofsted regarding cultural capital in early years education and care provision in England. In 2019 Ofsted, the organisation who inspect and regulate educational provision in England, introduced cultural capital as a new and key aspect of judgements on early years provision. Ofsted (2019) define cultural capital as 'the essential knowledge needed to be educated citizens', and provide vague references to examples. Cultural capital in the Bourdieusian (1984) sense could be utilised to identify and destabilize cultural and societal hierarchies through education however, Ofsted have included and defined cultural capital from a deficit perspective. In previous papers we have argued, and demonstrated that the inclusion of cultural capital represents symbolic violence particularly towards the early years workforce as the way Ofsted defines it diminishes non-elite forms of knowledge and culture (Wilson-Thomas & Brooks, 2024). Using a Freedom of Information Request we have accessed the training materials used by Ofsted to train inspectors on cultural capital, and we have examined the publicly available Ofsted inspection reports and any references to cultural capital. One of the main

problems of the way this sociological concept has been used is that it is poorly and vaguely defined so as to become almost meaningless. However, the implication that there is an essential knowledge that determines future success/ education status/ valued citizen status remains a symbolically violent undercurrent to its usage. We therefore argue that the current deployment of cultural capital within Ofsted's framework requires urgent reconsideration, as its deficit-oriented framing risks undermining inclusive pedagogical practice and obscuring the diverse cultural assets children and practitioners already bring to early years settings. The imprecise yet elitist deployment of cultural capital represents a narrowing of educational provision, and follows a contemporary trend within educational institutions and regulation to simplify forms of knowledge thus offering impoverished and standardized content. Our findings show that cultural capital is inconsistently applied and conceptually hollow, yet its evaluative force narrows curricula toward standardised, impoverished content. Ofsted risks deepening educational poverty by denying children access to diverse cultural resources and the conceptual tools needed for critical engagement with the world, which is essential for active citizenship. There are wider implications for this trend, and our research can be used to critically explore other countries where implicit and explicit references to cultural capital are embedded in educational policy and practice.

MULTIPLE IGNORANCES AND LOW PERFORMERS: THE ELEPHANT IN THE CLASSROOM AND THE EROSION OF DEMOCRATIC COMPETENCE

Laura Occhini (università di Siena, Italy)

Democratic competence | Ignorance | Low-performer students

Due to inappropriate use, the term ignorance has progressively acquired a semantic aura so broad that it has become difficult to define its conceptual limits and attribute a single characterisation to it. In colloquial language, as well as in some media and educational simplifications, the term is often conflated with notions that do not belong to it either linguistically or scientifically. It is no accident that, since the early 2000s (Proctor, 2004; Proctor & Schiebinger, 2025), agnotology has become established in the humanities sciences, as a field of study dedicated to analysing the historical, cultural, political and educational conditions that determine not only "the things" we do not know, but also "why" we do not know them, "what" – or even "who" – impedes access to knowledge, and "how" ignorance tends to consolidate and reproduce itself over time (Occhini, 2026, in press). This contribution fits into this theoretical framework and analyses the issue of ignorance on the basis of the most recent data on the level of preparation of Italian students provided by ISTAT (2025), OPENPOLIS (2025), OECD (2025) and INVALSI (2024), relating them to the objectives of the 2030 Agenda for Sustainable Development (United Nations, 2015). Comparative analysis shows that the Italian education system is marked by persistent and interconnected phenomena such as implicit early school leaving, educational segregation, a high percentage of ELET, familily's educational carelessness, implicit tracking, and the progressive simplification and narrowing of school and university curricula (Occhini, 2022; Occhini and Giampaolo, 2021). These phenomena are interpreted not only as critical outcomes of the structural system, but also as both the cause and effect of a progressive increase in levels of ignorance among the general population. Here, the attention to the relationship between these processes and the increase in acquired illiteracy, functional and relapse into illiteracy, which transforms ignorance into a cognitive and behavioural dimension that permeates large sections of the population, influencing individuals' interpretative, critical and decision-making skills. However, it is in the field of democracy that the effects of ignorance and illiteracy take on a particularly alarming significance. A population in which epistemic vices and forms of cognitive obstructionism extend from the individual and psychological to the collective and institutional levels is a fragile population, less able to distinguish between slogans and political programmes, impulsive choices and political consensus, and simply didactic knowledge and the effective internalisation of knowledge. From this perspective, ignorance is not only an educational question, but also a factor of democratic vulnerability, which can compromise the quality of participation, judgement and civic responsibility.

FROM SCHOOL TO CITIZENSHIP: THE ROLE OF EDUCATION AND SOCIAL ORIGIN IN SHAPING CIVIC ENGAGEMENT

Federica Rizzi (Università "La Sapienza", Italy) · **Adamo Lo Cicero** (Università "La Sapienza", Italy)

educational poverty · social origin · non-market returns

Education research has extensively documented the economic returns of schooling, particularly regarding employment, income, and labour market opportunities (Checchi, 2006; Ballarino et al., 2016; Pensiero et al., 2019). By contrast, less attention has been paid to its non-market returns, especially its contribution to promoting civic and political participation, associational involvement, and democratic orientations (Campbell, 2006; Assirelli, 2014; Sciolla, 2019). In line with the debate on educational poverty, this study interprets educational deprivation not merely as low educational attainment or a deficit in economically valuable skills (Giancola and Salmieri, 2023), but as a constraint on the resources required for active and informed citizenship. Within this perspective, three main theoretical frameworks are highlighted. The first conceptualises education as a mechanism of intergenerational reproduction of social and cultural inequalities (Bourdieu, 1972), whereby social origin continues to exert a strong influence on access to, persistence in, and success within educational trajectories, contributing to the transmission of both resources and disadvantages across generations. The second concerns the effects of low educational attainment, which extend beyond disadvantaged labour market outcomes (Giancola & Salmieri, 2022) to include the civic and political domains: lower levels of education are associated with weaker participatory skills, lower levels of institutional trust, and less tolerant attitudes toward others. Finally, the third refers to the capability approach (Sen, 1985), which frames education as a resource. The effectiveness of this resource depends on the extent to which educational credentials can be converted into real opportunities for agency. This study aims to analyse the joint role of social origin and educational attainment in shaping multiple dimensions of civicness, considering social origin both as a factor influencing educational trajectories and as a resource exerting a direct and indirect education-mediated effect on civic participation and orientations. Empirically, the study relies on data from the last four waves (2012, 2016, 2018, and 2020) of the European Social Survey (ESS) and examines the impact of education on selected dimensions of civicness identified by Campbell (2006) and further developed by Assirelli (2014): political engagement, interpersonal and institutional trust, and tolerance towards minorities. The methodological strategy combines two complementary analytical strategies. First, a compositional descriptive approach explores the interactions between social origin, education, and civicness through Multiple Correspondence Analysis (MCA) and Cluster Analysis (CA), providing a structured representation of the distribution of civic resources. Second, an exploratory-confirmatory approach based on multivariate linear models estimates the direct and indirect effects of the variables considered, controlling for key sociodemographic characteristics. The findings highlight the pivotal role of education in shaping civic inequalities. While educational attainment strongly shapes patterns of active citizenship, social origin still exerts an independent influence, operating both through educational pathways and directly. These findings underscore the persistence of inequality reproduction mechanisms within the civic sphere.

HISTORICAL KNOWLEDGE AND CITIZENSHIP COMPETENCES IN ITALIAN SECONDARY SCHOOLS: AN EXPLORATORY ANALYSIS OF EDUCATIONAL OPPORTUNITY INEQUALITIES IN HISTORY EDUCATION

Elena Gremigni (University of Pisa, Italy)

Educational inequalities | Upper secondary schools | History

Educational poverty is not only a matter of access to schooling but also of the quality of knowledge and competences that students acquire (Argentin et al. 2017; Ardeni, 2018; Pensiero, Gancola and Barone, 2019; Giancola and Salmieri, 2023). Historical competency, in particular, encompasses the critical ability to interrogate and evaluate sources, a skill increasingly vital in digital environments saturated with misinformation and low-quality content. Developing students' capacity to navigate such complex information landscapes is essential for fostering informed citizenship and civic responsibility (Armitage and Guldi, 2016; Pisanty, 2019; Prosperi, 2021). Despite this, history teaching in many Italian schools rarely covers contemporary topics, often neglecting structured engagement with primary sources and historiographical materials (Talarico, 2023). This pedagogical gap risks perpetuating cultural deprivation and reinforcing patterns of social reproduction (Bourdieu and Passeron, 1970). Addressing it requires not only increasing the instructional time devoted to history, particularly in technical and vocational tracks, but also providing teachers with professional development in source-centered approaches often lacking in their university training (De Bernardi, 2023). This presentation examines these issues through exploratory research based on a qualitative analysis of final reports from class councils in a sample of Italian upper secondary schools. The data offer insights into how micro-level teaching practices both reflect and contribute to broader social inequalities, and how a stronger emphasis on critical source use could simultaneously enhance historical understanding, civic competencies, and the ability to discern reliable information from misinformation in both offline and online contexts.

VIOLENCE, TRAUMA AND BLACK AFRICAN WOMEN'S NAVIGATION OF HIGHER EDUCATION

Kim Heyes (Manchester Metropolitan University, United Kingdom) · **Nicola Ingram** (University College Cork, Ireland) · **Benedicte Brahic** (Manchester Metropolitan University, United Kingdom) · **Aradhana Mansingh** (MANCOSA, South Africa) · **Shoba Arun** (University of Essex, UK) · **Mariam Seedat-Khan** (University of Kwa-Zulu Natal, South Africa)

habitus clivé | ruptured habitus | trauma

The post-apartheid South African Higher Education landscape remains marked by profound inequalities that perpetuate historical patterns of exclusion despite formal democratisation and policy reforms aimed at transformation in pursuit of social justice (Agumba et al., 2023). While access to universities has expanded since 1994, educational attainment continues to reflect deep structural disparities, with Black African students, particularly women from rural and working-class backgrounds, experiencing multiple intersecting layers of marginalisation (Heleta, 2016). Black women navigate a complex matrix of oppression where patriarchal structures intersect with enduring racial hierarchies, creating unique barriers to both entry and success in higher education (Hlatshwayo, 2020). This marginalisation is reinforced by the symbolic violence operating within the education field —the subtle, normalised forms of domination embedded in institutional cultures, curricula, and pedagogical practices that systematically devalue their knowledge systems, languages, and lived experiences while privileging Western-centric, masculinist epistemologies. Conceptually building upon this, in this paper, we show how sustained experiences of forms of violence - physical, sexual and symbolic - across the home and education field are internalised by the women in our study, and how this positions their conception of the world and their ways of being in it. Our analysis extends Bourdieusian conceptualisations of habitus clivé (Ingram, 2011; 2018; Friedman, 2016) by foregrounding trauma as an embodied, affective experience that leaves a lasting imprint on the habitus. Sustained and multi-generational exposure to physical, sexual, and symbolic violence across home and educational fields is internalised to form lasting perceptions and conceptions of the world. These deeply traumatic experiences can cause habitus rupture and a calling into question of taken-for-granted ways of being. This rupture is particularly pronounced in cases where the multiple fields in which a person lives their life, become misaligned with habitus (Brahic et al., 2025). The extreme nature of the violence and abuse suffered by the women in our study is recognised in the present, and not dismissed as something that happened in the past when read through the lens of ruptured habitus. It offers a way of acknowledging the violence not as something they have overcome, but as something they have internalised as history, and now embody in their orientation towards their future. Our results discuss the need for targeted support within the South African education context to tackle gender-based violence for children in schools and communities. The results also highlight the need for the Higher Education system to recognise trauma experiences for women from the poorest financial backgrounds, and we suggest that expert support services are needed to promote equity in accessing higher education.

SOCIO-EDUCATIONAL INTERVENTIONS IN AT-RISK NEIGHBORHOODS OF CATANIA: A DETECTION STRATEGY

Agnese Miccichè (Università degli Studi di Catania) · **Simona Manuela Antonietta Gozzo** (Università degli Studi di Catania) · **Marta Basile** (Università degli Studi di Catania) · **Elvira Celardi** (Università degli Studi di Catania) · **Deborah De Felice** (Università degli Studi di Catania) · **Simone Antonino La Mela** (Università degli Studi di Catania) · **Kristal Martina Crupi** (Università degli Studi di Catania)

educational poverty | educational networks | civic engagement

This study seeks to describe the educational situation in at-risk areas of Catania. The main goal is to analyse the presence and role of public institutions and third-sector organizations in preventing school dropout. This work also aims to assess the degree of homogeneity and specificity observed across the monitored areas with regard to active initiatives, existing challenges, and forms of collaboration. Educational poverty limits children's right to education and reduces their opportunities to develop the skills necessary to grow and integrate into society. This phenomenon arises from a lack of resources and opportunities within social and territorial contexts and negatively affects minors' cognitive development. Its consequences include difficulties in learning, comprehension, writing, numeracy, and the ability to cope with everyday problems and practical tasks. The metropolitan city of Catania shows very high levels of educational poverty: the school dropout rate has reached 26% (Openpolis, 2025). This situation particularly affects minors living in families with low levels of education and in difficult socioeconomic conditions. Many young people interrupt their studies to contribute economically to their families, sometimes becoming involved in informal or illegal activities. Schools play a central role in combating early school leaving, both through their own educational tools and through collaboration with institutions and voluntary organizations operating in the local area. Projects promoted by these actors aim to reduce the risk of dropout and to offer new learning opportunities, thereby fostering pathways out of intergenerational poverty and supporting social mobility. The research is structured in two phases: I) the selection and mapping of local areas that are experiencing the highest levels of social deprivation, identified through ISTAT data; II) the reconstruction of intervention strategies through interviews and questionnaires administered to schools and voluntary organizations. Methodologically, the research adopts a mixed-methods approach. It combines analysis of secondary data with qualitative methods, including semi-structured interviews and questionnaires administered to schools and voluntary organizations, to reconstruct local intervention strategies. The findings highlight a complex and differentiated phenomenon. Economic, social, and, in some cases, infra-structural difficulties – such as those observed in the district of Librino and San Cristoforo – make efforts to counter educational poverty particularly challenging. Nevertheless, multidisciplinary approaches and shared, project-based work involving multiple stakeholders have proven effective in developing educational pathways that address the specific needs of minors.

OUTDOOR EDUCATION AND SERVICE LEARNING AS RESPONSES TO EDUCATIONAL POVERTY IN SOCIO-ECONOMICALLY DISADVANTAGED SCHOOL CONTEXTS

Simone Consegnati (INDIRE, Italy) · **Chiara Giunti** (INDIRE, Italy) · **Silvia Panzavolta** (INDIRE, Italy)

Outdoor Education | Service Learning | Educational Poverty

This proposal explores how Outdoor Education and Service Learning can represent two effective pedagogical responses to educational poverty in school contexts marked by cultural and economic deprivation. Starting from the assumption that educational poverty does not simply coincide with low academic achievement, but also concerns limited access to meaningful learning opportunities, critical thinking, participation, and cultural resources, the paper presents two case studies of schools that have developed practices aimed at promoting the educational success of every student. The cases analyzed show how the combination of Outdoor Education and Service Learning can foster more inclusive and participatory learning pathways, highlighting the potential of the school as a democratic space capable of broadening students' horizons, strengthening their agency, and promoting more equitable access to rich and transformative learning experiences. The first case study concerns the Benci-Borsi Comprehensive Institute in Livorno, which, through the integration of different methodologies and pedagogical approaches (including Outdoor Education, Service Learning, Slow Education, and Philosophy for Children), has overcome the fragmentation of isolated interventions, fostering instead a process of structural transformation of the school toward a caring, community-oriented identity, with a whole-school approach to well-being. In this perspective, the school can be understood as a genuine educational ecosystem, based on three main elements: an extended interprofessional collaboration, with the school constantly engaged in co-design processes with local community partners; the enhancement of cultural diversity within both the school community and the wider local context; intergenerational practices aimed at creating spaces for encounter, exchange, and dialogue among different generations. The second case study reports the experience of the Piazzale della Gioventù Comprehensive Institute in Santa Marinella, which has introduced a biophilic curriculum within its school. The biophilic curriculum is a vertical, competency-based framework (structured through activities, practices, and progressive objectives) that prioritizes the development of transversal skills, behaviors, and attitudes (such as managed risk, relationships, and community engagement) rather than focusing solely on disciplinary content. It emphasizes civic responsibility and the affective dimension of learning, with biophilia and Service Learning as shared guiding principles, and integrates Outdoor Education not simply as "teaching outside", but as the construction of authentic experiences that connect body, emotion, cognition, and relationships with living beings. In this case, the educational response to deprivation is based on the idea that students should not be considered passive recipients of simplified knowledge, but active subjects capable of interpreting reality and contributing to its transformation. Taken together, the two case studies suggest that Outdoor Education and Service Learning are valuable strategies not because they compensate for disadvantage through simplification, but because they enrich educational pathways through participation, experience, and social meaning. The paper argues that, in contexts of deprivation, addressing educational poverty requires schools to expand access to knowledge rather than reduce it, and to create conditions in which all students can develop critical reflection, responsibility, and agency. From this perspective, the two approaches offer relevant insights for rethinking the democratic mission of schooling and for promoting inclusive and equitable forms of educational success.

EDUCATIONAL POVERTY, CAPITALS, AND SYMBOLIC VIOLENCE: ATTITUDES TOWARD SOCIOCULTURAL DIVERSITY IN CROATIAN UPPER SECONDARY SCHOOLS AND IMPLICATIONS FOR DEMOCRACY

Iva Odak (Institute for Social Research in Zagreb, Croatia) · **Saša Puzić** (Institute for Social Research in Zagreb, Croatia) · **Josip Šabić** (Institute for Social Research in Zagreb, Croatia)

Educational poverty | attitudes toward sociocultural diversity | democratic mission of schooling

Educational poverty is increasingly recognized as a structural phenomenon closely linked to social inequality and unequal distributions of economic and cultural capital. From this perspective, schools may either mitigate or reproduce these inequalities. Drawing on Pierre Bourdieu's (1984) theory of cultural reproduction, this paper examines how different forms of capital shape students' and teachers' attitudes toward sociocultural diversity in Croatian upper secondary schools, and how these processes may relate to educational poverty, symbolic violence, and the broader democratic role of education (Bourdieu & Passeron, 1990). Educational poverty is not limited to the absence of basic skills, but also involves restricted access to complex forms of knowledge, critical thinking, and cultural resources that enable active participation in democratic life (Adams & Bell, 2016). When curricula, pedagogical practices, or institutional cultures implicitly privilege dominant cultural capital, students from disadvantaged backgrounds may experience forms of symbolic violence that devalue their cultural resources and reinforce social hierarchies (Olneck, 2000). The study draws on data collected in 2026 through a national questionnaire survey conducted among a representative sample of approximately 2,000 upper secondary school students and 500 teachers across all types of upper secondary education programs in Croatia. The research examines determinants of attitudes toward sociocultural diversity among both groups. Multiple regression analysis will be employed to identify predictors of inclusive or exclusionary attitudes toward diversity. Particular attention will be paid to whether unequal distributions of economic and cultural capital correspond with more negative attitudes toward diversity and with patterns that reproduce symbolic boundaries within the school context (Pedersen, 1996). It is expected that students with lower levels of cultural and economic capital may encounter educational environments that

insufficiently recognize their cultural resources, potentially reinforcing experiences associated with educational poverty (Gorski, 2009). Teachers operating within institutional pressures and standardized curricular frameworks may also reproduce dominant cultural norms that unintentionally sustain symbolic inequalities. By connecting educational poverty with Bourdieu's concepts of capital and symbolic violence, this study contributes to discussions about how schools shape dispositions relevant to democratic participation. If educational systems fail to provide equitable access to rich cultural knowledge and reflexive capacities, they risk limiting the ability of young people to engage critically in democratic processes. The findings therefore highlight the importance of educational policies and pedagogical practices that expand cultural resources, challenge symbolic hierarchies, and strengthen the democratic mission of schooling.

Evaluating Education and Democracy: Approaches, Methodologies and Practices for Social Justice and Critical Literacy in the Digital Era

PANEL CONVENORS: Gabriele Tomei (President, Aiv (Italian Association of Evaluation), Italy); Donatella Poliandri (Vice President, Aiv (Italian Association of Evaluation), Italy)

PANEL KEYWORDS: Critical Democratic Literacy, Social Justice Evaluation, Educational Inequality

This panel explores how evaluation can assess and strengthen the reciprocal bond between learning and democracy, focusing on some of the critical twenty-first-century challenges: social inequality, digital transformation, and the growing proliferation of disinformation. We seek multidisciplinary research—spanning theoretical, empirical, and methodological fields—aimed at achieving a more just, inclusive, and genuinely participatory society. Building on this perspective, contributions may investigate the multidimensionality and intersectionality of poverty, as well as the effectiveness of policies addressing education, inequality, and social justice. The call also encourages analyses of how evaluation practices and results can foster a renewed critical democratic literacy within an infosphere increasingly shaped by polarization and hate speech. Submissions should present methodological frameworks and empirical studies that transcend the rigid separation between Learning for Democracy and Democracy for Learning, positioning evaluation as a tool for emancipation, active citizenship, and equitable educational opportunities.

CAN FAMILY GROUP CONFERENCES BE A RESOURCE IN ADDRESSING SCHOOL VULNERABILITY? EVIDENCE FROM A RANDOMIZED CONTROLLED TRIAL IN ITALY

Riccardo Gostoli (Università Cattolica del Sacro Cuore, Italy) · **Gian Paolo Barbetta** (Università Cattolica del Sacro Cuore, Italy) · **Giulia Assirelli** (Università Cattolica del Sacro Cuore, Italy) · **Gianluca Argentin** (Università degli Studi di Milano-Bicocca, Italy)

Family Group Conferencing (FGC) | Randomized Controlled Trial (RCT) | Italy

This paper presents the counterfactual evaluation of the educational project R.E.A.C.T. (Reti per Educare gli Adolescenti Attraverso la Comunità e il Territorio/Networks for Educating Adolescents through Community and Local Context), aimed at tackling educational poverty (Save the Children, 2014; Lohmann & Ferger, 2014), a widespread phenomenon in Italy both in terms of skills attainment (European Commission, 2025) and from a multidimensional perspective (ISTAT, 2024). The intervention, implemented during the 2018–2019 and 2019–2020 school years, involved 10 lower secondary schools located in highly deprived areas across Italy. Training and cultural activities were delivered to the local communities and to all students in the participating schools, with the objective of activating and strengthening the local "comunità educanti" (Zamengo & Valenzano, 2018; Tomei & Galligani, 2020). In addition, 226 particularly vulnerable students were provided with individualized educational plans developed through the Family Group Conference (FGC) model (Frost et al., 2014). This approach was adopted to better identify students' needs, mobilize family networks, and engage both formal and informal educational agencies within the local context. R.E.A.C.T. represents an interesting application of FGCs for

explicitly educational purposes, within an international context where this tool is primarily used in child protection and welfare services (Hohashi & Yi, 2025; Edwards & Parkinson, 2018), and where evidence regarding its effectiveness remains mixed (Dijkstra et al., 2016; Mitchell, 2020; Nurmatov, 2020; Hohashi & Yi, 2025). The impact evaluation focuses on the vulnerable students who participated in the individualized educational plans. A randomized controlled trial (RCT) design was adopted: teachers identified 431 students experiencing significant academic and relational difficulties, and through random assignment, 226 were allocated to the treatment group and 205 to the control group. For this population, both short- and long-term outcomes were assessed. Short-term outcomes concerned students' perceived well-being (measured through dimensions of school well-being, relationships with teachers, relationships with parents, and expectations about their future). A questionnaire administered before and after the intervention allowed these dimensions to be measured and changes over time to be recorded. Long-term outcomes referred to students' educational trajectories in the years following the intervention (promotion to the next grade and school dropout) as well as academic performance (grades obtained and scores in the national INVALSI standardized tests). These outcomes were recorded using data from the Anagrafe Nazionale degli Studenti (National Student Registry), covering four school years from 2018/2019 to 2021/2022, and from INVALSI. The analyses show a positive impact of the project on perceived school well-being (but no significant effects on relationships with teachers and parents or on future expectations). In the long term, the intervention is associated with a reduction in the risk of grade retention and school dropout among participating students.

HUMAN AND ARTIFICIAL INTELLIGENCE COMPARED IN HIGHER EDUCATION ASSESSMENT: A STANDARD RESEARCH ON SEMI-STRUCTURED TESTS AND POTENTIAL BIASES

Daniela Robasto (University of Turin, Italy) · **Lucrezia Bano** (University of Turin, Italy) · **Sabrina Natali** (University of Turin, Italy)

assessment · docimological bias · generative artificial intelligence

The paper presents early findings of an empirical research, within an exploratory framework, involving assessment processes carried out by generative artificial intelligence (AI) and human evaluators (HI). Research questions wonder whether I) between results of semi-structured test assessments carried out by HI and results of assessments carried out by AI, lies a discrepancy that could be considered critical – greater than the one found between human evaluators in the previous research phase – and II) if the upload of teaching materials, integrated with AI-HI interaction, have a significant relation with discrepancy reduction. Objectives of research are then to control the existence of such critical discrepancy

and the relation between teaching materials upload and discrepancy reduction. The research hypothesis states that I) a critical discrepancy exists and that II) it can be reduced with teaching materials uploading, commented by human evaluators. Population consists of Masters's Degree students, the sample being composed by those who have carried out in groups, as in itinere or summative assessment, a semi-structured project work during academic years 2024/2025 and 2025/2026. Awaiting further investigation, initial results describe the discrepancy as critical and seem to indicate that AI may be subject to docimological bias already attested for human evaluators as adoption of implicit criteria, failure to identify intermediate performance levels, lack of consistency over time, in addition to specific AI-related biases. This line of research is established in defence of a responsible and inter-subjective assessment practice, promoting quality and transparency in democratic pedagogy.

MATERIALIST CIVISM AS AN EVALUATIVE PARADIGM FOR YOUTH POLITICAL ACTIVATION: THE RIZOMI EXPERIENCE

Leonardo Parodi (RIZOMI, Italy) · **Riccardo Rangone** (RIZOMI, Italy) · **Francesco Pellettieri** (RIZOMI, Italy)

youth participation | multidimensional evaluation | democratic education

In the contemporary debate on democratic education, the distinction between Learning for Democracy (LforD) and Democracy for Learning (DforL) has shaped much of the theoretical reflection and educational practice [1–3]. However, both approaches share a common limitation: they tend to focus either on the acquisition of competences or on participatory experience in itself, without systematically integrating the material and structural conditions that make political action possible [4,5]. In a context marked by rising social inequalities and the increasing mediatization of the public sphere, this gap is particularly consequential for efforts to promote and enable youth participation [6–9]. This contribution proposes Materialist Civism as a theoretical paradigm and evaluative framework for promoting and studying youth political activation. This perspective reframes civic education not as the normative transmission of values nor as the mere experimentation of democratic practices, but as a process of concretely expanding the participatory and transformative capacities of young people [10,3]. Political activation is thus understood as the outcome of interactions between formative dimensions and material conditions, both individual and collective [11,12]. The paradigm was formalized through the experience of Rizomi's School of Political Activation and the analysis of the Theory of Change developed during the educational planning phase [13,14]. The adopted research methodology integrates: (1) a literature review on political participation and social behavior, with particular attention to enabling factors and structural constraints connected to participation [15,12]; (2) a critical analysis of major practices in active citizenship education [16,17]; (3) the theoretical reconstruction of the Theory of Change [13,14]; (4) a comparison with evidence emerging from a recent pilot study conducted within the School, using questionnaires aimed at studying the dimensions underlying the propensity to engage politically [18]. The key innovation achieved lies in the elaboration of a multidimensional evaluation model that moves beyond an assessment centered exclusively on "democratic competences," reintroducing the importance of contextual and relational factors [19–21]. The proposed framework identifies three domains: (a) personal resources, including competences, motivation, and self-efficacy [22,23]; (b) situated and collective resources, such as relational networks, organizational access to resources and tools, and shared agency [24,25]; (c) resources of political representation, understood as the concrete possibility of

accessing decision-making spaces and influencing public discourse [26,27]. The evaluation of political activation therefore requires tools capable of jointly measuring learning, resource availability, and the transformation of participatory opportunities [19,15]. By overcoming the separation between theory and practice and between LforD and DforL, Materialist Civism offers a transferable paradigm for both educational design and the evaluation of youth policies [10,16]. It contributes to the debate on democratic education by proposing a model capable of integrating training, context, and the actual distribution of resources and opportunities, enabling interventions aimed at fostering creative, autonomous, and situated youth participation [11,12,27].

EDUCATIONAL POVERTY ACROSS THE LIFE COURSE: EVALUATING INTERSECTIONS OF INEQUALITY IN SCHOOLING, SKILLS AND LIFELONG LEARNING

Lorenzo Maraviglia (INVALSI, Italy)

Educational poverty | Multidimensionality | Interactions

Educational inequality and educational poverty can be conceptualized—and consequently addressed—from different analytical perspectives. The most common approach focuses on the formal completion of basic levels of schooling. Traditionally, this has been operationalized through indicators such as early school leaving rates or the share of students who fail to obtain an upper secondary diploma or vocational qualification. Over the last decades, however, increasing attention has been paid to the limits of this perspective. With the development of the knowledge society, education is increasingly understood as a continuous process extending across the entire life course. In societies and economies characterized by rapid and constant transformation, opportunities for learning no longer coincide solely with formal schooling. As a result, educational inequalities may emerge at different stages of individual trajectories and involve multiple dimensions of learning. This shift has generated renewed interest in inequalities in access to and completion of tertiary education. In this

field, alongside traditional attention to class-based inequalities, growing attention has been devoted to gender differences in access to specific fields of study, often intersecting with other factors such as citizenship status or territorial disparities. At the same time, increasing attention has been directed toward the effective skills and resources acquired through educational processes. The recognition that formal credentials alone are insufficient to guarantee meaningful life opportunities has led to the development of new systems of evaluation and measurement focusing on students' actual competences and skills, such as the implicit dropout indicators proposed by INVALSI. Within this framework, educational poverty can be conceptualized as a multidimensional phenomenon measurable through a plurality of indicators. However, the theoretical and empirical implications of this multidimensionality remain only partially explored. More specifically, there is no reason to assume that the same risk factors operate uniformly across different dimensions of educational disadvantage. This issue becomes particularly relevant when considering the intersection between different vulnerability factors, such as social class, gender, citizenship, or territorial location. While in relatively shrinking phenomena such as early school leaving the most disadvantaged profiles often accumulate multiple risk factors, this pattern may not hold in expanding or emerging domains such as implicit school dispersion, unequal skills acquisition, or access to lifelong learning opportunities. Drawing on available empirical evidence, this contribution offers an exploratory analysis of the intersections—technically, interactions—between key risk factors associated with educational poverty across four domains: early school leaving, implicit school dispersion, access to tertiary education, and participation in lifelong learning. By comparing these dimensions, the paper aims to highlight how the configuration of educational inequalities may vary across different stages of the educational trajectory. In doing so, the study discusses how evaluation frameworks can contribute to a more comprehensive understanding of educational disadvantage and support policies aimed at expanding equitable learning opportunities. More broadly, improving the evaluation of educational inequalities represents a key step toward strengthening democratic participation, as access to meaningful learning opportunities constitutes a fundamental condition for active citizenship and inclusive democratic societies.

SELF-EVALUATION IN THE ITALIAN VOCATIONAL EDUCATION AND TRAINING: EVIDENCE FROM THE INVALSI EXPERIMENT

Emanuela Vinci (INVALSI, Italy) · **Michela Freddano** (INVALSI, Italy)

Vocational Education and Training | National Evaluation System | School Evaluation

According to the trend at the international level (OECD, 2013), the Italian National Evaluation System, established by Presidential Decree (DPR) No. 80/2013, aims to improve the quality of educational services and learning outcomes and evaluates the efficiency and effectiveness of the education and training system. Within the framework of the National Evaluation System, a gradual systematisation of the evaluation process developed for state and state-recognised schools at primary and secondary level, for provincial adult education centres, and for pre-schools (Freddano & Stringher, 2021; Freddano, 2025a, 2025b; Vinci, Freddano, Torti, 2026). Vocational Education and Training (VET) has also been interested by the introduction of a pilot self-evaluation report, marking this sector's full integration into the education and training system. In Italy VET represents a hybrid segment in which both regional and national dimensions coexist and it is based on specific quality assurance experiences and suggestions at national and international level (INAPP, 2025; Carlini & Evangelista, 2020; Dordit, 2018). Its dual nature, both national and regional, has influenced INVALSI to develop a specific self-evaluation report to ensure a uniform structure across all accredited training centres providing vocational education and training, while also recognising regional specificities (Freddano 2025b). At the end of the experimentation implemented by INVALSI in the 2020/2021 training year, the Director/Coordinator of the 173 accredited training centres that

participated at the experimentation, had been asked to provide feedback on the experimented self-evaluation report by filling in an online questionnaire. The aim was to have suggestions on the tools and procedures and to identify aspects of the self-evaluation process that had raised concerns and that could be revised ahead of the scale up of the self-evaluation report. The paper has the aim to understand how well the self-evaluation experience of the training centres met initial expectations and what roles they assigned to the evaluation process through the evaluation report. In total 168 Directors and coordinators of the 173 participating training centres compiled the final questionnaire. Descriptive and multivariate analyses were conducted on the collected data, focusing on three specific items exploring respondents' opinions. In particular, the analysis examined: the general perception of self-evaluation within training providers, the level of satisfaction with the experience compared to initial expectations, and the opportunities provided by the process to develop greater awareness of internal dynamics. The study explored organizational self-reflection, drivers for change, and the enhancement of training activities. The goal was to determine to what extent self-evaluation experience is perceived as a functional tool for organizational reflection and quality improvement. The implementation of the Self-Evaluation Report at an experimental level marks a significant milestone for the VET sector. By joining the National Evaluation System while preserving its regional specificities, the VET sector strengthens its role within the national education system, with positive implications for the quality and expansion of training offer.

ASSESSMENT TOOLS FOR DIGITAL STEAM EDUCATIONAL PRACTICES: EVIDENCE FROM THE ERASMUS+ EDUMAT + PROJECT

Laura Casaldi (Università La Sapienza, Italy)

STEAM | educational asssessment | digital education

In recent years, particularly following the COVID-19 pandemic, public and academic debate at both national and international levels has increasingly focused on the design of digital and hybrid learning environments capable of integrating or transforming traditional educational models (Barola et al., 2022). In this context, the STEAM approach (Science, Technology, Engineering, Arts and Mathematics) has progressively emerged as a transdisciplinary educational methodology capable of promoting active, collaborative, and inquiry-based learning, fostering students' engagement with scientific and technological disciplines. Educational projects based on the integration of STEAM and digital technologies represent a significant response to the challenges of contemporary societies, in which citizens are required not only to use advanced technologies but also to produce knowledge and participate critically and consciously in socio-technological ecosystems (Quigley et al., 2020). The transdisciplinary nature of the STEAM approach contributes to the development of key competences such as creative thinking, problem solving, communication, and collaboration (Brush & Saye, 2008). Within this framework, this contribution presents the outcomes of the design and pilot testing process of assessment tools aimed at analysing the quality and effectiveness of STEAM educational practices developed within the Erasmus+ KA2 project EDUMAT+ – Augmented Educational Mat: an infographic puzzle MATS for learning STEAM by coding for primary schools. The project involves teachers and students from primary schools and school networks in Italy, Romania, Bulgaria, Spain, and Portugal—contexts in which strengthening digital competences and reducing educational inequalities remain key priorities. The EDUMAT+ project promotes the use of coding and infographic mats as innovative tools to support the

teaching of topics related to the 2030 Agenda (United Nations, 2015), such as environmental sustainability and social inclusion. In particular, it envisages the development of augmented reality educational mats and coding activities that function as pedagogical devices for the integrated development of digital and citizenship competences. The research adopts an integrated evaluation approach based on mixed methods, aimed at analysing both the educational processes activated and the outcomes of the teaching intervention. The presentation will therefore focus on the evaluation framework used within the EDUMAT+ project and on the first results of its implementation. The analysis of the data collected during the pilot phase makes it possible to reflect on the role of digital STEAM practices as tools for promoting critical digital literacy, educational equity, and democratic participation within school contexts in the digital society.

Is University Paying Off? Upwardly Mobile Students and the Meaning of Meritocratic Striving

PANEL CONVENORS: Carlos Palma-Amestoy (Pontificia Universidad Católica de Chile); Flora Petrik (University of Tübingen)

PANEL KEYWORDS: Meritocracy, Social Mobility, University

In diverse national contexts, higher education has been promoted as an engine for social mobility. This has been part of a meritocratic model in which the idea of struggling to climb the social ladder has become an influential cultural trope (Littler, 2017). The values associated with this meritocratic striving (Sandel, 2021) have been appealing to many students, particularly those from lower social backgrounds. However, it seems that higher education is not paying off, and the promise of social mobility is not only broken, but may also be experienced as an unfulfillable promise (Mijs, 2016). Building on these observations, this panel invites authors from different countries to discuss the many tensions arising from the limits of meritocracy that upwardly mobile students may confront. Among the key questions guiding this panel are: how do students experience the promise of meritocracy? What are the implications of these struggles for their everyday lives? What expectation do they have for the future? How do students navigate the tensions between their aspirations and the structural conditions shaping their educational pathways? Drawing on these questions, this panel encourages authors to emphasise not only constraints and barriers, but also the critical, agentic, collective and reflexive capacities and practices that upwardly mobile students develop to move through university. Both theoretical and empirical contributions are welcome that explore how higher education can simultaneously reproduce social inequalities and open pathways for empowerment, and how it may serve as a lever for countering educational injustice.

MERITOCRACY FROM THE TOP: ELITE STUDENTS' PERSPECTIVES ON THE DISTRIBUTION OF HIGHER EDUCATION OPPORTUNITIES IN THE UK

Paulina Rodriguez Anaiz (University of Oxford, United Kingdom) · **Gonzalo Hidalgo Bazan** (University of Oxford, United Kingdom)

Elite students | inequality perceptions | higher education

Existing research highlights how privileged groups emphasise the role of talent and effort as explanations for individual success in meritocratic selection (e.g., Brown et al., 2016; Gogescu, 2025; Warikoo and Fuhr, 2014). Studies suggest that the ways elites understand inequality and success are influenced by the channels or characteristics of education institutions through which elite recruitment predominantly occurs (e.g. Friedman et al., 2024; Gogescu, 2025; Warikoo, 2018). However, the literature has largely focused on justifications for selection processes within specific institutions and elite

entry routes, paying less attention to how the "winners" of these systems conceptualise the distribution of educational opportunities as a whole and understand the opportunities available to others, as Gogescu (2025) notes. This ongoing study takes a distinctive approach by exploring how undergraduate students at a highly prestigious UK university perceive the causes and consequences of the distribution of educational opportunities, as well as the policies they are willing to support. Using interviews and an interactive task with movable components, participants visualise their perceptions of how educational opportunities are currently distributed and how they believe they should be distributed across different levels of the higher education system. This task enables an in-depth examination of inequality as unequal resource distribution, rendering abstract notions of opportunity distribution more tangible (Summers et al., 2022). Preliminary findings, available for the conference, will illuminate how students' socio-economic backgrounds and educational experiences shape their views. It will offer insights into perceptions of fairness and the distribution of opportunities in higher education from the top.

(RE)ASSEMBLING THE BELIEF IN THE UNIVERSITY 'GAME': FIRST-IN-FAMILY STUDENTS' PERCEPTIONS OF THE VALUE OF HIGHER EDUCATION

Sarah O'Shea (Charles Sturt University) · **Franziska Lessky** (University of Oxford, United Kingdom) · **Sally Patfield** (University of Newcastle)

First-in-Family | Bourdieu | subjective experiences of meritocratic striving

Recent studies suggest that the relationship between higher education and normative visions of 'the good life' has become increasingly problematic (Brooks et al., 2025), with some arguing that the promise of social mobility through university is nothing more than a "fantasy rhetoric" (Bathmaker et al., 2016, p. ix). In today's volatile labour markets, the symbolic and material value of higher education is eroding, raising questions about students' declining belief in the university 'game' – especially for those seeking upward mobility through education. This talk will interrogate the complexity of first-in-family (FiF) students' investment and persistence in contemporary higher education. Drawing on Bourdieu's concept of illusio (Bourdieu, 1990), we will use an empirical case - the story of Zoe who is an undergraduate student in Australia - to show that 'staying in the game' of university education is a multi-layered process shaped by moments of rupture, recalibration and reinvestment, as well as shifts in the meaning ascribed to higher education. By illuminating the fragility and volatility of first-in-family students' journeys through higher education, we will explore how they experience the promise of meritocracy and the implications of struggles within their everyday lives. We will also show how their experienced during studies reshape their expectation for the future.

DEGREES OF VALUE: CULTIVATING PRIVILEGE AT AN ELITE UNIVERSITY

Fiona Gogescu (London School of Economics, United Kingdom)

higher education · meritocracy · social mobility

Degrees of value: Cultivating privilege at an elite university This study examines how students at the London School of Economics (LSE) perceive the value of their university degree. While existing research in Sociology of Education has focused on strategies used by pupils to secure access to prestigious schools and universities (Kosunen and Seppänen, 2015; van Zanten, 2019), less is known about strategies used during time at university to gain positional advantage. This is a highly relevant research topic, as recent university graduates are facing unfavourable social mobility prospects (Bukodi and Goldthorpe, 2018), while attending elite education favours, but no longer guarantees elite outcomes (Wakeling and Savage, 2015). The research employs mixed methods, combining a survey of second- and third- year undergraduates with follow-up in-depth interviews. The survey captures students' perceived educational gains, priorities during university, as well as beliefs about factors influencing success at university and in the labour market. Students with different profiles — defined by the goals prioritised and their understanding of success —were selected for in-depth interviews. Findings show how under perceived conditions of social congestion (Brown, 2013), students approach elite higher education as a site for cultivating multiple forms of graduate capital (Tomlinson, 2017). Even though many respondents tended to emphasise 'knowing the right people' as most important for getting a good graduate job, this did not seem to influence their priorities during university. Even though social congestion made students more cynical about the meritocratic nature of the hiring process, this perspective did not permeate their understanding of the value of their university degree. Their narratives alternated between doubts about the meritocratic claims of hiring processes and faith in meritocracy as an organising ideal of higher education. Instead of being seen as hollowing out students' academic endeavours, early career development could be understood as an overlapping priority.

MOVING CEILINGS, UNEVEN FLOORS: THE PRODUCTION OF TRANSCLASSES IN HIGHER EDUCATION – AND WHY THIS MIGHT BE JUST WHAT WE NEED

Elena Attardo (Research Institute Social Cohesion, Germany) · **Jakob Hartl** (Research Institute Social Cohesion, Germany; Universität Halle-Wittenberg)

Class · Capital Theory · Civil Society

Meritocracy and social mobility are grounded in a universal, unified and unifying understanding of high and low, up and down. Whereas a plethora of evidence, beginning with Bourdieu and Passeron (1979), debunked meritocratic ideologies, conceptualisations of social mobilities remain static: The goals of the upwardly mobile are presented as objective positions in the social space and accordingly accessible if enough relevant (forms of) capitals are accumulated. Highly relevant at the time and place of its conception and publication (France at the dusk of the "golden age of capitalism"), this basic Bourdieusian understanding faces short-comings when applied to higher education (HE) in contemporary post-migrant societies after educational expansion. A way forward are Atkinson's (2016) amendments of capitals as recognition, relationality, and historic rationalisation: factoring in the necessity of recognition by the ruling class; the dynamic of relationality and thus accelerated inflation of capitals; and the efficacy of domination through historic rationalisation, we must reconsider the function of HE for social reproduction and our understanding of social mobility. Firstly, the socially mobile start from shaky grounds. Increased HE enrolment and educational mobility was – at least in OECD countries –ac-

companied by devaluations of hitherto valuable capitals, and increased educational attainment is driven and simultaneously drives credential inflation (Bourdieu 2008). Attainable goals however become fluid, since it is harder to constitute successful upward mobility. This is on the one hand driven by the reciprocal academisation of professions and professionalisation of academia (Stock et al. 2023). On the other hand, we can observe a moving of the goal posts as an act of domination and exclusion: without the right pedigree there is no access to elite positions (Friedman and Laurison 2019). This can, secondly, be understood only by reconsidering the second part of capital theory: interchangeability. The theorem relies on a unified market where all participants are equally eligible to exchange economic for cultural capital and vice versa. However, like labour markets, markets for capital exchange are highly fragmented and for the disadvantaged, changing the marketplace comes with worse exchange rates or high fees. Since the disadvantaged cannot pay these fees, (intergenerational) social mobility becomes incomplete or fragmented. HE bears special responsibility in this regard, since it alters and accelerates this "alienating universalisation" inherent to education systems in capitalist states (Bourdieu 2020). Thus, (public) HE was never an engine for climbing the social ladder up to the elite echelons, but a tool for the (re)arrangement of intermediate and transclasse (Jaquet 2023) positions. While this does not provide or bolster educational justice, we argue that there is a point in turning the system against itself. Contemporary elite (formation) is hardly dependent on reproduction through (public) HE institutions but recruits itself from political and economic networks, heavily inclined to the (far) right. Instead, the sector of the democratic public most dependent on HE nowadays has become civil society: from Chile to Germany, from Santiago to Riesa and Gießen, students, often in negligence of individual social mobility, have (once again) become the vanguards and vigilantes of social progress.

MERITOCRACY'S WINNERS? YOUNG WOMEN'S EXPERIENCES OF 'EARNING WHILE LEARNING' UK HIGHER EDUCATION

Kim Allen (University of Leeds) · **Kirsty Finn** (University of Manchester, United Kingdom) · **Rachel Cohen** (City-St. Georges, University of London) · **Kate Hardy** (University of Leeds)

gender inequality | graduates | student work

In the UK, universities are seen as a key driver of social mobility (Brooks et al. 2025; Reay 2021) with meritocratic discourses around aspiration and hard work underpinning decades of widening access and participation initiatives across successive governments (Harrison and Waller 2018). Celebratory narratives point to the increasing percentage of young people from diverse and disadvantaged backgrounds attending university each year, and the position of young women – who outnumber their male counterparts by 52% to 40% (Bolton and Lewis 2025) –as meritocracy's winners; hard working, savvy and entrepreneurial (Allen and Finn 2024). Notwithstanding data on women's participation, and the vocal concerns about young men 'missing out' on the promises of meritocracy via university (Hilman 2025), recently there has been significant and growing attention on inequalities within the university experience relating to an increasing number of students taking on paid employment during study (Neves et al. 2025; Adams 2024). In both wider policy discourse and academic literature, 'earning while learning' (hereafter, EwL) is typically presented in binary terms; as positive for developing young people's labour market experience and 'employability', or as hindering students' ability to fully engage in their academic studies and risking their degree outcomes and future prospects. Given that women graduates are already likely to earn 6% lower than male graduates one year after study (Bolton and Lewis 2025), the impact of EwL on the apparent winners of meritocracy needs further interrogation. To do this, this paper draws on data from a three-year, ESRC-

funded, mixed-methods study (2022-2026) that examines patterns of EwL in England longitudinally, and through young women's own narratives of working during full-time education and their earliest post-study labour market experiences. We present our data to show that women students are 50% more likely than men to undertake EwL and whilst there is very little difference in pay for men and women, this is because student pay is generally low for all (Zhong et al 2025). Whilst our quantitative findings highlight classed, raced and gendered inequalities in engagement in EwL, they show that working while in university does not impact the quality of degree outcomes nor occupation. However, for young women, working long-hours during university lowers the likelihood of progression into senior roles. The paper moves from these headlines into a deeper interrogation of young women's everyday experiences of EwL through analysis of 16 focus groups that reveals the struggles of women students' early exposure to poor pay, abuse and burnout (Hardy et al. 2026) but also how these sit in tension with the ways EwL brings opportunities for agency and social connection and independence. The paper illuminates how the diverse experiences and structuring of EwL in England shapes women's negotiations of, and cruel attachments to (Berlant 2011), meritocratic discourses of success both in the present and the future.

MERITOCRACY AND UNIVERSITY CHOICE: DECISION-MAKING LOGICS AMONG HIGH-ACHIEVING AFFIRMATIVE ACTION STUDENTS IN ECUADOR

María Francisca Bustamante Sage (Universitat Autonoma de Barcelona, Spain)

Meritocracy | University choice | Affirmative action

Merit-based admission systems frame access to higher education as the outcome of individual effort and academic achievement, suggesting that opportunities should be allocated fairly on the basis of merit (Mijs, 2016; Reay, 2020). However, access remains deeply stratified, with students unevenly distributed across institutions and programs with different levels of prestige and selectivity, reproducing inequalities of class, gender and ethnicity (Brunner & Labraña, 2020; McCowan, 2016). Academic performance hierarchically classifies applicants while legitimizing these differences as merit, even though achievement itself is shaped by social origin and educational inequalities (Liu, 2011; Reay, 2021). Educational choices, in turn, cannot be understood as purely individual decisions but as relational processes shaped by the interaction between social structures, institutional arrangements and students' dispositions (Bourdieu & Passeron, 1990; Hodkinson & Sparkes, 1997). In Ecuador, despite higher education reforms introduced in 2010 aimed at democratizing access, including tuition-free public university education and affirmative action policies for historically excluded groups, inequalities persist and barriers remain for Indigenous and low-income students (Ponce & Carrasco, 2017; Rivera, 2019). This paper explores how, despite high academic performance, students from historically excluded groups navigate the tensions between the promise of meritocratic access and the social constraints that shape their educational choices

and horizons of possibility. Drawing on a qualitative approach, the study uses data from 26 semi-structured interviews with affirmative action students who achieved high scores in the national admission exam at the Universidad Central del Ecuador. The findings identify four distinct logics of university choice, structured around orientations toward risk and the future. A maximization logic leads students to strategically pursue highly selective programs through knowledge of admission rules and family pressure toward prestigious careers. An entry assurance logic prioritizes securing admission over preferred programs, driven by perceptions of the process as uncertain and limited knowledge of the system. A confidence in entry logic involves lower systemic tension and more vocational decisions, although self-limitation emerges through perceptions of personal ability. These three logics share individualised and positional orientations toward the future, distancing students from the structural conditions shaping their trajectories and resonating with meritocratic narratives. A fourth logic operates differently. More frequently articulated by women and Indigenous students, it frames career choices in relation to collective experiences, community commitments and transformative aspirations, challenging the individualised and positional terms through which meritocratic futures are typically constructed (Webb & Sepúlveda, 2020). Taken together, these findings show that access to selective university programs cannot be understood solely as the outcome of individual merit or instrumental decision-making, but as a relational and socially conditioned process. Moreover, the experiences of affirmative action students in their transition to higher education reveal the limits of policies focused exclusively on distributive or compensatory mechanisms of access, and the need to incorporate broader conceptions of justice that attend to recognition (Fraser, 2008) and the relational dimensions through which educational choices and transitions are constructed (Lynch et al., 2021).

Minorities Political Socialisation At School: Educational Inequalities And Critical Stances

PANEL CONVENORS: Maxime Michiels (UCLouvain, Belgium)

PANEL KEYWORDS: Political Socialisation, Diversity, Critical Stance

The diversity of class, gender and race between pupils has been extendedly studied from the perspective of (re)production of educational inequalities. However, school can also be conceived as a socialisation agent and a place of everyday life where pupils meet people from new horizons. By bringing together individuals with diverse sociological backgrounds, schools inevitably reproduce tensions inherent in social, gender, and racial divisions. This encounter with otherness involves not only the heterogeneous group of pupils but also school actors (teachers, principals, counsellors) and families. Hence, the question arises regarding the consequence of the mix of mass schooling and persistent and transforming educational inequalities (of race, gender and class) on political socialisation. This panel seeks to explore the processes of political socialisation arising from the subjective experience of educational inequalities. While the school system constructs distinctions and hierarchies among individuals, their transmission is not automatic. Facing the power of the institution, actors retain the capacity to critique, subvert, or attenuate the category of judgment. With this panel, we explore among other things what causes the shift between incorporation of the social, gendered and racial order to a more critical stance. How must the processes of political socialisation within minority groups in the school context be understood? Under which conditions does socialisation foster a critical stance toward the social, gendered and racial order? These are some of the questions this panel aims to analyse to improve our comprehension of the political dynamics occur during and after the school years.

“WHAT DO WE DO WITH THEM?” DISCOVERING THE ROMA IN ICELANDIC ELEMENTARY SCHOOLS

Marco Solimene (University of Iceland, Iceland)

Icelandic schools | Roma | stereotypes

During recent years, for the first time in Icelandic history, a relatively stable and conspicuous community of Roma (mostly from Romania) has formed in Reykjavík, the capital area. This paper presents the materials that emerged from the research project RomÍs: History and ethnography of Roma people in Iceland. In particular, it focuses on the results of an investigation conducted among personnel at Reykjavík elementary schools in the period 2022-24. Together with social workers, the personnel of Reykjavík's schools represented the main point of contact between the newly emerged Roma community and Icelandic institutions. The paper explores the process of (gradual) “discovery” of the Roma pupils in Icelandic classrooms. It also traces the dynamics that framed the encounter between teachers and school personnel, on the one hand, and Roma pupils and their families, on the other. It will be argued that Roma built their approaches with Icelandic schools on their previous experience with other non-Roma institutions (in Romania and other countries of migration). Icelandic teachers and other professionals, instead, had no previous experience of encounter with Roma and felt lacking in knowledge and know-how to approach Roma pupils and families properly. While fearing reproducing in Icelandic schools the inequalities and discrimination that target most Roma in Europe, many Icelandic teachers and professionals involved in the reception of Roma pupils and families manifested a mix of curiosity and unease towards what they perceived a Roma specific social, economic, and cultural background. In doing so, they mirrored stereotypical images existing in Icelandic collective imagery, which portray Roma as exotic, fascinating but also unsettling Others. Some also got in contact with bluntly negative stereotypes, which they accessed not only through mass and social media, but also through direct interactions with migrants and foreign institutions, whose “indoctrination” (cfr. Zembylas, 2022) on Roma-related issues risked poisoning educational settings. So far, contrary to most European countries (cfr. Lauritzen and Nodeland, 2018), Roma in Iceland are not faced with the reproduction of inequalities in educational settings, neither at the hands of school personnel nor of non-Roma pupils. This is also because teachers and professionals involved in the reception of Roma children and families cultivated a critical, reflexive stance towards their own assumptions and practices. This situation, however, is fragile as anti-Gypsyism might find fertile soil to grow. This paper thus reflects on the reasons behind the Icelandic peculiarity, as well as on the ever-present risk that educational settings end up mirroring and socialising societal distinctions, hierarchies, and racialization processes.

SEXUALITY EDUCATION IN SCHOOLS: SOCIALIZATION SPHERES, GENDER POLITICAL SOCIALIZATION, AND INEQUALITY REGIMES

Sarah Gillo (Uclouvain, Belgium)

sexuality education | socialization spheres | gender political socialization

Education in Relational, Affective and Sexual Life (EVRAS) occupies a central place in educational policies aimed at promoting the sexual health of children and young people in French-speaking Belgium. Beyond its explicit goals, however, EVRAS also constitutes a public action instrument through which normativities of gender and sexuality are formulated, materialized, and transmitted. In light of this, this contribution offers a theorical perspective examining how EVRAS participates in the processes of gender political socialization among students, the ways in which young people internalize a critical relationship to gender relations and learn, negotiate, or contest the power structures inherent in them. Drawing on the concept of the inequality regime (Acker, 2006) – an analytical approach to the interrelated practices and meanings that sustain gender, class, and other social relations within organizations – this review also considers the links between inequalities present in the school institution and students' gender political socialization. The first part of the presentation discusses the foundations of comprehensive sexuality education (CSE), defined by UNESCO (2018) as "a curriculum-based process of teaching and learning about the cognitive, emotional, physical and social aspects of sexuality." This definition will be contrasted with the orientations specific to the French-speaking Belgian context, focusing on the gender and sexuality normativities prescribed in EVRAS policy texts. This section will also address the controversies surrounding EVRAS, particularly opposition expressed by some parents who view it as a threat to their educational authority or to the values they wish to transmit. These reactions illustrate the plurality of spheres contributing to the gender socialization of young people and shed light on conflicts of legitimacy between family and school. The second part examines how, in a context where EVRAS crystallizes tensions between familial prescriptions, school expectations, and broader social norms, gender socialization unfolds across its various spheres: family, school, peer groups, and youth sociability networks. Particular attention will be paid to individuals' agency in relation to norms, as well as to the school context according to schools' inequality regimes, in order to illuminate the effects of EVRAS on the gender political socialization of young people. The aim is to understand the conditions under which EVRAS may support the emergence of a critical stance toward gender relations or, conversely, contribute to the reproduction of gendered norms already present in young people's social environments. The concepts of conscientization (understanding the world) and conflictualization (taking a stand) (Druez & Durand, 2023) will provide a theoretical contribution for analysing how different postures shape young people's relationship to gender inequalities.

WHEN INEQUALITIES FOSTER CRITIQUE STANCE. POLITICAL SOCIALISATION IN UNEQUAL SCHOOLING SYSTEM

Maxime Michiels (UCLouvain, Belgium)

Political Socialisation | Diversity | Critical Stance

When considering the relationship between schooling and politics, sociologists, from Durkheim to Bourdieu, have seen the school as an institution that socializes students to the norms, values, and hierarchies of society, thereby ensuring the stability of the social order (Durkheim, 1966/1922, 2012/1902; Bourdieu & Passeron, 1970). However, despite the growing importance of education in Western societies, we cannot ignore the rise of protest, social conflict, and defiance against the state (Roudet, 2012; Siblot, 2015; Sallenave, 2019). This context invites us to revisit the question of political socialization in schools. Based on ongoing ethnographic research, combining observation and interviews in two socially differentiated schools in French-speaking Belgium, I aim to show how the educational institution can foster both adherence to and resistance against the educational order. Through the concept of symbolic recycling (Lignier & Pagis, 2017), these dispositions can extend to the broader social order. Drawing on the works of Bourdieu (1970, 1977, 1982) and Willis (1977), as well as recent literature investigating political socialization in a broader context (Sapiro, 2004; Bargel & Darmon, 2017; Boughaba et al., 2018; Barrault-Stella et al., 2020; Haegel, 2020), I argue that the outcomes of the school's socializing function depend on students' subjective schooling experiences. These experiences are differentiated by a number of factors such as class, gender and race. The diversity of unequal experiences produces a diversity of relationships to school and to its principles of vision and division structuring both the academic and the broader social world.

LISTENING OTHERWISE: WITNESSING NARRATIVES OF YOUTH OF COLOR IN URBAN EDUCATION

Zehra Colak (Utrecht University, Netherlands, The)

listening | youth | methodology

In this article, I want to discuss how I grappled with listening as an ethical relational practice in my research on the belonging of youth of color at an urban Dutch pre-vocational secondary education school. As an immigrant researcher of color, I noticed how my ability to receive the experiences of students in my research was shaped by my own implicit expectations, such as concerning their future aspirations. Drawing on the insights of Anastas and colleagues (2025), I approach listening in my research an instrument for caring for and witnessing the diverse stories of youth of color that are often silenced by dominant power structures. This is particularly important for addressing our responsibility as researchers in challenging unethical and extractive research practices that seek ownership. I illustrate through two guiding themes

and empirical examples how I aimed to engage in the work of 1: listening beyond damage and 2: listening to wisdom in my research. First, by paying attention not only to the stories of pain and discrimination but also to experiences of belonging and joy in school, I looked for ways of listening beyond damage, following Eve Tuck (2009), to understand the complexity of how youth of color experience schooling. Having previously researched racism and discrimination experiences of youth in education, shifting my orientation towards stories and feelings of belonging in school has challenged but also expanded my capacity to listen in ways I was not prepared for. Second, listening to the wisdom meant witnessing how the youth engaged in a critical analysis of the dehumanization and belonging they experienced across different schools, and openness to the ways they envisioned their professional futures, even when these did not align with societal notions of success. Overall, this work seeks to expand conversation on ethical and caring ways of doing qualitative research through otherwise listening of the layered and diverse stories of youth in contexts of educational and systemic inequities. Bio: F. Zehra Çolak is a postdoctoral researcher and lecturer working on educational inequities and youth belonging. Her research lies at the intersection of sociology, education, and psychology and draws on the insights of critical theories to trace how justice-oriented pedagogies and belonging emerge as situated practices across urban school classrooms and community-based spaces. Through collaborative and participatory research, her work explores alternative ways of engaging with communities and youth marginalized by dominant power structures. Institution: Utrecht University, Department of Education Email: f.z.colak@uu.nl

POLITICAL SOCIALIZATION OF URBAN LOWER-CLASS YOUTH IN SCHOOLS: THE ENCOUNTER BETWEEN THE EDUCATIONAL FIELD AND THE “SUBFIELD”

Géraldine André (UCLouvain Belgique, Belgium)

Political Socialization | Urban Lower-Class Youth | Subfield

Based on the results of a collective, multi-site, and multi-phase fieldwork conducted in some of Brussels' most disadvantaged neighborhoods, involving nearly one hundred young people (aged 18-30), mainly from lower social classes and primarily of second-generation immigrant backgrounds (mainly Turkish, Moroccan, Congolese), this presentation aims to contribute to debates about how young people from urban lower classes are politically socialized within the school environment, as well as their so-called political passivity. Research in political and social sciences on political socialization —particularly related to institutional and electoral forms of politics—indicates that political engagement tends to increase with higher levels of education and qualifications (Evans, Stubager & Langsather 2022, Kohn 2018; Gozzo & Sampugnara 2016). Specifically, within schools, social inequalities affect access to activities like serving as class representatives or participating in school events on societal issues, which foster political involvement (Hoskins, Janmaat & Melis 2017). Overall, schools and citizenship courses typically involve students in politics only minimally and often reinforce existing inequalities (Percheron 1984; Douniès 2019). However, beyond phenomena such as the political dispossession of lower-class youth from activities related to institutional politics—especially as demonstrated by quantitative research—there is a resurgence of the French tradition of political socialization (Mayer & Muxel 1993), where socialization encompasses processes through which youth internalize and adopt social norms, both vertically and horizontally, from various agents like school, family, work, media, and peers (Bargel 2020; Boughaba et al. 2019; Galland 2022; Can 2025; Michiels 2025). In this trend, a Bourdieusian-inspired qualitative sociology has started examining how working-class youth and their families are differently socialized into political participation through their daily but unequal interactions with schools (Barrault-Stella, Bongrand, Hugrée & Siblot 2020; Millet & Thin 2020). Although these studies are both stimulating and promising, the dominant categories within the education field tend to portray young people from working-class backgrounds as more passive than their more privileged counterparts in these processes. Against this trend, this presentation aims to understand the processes of political socialization among young people from working-class backgrounds within the school setting, situating them at the intersection of the school field and what we conceptualize as the 'sub-field'. By

combining Bourdieu's theory with cultural and subaltern studies (Willis 1977, Scott 1985 & 1990), our initial argument is that the processes of political socialization of working-class youth within the school field are often studied only by reflecting the effect of the dominant legitimacy, highlighting a rather passive role within the school environment. Second, we introduce the concept of 'sub-field', which is essential for understanding how deprived neighborhoods function as a result of urban segregation dynamics and how they can lead to different forms of consciousness, identification, and political belonging among young people from working-class backgrounds. Third, we demonstrate how 'infra-politics' (Scott 1985 & 2006) which develop among young people from working-class backgrounds and minorities—leaving 'few traces in the public record' (Lazzeri 2012) , and shaped by informal collective relationships and organizations within neighborhoods—come into tension with the logics and categories within the educational institution.

Practices of Freedom in Democratic Schooling: Policies, Reflections and Actions to Prevent and Counteract Early School Leaving

PANEL CONVENORS: Luisa Zecca (University of Milan-Bicocca, Italy); Francesca Davoli (Universitat de Vic – Universitat Central de Catalunya)

PANEL KEYWORDS: early school leaving, pedagogical innovation, decolonial social justice

Educational systems grounded in democratic principles should ensure that every learner - regardless of sociocultural, linguistic, economic, and any other form of structural disadvantage background - must access meaningful opportunities for growth and emancipation. In this perspective education is both the process and the precondition for sustaining a democratic society and enabling full citizenship (Dewey, 1916). It is only through a genuinely democratic education that a practice of freedom can take place, allowing vulnerable groups to liberate themselves and to critically read and transform the world (Freire, 1970). Yet international data on early leaving from education reveals persistent inequalities that undermine these ideals: rates of school dropout remain disproportionately high among socio-economically vulnerable communities (Eurostat, 2024).These dynamics demonstrate that the promise of democratic education is far from being fulfilled. Thus, to ensure truly equitable education - from early childhood through upper secondary schooling - it is required not only preventing early school leaving but also addressing its structural ecosystemic roots. This panel invites empirical and theoretical contributions that explore early school leaving as a complex phenomenon and that propose innovative approaches for its prevention and contrast. We welcome studies focused on policies, pedagogies, teacher education, family–school–community partnerships, and decolonial or justice-oriented frameworks capable of redesigning education as a space of inclusion, social cohesion, and democratic belonging for all learners. Each contribution should present in-depth theoretical assumptions, accompanied by a clear description of the study design (e.g., ethnography, action research, case studies…) and include relevant results.

GROUNDING DEMOCRATIC PRACTICES: AN ALTERNATIVE SCHOOL COMMUNITY ADDRESSES SOCIO-NATURAL PHENOMENA

Andrea Barrientos Soto (Universidad de Granada, Spain)

Democratic Practices | Social Human Capital | Alternative Schools

This presentation will explain the findings of a case study to highlight the key aspects of democratic practices and activities used in resilience building in an alternative educational community following Hurricane Maria (2017) in Puerto Rico. The analysis emphasizes the role of schools as entities that acted appropriately when governments failed to respond promptly and effectively to the crisis (Amnesty International, (2018). Schools, as “protective collectives” (Vargas-Díaz & Zambrana-Ortiz, 2019), extending beyond their physical facilities, also undertook the work of building resilience—psychological, emotional, physical, and community-based—resulting from the interaction between protective and risk factors, both individual and environmental (Celinski & Allen, 2017). However, to effectively strengthened protective factors that will mitigate losses of the human ecology, this must be accompanied by cultivating critical thinking in students and, in adults, promoting a democratic culture of care (Gilligan, 1982) within the community, delegating and co-working on community solutions, seeing the Otherness within the community (Falcón, 2008), as well as continuously cultivating human social capital (Putnam, Leonardi & Nonetti, 1995). Alternative schools are in a particular favourable position to enhance these democratic practices which allow its participants -early school leavers from economically disadvantaged communities-, to encourage a sense of belonging and commitment (Barrientos, 2022). Community understanding of the causes and effects of socio-natural phenomena requires a critical and preventative approach, geared towards the active development of resilience and social justice, as Fraser (1996) described it, encompassing redistribution and representation. Prioritizing the development of democratic practices is a strong tool to nurture the internal strength to become “resilient to vulnerability" in alternative schooling environments. By grounding theoretical and technical elements in the school community´s realities and worldviews, the result will be a school community that may positively enhance its future autonomy, equilibrium, and peace.

STUDENT PARTICIPATION AND SCHOOL DEMOCRACY: A THEORETICAL-CONCEPTUAL CONTRIBUTION FROM PRACTICE IN FIVE SECONDARY SCHOOLS IN SPAIN

Laura Farré-Riera (Universitat de Vic - Universitat Central de Catalunya, Spain) · **Albert Torrent-Font** (Universitat de Girona, Spain) · **Josep Castillo-Adrián** (Universitat de Vic - Universitat Central de Catalunya, Spain) · **Marta Garcia-Molsosa** (Universitat de Vic - Universitat Central de Catalunya, Spain)

school democracy | participation | multiple case study

The importance of incorporating student participation in school life as a fundamental pillar of education for democratic citizenship has been emphasised in academic literature and political agendas in recent decades. Authors such as Bauman (2008) and Brown (2015) argue that social atomisation, neoliberal logics and intersectional inequalities are eroding the foundations of democracy. However, although policy frameworks increasingly recognise student participation as central to democratic citizenship, research shows a gap between official discourse and school practice (e.g. Farstad, 2015; Martínez et al., 2023; Tursunović 2005). Moreover, qualitative studies exploring students' lived experiences of democracy remain limited (Haraldstad et al., 2021). The study we present addresses this gap by analysing the discourses of students, teachers and management teams in five secondary schools in Spain. Drawing on Feu et al. (2016) four-dimensional model of school democracy—governance, coexistence, alterity and ethos—it examines how student participation is understood and enacted, identifying elements that either approach or diverge from a fully democratic school model. To this end, a multiple case study was designed, incorporating the perspectives of 15- to 16-year-old students (n = 32), teachers (n = 21) and management teams (n = 8) from five secondary schools in Spain. This includes schools in high-need areas with high dropout rates. Throughout the thematic analysis process, the results are presented according to their theoretical and conceptual relevance. This enables the identification of facilitators and barriers to student participation in schools in relation to the concept of school democracy, including structural, relational, cultural, ethical, and pedagogical aspects. The analysis focuses on practices aimed at enhancing students' participation in secondary schools and strengthening their engagement with education and society as a strategy to prevent early school leaving. Indeed, according to the participants, the main challenge of school democracy in terms of participation is making students feel like co-participants in the educational community and fostering a shared identity. This aspect occupies a central position in the participants' narratives. In this regard, the key factors identified in the study are: 1) fostering social relationships between peers and between students (and their families) and teachers; 2) respecting and valuing differences; 3) implementing activities and methodologies that encourage students to play an active role; and 4) promoting activities, subjects and/or projects that encourage students to engage with their local community. Additionally, the study reaffirms the need to move toward a conception of participation as a structural dimension of the educational project of secondary schools, one that goes beyond the classic representative model and incorporates everyday practices of deliberation, co-responsibility, and collective action (Cook-Sather, 2020; Lozano-Estivalis et al., 2023), while also opening the debate on the meaning, forms, and limits of school democracy in broader terms.

AUTONOMY, COEXISTENCE, AND PARTICIPATION: THE DEMOCRATIC VALUE OF PEER RELATIONSHIPS IN NURSERY SCHOOLS

Berta Vila-Saborit (Universitat de Vic-Univertitat Central de Catalunya, Spain)

Early childhood interactions | democratic coexistence | nursery school

Interactions between young children are key to understanding how the foundations for participation and belonging are articulated from early childhood. Various pedagogical approaches agree that educational democracy requires environments that guarantee pupils' dignity, promote genuine forms of participation and address the structural causes that give rise to exclusion or inequality. These premises find an obvious parallel in the role that daily interactions between children in the early years of life play in the nursery school context, as they shape relational spaces where autonomy, negotiation, peer care and coexistence are at play. Firstly, children's interactions constitute early practices of freedom and democracy. Democratic and critical pedagogies, represented by authors such as Dewey and Freire, argue that democracy is learnt by living and practising it in everyday life, especially in relationships (Dewey, 1997; Freire, 2000). From this perspective, children's spontaneous interactions—negotiating meanings, listening and being listened to, managing conflicts and exercising autonomy—become experiences that anticipate incipient forms of agency and democratic coexistence. A well-designed early years setting, as a mindful context, is a space where participation and individual responsibility in collective endeavour are put into practice, and not merely a place where rules or values are taught in an abstract way. Secondly, educational research indicates that participation, voice and trusting relationships become protective factors against early school leaving, especially in contexts characterised by social inequalities. When, from early childhood, environments are provided where the child is listened to, cooperation is promoted and relationships are valued, conditions are created that foster well-being, educational continuity and a bond with the school. In this context, a significant contribution is made through a qualitative study that analyses in depth the interactions between children aged 1 to 3.5 years in nursery school. Through a process of direct and systematic observation, the relational network that emerges from the children's daily lives is described and classified, and the nature, the duration and complexity of interactions in natural situations, offering a glimpse into the richness and diversity of these early forms of relationship that are the basis of a participatory and democratic education. The results reveal the richness, variety and sociocognitive value of these relationships, demonstrating that children learn from and with their peers and that their interactions constitute mechanisms of mutual learning, the construction of agency and socio-emotional development. This empirical corpus reinforces the idea that true democratic education begins in the early years of life by showing that early interactions operate as genuine practices of freedom and coexistence, anticipating forms of participation and social engagement characteristic of participatory education. In summary, interactions between young children can be understood as the first manifestation of a daily democratic practice. These experiences foster the building of bonds and the creation of caring and belonging environments, thus contributing to the prevention of future inequalities. Indeed, the need is highlighted to address early childhood as a privileged space for promoting democratic education practices from day one.

PEER TUTORING IN A NEIGHBOURHOOD-BASED SERVICE AND TEACHER EDUCATION: BOUNDARIES, ALLIANCES, AND LEARNING PATHWAYS TO COUNTER EARLY SCHOOL LEAVING

Maddalena Cocco (Università degli Studi di Milano-Bicocca, Italy) · **Claudia Fredella** (Università degli Studi di Milano-Bicocca, Italy) · **Franco Passalacqua** (Università degli Studi di Milano-Bicocca, Italy)

early school leaving | non-formal education | pre-service teacher education

Early school leaving is increasingly understood as the outcome of intertwined educational, social and cultural processes, calling for systemic approaches that connect schools with territorial resources and non-formal educational services (European Commission, 2020; Pandolfi, 2017; Save the Children, 2025). Yet, in many contexts, schools struggle to recognize after-school settings as a pedagogical infrastructure, often treating them as ancillary support (Jilink, Leseman, Slot & Gevers, 2025). This paper addresses this tension by focusing on the professional learning of pre-service primary teachers and their capacity to "see" and interpret didactic processes occurring beyond the classroom (Passalacqua, 2022), with specific attention to peer tutoring practices in a community-based service. The study is situated in San Siro (Milan), within the "L'ABC del quartiere" service, a polyfunctional educational centre aimed at preventing educational vulnerability and supporting learning in a complex multicultural area. The service is managed by a multidisciplinary team, under the scientific supervision of Prof. Zecca (University of Milan-Bicocca) and educators and student-teachers get involved through internship pathways and community service learning programs (Fredella, 2025; Zecca 2024). In line with previous work on individualized tutoring in ABC (Cotza, Coacci, Fredella, 2025), the focus is on tutoring interactions as intentional dialogic practices that support learning through scaffolding, co-construction of meaning, and the mediation between formal school demands and meaningful educational activities. We examine a training experiment within the third-year course "Metodologia della Ricerca Pedagogica" (Primary Teacher Education, University of Milano-Bicocca). Students carried out structured fieldwork in ABC (and other non-formal settings), combining an online briefing, a guided visit with agreed documentation, interviews with key actors, and a short research report focused on peer tutoring and the educational meaning of the school–after-school relationship. Data include explicitation interviews with ABC coordinators, course instructors, and approximately 12 participating students. A thematic analysis examines (1) students' initial representations of after-school services, (2) shifts in beliefs about learning, vulnerability and agency emerging from boundary crossing, and (3) students' recognition of after-school tutoring as didactic work that can be supported, translated and connected to schooling. Results indicate a reframing trajectory rather than a sharp conversion: students' initial tendency to interpret after-school mainly as homework support progressively expands towards a more articulated understanding of peer tutoring as situated pedagogy, in which relationships, dialogic mediation and pupils' agency are seen as educational levers that can sustain engagement and continuity between learning environments. We outline three practical implications: strengthen research-based placements in non-formal settings as guided inquiry (not simple visits) to build a shared language with community services. Sharpen the didactic focus through systematic observation tools targeting tutoring moves (tasks, scaffolding, feedback, participation). Finally, involve young peer tutors as co-informants, inviting them to narrate and explain their practices to make tacit strategies visible and foster school–after-school dialogue.

BRIDGE BUILDERS THE ROLE OF EDUCATORS IN KINDERGARTENS FOR THE EARLY PREVENTION OF SCHOOL DROPOUT

Marion Lorenzon (Associazione La Strada-Der Weg ONLUS) · **Christa Ladurner** (Fondazione Forum Prävenzion) · **Heidrun Demo** (Libera Università di Bozen- Bolzano, Italy) · **Silvia Dell'Anna** (Libera Università di Bozen- Bolzano, Italy)

educational poverty | educator | kindergarten

This contribution is situated within the broader debate on “educational poverty”, acknowledging the ambivalent nature of this concept. On the one hand, the notion of educational poverty aims to compensate for inequalities experienced by children growing up in disadvantaged contexts (Bersanti, 2023; Milani, 2020). On the other hand, it risks reinforcing a deficit-based perspective, positioning individuals and families as “needy” and potentially obscuring broader social responsibilities (Arena, 2025; Finetti, 2023). The contribution focuses on selected final results of the “Il Ponte” (The Bridge) Project, coordinated by Associazione La Strada – Der Weg and funded by the social enterprise Con i Bambini. The project targeted preschool children attending ten kindergartens in South Tyrol. It was implemented in collaboration with several third-sector organizations, including Arciragazzi Bolzano, Cooperativa sociale EOS, Fondazione Forum Prävention, and Fondazione Südtiroler Kinderdorf ONLUS. The main objective of the project was to foster the creation of an inclusive educational environment capable of strengthening connections between kindergartens, families, and local services. This goal was pursued through the introduction of a dedicated educator figure within kindergartens. This professional role was designed to act as a “bridge” between different educational actors, supporting children’s development, facilitating communication with families, and promoting access to community resources. Educators carried out activities on three levels: within the kindergarten with children and teachers; in fostering cooperation between kindergartens and families; and in promoting collaboration between kindergartens and local services and organizations. The evaluation of the project was conducted by the Libera Università di Bolzano-Bozen using a participatory approach aimed at giving voice to professionals and families involved in the project. The research design adopted followed a convergent mixed-methods approach (Trinchero & Robasto, 2019), in which qualitative and quantitative data were collected with interviews and questionnaires in parallel and subsequently integrated into a comprehensive interpretative framework with the goals of describing the initial context, documenting implemented actions, and assessing perceived outcomes. Parallel to the evaluation process, the partner organizations—coordinated by Fondazione Forum Prävention—initiated a participatory process to define the professional profile, responsibilities, and functions of the educator within the kindergarten. This process aims to clarify the educator’s role in relation to kindergartens, families, and territorial services with the key objective to promote institutional recognition at the provincial level and move beyond project-based funding towards sustainable policy frameworks. The presentation will illustrate selected project activities, key outcomes emerging from the evaluation, and the current state of work on formalizing the educator’s role.

"DID YOU EAT AT SCHOOL?" ACTION RESEARCH WITH ETHNOGRAPHIC NATURE ON FULL-TIME SCHOOLING IN A CONTEXT WITH HIGH SCHOOL DROPOUT RATES

Noemi Giulia Dicorato (University of Bologna, Italy)

school canteens | food poverty | class assembly

State of the art Food poverty in Italy is a growing phenomenon. 10% of families are unable to provide their children with a balanced diet (Openpolis, 2023). School canteens play a central role in fighting food poverty (Osservatorio Italiano sui Conti Pubblici & Save the Children Italia Onlus, 2023). Food consumption has a multidimensional connotation: it is a central element for cultural expression and identity, but also an educational opportunity. Research shows a considerable

gap between the presence of school canteens in northern and southern Italy, as well as between different types of schools: 55.2% of primary school pupils have access to them, compared to 10.5% of lower secondary school pupils (Save the Children, 2024). The National Action Plan for the implementation of the Child Guarantee in Italy links school canteens to educational poverty because school hours - which are modified by the presence of the canteen service - can make a difference in fighting early school leaving. Full-time schooling - whose initial goal was to try to respond to social emergencies - does not necessarily bring a change (Ferrero, 2023), but it is an opportunity to examine food education and rethink school design (Oliviero, 2022), while it is often considered a “suspended time” that is not always consistent with teaching and educational interactions (Messere & Nicolini, 2019). Objectives The research project examines the role of school canteens within school time and is part of a PNRR project. For this purpose a research group in the field of pedagogy and anthropology has been set up by the Department of Education Sciences of the University of Bologna. The research involved a lower secondary school class at the IC Melissa Bassi school in Rome. Research design and methodology The PhD project used the methodology of participatory action research with ethnographic nature. The process involved workshops and focus groups between teachers, pupils and families, with the aim of identifying problems and possible strategies for improving lunchtime and full-time schooling, giving rise to a participatory design process (Cochran-Smith & Lytle, 2009). The key aspects were the discussion between different “points of view” and the use of specific tools, such as focus groups, interviews, observations, workshops, able to give voice to the experiences of those involved (Zecca, 2016). Results The proposal for full-time schooling in lower secondary school arose from observations made by the school management, which clearly showed that for some pupils, the school canteen was the only place where they could eat a proper meal. Despite this, the canteen service was not structured as a service designed for lower secondary school. Analysis of the data collected showed the need to recognize the school canteen and full-time schooling as an area for rethinking. Together with the teachers of the class involved, we focused on experimenting a teaching technique, which aimed at promoting the active participation of pupils in co-design: Celestin Freinet's class assembly. Some of the topics on the agenda of the first assemblies regarded the furnishings of the canteen, the tables clearing and the organization of the school time in the afternoon.

BUILDING DEMOCRATIC BRIDGES TO PREVENT EARLY SCHOOL LEAVING. THE ROLE OF NON-FORMAL EDUCATION BETWEEN SCHOOLS AND MIGRANT FAMILIES

Valeria Cotza (University of Milano-Bicocca, Italy) · **Rebecca Coacci** (University of Milano-Bicocca, Italy)

Early school leaving | School-family relationship | Non-formal education

Like many other countries in Europe, Italy is experiencing a period of large-scale migration, facing the challenges of an increasingly multicultural society (Di Rosa & Allegri, 2022). The children of migrant families (not only first-generation but also second-generation) face greater difficulties at school than their Italian-speaking peers, mainly due to language barriers, socio-cultural disadvantages and other factors preventing integration and inclusion (Dusi, Steinbach, & Falcon, 2014; Cavioni, Conte, & Ornaghi, 2024). In the school-family relationship, migrant parents face many difficulties in relating to school bodies and teachers (Mantovani & Gasperoni, 2018; Santagati & Colussi, 2024). This contribution aims

to present the initial findings of an experience and research carried out by a multifunctional educational centre, "L'ABC del quartiere", which works since September 2022 in a very complex urban area, San Siro, Milan (Grassi, 2022), as part of the MUSA project - Multilayered Urban Sustainability Action, Spoke 6, Task 3.1.3 "Contrasting and prevention of Early School Leaving in disadvantaged urban neighbourhoods" (Zecca, Fredella, & Cotza, 2024). The center adopts an ecological-systemic approach (Bronfenbrenner, 2005) and has as its main goal to prevent school dropout by welcoming children aged between 0 and 13 and their families (mainly mothers), almost all Arabic speakers. Children aged 0 to 7 are welcomed into the Play Space, with laboratories and play activities; children aged 8 to 13 are welcomed in the Study Support Space, where they find individualized tutoring (Cotza, Coacci, & Fredella, 2025); a third area is dedicated to mothers, who are offered an Italian L2 course. The Study Support Space offers personalized interventions and foster and support the school-family relationship, organizing meetings with teachers from the schools attended by the children (5 lower secondary schools and 6 primary schools) and supporting families in communication and during school-family meetings (since the 2024/2025 s.y.). The contribution aims to analyze how the center has structured this relationship with schools and how this process has been experienced and perceived by the mothers. To this end, a research diary was kept on the meetings with schools, and non-directive, semi-structured interviews were conducted from February 2026 with ABC mothers who have school-age children (16). The aim is not only to investigate mothers' perceptions and experiences of their children's schools, but also to understand whether and to what extent the processes implemented in the center provide concrete support to local communities in terms of school management and level of trust in institutions. An initial analysis, through reflective thematic approach (Braun & Clarke, 2021), profiled L'ABC as a bridge between the demands of the school, which are often unattainable for migrant families, and the needs of families facing major economic and socio-cultural challenges. The systemic work carried out by L'ABC seems to be successful in establishing a constant and productive dialogue between schools and parents, supporting communication and access to services from a democratic perspective. The voices of mothers is revealing experiences of great loneliness and barriers in their relationship with the school, which require cultural mediation and support for integration processes.

ITALIAN L2 EDUCATION FOR ADULT LEARNERS: A COLLABORATIVE APPROACH TO SOCIAL INCLUSION AND NEET PREVENTION

Petar Lefterov (Fondazione Bambini Bicocca, Italy) · **Laura Canil** (University of Milano - Bicocca) · **Sara Lavazza** (University of Milano - Bicocca)

NEET | Italian Second Language | migration

In contemporary democratic societies, linguistic education represents a key lever for social inclusion and for preventing processes of marginalization that may lead to educational and occupational exclusion. Within this framework, Italian as a second language (L2) education for adults assumes a strategic role in supporting migrants and vulnerable learners in accessing meaningful learning and employment pathways. The present contribution, grounded in the theoretical field of

adult L2 Italian didactics (Serragiotto, 2020; Adorno et al., 2017; Balboni, 2013) and lifelong learning (Knowles, 1984; Di Rienzo, 2015), views language competence as a crucial condition for participation, agency, and active citizenship. In light of this premise, the study aims to explore how targeted L2 Italian educational interventions can enhance adult learners' linguistic competences to support their educational and professional integration and reduce the risk of NEET conditions. Particular attention is devoted to the role of pedagogical innovation in CPIA contexts as a means of fostering equitable learning opportunities for linguistically and socio-culturally diverse adults. In order to reach its objectives, the study, grounded into pragmatical worldview (Peirce, 2003), adopts a qualitative method (Creswell, 2009) and a collaborative research methodology (Desgagné, 1997), developed through the training and supervised involvement of two pre-service teachers in Italian L2 didactics. After a structured preparation phase on adult language education, the two trainees implemented and observed L2 teaching practices within two CPIA contexts in Northern Italy (Como and Varese). The research combined systematic classroom observation, analysis of entry and progress language assessments, and the use of biographical–narrative tools (e.g., linguistic portraits) to capture both cognitive and identity-related dimensions of language learning. The collaborative nature of the study enabled cross-context comparison and reflective triangulation between the two field experiences. Findings highlight a progressive development of learners' Italian L2 competences, particularly in functional communication domains relevant to everyday life and work inclusion. Moreover, the data underline the strong interconnection between linguistic progress, learners' motivational trajectories, and their perceived possibilities for social and professional participation. At the same time, the use of biographical and narrative devices proved especially effective in supporting engagement, identity recognition, and persistence in learning pathways. Overall, the contribution argues that pedagogically grounded L2 Italian provision can function as a preventive device against processes of social and educational exclusion when embedded in inclusive, learner-centered, and reflexive teaching practices. The findings offer implications for teacher education, adult language policy, and justice-oriented approaches aimed at redesigning educational spaces as sites of democratic belonging and opportunity for adult migrant learners.

HOW POVERTY IN EDUCATION IMPACTS THE NEET PHENOMENON

Margherita Coppola (Università degli Studi di Salerno, Italy) · **Rosa Vegliante** (Università degli Studi di Salerno, Italy)

Early school leaving | NEET | Campania Region

This paper aims to examine the phenomenon of school dropout, viewed as the result of a complex interplay of individual, social, economic, and institutional factors that influence, to different extents, the failure, partial participation, or discontinuous participation of young people in the education system (Autorità Garante per l'Infanzia e l'Adolescenza, 2022). At the national level, there are two main categories of early school leaving: explicit early school leaving, corresponding to the Early Leavers from Education and Training (ELET) rate, which refers to the premature interruption of schooling, and implicit early school leaving, which refers to students who, despite having completed mandatory schooling, do not achieve adequate competence levels in key areas of knowledge. Starting in 2019, Italy implemented an integrated system for monitoring implicit early leaving, based on the National Student Registry, established by the Ministry of Education, and on periodic standardized surveys by INVALSI (Invalsi, 2024), which allow for the objective measurement of the degree of acquisition of basic skills by the school population. At the same time, the national picture is characterized by the significant presence of so-called NEETs (Not in Education, Employment or Training), young people aged between 15 and 29 who are not in education, training, or employment. According to the most recent available data from Eurostat (Eurostat, 2024), the incidence of NEETs in Italy (aged 15–29) will be 15.2%, confirming the country's second place in the

EU, after Romania. This situation highlights a twofold systemic problem: on the one hand, the high rate of early school leaving; on the other, the persistent mismatch between the skills acquired and those required by the labor market. In proposing a critical pedagogical interpretation of the relationship between educational poverty and NEET status, this paper focuses on NEET status not as an individual failure or personal choice, but as the systemic outcome of cumulative processes of educational vulnerability: fragmentation of educational environments, weakening of local networks, and insufficient integration of guidance systems and school-to-work transition pathways. From a perspective of democratic education and educational justice, focus groups are presented, carried out in the Campania Region (Vegliante & Coppola, 2024), which involved a group of experts (teachers, operators from employment centres, counselors from CPIA) from which emerge how educational poverty is therefore interpreted not only as a risk factor, but as a priority field of pedagogical and political intervention for the construction of paths of empowerment, capacity building and active citizenship, aimed at addressing inequalities and promoting inclusive and democratic social trajectories.

BUILDING EDUCATING COMMUNITIES THROUGH COMMUNITY PACTS: A CASE STUDY

Sabina Licursi (Università della Calabria, Italy) · **Giorgio Marcello** (Università della Calabria, Italy) · **Arianna De Bartolo** (Università della Calabria, Italy)

educating community | co-design | educational poverty

Educational poverty is a critical dimension of child poverty; by depriving children of equal opportunities, it creates economic, social, and cultural gaps that are often difficult to bridge (Meo, Unicef, 2022). As a multidimensional concept encompassing both cognitive and non-cognitive aspects , and drawing on the Capability Approach (Sen, 1997), educational poverty represents a fundamental deprivation of a child's opportunity to learn, experiment, and realize their potential. To address this, the 2020–2021 Italian School Plan introduced the "Community Education Pact", a strategy designed to strengthen the education system by mobilizing local territorial resources. This paper analyzes the multi-year implementation of such a Pact at the Spirito Santo Comprehensive Institute in Cosenza (Calabria, Italy). The research adopts a qualitative methodology, utilizing monitoring documentation, semi-structured interviews with third-sector practitioners and school leadership, focus groups with teachers, and direct observation of co-design meetings. The Pact, "Noi di CUSE' – Costruire Un Sogno Educativo," now in its fifth year, emerged from a synergy between school management and local associations, involving the University of Calabria and various third-sector actors (Licursi, Marcello, 2025). The intervention aimed to transform the school into an open educational space for the entire neighborhood, though it faced significant hurdles, such as limited engagement from the local Municipality. The research focuses on two guiding questions: Has the Pact successfully fostered the construction of an "educating community"? And has it shifted the professional awareness of school and association staff regarding the co-definition of interventions against educational poverty?. Findings reveal a complex landscape: while critical issues persist—particularly in maintaining co-design logic as the number of actors and resources increases—significant positive shifts have emerged. These include a transition in teacher attitudes from initial wariness to active collaboration, the repositioning of the school as a hub for family participation, and the enhanced ability of practitioners to intervene in school dropout through community outreach and co-presence in the classroom.

PEDAGOGICAL SPACES WITHOUT BARRIERS: ANALISING RESPONSES OF EDUCATORS ABOUT QUESTIONNAIRE ON INCLUSIVE SCIENCE FREE-CHOICE SPACES FOR CHILDREN IN SPAIN

Gabriel Lemkow Tovias (Faculty of Social Sciences in Manresa (UVic -UCC), Spain) · **Fina Carpena Mendez** (Faculty of Social Sciences in Manresa (UVic -UCC), Spain) · **Meritxell Cano Autet** (Faculty of Social Sciences in Manresa (UVic -UCC), Spain) · **Mounia Rachdi Errachdi** (Faculty of Social Sciences in Manresa (UVic -UCC), Spain) · **Miriam Navarro-Rúperez** (Universitat Autònoma de Barcelona, Spain)

free-choice barriers STEM

Children have an innate interest in exploring and learning from their immediate environment (Dewey, 2004; Gopnick, 2012). However, the role of educators in their settings is fundamental to be able to channel their interests and help develop the children's skills related to understanding their environments and to promote participation in the construction of meaning (Haldon et al. 2022). In this sense, educators have a fundamental role in adapting their settings to transform the innate curiosity of children into learning opportunities that promote their autonomous agency and understanding of surrounding phenomena. However, the didactic proposals and stations in free-choice pedagogical spaces, especially in the field of science/STEM, are not always appropriate or accessible to all children, given visible and invisible barriers and bias that may cause the dissafection of children in vulnerability risk situation in relation to their learning processes (Glockengiesser et al, 2023; Booth & Ainscow, 2002; Pedreira et al., 2025). Thus, offering free-choice accessible and inclusive science learning environments with a universal design (UD) perspective, free from prejudice and based on equity, are essential to avoid exclusion in the field of science for groups at risk of vulnerability and especially girls due to the gender gap in the STEM fields. Due to this and to cover a gap in this field the Impactlab project (PID2022-139472OA-I00 Generación del conocimiento, I+D) from the Faculty of Social Sciences of Manresa (Uvic-UCC) has designed an online self-assessment Toolkit so that educators and teachers can detect the degree of inclusive adequacy of their science spaces. One of the goals of the toolkit is to promote the teacher's self-awareness and to encourage a more reflective adult perspective in supporting autonomous learning processes for all children despite the different needs, backgrounds and competences of children so to keep them engaged in the different pedagogical settings and stages in ECEC and afterwards. This study presents the preliminary results collected in Spanish and Catalan educational centers, at the early childhood education stage regarding the responses from this toolkit oriented to the design of inclusive science spaces in schools in ECEC. The preliminary results will be discussed and recommendations will be proposed to promote and improve this type of pedagogical spaces to reinforce the pedagogical engagement in science education to all children despite their social backgrounds, needs and capacities and reinforce their engagement with their schooling and learning processes.

Reversing Educational Inequalities: Successful Interventions for Democratic Learning

PANEL CONVENORS: Tiziana Chiappelli (University of Siena); Sabina Leoncini (University of Siena); Maria Rita Mancaniello (University of Siena); Chiara Carletti (University of Siena); Giovanni Giamello (University of Siena); Garazi López de Aguileta (University of Barcelona); Lidia Bordanoba (University of Barcelona); Mariana Sultanova (Institute for Education, Bulgaria); Simona Sankalaitė (Public Policy and Management Institute)

PANEL KEYWORDS: educational inequalities, successful interventions, longitudinal data

This panel examines how educational research can contribute to strengthening democracy by reducing structural inequalities through evidence-based interventions that have been shown to be successful in diverse contexts across the world (Ruiz-Eugenio et al., 2023). Building on results from the Horizon Europe project REVERS-ED, the session explores how democratic educational communities—where students, families, and teachers participate through an egalitarian dialogue—foster both academic equity and civic empowerment. Through systematic literature reviews, large-scale cohort studies, longitudinal mixed-methods designs, and students' longitudinal successful trajectory analyses across different European countries, the contributions illuminate how inequalities emerge along socioeconomic, linguistic, and migratory lines, and how they can be reversed through successful interventions. These interventions, rooted in interaction, solidarity, and co-creation, have demonstrated measurable improvements in learning outcomes, coexistence, and students' civic agency (Soler, 2015). The panel argues that democratic schooling (Apple & Beane, 2007) is not only a normative aspiration but an empirically supported pathway to social justice. By integrating macro-level evidence with the lived experiences of students from vulnerable communities who overcame disadvantages, the session highlights how participation, dialogic learning, inclusion, and family engagement can transform educational systems and enable historically marginalized students to become active contributors to democratic life. The findings provide concrete, scalable strategies for policymakers and practitioners seeking to build more inclusive and democratic schools in Europe and beyond.

A COMPARATIVE LONGITUDINAL STUDY OF INEQUALITIES IN BULGARIA: EVIDENCE FROM SELECTED COHORTS AND SUCCESSFUL SCHOOL ACTIVITIES DEMONSTRATING STABLE AND IMPROVING OUTCOMES

Mariana Sultanova (Institute of Education, Ministry of Education and Science) · **Iva Zhivarova** (Institute of Education, Ministry of Education and Science) · **Natalia Vassileva** (Institute of Education, Ministry of Education and Science) · **Nina Tomova** (Institute of Education, Ministry of Education and Science)

Educational Inequalities | Matrix of Cultural and Social Asymmetry | Successful School Activities

The article presents the results of a longitudinal analysis of educational outcomes based on the National External Assessments in Bulgarian Language and Literature (BLL) and Mathematics, focusing on two student cohorts in Bulgaria (born in 1999 and 2003). The analysis examines achievement at the end of primary education and at the end of lower secondary education. These temporal cross-sections allow for intergenerational comparison between students educated in different socio-economic and institutional contexts, as well as for tracing the persistence of inequalities over time. The quantitative analysis employs a Univariate General Linear Model (GLM) to examine the effects of three independent variables: gender (female/male), language spoken at home (Bulgarian/other), and type of settlement (capital city/regional city/small town or rural area). The dependent variable is the average score on the National External Assessments. The model enables estimation of both the main effects of each factor and their interaction effects (e.g., language × settlement type). The analysis of data from the two cohorts indicates that the Bulgarian educational system tends to reproduce socio-cultural inequalities rather than mitigate them. Linguistic, social, and geographical differences form a matrix of cultural and social asymmetry within which schooling operates. Building on the principal finding of the quantitative analysis—that the language spoken at home remains the strongest predictor of academic achievement—we applied a set of selection criteria to identify schools demonstrating stable and improving educational outcomes in the National External Assessments. Through qualitative analysis of the school environment and its key stakeholders (students, teachers, parents, local community, etc.), as well as of the implemented school-level activities, we identified the factors associated with improving outcomes as reflected in assessment results.

SUCCESSFUL EDUCATIONAL ACTIONS AS DEMOCRACY IN PRACTICE: LONGITUDINAL SUCCESSFUL TRAJECTORIES OF VULNERABLE STUDENTS

Lidia Bordanoba-Gallego (University of Barcelona, Spain) · **Garazi López de Aguileta** (University of Barcelona, Spain)

successful educational actions | longitudinal trajectories | educational inequalities

There is extensive scientific evidence on the improvement of educational results achieved by schools from very different contexts implementing Successful Educational Actions (SEAs) (Ruiz-Eugenio et al., 2023; Soler, 2015). A growing body of literature has also shown that schools within the same region implementing these evidence-based actions obtain significantly greater improvements than other schools serving similar populations (Flecha et al., 2025). However, there is a need for more scientific literature analyzing the longitudinal trajectories of adults who completed their primary education in schools implementing SEAs, particularly regarding how such schooling may contribute not only to academic achievement but also to democratic citizenship. For the first time, this paper presents longitudinal evidence from five young adults with successful academic and professional trajectories who studied in a primary school implementing SEAs in a very low-SES neighborhood in a Spanish municipality. The school is located in a context historically affected by structural inequalities linked to poverty and social exclusión, with a majority of Moroccon and Roma population. The five Young adults are first-or second-generation immigrants from Morocco. We conducted in-depth interviews within the framework of the 1st Conference of Role Models organized in Spain, where these young adults reflected publicly on their educational and life trajectories. The analysis focuses on how they interpret the contribution of their primary schooling to their later success. Results indicate that the five participants attribute both their academic and professional achievements to their experience in this school, in particular to participating in the SEAs implemented in it. They have completed university degrees in fields such as mechanical engineering, computer science, and statistics, and have entered qualified professional careers. They explain that participating in SEAs such as Interactive Groups or Dialogic Gatherings not only enabled them to achieve excellent academic results and develop a strong culture of effort, but also fostered solidarity, teamwork, mutual help, and high expectations regarding their futures. Importantly, participants highlight that the school functioned as a democratic learning community. Through egalitarian dialogue, with the participation of the community (especially families) in learning and decision-making spaces, they experienced what can be conceptualized as democracy for learning: inclusive and dialogic interactions that enhanced cognitive development and academic success. At the same time, these practices promoted learning for democracy, as students learned to collaborate, respect diverse voices, assume collective responsibility, and contribute to the learning of their peers. These democratic experiences shaped their aspirations, self-confidence, and sense of agency, enabling them to overcome structural disadvantages and pursue ambitious educational and professional goals.

DIALOGIC LITERARY GATHERINGS AS AN EVIDENCE-BASED EDUCATIONAL PRACTICE: THEORETICAL FOUNDATIONS, EMPIRICAL EVIDENCE, AND IMPLICATIONS FOR SOCIAL INCLUSION

Sabina Leoncini (UNISI, Italy) · **Giovanni Giamello** (UNISI, Italy)

inequalities SEAs Revers-ed

Dialogic Literary Gatherings (DLGs) have progressively established themselves as one of the most impactful educational approaches for the promotion of linguistic development, critical reasoning, self-esteem, and social inclusion within diverse learning contexts. Rooted in a dialogic and participatory conception of education, DLGs are grounded in a solid theoretical framework drawing on the socio-cultural theory of Lev Vygotsky, the constructivist and narrative perspective of Jerome Bruner, the critical pedagogy of Paulo Freire, the theory of communicative action elaborated by Jürgen Habermas, and the dialogic learning framework systematized by Ramon Flecha. These theoretical contributions converge in emphasizing the centrality of dialogue, social interaction, and egalitarian participation as key drivers of cognitive and socio-emotional development. This paper provides a comprehensive analysis of the pedagogical foundations of DLGs, outlining their operational structure and methodological principles. Dialogic Literary Gatherings are structured around the collective reading and discussion of classical literary works, in which participants engage in egalitarian dialogue, grounding their contributions in textual evidence rather than hierarchical authority. Through this dialogic dynamic, knowledge is co-constructed, and the learning process becomes a shared endeavor that values plurality of perspectives, cultural diversity, and mutual respect. The article further synthesizes empirical evidence derived from large-scale European research initiatives, including INCLUD-ED, REFUGE-ED, and REVERS-ED. These projects, focused respectively on educational inclusion strategies, the integration of refugee children through effective educational and psychosocial practices, and the analysis of long-term trends in educational inequalities and successful interventions to reverse them, provide substantial data supporting the effectiveness of DLGs across heterogeneous socio-cultural contexts. The findings consistently indicate that dialogic practices contribute to measurable improvements in linguistic competencies, enhanced reading comprehension, and the development of higher-order thinking skills. Moreover, participation in DLGs has been associated with a significant reduction in cultural prejudices and stereotypes, fostering intercultural dialogue and strengthening social cohesion. The creation of non-violent, respectful, and inclusive educational environments emerges as a recurrent outcome, particularly in settings characterized by social vulnerability. Crucially, the evidence underscores the importance of comprehensive teacher training and the co-creation of educational activities among educators, families, and community members as determining factors for the sustainability and success of the initiative. In light of these findings, the article advocates for the broader dissemination and institutionalization of Dialogic Literary Gatherings as an evidence-based educational practice capable of addressing structural inequalities, promoting democratic participation, and nurturing active and critical citizenship within contemporary pluralistic societies.

READING ALOUD AS DEMOCRATIC PRACTICE: REVERSING INEQUALITIES THROUGH IRONY, DESIRE AND AGENCY IN TUSCAN SCHOOLS

Maria Rita Mancaniello (University of Siena, Italy) · **Chiara Carletti** (University of Siena, Italy)

reading aloud | school dropout prevention | democratic learning

Educational inequalities in secondary schools remain a structural challenge across Europe, with early school leaving disproportionately affecting students from disadvantaged socioeconomic and cultural backgrounds (European Commission, 2020). In the Italian context, the Tuscan region has addressed this challenge through the large-scale policy "Leggere: Forte! Ad alta voce fa crescere l'intelligenza", a regional programme promoting systematic reading aloud in schools as a tool for educational equity (Batini, 2021). Building on six years of implementation and previous results, the "Leggere Forte 4.0 (2025–2028)" research project, conducted by a team of researchers from the University of Siena and coordinated by Prof. Maria Rita Mancaniello, extends this intervention to secondary schools, investigating how reading aloud can function as a democratic educational practice capable of reversing structural inequalities. This contribution presents the theoretical framework and the preliminary research design of the 2025–2026 phase, articulated in three interconnected strands. The first develops a predictive model for dropout risk using cluster analysis and artificial neural networks, identifying individual, relational and contextual variables that signal disengagement from schooling. The second, grounded in Participatory Action Research (Orefice, 2006), explores the effects of reading aloud on critical-reflective thinking, the capacity to recognise one's own desire (Recalcati, 2014), and an ironic forma mentis (Cambi, 2008; Carletti, 2024), pedagogical categories understood as resources for navigating complexity and fostering agency. The third introduces a case study that aims to analyse and validate the practice of silent reading in virtual reality environments, in comparison with traditional reading, focusing on comprehension, motivation, emotional wellbeing and attention management. Crucially, the project aligns reading aloud with the European LifeComp framework (Sala et al., 2020), mapping its effects across personal, social and learning-to-learn competences. This alignment allows the intervention to be interpreted not merely as a literacy practice, but as a transversal device for democratic learning, one that cultivates the civic, relational and metacognitive capabilities necessary for active participation in democratic life. The study involves approximately 300-400 pre-adolescents and adolescents in Tuscan secondary schools, with mixed-methods data collection including standardised instruments, observation grids, reflective diaries, focus groups and digital VR logs. The

analytical approach integrates quantitative and qualitative methods through methodological triangulation (Mortari, 2007; Mortari & Ghirotto, 2019), consistent with the project's naturalistic and transformative orientation (Lincoln & Guba, 1985). The contribution argues that reading aloud, when embedded within a participatory and critically informed pedagogical framework, constitutes a successful and scalable intervention for reducing educational inequalities. By enabling students to develop desire, irony and critical agency, it transforms the classroom into a space of democratic co-construction, where traditionally marginalised learners can become protagonists of their own educational trajectories.

WHEN DIMMI MET REVERS-ED: SUCCESSFUL EDUCATIONAL ACTIONS, FAMILY ENGAGEMENT, AND THE CO-CONSTRUCTION OF EDUCATING COMMUNITIES

Chiara Babetto (Convoi scs, Italy) · **Giovanna Placido** (Istituto Comprensivo Borsi, Castagneto Carducci, Italy) · **Jessica Callaioli** (Municipality of Castagneto Carducci) · **Michela Soldi** (Istituto Comprensivo Borsi, Castagneto Carducci, Italy) · **Eleonora Andreani** (Convoi scs, Italy) · **Matilde Ferri** (Istituto Comprensivo Borsi, Castagneto Carducci, Italy) · **Neusa Tonini Chivinda** (Convoi scs, Italy) · **Silvia Rusignuolo** (Convoi scs, Italy)

Community-based education | Early second language acquisition | Dialogic learning and Successful Educational Actions (SEAs)

This paper analyses the intersection between the local project DIMMI, implemented in Castagneto Carducci (Tuscany, Italy), and the European research framework REVERS-ED (University of Siena), which aims to reverse educational inequalities through dialogic and community-based approaches. Adopting a participatory action research approach, DIMMI was developed within a structured public network involving the Municipality of Castagneto Carducci, local early childhood education services, G. Borsi Comprehendive School, and the social cooperative Convoi. Targeting preschool children (3–6 years old), with a particular focus on those with migrant backgrounds, the project concentrated on Italian language acquisition and/or enrichment through small-group, playful laboratories, narrative practices, and linguistic support. However, a substantial and defining component of DIMMI was the active engagement of parents, embedded within a broader set of school- and territory-based initiatives. Rather than treating families as external stakeholders, DIMMI sought to position them as co-educators. Multilingual communication, the presence of cultural mediators, simplified institutional materials, and collective meetings were designed to lower symbolic and linguistic barriers. Family participation was further strengthened through collaborative events, community gatherings, and informal spaces for dialogue, all promoted by the school and local actors. In this sense, language support became inseparable from trust-building and from the co-construction of an inclusive educational environment. REVERS-ED extended and systematised this participatory orientation by proposing additional experimentation beyond the implementation of Successful Educational Actions (SEAs) and the systematic analysis of the achievements. In particular, dialogic family sessions, interactive groups in classrooms, and Dialogic Literary Gatherings are practices aimed at fostering shared meaning-making and high expectations for all students. Through interviews, focus groups, and participatory meetings, REVERS-ED initiated a path of co-design involving children, teachers, parents, educators and school leadership across pre-school services (3-6 y.o.), primary and lower secondary schools. This process allowed for a contextualised understanding of needs, expectations and local resources, reinforcing the territorial dimension. According to the dialogic methodology, the school is more than a mere service provider and is conceived as a deliberative space, where interventions are shaped through collective

reflection and shared responsibility. Putting DIMMI in dialogue with REVERS-ED shows how early language support, parental engagement and dialogic pedagogies can converge within a multi-level public network. The case demonstrates that reversing educational inequalities requires not only early and situated interventions but also sustained processes of participation, epistemic recognition and community co-construction. Educational innovation emerges not from isolated projects, but from relational ecosystems where families, schools and territorial actors jointly redefine the meaning and practice of inclusion.

REVERSING EDUCATIONAL INEQUALITIES THROUGH COMMUNITY PARTICIPATION: BUILDING DEMOCRATIC LEARNING ENVIRONMENTS THROUGH INTERACTIVE GROUPS AND PARENTAL INVOLVEMENT

Tiziana Chiappelli (University of Siena, Italy)

Reversing Educational Inequalities | Community Participation | Successful Education Actions

Interactive Groups (IGs) are among the Successful Educational Actions (SEAs) identified in the European research project INCLUD-ED as evidence-based practices capable of improving academic learning while strengthening social cohesion in diverse educational contexts (Flecha, 2000; Flecha & INCLUD-ED Consortium, 2015). Grounded in the principles of dialogic learning, Interactive Groups reorganize classroom dynamics through heterogeneous small-group work and egalitarian dialogue, fostering collaborative learning and the active participation of students, educators, families, and community members. This paper presents the Italian fieldwork conducted within the Horizon Europe projects SHAR-ED and REVERS-ED, focusing on the implementation and experimentation of Interactive Groups in educational settings characterized by socio-economic diversity and the presence of students from migrant and vulnerable backgrounds. Rather than approaching IGs merely as a pedagogical technique, the study examines them as a community-based educational practice capable of reshaping relationships within schools and between schools and their surrounding social environments, in line with dialogic and participatory research traditions (Gómez, Puigvert, & Flecha, 2011). The analysis draws on both quantitative and qualitative fieldwork conducted in Italian schools, including classroom observations, interviews with teachers and volunteers, and collaborative reflection with school communities engaged in the experimentation. Particular attention is devoted to understanding how Interactive Groups contribute not only to improvements in instrumental learning and classroom interaction, but also to broader processes of community participation and democratic engagement within the school environment. Preliminary findings highlight that the involvement of volunteer parents and community members in classroom activities expands the educational space beyond the traditional boundaries of the school, strengthening relationships between families, educators, and the wider community. This participatory structure fosters inclusive learning environments in which students with diverse abilities and backgrounds collaborate and support one another, reducing segregation and enhancing mutual recognition. The Italian experiences analyzed in this paper suggest that Interactive Groups can operate as a powerful mechanism for reversing educational inequalities, combining academic support with the mobilization of community resources and social capital. Beyond measurable cognitive outcomes, their impact extends to the relational and civic dimensions of schooling, contributing to the development of democratic learning environments where dialogue, solidarity, and collective responsibility become central elements of the learning process. By documenting how Interactive Groups are implemented and experienced in the Italian context, this study contributes to the broader objectives of REVERS-ED, offering insights into how evidence-based educational interventions can promote academic equity, social inclusion, and community engagement while strengthening the democratic role of schools in increasingly

diverse societies (Ruiz-Eugenio et al., 2023). These findings contribute to current debates on how evidence-based educational practices can play a key role in reversing structural inequalities while strengthening democratic participation in education.

School Segregation Effects: the Educational and Social Impacts of Concentrated Vulnerabilities in Schools

PANEL CONVENORS: Xavier Bonal Sarrò (Autonoma University of Barcelona); Marta Cordini (Polytechnic of Milan, Italy); Costanzo Ranci Ortigosa (Polytechnic of Milan, Italy)

PANEL KEYWORDS: school segregation, educational inequalities, social impact

The effects of school segregation are wide-ranging and extend beyond impacts on academic achievement, reproducing inequalities linked to social origins. Research has shown that segregation negatively affects educational outcomes and tracking, leading to lower performance in segregated schools and a concentration of vulnerable students in vocational and technical tracks. Its implications for social mobility have also been examined: attending a segregated school can predict limited social mobility, precariousness and reduced financial capital. In addition, segregation shapes students' social capital by restricting opportunities for cross-class interaction, limiting access to diverse networks, and reducing exposure to information, aspirations, and resources that are unequally distributed. Other social outcomes - trust, civic engagement, and perceptions of belonging- can also be weakened when peer groups are highly homogeneous and schools are socially isolated. School segregation can also affect schools and territories through processes of stigmatization. Such processes can both result from and trigger avoidance behaviours, further concentrating disadvantaged students in already marginalized schools. This vicious cycle may ultimately undermine social cohesion, though empirical evidence on this relationship remains limited. We welcome contributions that advance understanding of the effects of school segregation, either corroborating or challenging existing evidence and disentangling its social impacts at the following levels: Individuals: educational outcomes, social mobility, income, social capital; Social Groups: educational and labour market inequalities among ethnic groups and/or social classes School systems: at the level of schools or broader organizational scales; Territories: mechanisms of stigmatization, relationships with urban transformations, and implications for social cohesion and collective social capital.

INEQUALITIES IN EDUCATIONAL PATHWAYS: THE ROLE OF LOWER SECONDARY SCHOOL COMPOSITION IN UPPER SECONDARY SCHOOL CHOICE

Berenice Scandone (Polytechnic University of Milan, Italy) · **Carlotta Caciagli** (Polytechnic University of Milan, Italy)

School choice | Guidance practices | School segregation

Socioeconomic and ethnic inequalities continue to influence upper secondary education choices in Italy, as in the rest of Europe (OECD 2023; INVALSI 2025). These disparities stem both from "primary effects" of individual background on academic achievement and from "secondary effects" related to family decision-making processes, which are particularly relevant in the Italian context (Ress & Azzolini 2014). While most studies have focused on dynamics linked to students' individual and family characteristics, a growing body of research shows that the socioeconomic and ethnic composition of lower secondary schools also shapes upper secondary school choices (Tan et al. 2023; Rosenqvist & Brandén 2024). However, empirical evidence on the mechanisms through which school composition affects subsequent educational decisions remains limited. This paper aims to fill this gap by investigating the "school effect", that is, the mechanisms through which the socioeconomic and ethnic composition of lower secondary schools influences upper secondary education choices. The findings presented are drawn from research conducted in Milan in 2025, combining INVALSI data ana-

lysis with qualitative interviews involving school leaders and teachers from ten lower secondary schools (39 interviews in total) and students and parents from four of these schools (56 interviews in total). The research is part of the project EDIN – Understanding School Effects: How the Socioeconomic and Ethnic Composition of Schools Affects Educational Inequalities, funded by Fondazione Cariplo. Quantitative findings show that students attending socially advantaged schools are significantly more likely to enrol in academic high schools, while those in schools with higher concentrations of socioeconomically disadvantaged and migrant-background students more frequently choose technical or vocational tracks. Qualitative findings show that, while school guidance practices share similar aims and approaches, the content and tone of guidance vary by social composition. In disadvantaged schools, collective information sessions focus strongly on technical and vocational institutes, with academic tracks presented as more demanding and suitable primarily for "excellent" students. Teachers often adopt a cautious approach, recommending pathways considered more attainable or secure. In socially advantaged or mixed schools, students are more widely exposed to academic options through school initiatives and peer networks. In socially advantaged contexts, family aspirations weigh more heavily and academic tracks are encouraged even for average performers. Overall, guidance practices appear to adapt to school contexts in ways that ultimately reinforce, rather than mitigate, existing inequalities and the "school effect". The analysis highlights the central role of school composition in re-producing or counteracting pre-existing inequalities. These findings call for reflection on the need for policies aimed at reducing school segregation and rethinking information and guidance practices to promote more equitable access to educational opportunities.

SELECTING, SEPARATING, SEGREGATING: A SCHOOL DATA-BASED ANALYSIS

Lorenzo Luatti (Oxfam Italia, Italy) · **Sibilla Filippi** (Oxfam Italia, Italy)

inequalities in educational outcomes · educational streaming · intergenerational mobility

Lower secondary school represents the final stage of the Italian education system in which social classes, gender, and citizenship backgrounds remain relatively mixed. With the transition to upper secondary education, however, a process of differentiation begins - more or less explicit - giving rise to various forms of "educational streaming." These streaming processes - or, in some cases, actual segregation - intersect with inequalities in learning and educational outcomes and simultaneously reinforce them. The result is an implicitly hierarchical upper secondary education system, structured into studies perceived (by teachers, families, and public opinion) as first-, second-, and third-tier options or, alternatively, as intended for students considered "more or less capable," "native or foreign," or "male or female." Within this framework, both explicit and implicit selection mechanisms operate, active at entry and throughout school , formally justified by academic performance but often intertwined with social, cultural, or undeclared criteria. Academic performance itself, as widely recognized, is frequently influenced by students' socio-economic and cultural backgrounds. The streaming that occurs at the end of the first education cycle thus acts as a telling indicator of the persistent selective structure Italian secondary education, which still remains far from fully achieving the principles of equity, inclusion, and effectiveness enshrined in Articles 3 and 34 of the Italian Constitution. The contribution aims to outline a comprehensive picture of these dynamics through the integrated analysis of multiple sources and datasets, examined from diachronic and longitudinal perspectives, across geographical areas and in relation to the different upper secondary studies. The paper also advances several proposals in terms of policies and actions. The proposed contribution is based on a methodology for data extraction, processing, and interpretation aimed at monitoring school dropouts at the local level, developed and tested by Oxfam Italy in five different school systems and, vertically, in fifteen lower and upper secondary schools. The primary focus is on the secondary education segment (lower and upper secondary levels). By combining data on explicit

and implicit dropouts, the study seeks to provide a detailed overview of inequalities in learning and outcomes, highlighting how structural and contextual factors interact in shaping educational results. Among the research hypotheses to be explored through data analysis are: the “ambivalent” relationship between explicit and implicit dropouts: does reducing predictive events associated with explicit dropouts (failures, grade repetition, delays, changing schools) - and therefore lowering the risk of early school leaving - necessarily lead to lower levels of learning and competencies? the “pyramidal” configuration and persistent selective structure of upper secondary education - from the academic high school track, including internal differentiation, to vocational education - appear confirmed by a wide range of data. The hypothesis is that this structure produces “mirror effects,” both ex ante (in school choices) and ex post (in labor market stratification); do streaming processes already emerge at entry and become consolidated throughout the school? What relationship exists between educational streaming and school dropouts? The proposed hypothesis is that each school’s “positioning” within the system contributes, in a circular manner, to reinforcing both streaming processes and dropouts.

ACCUMULATED TEACHER TURNOVER: APPROACHING INTENSIFIED EDUCATIONAL INEQUALITIES IN SOCIALLY VULNERABLE SCHOOLS

Núria Roca Samon (Universitat Autònoma de Barcelona, Spain) · **Xavier Bonal Sarró** (Universitat Autònoma de Barcelona, Spain) · **Sheila González Motos** (Universitat de Barcelona, Spain) · **Edgar Quilabert Argudo** (Universitat Autònoma de Barcelona, Spain)

Teacher turnover | School social composition | Educational inequalities

Teacher turnover has been identified as one of the main factors in shaping teacher stratification dynamics across schools (Feng & Sass, 2017; Steele et al., 2015; Clotfelter, Ladd & Vigdor, 2011). International literature has consistently shown that teacher turnover does not affect all schools uniformly but rather tends to have a greater impact on schools that concentrate students from socioeconomically disadvantaged or migrant backgrounds, with higher poverty rates and lower academic performance, which systematically exhibit higher turnover rates than more socially advantaged schools (Sorensen & Ladd, 2020; Carver-Thomas & Darling-Hammond, 2019; Allen, Burgess & Mayo, 2017; Barbieri, Rossetti & Sestito, 2011). These schools face persistent challenges in retaining highly qualified teachers and in consolidating stable teaching staff, which contributes to intensifying educational inequality between schools (Ferrer-Esteban et al., 2025; Ingersoll et al., 2019). In the case of Catalonia, although teacher turnover is widespread across the education system, available evidence indicates that it is particularly concentrated in schools with high levels of social vulnerability (Ferrer-Esteban et al., 2025). However, the analysis of this phenomenon has traditionally been examined through annual measures that provide a short-term approximation of teacher turnover, thereby limiting understanding of the temporal dimension of turnover processes and of sustained patterns of staff instability over time. The aim of this research is to deepen the analysis of the relationship between teacher turnover and the social composition of schools in Catalonia,

adopting a longitudinal perspective that enables teacher turnover to be examined as a cumulative process of staff instability over successive years. The study draws on Holme et al. (2018), who propose approaching teacher turnover beyond annual rates and conceptualising it as a process that manifests in different patterns of instability measured through longitudinal indicators. Methodologically, this study employs a quantitative approach based on the analysis of official administrative data from the Department of Education of Catalan Government, covering seven academic years (2018-2019 to 2024-2025). Through the construction and application of longitudinal indicators of teacher turnover, the study identifies not only the profiles of schools with high turnover rates, but also distinct underlying patterns of instability, distinguishing between situations of chronic instability, cumulative instability, isolated episodes, or intermittent dynamics. The analysis examines how these patterns of instability are distributed across schools according to their social composition and students' level of vulnerability, thereby enabling the identification of schools facing significant challenges in retaining teachers. The research findings capture prolonged trajectories of disadvantage experienced by schools, most of which are concentrated in the lower percentiles, and provide new evidence on how the persistence of teacher turnover in contexts of social vulnerability constrains these schools' capacity to consolidate qualified and stable teaching staff, thereby reinforcing patterns of teacher stratification and contributing to the reproduction of educational inequalities in contexts of school segregation.

HOMOGENEOUS EDUCATIONAL ENVIRONMENTS DESPITE 'FREE' SCHOOL CHOICE – THE INFLUENCE OF SCHOOL ADMISSION POLICIES ON THE CREATION OF SEGREGATED SCHOOLS IN HAMBURG

Lea Wistuba (University of Siegen, Germany)

social inequality | educational policy | school segregation

Despite various reform efforts, social background still has a strong influence on a child's educational opportunities in Germany (Busemeyer et al., 2023; OECD, 2023; Scharf et al., 2020). So far, little is paid to the institutional mechanisms that (re)produce inequalities in the everyday structures and practices of the school system. Organizational regulations enshrined in legal and administrative documents can create differentiation processes that systematically disadvantage certain groups of students and perpetuate existing disparities (Böhmer, 2025). One theoretical perspective that has only been used sporadically to date but offers great analytical potential for investigating such mechanisms is the concept of space as a product of social action (Kessl et al., 2016; Löw & Sturm, 2019; Riveros & Nyereyemhuka, 2023). In Germany, the transition from primary to secondary school represents a decisive moment for the emergence of social inequality and manifests itself in segregated school landscapes – especially in large agglomerations such as Hamburg (Fernandez & Zehetner, 2025; Racherbäumer & Bremm, 2021; Stočić, 2015). The school policy of parental choice, according to which parents can freely choose their children's school regardless of their place of residence, could contribute to reducing such inequalities. Nevertheless, secondary school types – in Hamburg, from grade 5 onwards, a distinction is made between two types of general education schools with different graduation options – are distributed in a striking manner depending on the socioeconomic status of the social environment. This article addresses a gap in research by focusing on the institutional framework conditions that create socially unequal (educational) spaces (Fernandez & Zehetner, 2025), shifting attention away from individual actors, such as parents or students towards the actions of educational policy actors. The analysis focuses on the question of what influence the right to free school choice has or may have on the socio-spatial distribution of students across different types of secondary schools. Methodologically, the article combines a policy-analytical evaluation of the legal basis for parental choice in Hamburg with a socio-spatial analysis of the school structure. Hamburg is suitable for this, as the city publishes data on schools in the Regional Education Atlas (https://geoportal-hamburg.de/bildungsatlas/) and status indices for social spaces in the annual Social Monitor (BSW Hamburg, 2024) on a small scale, even within district boundaries. In addition, each school in Hamburg is assigned a school social index, which allows conclusions to be drawn about the social composition of the students. These data sets make it possible to examine the distribution of school types and their embedding in different socio-spatial contexts and to discuss the effectiveness of parental choice. A particular focus is placed on the west and southeast of Hamburg, where extreme socioeconomic differences between residents are visible despite short geographical distance. By analysing the interplay of institutional regulations, socio-spatial structure, and school type distribution, it highlights the possibilities and limitations of individual freedom of choice in a socially unequal urban context and how spaces are (re)produced through social actions thus contributes to the debate on the role of school policy control instruments in the reproduction of inequalities.

WHEN DISADVANTAGE CONCENTRATES: STUDENTS' ACHIEVEMENTS, TEACHING PRACTICES, AND SEGREGATION DYNAMICS IN MILAN

Andrea Parma (Politecnico di Milano, Italy) · **Giulia Marroccoli** (Politecnico di Milano, Italy)

school segregation | achievements | milano

The literature on the consequences of school composition has a long tradition, particularly in Anglo-Saxon contexts, and one of the main strands of research has focused on its impact on students' learning outcomes. However, the dynamics underlying the effects of segregation on school performance and levels of learning remain complex (Baysu and de Valk 2012; Dronkers et al. 2011). Several factors may be involved, including peer-group influence, teaching practices, and management processes related to school organization (van Ewijk et al. 2010; Thrupp and Lauder 2006). Most existing research focuses on the role of peers (Borgen 2023; Caponera and Losito 2016), but teachers and class organization may be equally important in shaping the consequences of segregation. Teachers may respond to the composition of the student intake by reallocating time, adapting the pace of instruction, and adjusting expectations (Boone et al. 2018; Kalogrides et al. 2013). With regard to school organization, relevant dynamics include teacher recruitment, retention, and turnover; the quality and experience of the teaching staff; the curricular offer; the educational framework; and the working climate (van Ewijk et al. 2010; Scafidi et al. 2007). Focusing on the case of Milan, this contribution has two main aims. First, it examines the extent to which the socio-economic and ethnic composition of classes affects students' achievement in standardized tests in Reading and Mathematics. Drawing on INVALSI microdata for Grade 8 students, this statistical analysis shows that the concentration of disadvantaged students – particularly those from low socio-economic and/or migrant backgrounds - is associated with lower performance, above and beyond the effect of individual characteristics, including prior achievement. However, such analysis alone does not fully capture the mechanisms through which class composition affects learning outcomes. Hence, the contribution draws also on qualitative research conducted in two lower secondary schools in peripheral areas of Milan. Data are based on interviews with teachers and principals and explore the challenges associated with managing particularly complex classes where multiple forms of disadvantage tend to concentrate. Schools report a growing presence of students with specific learning needs, which adds to the newly arrived migrant students and students with migrant background. This results in classrooms characterized by multiple and heterogeneous educational needs, requiring different forms of pedagogical support and attention. Teachers describe how this complexity often constrains teaching practices, limiting the range of strategies they can effectively implement and reducing the time available for curriculum development and deeper learning activities. As a consequence, the overall pace of instruction may slow down, potentially affecting the learning opportunities of the entire class. These processes may also have broader implications. The concentration of disadvantages can negatively affect the reputation of schools, contributing to processes of stigmatization. In turn, this may encourage avoidance behaviors among middle-class families, who may opt for other schools or for more selective curricular tracks within the same school, such as music programs, where students with more favorable socio-economic backgrounds tend to concentrate. These dynamics may further reinforce both territorial and within-school segregation, contributing to the reproduction of educational inequalities.

school effects | socio-economic composition | systematic literature review

A considerable body of scientific research has taken shape in recent years that examines how schools influence educational outcomes, against the backdrop of residential segregation, social inequalities, family preferences and individual attributes. This research explores the effects of socio-economic composition, ethnic composition, endogenous peer influence, school climate, the characteristics of teachers and other factors that are believed to influence educational outcomes. This field of inquiry often uses state-of-the-art methodological tools and statistical models to identify aggregate-level and interaction effects, yielding scientific advances with policy implications. The study of school/contextual effects has also become a fruitful area of multidisciplinary research, with debates taking place between sociologists, economists, statisticians, geographers, demographers and education researchers. It is arguably an appropriate time to take stock of these developments and to summarise the results of this research. In this paper, we present the results of a systematic literature review which synthesises the scientific literature of the past decade, with reference to schools in Europe, USA, Canada and Australia. This enables us to go considerably beyond all existing reviews, which are much more limited in scale and scope. Eligibility was confined to studies examining the relationship between the socio-economic or the ethnic composition of schools or classrooms, on the one hand, and either academic performance or choice of upper secondary school, on the other. A four-concept search strategy was used to search Scopus, Web of Science, ProQuest, EBSCO, Google Scholar and Semantic Scholar, including both quantitative and qualitative studies. The first concept identifies the context (secondary schools), while the second confines the search to studies which focus on school composition; the third describes the specific form of composition (socio-economic or ethnic) and the fourth captures the main outcome variable (performance or choice of upper secondary school). The resulting 12,462 records were subjected to rapid screening in order to exclude obviously ineligible studies, and the remaining 6,519 publications were blind screened in parallel on title and abstract by at least two researchers using the Rayyan software system, and any relevant documents were then screened on their full text. Disagreements were resolved through discussion, based on a close examination of the records in question. We then carried out data extraction and constructed a data extraction sheet which summarises the key characteristics of the 232 studies identified as relevant. A narrative synthesis of the research results was completed, summarising the principal findings of the included studies using headings developed from the thematic analysis of eligible research reports.

Schools as Democratic Territories: Spatial Justice, Participation and Co-Governance Across the Whole School-Building Process

PANEL CONVENORS: Petra Regina Moog (Sophia::Academy, Germany)

PANEL KEYWORDS: Spatial Justice, Participatory School Design, Learning Environments

School buildings are not merely infrastructures; they are public democratic spaces in which power relations, participation opportunities and everyday forms of living together become visible and negotiable. This panel explores how Spatial Justice (Soja, 2010), Democratic Co-Governance (Mouffe, 2013; Biesta, 2022) and participatory school development can be meaningfully integrated across the entire school-building process, from early visioning and needs assessment through design negotiations, implementation and post-occupancy evaluation. The central question is: How can learning environments be shaped so that they do not merely reflect democratic culture, but actively enable it? International research demonstrates that belonging, agency, social safety and spatial usability do not emerge as side effects of architecture. Instead, they result from intentional socio-spatial decisions. Studies from Scandinavian and British contexts (Woolner 2015; Sigurðardóttir 2020; Dovey and Fisher 2014) show that democratic spaces arise when spatial design and social practices are negotiated together at an early stage, and when learners, teachers and educational teams are recognised as legitimate co-designers of their environments. The panel welcomes contributions that analyse co-governance models in school-building processes; provide empirical evidence of how students and staff act as democratic agents in shaping educational spaces; formulate spatial-justice criteria for learning environments; or conceptualise pedagogical interior architecture as a democratic practice that fosters equity, participation and collective responsibility. The aim is to initiate a European dialogue on how schools can become democratic territories—places in which spatial justice and lived democracy converge in everyday educational life.

LEARNING DEMOCRACY BY SHAPING SPACE: CHILDREN'S CO-CREATION AND COLLECTIVE DECISION-MAKING IN A PRIMARY SCHOOL

Petra Regina Moog (Sophia::Academy, Duesseldorf, Germany) · **Evelyn Burchhart** (Familengrundschulzentrum Sonnenstrasse, Duesseldorf, Germany) · **Sandra Mantica** (Familengrundschulzentrum Sonnenstrasse, Duesseldorf, Germany) · **Ines Agel** (Familengrundschulzentrum Sonnenstrasse, Duesseldorf, Germany) · **Kornelius Knettel** (Familengrundschulzentrum Sonnenstrasse, Duesseldorf, Germany)

Democratic participation · Educational architecture · Spatial justice

Democratic learning in schools does not only take place through formal curricula or participatory structures, but emerges through everyday practices in which power, voice and responsibility are negotiated. This paper examines how democratic competencies and participatory cultures can emerge when children are not only consulted but actively involved in decision-making processes concerning their school environment. It presents an exploratory practice-based study conducted in a primary school in Düsseldorf located in a socially and structurally challenging context, where questions of voice, recognition and shared responsibility are particularly significant. Over a period of 32 weeks, a mixed-age group of 14 pupils (Grades 1 to 4) participated a non-instructional project format in which every Friday three hours were reserved for self-chosen, collaborative inquiry (Rasfeld, 2019). Within this framework, children investigated their school as a shared democratic space. Democracy was not addressed as a curricular topic, but as a lived practice enacted through observation, discussion, negotiation and collective decision-making. The pupils analysed everyday spatial experiences of wellbeing, exclusion and belonging and developed proposals for change. Participation deliberately extended beyond the project group. Based on questionnaires and spatial analyses developed with the children, the entire school community of approximately 320 pupils was involved in reflecting on school spaces, preferred atmospheres and needs. The project group acted as representatives and mediators, collecting, analysing and communicating the perspectives of their peers. Central democratic decisions were made collaboratively, including the selection of colours, furniture and spatial arrangements for shared school spaces. A key moment in the process was the participation of the pupils in a study visit to the Didacta fair, one of the largest educational trade fairs in Europe. There, the children discussed spatial concepts directly with architects and furniture manufacturers and compared professional design approaches with their own analyses. Drawing on the results of the school-wide survey, they took part in collective decision-making about which furniture and design elements would ultimately be purchased and implemented. This step marked a shift from consultation to shared

responsibility for concrete outcomes. Methodologically, the study combines participatory spatial inquiry, pedagogical interior architecture and Post-Occupancy Evaluation with child-centred questionnaires, spatial mapping, photographic documentation, reflective diaries, focus groups and interviews. The participatory design of the process was informed by insights from the Erasmus+ project CLEAR on learning environments. The analytical framework further draws on theories of democratic education and participation (Biesta, 2022), spatial justice (Soja, 2010) and socio-spatial agency (Dovey & Fisher, 2014), as well as research on participatory school environments (Woolner, 2015; Sigurðardóttir, 2020). The findings show that being listened to, taken seriously and entrusted with real decisions strengthened pupils' sense of self-efficacy and transformed patterns of acceptance within the school community. The paper argues that participatory engagement with school space can function as a powerful form of democratic education, demonstrating that even young children are capable of informed, collective decision-making. It contributes to Scuola Democratica debates by illustrating how democracy can be learned and practised through the shared shaping of everyday environments, fostering a future-oriented school culture grounded in participation, spatial justice and collective care.

DEMOCRATIC TERRITORIES ARE MADE, NOT GIVEN – PEDAGOGICAL INTERIOR ARCHITECTURE IN EDUCATIONAL SPACES

René Pier (ECIA/ SCHIENBEIN PIER PARTG MBB INNENARCHITEKTEN, Germany) · **Petra Regina Moog** (Sophia::Academy, Germany)

Pedagogical Interior Architecture | Spacial Justice | Everyday Democratic Practice

School buildings function as public spaces in which participation, access and everyday forms of democratic practice are materially shaped. From a spatial justice perspective, educational environments can be understood as democratic territories in which freedoms are unevenly distributed and continuously renegotiated (Soja, 2010). While research on learning environments has often focused on architectural typologies or degrees of openness, this paper shifts attention to small-scale spatial interventions that structure everyday use, interaction and decision-making, drawing on understandings of educational space as a socio-spatial assemblage rather than a fixed architectural form (Dovey & Fisher, 2014). The paper draws on two qualitative case studies from different educational contexts: a primary school participating in the German Startchancen programme and an adult education centre (Volkshochschule) located in a listed historic building in Hamburg. Although differing in age groups, institutional logics and architectural conditions, both cases reveal how spatial micro-infrastructures shape democratic practices in everyday educational life. The analysis is informed by approaches from pedagogical interior architecture and is based on qualitative documentation of spatial transformations, user feedback and observed patterns of spatial appropriation. In the primary school case, four previously underused rooms were transformed into differentiated learning environments, including a storytelling space, an experimental research room, a construction and movement space, and a flexible makerspace. These spatial changes resulted in a redistribution of everyday freedoms, conceptualised by the school as a freedom matrix that differentiates where, how and with whom learning can take place. Rather than prescribing behaviour, the spaces enabled pupils and teachers to negotiate learning situations, responsibilities and supervision in practice. Democratic action emerged through everyday decisions about use, access and movement within the school. The adult education case in Hamburg focuses on spatial micro-infrastructures such as accessible drinking-water points, informal meeting niches and reprogrammed circulation areas. In a context characterised by voluntary participation and diverse user groups, these elements function as low-threshold spaces of encounter and self-organisation. They support informal interaction, collective responsibility and negotiated use without

requiring formal participation structures. The democratic quality of these spaces lies in their capacity to invite appropriation and shared use across institutional roles. Across both cases, the findings suggest that democracy in educational spaces is not primarily produced through architectural openness or formal participation formats, but through spatially distributed micro-infrastructures that enable everyday negotiation. These elements create conditions for agency, accessibility and shared responsibility by embedding democratic possibilities into routine practices. Educational spaces thus become democratic territories not through symbolic design gestures, but through spatial arrangements that make everyday decision-making, encounter and co-presence possible. By foregrounding spatial micro-infrastructures as democratic enablers, the paper contributes to debates on spatial justice and co-governance in school-building processes and argues for a shift from large-scale architectural concepts to the socio-spatial effects of small, distributed intervention.

SCHOOL BUILDING AS DEMOCRATIC GOVERNANCE: A MULTI-ACTOR FRAMEWORK FOR PARTICIPATORY EDUCATIONAL SPACE

Nicole Wentzel (Gebaeudemanagement der Stadt Wuppertal, Germany) · **Teun van Wijk** (ICS Adviseurs, The Netherlands) · **Petra Regina Moog** (Sophia::Akademie, Germany)

democratic governance | participation | school development

School building processes are typically organised as linear, technical and administrative procedures, while schools themselves function as complex democratic institutions. This paper addresses this structural tension by reframing school construction and transformation as a form of democratic governance rather than a purely instrumental planning task. Following Lefebvre's understanding of space as socially produced (Lefebvre, 1991), educational buildings are conceptualised as outcomes of negotiated social practices rather than neutral containers. The theoretical framework combines perspectives from democratic participation (Arnstein, 1969), spatial justice (Soja, 2010) and school development theory (Biesta, 2011; Fielding, 2012). Participation is not treated as a single event but as a continuous relational practice embedded in institutional decision-making. From this perspective, school building becomes a pedagogical and political process in which power, knowledge and responsibility are distributed unevenly across actors and phases. Empirically, the paper draws on an ongoing European practice-based research project that developed a visual school building compass (CLEAR, 2025). Using co-creation workshops as a design-research method (Sanoff, 2007), practitioners and researchers jointly mapped actor-specific process lines—such as school leadership, students, school authorities and external partners—across the full lifecycle of a school building, from early needs assessment (Phase 0) to long-term use and evaluation (Phase 10). A metro-map metaphor was used to visualise simultaneity, intersections and temporal asymmetries between actors. The findings reveal that dominant linear planning models obscure the fact that actors operate with different temporal logics and degrees of agency. A comparative focus on Germany and the Netherlands illustrates how participation cultures shape these dynamics. While student participation in Germany is often limited to early consultation and post-occupancy feedback, Dutch practices more frequently integrate students through continuous information, reflection and contextualised engagement during planning and construction. These practices align with Fielding's concept of democratic partnership, emphasising understanding and agency rather than constant co-decision (Fielding, 2012). The paper argues that continuous intelligibility of processes—rather than maximal participation—supports democratic competence, spatial literacy and institutional trust (Biesta, 2011). By foregrounding participation as an infrastructural condition of governance, the proposed compass offers a transferable analytical and practical tool. It contributes to debates on democratic education by demonstrating how spatial transformation processes can actively cultivate democratic culture within and beyond schools.

EDUGREEN FURNISHINGS: INTEGRATING PLANTS INTO EDUCATIONAL ENVIRONMENTS

Beate Christine Weyland (Free University of Bolzano, Italy)

Indoor plants | Learning landscapes | Well-being

This contribution presents the results of a research project commissioned by GAM Gonzagarredi Montessori and conducted by the EDENLAB research laboratory of the Faculty of Education at the Free University of Bozen-Bolzano between 2022 and 2024. The study investigates the educational, aesthetic, and inclusive potential of the Edugreen furnishing line, specifically designed to support the structured introduction of indoor plants in educational settings. While previous research has documented the positive effects of indoor greenery on students' well-being, stress reduction, and cognitive performance (Han, 2009; Li & Sullivan, 2016; Lindemann-Matthies et al., 2021; Meng et al., 2023), limited attention has been paid to how purpose-designed furniture can mediate the pedagogical integration of plants across different school contexts. The project is grounded in a theoretical framework that combines environmental psychology, ecological education, and inclusive design. Plants are conceived as "didactic mediators" (Weyland & Boaretto, 2022), capable of fostering ecological awareness, responsibility, and care practices. In line with the idea of architecture as pedagogy (Orr, 1993) and with the concept of schools as dwelling spaces for living and learning (Weyland & Sigillo, 2025), the introduction of plants contributes to shaping the school as a learning landscape in which space actively participates in knowledge construction. Moreover, understanding the school as public space in action (Viteritti & Weyland, 2026) highlights how spatial quality is co-constructed through daily practices, material arrangements, and shared responsibility. The research adopts principles of Universal Design and Universal Design for Learning (Mace et al., 1996; CAST, 2024), ensuring accessibility, flexibility, autonomy, and legibility for all users, consistent with inclusive education perspectives (Booth & Ainscow, 2014) and the ICF framework (WHO, 2001). Methodologically, the study follows a qualitative multi-site research design combining experimentation and observation across educational levels. In the Faculty of Education, Edugreen prototypes were installed in two classrooms and common areas, transforming them into experimental green learning environments. University students participated through a Photovoice methodology (Santinello et al., 2022), documenting and reflecting on their experiences via a digital Padlet ("My Green University"). In parallel, an action-research process was conducted at the Monini kindergarten (Umbertide, Italy), where two classrooms were newly equipped with Edugreen furnishings as part of a broader pedagogical reorganization explicitly centered on plant-based interaction. Teachers used structured observation grids assessing functional qualities (e.g., modularity, ergonomics, durability) and aesthetic-pedagogical dimensions (e.g., creativity, sociality, interdisciplinarity, physical participation), complemented by open-ended reflections. Data were analyzed through qualitative content analysis (Krippendorff, 2022). The cross-context experimentation demonstrates the adaptability of the furniture to diverse age groups and pedagogical practices. Modularity and mobility facilitate flexible spatial configurations and plant exposure. Vertical structures support observation of plant growth and responsibility routines. The "little house" element functions as a multifunctional micro-environment for rest, dialogue, reading, and imaginative play. Across settings, participants reported enhanced environmental quality and stronger engagement with sustainability-related themes. The findings confirm that the experimentally monitored introduction of plants, supported by inclusive furnishings, enhances aesthetic quality, perceived well-being, and ecological competences, enabling schools to act as living laboratories of sustainability, care, and shared responsibility.

POST-OCCUPANCY EVALUATION FOR LEARNING ENVIRONMENTS (POELE): A FORMATIVE ASSESSMENT TOOL

Michelle Dumont Laux (PH Freiburg, Germany) · **Florian Schuberth** (TU Twente, The Netherlands) · **Kai Schuster** (University of Applied Science Darmstadt) · **Maik Beege** (PH Freiburg, Germany)

Post-Occupancy Evaluation | School | Architecture

Discussion on the subject of how to design an optimal learning environment has always reflected constantly changing educational, social, and technological circumstances, and it continues to do so. Despite being a small field of research, it has attracted attention since its origins in the 19th century (Renz, 2016). However, particularly in the past decade, this state of upheaval in school construction not only intensifies the interest in research but also (re-)vitalize planning processes through participation procedures. As an integral part of democracy, participation plays a key role in shaping educational spaces. Just as users can be involved conceptually at the beginning of a construction project, participation is also possible after a school building has been inhabited. This method of Post-Occupancy Evaluation (POE) was defined by Preiser et al. (1988, p. 3) as ''a process of systematically evaluating the performance of buildings after they have been built and occupied for some time''. It aims to improve the fit between users and their buildings (Zimmerman & Martin, 2001). The aim of this work was to develop a empirically tested method for evaluating school buildings (with the aim of improving them). Building on existing post-occupancy evaluation methods (e.g. Cleveland et al., 2016), it is carried out using the data-driven index creation MARI method (Fluck & Lichtenberg, 2021). The benefits of such formative models are still largely unknown in the social sciences and therefore underestimated (Fluck & Lichtenberg, 2021; Jarvis, MacKenzie & Podsakoff, 2003). Testing at six schools with a total of more than 700 students (aged 11 to 19), has shown that the questionnaire could be further developed: Among other things, it is still too complex and should therefore be simplified, especially for younger students. Overall, however, this Post-Occupancy Evaluation for Learning Environments (POELE) proves to be a robust testing tool that provides a sound basis for the comprehensive assessment of school buildings.

THE EPISTEMIC SCHOOL: EDUCATIONAL ARCHITECTURE AS DEMOCRATIC KNOWLEDGE INFRASTRUCTURE IN THE ALGORITHMIC AGE

Karl-Heinz Machat (Architectural Faculty, University of Innsbruck, Austria) · **Heike Bablick** (Architectural Faculty, University of Innsbruck, Austria)

epistemic school | educational architecture | spatial infrastructures

Democratic societies rely on shared epistemic infrastructures through which citizens can evaluate evidence, interpret knowledge claims, and participate in collective deliberation. Public reasoning in elections, policy debates, and civic decision-making depends upon institutional environments that stabilize norms of evidence, credibility, and argumentation (Habermas, 1996; Dewey, 1916). Historically, educational institutions—particularly schools, libraries, laboratories, and archives—functioned as core components of this democratic epistemic architecture. These environments cultivated not only cognitive competencies but also material practices of inquiry through which knowledge could be publicly encountered, scrutinized, and debated (Freire, 1970). However, contemporary informational ecosystems are increasingly structured by algorithmically mediated media systems. Social media platforms, search engines, and artificial intelligence infrastructures shape the circulation of knowledge through computational systems that rank, recommend, and personalize information flows (Gillespie, 2014). While these technologies expand access to information, they also introduce new epistemic challenges. Algorithmic amplification can accelerate the diffusion of misinformation across networked communication environments (Vosoughi, Roy, & Aral, 2018), while personalization mechanisms fragment shared informational contexts that historically supported democratic deliberation (Sunstein, 2018; Pariser, 2011). At the same time, the economic logics of platform capitalism prioritize engagement and behavioral prediction over epistemic reliability, transforming information environments into systems optimized for attention extraction (Zuboff, 2019). These developments contribute to what may be described as algorithmic epistemology, in which the circulation and interpretation of knowledge are increasingly governed by opaque computational infrastructures rather than institutional processes of verification. Parallel transformations are occurring within educational environments themselves. The increasing digitization of education has reduced the material presence of traditional knowledge infrastructures such as libraries, archives, and collections of demonstrative objects. Although digital technologies broaden access to information, they can also weaken the spatial and institutional environments through which knowledge becomes socially visible and collectively interpretable. This article argues that educational architecture plays a critical but underexamined role in sustaining democratic epistemology. Drawing on democratic theory, media studies, science and technology studies, and architectural theory, the article proposes Epistemic Infrastructure Theory, which conceptualizes educational environments as spatial systems that stabilize democratic knowledge practices. Institutional architectures shape patterns of attention, interaction, and authority, thereby influencing how knowledge claims are encountered and evaluated (Foucault, 1977; Koolhaas, 1995; Lefebvre, 1991). To explore this argument, the article introduces a speculative architectural model: the Epistemic School. The Epistemic School conceptualizes educational buildings as spatial infrastructures designed to support democratic knowledge production. Rather than treating libraries, classrooms, laboratories, and digital systems as separate functions, the model integrates them into a distributed epistemic landscape composed of knowledge commons, algorithm observatories, evidence forums, and research laboratories. Within this framework, architecture functions as a visible interface through which students encounter not only information but also the processes through which knowledge is produced, validated, and debated. By re-materializing epistemic infrastructures within educational environments, the Epistemic School seeks to strengthen the cognitive and institutional capacities necessary for democratic participation in algorithmically mediated societies. In doing so, the article reframes educational architecture as a crucial component of democratic knowledge systems in the digital age.

SPACE AS STUDIO: EXPERIMENTAL ARCHITECTURE, BIOPHILIC INFRASTRUCTURES, AND OBJECT-RICH DISPLAYS TO CATALYZE PEDAGOGICAL EXPERIMENTATION IN TEACHER EDUCATION

Heike Bablick (University Innsbruck, Austria) · **Karl-Heinz Machat** (University Innsbruck, Austria)

experimental architecture | teacher education labs | active learning

Preparing teachers for complex, collaborative practice requires environments that render teaching and learning visible, improvable, and collectively owned. Research shows spatial configuration shapes encounter and co-presence (Hillier & Hanson, 1984; Gehl, 2011) and that active, dialogic pedagogies improve outcomes (Freeman et al., 2014; Baepler, Walker, & Driessen, 2014). Grounded in progressive and situated learning traditions—experience, participation, and iterative design (Dewey, 1938; Lave & Wenger, 1991; Brown & Duguid, 1991)—this contribution presents a deployable framework that uses experimental architecture, biophilic infrastructures, and curated objects/displays to catalyze pedagogical experimentation in teacher and pedagogue education. We operationalize six principles. 1) Visibility with care—curated transparency (glazing, permeable screens, writable surfaces) makes processes observable while protecting privacy and psychological safety, aligning with evidence on space, movement, and co-presence. Documentation walls and "learning galleries" situate the environment as a third teacher (Malaguzzi, 1998). 2) Adaptability via a kit-of-parts—mobile partitions, lightweight furniture, and infrastructural spines enable sub-hour transitions across seminar, studio, micro-teaching, critique, and gallery modes (Hertzberger, 2008; Nair & Fielding, 2005; Oblinger, 2006). 3) Embedded capture and feedback—discreet audio/video with clip marking and annotation stations support high-impact, evidence-informed debriefs (Hattie, 2009). 4) Activity zoning and acoustic ecology—differentiated zones (quiet nooks, open studios, coaching alcoves) and treatments sustain parallel activities without interference (Fisher, 2005; OECD, 2017). 5) Governance as pedagogy—daily stand-ups, rotating stewardship, and equitable booking democratize space use and build professional agency (Stoll et al., 2006; Biesta, 2010). 6) Biophilic and green infrastructures—courtyards, planted atria, and indoor biophilia provide restorative, instruction-ready spaces linked to attention and stress recovery (Kuhnert & Ngo, 2022), implemented via evidence-informed patterns (Browning, Ryan, & Clancy, 2014) with inclusive planting and IAQ safeguards (Wells, 2000). Objects and Displays as Pedagogical Mediators: Tangible artifacts function as cognitive and boundary objects that anchor abstract ideas and bridge communities (Norman, 1991). Process boards, exemplars, and visible rubrics support metacognition and assessment for learning, augmented with scannable links to micro-video and portfolios (Ritchhart, Church, & Morrison, 2011). Implementation: A living-lab model progresses from a minimal viable studio through co-design sprints that generate and test "pattern cards," scaling into a program-wide pattern language and cyclical reviews (Sanders & Stappers, 2008; Mulgan, 2014; Kolb, 1984). Inside–outside gradients prioritize outdoor classrooms and green courtyards as first-class learning zones. Evaluation and Ethics: Mixed methods triangulate space-use analytics (heat maps, dwell times, setup/reconfiguration metrics), interaction analysis (turn-taking, wait time, proximity networks), and indicators of professional growth (self-efficacy, feedback literacy, authentic performance), interpreted via theory-informed rubrics to avoid simplistic "furniture effects" (Jamieson, 2003; Imms, Cleveland, & Fisher, 2016). Universal design ensures accessibility and sensory wellbeing (Meyer, Rose, & Gordon, 2014). Significance: The model aligns architectural and educational logics under a shared ethos of inquiry, offering a portable blueprint—principles, patterns, workflows, and evaluation instruments—adaptable to diverse contexts and resources. By making space, green infrastructure, and curated objects/displays central to practice and reflection, teacher education becomes continuous design research, fostering equitable participation, attention restoration, and feedback-rich cultures.

The Encounter Between Educational Institutions and Families in the 21st century: Educational Inequalities, New Conflicts and Social Changes

PANEL CONVENORS: Géraldine André (UCLouvain Belgique, Belgium); Andrew Crosby (UCLouvain Belgique, Belgium); Mervé Ozden (UCLouvain Belgique, Belgium)

PANEL KEYWORDS: social conflicts, educational inequalities, conflict theories

Despite the democratic ideal of equal opportunities that motivated post-war European educational reforms and the rise of new pedagogies, social inequalities persisted, resulting in waves of massification. In fact, as analysed by conflict theorists (Bourdieu & Passeron 1964, 1970; Bernstein 1971), the school transforms social inequalities into educational ones by dissimulating the affinities of the implicit norms of educational methods with the capitals and codes of middle- and upper-class families and, as well as their divergence with lower-class family socialization. Likewise, while the contemporary increased diversity of the school population indicates greater opportunities for social groups that were previously invisible, inequalities and discrimination based on migration, gender, sexuality, non-traditional family structures, ableism, etc., remain widespread. To what extent do educational institutions promote educational codes and culture that diverge from the socialization of students from these diverse backgrounds? How do these students and their families navigate the school system? Furthermore, if modelled upon the codes and capitals of dominant social groups, the diversification of educational methods, driven by the rise of new technologies, artificial intelligence, and inclusive pedagogies, potentially widens the gap between institutions and students from the most diverse social backgrounds. This panel explores how encounters between educational institutions and different forms of socialization reproduce or challenge inequalities, whether based on class, gender, migration, ableism etc. The panel welcomes both empirical and theoretical contributions that address all stages of educational processes, and that incorporate conflict theories alongside other critical perspectives, such as feminist, queer, postcolonial, and intersectional approaches.

‘PRESSURE FROM ABOVE’ AND PROBLEMATISATIONS OF PUPILS AND THEIR FAMILIES AS DISRUPTIVE FOR EQUAL ACCESS TO EDUCATIONAL SUPPORT AND DRIVING NEW EDUCATIONAL INEQUALITIES

Carlos Rojas (Stockholm University, Sweden)

equity | educational support | foucault

Regardless of what labels are put on them, every school in every society has pupils who do not adjust with the realities of the school and the education system. Educational support is a general response to this, as purposeful for equity in education. As such, it is moreover defined as key for sustainable education (Van der Branden, 2012; Bunar et al., 2021). According to the Swedish School Inspectorate (2024) and the Swedish Teachers’ Union (2024), most pupils are provided educational support when in need of it, but as many as a third are not. Based on field work comprising interviews with 118 educational professionals, pupils and their families, the present study contributes to both scholars and practitioners with a Foucauldian inquiry on power dynamics influencing the provision of educational support in the Swedish education system. Holding provision of educational support as object of study, the object of knowledge is the power dynamics and processes involved in the provision. The empirical data consists of material gathered in three distinct data collections in nine Swedish municipalities and their corresponding LEAs and schools. An initial content analysis (Krippendorff, 2013: 355ff), of policy documents and plans on educational support, was followed by interviews with heads of LEA and principals in the same municipalities. Two lower secondary schools were thereafter entered for an extensive field work during three semesters, holding an ethnographic approach (Hammersley & Atkinson, 2019: 102f). It included observations of classes as well as other domains of everyday life at schools, and interviews with pupils, parents, teachers, special educators, and other school personnel. The empirical data has been analysed informed by the theoretical realm of Foucault (1972/2002; 1980; 1988), making visible power dynamics involved in and influencing on the provision of educational support. A heavy accountability structure (Bergh, 2015) exerting ‘pressure from above’ on teachers and other school personnel, lead to problematising (Foucault, 1988: 257) school failures in ways that deflect responsibility from these and to the pupils and their families. Provision of educational support is moreover influenced by risks of being held accountable for school failure, making this a priority and reducing the priority of supporting pupils at par with their needs. Discourses and constructions of social change and of ‘Other’ families and pupils who ‘don’t give a damn’, become pur-

poseful for school personnel experiencing time poverty, as to prioritise provision of educational support based on moralising judgements and medical diagnosis, instead of based on pupils' needs. When such judgements are more prevalent regarding social groups already experiencing more vulnerable situations, the waiving of educational support compounds vulnerability, further distorting academic careers of the pupils and increasing educational inequalities.

INTERSECTIONAL INEQUALITY REGIMES AND REASONABLE ACCOMMODATIONS: FAMILY PRESUPPOSITIONS AND SPECIAL EDUCATION PATHWAYS IN FRENCH-SPEAKING BELGIUM

Mervé Ozden (UCLouvain, Belgium)

Inequality regimes | Inclusion reforms | School-family relationship

In French-speaking Belgium, the educational system is transitioning from a segregated model for students with special educational needs towards a more inclusive one, notably through the 2018 decree on reasonable accommodations. Despite this reform, which aims to promote inclusion, specialized education pathways continue to see an overrepresentation of boys from disadvantaged and immigrant backgrounds. This research, therefore, investigates how an instrument designed for inclusion can paradoxically reinforce pre-existing social inequalities. Adopting an intersectional framework based on the concept of "inequality regimes" (Acker, 2006), this study analyzes how schools' categorizations of pupils and their families shape access to reasonable accommodations versus pathways into special education. The research unfolds in two qualitative phases. The first phase, consisting of 22 semi-structured interviews with primary school principals in Brussels, reveals that institutional presuppositions regarding families' resources, reliability, and perceived "compatibility" with school norms are pivotal in how the legal framework is applied. The second phase deepens this analysis through a multi-sited, multi-actor study in five socio-economically diverse schools. It combines detailed reconstructions of pupils' trajectories with in-depth interviews with both teachers and parents. This approach allows for a granular examination of how intersectional categorizations (class, race, gender, etc.) inform the concrete implementation of reasonable accommodations and how families perceive, negotiate, or contest the school's decisions. By focusing on the encounter between educational institutions and diverse family socializations, this paper demonstrates how an inclusive instrument can, in practice, transform social inequalities into educational ones. It also sheds light on the agency of families as they resist or partially reconfigure institutional expectations, offering a critical perspective on the complex realities of inclusive reform.

EDUCATIONAL INEQUALITIES AND PRECARIOUS MIGRATORY STATUS

Andrew Crosby (Université catholique de Louvain, Belgium) · **Mohamed Youjil Chaouki** (Université catholique de Louvain, Belgium)

educational inequalities | migration studies | socialisation

Educational inequalities related to migration have long been analysed through the bourdieusian lens of reproduction (Bourdieu and Passeron 1964, 1970). Children of migrants were considered working-class children. In fact, when controlling for socio-economic status, it was argued they outperformed their native peers (Vallet & Caille 1996). The latest PISA report (OCDE 2025) confirms this general trend at the level of OCDE average. However, when disaggregated, this finding does not hold for all countries (OCDE 2025, Agirdag 2020). As argued by Ichou (2018), speaking of "foreigners" or "immigrants", is essentializing and homogenizing practice, which conflates very different migratory trajectories and experiences. As such, he argues one must consider the premigratory status of families to grasp their subjective social position, which accounts better for their cultural capital. As such, Ichou shed light on the importance of migrant selectivity in educational inequalities. Against this background, the absent research on the impact of precarious migratory statuses in Europe stands in contrasts with research on irregular latino/as in the US (Bernal-Areval et al. 2021). This gap constitutes a conspicuous epistemological blind spot in educational sociology considering how migration policies have become ever more restrictive, leading to a variety of precarious migratory statuses (de Haas, Natter & Vezzoli 2016). This presentation aims to start filling this gap through a first, tentative, systematic review of the literature. Crossing a bourdieusian lens with migration studies, it first seeks to understand what the different experiences are of pupils with precarious migratory status (asylum seekers, undocumented, refugees), how this affects their socialisation, and how the school is blind for it and devalues it. It then asks, to what extent the school's blindness for these different forms of socialisation potentially reproduces the border and as such acts an institution of border control. The conclusions are intended to guide future research.

THE CLASH BETWEEN SCHOOL FIELD AND YOUNG PEOPLE'S DIGITAL SKILLS FROM WORKING-CLASS FAMILIES SOME CONCEPTUAL REFINEMENTS OF BOURDIEUSIAN THEORY

Géraldine André (UCLouvain Belgique, Belgium)

Digital educational inequality | working class youth digital practices | Bourdieusian Theory

Building on empirical findings from an extended ethnography of school-to-work transitions among working-class youth in Brussels (Belgium), this paper aims to develop an appropriate theoretical framework and methodology to advance the study of digital skills among lower-income youth and, more broadly, educational inequalities in the context of increasing digitalization in education. Digital divides mirror wider patterns of social inequality. Access to hardware, information, services, and the development and possession of digital skills are linked to socioeconomic status and education levels (Plantard, 2016; DiMaggio et al., 2001; Vodoz, 2010). Research on the "second order digital divide" (Brotcorne 2019; Valenduc et al., 2010; DiMaggio et al., 2001) examines digital inequalities through the lens of the key knowledge and skills needed to use ICTs within mainstream institutions and roles. Digital literacy is connected to cultural capital, familiarity with written language, and argumentative skills (Auray, 2016; Pasquier, 2018; Grimault-Leprince & Décret-Rouillard, 2023; Harrache & Mell, 2024; Pacouret, Bastin & Marty, 2024). Less scholarly attention has been paid to how young people from lower socio-economic backgrounds and other minorities develop their digital skills outside of school and

formal settings, such as in areas disconnected from power. Some studies challenge this view by showing that digital practices do not differ significantly across social class or minority backgrounds, although their use within schools often conflicts with teachers' expectations and perceptions (Rafalow, 2020). These perceptions help sustain processes of domination and legitimation within the school system. This paper aims to contribute to this perspective by proposing theoretical and methodological adjustments to Bourdieusian theories. Bourdieu's theory is noteworthy for emphasizing, through the dialectics of affinities between, on one hand, the culture, categories, and judgments that shape the school field, and on the other hand, the culture of the dominant classes, how the legitimacy of practices of students from privileged backgrounds is reinforced. Conversely, his theory is less effective for illuminating how the value of cultural practices among young people from lower-class backgrounds is obscured by the school system and how their legitimacy is undermined in the job market. Indeed, Bourdieu's theory presents a risk of "miserabilism" (Grignon and Passeron, 1989), which involves analyzing the symbolic worlds of dominated agents solely in relation to the dominant culture and the categories of the field of power and institutions, rather than from their own perspective. Therefore, to shed light on how educational inequalities are reinforced in the digital era—particularly regarding the digital practices of working-class and lower-class youth within the school field and their interactions with teachers' judgments—we propose developing a Bourdieusian epistemological framework based on the concept of "subfield." This concept refers to marginalized parts of the social space that still maintain a degree of autonomy. Although the idea of subfield and its autonomy are inherently relative, they help explore dominated symbolic universes and their digital practices before examining their relationship with legitimate culture as school culture.

HOW LANGUAGE CREATES BOUNDARIES: MULTILINGUAL FAMILIES ENCOUNTERING MONOLINGUAL SCHOOLS

Giorgia Andreolli (Eurac Research - Institute for Applied Linguistics, Italy)

educational transitions | multilingualism | family ethnography

Educational encounters between families and institutions are central sites where social inequalities are reproduced, negotiated, or contested. This is particularly visible in increasingly multilingual societies, where institutional expectations about languages and parental involvement often reflect the norms of socially dominant groups. Such norms, often rooted in language ideologies (Gal & Irvine, 2019), can generate or reinforce inequalities, especially when institutional expectations diverge from those of families from minoritized or marginalized backgrounds. Against this backdrop, this presentation focuses on a project investigating educational transitions from pre-primary to primary schools in South Tyrol (Italy). First, the presentation will briefly outline the context of the study. South Tyrol is an officially trilingual border region, and its school system is organized into separate monolingual tracks corresponding to the three official languages, namely German, Italian, and Ladin. This structure, based on a mother-tongue principle (Statute of Autonomy, 1972), was designed to protect minorities and guarantee balanced representation and participation. However, this ethno-linguistic separation has been increasingly challenged by migration patterns (Wisthaler et al., 2022; Carlà, 2022; Rocha & Costa, 2021) and new forms of multilingualism, e.g., among individuals whose repertoires differ from those officially recognized. In this context, German represents the dominant group and is a prestigious language tied access to educational opportunities and upward social mobility. Building on these premises, the study follows two multilingual families with migration trajectories from Morocco and Ethiopia as their children transition into, respectively, the Italian and German school systems. Indeed, this transition has been described as a key event in family's lives (Huf, 2013; Turunen, 2014; Jose et al., 2022). In South Tyrol, the choice of primary school attracts sustained attention from both political institutions and the media (e.g., Liberto, 10 December 2025). As such, it is a particularly revealing site for exploring the ideological tensions that underpin the separation of education along ethnolinguistic lines. Methodologically, multi-sited ethnography was employed (Marcus, 1995; Dick & Arnold, 2017) and the data consist of field notes, interview transcripts, and artefacts

generated during participant observation. This approach allows us to understand transitions not as discrete events, but as dynamic, co-constructed processes embedded in everyday practices, institutional expectations, and ideological landscapes which, alongside the family's own linguistic practices and choices regarding children's education, "form the mechanisms [...] through which social inequalities are reproduced" (Curdt-Christiansen et al., 2023). The study examines how language becomes salient in these moments, how families mobilize their funds of knowledge, and how institutional discourses frame parental involvement and appropriateness. The presentation will also exemplify on how families navigate the school system and, at the same time, grapple with intersecting processes of marginalization such as gender-based violence and housing precarity.

THE ENCOUNTER BETWEEN SCHOOLS AND MOTHERS WITH DISABILITIES: ADDRESSING HIDDEN INEQUALITIES AND RETHINKING SCHOOL–FAMILY PARTNERSHIPS

Barbara Alesi (Univeristy of Macerata, Italy)

School-family relationship | Mothers with Disabilities | Discriminations

The transformative process towards inclusion and democracy that has reshaped school systems supports the pedagogical vision of the learning community, which is called upon to foster student development through the principle of shared educational responsibility (Conzemius & O'Neill, 2001). Within this perspective, schools are invited to adopt a democratic approach that extends their focus beyond the individual to include the family ecosystem enhancing collaboration among schools and families and strengthening the connection between these two social systems (Faure, 1972; Sanders & Epstein, 2005; Pavone, 2014; Di Michele, 2023). Scientific literature has extensively explored the positive effects of this partnership (Christenson, 2004; Pirchio et al., 2016) while also highlighting the persistence of marginalization processes affecting families whose characteristics do not correspond to standardized models (Lohmann, Hathcote & Hogan, 2018). Within this context, academic research has begun to investigate the challenges faced by parents with disabilities in participating in their children's education (Robinson, Hickson & Strike, 2001; Stalker et al., 2011). From the perspective of the Intersectionality Approach (Crenshaw, 1989) and Feminist Disabilities Studies (Wendell, 1989; Garland-Thomson, 2005) this contribution seeks to give voice to the experiences of school-based discrimination faced by families with these atypical structures, framing them as issues of social justice in education (Ayers, Quinn & Stovall, 2009). Specifically, it reflects on the interaction between mothers with disabilities and educational institutions, as well as the impact that such interactions may have on their children. The contribution presents the qualitative findings of a doctoral research project based on a mixed-methods design (Creswell & Plano Clark, 2018) which included 30 semi-structured interviews with mothers with disabilities. Themes emerged from the Reflexive Thematic Analysis (Braun & Clarke, 2021) revealed barriers

to mothers' participation in school life that are not attributable to their impairments, but rather to institutional and cultural configurations that fail to recognize this form of parenting. Obstacles to accessing school spaces and communicating with teachers and other parents emerged, along with prejudices that undermine the recognition of mothers' parental roles and capabilities. These dynamics contribute to indirect discrimination against their children, who are often victims of bullying or exclusion, subjected to higher levels of teachers control, and involved in processes of adultification that position them as mediators in communication between school and family. At the same time the narratives reveal significant self-advocacy practices enacted by mothers with disabilities that redefine their role in school–family partnerships and strengthening more equitable forms of participation. For an increasingly democratic school system, supporting the participation of mothers with disabilities is not a marginal concern but a critical test in preventing the translation of social inequalities into educational inequalities, and in pursuing new inclusive horizons grounded in an ecological perspective (Bronfenbrenner, 1979). Future research could explore children's perspectives in greater depth and develop institutional guidelines for inclusive partnerships between schools and families that value the educational role of mothers with disabilities. With their collaboration virtuous alliances could be promoted that address invisible vulnerabilities and challenge discriminatory norms and exclusionary practices affecting both students and their parents.

WHEN EXPECTATIONS FADE: SOCIAL INEQUALITIES IN FAMILY UNIVERSITY EXPECTATIONS ACROSS COMPULSORY SCHOOLING

Daniel Bianchi (Universidad de La Laguna, Spain) · **Francisco Santana-Armas** (Universidad de La Laguna, Spain) · **Carmen Pérez** (Universidad de La Laguna, Spain)

Family academic expectations | Parental education | Grade retention

The relationship between family expectations and student performance has long been a central question in the sociology of education. Reproduction theorists argue that educational institutions reproduce social inequalities by privileging the cultural codes of dominant classes, while families from lower social backgrounds progressively disengage from a system not built for them (Bianchi et al., 2025; Cabrera et al., 2019; Pérez et al., 2014). This paper examines how this disengagement unfolds longitudinally, focusing on inequalities in families' university expectations by parental education level and their relationship with reading performance throughout compulsory schooling. We use longitudinal data from three standardised assessments —aligned with international large-scale assessment frameworks— conducted by the Canary Islands

Agency for University Quality and Educational Evaluation on the same cohort in 2016, 2019 and 2023, when students were in 3rd, 6th and 10th grade. The assessments covered almost the full student census in the Canary Islands (Spain), with nearly 20,000 students per wave (n = 20,431; 19,855; and 18,522, respectively). We use sequential binomial logistic regression models to first estimate the probability that a family reports a defined expectation (vs. “don’t know”), and then, among those families, the probability of expecting university completion. At 3rd grade, university expectations are high across all groups: 74% among families with lower secondary education or less, 86% among those with upper secondary, and 95% among university-educated families. By 10th grade, expectations among the lowest-educated families drop sharply to 48%, whilst they remain at 88% among university-educated families — a gap of 40 percentage points. Grade retention disproportionately affects students from lower-educated families and significantly reduces university expectations; crucially, there is a significant interaction whereby performance increasingly penalises these families over time, progressively eroding their connection to university expectations in ways not observed among higher-educated families. These results show that lower-educated families do not begin with substantially lower aspirations, but declining performance trajectories and a higher risk of grade retention progressively signal that university is not a realistic destination for their children. The school does not merely reflect existing inequalities; it can contribute to amplifying them through institutional mechanisms and the progressive disengagement of families with lower cultural capital. This study provides census-level longitudinal evidence on how the encounter between educational institutions and families from different social backgrounds contributes to the progressive fading of educational expectations. Inequalities emerge not from initial differences in aspirations, but from declining performance trajectories, grade retention, and the gradual disengagement of lower-educated families. Implications for equity-oriented policy and early intervention will be discussed.

The Multidimensionality of Educational Poverty on the Lives of Children Living Outside Their Birth Families. A Focus on Protective Factors

PANEL CONVENORS: Alessia Tabacchi (Università Cattolica del Sacro Cuore, Italy); Anna Guerrieri (Coordinamento Care – Coordinamento delle Associazioni Familiari adottive e affidatarie, Italy)

PANEL KEYWORDS: Adoption&Foster care, Resilience, Educational poverty

According to Save the Children, educational poverty refers to the deprivation of children's opportunities to learn, develop, and flourish in terms of their abilities, talents, and aspirations. It undermines the right to education and to meaningful learning opportunities in everyday contexts (family, school, friendships, sport&leisure). Research shows that educational poverty is often intertwined with complex life trajectories. Among the many factors that can hinder the developmental path, there is the experience of living outside one's birth family, due to the outcomes of adverse childhood experiences (Sinclair et al.,2020; Oakley et al.,2018; Stein et al.,2008), traumatic events, or deprivations (Dalen&Steinar, 2019; Ferritti et al.,2022; Lorenzini, 2023, 2019; Balenzano et al., 2024). Studies have long drawn attention to the critical dimensions, which involve situations of disadvantage, exclusion, stigma, and discrimination (Garber&Grotevant, 2015; Ferritti, 2019). However, having supportive relationships and networks can be a protective factor in shaping resilience and positive life trajectories (Forsman et al., 2016; Ricchiardi&Coggi, 2019; Ricchiardi, 2022). The challenge is to develop strategies to address educational poverty promoting equal rights and social justice for all children (Goding et al., 2022). The panel aims to explore the topic from a multidisciplinary perspective by investigating theoretical approaches, research, innovative practices, and social policies aimed at reducing inequalities, stigma, discrimination, and promoting participation processes. What are the best practices to contrast educational poverty? What are the protective factors that can foster inclusion and equity pathways in the development of children? What training and alliances are best for adults involved in education?

GENDER AND DISCRIMINATION IN EDUCATIONAL PROCESSES: INVISIBLE VULNERABILITIES AND PROTECTIVE RESOURCES

Monya Ferritti (INAPP, Italy) · **Luca Mattei** (INAPP, Italy)

bionormativity values educational poverty

The literature on educational poverty has highlighted the multidimensional nature of inequalities in learning processes and the particularly high exposure to educational risks among minors who are not living with their family of origin, for whom relational continuity and access to protective resources constitute central factors in developmental trajectories. Within this framework, this contribution analyses the role of normative frames and value systems in the construction of educational vulnerabilities and in the activation of support resources, with particular attention to gender dynamics in educational decision-making processes. The paper assumes that the assessment of educational difficulties is a process shaped by social representations of expected developmental standards and by culturally legitimised models of autonomy and individual success. From this perspective, the concept of bionormativity is used as an analytical lens to examine how such models may orient the interpretation of difficulties and the definition of educational interventions, potentially affecting the activation of protective resources in the trajectories of minors in out-of-home care contexts. From an empirical standpoint, the contribution integrates two analytical strategies. First, it draws on secondary analyses of data from the European Social Survey Round 11 to examine the distribution of values related to self-assertion, social recognition, and gender roles in the European and Italian contexts. This analysis makes it possible to reconstruct value hierarchies and representations of individual autonomy that contribute to defining socially shared models of development and success, thereby outlining the cultural context within which educational processes and protective practices are situated. Second, the contribution presents an exploratory study based on factorial vignettes administered to education professionals, aimed at observing the threshold for activating interventions and the perceived structural nature of school difficulties in equivalent situations, varying only the gender and relational context of the described profile. This design makes it possible to analyse whether, with the same level of difficulty, differences emerge in the intensity of educational responses and in the definition of protective resources. The contribution therefore integrates structural and cultural dimensions in the analysis of educational poverty, highlighting how value systems and normative categories may shape the interpretation of vulnerability and the activation of protective factors in the educational trajectories of minors in conditions of particular fragility.

EDUCATIONAL PRACTICES AND POLICIES TO PROMOTE INCLUSION IN SCHOOLS OF CHILDREN LIVING OUTSIDE THEIR BIRTH FAMILIES (ADOPTION - FOSTER CARE)

Águeda Ruibal Silva (CORA (Coordinator of adoption and foster care associations - Spain), Spain) · **Ma Jesús Vázquez Paredes** (MANAIA (Galician Association for Adoption and Foster Care), Spain)

Inclusion | Networking | Sensitive Schools

Adopted and foster children are children who, for different reasons, have been separated from their birth families. This separation means that their lives have been marked by adverse situations at an early age. These difficult experiences, prior to adoption and/or fostering, usually influence their development at different levels (emotional, social, cognitive, etc.), which can result in difficulties in learning processes and social relationships with their peers or the adults who accompany them throughout their schooling, among other things. In order to minimise these difficulties, the school environment must become an emotionally safe space, adapted in its daily practice to the diversity of the students. Educational practices that promote inclusion When discussing educational practices that promote inclusion, it is essential to take into account UDL (Universal Design for Learning), which promotes flexibility in the curriculum to adapt it to different learning styles and paces. Based on this idea, the following are considered inclusive practices: • Adapting resources and materials to facilitate access to information for each student: - Visual and audio incentives, graphics and diagrams, various material supports and textures... • Using emotionally-based open methodologies that promote group cohesion, combating discriminatory attitudes, fostering respect for diversity and increasing self-esteem: - Teamwork, peer tutoring, diversity projects, talking circles... • Planning activities that can be adapted to different learning paces and with different options for execution: - Hands-on activities, experimentation, discussion, reading aloud... • Promoting collaboration and networking with professionals who work with students and their families, creating an atmosphere of cooperation with teachers that improves students' emotional security. • Implementing reference persons when needed at different times throughout the school year. Educational Policies towards an Inclusive School In terms of the educational policies necessary for true inclusion, the following measures are essential: • Recognise the special educational needs of adopted and foster children in the Laws on Attention to Diversity among pupils in schools. • Include Early Adversity in teacher training in Faculties of Education and in all university studies or training courses related to childhood. • Establish common protocols for all centres in the process of schooling adopted and fostered children, covering all necessary aspects. • Leverage the experience of other communities in training professionals in this field and promote actions similar to existing ones that are generating positive results. • Compile resources developed by different departments and entities and promote them for use by education professionals. • Promote the diffusion of essential documents through government websites, with regular updates, so that they are visible and accessible. Summing up: “We must promote an inclusive school where all differences are welcome and where all students feel valued and have the same opportunities to develop”

SELF-DISCLOSURE AND CLASSROOM CLIMATE: A NARRATIVE INTERVENTION IN PRIMARY SCHOOL CLASSES INCLUDING ADOPTED CHILDREN

Laura Ferrari (UNIVERSITA' CATTOLICA DI MILANO, Italy) · **Sonia Negri** (Petali dal mondo odv) · **Rosa Rosnati** (UNIVERSITA' CATTOLICA DI MILANO, Italy) · **Sonia Ranieri** (UNIVERSITA' CATTOLICA DI MILANO, Italy) · **Martina Petrosino** (UNIVERSITA' CATTOLICA DI MILANO, Italy) · **Giuliana La Fico** (UNIVERSITA' CATTOLICA DI MILANO, Italy) · **Sara Ortoleva** (UNIVERSITA' CATTOLICA DI MILANO, Italy)

Adoption | Self-disclosure | Classroom climate

Promoting educational environments that reduce inequality, stigma, and exclusion is a central challenge in addressing educational poverty and supporting equitable developmental pathways for children with complex family histories (Ferrari et al., 2022). Within this framework, addressing adoption in school contexts is increasingly recognized as relevant both for children's well-being and for the creation of inclusive learning environments (Caceres et al., 2024; Novara et al., 2020). Although the literature emphasizes the importance of self-disclosure and openness in communication about adoption (Aramburu Alegret et al., 2020; Ranieri et al., 2022; Ranieri et al., 2025; Santona et al., 2022), studies describing structured school-based interventions on these topics and evaluating their effectiveness remain scarce. This work presents an exploratory study of the intervention "Quante storie in ogni classe" ("How Many Stories in Every Classroom"), a programme developed by a voluntary non-profit organization Petali dal Mondo, and implemented in primary schools. The intervention is conceived as an educational practice designed to strengthen protective factors relevant to the prevention of educational poverty, fostering opportunities for self-disclosure, active participation, recognition of individual stories, promoting a positive classroom climate, and enhancing the quality of peer relationships. From this perspective, narrative work serves an inclusive function not only for adopted children but for the whole class group, making differences visible and valuing them within everyday school experience (Brown & Shelton, 2024; Grotevant & Van Korff, 2011). The study assumed a pre–post design in order to observe possible changes in children's levels of self-disclosure, perceptions of classroom climate, and sociometric dynamics. Twenty-four children from a comprehensive school in the North of Italy (mean age 7 years), including one adopted child, took part in the research. Both quantitative and qualitative instruments were used: the Self-Disclosure Scale; the Social Satisfaction subscale of the Children's Loneliness; the Social Dissatisfaction Scale; graphic and narrative productions representing the self at school and in the family; and a sociogram to analyze peer relationships. Overall, the findings indicated a positive trend following the intervention. Improvements were observed in perceived social satisfaction and relational classroom climate, together with a shift toward deeper and more reflective forms of self-disclosure. Sociometric data also showed increased reciprocity among classmates. While causal conclusions cannot be drawn, these results suggest that structured self-disclosure and cooperative structured self-narrative activities and cooperative work may contribute to a more participatory and inclusive school context, supporting processes of recognition and belonging that are key dimensions in the prevention of educational poverty. The study, therefore, proposes this intervention as a promising educational practice capable of strengthening relational protective factors. In this perspective, the findings encourage wider dissemination of school-based interventions addressing adoption and autobiographical narrative, and call for further research into their effectiveness, supporting genuinely inclusive educational pathways for children with complex and challenging family histories.

GUIDELINES FOR THE RIGHT TO EDUCATION OF CHILDREN OUTSIDE THE BIRTH FAMILY (2017-2023). A CRITICAL-PEDAGOGICAL REREADING

Margherita Cestaro (Istituto Universitario Salesiano Mestre (IUSVE), Italy) · **Fabrizio Pizzi** (Università di Cassino e del Lazio Meridionale)

Educational Poverty | Educational Network | Democracy

The paper aims to propose a reflection and a critical analysis from a pedagogical perspective of the ministerial document Guidelines for the right to education of pupils outside the family of origin (2017-2023). The theoretical framework for this reflection is inherent in the complex concept of educational poverty. Introduced in Italy by Save the Children in 2014, this concept has recently been relaunched as "the deprivation of children and adolescents from the opportunity to learn, experiment, develop, and consolidate skills, talents, and aspirations" (Save the Children, 2022). Therefore, by configuring itself as a "multidimensional phenomenon" (Istat, 2024), it, by intertwining factors of a different nature (not only economic but also connected to the lack of educational and cultural resources characterising the educational community), is configured both as a "poverty of resources" and as a "poverty of outcomes": the latter form of educational poverty is related to the lack of possibility of acquiring cognitive, social and emotional skills capable of allowing each person to feel part of a community, to "actively and consciously exercise the right of citizenship" (Ibidem). Starting from these considerations and with constant reference to a pedagogical (Santerini, 2019; Amadini et al. 2023) and intercultural pedagogical (Fiorucci, Minerva, Portera, 2017; Macinai, 2020; Portera, 2022) perspective, aimed at promoting the capacity for existential planning of individuals and communities within a democratic social framework (Dewey, 1965), this contribution intends to reread the text of the Guidelines, focusing on the following questions: - What idea of the minor supports and guides the set of operational indications contained in the document? What idea of educational poverty does this image of the minor contribute to shaping? - What are the underlying principles (human and ethical) on which the "Italian path to inclusion" proposed by the document is built? - What idea of "school" emerges from the document? - What strengths and weaknesses characterize the text in terms of operational, formative, and didactic attention and indications? - What specific contribution can the pedagogical stance offer to strengthen the strengths highlighted and, above all, to smooth out the weaknesses? By responding from a critical-pedagogical perspective to each of the above questions, this paper aims to outline a path of pedagogical reflection aimed at enabling educational action to translate into an experience capable of enabling each child to learn with others not only to "know" and "know how to do," but also, and more specifically, to "be," in order to "learn to live together" (Delors et al. 1997) in today's plural social contexts.

EDUCATIONAL STRATEGIES FOR THE PROTECTION OF CHILDREN IN COMPLEX SITUATIONS: SUCCESS CASES

Paola Ricchiardi (Università di Torino) · **Veronica Lucchina** (Comune di Torino)

foster care | success case method | protective factors

National and international reports indicate a decline in the number of children placed in foster families and a corresponding increase in the number of children accommodated in residential care, likely linked to a reduction in the availability of foster families (Ministero del Lavoro, 2024; Administration for Children and Families, 2024; Delhon, 2023). The difficulty in recruiting available foster families is currently exacerbated by the growing complexity of the situations of children in need of protection. In particular, the high prevalence of children presenting significant risk factors makes the matching process and the successful development of foster care trajectories even more delicate. This study, developed through a collaboration between the University of Turin and the Municipality of Turin, aims to identify educational and social support strategies that can foster positive outcomes even in foster care placements initially characterized by high levels of complexity. The methodological framework is grounded in the Success Case Method (Brinkerhoff, 2003), enriched by insights derived from the theoretical orientation of Appreciative Inquiry, an approach developed by David Cooperrider and rooted in a constructivist and generative perspective on organizational change. Appreciative Inquiry is distinguished by its focus not on deficits or critical issues, but rather on the identification of strengths, effective practices, and enabling factors that make successful experiences possible (Cooperrider & Whitney, 2005). Within this perspective, the study of "success cases" does not constitute a merely positive selection of data; rather, it represents an epistemological stance aimed at understanding which relational, educational, and institutional conditions foster generative outcomes even in highly complex situations. The research involved an in-depth analysis of successful cases through the engagement of multiple sources to enable triangulation of perspectives (foster families, social workers, psychologists, and family associations) (Greenhalgh, 2025). The identification of recurring positive factors provides a basis for designing new forms of support for children placed under protection.

ADOPTED ADOLESCENTS LIVING OUTSIDE BIRTH FAMILIES: DEMOCRATIC IDENTITY LITERACY AS A PROTECTIVE FACTOR IN SCHOOLING

Angela Muschitiello (Università degli Studi di Bari, Italy)

adoption | adolescence | democratic literacy

Adolescence represents a critical phase for young people who have experienced adoption, particularly for those who have spent part of their childhood outside their birth families. Between the ages of 11 and 17, the intersection of complex biographical trajectories, the search for belonging, and the demands of school systems often generates multidimensional forms of educational poverty—cognitive, relational, and institutional. Building on pedagogical studies concerning adopted children in school, special needs in adoption, and recent contributions that advocate for authentic human educational diagnoses (Muschitiello, 2025), this paper proposes an innovative framework conceptualising adopted adolescents as subjects positioned at the crossroads of vulnerability and democratic potential. Moving past risk-centred interpretations that associate adoption with permanent risk, the paper introduces the concept of democratic identity literacy. This construct refers to adolescents' capacity to interpret and narrate their life story, including ruptures and transitions across

families and institutions; negotiate meanings of belonging and difference within school and peer communities; exercise voice, participation, and agency in educational settings; and transform experiences of discontinuity into resources for solidarity, critical thought, and commitment to others. Democratic identity literacy thus emerges as a protective factor against educational poverty for young people growing up outside their birth families, aligning with research on protective trajectories in out-of-home care (Ferritti & Guerrieri, 2020). The theoretical framework draws on Vygotskian concepts of creative compensation and defectology, which emphasise the role of symbolic and imaginative processes in overcoming developmental disharmonies (Vygotskij, 1945). It also integrates contemporary approaches to educational distress and human inclusion. From this perspective, adoption is understood as a lifelong process in which early adverse experiences—such as neglect, institutionalisation, multiple placements, or separations—can be re-signified through new networks of care and recognition. As highlighted by Lorenzini (2004), experiences of estrangement and familiarity shape the identity work of adopted young people, particularly in adolescence, when questions of origin, continuity, and legitimacy become central. Empirically, the paper draws on an exploratory qualitative study involving adopted adolescents aged 11–17, adoptive parents, and teachers in Italian lower and upper secondary schools. Through semi-structured interviews and focus groups, the research examines how adolescents narrate their educational trajectories, how they perceive expectations and evaluations within school contexts, and which relationships and practices they identify as supportive or exclusionary. Particular attention is devoted to everyday educational micro-practices—classroom discussions, group work, narrative activities, and informal interactions—that may either reinforce educational poverty (through stigma or stereotyping) or function as protective factors (through recognition, trust, and shared responsibility). Preliminary findings suggest that democratic identity literacy is fostered when schools acknowledge adoption and out-of-home care experiences as legitimate, non-pathologised biographies; involve adolescents in co-constructing rules, curricula, and projects; create spaces for narrative and imaginative work enabling the integration of past and present; and build alliances with families and services grounded in mutual respect and pedagogical care. The paper concludes that focusing on adopted adolescents living outside their birth families can support educational systems in reframing educational poverty, shifting from diagnostic categorisation to the intentional promotion of protective and intrinsically democratic factors.

EDUCATIONAL POVERTY AND PROTECTIVE FACTORS IN ADOPTIVE FAMILIES: THE ROLE OF FAMILY DIGITAL MEDIATION IN AI-BASED CONTEXTS

Gaetano Di Napoli (Department of Psychology, Educational Science and Human Movement, University of Palermo (Italy)) · **Marco Andrea Piombo** (Department of Psychology, Educational Science and Human Movement, University of Palermo (Italy)) · **Cinzia Novara** (Department of Psychology, Educational Science and Human Movement, University of Palermo (Italy))

Adoption · Educational Poverty · Protective Factors

The increasing diffusion of digital technologies and artificial intelligence (AI)-based systems is profoundly transforming the educational and family environments in which children grow up and develop opportunities for learning and social participation. Within this evolving landscape, disparities in digital competencies and adult mediation practices may represent an emerging dimension of educational poverty, influencing children's safe and meaningful access to online learning, relational, and developmental opportunities (Hong & Kim,2024; Yu et al., 2024). This perspective is particularly relevant for children who are adopted or living outside their family of origin, whose developmental trajectories are often shaped by adverse childhood experiences and specific needs for protection and educational support (Basso, 2023). This contribution presents findings from an exploratory study aimed at examining the use, levels of trust, and perceptions of artificial intelligence among a sample of 180 parents, including 87 biological and 93 adoptive parents. The main objective was to investigate how family digital mediation practices may function either as risk factors or as protective resources within children's developmental pathways. Quantitative results indicate generally cautious attitudes toward AI and

relatively low levels of trust across both groups, with no statistically significant differences. However, adoptive parents demonstrated higher levels of digital literacy and greater involvement in supervising their children's online activities. Qualitative findings further highlight specific concerns expressed by adoptive parents regarding the protection of children's identity and personal history, particularly in relation to the risk of unwanted contact with biological families and exposure to emotionally sensitive digital content. These findings suggest that parental digital competence and the creation of safe online environments may represent key protective factors supporting inclusion, participation, and children's wellbeing. Overall, the study underscores the need to develop educational and training interventions addressing not only children but also caregivers and educational professionals, fostering alliances among families, schools, and community services (Pentina, Hancock, & Xie, 2023). From this perspective, informed digital mediation emerges as a crucial educational practice for addressing emerging forms of educational poverty and promoting equitable developmental opportunities, contributing to the strengthening of educational communities capable of supporting children with complex family backgrounds.

ADDRESSING EDUCATIONAL POVERTY IN ADOPTION PATHWAYS: ASSOCIATIVE NETWORKS, SOCIAL CAPITAL, AND EDUCATIONAL JUSTICE

Alessandra Lo Piccolo (Università degli Studi di Enna Kore, Italia) · **Daniela Pasqualetto** (Università degli Studi di Enna Kore, Italia)

Educational poverty · Adoption · Support networks

Educational poverty represents a multidimensional condition that limits children's opportunities for learning, participation, and the full development of their capabilities across different life contexts (Save the Children, 2016). It manifests not only as economic deprivation, but also as a restriction of relational, cultural, and symbolic resources that affect developmental processes. Within adoption pathways, this phenomenon may assume specific configurations, intertwining with early experiences of trauma, affective discontinuity, and identity fragility that influence socio-emotional well-being and school experience (Palacios & Brodzinsky, 2010; Van IJzendoorn & Juffer, 2006). Adopted minors may encounter difficulties in emotional regulation, learning processes, peer relationships, and in constructing a sense of belonging, thereby becoming exposed to risks of marginalization or misunderstanding within educational settings (Ferritti, 2019). From this perspective, educational poverty can be understood as a dynamic process generated by the interaction between individual vulnerabilities and the quality of support networks. Addressing it requires a systemic approach capable of activating protective resources at both family and community levels (Lo Piccolo, 2024). In this framework, opportunities for dialogue between families and mutual self-help groups are particularly significant, as they foster the sharing of narratives, reduce isolation, and promote empowerment processes. These experiences positively affect parents' capacity to interpret their children's educational needs and to build effective alliances with schools (Guerrieri & Nobile, 2016). Furthermore, the associative dimension can contribute to the generation of social capital, strengthening the sense of community belonging and counteracting stigma and stereotypical representations of adoption (Greco, Ranieri, & Rosnati, 2014). This contribution presents an exploratory study aimed at analyzing the potential of such contexts in addressing educational poverty within adoption pathways (Balenzano et al., 2024). The study seeks to provide evidence useful for the design of integrated interventions capable of enhancing local networks and promoting equity, inclusion, and educational justice.

PROTECTIVE AND RESILIENCE FACTORS IN ALTERNATIVE AND FOSTER CARE: FOCUSING ON THE TRAINING OF CAREGIVERS AND TEACHERS

Alessia Tabacchi (Università Cattolica del Sacro Cuore, Italy)

Foster Care | Alternative Care | Training

Research examining the relationship between academic success and living conditions has revealed that individuals living away from their birth family are more vulnerable (Chamberland et al., 2015; Coggi & Ricchiardi, 2019; Balenzano et al., 2024b). Children in foster or residential care often experience disadvantage, social marginalisation and educational poverty related to adverse early experiences (Felitti et al., 1998; Racine et al., 2025; Janković et al., 2025), an absence of stable caregivers capable of providing continuous and quality bond, depressing life contexts, insufficient stimuli in childhood and long periods of institutionalisation (Stein, 2008; Oakley et al., 2018; Balenzano et al., 2024a). It is worth considering how long studies have drawn attention to the critical dimensions and consequences of adverse childhood experiences (O'Higgins et al., 2015; Luke et al., 2015; 2017; Sinclair et al., 2020). Conversely, it is interesting to shift the focus from a deficit-based approach to one that emphasises positive experiences and best practices, outlining positive life trajectories and educational opportunities for children (Goding et al., 2022; Pandolfi, 2019; McGuire et al., 2021; Ricchiardi, 2022). (Avant et al., 2021; Pandolfi, 2019; McGuire et al., 2021; Ricchiardi, 2022). Within this framework, protective factors play a pivotal role in fostering inclusion and equity in children's development (Goding et al., 2022). This paper aims to advance research and practices that enhance protective factors and reduce the impact of inequalities throughout the life course, focusing on girls living outside their family of origin in foster care or residential communities. Countering educational poverty requires a multidimensional and integrated approach that can simultaneously address educational, family and community contexts. On the one hand, the importance of integration between formal and non-formal education, social services, and local resources is emphasised (Ripamonti, 2022; Tabacchi, 2023). On the other hand, there is a need to support families and caregivers (Golding, 2003; Balenzano et al., 2024a). The analysis will provide a theoretical basis for outlining educational support pathways for foster parents, educators and other adults involved in education and instruction. At the same time, networking between schools, families, and public, private, and third-sector services enables a coordinated approach to the complexity of educational needs, building personalised, sustainable responses in the process. In summary, tackling educational poverty requires policies and practices that can combine prevention, protection and the promotion of rights from a social justice and well-being perspective for all children.

EVERYDAY SCHOOL PRACTICES AS RISK AND PROTECTIVE FACTORS FOR STUDENTS LIVING OUTSIDE THEIR BIRTH FAMILIES: SELF-DETERMINATION, NARRATIVE PRIVACY AND INCLUSIVE TEACHING

Anna Guerrieri (Coordinamento CARE, Italy) · **Monya Ferritti** (Inapp, Italy)

Educational inclusion | Children outside birth families | Protective factors in schooling

Recent studies on educational poverty highlight its multidimensional nature, showing how exclusion may arise not only from socio-economic disadvantage but also from school practices that limit participation, recognition, and agency. This paper focuses on children living outside their birth families, with particular reference to pupils who have been adopted, and analyses how ordinary school routines may function either as risk factors or as protective conditions for their well-being and educational inclusion. The contribution adopts the recent Italian guidelines on the right to education of adopted students as a conceptual and normative framework and develops a conceptual–argumentative analysis grounded in inclusive pedagogy, adoption studies, and research on identity and self-determination. The paper examines the role of micro-devices embedded in everyday teaching practices — such as assignments, classroom rituals, language use, textbooks, and information-sharing procedures — which often rely on implicit assumptions about family continuity and personal biography. When not intentionally designed, these practices may generate specific risks, including non-consensual biographical disclosure, symbolic marginalization, and reduced participation, thus contributing to forms of educational poverty linked to lack of recognition and limited control over one's own narrative. To interpret these dynamics, the paper mobilizes the concepts of self-determination and self-identification as key protective factors in school contexts. From this perspective, inclusion requires that students retain the right to decide whether, when, and how to share personal information and to define the terms through which their family history is represented in school life. The paper proposes an organizational repositioning of teaching practices based on four operational principles: (1) the right to choose about personal disclosure; (2) safeguards against non-consensual identity exposure; (3) non-prescriptive language and flexible task design; (4) clear informational boundaries within school–family–services alliances. By reframing everyday teaching as an organizational responsibility, the study argues that inclusive micro-practices can act as protective factors against educational poverty, supporting agency, belonging, and identity development for children whose life trajectories include adoption, foster care, or other forms of out-of-home care.

GUIDELINES TO PROMOTE THE RIGHT TO EDUCATION FOR PUPILS WHO HAVE BEEN ADOPTED 2023. RESOURCES, CHALLENGES, PROPOSALS

Stefania Lorenzini (Università di Bologna, Italy) · **Angela Muschitiello** (Università di Bari, Italy) · **Michele Corriero** (Unicusano, Italy)

Adoption school guidelines

...some reflections on the strengths, weaknesses and proposals for implementing the document 'Guidelines for guaranteeing the right to education for adopted pupils', issued by the MIUR in 18 December 2014, No. 7443, and updated by Decree No. 5 of 28 March 2023 of the MIM, which renamed it 'Guidelines to promote the right to education of adopted pupils – 2023'. Adoption, whether domestic or international, can bring with it its own particular challenges, for example during the initial stages of mutual family adjustment, settling into school, social integration, and adolescence; throughout the various stages of growing up, a person with a history of adoption feels the need to answer questions such as 'Who am I, where do I come from, where am I going?? questions for which one may choose not to seek an answer, or instead embark on a search that may continue over time, whether peaceful or restless, with oneself and others. Experiencing complex life trajectories and multiple, often sudden, changes are unavoidable circumstances for every adopted child; the experiences accompanying these events, which take various forms, can themselves be very different, as can the possibilities for reworking and integrating one's identity. These elements, however, must not lead to simplifications, generalisations or determinism, fuelling misleading expectations and interpretations of the behaviours and possible difficulties of those involved in adoption. These premises in themselves serve as a reminder of the complexity of every life story, including in adoption, and of the need to pay attention to the unique characteristics of each individual—both their specific challenges and needs, and their resources and potential. This applies to both the circumstances of life prior to adoption and those within the new family and social context. In addition to the family, the school environment is a crucial setting for fostering well-being, opportunities for growth and development, where the experience of interacting with peers and new adults at school constitutes one of the most significant relational milestones for building a secure cognitive and emotional foundation – the cornerstone for active learning, inclusion, and familiarisation with the new educational and cultural system. The 2023 Guidelines are an important and innovative document; they provide teachers with knowledge and a framework for adoption, whilst also requiring them to apply it, focusing on good practices for welcoming pupils into school at various levels (administrative and bureaucratic, communicative and relational, continuity in the educational pathway, and links with local resources). Schools are not merely called upon to 'teach', but to create a safe and welcoming environment that fosters the development of identity and a sense of belonging. However, when viewed from a pedagogical-educational perspective, including an intercultural one, certain critical issues also emerge in the 2023 Guidelines. It is on these issues that we propose a reflection and educational best practices. For example, regarding the significance of the overall approach to recognising and encouraging recognition, within the school context, of the unique aspects of the adoption experience and the personal history of pupils who have been adopted.

ITALIAN ADOLESCENTS IN RESIDENTIAL CARE: EDUCATIONAL POVERTY AND PROTECTIVE FACTORS

Susanna Papagno (Department of Political Sciences, University of Study of Bari Aldo Moro, Italy) · **Caterina Balenzano** (Department of Political Sciences, University of Study of Bari Aldo Moro, Italy)

Educational poverty | Residential care | Protective factors

Out-of-home children are often exposed to adverse childhood experiences, which heighten the risk of educational poverty and emotional and behavioral problems. (Jozefiak et al., 2016; Seker et al., 2021). However, resilience-oriented perspectives highlight the role of some protective factors in promoting their adjustment and social inclusion (Ricchiardi & Coggi, 2019; Cassibba et al., 2023). This study, part of RESILAB project, addresses two objectives: (a) to identify practices aimed at reducing educational poverty among adolescents in residential care, and (b) to examine the protective factors that promotes their positive outcomes. A mixed-methods research combined data from focus group discussions and interviews with 9 professionals and questionnaires completed by 61 adolescents aged 11–17 (55.7% male) living in residential communities in Southern Italy, as well as their care workers. The measures examined included adverse childhood experiences, mentoring relationships, adolescents' sense of belonging to the residential setting, attachment, hope, resilience, and emotional and behavioral difficulties. Qualitative analysis identified three main strategies used to counteract educational poverty. Educational relationships: building a supportive alliance between adolescents and educators through empathy, counseling, and a nurturing relational environment. Structured educational planning: implementing individualized educational plans, annual activity programs, and practices that promote self-regulation and social competence. Participatory and networked approaches: encouraging cooperative learning within residential care and fostering collaboration with schools, local organizations, social and health services. Quantitative analyses showed that adolescents' difficulties were positively associated with adverse experiences ($r = .34$, $p < .05$) and negatively associated both with the time spent in residential care ($r = -.35$, $p < .01$) and with a stronger sense of belonging to the community ($r = -.29$, $p < .05$), suggesting that living for a longer period within a care setting that fosters a sense of belonging may support psychosocial recovery. Consistently, among protective factors, secure attachment ($r = -.36$, $p < .01$) and hope ($r = -.60$, $p < .01$), were negatively associated with emotional and behavioral difficulties, while no significant association emerged between mentoring and adolescents' adjustment. However, mentoring was positively associated with adolescents' sense of belonging to the residential setting ($r = .37$, $r = .43$, $r = .43$, $p < .01$) and with resilience ($r = .39$, $r = .37$, $p < .01$). Overall, the findings highlight the importance of strengthening relational and contextual protective factors to counteract educational poverty and promote adjustment among adolescents in residential care. Residential communities can serve as key educational environments that mitigate the impact of adverse experiences, foster resilience, and support more positive developmental and educational trajectories for vulnerable adolescents. From this perspective, residential care is part of a broader educational community in which multiple actors share responsibility for supporting the development of vulnerable minors. Strengthening these collaborative networks is crucial both during residential care and in supporting young people's transition to adulthood and social inclusion.

Tracing Inequalities to Foster Democratic Education: The Value of Longitudinal Data

PANEL CONVENORS: Veronica Mobilio (Fondazione per la Scuola, Italy); Gianluca Argentin (University of Milano-Bicocca, Italy); Ilaria Lievore (Fondazione per la Scuola, Italy)

PANEL KEYWORDS: Longitudinal data, educational inequalities, educational interventions

Educational achievement and the acquisition of basic skills are central not only to individual development and employability, but also to democratic participation, social cohesion, and equal opportunity. Despite sustained policy attention, persistent educational inequalities across Europe continue to undermine the principle of equal access to learning and participation. Longitudinal data represent a powerful but still underused resource for understanding and addressing educational inequality. By following students, cohorts, or schools over time, longitudinal approaches make it possible to identify when achievement gaps emerge, how they evolve, and which institutional and social factors shape learning trajectories - as highlighted in recent scoping and systematic reviews (Campos et al., 2025; Kampylis et al., 2024) and in comparative mapping work (Pavolini et al., 2025). From a policy perspective, longitudinal evidence also offers a more solid basis for evaluating the long-term impact of educational reforms and interventions aimed at improving basic skills, reducing early school leaving, and promoting equity. Strengthening the use of longitudinal data is essential for designing effective policies. This panel, proposed by Fondazione per la Scuola as coordinator of the Horizon Project LINEup (Longitudinal Data for INequalities in Education), aims to advance the debate on what drives educational inequalities over time, and how evidence-informed, student-centered policies contribute to more democratic education systems. We welcome theoretical, methodological, and empirical contributions that (a) use longitudinal approaches to analyse inequalities, (b) examine the long-term effects of compensatory or equity-oriented interventions, or (c) reflect on the democratic and policy implications of strengthening longitudinal evidence in education.

THE GLOBAL IMPACT OF THE PANDEMIC ON STUDENT OUTCOMES

Louis Volante (Brock University) · **Don A. Klinger** (Murdoch University)

Student Outcomes | Learning Losses | Pandemic

This paper provides a preliminary overview of the impact of the pandemic on K-12 student learning losses. The authors summarize some of the more salient trends documented globally in the aftermath of the pandemic such as deteriorations in cognitive and non-cognitive student outcomes such as socioemotional learning, mental and physical health. Examples of prominent education policies and interventions that have been adopted to address these cognitive and non- cognitive student outcomes will be highlighted. The authors describe the types of evidence that currently exist, and the strengths and limitations of the evidence used to enact pandemic related education policies. The introduction also explains the rationale for the selection of educational jurisdictions that are represented in a recently published Routledge volume. The introduction situates the importance of the volume within a broader global context, arguing that the pandemic and resulting research provides an illustration of the educational impacts of unexpected, devastating events that suddenly change the learning environment, and the differential impacts on these sudden changes on vulnerable student populations.

EDUCATIONAL INEQUALITY IN ITALY: PERSISTENT GAPS OR EMERGING CONVERGENCE? AN INTERTEMPORAL ANALYSIS USING OECD PISA DATA

Adamo Lo Cicero (Università "La Sapienza", Italy) · **Federica Rizzi** (Università "La Sapienza", Italy)

Social Inequalities in Education | Intertemporal Analysis | Multilevel Analysis

Educational inequalities continue to represent a structural and persistent challenge for contemporary school systems. This issue is especially pronounced in upper secondary education in Italy, where marked disparities in student performance persist across institutions and educational tracks. In this context, learning outcomes are strongly shaped by family background characteristics, such as socioeconomic status, cultural capital, and parental educational attainment, as well as by school composition factors (Giancola & Salmieri, 2020). In this analysis, educational inequalities are interpreted as the outcome of the interaction between individual and school-level factors: on the one hand, the mechanisms of reproduction of familial cultural capital through selective school processes (Bourdieu, 1971); on the other, differences in social and relational capital across school contexts (Coleman, 1988, 1990). The aim of this study is to examine the evolution of these inequalities over time by using OECD-PISA test scores in Italian (reading literacy) and mathematics as proxy indicators of learning outcomes. The analysis draws on data from the 2018 and 2022 assessment cycles, corresponding respectively to the pre- and post-pandemic periods, in order to evaluate the effects associated with school closures and the economic crisis following COVID-19. This intertemporal approach makes it possible to move beyond a static perspective and to observe changes in the mechanisms through which educational inequalities are produced over time. To analyze the effects of transformations over time, an intertemporal dataset was constructed by integrating the original database with time variables and interaction terms. Following a preliminary descriptive analysis, multilevel models and multiple linear regression models (four for reading and four for mathematics) were estimated in order to assess changes over time in the impact of family- and school-level factors (Jaccard & Turrisi, 2003; Giancola & Colarusso, 2020), through the progressive inclusion of variables. The baseline model included the main individual characteristics (gender and migrant background), as well as family and school characteristics, together with territorial controls. In subsequent models, interaction terms between family background, school composition, and time were introduced, first separately and then jointly, so as to estimate variations in their effects across the two waves. The empirical findings reveal a significant increase in the influence of both family-level factors (e.g., socioeconomic status) and school-level factors (e.g., the sociodemographic composition of classes) on educational inequalities, alongside a widening gap between advantaged and disadvantaged students. The pandemic appears to have intensified these dynamics, generating differential effects for more vulnerable groups. Overall, the evidence points to the need for targeted educational policies aimed at reducing structural inequalities within the Italian school system, promoting interventions grounded in a stronger equity-oriented perspective.

UNEQUAL CLASSROOMS: THE JOINT EFFECTS OF ABILITY PEER EFFECT AND SOCIOECONOMIC COMPOSITION ON ACADEMIC TRACK ENROLLMENT

Emanuele Fedeli (University of Milan, Italy) · **Moris Triiventi** (University of Milan, Italy)

peer effect | classroom composition | track enrollment

The effects of peer abilities in education are central to understanding how the individual educational pathway is shaped by social environments. Although tradi- tional theories emphasize positive spillovers from high-achieving peers, alternative perspectives such as social contrast hypotheses highlight potential negative conse- quences for student motivation and self-concept. In addition, much attention has been devoted to the important role of parental socioeconomic background, but less attention has been paid to its interaction with ability-peer effects. This study aims to investigate how the effects of peer ability and the socioeconomic composition of classmates influence the enrollment of students on the path to university when they switch to lower secondary schools in Italy. The results show that the average effect of peer ability is negative, but the socioeconomic composition of the classroom plays a compensatory role. In addition to that it comes out that low achievers are more hit by the peer comparison.

USING LONGITUDINAL DATA TO MONITOR THE TRUE DYNAMICS OF EDUCATIONAL INEQUALITIES

Nadir Zanini (Cambridge University, United Kingdom)

Educational inequalities | Longitudinal data | Multi-variate analysis

Attainment gaps are a key indicator of educational and societal inequalities. The analysis and reporting of educational attainment are often based on cross-sectional data and take the form of simple breakdowns of students' achievement by selected characteristics. These descriptive statistics, although relevant, are potentially misleading. They fail to account for the interplay between students' characteristics and, crucially, for information that is only available when longitudinal data is used. The aim of this presentation is to show the advantage of using longitudinal data for the systematic reporting of attainment gaps. From a methodological perspective, we will demonstrate that, despite their complexity, educational inequalities can be systematically measured and reported. More specifically, we will outline an analytical research strategy that makes use of micro-data gathered through schooling paths to account for the interplay between students' characteristics and other factors affecting their academic performance, most notably attainment at prior stages of education. From a more substantive perspective, we will present evidence on attainment gaps across different groups of secondary school students in a way that facilitates the identification of over-time trends in educational inequalities. We used the National Pupil Database, a rich administrative linked micro-dataset, maintained by the UK Department for Education. The dataset covers eight cohorts of students in England completing their lower- and upper- secondary education between 2018 and 2025. For all students, it features a broad set of characteristics at individual- and school-level recorded during their primary and secondary education. At student level, the dataset includes standardised measures of educational attainment, specifically at the end of primary, lower secondary and upper secondary education. It also includes socio-demographic characteristics (eg, gender, ethnicity, first language spoken at home, special educational needs), and socio-economic background. At school level, we used information on the type of schools attended, their geographical location, and a measure of deprivation. A multivariate analysis based on a regression approach was employed to measure the impact of each characteristic, once other factors were held fixed. To account for school-level effects, a multi-level regression approach was used. Each year's data was analysed separately, using the longitudinal component of the data as a crucial aspect of modelling academic performance. To interpret findings, a set of criteria was considered to flag changes over time in attainment gaps that were considered 'notable'. We will present evidence on attainment gaps for students taking different education pathways in England. We will focus on the dynamics of educational inequalities between 2018 and 2025, drawing conclusions on the impact of the assessment arrangement put in place in 2020 and 2021 as a response to the pandemic and the return to a 'new normal'. We will show the mitigating (or some-

times exacerbating) effects that the longitudinal information on prior attainment and the school-level characteristics can have on the estimation of attainment gaps. In this way, it will be possible to argue that collecting and making available rich longitudinal micro-data is key to producing evidence on the true dynamics of educational attainment.

MULTI-AGENCY DATA SHARING FOR SCHOOL DROPOUT PREVENTION: EVIDENCE FROM A LOCAL ITALIAN CONTEXT

Arianna Beri (Università degli Studi di Bergamo, Italy) · **Laura Sara Agrati** (Università Telematica Pegaso, Italy) · **Marco Lazzari** (Università degli Studi di Bergamo, Italy)

school dropout · education agency · longitudinal models

School dropout is a complex and persistent phenomenon with significant and concerning repercussions at both the individual and social levels. At the individual level, it affects employment, health and well-being, while at the social level, it fosters greater economic and social inequalities and hinders the development of a more equitable and inclusive society. Given the potential consequences of school dropout for individuals and society, preventive intervention is not only a priority, but also an ethical necessity. However, although research shows that dropping out is not a sudden act, but rather the result of multiple factors, the data currently available at national and international levels is often inaccurate, fragmented and «ex post», i.e. collected months or even years later. Consequently, longitudinal models that use Big Data to monitor students' pathways over time are needed. This will allow us to identify situations of student hardship early on and intervene before they result in school dropout. Based on these premises, the present study stems from a doctoral project carried out in collaboration with the municipality of X in Italy. The aim was to build a shared system for data collection and management among the various local educational agencies to improve monitoring of school dropout through longitudinal, continuous and updated data. In this context, the models used by five educational agencies in the X area were examined (the Ministry of Education, the Province, and the Vocational Education and Training department). A comparative and documentary analysis of the surveyed data and systems highlights significant heterogeneity in the methods used to collect, manage and measure the school dropout rate. While the sources demonstrate some operational differences, they also exhibit structural issues that hinder an integrated interpretation of the phenomenon. In general, there is a lack of clear definition of the construct, a problem that has already been highlighted in the literature, which leads different agencies to measure the phenomenon using different and often non-overlapping variables, such as dropouts, withdrawals and transfers. Similarly, most models use a data collection system at specific moments (e.g. the end of the school year or transition between cycles) which does not allow for timely intervention with students, but which, as previously mentioned, provides data referring to months or even years earlier. Some differences instead concern the scope of coverage: these range from the Ministry of Education and Merit, which is responsible for schooling and ensures coverage across the entire territory, to three education and training systems (therefore relating to a more limited student population), up to the Province, which, despite having access to a large amount of data, responds more to planning purposes than evaluative ones and therefore does not deal with analyzing the phenomenon. This fragmentation confirms what has emerged in national and international literature and makes the need for shared data systems among agencies operating in the same territory, including both education and training, even more urgent. From this perspective, data integration is essential for the effective and timely prevention of school dropout.

ACHIEVEMENT GAPS ACROSS SCHOOL STAGES: EDUCATIONAL TRAJECTORIES OF MIGRANT-BACKGROUND STUDENTS IN ITALY

Anna Loi (University of Milan-Bicocca, Italy)

migrant-background students | achievement gaps | longitudinal data

Taking advantage of the possibility offered by INVALSI data to link students' performance over time, this study investigates the educational trajectories of students with a migrant background in the Italian school system, focusing on the evolution of achievement gaps. Specifically, it examines whether second-generation students' academic outcomes progressively converge toward those of native students, as predicted by classic theories of generational progress, while first-generation students experience a more persistent disadvantage (Portes & Zhou, 1992; Alba & Nee, 1997). Although evidence on generational progress is substantial, it largely refers to traditional immigration countries. Research on the Italian context has often been limited by the historically smaller presence of second-generation students (Azzolini et al., 2012) and by the lack of longitudinal data (Lovaglio et al., 2018). This study exploits population-based standardized assessments of reading and numeracy administered by INVALSI. The analysis follows a cohort of students who attended Grade 5 in the 2018/19 school year through lower secondary school (Grade 8 in 2022/23) and into the second year of upper secondary education (2023/24). The study addresses two main research questions. First, do second-generation students display greater convergence toward native peers than first-generation students over the course of their school trajectories? Second, to what extent are these differences explained by socio-economic background? To answer these questions, the analysis reconstructs the evolution of achievement gaps between migrant generations and native students across school stages. The empirical analysis relies on OLS models controlling for survey wave to estimate the relative position of first- and second-generation students compared with native peers at different points in their school careers. Overall, the study contributes to the understanding of migration-related educational inequalities by providing longitudinal evidence on how achievements gaps between migrant generations and native students evolves across different stages of school careers.

ETHNIC GAPS IN TRACKING CHOICES WITHIN THE COVID-19 TIMELINE

Francesca Carimando (University of Bologna) · **Loris Vergolini** (University of Bologna; University of Bologna - FBK-IRVAPP)

Track choice | Migration background | COVID-19

Introduction The transition from lower- to upper-secondary education represents a decisive juncture in students' educational trajectories, with long-term consequences for academic achievement, labour-market outcomes, and social mobility. In Italy, this transition occurs at the end of Grade 8, when students choose whether to enrol in an academic, technical, or vocational track. While a growing body of research has documented learning losses associated with the COVID-19 pandemic, less attention has been paid to its influence on educational decision-making at key branching points (Aalto et al., 2023; van de Werfhorst et al., 2023). Disruptions to in-person schooling, counselling activities, and teacher-family interactions, combined with economic uncertainty, may have altered how families evaluated the risks and returns of upper-secondary tracks. Ethnic inequalities in Italian education are well documented (Azzolini & Barone, 2013). Even net of academic performance, students with a migration background are less likely than natives to enrol in academic tracks and more likely to enter technical or vocational programmes (Ferrara & Brunori, 2024). The pandemic may therefore have reinforced employment-oriented decisions among disadvantaged families, potentially widening pre-existing ethnic gaps. This study examines whether the COVID-19 pandemic influenced upper-secondary track choices and whether these changes differed between native children and children of immigrants. Data and methods The analysis uses population data from INVALSI-SNV, longitudinally linked to follow students from Grade 8 into Grade 10. Two cohorts are observed: a pre-Covid cohort in Grade 8 in 2016/17 and Grade 10 in 2018/19, and a Covid cohort in Grade 8 in 2020/21 and Grade 10 in 2022/23. The cohorts are pooled and analysed through a multilevel multinomial logistic model with school-level random intercepts, random slopes for the Covid cohort, and provincial fixed effects. The outcome variable is upper-secondary track choice (academic, technical, vocational). The main independent variable is migration background, distinguishing native, mixed-origin, second-generation and first-generation students. An interaction term between migration background and cohort is added. Four models are estimated. Model 1 controls for gender, regularity of school progression, attendance of early childhood education. Model 2 additionally includes parental socioeconomic status. Models 3 and 4 further control for prior academic achievement, measured using students' lower-secondary grades in Italian and mathematics in Grade 8 (Model 3) and standardised test scores in the same subjects (Model 4). Preliminary findings Results show persistent ethnic stratification in track choice. In Model 1, second- and first-generation students are more likely than natives to enrol in technical and vocational tracks rather than academic ones, with stronger shifts towards non-academic tracks in the Covid cohort. In Model 2, controlling for parental socioeconomic background reduces these differences, but they do not disappear. The key findings emerge in Models 3 and 4, which account for prior achievement using alternative measures. When achievement is measured through lower-secondary grades (Model 3), Covid-by-migration interactions become statistically insignificant. However, when achievement is measured using standardised test scores (Model 4), significant post-Covid interactions persist, particularly for second-generation students, who show an increased likelihood of entering technical and vocational tracks rather than academic ones.

STUDENT VOICE AND DATA HERMENEUTIC TO FOSTER COLLECTIVE LEADERSHIP AND THEREFORE EDUCATIONAL JUSTICE. THE MONITORING, EVALUATION AND LEARNING OF TEACH FOR ITALY

Antonio Piscopo (Teach For Italy, Italy)

collective leadership | educational justice | data hermeneutic

What is the purpose of education? The answer to this question can go in very different directions, and mostly depends on the context an educational effort is engrained into and the goals it pursues, explicitly and implicitly. Defining a context and the sets of goals pursued there is also not an easy task. For sure the context - whatever metaphysics characterises it - influences education greatly. The opposite is also true, just less seen: education influences the context, mostly in the effort - in some cases consciously, in some probably not - of reproducing or consolidating it. Authors like John Dewey, those of the so-called "Frankfurter Schule" and Martha Nussbaum centred many of their reflections on understanding and describing these peculiar dynamics. This contribution to this panel aims to illustrate a pedagogical practice developed on one assumption: Democracies are not a given, and their constitutions are perishable products of history if the promises of equality of opportunities for every citizen and therefore of freedom - both positive and negative - made at their origins are not taken seriously. There are many factors that play a significant role in whether the foundational promise of equality, freedom and justice are kept or not, and to what degree. Education is one of these factors, and it can and should do more to make democracies and their promises attainable and sustainable. This is the reason why promoting equity of opportunities, justice, is key. Promoting educational justice in disadvantaged contexts is the mission of Teach For Italy. The practice I'll be presenting was designed and implemented to help the classrooms where Teach For Italy fellows teach in being places that foster student leadership, well-being and inclusion, while centering on "Student Voice" as one of the elements that constitute a Monitoring, Evaluation and Learning system. A Monitoring, Evaluation and Learning system that has the peculiarity of being an instrument for collecting data (quantitative and qualitative evidence) generated by students, as well as their parents and teachers, which serves the principle of a collective hermeneutic circle. All involved stakeholders are actively participating not just in the process of generating data, but also - and equally essentially - in interpreting them, making sense of them for the purpose of enhancing dialogue, sense of belonging, reflection, wellbeing - advanced citizenry capabilities. The paper ultimately argues that longitudinal data acquire democratic value when they enable institutions to recognize patterns of inequality, deliberate collectively about their meaning, and act intentionally to transform them. In this sense, tracing inequalities becomes a concrete pathway toward fostering democratic education.

SCHOOL ADMISSION PRIORITY RULES ACROSS COUNTRIES: DIFFUSION PATTERNS AND SEGREGATION EFFECTS

Andrea Pietrolucci (Università di Milano, Italy) · **Nathalie Vigna** (Università di Milano, Italy)

Educational policies | school segregation | longitudinal

Education systems have been reshaped in response to the social challenges of globalisation, including changing labour markets, migration dynamics, and processes of individualization (van de Werfhorst 2014). In this context, many countries have adopted quasi-market reforms in education (Ichilov 2012), inspired by economic theory (Friedman 1962; Chubb and Moe 1990) and by international organisations (Sellar and Lingard 2013). Neoliberal education policies have promoted

school autonomy, privatisation, and accountability (Levačić 1995; Clark 2009). These reforms have intensified competition among schools, encouraging strategies to attract or select higher-performing students. Among these strategies, school priority rules for admission have become increasingly important. Schools may use criteria such as prior achievement, recommendations from schools or parents, catchment-area requirements, and interest in specific programmes. However, the consequences of these rules for socio-economic segregation between schools remain insufficiently understood. This study examines the diffusion of school priority rules across countries, distinguishing between performance-based and residence-based criteria, and investigates their effects on socio-economic segregation between schools. It addresses four research questions: (RQ1) Are schools increasingly adopting performance-based and residence-based priority rules? (RQ2) Is the diffusion of these rules greater in countries where they were initially less widespread, suggesting convergence over time? (RQ3) Does the adoption of these policies increase socio-economic segregation between schools, and which type has the strongest effect? (RQ4) Do performance-based and residence-based rules have cumulative effects when adopted jointly? We use data from all eight waves of OECD-PISA, from 2000 to 2022. The analytical sample includes more than 122,000 schools in 72 countries, corresponding to 465 country-year observations. A school is defined as adopting priority rules when the principal reports that residence in an area or students' academic record is sometimes or always used as an admission criterion. To address RQ1, we describe the share of schools adopting each rule across PISA waves. For RQ2, we estimate regression models in which the change in the share of schools adopting these policies between T and T–1 is regressed on the share observed at T–1. For RQ3 and RQ4, we regress the level of segregation between schools on the share of schools adopting residence-based and performance-based rules. Segregation is measured using the dissimilarity index (Duncan and Duncan 1955) for students' ESCS, gender, and migrant background. These models include country fixed effects. Preliminary findings are presented for RQ1 and RQ2; analyses for RQ3 and RQ4 will be completed before the conference. Preliminary results show different diffusion patterns for the two rules. Residence-based rules remained stable, increasing from an average of 55% of schools in 2000-2009 to 60% in 2012-2022. By contrast, performance-based rules grew substantially, from 48–52% in 2003–2009 to 65% in 2015, before declining to around 55% in 2018 and 2022. Results for RQ2 indicate that both types of rules tend to spread more rapidly where prior adoption was lower, while growth is more limited where adoption is already widespread. This pattern is robust to nonlinear specifications, suggesting cross-country convergence in the diffusion of priority rules. Analyses will explore ceiling effects and geographical heterogeneity.

Urban Education, Gentrification and School Segregation: Implications for Education and Social Justice

PANEL CONVENORS: Marcel Pagès (Universitat de Barcelona, Spain); Xavier Bonal (Universitat Autònoma de Barcelona, Spain); Sheila Gonzalez (Universitat de Barcelona, Spain)

PANEL KEYWORDS: School Segregation, School Gentrification, Educational Inequalities

Cities have become central arenas where contemporary social tensions are concentrated, including widening inequality, persistent poverty, and growing socio-spatial polarization (Musterd et al., 2017). In these contexts, education systems face pressing patterns of segregation and inequalities (Bonal & Bellei, 2018) undermining the role of education in promoting social cohesion, equitable learning opportunities, and democratic participation. Moreover, processes of urban transformation and gentrification often exacerbate divisions, limiting the potential of education to act as a lever for social justice (DeSena, & Ansalone, 2009). This symposium, as part of the Thematic Axis 6, directly addresses the conference theme on the "multidimensionality of poverty" by examining how urban educational landscapes are reshaping educational experiences, identities and processes of teaching and learning in contexts of social and cultural heterogeneity. The session aims to explore the complex and interconnected relationships between urban transformation and educational inequality, as well as its broader implications for democracy and social cohesion. We welcome contributions that investigate: - The impacts of gentrification on school choice, enrolment dynamics, socio-economic composition and identities and experiences of educators, families and students - Mechanisms and consequences of school segregation and gentrification in urban settings - Desegregation initiatives, inclusive policies, and community-based practices designed to counteract these trends Bringing together empirical research, policy analysis, and critical theoretical perspectives, the panel seeks to open a space for debate on the opportunities and limits of education to confront structural injustices and foster democratic coexistence in rapidly changing urban environments.

IT DEPENDS ON WHERE YOU LOOK FROM: THE JOINT INFLUENCE OF RESIDENTIAL NEIGHBORHOODS AND SCHOOLS' SURROUNDING AREAS ON SCHOOL CHOICE

Quentin Ramond (Centre for Economics and Social Policy, Universidad Mayor, Chile) · **Cristóbal Ortiz** (Millennium Nucleus Insecurity and Urban Cohesion, Chile)

school choice | neighborhood effects | territorial stigma

Previous studies show that the characteristics of both families' residential neighborhoods (e.g., Burdick-Will et al., 2024; Candipan, 2020; Scandurra et al., 2020) and schools' surrounding areas (e.g., Bell, 2009; Bernelius et al., 2021; Hailey, 2025) influence school choice behavior, but few have analyzed these contexts simultaneously. In this article, we integrate research on neighborhood effects, territorial stigmatization, and school choice to advance the argument that the effect of school surroundings on enrollment decisions operates not only in absolute terms but also relative to families' place of residence. The neighborhoods in which families live, we suggest, may shape how they perceive and act upon the characteristics of schools' surrounding areas when making school choices. Importantly, we anticipate that these dynamics may vary by social class, given the salience of class in shaping perceptions of urban space and school choice strategies. Does the influence of schools' surrounding areas on enrollment decisions depend on families' residential contexts? Do these relative effects vary across social classes? To address these questions, we assemble a unique dataset that combines geocoded administrative data from the Chilean School Admissions System with several sources of information at the census block level. We examine how violence and deprivation levels around schools and students' homes jointly influence secondary school choice. We focus on two outcomes that capture the key stages of the school choice process: the likelihood of applying to a school and the ranking of applications. Results of our regression models indicate that absolute levels of violence and deprivation around schools reduce the likelihood of applying to a school and the probability that it is ranked higher. Families are also more likely to list and rank higher schools located in comparatively wealthier neighborhoods than their place of residence. The results for relative violence levels are mixed. Deprivation matters more in the construction of application lists, whereas violence has stronger effects in ranking decisions. These effects are more pronounced among high-SES students, and this class-based variation reflects not only structural differences in choice set attributes but also differences in preferences. A set of sensitivity analyses indicates that these findings are robust to the use of many alternative measures of school surroundings, choice sets, and model specifications. Overall, our findings

emphasize the interaction between schools' geographic surroundings and families' residential neighborhoods in understanding the link between spatial inequality and school choice. We suggest that the residential neighborhood serves as a baseline context from which parents form judgments about other neighborhoods and the schools located within them, ultimately influencing their enrollment decisions. Beyond school choice, the framework developed in this paper may improve how scholars study contextual effects on individual behavior, by considering the joint influence of the urban contexts in which people and institutions are embedded.

ELECTIVE BELONGING AND THE GENTRIFIER HABITUS: SCHOOL CHOICE, MORAL DILEMMAS, AND URBAN INEQUALITY

Xavier Bonal (Universitat Autònoma de Barcelona, Spain) · **Pablo Neut** (University of Barcelona, Spain)

Gentrification | elective belonging | displacement

This study investigates the role of gentrifying families in Barcelona's public schools, examining how their school choice practices intersect with broader processes of class reproduction and urban transformation. Drawing on the concept of a gentrifier habitus we argue that middle-class families' decisions cannot be reduced to pragmatic calculations of school quality. Rather, they engage in complex moral reasoning and risk management, navigating perceptions of safety, school reputation, and social fit while simultaneously constructing narratives about what counts as legitimate participation in school communities. These rationalities of school choice (Bonal et al. 2024) are deeply embedded in culturally and socially informed dispositions that reproduce class advantage. In gentrifying neighbourhoods, families actively assert elective forms of belonging, assuming the authority to represent the school and to define the norms of inclusion within both the educational community and the wider neighbourhood (Reay et al. 2011). This elective belonging generates a sense of entitlement for gentrifiers while simultaneously masking and reinforcing exclusion and displacement among long-term residents (Lipman, 2011). The paradox is striking: gentrifiers seek integration into local schools and neighbourhoods, yet their claims to representation and influence often undermine the participation and voice of historically established communities (Saporito & Sohoni, 2006). These dynamics illustrate how gentrification shapes public schooling beyond mere demographic shifts. While the presence of middle-class families may diversify urban schools numerically, the social and cultural influence they exert through elective belonging can entrench inequalities, privileging certain values, expectations, and forms of participation over others (Posey-Maddox et al., 2016). The interaction of risk management, moral reasoning, and classed rationalities in school choice highlights the subtle mechanisms through which urban inequalities are reproduced, even within institutions nominally open to all. By integrating insights from school choice, class reproduction, and urban sociology, this study underscores the paradox of integration and displacement. Inclusion for some—defined through self-authored belonging and assumed representation—coexists with marginalization for others, resulting in differentiated access to educational opportunities and reinforcing broader patterns of urban inequality. Understanding the elective rationalities of gentrifiers is thus essential for both research and policy aiming to address inequities in public schooling under conditions of rapid urban change.

PARENTAL PREFERENCES AND THE REPRODUCTION OF SCHOOL SEGREGATION – EVIDENCE FROM A CHOICE EXPERIMENT LINKED TO REGISTER DATA

Andreas Alm Fjellborg (Uppsala University, Sweden) · **Håkan Forsberg** (Uppsala University, Sweden)

School choice | Segregation | Parental preferences

How do parental preferences for compulsory schools vary along ethnic, socioeconomic, demographic, and geographic lines? In particular, is school reputation equally important across groups, or does its salience vary systematically across the population and across different residential contexts? This study examines how key school attributes shape parental preferences in an educational landscape characterised by free school choice. We pay particular attention to the role of school reputation and assess whether its importance differs between groups defined by education, income, ethnic background, and residential context. Furthermore, we examine whether preference structures are homogeneous across areas with different socioeconomic and demographic compositions, or whether similar groups express different priorities depending on local context. To analyse parental preferences and their variation across background characteristics, we conducted a survey including a choice experiment (Davidson et al. 2022; Thompson 2024) and linked the responses to register-based data on place of residence, income, educational attainment, household composition, and labour market attachment. Parents' residential locations were identified on a 100 × 100 metre grid, and survey responses were linked to Swedish register data by Statistics Sweden. The survey was distributed to all households in two Swedish municipalities (N = 4,526 households) with a child about to enter compulsory school, nine months before school start and one month prior to the school choice deadline (response rate: 29%, n = 1,293 households). Access to full-population register data enables us to assess response patterns and potential representation bias across social groups. The choice data are analysed using Mixed Logit (MXL) models, allowing for random preference variation and systematic heterogeneity across respondents (Louviere, Flynn, and Carson 2010; McFadden and Train 2000). The results show strong preferences for proximity, experienced teachers, and municipal rather than private providers. Parents also express systematic preferences regarding the ethnic composition of schools. However, preferences are not evenly distributed across the population. The importance of ethnic composition and school reputation varies significantly with parental education and income. Highly educated and high-income parents place greater emphasis on their child attending the same school as friends, highlighting the role of pre-school peer networks in shaping subsequent school choices. These findings suggest that preference heterogeneity – particularly regarding school reputation and social composition – may contribute to sustaining or reshaping patterns of school segregation in systems with free school choice.

ANALYSING SCHOOL GENTRIFICATION IN BARCELONA: OPERATING MECHANISMS AND IMPLICATIONS FOR PUBLIC POLICY

Andreu Termes (Institut Metròpoli, Spain) · **Pablo Neut** (Universitat de Barcelona, Spain) · **Nur Garcia-Borés** (Universitat Autònoma de Barcelona, Spain)

Urban gentrification | school gentrification | public policies

Urban gentrification is a global phenomenon that has physically and socially transformed 21st century cities. Although in recent years, several studies have addressed the relationship between gentrification and school segregation (e.g., Boterman, 2020), academic outcomes (e.g., Pearman and Steyer, 2023), and family participation (e.g., Posey-Maddox, 2014), the academic literature has tended to focus on Anglo-Saxon and Northern European environments, overlooking the specific characteristics of Southern European settings. Precisely, this presentation analyses school gentrification processes in Barcelona as an exploratory case study. The presentation is based on the GENTRED project, "The effects of gentrification on educational inequality" (Ref: PID2022-137183NB-I00), led by Dr. Xavier Bonal. Methodologically, the project is based on a mixed methodology, although this presentation will focus on the qualitative dimension of the analysis and fieldwork. This analysis is interpreted as a critical case study, to test theories and hypotheses in situations where they are more likely to be true (Yin, 2018). Based on this approach, different sources have been triangulated: documentary analysis (e.g., websites, school educational projects, promotional materials), interviews, and observations at open house events. The sample stratification followed complementary strategies: two Barcelona neighbourhoods have been identified with high rates of urban gentrification (López-Gay et al., 2021); in these neighbourhoods, six schools have been selected with changes in their composition similar to those observed in their neighbourhoods. The fieldwork included 52 interviews, with families (n=17), teachers (n=16), principals (n=15) and key informants from the administration (n=4); in addition, we conducted six observations in open days. The analysis describes the specific characteristics of urban gentrification in the city, especially transnational migrations and intensive touristification (Arbaci, 2019; Cocola-Gant and Lopez-Gay, 2020; Janoschka et al., 2014). These characteristics are shared with other urban areas in the Mediterranean. The analysis highlights that the specific characteristics of urban gentrification in the city strongly condition the dynamics of school gentrification. Furthermore, the article inductively identifies seven mechanisms that explain how school gentrification occurs: (1) the second-order competition strategies of schools in the process of gentrification; (2) school legitimation through a pro-diversity discourse; (3) the pedagogical legitimation of school change; (4) the work of delimitation and symbolic signaling; (5) social homophily as a mediator of school decisions and relationships; (6) pro-equity axiological dispositions; and (7) the moral rationalization and reconfiguration of the social identity of gentrifiers. We suggest that school gentrification has a primarily material basis, while cautioning to conceive school gentrification as a mere passive by-product of urban gentrification and segregation. On the contrary: school gentrification is actively (re)produced through the actions of various actors (schools, families and administrations), with an important degree of agency and reflexivity – especially on the part of those with greater cultural capital. The presentation concludes with a series of recommendations for public, urban, and educational policies to mitigate the adverse effects of school gentrification. Those recommendations are particularly applicable to similar urban contexts, i.e., Southern European cities affected by transnational migrations and intense touristification.

GENTRIFYING NEIGHBOURHOODS AND SCHOOLS COMPOSITION. DIVERSE OUTCOMES IN A TRANSFORMING CITY

Marta Cordini (Polytechnic of Milan, Italy) · **Andrea Parma** (Polytechnic of Milan, Italy)

gentrification | school composition | urban trasformations

Several cities have been intensively interested by processes of gentrification, often triggered or accelerated by important urban changes. The consequences of these transformations have gone also far beyond the housing and the neighbourhood dimensions, affecting also schools. The city of Milan have been interested in the last decade by several relevant urban transformations and important and scattered processes of gentrification, that have developed in a quasi-market educational system, characterized by an extensive freedom of choice, a high presence of private and subsidized school and a strong competition. This study explores the effects on the composition of local schools of urban and social transformations at neighbourhood scale, focusing on the case of Milan. The analysis takes into consideration neighbourhoods characterised by an increase in the share of residents with university degrees and employed as managers and professionals. The selection builds on socio-economic and demographic data at neighbourhood level. The five selected neighbourhoods are at different stages of the process of change that has been set in motion by different drivers such as housing estate projects, urban renovation or mega-events. The contribution then follows by analyzing trends in local school enrolment highlighting whether and to what extent the change in the socio-economic profile of the neighbourhood have led also to a change in the schools' composition. Results show a variety of outcomes as specific local educational landscape can affect the choice patterns of parents, the relationship among schools and with the surrounding territories. Overall the study highlights on one hand the need for further research on the relationship between urban trasformations and the reproduction of educational inequalities, and on the other hand it signals the need for a policy agenda that takes into account these intertwined consequences of urban changes at neighrbouhdoor and school level.

THE DESIRED, THE SAVIOUR AND THE INTRUDER: PUBLIC SCHOOLS' PERCEPTIONS AND LOGICS OF ACTION UNDER URBAN GENTRIFICATION

Nur Garcia-Borés (Universitat Autònoma de Barcelona, Spain) · **Marcel Pagès** (Universitat de Barcelona, Spain)

School perceptions | School's logics of action | School gentrification

With the advent of globalisation, many European cities are undergoing accelerated social and urban change, with urban gentrification emerging as a key process. In education, while early research showed that middle-class families historically tended to opt out of local schools in gentrifying areas, more recent studies reveal a shift in these patterns. In gentrified environments, some middle-class families are becoming increasingly inclined to enrol their children in local schools, driven by progressive narratives (Posey-Maddox et al., 2014; Freidus, 2019). However, less is known about how their arrival is experienced by school actors and how it translates into different logics of action (Van Zanten, 2009). This paper aims to address this gap with a focus on Barcelona, a city encompassing areas with a strong presence of urban gentrification (López-Gay et al., 2021), where the controlled choice system enables strategic behaviour within and beyond school choice. Adopting a qualitative approach, the study explores how gentrification processes affect school perceptions and logics of action. More specifically, it draws on a comparative case study of six public primary schools that have recently undergone substantial transformations linked to sharp urban changes. School rationalities are examined through the cross-analysis of semi-structured interviews with teachers and school leaders, as well as observations during schools' open days. Based on school actors' narratives, three drivers of educational change are identified, which vary across cases in both nature and influence. First, educational policies, operating both as constraints and catalysts for changes in school composition. Second, surrounding urban transformations, generally shaping opportunity structures for school change.

Third, schools themselves, promoting various internal and external strategies aimed at triggering specific educational changes. In this regard, the paper identifies three main perceptions through which school actors interpret the arrival of 'gentrified' families. First, these families are seen as the "desired" profile by schools experiencing low or declining middle-class enrolment despite their growing local presence. Second, schools that have strategically pushed for and increased middle-class enrolment often frame new families as "saviours" of the school. Finally, schools that receive this profile more passively tend to perceive them as "intruders", particularly when friction arises around intense forms of parental participation. These perceptions connect with particular logics of action, which are strongly shaped by the nature and intensity of schools' attraction of this new population. One logic, "resistance" -often coupled with sense of loss and nostalgia-, occurs when schools perceive declining middle-class appeal and are compelled, primarily by policy mandates, to include more disadvantaged students. Another, "accommodation", emerges in those schools that, primarily due to urban shifts, experience increased enrolment and participation from new middle-class families. A third, "conversion", arises when schools actively implement consistent strategies to promote themselves, attracting the attention of more affluent families and embracing transformation as a successful result of school renewal efforts. In conclusion, public schools perceive change in varied ways and develop diverse logics of action within gentrifying contexts. These findings reflect schools' agency and their capacity to interpret and respond to structural constraints, while also shaping educational dynamics.

MIDDLE-CLASSES FACING DESEGREGATION AND DIVERSITY IN SCHOOLS: THE AMBIVALENCES OF SOCIAL MIXING POLICIES IN CATALONIA

Marcel Pagès (Universitat de Barcelona, Spain)

School segregation | school choice | middle classes

Recent school admission policies in Catalonia, particularly those based on reserved quotas for vulnerable students, have contributed to a significant reduction in school segregation. However, these measures have shown more limited effects in schools with a high concentration of socially vulnerable students. In this context, a group school enrolment policy has emerged as an innovative instrument aimed at reversing this trend. The policy allows groups of non-vulnerable families, mostly from middle-class backgrounds, to enrol together in entry grades of early childhood and secondary education in schools serving highly disadvantaged populations. The policy assumes that school choice may acquire a collective dimension and that some segments of the middle classes may be willing to choose socially diverse schools when this decision is made in group and under specific institutional conditions. Building on this context, this paper analyses how middle-class families who access socially disadvantaged schools become involved in and position themselves within school communities. More specifically, it examines the motivations underpinning these decisions, the social and emotional mechanisms shaping both school choice and school experience, and the organisational dynamics that emerge in schools following the arrival of these groups. More broadly, the paper contributes to debates on the role of middle-class families in desegregation policies and on the tensions that may arise between redistributive aims and processes of recognition and representation within school communities. While school choice has often been understood as an individualised strategy through which middle-class families mobilise resources to maximise educational advantage (Ball, 2003; Van Zanten, 2003), a growing body of research suggests that, under certain conditions, school choice may also incorporate moral, political, and normative considerations linked to equity, diversity, and commitment to public education (Wilson, 2021; Posey-Maddox et al., 2014; Freidus, 2019). From this perspective, school choice is approached here as a situated social practice in which educational rationalities, moral commitments, emotional responses, and dynamics of social distinction are articulated simultaneously. Methodologically, the paper draws on a qualitative research design combining in-depth interviews with families, school leaders, and policy actors, together with observation in school and community

spaces linked to the implementation of the policy. This approach makes it possible to analyse both the meanings families attach to their decisions and the institutional responses developed by schools. Findings show that participation in group school enrolments is shaped by a combination of normative commitments, emotional uncertainty, and collective dynamics. While many families frame their decision in terms of support for public education and social mixing, collective enrolment also helps reduce perceived risk and facilitates the mobilisation of social capital. At the same time, these processes may generate ambivalent effects within schools, including forms of social closure, differentiated patterns of participation, and organisational adaptations oriented toward retaining and attracting these families. Overall, the paper argues that group-based school enrolments may open innovative pathways toward school desegregation, but they also raise important questions about symbolic power, representation, and inequality within diverse school communities.

Meritocracy, Educational Inequalities and Democratic Transformations Across Contexts

PANEL CONVENORS: Orazio Giancola (Università di Roma "Sapienza", Italy)

PANEL KEYWORDS: meritocracy, inequality, democratic transformation

The panel explores the intersections between meritocracy, educational inequalities, and democratic transformations across diverse contexts, examining how educational practices, social perceptions, and public policies shape access, participation, and educational justice. Contributions address multiple dimensions: from the experiences of rural female students in China, navigating the tensions between enchantment and disillusionment with meritocracy, to the perceptions of British undergraduate students regarding meritocracy in elite higher education institutions; from inequalities and discrimination in Brazilian education, with reference to the notion of "racial democracy," to educational poverty in Abruzzo and the counter-practices implemented to address it. Additional contributions investigate governance and educational innovation in small schools in inner areas and propose new democratic paradigms for public education in multicultural societies, highlighting strategies to foster equity, inclusion, and active participation.

INEQUALITIES AND DISCRIMINATION IN BRAZILIAN EDUCATION: A 'RACIAL DEMOCRACY'?

Lucio Esposito (Fondazione Quarta - De Matteis ETS, Italy) · **Sandra Macedo** (Petrobras Rio de Janeiro) · **Sunil Kumar** (King's College London) · **De Matteis Alessandro** (Fondazione Quarta - De Matteis ETS, Italy)

Educational Inequalities | Discrimination | Racial Democracy

Racial miscegenation and the absence of a legal framework that explicitly discriminated against black people fuelled the idea of Brazil as a racial democracy (Freyre 1933), characterised by a "paradisiac innocence, with respect to differences of race" (Park 1942, p.xix). For over half a century, when claims of racial superiority and apartheid regimes seemed to be the norm across continents, the myth that races in Brazil coexisted harmonically was well spread worldwide (Telles 2004). While Freyre's writing offered formidable opposition to the spread of scientific racism in the 20th century (Skidmore 2002), it also fostered a romanticised view of Brazil as a country which had no racial problems. Race dynamics were, however, far from innocent. Skin colour patterned a range of socioeconomic inequalities in Brazilian society, challenging the long-standing perception of Brazil as a symbol of social justice with respect to race. Pervasive and persistent racial inequalities with low social mobility of non-white population came to be widely documented (Ribeiro 2006). Yet, for long time, the significance of racial disparities failed to be fully appreciated, as these were masked by, confounded with and blamed upon inequalities along other socioeconomic axes such as wealth and class – leading to an underestimation of the crucial role of race in shaping Brazilian society (Valente 2017). This paper examines racial inequalities in educational

attainment in Brazil. Specifically, we use multiple waves of national secondary-school exams data (N>9 million), and employ fixed-effect and Oaxaca-Blinder-decomposition regressions to investigate racial educational gaps between Blacks, Mixed-race and Whites. Beyond its size and coverage, our data is of particular significance as this exam plays a critical role for university admission. Aiming to increase access to higher education by allowing students to apply to universities across Brazil (Mello 2022), it is a vital tool to provide educational opportunities and enable social mobility in a country marked by striking socioeconomic inequalities. We find that outcomes are markedly lower for both Blacks and Mixed-race compared to Whites. Although a substantial portion of racial disparities can be attributed to socioeconomic status, racial inequalities persist after controlling for socioeconomic, demographic and contextual characteristics, as well as when looking at specific subsamples which are homogeneous across socioeconomic lines. We also find support for the so-called 'mulatto escape hatch' hypothesis, namely the existence of a significant difference in outcomes between Blacks and Mixed-race – originating in the latter's possible lower exposure to discrimination practices compared to Blacks. Mixed-race students have higher scores compared to Blacks: differences are small in magnitude but robust and statistically significant, and are more marked amongst those in higher socioeconomic strata as well as in Southeastern and Southern regions. In addition, over the decade under consideration, the Black-Mixed gap appears to have widened. Beyond the assessment of racial disparities in Brazilian education, our paper therefore also contributes to the methodological debate on whether to conceptualize race as a three-tiered or a binary (non-white-white) categorisation for the purposes of research and policy, illustrating that treating non-whites as a monolith can ignore important nuances.

EDUCATIONAL POVERTY IN ABRUZZO AND IMPLEMENTED COUNTER-PRACTICES

Adele Bianco (Università "G. d'Annunzio", Italy) · **Luca Santonetti** (Università "G. d'Annunzio", Italy)

Educational poverty | Early school leaving | Territorial disparities

This paper analyses educational poverty in the Abruzzo region. It begins by situating Abruzzo within the national and European context, drawing on the BES territorial reports for Abruzzo (ISTAT, 2025) and cross-referencing this data with national and European indicators of educational inequality (ISTAT, 2024–2025; EU Education and Training Monitor, 2025). The study then maps the structural dimensions of educational disadvantage in the region, revealing its liminal position: Abruzzo ranks last among the more developed Centre-North regions yet first among the more disadvantaged regions of the Mezzogiorno. Overall, its indicators compare favourably with those of the southern regions — most notably an early school leaving rate of 8%, which falls below the EU target of 9%. Second, narrowing the focus to the intra-regional level, the paper disaggregates the dropout rate variable to highlight significant internal disparities among Abruzzo's provincial capitals — particularly between the city of L'Aquila and peripheral areas — including disparities in the availability of early childhood education services (24.5% coverage, against the EU benchmark of 33%). Disparities between urban and rural areas are similarly examined, where the 33% threshold remains a distant target. The paper then turns to regional measures countering educational poverty, including interventions funded by the PNRR (84 institutions, €8.76 million). Notable examples include third-sector projects promoted by Con i Bambini and Openpolis (2022) and the community education model Voci di Cura. The quantitative and qualitative outcomes of these initiatives are assessed across several dimensions: skills and learning, early childhood service coverage, NEET rates by area and gender, adult participation in education, and both explicit and implicit dropout. A further issue the paper addresses is the considerable burden placed on families — and at times on individuals — in managing educational risk. Tackling educational poverty in Abruzzo therefore calls for interventions capable of building a collaborative network that integrates school institutions, third-sector

organisations, local welfare systems, and community stakeholders, operating through territorialised pedagogical models designed to counter the social reproduction of educational disadvantage. At the theoretical level, the paper draws on Bourdieu and Passeron's (1970) theory of cultural reproduction, Lareau's (2003) concept of concerted cultivation, the capability approach (Sen, 1999; Nussbaum, 2011), the educating community paradigm (Dewey, 1916; Frabboni, 2005), and recent literature on European learning cities and regions (OECD, 2013; UNESCO).

BEYOND MARGINALITY - GOVERNANCE AND EDUCATIONAL INNOVATION IN SMALL SCHOOLS IN INNER AREAS

Chiara Zanoccoli (INDIRE, Italy) · **Laura Parigi** (INDIRE, Italy)

Inner areas | multigrade classes | local policies

The Italian education system is marked by profound territorial divides that affect students' access, educational quality, and learning outcomes. For over two decades, national and international surveys have highlighted the persistence of a fracture between the North and South of the country, which intersects with the divide between inner areas and urban centers. In these regions, declining birth rates, demographic aging, and migratory flows towards urban hubs generate a structural decrease in school enrollments, exposing small school facilities to the risk of closure and leading to an increase in multigrade classes. This study aims to analyze the organizational and pedagogical strategies implemented by schools with stable multigrade classes working in synergy with local authorities. The objective is to understand how such collaborations ensure the sustainability and functionality of educational outposts in fragile territories. Utilizing a case study methodology, the research identified five distinct experiences, structuring the analysis along two complementary dimensions: firstly, the analysis of local governance and the decision-making mechanisms adopted to address the demographic challenge; secondly, the analysis of the educational provision developed by schools, focusing on their capacity to innovate and diversify educational pathways to make them more aligned with local socio-territorial needs and, simultaneously, more attractive to families. The investigation intends to provide a comprehensive framework of the policies enacted at the local level, analyzing how schools can act as central players in policies aimed at countering territorial marginalization. Ultimately, the analysis will outline both the success factors attributable to the effectiveness of the institutional network and those linked to the pedagogical and didactic innovation put into practice by the school.

ENCHANTMENT AND DISILLUSION: RURAL FEMALE STUDENTS NAVIGATING MERITOCRACY IN SMALL-TOWN CHINA

Ting Huang (University of Bristol, United Kingdom)

Gaokao | Rural female students | Diligence

In China, the Gaokao has become a universally accepted and legitimized educational selection mechanism and a crucial vehicle for meritocracy. As a result, 'education changes fate' has evolved into 'Gaokao changes fate' (Howlett, 2021) — the belief that diligence and academic effort can transform one's fate, particularly for rural students from disadvantaged backgrounds. Rural female students have historically been celebrated as the most diligent embodiment of this meritocratic ideal, outworking their male and urban counterparts in pursuit of upward mobility (Howlett, 2023; Gu and Jean Yeung, 2021; Wang, 2017). However, the ongoing devaluation of educational credentials and decreasing educational mobility have further eroded the myth that diligence for the Gaokao can change one's fate. In response, this study examines how rural female students experience, negotiate, and respond to the disillusionment of meritocracy in their daily school lives. This study draws on semi-structured interviews with 20 female students from two lowest-performing classes, a science track (n=10) and an arts track (n=10), in an elite county-level high school in central-southern China. Hence, the study finds that female students have developed different educational attitudes and strategies in response to their disillusionment with meritocracy. First, some students who believe in the value of education engage in covert studying, as showing effort openly carries negative social connotations and invites mockery. Second, some students skip exams to avoid confronting their poor performance. Third, others cheat in exams, not because they value education, but to meet parental expectations. Fourth, some students leave campus during self-study sessions — eating out, playing billiards, or visiting cafés — as a way of stepping away from school life. Finally, a small number remain enrolled but stop attending school and work outside instead, showing a complete rejection of the educational system.

BEYOND A MERE SUBMISSION TO THE MERITOCRATIC DOXA: EXPLORING UNDERGRADUATE STUDENTS' PERCEPTIONS OF MERITOCRACY AT ELITE HIGHER EDUCATION IN ENGLAND

Rodolfo Benites (University of Bristol, United Kingdom)

meritocracy | higher education | doxa

Meritocracy is the belief that all individuals are responsible for and capable of activating their merit through hard work, enabling them to succeed in life (Littler, 2017). Several studies have documented how meritocratic beliefs are widely held in contemporary higher education, including the study of assumptions about who deserves to participate in and succeed in higher education (or in the most prestigious institutions) (Poulsen, 2026; Varriale and Franceschelli, 2025; Jin and Ball, 2019; Warikoo, 2018), or how far the values of excellence, prestige and success should drive higher education systems (Reeves and Friedman, 2024; Sandel, 2020). Less academic attention has been paid to how meritocratic beliefs are lived, experienced and interpreted by individuals during their academic journeys. In this paper, I draw on Pierre Bourdieu's concepts of habitus, field and doxa to examine how undergraduate students from different social-class backgrounds at an elite university in England experienced and made meaning of the dominant meritocratic doxa. The paper relies on primary data collected through an online questionnaire (n=450) and semi-structured, in-depth qualitative interviews (n=25) with working- and middle-class undergraduate students from diverse academic disciplines at one Russell-Group university in England. The paper presents partial findings from an ongoing mixed-methods comparative case study conducted at two universities in England aimed at exploring how meritocratic beliefs are reproduced at elite and non-elite universities. By focusing particularly on the concept of doxa (Bourdieu, 1999, 2000) (the set of beliefs and assumptions understood as

natural or 'taken-for-granted'), the paper uncovers the complex reflective and affective processes through which meritocratic experiences are interpreted. In doing so, it contributes to ongoing debates about how meritocratic beliefs are socially perpetuated and the prominent roles that elite and educational fields play in this process.

WHO GETS IN AND WHY? RACE, CLASS AND ASPIRATION IN SOUTH AFRICA'S SCHOOLS

Samantha Kriger (Cape Peninsula University of Technology, South Africa)

School admissions politics | Post-apartheid schooling | Educational inequality

More than three decades after the end of apartheid, South Africa continues to grapple with enduring patterns of racial and class inequality within its schooling system. While national education policy formally commits to the principle of non-racial education, the persistence of white-majority enrolments in many former white schools raises critical questions about the democratic transformation of schooling. This study examines the micropolitics of school re-segregation in elite schools located in the affluent southern suburbs of Cape Town. The research forms part of a broader investigation into the politics of school admissions and seeks to explain how historically privileged schools sustain racial and socio-economic exclusivity despite the policy framework of post-apartheid democratic education. The study draws on a two-year qualitative investigation involving intensive interviews with principals and admissions officers from thirty former white schools. The sample was deliberately structured to include schools across a spectrum of socio-economic contexts, ranging from wealthy institutions with predominantly white enrolments and high school fees, to middle-class schools with smaller white majorities, and lower-middle-class schools that have experienced re-segregation as predominantly black institutions with relatively low school fees. This sampling strategy enabled comparative insights into how elite schools maintain racial and class privilege while other former white schools undergo demographic transformation. Data collection integrated multiple sources to capture the complex processes shaping admissions decisions. These included in-depth interviews with school administrators responsible for admissions, focus group discussions with teachers and parents, analysis of government enrolment data disaggregated by race, geographic analysis of school locations and socio-economic neighbourhoods, examination of admissions policy documents obtained from school records and websites, and interviews with estate agents who often influence parental school choice through residential "steering". Thematic analysis of interview transcripts and policy documents was combined with statistical analysis of enrolment patterns to develop a comprehensive understanding of how admissions processes operate in practice. Using the metaphor of a spiderweb, the study demonstrates how these mechanisms, often embedded in admissions policies, language requirements, feeder systems, and residential patterns, operate simultaneously and reinforce one another. While each instrument may appear neutral when considered individually, together they create a powerful structure that shapes access to elite schooling. Drawing on interest convergence theory, the study suggests that these micropolitical practices are sustained by broader macropolitical arrangements that emerged during South Africa's democratic transition. Within the broader theme of reimagining democracy in schools, the study highlights the tensions between formal democratic ideals and the lived realities of schooling structures that continue to reproduce inequality. The findings suggest that meaningful democratic renewal requires more than policy commitments; it demands critical engagement with the organisational and governance practices

that shape access to educational opportunity. By illuminating the micropolitical mechanisms through which privilege is reproduced, this study contributes to ongoing debates on how democratic participation, institutional accountability, and policy reform might foster more inclusive schooling environments in post-apartheid South Africa.

Rethinking Educational Inequalities and Democratic Practices

PANEL CONVENORS: Ilva Skulte (Riga Stradins University, Latvia); Alīna Romanovska (Daugavpils University); Mairita Folkmane (Rothko Museum)

PANEL KEYWORDS: educational inequalities, cultures, democracy

The panel explores educational inequalities and democratic practices, examining how policies, social contexts, and educational actions shape learning opportunities and participation. Contributions cover a range of topics: from school segregation, moving beyond purely quantitative analyses and proposing desegregation strategies informed by theoretical perspectives and empirical evidence, to the democratization of education in rural European areas, with a comparative analysis of policies, practices, and tensions in contexts of socio-political restructuring; from "education starting at home," investigating the role of intensive parenting as a moral boundary in the implementation of desegregation policies in Chile, to generativity and the public meaning of education through family-institution relationships. Additional contributions examine how neighborhood conditions influence educational opportunities in disadvantaged contexts, drawing on a Freirean approach, and explore participatory documentation as a civic infrastructure to promote inclusion and active participation.

"EDUCATION STARTS AT HOME": INTENSIVE PARENTING AS A MORAL BOUNDARY IN THE ENACTMENT OF DESEGREGATION POLICY IN CHILE

Gonzalo Hidalgo Bazan (University of Oxford, United Kingdom)

Parents | Intensive Parenting | School Segregation

This paper examines parental educational narratives amid the implementation of Chile's Inclusion Act, a reform designed to address key drivers of socioeconomic segregation in schools and recognised as one of the first explicit attempts to promote social mixing (Rojas et al., 2023). Research on its implementation suggest that the reform has had limited impact on the enrolment of low-income families (Honey & Carrasco, 2023; Sillard et al., 2018). Moreover, it has faced considerable resistance from parents, who experience the new system with anxiety and heightened perceptions of risk, feeling that the reform devalues capitals they previously mobilised in school choice processes (Carrasco et al., 2021; Hernández & Carrasco, 2022). Drawing on 47 interviews with 20 families whose children attend schools implementing the Inclusion Act in southern Santiago, this paper broadens analysis of parents' resistance to desegregation policies by showing how their understandings of 'good education' extend beyond formal schooling. Parents consistently emphasised that 'education starts at home', using this expression to describe intensive parenting practices marked by demanding physical and emotional labour, including ubiquitous presence, vigilant monitoring of schools, and acting as moral exemplars to transmit values such as effort and respect. Yet the importance parents attribute to 'what happens at home' contrasts with its perceived fragility. Many feared that this home-centred dimension of education could be undermined through contact with families they regard as lacking 'good' parenting – particularly from other social groups – reinforcing the value they place on socially homogeneous schools. Building on Collet & Tort's (2017) understanding of educations as plural, the paper extends analysis of families' enactment of desegregation policies by considering discourses beyond schooling that shape family-education relationships. It argues that parents' conflation of 'good education' and 'good parenting' underpins their preference for socially homogeneous schools. 'Good parenting' becomes a crucial moral boundary that reinforces individualised educational responsibility and limits dispositions toward social mixing.

GENERATIVITY AND THE PUBLIC MEANING OF EDUCATION: A SOCIAL PEDAGOGICAL PERSPECTIVE ON FAMILY-INSTITUTION RELATIONSHIPS

Vito Balzano (University of Bari Aldo Moro, Italy)

Generativity | Social pedagogy | Family-institution relationships

In contemporary educational debate, the relationship between families and educational institutions is most often discussed through the language of parental involvement, partnership, and shared accountability. While these perspectives have undoubtedly contributed to acknowledging the relevance of families in educational processes, they also tend to assume the institutional framework as the primary locus of education. Within this view, the family risks being interpreted mainly in terms of its degree of alignment with institutional expectations, rather than being recognised in its own pedagogical specificity. From a social pedagogical standpoint, this raises a more fundamental question concerning the educational meaning of the family as a generative space. Social pedagogy has long emphasised that education cannot be reduced to instruction or institutional provision alone but unfolds within relationships through which new generations are gradually introduced to a shared world. In this sense, the family represents the first context in which the asymmetrical responsibility of adults towards those who arrive in the world takes shape. This responsibility does not primarily consist in performing predefined functions, but in sustaining the conditions through which new subjects can find a place in an already existing symbolic and social horizon. Education, therefore, emerges here as a generative practice, rooted in the intergenerational continuity that allows the world to persist while remaining open to renewal. Reconsidering the notion of generativity within a social pedagogical framework, this reflection interprets generativity not simply as an individual developmental disposition, but as a relational and educational structure connected to the responsibility for the continuity of the human world. Such an interpretation resonates with broader pedagogical reflections that understand education as a response to the arrival of newcomers, whose presence calls for processes of transmission, recognition, and transformation. From this perspective, family generativity can be understood as a fundamental pedagogical condition that precedes institutional arrangements while also making them possible. This issue appears particularly relevant in late modern societies, where processes of individualisation and functional differentiation have profoundly reshaped both family life and educational institutions. In this context, the relationship between families and institutions is frequently organised around procedural and regulatory frameworks, which, although necessary, may obscure the deeper pedagogical significance of their encounter. A social pedagogical perspective makes it possible to bring this dimension back into view, highlighting how families and institutions participate, in different ways, in a shared generative responsibility. Reframing family-institution relationships through the lens of generativity allows us to move beyond an exclusively functional understanding and to recognise their common orientation towards the formation of subjects and the continuity of the social world. It also becomes possible to reconsider the public significance of family educational experience, not as a matter external to education, but as one of its essential conditions. By placing generativity at the centre of reflection, this paper seeks to contribute to current international discussions on education, social pedagogy, and democracy, proposing a social pedagogical perspective that understands educational relationships as generative practices through which society assumes responsibility for its own continuity and for the public meaning of education.

PARTICIPATORY DOCUMENTATION AS CIVIC INFRASTRUCTURE

Monica Amadini (Università Cattolica del Sacro Cuore, Italy)

Participatory-documentation | community | social justice

This contribution presents a community-based practice developed to counteract widening inequality, persistent poverty, and increasing socio-spatial polarisation. Through the Sguardi inSUStituibili initiative (promoted by CESPEFI – Centre for Family and Childhood Education Studies), it illustrates a participatory documentation process that, in 2024 and 2025, involved all educational institutions in a specific district of Brescia marked by socio-cultural complexity, segregation and high levels of vulnerability. As part of the broader SUS (Sustainable Urban Development) Strategy promoted by the Municipality of Brescia, participatory documentation served as a strategic tool to reinforce the role of schools as key institutions for social cohesion, equal opportunities, and democratic participation. In a highly marginalised area, schools recognised themselves not only as places of instruction but also as privileged observatories of inequality and catalysts of collective learning processes. Each social and educational actor in the area observes inequality from different and partial perspectives. Participatory documentation enabled these viewpoints to be connected, valuing both professional knowledge and everyday practices. Through the systematic collection of observations, narratives, educational materials, and qualitative evidence, it became possible to make visible the learning processes generated by the SUS project and to identify the changes emerging at both educational and community levels. The collected materials were discussed in teachers' meetings, assemblies, and community round tables, ultimately converging in a public event with local authorities and associations. This dialogic dimension nurtured a culture of transparency, open discussion, and shared responsibility, transforming the school into a genuine community laboratory—a place where democracy is enacted through collective interpretation of processes, reflection on choices, and evaluation of outcomes. The involvement of all actors in producing and interpreting documentation strengthened a sense of collective responsibility in addressing inequality. Documenting together means revealing what is often invisible: everyday educational processes, pedagogical decisions, students' real needs, and interactions between schools and their surrounding territory. This fosters a public culture grounded in dialogue and mutual accountability. Participatory territorial documentation also makes it possible to identify barriers and resources, recognises inequalities in access to educational opportunities, brings to light latent assets within the community, and gives visibility to innovative practices that exist but are not yet systematised. It is not conceived as a project for communication, but rather as a transformative device—an engine of social cohesion, a space for democratic participation, and a driver of shared growth for all institutions involved. Through joint reflection and continuous review, the initiative promoted pedagogical innovation and inclusion, turning the inequality-reduction project into a collective process of learning, evaluation, and civic action. By valuing the contributions of all participants, it helped steer the local education system toward greater equity and social justice. As the promoter and guardian of this territorial documentation process, the school strengthened its public legitimacy as a democratic institution. It assumed a role of cultural leadership within the educational community and presented itself to citizens as a space for dialogue, knowledge, and the collective construction of social justice.

SCHOOL SEGREGATION: BEYOND NUMBERS. FROM THEORETICAL PERSPECTIVES TO AN EMPIRICAL EXPLORATION OF DESEGREGATION STRATEGIES

Greta Bolzoni (Università Cattolica del Sacro Cuore, Italy) · **Enrico Orizio** (Università Cattolica del Sacro Cuore, Italy) · **Katia Montalbetti** (Università Cattolica del Sacro Cuore, Italy)

school segregation | theoretical perspectives | desegregation strategies

A clear sign of inequity within current educational systems is school segregation, generally defined as the high concentration of a minority or disadvantaged group within a school or a classroom, relative to the presence of that same group in the surrounding area (Antonini, Argentin & Santagati, 2025; Cordini & Parma, 2025; Cordini & Ranci, 2025; Council of Europe, 2017). Originally conceptualized in the United States, a context historically shaped by significant migratory flows and residential segregation, this phenomenon has evolved into a global subject of analysis. Over time, diverse theoretical perspectives have converged in recognizing its complex and multifaceted nature. Furthermore, there is a broad consensus in identifying a plurality of drivers — ranging from family choices to the so-called 'educational landscape' (Cordini & Parma, 2025) — that interact across different cultural, social, and educational dimensions. Developing a comprehensive theoretical framework is essential for highlighting diverse interpretative perspectives. One approach prioritizes the quantitative dimension, defining the phenomenon numerically as a high concentration of disadvantaged students (Ranci, 2019). While seemingly straightforward, this definition raises significant conceptual issues regarding the meanings of 'disadvantage,' 'foreign background,' and 'socio-economic status', categories that are often intertwined. From another standpoint, a different reading focuses on the quality of the educational experience: school segregation occurs when the educational path provided and experienced within the school lacks quality (Zolletto, 2022). As such, to design effective counter-strategies that integrate multiple levels and dimensions, it is essential to adopt a broad analytical perspective. In 2022, the social enterprise Con i Bambini, as part of the Fondo per il contrasto alla povertà educativa minorile, issued the 'Vicini di scuola' call for proposals. This initiative supports projects aimed at reducing school segregation phenomena affecting minors aged 6–13. The call promotes interventions that ensure high-quality education even in the most complex contexts, with the medium-term goal of progressively rebalancing the social composition of schools. This objective is pursued by expanding the services available to minors and families, experimenting with educational practices that bridge the gap between schools and the extracurricular world, and fostering collaboration between schools with diverse student populations. Ultimately, these actions seek to encourage families to return to their local neighborhood schools, attracted by the quality of learning, relationships and educational experiences, as well as the strength of the services provided. As is increasingly common, the call for proposals required an external body tasked with the initiative's impact evaluation. Although this process is currently ongoing, the privileged position of the Center for Research on Education Policies (CeRiForm) at the Università Cattolica del Sacro Cuore, to which the authors belong, has enabled a preliminary reconstruction of the main desegregation strategies. Through a desk analysis of the 23 funded projects, this study explores the main approaches adopted to counteract segregation. From this perspective, it is particularly valuable to reflect on the secondary data acquired, placing them in dialogue with the conceptual framework described above.

NEIGHBOURHOOD CONDITIONS AND EDUCATIONAL OPPORTUNITIES IN A NORWEGIAN LOW-SES NEIGHBOURHOOD: A FREIREAN PERSPECTIVE

Hanne Eikefet Mikkelsen (Western Norway University of Applied Science, Norway) · **Rita Agdal** (Western Norway University of Applied Science, Norway)

Paolo Freire | Urban neighborhoods | Educational opportunities

Neighbourhood effects related to education are well documented in both Nordic and international research (Berg, 2021; Borgen & Zachrisson, 2025; Galster & Sharkey, 2017; Ljunggren & Orupabo, 2020; Markussen et al., 2024; Markussen & Røed, 2022, 2023; Mikkelsen & Agdal, 2024; Nieuwenhuis & Hooimeijer, 2016; Sharkey & Faber, 2014). Despite long-standing ambitions of equal educational opportunities (Blossing et al., 2014; Corall-Granados et al., 2025; Elstad, 2023; Mikkelsen & Agdal, 2024), socioeconomic inequality and urban segregation are increasing in Nordic cities (NOU 16:2020; Tunström & Wang, 2019). We explore how youth and professionals understand neighbourhoods for educational opportunities. This paper draws on qualitative interviews with young people living in low-socioeconomic-status (SES) neighbourhoods in a Norwegian city, and with professionals working with youth in the same areas. While most of the professionals live in other parts of the city and therefore do not encounter the neighbourhood in the same immediate way as the youth living there, they are familiar with these areas through their professional practice and voluntary engagement. There are significant differences in how professionals understand and perceive youth's living conditions. Some professionals occasionally invite youth to tell about issues such as racism and criticize other professionals for relying on assumptions rather than youths' own accounts and lived experiences. Although some professionals actively ask questions, they nonetheless have knowledge about the youth's lived experiences. While the youth themselves emphasize racism, violence, and poverty as central features of their everyday lives, professionals often frame these conditions differently. Poverty is frequently silenced, and assumptions about parents do not always correspond to the youth's own accounts. Whereas professionals tend to highlight language-related challenges, the young people describe the precarities of poverty and parents who are often unavailable because of unpredictable and unfavourable working hours. Professionals thus appear to orient themselves through pre-existing assumptions that may themselves be marked by antagonistic contradictions. Hesitation or discomfort in approaching these lived realities may cause them to miss crucial aspects of young people's experiences. Drawing on Paulo Freire's pedagogy (1970), we argue that this gap is not simply a matter of different perceptions, but also of which experiences are recognised as valid in pedagogical practice. Freire's understanding of dialogue, participation, and critical consciousness, highlights the need to move the relationship between professionals and youth from a subject–object to a subject–subject relation. From this perspective, the task of the professionals is to explore youth`s situation together with them. By starting from generative themes grounded in everyday life, youth and professionals may develop a more situated understanding of how structural conditions shape educational opportunities. Seen through Freire's pedagogy of hope, the problem is not only misunderstanding, but of pedagogy itself. When professionals do not see the concerns voiced by young people, they risk reinforcing alienation and closing opportunities for the development of critical consciousness. A more dialogical approach, grounded in young people's own lived experiences, may instead create conditions for less alienation and greater possibilities for action, choice, and transformation.

PLACE, ART, AND COMMUNITY: BUILDING SOCIAL COHESION THROUGH THE CULTURAL COMMONS

Ilva Skulte (Riga Stradins University) · **Alīna Romanovska** (Daugavpils University) · **Mairita Folkmane** (Rothko Museum)

social cohasion · cultural commons · art based education

A place, understood as the geographic space inhabited by a diverse community, can be viewed as a cultural commons resource for art educators seeking to promote social cohesion through art-based education. Daugavpils is not only the birthplace of Mark Rothko but also the second-largest city in contemporary Latvia. Historically situated at the crossroads of different states, cultures, and economic traditions, the city has long functioned as a meeting point of diverse communities. Today, Daugavpils is home to a heterogeneous population representing a variety of cultural, linguistic, religious, and social groups. While this diversity constitutes a valuable social and cultural resource, it also presents challenges. Different communities often remain separated by historical narratives, stereotypes, prejudice, and limited opportunities for meaningful interaction. As a result, the absence of shared cultural ground can hinder inclusive communication, mutual trust, and effective social integration. In this context, the creation and activation of cultural commons—shared cultural spaces, practices, and resources accessible to all community members—may play an important role in reducing social tensions. One of the key institutions contributing to this process is the Mark Rothko Museum, a major cultural centre in Daugavpils. The museum not only preserves and promotes the artistic legacy associated with Rothko but also actively participates in Latvia's contemporary art life through international exhibitions, artist residencies, and cultural events. In addition to its exhibition program, the museum plays a significant educational role. Through a range of museo-pedagogical initiatives, it supports the development of cultural literacy among local youth and encourages active engagement with art. These workshops create opportunities for participants to critically reflect on artistic expression, explore issues of identity and perception, and develop their own creative abilities. This paper analyzes a series of youth workshops organized by the Rothko Museum in collaboration with Daugavpils University under the title "The Other in Art and Life." The workshops were designed as a creative intervention aimed at encouraging dialogue about identity, difference, and coexistence within a culturally diverse urban environment. Using an evaluation framework that considers inputs, activities, outputs, and outcomes, the study examines how participation in these workshops influenced young people's attitudes and interactions. Particular attention is given to indicators such as increased tolerance, improved cultural understanding, and enhanced intergroup communication. The findings suggest that the workshops created an environment for dialogue and collaborative creativity, enabling participants from different backgrounds to engage with one another in meaningful ways. By exploring artistic interpretations of "the Other," participants were encouraged to reflect on their own identities as well as on the perspectives of others within their community. As a result, the program contributed to strengthening intergroup understanding and tolerance among young people in Daugavpils. Furthermore, it supported the recognition and practical use of cultural commons (Bowers, 2009, Santagata et.al. 2011, Bertacchini, 2020) —shared

cultural experiences, narratives, and creative spaces—as a foundation for building social cohesion. In this way, the workshops demonstrate how art-based educational initiatives can foster a deeper awareness of collective identity while simultaneously respecting cultural diversity within the local community.

Citizenship Education and International Pupil Mobility

PANEL CONVENORS: Mattia Baiutti (Fondazione Intercultura ETS); Piero Valentini (ISTAT); Giuseppe Ricotta ("Sapienza" Università di Roma)

PANEL KEYWORDS: citizenship education, international student mobility, intercultural competence

Adjectives such as active, responsible, intercultural, and global outline a concept of citizenship that aspires to broaden the definition of citizenship established with the birth and development of nation states. From a pedagogical and didactic perspective, what skills are associated with this expanded citizenship? What teaching methods can be used to develop and assess them? Internationally, some contributions offer proposals in this direction. For example, consider the European Union's key competences (2018), the Council of Europe's competences for a culture of democracy (2018b), the OECD's global competence in PISA (2018), and UNESCO's global citizenship (2014, 2018). In Italy, the introduction of civic education (Law 92/2019) had, in some respects, revitalised the debate on citizenship education, although it has revealed gaps regarding the intercultural and international dimension (Scuola Democratica 2021). Are there opportunities to develop civic and citizenship education in schools that effectively combine democratic values with international and intercultural dimensions? Individual international pupil mobility is recognized as a resource for developing young people's intercultural competence (Barrett 2018), but how can its potential be integrated into citizenship education through innovative teaching approaches that engage not only the student participating in mobility but also the rest of his school class? The workshop will present the research project “Civic Education and International Student Mobility” by Fondazione Intercultura and Associazione “Per Scuola Democratica”. The project included variuous activities: a background study, a pilot study involving a group of schools and teachers, and a survey. The provisional agenda is as follows: One speaker will introduce the background research, providing a critical review of the scientific and policy landscape on civic and citizenship education, internationalisation and international student mobility, intercultural democratic competence. Two speakers will present the research underpinning the pilot project to be proposed to schools. Two speakers, based on the concrete experience of the pilot project carried out in schools, will share insights into the teaching approaches and organizational conditions that help schools integrate internationalization into civic education. Two further speakers will discuss the survey, examining the values of students who studied abroad with Intercultura. The workshop offers a coordinated overview of how international mobility and democratic citizenship can strengthen each other, and provides insights into the obstacles that schools face in this context.

REFRAMING INTERNATIONAL STUDENT MOBILITY FOR DEMOCRATIC AND GLOBAL CITIZENSHIP: FINDINGS FROM ACTION 2 – PHASE 1 OF THE NATIONAL RESEARCH PROJECT “CIVIC EDUCATION AND INTERNATIONAL STUDENT MOBILITY”

Giuseppe Ricotta (Sapienza Università di Roma, Italy) · **Valeria Damiani** (LUMSA University, Italy) · **Pietro Valentini** (ISTAT and Associazione "Per Scuola Democratica")

Democratic culture | Citizenship Education | International Pupil Mobility

The relationship between education and democracy has long been recognized as a foundational nexus for addressing the structural tensions of late-modern societies, from deepening inequalities to the erosion of civic trust. In the wake of global crises and widening socio-economic disparities, educational systems are increasingly called upon not only to transmit knowledge, but also to cultivate democratic culture, intercultural dialogue, and civic engagement. Within this framework, citizenship education is understood as a transformative process that equips students to confront complex and planetary challenges, fostering critical awareness, social responsibility, and commitment to justice. Against this backdrop, our contribution explores the educational potential of individual international pupil mobility as a lever for strengthening citizenship education and promoting social justice awareness. Drawing on findings from the research project Civic Education and International Pupil Mobility, conducted in Italy in 2022 by Fondazione Intercultura and Associazione Per Scuola Democratica, the study investigates the pedagogical and organizational conditions under which mobility experiences can contribute to the development of civic competences and global citizenship. The paper aims to contribute to a better understanding of the following thematic areas: a) how the international mobility experiences of a part of the students can offer promising potential for civic and citizenship education for all students; b) which conditions and risks should be considered by educational institutions intending to implement civic education programmes that significantly integrate international mobility experiences. The qualitative research design involved semi-structured interviews with headteachers (N=11) and field experts (N=10), alongside four focus groups with teachers from upper secondary schools in Northern, Central, and Southern Italy. Schools were selected based on their consolidated experience in student mobility

and/or civic and citizenship education initiatives. Data collection focused on four analytical dimensions: (1) the implementation of civic education; (2) the conceptualization of its international dimension; (3) the organization and management of outgoing mobility; and (4) the reintegration and educational valorization of students upon return. Findings reveal a persistent disconnection between individual mobility experiences and structured civic education pathways. In most cases, schools frame international mobility as a predominantly private undertaking, centered on the student and their family, with limited pedagogical spillover effects. Non-mobile students are rarely involved in reflective or dialogical processes that critically examine similarities and differences between sociopolitical contexts. Likewise, systematic strategies to integrate returnees' experiences into curricular activities or collective learning processes are largely absent. Overall, the study highlights the lack of coherent and institutionally embedded approaches linking international mobility with democratic and citizenship education. By identifying both critical gaps and promising practices, the final section advances actionable recommendations for educators and policymakers. These include the development of structured pre-departure and re-entry modules, whole-class reflective practices, and cross-curricular projects aimed at transforming mobility from an individual experience into a shared democratic learning opportunity. In doing so, the paper argues for a reconceptualization of international mobility as a strategic resource for fostering inclusive, participatory, and justice-oriented educational environments.

"SCHOOLS IN THE WORLD, THE WORLD IN SCHOOLS" INTEGRATING INTERNATIONAL STUDENT MOBILITY AND CIVIC EDUCATION: INSIGHTS FROM A PILOT PROJECT IN SECONDARY SCHOOLS

Giulia Pastori (University of Milan-Bicocca, Italy) · **Alessandra Maiorano** (University of Milan-Bicocca, Italy) · **Valentina Pagani** (University of Milan-Bicocca, Italy)

International student mobility | Civic education | Democratic and intercultural competences

This paper presents the implementation and preliminary outcomes of the pilot project "Schools in the World, the World in Schools", developed over three school years (2023–2026) in Italian upper secondary schools. The project involved 17 schools, 17 classes, around 20 teachers and approximately 340-370 students. Each participating class included at least one student taking part in the annual international mobility programme promoted by Fondazione Intercultura, whose experience abroad was used as a starting point for educational activities involving the entire class. The project explores how international student mobility can be integrated with civic education to promote democratic and intercultural competences among all students, not only those directly involved in mobility experiences. The pedagogical framework of the project draws on the Council of Europe's Reference Framework of Competences for Democratic Culture and is grounded in a research–action approach. Schools were accompanied by a team of researchers and facilitators in designing and experimenting with educational pathways that connect internationalisation with civic education, transforming the mobility experience of individual students into a learning resource for the entire class. The underlying hypothesis is that international mobility can foster democratic learning processes within the classroom, while civic education activities can deepen the educational impact of mobility experiences. The project was structured over three school years. The first year focused on activating curiosity and dialogue around cultural differences and experiences of international mobility, including the preparation of students who would leave for mobility programmes. The second year centred on classroom debates and exchanges with students abroad, as well as inquiry activities exploring issues related to the school and local community. The third year focused on collective reflection, public presentation of students' projects and participatory decision-making processes within the school. Learning activities included classroom discussions on global and social issues, dialogue with students abroad through digital tools, collaborative inquiry on school or community challenges, and the development of student-led projects aimed at improving aspects of school life or the local environment. Through these activities, the project aimed to strengthen students' democratic participation, intercultural awareness and engagement with contemporary social issues. The study combines quantitative and qualitative monitoring tools. A longitudinal student questionnaire administered over three years explores changes in democratic values, intercultural sensitivity, student agency and participation. Qualitative data include teachers' reflective diaries, facilitators' documentation of the co-design

process, materials produced by students, and focus groups with teachers and students. The analysis focuses on how the project was implemented across different school contexts and on the pedagogical and organisational conditions that facilitate or hinder the integration of internationalisation and civic education. More broadly, the project aims to generate insights into how international mobility can be transformed into a collective learning resource and to inform recommendations for scaling similar approaches in schools that may not have access to external facilitation. The presentation will also discuss the first results emerging from the ongoing analysis of the data collected during the pilot implementation.

E.00. Citizenship Education and International Pupil Mobility

CITIZENSHIP EDUCATION AND INTERNATIONAL PUPIL MOBILITY: THEORETICAL LINKS

Mattia Baiutti (Fondazione Intercultura ETS) · **Roberto Ruffino** (Fondazione Intercultura ETS)

citizenship education | global citizenship education | international pupil mobility

In the 2020/21 school year, the Italian Ministry of Education introduced Civic Education as a compulsory subject within the national curriculum. The framework identified a broad range of themes to be addressed, including the Constitution, sustainability, and digital citizenship. However, an explicit international dimension of citizenship remains largely absent. Therefore, Fondazione Intercultura and Scuola Democratica conducted the study 'Citizenship Education and International Pupil Mobility', which explores how individual mobility experiences in secondary education may foster global citizenship competences. One of the most innovative features of the study lies in its ambition to generate an educational impact not only on pupils directly involved in international mobility, but also on the wider school community. The research was structured in three phases, and this paper presents findings from the first phase, which focused on the conceptual background of the project. The main aim of this phase was to identify the theoretical connections between civic education, globalò citizenship and international pupil mobility. The paper adopts a theoretical approach based on desk analysis and offers a critical overview of the principal perspectives on citizenship education, global citizenship education, and international pupil mobility, with particular attention to their educational implications and outcomes. The central argument is that one of the main learning outcomes of international pupil mobility is the development of intercultural competence. This may be understood as a constellation of knowledge, skills, attitudes, and values, including appreciation of cultural diversity, respect for others' beliefs and worldviews, empathy, flexibility, adaptability, plurilingual competences, and cultural self-awareness. These components are also reflected in the Competences for Democratic Culture developed by the Council of Europe, which are regarded as a foundation for citizenship and civic education. From this perspective, the internationalisation of school education emerges as a promising pathway for rethinking citizenship education in contemporary schooling through an intercultural lens.

E.00. Citizenship Education and International Pupil Mobility

CROSSING BORDERS, TRANSFORMING ATTITUDES? A LONGITUDINAL STUDY ON CIVIC AND INTERCULTURAL DISPOSITIONS AMONG STUDENTS IN INTERNATIONAL MOBILITY PROGRAMS

Orazio Giancola (Università di Roma "Sapienza", Italy) · **Matteo Bonanni** (Università di Roma "Sapienza", Italy) · **Leonardo Piromalli** (IREF – Istituto di Ricerche Educative e Formative)

Citizenship education | International student mobility | Intercultural competence

This contribution presents the results of a longitudinal study conducted on a cohort of upper secondary school students who participated in a study abroad program promoted by Fondazione Intercultura. The research was designed to investigate whether and to what extent an international mobility experience influences students' civic and intercultural development over time. In the first phase of data collection, participants completed a structured questionnaire aimed at exploring a range of attitudinal and experiential dimensions. These included civic values and attitudes, openness toward cultural diversity, and selected aspects of the school experience. The instrument was designed to capture a baseline profile of

students prior to – or at the outset of – their mobility experience, providing a reference point against which subsequent changes could be measured. Following this initial phase, the same students were involved in a second round of data collection. This follow-up survey was built using an instrument developed in close coherence with the original questionnaire, ensuring conceptual and methodological continuity between the two measurement points. The response rate for the second wave stood at 33.3% relative to the first, a figure that reflects the inherent challenges of longitudinal panel designs, particularly when dealing with adolescent populations undergoing significant transitions. Despite this attrition, the paired dataset allows for meaningful analysis of individual-level changes across the dimensions under investigation. The analytical focus of the study centers on the relationship between transnational educational experiences and processes of civic and cultural socialization. Specifically, the research examines in what measure exposure to a different national context – with its distinct educational system, social norms, and cultural practices – contributes to shifts in students' openness to diversity, their sense of civic responsibility, and their disposition toward active participation in public life. The longitudinal design is a key methodological strength, as it enables researchers to move beyond cross-sectional snapshots and trace trajectories of change attributable, at least in part, to the mobility experience itself. The findings offer a nuanced contribution to the broader debate on citizenship education and international student mobility. They provide empirical grounding for understanding how living and studying abroad can function as a catalyst for the development of intercultural democratic competence – a set of values, attitudes, and skills increasingly recognized as essential for navigating multicultural societies and engaging as responsible global citizens.

This work is embedded within the wider research project Civic Education and International Student Mobility, promoted by Fondazione Intercultura and Associazione “Per Scuola Democratica”.

Bringing Elias Back To School (And Beyond): Figurational And Processual Perspectives On Education In Troubled Times

PANEL CONVENORS: Lorenzo Pedrini (Università Milano-Bicocca, Italy); Luca Bifulco (Università Milano-Bicocca, Italy)

PANEL KEYWORDS: Elias, Figuration, Functional democratization

Norbert Elias’ figurational theory represents a unique approach across social sciences. Conceptualizing reality as long-term processes of interdependence linking institutions with individual personality, the Eliasian legacy provides critical insights into the ambivalent role of education in contemporary (anti)democratic transformations of society (Gabriel, 2024). The ongoing nature of social processes, the notions of ‘tension balance’, ‘power’, ‘civilizing’ / ‘de-civilizing’ and ‘social habitus’ are pivotal in figurational analysis (Dunning, Hughes, 2013). In troubled times, with ‘functional democratization’ threatened by rising tensions, mistrust in rational-scientific thinking and polarization, ‘learning to think with Elias’ regains crucial importance (Delmotte, Górnicka, 2021). This panel brings Elias back to school – and beyond – to address three main issues: - How do the long-term and mid-term evolutions of educational systems contribute to the democratization of society and to the reduction of social inequalities? And to what extent does formal education fuel anti-democratic and unequal orientations? - In a period of endemic conflicts – social, global, military – how does curricular as well unofficial education participate in social pacification dynamics? - What are the socializing spaces and practices – especially targeting young people – that develop alongside formal educational and civil sphere and trigger divergent processes, from participation functional to civic life to populism and radicalism? We welcome contributions from sociology, anthropology, history, psychology, education and Law. Proposal of particular interest are those ones that combine Elias with alternative processual perspectives in order to shed light on how democratic and egalitarian dispositions are daily taught, transformed or eroded.

SCHOOL AS A FIGURATIONAL SURVIVAL UNIT: CIVIC HABITUS, SECOND GENERATIONS, AND DEMOCRATIC RESILIENCE IN CRISIS CONTEXTS

Stefano Costantini (Università degli studi di Firenze, Italy) · **Alon Helled** (Università degli studi di Torinoi, Italy)

habitus | generations | mediation

Contemporary schools operate within a growing structural tension: students do not share the same legal status of citizenship, and nationality lacks a single, widely accepted definition. This condition particularly affects second generations, often situated between multiple belongings, partial institutional recognition, and ambivalent social expectations. In this context, schools are called upon to reinterpret the res publica as a set of shared rules, affective orientations, and forms of

habitus capable of sustaining coexistence in increasingly heterogeneous societies. The transformations of sovereignty (Galli, 2019) and the rise of populism and anti-politics (Mastropaolo, 2005) signal a broader crisis of institutional mediation that also involves schools. From a figurational perspective inspired by Norbert Elias, these developments can be understood as reconfigurations of the chains of interdependence underpinning political life. Democratic crisis thus appears not as a sudden rupture, but as tension within civilizing processes, with the risk of decivilizing spurts and dynamics of decivilization (Delmotte, Górnicka, 2021). Within this framework, the school can be interpreted as a figuration-based survival unit: an institutional space through which society preserves the continuity of political integration under conditions of growing complexity. It plays a key role in the intergenerational reproduction of social order, bridging primary socialization and the formation of civic habitus. Delmotte and Duchesne (2024) show how national habitus begins to form in early family practices that naturalize belonging. School is the arena where such dispositions can be reworked in a civic-republican direction. For second generations, however, this transition may be discontinuous when implicit models of nationality conflict with plural identities. When schools lose legitimacy as spaces of mediation, particularistic affiliations—cultural, religious, or communal—may prevail over civic belonging. Students may feel insufficiently recognized as members of the political community and perceive school as a classificatory rather than emancipatory institution (Darmody and Smyth, 2023). European data indicate that students with a migrant background face higher risks of early school leaving (European Education Area, 2024). Systematic reviews (Di Lisio, Fernández and Serrano, 2025) highlight the combined effects of socioeconomic disadvantage, family cultural capital, and language barriers, while dialogical and collaborative practices significantly reduce dropout rates (García Carrión et al., 2025), strengthening interdependencies among schools, families, and communities. This contribution offers a theoretical-interpretive reconsideration, grounded in recent empirical research, of the school's role in sustaining the res publica. Democratic resilience (Helled, Pala, 2025) is conceptualized not as a moral quality but as a figurational property rooted in the stability and transformability of networks of interdependence and in the reflective continuity of civic habitus transmission. In times of democratic crisis, the school's task is not to produce immediate consensus, but to preserve the long-term conditions for possible political coexistence.

BEING ACTIVE OR BEING PERFORMATIVE? AN ETHNOGRAPHIC EXPLORATION IN HOW HIGH SCHOOL SHAPES THE DECENT SUSTAINABLE CITIZEN

Lorenzo Pedrini (Università Milano-Bicocca, Italy)

civic education | sustainability | youth

Within contemporary national States, the inclusion of environmental issues within governments' agendas, as well as the rise of collective actions to face climate change and ecological degradation, has favoured the emergence of what is defined as 'sustainable citizenship' (Micheletti et al., 2014). As a 'total relationship of being' among individuals, the State, the market, and civil society, the idea of sustainable citizenship underlies a 'lengthening in the chain of interdependence' (Dunning & Hughes, 2013) between social agents and institutions. In this broad process, education plays a pivotal role. Particularly, schools and formal pedagogies are increasingly involved in addressing the more pressing preoccupation of our time, with key functions in socializing younger generations into the complexities of contemporary citizenship and appropriate behavior (Gabriel, 2024). The Italian case is revealing. Law n. 92/2019 has introduced 'civic education' as a

mandatory subject in both primary and secondary schools. The curricula revolve around three main topics: "constitution and legality", "digital citizenship", and "sustainable development". Yearly, in each school, every class is required to implement educational activities on one of these topics, involving external stakeholders such as public authorities, associations and businesses. The present paper elaborates the findings of an ethnographic research conducted in ten secondary schools of Milan to examine various initiatives dedicated to sustainability education (2022-2025) (Pedrini et al., 2025). Adopting an Eliasian perspective (Law & Mennel, 2023), this contribution aims to interpret the teaching initiatives on sustainability as a small-scale civilizing process. Precisely, the analysis focuses on the discursive frameworks - e.g., 'Agenda2030', the 'Green Deal', and 'changemaking' - to which the observed projects refer, the techniques used to engage the younger generations, the practices of sustainability promoted, and the implicit construction of the figure of the desirable sustainable youth. The argument stresses how school pedagogies absorb and reframe the demands, keywords, and methods of youth climate movements (Boltanski & Chiappello, 2007), by turning social critique within a 'civilized' perspective oriented toward social consensus. This reframing channels any expression of conflict into the realm of barbarism. From this interpretation, it emerges the identity of the ideal youngster: a climate-conscious subject committed to act for democratic transformation of society through productive-performative engagement within existing capitalist relations. Moreover, a threefold 'ambivalence' – as integral to the critical Elias' conceptualisation of the civilizing process (Burkitt, 1996) – are higlihted: first, the top-down imposition of democratization that is supposed to originate from below; second, the system's capacity to appropriate every aspects of social critique and convey a 'new spirit' of (green) 'capitalism' (The Trilateral Commission, 2022); third, the contradiction between, on one hand, the demand for the individual's total responsibility regardless of social disadvantages and priviledges, and on the other, the denial of any call for systemic challenge. To conclude, while young people are expected, according to the established good manners, to learn to act decorously (Pavoni, Tulumello, 2023), governments legitimise authoritarianism as a dominant political culture, invest in society's militarisation, and support wars initiated by Western countries worldwide.

PROCESSES OF LEARNING FOR DEMOCRACY – DEVELOPING A DEMOCRATIC HABITUS

Norman Gabriel (University of Essex, United Kingdom)

Learning Processes | Democratic Habitus | Norbert Elias

This paper will argue that the relational concepts of John Dewey, a pioneer in the development of the concept of 'democratic education', can be integrated with Norbert Elias's argument on long-term processes of civilisation. Although Norbert Elias did not explicitly address educational practice or the role of education in society, he was deeply interested in the development of the social learning processes of young children and adults. One integral aspect of the civilising process is that young children should eventually grow up through their own self-regulation. I introduce Elias's important relational concept of love and learning to focus on the long-term individual civilising processes that young children undergo as they prepare for education in complex societies. The relation between love and learning is used as a sensitising concept to focus on the way in which young children's educational development is both a cognitive and affective process, one that enables us to integrate the findings from other disciplines apart from sociology, especially from psychoanalysis and developmental psychology. But how do processes of learning between adults and children relate to the development of a democratic habitus in learning between adults and children? To address this question, I compare Elias's framework with Dewey's account of education for democracy, focusing on the formation of democratic habits that are conducive to

processes of thinking together. These habits facilitate intelligent action by predisposing persons toward seeking out and taking account of the perspectives of others. Dewey discusses one such democratic habit, which he names 'the habit of amicable cooperation' which he defines this as a habit "to treat those who disagree ... with us as those from whom we may learn'. Such habits are formed through direct experiences with a democratic way of life in an educational environment which can facilitate the co-construction of educational encounters between teachers and children. However, in contemporary societies the potential for these democratic processes of learning to be developed and embedded can be 'blocked' by teachers in educational institutions where it is assumed that pedagogy is mainly a rational, conscious and deliberate process. According to Winnicott (1964: 202-3), 'The child, in learning to be civilised, naturally also feels frustrations acutely, and is helped in becoming civilised not so much by the teacher's precepts as by the teacher's own ability to bear the frustrations inherent in teaching'. Within this perspective, schools can be seen as anxious institutions where young children must exercise a more intensive and all-embracing control over their emotions. By refocusing on the unconscious processes of risk and uncertainty in the classroom, I will offer some suggestions for the 'good enough' school - a way beyond the dead-end approach of accepting or rejecting prescriptive advice on how to teach better or how to deal with 'difficult' pupils.

Winnicott, D.W. (1964). The child, the family, and the outside world. London: Penguin.

LEARNING IN THE CIVILIZING PROCESS: A CULTURAL-HISTORICAL AND ACTIVITY-THEORETICAL PERSPECTIVE

Aleksejs Šņitņikovs (Riga Technical University, Latvia)

civilizing process | cultural-historical theory | learning activity

Norbert Elias considered the plasticity of the human psyche and habitus a fundamental premise of his theory of the civilizing process. As he pointed out, history exists because of the human capacity to learn (Elias, 2010). However, Elias did not make learning a specific object of theoretical analysis, instead relying on general notions of social learning and the internalization of external constraints into internal restraints (Elias, 2001). For Elias, the concept of social learning was sufficient for his purposes, since the central problem in his investigations of the civilizing process was the formation of conscience – the superego – across different social strata and states in Europe. A particular line of Elias's research concerned the sociology of knowledge (Elias, 2009). Elias's lifelong interest in this subject culminated in his last book, The Symbol Theory (Elias, 2011), in which he discussed the long-term interconnections between knowledge, communication, and thinking. In this work he came close to understanding of what cultural-historical psychology conceptualizes as higher psychological functions, although this line of inquiry remained unfinished. A central argument of cultural-historical psychology is that higher psychological functions develop through the mastery of cultural means of mediation, such as language. Through mastering these means, individuals gain control over their own psychological processes. With the development of reflexivity, individuals become able to form psychological systems – what Vygotsky called "tertiary connections" – which enable willful, conscious, and relatively free behavior (Vygotsky, 1997). According to Vygotsky, children's psychological development occurs within specific social situations of development, and participation in educational institutions plays a crucial role in this process (Vygotsky, 1998). As young people master cultural forms of behavior, they become active subjects of learning and of their own psychological development. Experimental and ethnographic studies of cognitive skills conducted by Luria demonstrated that education and socialization foster the transformation of the psyche, leading to changes in the systemic and semantic organization of consciousness (Luria, 1976). Leont'ev further developed this perspective by proposing the concept of learning activity as a specific form of psychological development. In the learning process, individuals master ways of acting and operations with tools and signs that encapsulate the cultural-historical experience of humanity, thereby appropriating practical and theoretical skills developed throughout history (Davydov, 1996). Engeström later extended the concept of learning activity, arguing that in late modernity it has become a central form of activity through which learning subjects, including adults, can develop their intellectual and creative capacities by mastering existing systems of activity and generating new ones (Engeström, 2019). This paper argues that some of the key concepts from cultural-historical psychology and activity theory, such as higher

psychological functions, zone of proximal development and learning activity, help to better understand the role of education in the civilizing processes. These two approaches provide analytical tools for explaining how education contributed to functional democratization by specifying the learning mechanisms through which individuals acquire culturally mediated forms of self-regulation and autonomy, and how civilizing processes have continued in the twentieth and twenty-first centuries through institutionalized learning.

This article draws attention to the fact that, in his 1956 article of the same name, Elias introduces the continuum of human behaviour between involvement and detachment through the evolutions in human attitudes towards natural as compared to social events. Based on this, this article questions way schools approach the learning and teaching of contemporary crises, specifically climate education and citizenship education. It suggests that in both these curriculum areas, teaching is marked by attempts at Eliasian "detachment" and the evacuation of emotional engagement, in response to anticipated emotional reactions by students that are implicitly seen as problematic by educators (Bozec, 2018; Albion et al., 2025). In addition to education literature on the adequacy of these programmes and literature on the importance of affect in understanding democratic behaviour (Neuman et al., 2007; Neckel and Hasenfratz, 2021), this contribution draws on qualitative interviews in France and Belgium with young people themselves (age 10-17), to explore their perspective on involvement and detachment in this learning. Using this empirical approach, it asks whether the evacuation of emotional engagement in the pursuit of scientific, objective detachment in this learning has not contributed to the learning of disinterest, which may constitute a barrier to democratic engagement by young people. By extension, the article

explores how the "civilised armour" (Elias, 2012) and the pursuit of "high levels of detachment or objectivity"(Elias, 1956, p. 240) that students learn at school might in fact encourage emotional responses to contemporary crises, such as disinterest or even resentment, that are in tension with the engagement necessary for democracy.

LEARNING AUTONOMY IN TROUBLED TIMES: HABITUS FORMATION AND FUNCTIONAL DEMOCRATIZATION IN ITALIAN ALPINE CLUB SCHOOLS

Alicia Chiodi (University of Trento, Italy)

Alpinism | Risk and embodiment | Non-formal learning

Alpinism may appear as a niche and "exotic" practice, yet it offers a paradigmatic lens through which to observe broader processes of democratization that have traversed modernity and are now re-emerging in contemporary troubled times. Historically, alpinism has been an elite activity, not only socially but also in terms of the highly specialized skills, knowledge and embodied competencies it requires for minimizing intrinsic risks. In recent years—particularly in the post-COVID era—the growing popularity of mountain environments has been accompanied by significant transformations: the diffusion of romanticized experiential imaginaries through social media, increased accessibility and commercialization of mountain practices, and the availability of new technologies that contribute to a perception of reduced risk. This has led to the emergence of new practitioners "perhaps better equipped than experienced" (Johnston and Edwards, 1994), in a context further complicated by climate change, which renders already fragile high-altitude environments increasingly unstable and demanding in terms of skills and judgement (Mourey et al., 2019a). In this context—also marked by growing mistrust in expert knowledge—revisiting Elias allows us to explore how dispositions such as autonomy, judgement and responsibility are not given but socially produced within specific configurations of learning and practice. Addressing the panel's question concerning how educational processes contribute to democratization, this paper examines the Italian case of alpinism schools within the Club Alpino Italiano (CAI), a state-recognized institution whose training activities operate as voluntary associations within the civil sphere. These schools constitute spaces of socialization in which shared values, forms of solidarity and civic belonging are produced, while simultaneously fostering embodied dispositions related to autonomy, responsibility and risk management. After briefly outlining the process of the quasi-sportivization of Italian mountaineering—which led to the emergence of CAI schools—and the subsequent process of democratization, both closely intertwined with broader Italian socio-political developments and reconstructed through documentary analysis, the paper draws on an enactive ethnography, complemented by visual and creative methods, to analyse alpinism and rock climbing courses as institutionalized yet non-formal sites of learning. It shows how instructors do not substitute action—as in traditional guided climbing—but contribute to the formation of an expert habitus capable of acting under conditions of uncertainty. In this sense, autonomy emerges not as an individual attribute, but as the outcome of a relational and processual configuration of interdependence. By integrating Elias's figurational approach with a focus on the material-natural environment - the paper conceptualizes risk-taking and management as an embodied, relational and socially mediated practice, rather than as an individual choice. It argues that expert knowledge does not eliminate uncertainty but enables practitioners to navigate it as an irreducible dimension of mountain environments in which zero risk does not exist. In doing so, the paper contributes to understanding how processes of functional democratization (Elias, 2012 [1970]) unfold within non-formal educational settings, through the embodied formation of subjects capable of responsible action.

Children as Political Actors: Rethinking School, Agency, and Democracy

PANEL CONVENORS: Maria Giatsi Clausen (Queen Margaret University, Edinburgh); Marlies Kustatscher (Edinburgh University, Edinburgh); Kristina Konstantoni (Edinburgh University, Edinburgh)

PANEL KEYWORDS: children's agency, democratic education, resistance

This panel explores how children often act as political subjects within and beyond school, and how their participation, resistance, and everyday negotiations invite new ways of understanding democracy. Rather than viewing children as adults and citizens "in-waiting", we emphasize the diverse ways they already engage with power through dialogue, collective action and activism, subtle forms of resistance or subversiveness, and practices of meaning making. These actions challenge assumptions that political agency emerges only with maturity and reveal schools as contested spaces where democratic capacities are reproduced, constrained and, potentially, reimagined. Schools operate within hierarchical, surveillance-driven, and neoliberal structures that often privilege compliance and, at times, inequality. They also contain possibilities for agency, solidarity, and democratic expression. Children's responses, ranging from everyday infrapolitics to activism, highlight capacity to interpret, contest, and reshape their social worlds. Moreover, participatory and dialogic approaches to learning can open spaces where intergenerational relations become more reciprocal, enabling children to articulate concerns and analyse conditions. The panel invites contributions that expand the democratic imaginary to include children as active co-participants in civic life. We welcome papers from education studies, childhood studies, sociology, political philosophy, anthropology, psychology, social policy, critical pedagogy, occupational science, and related interdisciplinary fields, drawing on theory, empirical research, or policy analysis. The panel aligns with the themes such as as Childhood, Citizenship & Social and Cultural Justice, Pedagogical Practices, Democratic Participation & School Governance, as it stresses children's political agency and the democratisation of schooling.

CHILDREN AS COMMONERS BEYOND THE LIMITS OF CRITICAL PEDAGOGY

Stelios Pantazidis (University of Thessaly, Greece)

Educational commons | Freinet Pedagogy | Childhood Studies

Critical pedagogy has played a decisive role in challenging developmentalist and paternalistic constructions of childhood. By foregrounding dialogue, conscientisation and resistance, it repositioned children as thinking subjects capable of questioning domination and participating in democratic life. In doing so, it unsettled the notion of students as citizens in waiting and exposed schooling as a political space structured by power. This reorientation resonates with the recognition of children as rights holders in international frameworks such as the UN Convention on the Rights of the Child, particularly the right to participate in matters affecting them. Yet, despite its transformative ambitions, critical pedagogy often remains anchored in a model in which emancipation is achieved primarily through critical awareness and dialogic participation. While students may be invited to speak, reflect and contest injustice, the institutional architectures of schooling, including control over time, curriculum, spatial organisation, evaluation and legitimate knowledge, frequently remain intact. Political agency risks being framed as discursive expression without extending to shared governance of educational life, and participation risks becoming procedural compliance with rights discourse. This paper argues that moving beyond these limits requires a conceptual shift from participation to commoning. Drawing on theories of the educational commons, democratic governance and childhood studies, it proposes the figure of the child as commoner. The child as commoner is understood as a political actor engaged not only in critique but in the collective stewardship of social and pedagogical arrangements. Educational commons are conceptualised as relational and institutional processes through which communities co create and co regulate norms, responsibilities, uses of space and forms of knowledge production. Democracy, in this sense, exceeds voice or consultation and becomes an ongoing practice of negotiating authority, redistributing responsibility and collectively designing shared rules. Children's rights are approached not as abstract entitlements guaranteed from above, but as lived practices enacted through shared decision making and collective responsibility. Revisiting central themes in critical pedagogy such as dialogue, power and emancipation, the paper interrog-

ates their structural implications within contemporary neoliberal schooling. Without institutional reconfiguration, dialogic participation can be absorbed into managerial and performative logics, transforming critique into a pedagogical technique while leaving governance untouched. Commoning redirects attention to the material and organisational conditions that enable or constrain democratic co-determination. It foregrounds questions of who decides, under what conditions and through which collective mechanisms authority is exercised and redistributed. This shift demands that democracy be enacted as an experiential practice in the here and now. If children are to exercise their rights meaningfully and contest existing arrangements, they must encounter and reshape them within everyday educational environments. Political agency emerges through situated practices of reclaiming space, exercising parrhesia, co deciding rules, co learning knowledge and co configuring the rhythms of classroom life. Inspired by commons based and Freinet influenced traditions, democratic formation unfolds through repeated collective practices that rework authority and responsibility in daily interactions. Children are therefore understood not only as rights holders or critical subjects, but as co-governors shaping the commons of schooling.

POLITICAL CAPABILITIES AND ENVIRONMENTAL JUSTICE AMONG SOCIALLY AND ECONOMICALLY MARGINALISED YOUTH IN QUÉBEC

Charles-Antoine Bachand (Université du Québec en Outaouais, Canada) · **Partick Joseph** (Universidade Federal da Integração Latino-Americana (UNILA), Brazil) · **Olivier Royer** (Université du Québec en Outaouais, Canada) · **Cassiopée Bouret** (Université du Québec en Outaouais, Canada)

youth agency · collective capabilities · environmental justice

This communication examines how socially and economically marginalized youth enact political agency in relation to socio-ecological crises. In line with the symposium's focus on youth as political actors, the study challenges the tendency to position young people as compliant and responsibilized future citizens rather than present participants in democratic life. It adopts a critical posture aimed at giving voice to youth, recognizing the diversity of their concerns, and exploring the spaces where they feel heard—as well as those where they experience frustration, invisibility, or political disregard (Gaudet et Caron, 2024). The presentation draws on preliminary findings from an ongoing collaborative research project conducted in the Outaouais region (Quebec, Canada). The research team has worked with youth centres, animation teams, and facilitated group discussions with young people aged 12 to 17 across urban, rural, and peri-urban sectors. In Quebec, youth centres (Maisons de jeunes) are non-profit community organizations dedicated to supporting adolescents aged 12–17 in becoming critical, active, and responsible citizens. Rooted in proximity-based and participatory approaches, they emphasize empowerment, voluntary and egalitarian relationships between youth and adults, and active involvement in decision-making processes. These spaces, therefore, offer a particularly fertile terrain for examining youth political agency beyond the formal structures of schooling (Cantin, 2023). Data collection followed a bricolage methodology (Kincheloe, 2001), combining dialogic activities, collective mapping, visual artifacts, informal conversations, and recorded group exchanges. This methodological flexibility was designed to respect the needs and specificities of each youth centre and the lived realities of participants, rather than imposing a uniform research protocol. The approach aligns with the project's commitment to epistemic justice and to recognizing youth as legitimate co-constructors of knowledge. Rather than presenting definitive findings, the paper reflects on emerging analytical directions. Initial discussions suggest

that youth articulate environmental concerns in ways closely intertwined with everyday experiences of inequality, territorial belonging, and recognition. The research pays particular attention to how youth describe moments of collective dialogue, instances of feeling politically ignored, and situations in which they perceive opportunities for action. Drawing on the capability approach (Deveaux, 2021), the study conceptualizes political capabilities as collectively constructed capacities to interpret shared conditions, deliberate about common concerns, and imagine transformative responses. By situating youth centres as democratic spaces beyond school, this contribution expands the democratic imaginary to include socially and economically marginalized youth as present political actors. Recognizing their voices, tensions, and forms of resistance is not merely descriptive; it constitutes a normative commitment to renewing democracy in contexts marked by deepening socio-ecological injustice.

TOWARDS A THIRD SPACE WITHIN A MIDDLE SCHOOL: A QUEST FOR SUBJECTIVATION

Enrico Ieroncic (Università degli Studi di Verona, Italy)

Third Space theory | Subjectivation | Partecipatory Action Research

Article 12 of the United Nations Convention on the Rights of the Child offers a pivotal framework for recognizing children not as citizens-in-waiting, but as active political actors within their educational communities. This framework is fundamental to ensuring that rights are not merely stated but effectively practiced (Lundy, 2007). However, formal institutions often prioritize adult-led agendas and rigid hierarchical structures, effectively silencing students' capability to influence their own educational paths (Ingold, 2018). Recognizing these dynamics is vital for establishing an inclusive environment where children's perspectives are not just "heard", but become a primary force in shaping school life (Balloo, 2023; Gupta, 2015; Gutiérrez, 2011). This ongoing PhD research initiative centers on the co-construction of a "Third Space" (Bhabha, 2004; Tatham, 2025) within a middle school situated in the hinterland of Venice (Italy), a borderland region marked by marginalization and rich sociocultural diversity (Anzaldúa, 1987; hooks, 2009). Rather than a top-down intervention, this project conceptualizes the Third Space as a site of subjectivation—a vibrant arena where students' lived experiences and institutional school culture intersect and transform one another (Biesta, 2024, 2021). Our objective is to investigate how young people, acting as protagonists of their own development, exercise their agency to reshape knowledge and identity through an ecological perspective (Biesta and Tedder, 2007). We view the school as a space where subjectivation occurs through students' direct responsibility for decisions that impact their collective future, disrupting the conventional divide between formal education and students' life-worlds (Ingold, 2018; Rantavuori & Sannino, 2026). To realize these objectives, we adopt a participatory and horizontal methodology that breaks with traditional "extractivist" research (Mortari, 2016). A series of collaborative activities will engage teachers, students, and stakeholders not as subjects of study, but as co-researchers in shared brainstorming. This year we started the participant observation, the first round of collaborative semi-structured interviews with educational stakeholders, and interactive workshops with students to uncover the essence of the Third Space within this school (Sannino, 2010). The ongoing data analysis identifies both facilitators and potential challenges to sustain a thriving democratic space within the school context, encouraging all participants to critically reflect their interactions and power dynamics (hooks, 1994). We are dedicated to a longitudinal approach and anticipate our next collaboration with the school community to produce a comprehensive research report. This initiative will culminate in an in-depth podcast that features student reflections, thereby providing a platform to amplify their voices as the primary agents of pedagogical innovation. The ultimate objective of this work is to explore how acknowledging student agency transforms the school and how it contributes to institutional change towards democratic and inclusive learning environments. At this juncture in our ongoing research, we present our analysis of the initial round

of semi-structured interviews, alongside data derived from participant observations. This data encompasses the roles of educational stakeholders, the challenges faced by teachers, the ways in which students experience and navigate the school environment, and preliminary considerations regarding the Third Space within the middle school context.

CHILDREN AS POLITICAL SUBJECTS: INFRAPOLITICS, WAR OF POSITION AND DEMOCRATIC STRUGGLE IN SCHOOL

Maria Giatsi Clausen (Queen Margaret University, Edinburgh, United Kingdom) · **Lorena Elektra Clausen** (Independent youth scholar)

Children's political agency | Infrapolitics | War of position; Scholé

This co-authored paper, written by an adult scholar and a young person, examines children as present political actors whose everyday experiences in school reveal ongoing negotiations with power, authority and democracy. The collaboration itself is a deliberate enactment of the argument: that children are not citizens-in-waiting but legitimate co-producers of political knowledge. By sharing authorship, the paper seeks to live the democratic and intergenerational values it advocates. The paper argues that children already participate in political life through subtle acts of compliance, resistance, solidarity and collective action within and beyond formal schooling. Drawing on Ivan Illich's critique of institutionalized education and Foucault's analysis of discipline and surveillance, contemporary schooling is situated within neoliberal structures that normalize hierarchy, performance and compliance. At the same time, Václav Havel's notion of the "ideological excuse" helps illuminate how children strategically conform to institutional expectations in order to avoid sanction and preserve spaces of autonomy. The presentation will explore real-life examples of such ideological excuses, while privately disengaging, questioning or reinterpreting their experiences. Building on James C. Scott's concept of infrapolitics, the paper examines everyday forms of resistance, such as minimal compliance, quiet refusals, peer solidarities and selective participation, as "hidden transcripts" that coexist with public conformity. These practices reveal children's political literacy and their capacity to interpret and negotiate institutional power without necessarily engaging in overt confrontation. The paper also turns, briefly, to more visible collective struggles through Gramsci's distinction between "war of position" and "war of manoeuvre." Examples of war of position include sustained efforts to reshape school culture through student assemblies, curriculum discussions, and solidarity with teachers during disputes, as gradual attempts to transform common sense from within institutional spaces. In contrast, examples of war of manoeuvre include school occupations, coordinated walkouts and public protests. Such moments of direct confrontation expose the political character of schooling and disrupt established hierarchies.The paper focused more on "war of position". Engaging

critically with Hannah Arendt's call for the depoliticization of education, the paper argues that schools are inherently political in their organization of time, authority and recognition. As such, the paper advances the concept of the Scholé as an alternative democratic imaginary: reclaiming time and space for shared inquiry, dialogue and collective reflection beyond narrow productivity regimes. In this vision, children are not merely being prepared for democracy; they are already enacting it through infrapolitics, solidarities and collective struggles in contested educational spaces.

RECONFIGURING POLITICAL PARTICIPATION: YOUTH ACTIVISM AS DECOLONIAL PEDAGOGY THROUGH THE LENS OF DOING SOCIETY

Marta Salinaro (University of Bologna, Italy) · **Maila Leoni** (University of Bologna, Italy)

youth activism | political participation | doing society

The dominant debate on youth citizenship continues to question young people's capacity to operate as autonomous and competent civic actors (Print, 2007; Wood, 2022), focusing on the characteristics that relegate them outside full citizenship rights: age, economic dependence on adults, and marginal social status (Biesta et al., 2009; Gordon, 2010; Kiilakoski, 2020). This entails that the democratic participation of younger generations is still frequently interpreted through the lens of crisis, apathy, or radicalisation (Loncle et al., 2018; Haidt & Lukianoff, 2018; Biffi, 2023). However, student mobilisations and forms of youth activism that traverse schools and universities at national and transnational levels show that the issue does not concern a decline in participation, but rather a profound transformation of its forms, languages, and spaces of expression (Bressant, 2020; Brennan et al., 2022; Pickard, 2019; Taft, 2010; Pitti, 2025). These practices propose counter-narratives that value young people as political subjects capable of critically interpreting the social, educational, and symbolic conditions in which they are situated, recognising them as crucial actors for social change (White & Wyn, 2008; Shah & Khan, 2023). Through the conceptualization of doing society (Eranti and Luhtakallio, 2024), this contribution proposes a pedagogical reading of youth activism as a practice of political learning and as a form of public pedagogy (Giroux, 2000; Biesta, 2012), questioning the role of formal educational contexts in processes of recognition, legitimation, or neutralisation of such experiences. Within this framework, a decolonial and intersectional reading allows us to analyse and understand how the coloniality of knowledge (Quijano, 2000; Walsh, 2012), supported by the current political landscape and contemporary ideologies, continues to shape curricula, educational practices, and the forms of participation recognised as valid. As a consequence, the voices of young people positioned at the margins due to cultural belonging, racialisation, gender, or class remain increasingly unheard. In this context, youth activism represents a political space for the recovery and construction of new knowledge capable of challenging dominant cognitive hierarchies and of valuing education in its democratic and transformative function. Reconsidering educational contexts in light of activist practices and decolonial epistemologies (Santos, 2014) therefore means recognising young people as co-producers of knowledge and as political interlocutors, restoring centrality to education as an inclusive relational space, a site of power negotiation, of belonging construction, and of democratic participation.

TO BE OR NOT TO BE A CITIZEN: HOW CHILDREN WORK AROUND POLICIES THAT DISQUALIFY THEM AS LEGITIMATE ACTORS

Raphaël Godefroid (Aix-Marseille Université, France)

Citizenship | Children as political actors | legitimationstrategies

Using empirical material collected for my PhD thesis, this abstract aims at understanding the concrete actions of educations policies claiming to « teach citizenship » to children, inside and outside of schools and their receptions by children. In France, in the aftermaths of the terrorist attacks of 2015, successive governments put clear emphasis on the so-called « éducation à la citoyenneté » (citizenship education). This teaching was designed to form pupils, from an early age all the way through their majority, to become politically active citizen and to engage accordingly in society (Barrère & Martuccelli, 1998; Xypas, 2003; Bozec, 2016). However, this program remains very unclear on the real meaning of its aim. In this abstract, I will try to demonstrate two main points. Drawing on Patrick Rayou (2000), my work tries to show that the concept of citizenship, as intended in education policies, is notable for its vagueness and polysemy and should be regarded as a social and educational construct, whose definition is the subject of constant discussion and political wrestling. Among many points, public policies, both on national and local levels, have come short to provide a consensus on the topic of children political status in the making of policies regarding their direct environment. The question of children as political actors is therefore continuously unanswered and the political discourse is revolving around a voluntary blurring between a vision of children as future citizens and a vision of children as an actual citizen of the world in which he lives. Secondly, this vagueness in political definitions has had consequences in the research both in the field of political sociology and of education sociology: depending on the vision of citizenship that is mobilized, children are to be considered either as political actors with an agency (Garnier, 2015) or as passive publics of public policies. I propose an approach inspired by the work of James C. Scott (1990) that allows for the development of a 'hidden transcript' through which children, even in dispositifs (Foucault, 1993) that do not consider them as legitimate actors, present a critical discourse and seek to assert a certain number of positions. Using data from ethnographic observations, I will try to show how children develop resistance strategies in social relationships with adults that are more or less strict but always unequal.

Civic Education Between Formal And Substantive Democracy

PANEL CONVENORS: Lucia Ariemma (Università della Campania Luigi Vanvitelli, Italy); Andrea Millefiorini (Università della Campania Luigi Vanvitelli, Italy)

PANEL KEYWORDS: Democracy, Civic Education, Civic Participation

Democracy, understood not merely as an institutional structure but as a socio-cultural practice and an ethical-political horizon (Dewey; Habermas), requires citizens capable of critical reflectivity, informed participation, and an inclusive perspective. Within this framework, learning is not merely a transfer of knowledge, but it is a dynamic process of building active citizenship and developing skills for democratic co-existence. From this perspective, school is not merely a place of preparation for life; rather, it becomes "life" itself for teachers and students who inhabit and shape it (Dewey; Laporta). The panel will focus on analyzing the practices employed within the teaching of Civic Education as defined in Law 92/2019 and according to the guidelines of the Ministry of Education and Merit (MIM) dated September 7, 2024. The teaching of Civic Education, from its initial definition to the present day, and through various revisions, has consistently constituted a moment within the scholastic context for the reconstruction of knowledge about citizen education. The purpose of the panel is to discuss and explore potential approaches that are complementary to traditional teaching methodologies in Civic Education, methods which focus on civic participation, the centrality of the group and the community, also considering the perspective of onlife meeting environments (Floridi).

RELIGION AND CIVIC EDUCATION AT SCHOOL BETWEEN MISUNDERSTANDINGS AND OPPORTUNITIES

Andrea Avellino (Università di Roma La Sapienza, Italy)

Religious Literacy | Active Citizenship | School

The relationship between religion and civic education represents one of the most fertile—yet problematic—fields of inquiry in contemporary pedagogy. While Law 92/2019 and the recent MIM Guidelines (2024) emphasize the need to cultivate citizens capable of navigating a pluralistic and "onlife" society, the presence of religious phenomena within the school context often oscillates between generative possibilities and profound misunderstandings. The possibility lies in the potential of religion to serve as a "reservoir of meaning" and an ethical compass. In a democracy understood as a socio-cultural practice, knowledge of religious traditions provides the tools for "critical reflectivity" and the construction of an identity open to alterity. However, this potential frequently clashes with structural misunderstandings: The overlap between civic instruction and confessional indoctrination. The difficulty of mediating between absolute religious values and democratic relativism. Emerging tensions in multicultural classrooms, where the "religious fact" can become a barrier rather than a bridge. With the atypical status of religious teaching in Italy, can the religion teacher teach civic education? This paper intends to explore how the teaching of religion (or the treatment of religious facts within pluralistic contexts) can integrate with Civic Education methodologies to promote a democratic coexistence that is truly inclusive. If school is "life itself", understanding diverse faiths and value systems becomes a key tool for decoding contemporary social complexity. Through a comparison of educational models, the discussion intends to demonstrate that religious literacy is an essential prerequisite for conscious citizenship, capable of integrating the spiritual dimension into a shared ethical-political horizon.

DEMOCRACY, EDUCATION, AND CENTRALIZATION IN A POST-SOCIALIST CONTEXT: THEORETICAL TRIANGULATION AND FIRST FINDINGS FROM CROATIA

Monika Pažur (Faculty for Teacher Education University of Zagreb, Croatia) · **Nikola Tomašegović** (Faculty of Humanities and Social Scientist University of Zagreb, Croatia)

Democracy-as-education | Formal and substantive democracy | Post-socialist context

At its most basic level, democracy signifies "power of the people," grounded not only in majority rule but also in individual responsibility for the collective good. Beyond its institutional dimension, democracy is understood as a dynamic and evolving social process that continuously negotiates individual freedom, equality, solidarity, and the rule of law (Dahl, 1989; Rohmann, 1999). It functions simultaneously at individual and societal levels, requiring a delicate balance between personal autonomy and belonging to a community (Perotti, 1994). When equality and solidarity compete with individual liberty, the central liberal-democratic question arises: is a sustainable balance between these values possible (Sorensen, 2008)? Education is crucial in mediating this balance. Democracy depends on the political knowledge, civic awareness, and participatory capacities developed throughout life (Dewey, 1916). Schools and universities therefore represent key arenas where democracy is either enacted as a lived practice or reduced to formal procedures. Inclusion, understood as the meaningful participation of all those affected by decisions (Young, 2002), becomes a defining criterion of democratic quality. Democratic development unfolds across interconnected dimensions—policies, cultures, and practices (Booth & Ainscow, 2002)—which together shape the everyday experience of democracy within institutions. To reconstruct how these dimensions have been conceptualized across disciplines, we conducted a narrative systematic meta-analysis of more than 200 scientific and professional publications from pedagogy, political science, sociology, anthropology, and history. Through theoretical triangulation and qualitative content analysis, recurring themes, categories, and conceptual patterns were identified. The analysis revealed three dominant conceptual strands of democracy in relation to education: (1) democracy as institutional-legal governance focused on rights, representation, and formal structures; (2) democracy as participatory culture emphasizing voice, dialogue, shared responsibility, and relational power; and (3) democracy as transformative practice linked to moral responsibility, social justice, and active citizenship. These strands, often treated separately within disciplinary boundaries, were integrated into an analytically unified triangulated model conceptualized as "democracy-as-education." This model understands democracy as simultaneously structural, cultural, and pedagogical. Applying this triangulated model to the Croatian post-socialist context reveals a significant tension. While democratic institutions and legal frameworks have been formally established since the 1990s, centralized governance structures and hierarchical administrative traditions persist. Findings of previous research indicate that democracy is predominantly interpreted as a legal-institutional arrangement rather than as a participatory culture (Pažur, 2019). Student voice, shared governance, and local community influence remain limited, suggesting that democratic culture and practice lag behind formal policy commitments. The imbalance between structural democratization and cultural-pedagogical transformation reflects historically rooted asymmetries of power typical of post-socialist societies. This paper presents first-year findings from the Croatian research project "Gordian Hub of Croatian Democracy: How to Untangle It?" (DEMOhub). By situating empirical observations within a theoretically triangulated and historically grounded framework, the study demonstrates how democracy–education relations unfold across four interconnected levels: national policy, local governance, educational institutions, and individual actors. By bridging theory and empirical analysis, the study contributes to a deeper understanding of how democracy can move from formal adoption toward lived practice in centralized, post-socialist contexts.

INSIDE THE CLASSROOM AND OUTSIDE THE NATION: ADDRESSING THE EPISTEMIC GAP BETWEEN HISTORY AND CIVIC EDUCATION IN ITALIAN UPPER-SECONDARY SCHOOLS

Alessia Frola (University of Bristol, United Kingdom)

History and Civic Education | Racialisation | Italianness

In Italy, access to full civic belonging remains deeply shaped by the citizenship regime based on jus sanguinis (Law 91/1992). As a result, many young people who were born in Italy or arrived at a young age remain legally classified as foreigners, profoundly shaping their material relationship to rights, recognition, and belonging. These dynamics are mirrored within the school system itself, where students without Italian citizenship are addressed as future members of the Italian community and socialised into the values and responsibilities associated with civic participation, while remaining excluded from the rights that full legal status entails. The classroom thus becomes a paradoxical space in which young people are symbolically socialised into full membership while empirically positioned as outsiders. Literature has shown how national identity has been historically shaped through racialised distinctions, including colonial imaginaries and North-South divides (Giuliani & Lombardi-Diop, 2013). When these historical processes remain marginal within educational narratives, students are encouraged to develop civic competencies without fully confronting the histories that structure contemporary inequalities and exclusions. Consequently, schools actively reproduce a distinction between "unmarked" Italians and "foreigners," categories that frequently map onto racialised hierarchies of belonging. This presentation examines how racialised Italianness, understood as an analytical assemblage that embeds cultural and political horizons, is produced and contested at the intersection of history and civic education in Italian upper-secondary schools. These tensions reveal an epistemic gap between the two domains: while civic education aims to promote democratic participation and inclusive belonging, history curricula often reproduce narratives of national innocence and cultural homogeneity that leave little room to critically address racialisation and the historical construction of Italianness. The paper explores how civic education laboratories and participatory learning activities can help address this gap, fostering more critical and equitable forms of civic formation for students. Drawing on Foucauldian approaches to discourse (Bacchi & Bonham, 2014; Foucault, 1972), Hall's (2017) conceptualisation of race as a floating signifier, and assemblage thinking (Deleuze & Guattari, 1987), the study approaches Italianness as a contingent formation continuously produced and negotiated through educational knowledge and practice. To investigate how these processes operate within schooling, the research combines critical discourse analysis of ministerial curricula and directives with ethnographic fieldwork in upper-secondary schools in Turin. Particular emphasis will be placed on the role of participatory workshops conducted with fourth- and fifth-year students, using methods such as problem-based learning and scenario-based discussions. The workshops invited students to critically engage with questions of belonging and historical responsibility. By bringing historical narratives into dialogue with civic questions of equity and participation, these activities sought to address the epistemic gap between history and civic education identified earlier. Preliminary findings suggest that dominant narratives of national innocence and normative whiteness produce epistemic silences around colonial histories and contemporary racial hierarchies. At the same time, moments of hesitation, discomfort, and debate reveal the pedagogical potential of civic education as a space where taken-for-granted narratives of national identity can be critically examined and reimagined.

DESIGNING AS A FRAMEWORK FOR EDUCATING FOR CHOICE

Stefania Maddalena (University Suor Orsola Benincasa of Naples, Italy) · **Fernando Sarracino** (University Suor Orsola Benincasa of Naples, Italy)

Digital Citizenship | Decisional Autonomy | Reflective Thinking

Educating for choice represents a central pillar of digital citizenship, defined by the Guidelines for the Teaching of Civic Education as an individual's capacity to interact consciously and responsibly with technological developments (Ministero dell'Istruzione e del Merito [MIM], 2024). In a context marked by the "fragmented society" and infobesity, the mere availability of a vast amount of data does not guarantee more rational decisions; on the contrary, it often induces users to passively follow the initial options proposed by algorithms without undertaking a deeper critical analysis (Ariemma & Sarracino, 2025). In terms of "decision science", educating for choice means stimulating the activation of System 2 -slow, deliberate, and analytical thinking - in order to oversee the rapid and often biased intuitions of System 1, which operates automatically and with minimal effort (Kahneman, 2011). Decisions are, in fact, often profoundly influenced by emotions and non-objective parameters such as stereotypes and preconceptions, which act as powerful cognitive "shortcuts" (Berthoz, 2004). The uncontrolled expansion of the web and the proliferation of digital services have generated an information overload that, paradoxically, hinders decision-making processes: an excess of options causes bewilderment, unease, and dissatisfaction (Ricci et al., 2011). Consequently, we are inclined to delegate our choices to recommender algorithms, "black boxes" that, by limiting exposure to divergent perspectives and reinforcing pre-existing biases, allow us to reach a choice quickly and with satisfaction (Ariemma & Sarracino, 2025; MIM, 2024). Was it, however, a true choice? To respond to these challenges, schools must adopt a transversal perspective and laboratory-based methodologies that promote experiential learning and the ability to integrate and re-elaborate digital content in a personal way (MIM, 2024). The teaching of civic education must therefore evolve towards an "Algorithmic Pedagogy" (or AI Literacy), which equips students with the critical tools to evaluate the reliability of sources and understand the principles regulating data flow (Pasta & Rivoltella, 2022). Educating for choice means transforming students from passive consumers into responsible protagonists, capable of exercising their decisional autonomy through the critical recomposition of knowledge and the activation of deliberate thought. This contribution illustrates the evolution and pedagogical aims of an educational path focused on the "choice" enacted with students of the Degree Course in Educational Sciences. This path starts from the construct of "designing" understood as a pedagogical device to transform interaction with technology from passive consumption into an act of intentional and critical construction. Teaching how to design thus becomes an exercise in active digital citizenship, as it requires students to evaluate the reliability of sources, manage their own identity, and understand the ethical implications of their own productions. Through design, choice is no longer an option endured among alternatives suggested by an algorithm; instead, it becomes the critical synthesis of a process of knowledge recomposition, in which the student learns to govern information flows rather than being passively contaminated by them.

MAPPING CIVIC EDUCATION IN ITALY: A NATIONAL STUDY ON STUDENT ENGAGEMENT AND HUMAN RIGHTS EDUCATION FROM NURSERY TO UPPER SECONDARY SCHOOLS

Augelli Alessandra (Università Cattolica del Sacro Cuore, Italy) · **Pagliai Valentina** (Università Cattolica del Sacro Cuore, Italy)

Civic Education | Human Rights | Citizenship

Between April and October 2025, the Permanent Observatory on Civic Education 'Prof. Franco Anelli', created through collaboration between the Catholic University of the Sacred Heart and the Robert F. Kennedy Foundation of Italy Onlus Association, conducted the first quantitative survey at the national level to observe the current situation in relation to organisational and teaching methodology, human rights issues, student participation, family and community involvement, and teacher training processes. The survey involved more than 4,000 teachers from nursery, primary and lower secondary schools to upper secondary schools, distributed throughout educational institutions across the country. This contribution aims to shed light on the section of the research that specifically analysed the role of students and to share the findings on the participation of children and adolescents, the issues and methodologies they favour, the learning paths they develop, and the ways in which they develop civic awareness, exercise citizenship, and promote human rights. In light of the data and related analyses, meaningful directions, significant experiences and desirable changes are outlined.

DWELLING IN DEMOCRACY: SCHOOL, INFOSPHERE AND COMMUNITY PARTICIPATION

Gennaro Balzano (Università degli Studi di Messina, Italy)

Democracy | Civic Education | Onlife citizenship

In contemporary pedagogical debate, democracy can no longer be conceived solely as an institutional form or as a set of normative devices; rather, it must be understood as a daily cultural practice, as a relational experience that takes shape within the concrete contexts of social life. In the perspective of John Dewey, democracy was already conceived as a "mode of associated living," while in Jürgen Habermas it assumed the features of a public sphere grounded in communicative action and in the possibility of shared rational deliberation. Today, however, this theoretical horizon is undergoing a profound transformation: the progressive integration between the analogical and the digital dimensions radically reshapes the spaces, times, and modalities of democratic experience. Drawing on Luciano Floridi's view, according to which the distinction between online and offline now appears conceptually outdated, this contribution proposes interpreting contemporary citizenship as an "onlife" experience embedded within the infosphere; that is, not a parallel or secondary space with respect to social reality, but a structural dimension within which identities, relationships, and forms of participation are redefined. Citizenship thus assumes an informational configuration and is exercised through data, platforms, algorithms, dynamics of visibility, and processes of technological mediation that affect the construction of consensus and the organization of dissent. In light of this transformation, the teaching of Civic Education (Law 92/2019 and the Ministerial Guidelines) must be reconsidered beyond a predominantly content-based approach. The risk of an overly traditional perspective is that it fails to grasp the actual processes through which public opinion is formed and participation is exercised today. Phenomena such as disinformation, digital polarization, and algorithmic profiling cannot be regarded as marginal to the education of citizens; on the contrary, they represent sensitive arenas in which the quality of

democracy is at stake. Three main lines of development are therefore proposed. First, the promotion of critical competences capable of questioning sources, understanding dynamics of manipulation, and being aware of mechanisms of algorithmic amplification. Second, a careful analysis of new forms of digital participation, balancing the expansion of the public sphere with the risks of superficial or merely performative engagement. Third, the need for algorithmic awareness enabling individuals to understand how technological architectures shape civic experience. From this perspective, the school emerges not merely as a place for instruction about digital citizenship, but as a laboratory in which democracy is effectively inhabited and practiced, including within the hybrid environments that characterize contemporary society. Educating for citizenship today therefore means educating individuals to inhabit the infosphere responsibly, so that democracy does not shrink to a set of formal procedures, but becomes a concrete experience of conscious participation and shared community responsibility.

DECONSTRUCTING THE ALGORITHMIC PARADOX: CO-WRITING AND CRITICAL AI LITERACY IN EARLY PRIMARY EDUCATION

Fernando Sarracino (Università Suor Orsola Benincasa, Italy) · **Lucia Ariemma** (Università della Campania "Luigi Vanvitelli")

co-writing AI Primary Education

In accordance with the 'Guidelines' issued by the Italian Ministry of Education (MIM, 2024), the teaching of civic education in primary schools - structured around three interconnected conceptual pillars: the Constitution, Sustainable Development, and Digital Citizenship - is established as a cross-curricular and foundational pedagogical paradigm, aimed at the holistic development of the individual and the citizen. Its transversal nature implies that educators are required to integrate citizenship content within their specific teaching pathways, transcending the logic of fragmented knowledge to promote a unified and critical understanding of social and institutional reality. The 'on-life' reality (Floridi, 2017) in which we are immersed is increasingly integrated with Artificial Intelligence (AI) devices that act as invisible mediators: through the massive analysis of behavioural data, they filter information to steer user choices (Susser et al., 2019). This generates informational isolation that reinforces pre-existing biases and restricts encounters with diversity. The use of subtle persuasion techniques (nudges) and probabilistic calculations enables AI to anticipate and co-create individual desires, transforming apparent freedom of choice into a pre-channelled path (Zuboff, 2019). This scenario delineates a paradox of individual autonomy and raises crucial ethical questions regarding the transparency of systems that, by operating silently, redefine the boundaries of human agency and access to reality. Given these premises, it is evident that, from primary school onwards, there is an urgent need to structure Artificial Intelligence (AI) education within the framework of Civic Education. This aligns with the digital citizenship pillar, which addresses the necessity of cultivating informed technology users capable of navigating virtual spaces with critical discernment. An early approach allows pupils to be transformed from passive consumers of algorithmic suggestions into conscious citizens, capable of recognising the probabilistic and non-deterministic nature of such technologies, thereby ensuring the preservation of free and pluralistic access to reality (Panciroli & Rivoltella, 2023). Without specific algorithmic literacy, children risk growing up within "filter bubbles" which, by catering exclusively to prior preferences, drastically limit encounters with otherness and divergent thinking. Therefore, educating on AI from primary school means deconstructing this paradox of individual autonomy by making explicit the silent mechanisms that redefine the boundaries of human will (Ranieri et al., 2023). The following contribution presents a

didactic experiment conducted with children in Year 1 and Year 2 of primary school in the metropolitan area of Naples. The project was structured around a co-writing activity (Lowry et al., 2004; Tinajero & Rojas-Drummond, 2012; Storch, 2019; Coccimiglio & Ranieri, 2023; Tsatsou-Nikolouli, 2025; Martins et al., 2025), followed by a comparison with AI. The latter was utilised as an alternative device to enable children to detect the adherence (or lack thereof) of algorithmic choices to the proposed text and the extent to which these diverged from the choices made by the children themselves, thereby highlighting AI biases.

CIVIC FORGETTING AND CIVIC AMNESIA AS ELEMENTS OF CONSOLIDATION OF NEW DEMOCRATIC ELITES

Bohdan Szklarski (University of Warsaw, Poland)

transformation elite amnesia

In democracies which have emerged after authoritarianism development of new elites is a part of the process of transformation. We can observe certain stages in that process. At first there is concern about the role of the outgoing authoritarian elites in the new system and a plan for their replacement. It is followed by the search for the new elites, naturally coming from the amateur ranks of "democratic" opposition. Then we witness the process of professionalization of the new elites. This professionalization usually means a second replacement, this time the first generation of new democratically elected elites leaves the stage replaced by policy entrepreneurs who treat civic values instrumentally. In the background of this process of elite replacements we witness the gradual fading of the civic values from the aspirational role as noble alternatives to the authoritarian rule, to the role of a façade covering brutal power games over narrow interests. It might be said that when it comes to the significance and usage of civic values among the political elites the process of democratic transformation resembles that of semantic forgetting till it reaches the stage of civic amnesia. The process of civic forgetting has its spillover effect into the sphere of civic education of young people who become new political cadres. The purpose of this text is to describe the stages and scope of civic forgetting, explain its causes and consequences for the character and prospects of new post-authoritarian democracy.

FORMAL CIVIC EDUCATION AND DEMOCRATIC EDUCATION THROUGH DIRECT EXPERIENCE WITHIN THE SCHOOL PLACE : A PRODUCTIVE TENSION OR VIRTUOUS INTERPLAY?

Marcelline Lejeune (UCLouvain, Belgium) · **Ivan Haverlant** (UCLouvain, Belgium) · **Marie Verhoeven** (UCLouvain, Belgium) · **Reuchamps Min** (UCLouvain, Belgium)

School democracy | civic education | democracy education

Formal Civic Education and Democratic Education Through Direct Experience Within the School Place : a Productive Tension or Virtuous Interplay? A Qualitative Survey in 10 French-speaking Belgian Schools. Building on the results on a one-year sociological research on school democracy pedagogical practices and devices in French-speaking Belgium, our contribution focuses on the relationship between formal civic and democratic education (formal teaching of rights, institutions, and rules of citizenship distributed across various subjects) and democratic education through practice (direct experience of participation, actual engagement in projects, speaking out, collective decision-making). In relation to the theme of this symposium, our contribution seeks to broaden the analytical lens by examining the interplay between formal education practices and the concrete participatory devices designed to foster the direct experience of democracy in schools (a dimension which has been politically promoted in French-Speaking Belgium in recent years, since the “Pacte pour un Enseignement d’Excellence” was voted). Based on a qualitative survey conducted in ten (primary and secondary) schools, through observations, in-deph interviews with principals, teachers, and focus groups with students, we demonstrate that these two approaches coexist to varying degrees in schools without ever fully harmonizing. These ten schools were grouped into four clusters based on their degree and modalities of implementation of democratic principles, highlighting the tensions, obstacles, and dynamics at work in contrasting settings. To the question of formal democratic education and education through action, our research reveals that these two approaches constitute a dialectical tension that runs deep in the way all schools conceive, organize, and implement democracy. This tension manifests itself in very different ways depending on the contexts observed. The contexts in the schools in the first cluster (those that are relatively new to democratic issues) focus mainly on formal learning; civic language is used, but opportunities to practice democracy remain marginal or symbolic. In intermediate configurations, projects exist but are not always linked to formal learning or existing mechanisms. In the most advanced schools, the two approaches mutually reinforce each other: participatory mechanisms are used as venues for civic learning, and formal learning gives reflexivity to lived practices. This virtuous interplay produces both firmly rooted learning and experienced notions of lived democracy.

HISTORICAL MEMORY AND NEW RIGHTS IN CIVIC EDUCATION THE VENTOTENE MANIFESTO AS A LABORATORY OF EUROPEAN CITIZENSHIP

Vincenzo del Giudice (University of Suor Orsola Benincasa, Naples. Italy)

historical memory | civic education | teacher training

The teaching of civic education is universally recognised as a key driver in the formation and education of constitutionally aware citizens. In recent decades, new pedagogical challenges have emerged in this field, and consequently new opportunities have arisen. These have been addressed both through Law No. 92/2019, which introduced a specific curricular subject with a substantial number of teaching hours, and through the successive national guidelines, the most recent of which were issued by Decree No. 183 of 7 September 2024. The new guidelines identify three fundamental conceptual pillars: the Constitution, economic development and sustainability, and digital citizenship. They acknowledge that the study of civic education can no longer be confined solely to the dimension of civil rights but must extend to multiple aspects of social life, including technological development and environmental issues. It is therefore necessary to reflect on whether the pursuit of these new educational objectives risks overshadowing another aspect that, even in the recent past, has been considered fundamental by several members of the scientific and civic community (for example, Aldo Moro). In particular, it is worth considering whether the educational project, even in the absence of explicit guidance, should continue to value the historical phases that have shaped the evolution of our society. This contribution therefore

aims to analyse whether, and to what extent, it is beneficial to integrate both a historical-critical approach and an ethical-critical perspective into the teaching of civic education. This analysis also incorporates the viewpoints of students—future teachers—attending the Laboratory of Planetary Citizenship and Environmental Sustainability Education offered within the Primary Education Degree Programme at Suor Orsola Benincasa University of Naples. The exploratory study is prompted by a reflection on what aspects of the Ventotene Manifesto remain relevant today—such as the values of freedom, rights and democracy, cooperation among states, European integration, and solidarity among peoples—and proceeds to critically examine some of the major contemporary challenges, including the crisis of the European Union, the resurgence of nationalism, armed conflicts, and climate change.

INCLUSIVE CITIZENSHIP AND THE ECOLOGY OF RELATIONSHIP: EDUCATING FOR OTHERNESS THROUGH THE CINEMATIC MEDIUM

Lucia Ariemma (Università della Campania Luigi Vanvitelli, Italy) · **Fernando Sarracino** (Università degli Studi Suor Orsola Benincasa, Napoli)

Civic Education | Intercultural Education | Primary School Teachers

The integration of the Guidelines for Teaching Civic Education (MIM, 2024) with the paradigms of intercultural pedagogy establishes an educational horizon in which citizenship is no longer perceived as the mere acquisition of legal notions. Instead, it is understood as a relational praxis grounded in the recognition of otherness. The convergence of these two fields is primarily expressed through the transcendence of a monocultural vision of law and coexistence, proposing a model of "inclusive citizenship". The first pillar of the Guidelines, centred on the knowledge of the Constitutional Charter, aligns with intercultural pedagogy through the valorisation of Articles 2 and 3; by enshrining the inviolability of human rights and both formal and substantive equality, these articles mandate the overcoming of all ethnic, religious, or social barriers. In this sense, civic education becomes the elective ground for exercising "cognitive decentring" (Abdallah-Pretceille, 1996) — a pivotal capacity in intercultural reflection that enables individuals to move beyond cultural self-referentiality to embrace a plurality of perspectives as a constituent element of democracy. Parallel to this, the second thematic core regarding sustainable development and global citizenship projects individual responsibility onto a supranational scale, requiring a critical reading of global interdependencies inherent to the intercultural approach. According to Milena Santerini (2017), intercultural education for global citizenship represents the necessary evolution of the traditional concept of civic belonging, transcending the boundaries of the nation-state to embrace a planetary dimension consistent with the objectives of the 2030 Agenda. The author posits that the second pillar of the Guidelines for Civic Education should not be understood as a simple repertoire of ecological best practices, but as a pedagogical device aimed at forming a citizen capable of inhabiting complexity and interdependence, thereby promoting an "ecology of relationship" that protects both the environment and anthropological diversities. Within this framework, empathy assumes a fundamental gnoseological role: it is interpreted not as a vague sentiment of proximity, but as an "intercultural competence" that allows for the recognition of the other in their full dignity, surpassing mechanisms of exclusion and identity barriers (Portera, 2020; 2022). Santerini emphasises how empathy acts as the engine of decentring — the ability to view the world through different cultural lenses — which is an essential condition for understanding global challenges, from the climate crisis to migration, not as isolated phenomena but as nodes in a network involving the whole of humanity. Ethical responsibility is indissolubly linked to this empathic dynamism, transforming awareness into civil action. Building upon these premises, a research-training programme was developed for prospective primary school teachers. Based on film analysis as a pedagogical device (Malavasi et al., 2005), this programme constitutes an elective strategy for translating the theoretical tenets of cognitive decentring and the ecology of relationship into concrete didactic practices. The activity,

structured according to the paradigm of reflexivity, intended to utilise the filmic medium not as a mere illustrative aid, but as a "laboratory of gazes" capable of fostering the empathic posture and ethical responsibility that should characterise the teaching profession (Sozio, 2025).

CULTURAL HERITAGE, SCHOOL, MUSEUM: EDUCATIONAL PRACTICES TO PROMOTE ACTIVE CITIZENSHIP AND DEMOCRATIC PARTICIPATION

Laura Landi (Università di Modena e Reggio Emilia, Italy) · **Chiara Pelliciari** (Civic Museums of Reggio Emilia)

Civic Education | participation | widespread education

This contribution presents Una Settimana al Museo (A Week at the Museum), an established educational initiative developed by the Civic Museums of Reggio Emilia, in which school classes temporarily relocate their learning environment within the museum's collections for an entire week. The project aligns with the emerging construct of Widespread Education and moves beyond the conventional logic of the school visit, proposing instead an immersive, co-designed educational experience in which the museum functions as an extended and shared learning environment, capable of fostering authentic dialogue across past, present, and future. The extended timeframe of the experience proves particularly well-suited to the demands of citizenship education and democratic participation. Sustained immersion in the museum space allows students to engage with complex constructs — rights, identity, participation, responsibility, and democratic coexistence — exploring their plurality of meanings and their inherently problematic dimensions. Cultural heritage and museum artefacts serve as catalysts for reflection and dialogue, enabling a form of learning that connects historical understanding, personal experience, and contemporary context. This approach resonates with the framework of Global Citizenship Education (GCED) as defined by UNESCO (2025), which emphasises the development of knowledge, skills, values, and attitudes that empower learners to act as responsible global citizens. Similarly, the European Declaration on Global Education to 2050 (GENE, 2022) calls for educational practices that nurture critical thinking, active participation, and a sense of shared responsibility across local and global dimensions. The initiative also aligns with the aims of Civic Education as established by Italian Law 92/2019 and elaborated in the Guidelines issued by the Ministry of Education and Merit (MIM) on 7 September 2024, which foreground the formation of conscious, participatory, and democratically engaged citizens. The contribution focuses on the experience of lower secondary school classes at the Museo del Tricolore in Reggio Emilia — a symbolic site of Italian institutional history, where the Italian flag was born in 1797. In this context, historical heritage becomes an occasion to interrogate the meanings of citizenship and democracy, connecting collective memory with contemporary questions of rights and civic participation. The proposed activities promote active and participatory learning. Through autonomous exploration of museum spaces, engagement with historical sources and documents, narrative construction, and structured collective discussion, students are involved in processes of inquiry and interpretation. Simulation activities and guided debate invite students to engage with questions of community life, practising listening, negotiation, and shared decision-making — competencies central to both GCED and civic education frameworks. Observations gathered during the activities indicate that students tend to perceive the museum, following this experience, as a welcoming and meaningful space in which diverse modes of learning and participation become

possible. The project demonstrates how the dialogue between school, cultural heritage, and local territory can contribute to building educational contexts oriented towards the formation of critically aware and democratically engaged citizens — positioning cultural heritage as a strategic educational resource for the twenty-first century.

Learner Voice for Democratic Learning

PANEL CONVENORS: Thomas Murray (Aontas Ireland's National Adult Learning Organisation, Ireland); Philip Finn (Aontas Ireland's National Adult Learning Organisation, Ireland)

PANEL KEYWORDS: Learner Voice, Democratic Learning, Adult Education

Learner Voice centres adult learners in policy and decision-making by offering appropriate ways of listening to their concerns to develop more supportive educational experiences and relationships. Learner Voice seeks to extend long-standing values of dialogue, equality, and empowerment in adult education beyond the classroom into institutional and policy-making domains (Fielding, 2010). Learner Voice emerges as a vital space for 'bottom-up' participation (See Beresford, 2016), one in which learners can articulate recognitions and misrecognitions and challenge wider social, cultural and economic inequalities (Fleming, 2021). At stake is what Gert Biesta (2016) has called 'democratic learning', the education that flows from participating in constructing a common life together. This panel invites papers seeking to engage with critical questions for Learner Voice advocates. How do adult education systems listen to adult learners? How do they act on what learners say? What are the implications for democracy - in our education systems and in our society – of learner participation in decision-making? What does it mean to adult learners to make their recognitions and misrecognitions known? What are the implications of not listening to Learner Voice? We welcome comparative perspectives aimed at sharing diverse Learner Voice theories and practices. From accredited learning to popular education, we are interested in discussing how Learner Voice takes shape in specific adult learning spaces and policy systems. From policy consultation through participatory budgets to popular assemblies, what institutional forms might voice take? To what extent can we have confidence in meaningful participation, substantive change, and democratic learning?

FROM PASSIVE RECIPIENTS TO CO-CREATORS: LEARNERS' VOICES SHAPING EDUCATION FOR SUSTAINABLE DEVELOPMENT (ESD) IN IRISH HIGHER EDUCATION INSTITUTIONS (HEIS)

Hayette Bellakehal (South East Technological University (SETU), Ireland) · **Niamh O`Brien** (South East Technological University (SETU), Ireland) · **Carol O`Byrne** (South East Technological University (SETU), Ireland) · **Michelle Maher** (South East Technological University (SETU), Ireland)

Learners` Voices | Education for Sustainable Development (ESD) | and Higher Education Institutions (HEIs)

In response to global uncertainties, UNESCO (2020) positioned Education for Sustainable Development (ESD) as a critical framework to prepare learners for economic and socio-ecological crises. However, this goal often faces institutional barriers. Fundamentally, ESD is based on "transformative learning", where education goes beyond conveying facts to empowering students to shift perspectives and take meaningful action (Mezirow, 2000; Sterling, 2011). While ESD is theoretically rooted in transformative agency, current institutional models frequently treat students as passive recipients of information rather than active partners in a democratic "educational commons". Hierarchical decision-making risks reducing the student's role to a mere statistic, obstructing the participatory engagement needed for genuine democratic learning (Biesta, 2016)—a process essential for strengthening dialogue, equality, and empowerment in society. This study investigates learners' perspectives on sustainability in Irish Higher Education Institutions (HEIs) and the factors influencing their engagement. The first phase adopted a qualitative inquiry to capture diverse viewpoints on ESD, revealing key themes of engagement, dialogue, and equality. These insights informed the development of a quantitative measurement scale for ESD, guiding the survey design and contributing to its subsequent validation. The resulting framework offers a practical diagnostic tool for Irish HEIs to assess learners' engagement with ESD. This research adopts a constructivist grounded theory orientation with an exploratory sequential mixed methods design to develop an integrated theory rooted in learners' voices. In the first phase, semi-structured interviews (n=18) and a focus group discussion (n=4) were conducted with undergraduates from two campuses of one Irish HEI. The analysis followed an inductive, data-driven approach, capturing the richness and complexity of students' perspectives without imposing pre-existing theories. The qualitative data were analysed using reflexive thematic analysis guided by grounded theory principles of iterative coding, constant comparison, and theory generation from emerging data. Codes were grouped into survey domains, and learners' direct quotes informed the development of survey items. The survey will later be administered across five university campuses to test and validate insights on a larger scale. Findings reveal that sustainability evokes diverse, often conflicting perspectives, from scepticism and frustration to hopelessness. Many learners perceive sustainability as unattainable due to systemic financial constraints, fostering a sense of "infeasibility" that limits participatory engagement.

Participants also highlighted a tension between authentic sustainability and dominant capitalist priorities, noting that institutional narratives often prioritise reputational sustainability and economic growth over deeper structural transformation. This suggests that learners' voices navigate a landscape of "misrecognition," typically marginalised by market-driven agendas. The results suggest that to support democratic learning, ESD needs to move beyond hierarchies and uphold shared values of responsibility, stewardship, and equity. By cultivating critical thinking to navigate complex power structures, HEIs can enable students to transform passive frustration into active, agentic participation in shaping a sustainable common life. This study makes a methodological contribution through an assessment framework co-created with learners to centre their voices at the heart of institutional ESD evaluation. This participatory instrument provides a concrete solution, enabling Irish and international HEIs to assess learners' needs effectively and move beyond tokenistic engagement.

FROM VOICE TO BELONGING: REIMAGINING UNIVERSITY COMMUNITY THROUGH DIALOGUE TABLES

Giulia Elardo (University of Padua, Italy)

learner voice | critical pedagogy | dialogue tables

The quality of intergenerational relationships has undoubtedly changed. Educational relationships—such as those between parents and children or teachers and students—have taken on new forms in response to the transformations characterising contemporary society, including the advent of the internet, new media, and artificial intelligence (Jandrić, 2017). In this context, the adult world appears to be finding it increasingly difficult to respond adequately to the demands and needs of younger generations. This is evident in the growing number of anxious parents who turn to specialists and manuals (Haidt, 2024), teachers who often feel frustrated by their perceived inability to understand youths (Cickovska, 2022), and policy measures of questionable effectiveness aimed at addressing youth violence (such as recent proposals to introduce metal detectors in schools). Adults frequently appear inadequate, presenting themselves either as fragile caregivers or oscillating between extremely controlling and highly indulgent attitudes, often unable to express dissent or set limits. Such approaches risk fostering a sense of uncertainty among young people and a weakened adherence with reality, resulting in increased fragility in managing relationships and social challenges. These dynamics contribute to the gradual withdrawal of many adolescents and young adults from the public sphere and to a diminished capacity to imagine themselves as active citizens within a democratic society (Giroux, 2014). Increasingly absorbed by their smartphones, young people risk becoming subjugated by social media, influenced by the myth of perfection and the anxiety generated by systems of capitalist efficiency. In this scenario, some turn to "alternative listeners" (e.g. AI-based tools acting as psychological supports) to address their doubts and questions. Others respond by engaging in "social and digital detox" practices, while still others demonstrate a strong commitment to proactivity in areas such as peace and sustainability. As educators, we cannot remain silent in the face of the multifaceted requests for listening expressed by young people. Among the experiences that higher education can offer, dialogical practices emerge as powerful tools for empowerment, critical awareness, and democratisation. The research project presented in this paper is situated within this framework. Drawing on critical–emancipatory pedagogy (Denzin & Lincoln, 2023) and a bottom-up participatory approach, the study employed a qualitative research design centred on a series of five focus groups—referred to as "dialogue tables"—with students enrolled in Educational Sciences degree programmes at several Italian universities. The aim was to explore students' attitudes towards personal and collective participation by foregrounding their voices and concerns. The dialogue tables were facilitated by the researcher using an interview guide developed from the thematic analysis of responses to a questionnaire administered in spring 2025 (n of responses= 580). Each dialogue table lasted approximately two hours and engaged participants in discussion around five generative themes. The project sought to create a shared dialogical space

in which students could collectively reflect on practical issues that directly affect their lives as individuals and citizens. This practice aims to support the development of dialogical skills, autonomy in decision-making, and responsibility towards others, in line with the goal of cultivating humanity (Nussbaum, 2006).

ADULT EDUCATION AND DEMOCRATIC LEARNING: LISTENING TO LEARNER VOICE

Thomas Murray (AONTAS Ireland's National Adult Learning Organisation, Ireland)

learner voice | democracy | adult education

Drawing on the work of Antonio Gramsci and Paulo Freire, Marco Pitzalis (2024) has proposed that emancipatory projects to counter neoliberalism require research that interrogates the education system 'from below'. It follows that democratic dialogue demands 'epistemic justice', a critique-movement against and beyond power-holders' symbolic violence of classification, categorisation, and devaluation 'from above'. Acknowledging this challenge, to what extent might Learner Voice foster democratic dialogue between academia, policy makers and practitioners in adult education? The following paper explores this question through the lens of a single case study: the National Further Education and Training Learner Forum (NFLF) of Ireland. The NFLF is one of the largest and most enduring Learner Voice projects in Europe. Since the first national forum was held in 2016, the NFLF has engaged and listened to over 14,000 adult learners. Each year, the NFLF brings together hundreds of adult learners across Ireland to ask their views of and satisfaction with their experience of Further Education and Training (FET). Its purpose is to ensure that FET meets the needs of adult learners today and continues to do so in future. AONTAS, Ireland's National Adult Learning Organisation, is responsible for the NFLF, collaborating with the state's 16 Education and Training Boards to host regional forum events. AONTAS documents Learner Voice through both regional and national reports, and further utilises these findings as an evidence-base for advocacy to influence national policy. In the context of multiple, intersecting crises of ecology, economy, and society, fostering democratic practice and conviction in adult education acquires renewed urgency. Arguably, the NFLF creates a space within which to embed 'democratic learning', the learning that flows from participating in constructing and maintaining a common life (Biesta, 2016, 104). Reflecting on the work of the NFLF offers us an opportunity to consider the quality of dialogue among diverse actors in the adult education system, assessing its fundamental character as well as associated challenges and opportunities. The present paper highlights both the potential for transformative change that arises when we listen deeply to adult learners and the necessity of institutions to make voice effective. In doing so, the paper speaks to diverse, interdisciplinary scholarship in the fields of citizen participation, participatory social policy and transformative student voice (Clancy and Murray, 2025; Murray and Brennan, 2023; Angus et al., 2013; Fielding, 2010).

NAVIGATING DIGITAL BARRIERS: IMPLICATIONS FOR INCLUSION INTO LIFELONG LEARNING.

Kevin McCabe (Dublin College Balbriggan (Adult Education Service), Ireland)

Lifelong Learning | Neoliberalism | Online Course Application Systems

This abstract addresses the issue of adult learners with limited digital skills applying online for courses with Adult Education Services (AESs). AESs meet the educational needs and goals of a highly diverse student body (Grover and Miller, 2016). This diversity is reflected in AES course provision, including but not limited to: professionally accredited courses, English language courses, literacy courses, and community education courses. In the Republic of Ireland (ROI), adults are directed to a website called Further Education and Training Course Hub (FETCH) to apply for lifelong learning courses. FETCH was launched in 2016 with the intention of making adult education more accessible (Mitchell, 2016) and is aligned with governmental pledges to make lifelong learning inclusive of all adults (DFHERIS, 2020). This digitisation of the course application process epitomises how digital systems are rapidly replacing their analogue predecessors (Pihlainen et al., 2021). However, these digital systems place adults at risk of social exclusion if they do not possess the requisite skills to use them fully (Enright, 2023). Some adults require an alternative to digital forms (Anrijs et al., 2023). Almost 50% of respondents to a literacy survey in the ROI know an acquaintance who requires digital device support (DFHERIS, 2021). Notably, some adult learners attending digital literacy classes can still require support when using apps or the internet outside of the classroom (AONTAS, 2025). Furthermore, AESs have a responsibility to respond to learner needs at the local level (DES, 2000) and an ability to develop appropriate procedures for current and prospective students (Ross-Gordon et al., 2017). Yet, policy-compliance issues can hamper initiatives to broaden participation in lifelong learning (Clain, 2016). Moreover, neoliberal policies and practices have taken root in European education (Schmoelz, 2023). Notably, equity through the neoliberal lens has been reconstructed in economic, efficiency, and performance-measurement terms, while it does not address the causal factors of inequality, thus further alienating marginalised learners (Mikelatou and Arvanitis, 2021). Consequently, digitally vulnerable adult learners are expected to use a 'top-down', neoliberal-esque course application process that is not informed by their needs, which can in turn become an institutional barrier (Sualehi, 2023) for those adults who cannot complete the form. The impact of using such systems on said adults includes privacy concerns (Mesa, 2023; Tokovska et al., 2023), disempowerment (Hill et al., 2015), exclusion (Seifert et al., 2018), and stress (Nimrod, 2017). However, digital services have the capacity to be 'bottom-up' and designed around the needs of end users via consultation with them (Savoldelli et al., 2014; Tokovska et al., 2023). I advocate that the Learner Voice should be meaningfully heard in discussions and decisions about course applications systems. Not listening to adult learners who have difficulty in navigating, or concerns with, digital application processes risks excluding them from lifelong learning altogether. This could potentially create a Matthew Effect wherein those who successfully completed courses before will continue to do so, and those who experience challenges with course applications will not reap the benefit of lifelong learning (Van Nieuwenhove and de Wever, 2021).

DISABILITY, SOCIAL JUSTICE AND THE POWER OF LEARNER VOICE

Philip Finn (AONTAS, Ireland)

learner voice | democracy | disability

Disability is neglected both in terms of applications of social justice perspectives and in what an understanding of disability can bring to these perspectives (Mladenov 2016). Fraser (1996) contends that social justice requires 'parity of participation' through redistribution, recognition and representation. In the realm of education, Learner Voice offers a space in which these goals can be pursued and realised by centring the agency of learners as active participants and partners in educational processes rather than as objects of policy and pedagogy (Dowdall, Sheerin, and O'Reilly 2019). Learner Voice aims to extend the values of democracy, equality and empowerment central to adult education practices from the classroom into institutional and decision-making domains (Fielding 2010). People with disabilities face a significant risk of poverty, high unemployment rates, and lower educational attainment levels than the general population, as well as stigma and discrimination (EDF 2022), which undermines a 'parity of participation'. Compounding this is an extra 'cost of disability' in their everyday lives due to navigating society with a disability. To what extent then can Learner Voice respond to the redistributive, symbolic and representative inequalities faced by learners with disabilities? The paper utilises mixed method research carried out by AONTAS, the Adult Learning Organisation, as part of the National Further Education and Training (FET) Learner Forum (NFLF) in Ireland. The NFLF is carried out annually and the project is one of the largest of its kind in Europe. Between October 2024 and May 2025, the NFLF included a total of 98 focus groups incorporating 778 learners and 1858 survey respondents across 10 regional Education and Training Boards. The NFLF operates on a Learner Voice basis providing opportunities for learners to articulate their experience of FET to inform evidence-based advocacy to influence national policy. As such, the NFLF aims at 'democratic learning' (Biesta 2016) by providing mechanisms for learners to participate in, and shape, their world. By attending to these opportunities and challenges faced by a sub-set of research participants, learners with disabilities, we can unpack the environmental and symbolic supports necessary to enhancing participation in adult education. In doing so the paper returns to Fraser (1995) to distinguish between the affirmative practices correcting inequalities and transformative practices aiming deeper structural changes, and the potential of the NFLF as a space 'in-against-and beyond' (Holloway 2010) the policy context in which it operates.

DEMOCRATIC PARTICIPATION IN LEARNING CITIES. LEARNING FESTIVALS AS EDUCATIONAL COMMONS

Carmel Berendi (ASEM Lifelong Learning Research Network)

learning cities | lifelong learning | participation

In recent years, the concept of Learning Cities has emerged as a significant policy and practice framework for strengthening democratic participation through lifelong learning. Developed within the policy architecture of the UNESCO Institute for Lifelong Learning and the UNESCO Global Network of Learning Cities, the learning city approach places learners and communities at the centre of local lifelong learning ecosystems. UNESCO policy frameworks emphasise that learning opportunities should respond to the needs, aspirations, and lived experiences of citizens, thereby fostering inclusive participation and social cohesion (UIL, 2015; UIL, 2021). This paper explores how Learner Voice is enacted within learning city ecosystems through the practice of learning festivals, which represent distinctive civic spaces where adult learners, educators, civil society organisations, and local authorities collaboratively shape lifelong learning opportunities. Learning festivals are typically developed through participatory processes in which programme themes and activities emerge from learners' interests, community initiatives, and local organisations. In this way, they provide concrete mechanisms for bottom-up participation and democratic engagement in adult learning. (O Tauma, 2016) The study investigates how learner needs and experiences influence the design and organisation of learning festivals and related lifelong learning initiatives in selected European learning cities. The comparative study adopts a qualitative approach across three national contexts: Cork and Limerick (Ireland), Pécs and Szombathely (Hungary), and Trieste and Cividale del Friuli (Italy). These cities represent diverse yet interconnected examples of learning city development within European lifelong learning policy networks. (UIL, 2017) Methodologically, the research employs autobiographical inquiry in the form of in-depth qualitative interviews with adult learners, organisers of learning festivals, and coordinators of local lifelong learning initiatives. By foregrounding the lived experiences of participants, the study explores how learners perceive recognition, participation, and agency within these learning ecosystems. Particular attention is given to how learner input shapes programme design, institutional collaboration, and community engagement in local learning initiatives. The paper also situates these practices within their broader socio-political context. In several contemporary societies, opportunities for participatory democracy are under pressure due to increasing political centralisation and democratic backsliding. In such contexts—illustrated for example by recent developments in Hungary—spaces for civic participation within formal political structures may be narrowing. Lifelong learning initiatives embedded in local communities, such as learning festivals, can therefore acquire additional significance as alternative arenas of democratic participation, where citizens can articulate their voices, share experiences, and actively contribute to shaping the social and cultural life of their communities.(Németh, 2019) By examining learning festivals as spaces of democratic participation, the paper contributes to debates on learner's voice and democratic learning in adult education. It argues that learning city initiatives can function as educational commons, where citizens co-create learning opportunities and where participation in learning becomes intertwined with participation in civic life.

Music and Anthropology a Synergistic Dialogue in School Autonomy: Is It Possible to Co-construct Permanent Values of Active Citizenship?

PANEL CONVENORS: Marta Villa (Department of Sociology and Social Research, University of Trento); Carlo Centemeri (Independent researcher and Classical Music editor for Radio Popolare Milano)

PANEL KEYWORDS: music, anthropology, Active Citizenship

The panel invites interdisciplinary contributions exploring critical intersection of music, anthropology, and education as a tool to promote democratic pedagogical practices. Starting from the guidelines that define democracy as a plural and situated cultural phenomenon, we argue that musical practices offer a specific lens for understanding different historical periods, current social dynamics, and collective construction of meaning in diverse communities: they can be used as ethnographic sources to understand the relationship between power, culture, and cultural product (Zagrebelsky 2014). The panel will welcome both ethnographic studies and practical, participatory approaches that analyze how the production, performance, and reception of music within educational contexts function as arenas for negotiation, power dynamics, and the co-construction of values (Bagaskara et al. 2024). We intend to investigate music not merely as content, but as a methodological tool that reveals existing hierarchies, identities, and structures of belonging (Centemeri 2017). Furthermore, we will critically address the role of institutional autonomy in facilitating or hindering the integration of musical practices into curriculum. How can educational autonomy be utilized to favor the inclusion of music education at all levels of instruction, promoting the recognition of the inherent knowledge and historico-social understanding within diverse musical traditions? What tensions emerge between the democratic promise of music education, understood as a space for critical citizenship, and the constraints of public accountability and standardization? How can music education, read through the critical lens of cultural anthropology, form citizens capable of relating to the cultural products they will encounter throughout their lives?

CD AS CONNECTION DEVICE

Stefano Vaia (Coro Tridentum, Italy) · **Giuseppe Calliari** (Coro Tridentum, Italy)

Choir laboratory | alpine traditional music | connection device

This contribution aims to present the experience of the Tridentum choir-laboratory, founded in Trento (Italy) in 2017 and devoted to the historical repertoire of Alpine polyphonic singing (Labanca et al. 2020). Over the past year, the Tridentum choir-laboratory has been producing a CD intended as an opportunity to refine interpretative choices through a process that questions vocality, phrasing, and the relationship with the traditional text. This cultural project simultaneously encourages critical observation from different disciplinary perspectives. Alongside the collective work of studying and recording the songs, professionals invited to share in the experience are producing contributions that will be collected in a forthcoming volume. In this way, a compact disc takes on the broader and more significant role of a Connection Device. Choral practice within the Tridentum choir-laboratory becomes a form of active citizenship education. The choir functions as a pedagogical and social space in which collective musical production becomes a site for negotiating meanings, shared responsibilities, and reciprocal listening. From this perspective, choral practice involves not only the singers—who are called upon to exercise cooperation, coordination, and participation—but also the audience, which through listening participates in a process of cultural and symbolic construction. Choral practice thus becomes an educational device capable of activating forms of cultural citizenship both in the performative dimension and in that of reception, showing how music can operate as a space for civic education and critical reflection (Schütz 2015).

THE SELF-MANAGED ORCHESTRA: A CIVIC EDUCATION PROJECT IN LOWER SECONDARY SCHOOL

Andreina Re (Istituto Comprensivo Roveredo in Piano, Italy; Associazione Antropolis, Italy)

musicking | active citizenship | participatory composition

This paper analyzes the "Self-Managed Orchestra" project, developed within my school's Music Department following the introduction of Civic Education as a cross-curricular subject (Law no. 92, August 20, 2019). This regulation mandates that the subject should not be restricted to a single discipline but should emerge from the synergy of the entire Class Council through shared competence goals. Moving beyond a purely content-based perspective—which often reduces Civic Education to the study of symbols or celebratory texts—this project distances itself from a notionistic approach. Instead, it embraces the spirit of the 2018 National Guidelines and New Scenarios, which promote "Arts for Citizenship" as tools for fostering active and aware citizens. The teaching unit enables third-year students (Grade 8) to experience firsthand the weight of individual and collective responsibility. The methodological approach is based on the deconstruction of the vertical hierarchy typical of traditional orchestras, placing all operational decisions in the hands of the students to perform a collective piece within a set timeframe. This model draws on Christopher Small's concept of "Musicking," which defines music not as an object but as a relational and social action capable of shaping interactions between individuals. Through process observation, this study documents critical phases of negotiation: Repertoire Selection: Students mediate between identity-based tastes and technical feasibility, transforming the choice into a democratic act. Peer Tutoring: The establishment of "section leaders" redefines group dynamics, promoting informal learning and exposing—in a rare way—the "underground life of the classroom" (Benadusi, 2012). Collective Arrangement: Participatory composition redefines the "cultural product" as a synthesis of the group's demands, turning musical practice into an exercise in micro-politics (Laes et al., 2025). Through participant observation, musical practice is reinterpreted as a space of resistance against the pressures of evaluative standardization. It promotes a socio-historical understanding of music-making as an act of democratic co-creation and an awakening of power dynamics. Ultimately, the Self-Managed Orchestra addresses the challenge of forming citizens capable of critically inhabiting conflict.

"FOUNDED ON CULTURE": SINGING AS A PRACTICE OF ACTIVE CITIZENSHIP BETWEEN EDUCATIONAL AUTONOMY AND INCLUSIVITY.

Elisa Luppi (Armonicà, Italy)

Choral singing | educational autonomy | active citizenship

The contribution moves from the idea of a Republic "founded on culture," interpreting Articles 3, 9, and 33 of the Italian Constitution. While Article 9 entrusts the Republic with the promotion of culture, Article 3 clarifies its substantive dimension by committing public institutions to remove the obstacles that limit full participation in social and cultural life; Article 33, finally, safeguards the freedom of art and teaching, opening a space of pedagogical autonomy within which artistic practices may assume a public and democratic function (Zagrebelsky 2014). Within this framework, music is understood not merely as a disciplinary subject, but as a situated cultural practice capable of generating relationships, constructing shared meanings, and making visible the relational dimension of citizenship. Through the experience of the association Armonicà (Trentino), the paper analyzes collective singing as a device of inclusion and co-construction of enduring values (Freire 1970). The programmes developed – addressed to participants aged 7 to 80, including people with disabilities – integrate vocal technique, bodily awareness, theatrical expression, and choral work, configuring the group as a community of practice: a place where equality is not assumed but constructed through mutual listening, cooperative discipline, the valorization of differences, and shared responsibility for a common work. These practices have been implemented not only within the associative context but also in institutional music education settings, particularly at

the music school of Riva del Garda, where educational autonomy has made it possible to experiment with inclusive and interdisciplinary pathways. The case presented aims to contribute to the debate on the tensions between the democratic promise of music education and processes of standardization, proposing music as an educational common good and as a cultural infrastructure of active citizenship.

THE ROLE OF MUSIC IN THE EDUCATION OF CHILDREN AND YOUNG PEOPLE: TOWARDS THE PROMOTION OF A CONSCIOUS CULTURE AND CITIZENSHIP

Marianna Setti (Associazione Coro Polifonico Castelbarco, Italy)

music education | primary school | cultural transmission

My aim is to provide a critical and reasoned account of my work both as a primary school teacher and as a choir director, which allows me to observe and experience the many benefits that arise from musical practice. Both in classroom work and within the structured setting of a children's choir, it is clear how music can be regarded as an educational and social endeavour. Music is thus interpreted and utilised as a vehicle for transmitting values, both in terms of content—thanks to the lyrics used in choral practice—and from a social and well-being perspective: the importance of listening, respect and observing rules. Music is a catalyst for cognition, participation and collaboration: working together to achieve a common goal, recognising one's individuality within the group and strengthening the sense of belonging to a community (Caon, Lobasso 2008). Observing music-based activities with children and teenagers reveals just how much music can act as a facilitator in the teaching of academic subjects. I will therefore present the pilot study conducted for my undergraduate thesis in two primary school classes: the aim of the research was to examine whether music-based teaching activities can facilitate foreign language learning compared to more traditional methods, and thus act as a facilitator (Degrave 2019). Between April and May 2019, a short teaching intervention was carried out at the Mori-Brentonico Institute (TN), in which music was integrated with linguistic content and activities. It was noted that music triggered significant language memorisation processes, as these were linked to the tonal, affective and emotional dimensions (Dolean 2016).

MUSICAL INSTRUMENT STUDY IN ADOLESCENCE AS A PATH TOWARDS ACTIVE CITIZENSHIP: THE CASE OF MUSIC HIGH SCHOOLS IN ITALY

Federico Bagnasco (Liceo Classico e Musicale Cavour Torino, Italy)

music high school | study of a musical instrument | civics

Established in 2010, music high schools (licei musicali) are currently the benchmark in Italy for structured and recognized music studies in adolescence, including as a possible pre-academic path following the 1999 reform of "Conservatori di Musica" (Italian musical academy). The music curriculum includes two or three hours per week of individual afternoon instrument lessons. The uniqueness of this type of high school within the secondary school system allows us to investigate and explore how the study and practice of an instrument during adolescence can be a vehicle for growth, not only individual but also social: such a growth focuses on a pluralistic and collaborative community vision, in which multiple individuals 'concert' in a shared direction; it allows to conceive a multi-perspective reading of the surrounding world, with empathy and sensitivity, and to overcome obstacles with determination and perseverance. In this context, the study of the musical instrument is also connected with the transversal skills of reference for active citizenship and civic education.

Studying an instrument requires each student to organize their activity and time through slow gestures, repetition, patience, attention to detail, method, and discipline (far different from the “smart society”, in which today students are living). In the same way, it allows them to face with their own emotional or even physical insecurities, and the instrument becomes a way to bring out and discover parts of themselves. Instrumental practice, in comparison with the repertoire, as well as in improvisational practice (mentioned in the National Guidelines concerning the specific learning objectives of music high schools), develops students' creativity, problem-solving and adaptation skills, and curiosity. The study of music typically involves both rational and emotional aspects (for this reason it has frequently been the object of neuroscience studies), connecting different ways of thinking and thus allowing the ability to envisage more personal solutions and perspectives. However, the study of music is also an opportunity to be “other than oneself” (as is the case with theater), to experience distant worlds and poetics, and above all, it is an opportunity to perceive oneself in relation to others, to listen to others. Specifically, ensemble music (developed in music high schools as part of the school curriculum in morning lessons and through various extracurricular activities) becomes an opportunity to listen to and understand others, and to share a common idea. It allows students to be part of social dynamics, which may involve different systems and relationships between individuals, with different roles and responsibilities. This experience, in relation to the age group typically in transition and change from youth to adulthood, helps to promote a dimension of democratic participation among young people.

CHORAL PRACTICE AND PARTICIPATION BETWEEN IDENTITY AND OPPORTUNITY: TWO COMPARATIVE CASE STUDIES FROM LOMBARDY AND TRENTINO

Marta Villa (University of Trento, Italy)

Choral practice | comparative ethnography | democratic community

Choral practice constitutes a privileged space of cultural participation in which individuals and groups build forms of belonging, learn shared practices, and negotiate collective meanings. This experience is not merely a musical activity but also a social context in which forms of cooperation, mutual recognition, and participation in the cultural life of the community develop. Choral practice can also be interpreted as a form of cultural literacy through which individuals acquire tools to recognize, interpret, and attribute meaning to the cultural products they encounter throughout their lives. Participation contributes to the development of an interpretive competence that allows individuals to orient themselves critically within the symbolic systems of their community, thus constituting an important dimension of citizenship formation (Turino 2008). The choir can therefore be interpreted as a community of practice, a social space in which learning, the transmission of knowledge, and the construction of identity occur through both shared participation in a common activity and processes of situated learning, in which musical and relational competences gradually develop within collective practice (Lave & Wenger 1991). This contribution is based on twenty years of research conducted through methods typical of anthropological inquiry and complemented by a component of autoethnography, which values the researcher’s direct involvement within the practice under study as a tool for analysis and critical reflection (Ellis, Adams & Bochner 2011). Choirs are observed as micro-communities comparable to the villages traditionally studied in anthropology: circumscribed social spaces in which it is possible to analyze from within forms of organization, systems of relationships, collective rituals, and the processes through which belonging is constructed. The comparison between two case studies is conceived as an exercise in comparative ethnography aimed at highlighting how different configurations produce distinct modes of participation. The study compares two geographically close contexts characterized by different

forms of organization and participation: Lombardy and Trentino. In the Lombard context, choral practice tends to take the form of a community of practice oriented toward identity and group stability: joining a choir often implies exclusive and long-term participation, fostering strong collective identification and lasting social bonds. In the Trentino context, by contrast, a more fluid and network-based model of participation emerges, in which singers with recognized competences may participate in multiple ensembles and actively negotiate their presence and musical trajectories. This comparison highlights a tension between two different modes of participation: on the one hand, a model based on identity-based belonging and group stability; on the other, a model characterized by mobility, multiple affiliations, and greater individual autonomy. Which of these forms of participation proves more effective in fostering processes that contribute to the construction of active citizenship? Through this open question, the contribution proposes to examine choral practice as a space in which dynamics of belonging and negotiation emerge, reflecting on the role of such practices in educational contexts as sites of participation, social formation, and the construction of democratic values.

BROADEINING ACCESS TO BASIC MUSIC EDUCATION: THE TRENTINO EXPERIENCE

Silvia Sacchetti (University of Trento, Italy)

music education system | cultural co-production | individual motivation and wellbeing

Drawing on the personal outcomes of students and band members observed during two distinct research projects involving the Music School System (SMT) of the Autonomous Province of Trento, this paper presents the characteristics of the primary music education production system. This system contributes to such results through a model of public and private-cooperative co-production. The study outlines student objectives, the genres studied versus those listened to, and their motivations (Deci, 1975; Ben-Ner and Putterman, 1998). It further explores the quality of established relationships (Gui and Stanca, 2010) and the environments where student creativity best flourishes (Dewey, 1916). Outcomes are also analysed in terms of accessibility (geographical, demographic, and socioeconomic) and used to delineate the traits of the cultural production system shaped by Trentino's 1987 provincial law on culture. It must be noted, however, that music schools are not an alternative to other educational entities; rather, they represent a service production model that is complementary to other musical institutions. Cultural volunteering, for instance, constitutes a fundamental pillar of the cultural democratization project. It offers a vital point of access to music—especially folk and community music—facilitated by a widespread network of band and choral associations supported by local administrations (Sacchetti, Diani, 2022; Diani, Sacchetti, Trulli, Schiavo 2024). Band and choral training projects involve the SMTs alongside the federations of bands and choirs. These collaborations also extend to compulsory schooling through ensemble music and choral projects. Furthermore, several SMTs are currently developing partnerships with the Bonporti Conservatory of Trento and Riva del Garda. This plurality of actors and the collaborations—both active and potential—represent a significant resource for the region's musical vitality. They reflect a wide array of aspirations and needs, ranging from professionalizing opportunities in higher education to relational and personal growth in the majority of other cases.

THE KINGDOM OF COMPETENCE: THE CHOIR AS A MIRROR OF SOCIETY BETWEEN VICE AND VIRTUE

Enrico Correggia (Conservatorio "A. Steffani" di Castelfranco Veneto, Italy)

University Choir · Mirror of Society · Cooperation

Nothing that begins in such division is likely to end well. (Charles II: The Power and the Passion) The choir represents a highly heterogeneous social ensemble. It brings together individuals from entirely different backgrounds, possessing disparate ideas, perspectives, and skill sets. While this is true of choral singing in general, such characteristics are even more pronounced within university choirs (Van der Sandt J., Nardi C. 2024). By their very nature, these groups are subject to rapid turnover and draw from a much wider variety of origins than those typically found in standard cultural associations. The choir is a perfect mirror of society. Individual tensions and seemingly insurmountable differences of opinion may exist; yet, to achieve the collective goal - the creation of an intangible sound as a conduit for beauty - all energies must converge towards concord. This pursuit requires two essential elements: the conductor's clear artistic vision and the quality of listening (Correggia 2025). To be brought into existence, sound requires silence, and it is within silence that listening finds its fertile ground. Every chorister is aware of their specific role within the composition. A role defined by rests, moments of prominence, and, above all, cooperation (Pearce E. et al. 2015). Meanwhile, the conductor bears the responsibility of providing a definitive interpretation, instructing the ensemble, and governing the community. Drawing on a case study of the University of Trento Choir, I aim to reflect on how the teachings of the choral world can contribute to developing a better, more attentive, and more efficient society. Conversely, I intend to examine how a dysfunctional society can transmit vices and misconceptions which ultimately hinder the attainment of choral objectives.

UNDERSTADING EACH OTHER'S OWN NOISE: EXCHANGING KNOWLEDGE ABOUT MUSIC BETWEEN GENERATIONS

Carlo Centemeri (Independent researcher, classical music editor for Radio Marconi, classical music editor for Radio Popolare) · **Francesca Mulas** (Independent researcher, author for Rotoclassica-Musica-Le Salon Musical-L'Ape musicale, member of ANCM)

Music · school · integration

Teaching music history is frequently understood as talking about the past; however, the process of learning (every kind of) history should aim to know the past to understand the present. Our work proposes a practice approach, suitable to any kind of music, where generations can meet in exchanging information about their generation's own music, their musical tastes and the reasons behind them, to create a link where the history of music is not about remembering a golden past, but it's a tool to create comparison between experiences from the past and the present, to assure a deeper knowledge of every musical language and to strengthen the link between different tastes. Sharing as many tools as possible and comparing similar situations we can enhance knowledge and comprehension. Through this process, a stronger integration between generations, cultures, and citizens can be achieved.

Spaces of Commons in Education: Learning Democracy through Practices of Togetherness

PANEL CONVENORS: Stelios Pantazidis (University of Thessaly, Greece); Yannis Pechtelidis (University of Thessaly, Greece)

PANEL KEYWORDS: Spaces of commons, Educational commons, Commoning democracy

This panel explores commons in (non) formal educational settings as an alternative synthesis of practice and theory, where spatial and relational practices challenge the institutional, disciplinary, hierarchical, and market-driven structure of society while strengthening democracy. Emerging from a view of learning as a collective and affective process that transcends individualized achievement and competitiveness, the panel foregrounds spaces of commons as fluid environments shaped through processes of commoning, where knowledge, care and responsibility circulate horizontally among participants. These spaces include schools, museums, libraries, community centers and other cultural and public environments. Within such spaces, democracy is not approached as a distant ideal to be taught but unfolds through commoning as a lived practice, continually enacted and materialized within shared practices of togetherness. Through these everyday encounters, the "ambience of the commons" is sustained, an atmosphere where practical aesthetics becomes a site of cultivation of democratic relationships among equals. Drawing on childhood and youth studies, the panel also problematizes how educational commons creates the conditions for children and youth to act as present citizens and political subjects. In this sense, it goes beyond participation, bolstering shared responsibility in shaping how things are done and decided. The panel raises a central question: How does the commoning of educational, cultural and public spaces generate new imaginaries of democracy as practices of togetherness on an equal footing? Through theoretical and empirical contributions, the panel invites interdisciplinary perspectives to discuss how shaping space as a commons transforms both learning and living together thereby deepening democracy.

LIBRARIES AS A PLACE FOR EDUCATIONAL COMMONS

Antoine Henry (Lille University, France)

Educational Commons | learning territory | social hub

Inspired by the principles of Educational Commons (De Lissovoy, 2011; Pechtelidis, 2020), this research explores the evolving role of libraries in fostering learning environments that extend beyond the traditional confines of the school. It's an opportunity for us to think about Education not only within schools, but also in other places where children can learn, experiment, contribute and share. Libraries are increasingly becoming vital social hubs and incubators for innovation, offering spaces for children and young people to learn, experiment, contribute, and share. This proposal investigates how these libraries are echoing the ideals of an Educational Commons, creating opportunities for participatory learning and community engagement. This proposal will focus on two cases in France where libraries are experimenting innovative approaches related to educational commons. Their experiments contribute to the transformation of libraries as a social hub, further from their traditional missions: With eXperium, Lilliad (Lille University Learning Center) is performing an important scientific mediation (more than 10 000 children were concerned) and transforming the way students are practising the library. From its start, the Petite Bibliothèque Ronde is about children's literature and how to create a space for them. By actively involving artists and with people under constraints (children/people in detention facilities), the library is working on key concepts like democracy, inclusion and access to reading. Libraries are deeply related to their territory meaning that this place could be an opportunity to create space where the initial "doing things together" also means creating spaces to rediscover this "common moral and political socialization of all children and young people."(Laval, 2006) In this perspective, we are working on a "learning territory" (Gwiazdzinski & Cholat, 2019) where education performs within and outside School.

CONNECTING LOCAL PRACTICES OF EDUCATIONAL COMMONS WITH SYSTEMIC TRANSFORMATION: THE LIBCOMMON CASE

Yannis Pechtelidis (University of Thessaly, Greece) · **Stelios Pantazidis** (University of Thessaly, Greece)

Libraries | Educational commons | Commoning democracy

This presentation examines educational commons as an alternative pedagogical and political paradigm that reconfigures learning as a collective, relational, experimental, and democratic process. Challenging individualized, competitive, and market-oriented models of education, it conceptualizes education not as a private good but as a common good and a shared social practice grounded in processes of commoning. Educational commons extend beyond the notion of shared resources to encompass dynamic practices through which communities collectively govern knowledge and learning, spaces, and social relations. Through horizontal decision-making, shared responsibility, and co-creation of knowledge, educational environments are transformed into sites of democratic experimentation, where learning becomes affective, collaborative, and socially embedded. The presentation highlights the significant contribution of the Laboratory of Sociology of Education at the University of Thessaly in advancing the study of educational commons both theoretically and empirically. Drawing on European and national research projects, the Laboratory has systematically explored how practices of commoning emerge within schools, youth spaces, and cultural institutions such as museums and libraries. These projects investigate children's and young people's participation in collective governance, the potential of collaborative structures to address educational inequalities, and the ways institutional cultures can shift toward more inclusive and democratic forms. Central to the presentation is the Libcommons project, which serves as the main empirical case study. Libcommons explores how public, school, and academic libraries can function as commons-based educational infrastructures, repositioning them from passive repositories of knowledge to active hubs of collaborative learning and democratic participation. By fostering structured partnerships between higher education institutions and libraries, the project bridges formal and non-formal education and promotes innovative pedagogical practices. Within this framework, libraries are reimagined as living ecosystems in which students, educators, librarians, and local community actors co-design learning activities, co-produce knowledge, negotiate shared norms, and cultivate collective stewardship. This approach supports the development of key competencies for contemporary societies, including civic engagement, participatory citizenship, intercultural dialogue, critical thinking, digital literacy, and lifelong learning. At the same time, the presentation critically engages with the tensions between grassroots commons-based initiatives and macro-level educational policies. By situating Libcommons within national and European policy frameworks, and drawing from the theories of hegemony and post-hegemony, it examines how dominant policy discourses both enable and constrain the scaling of commoning practices. This micro-macro perspective allows for a nuanced discussion of the conditions under which educational commons can be sustained, institutionalized, or transformed without losing their participatory ethos. Drawing on insights from childhood and youth studies, the presentation foregrounds children and young people as present political subjects rather than future citizens. In commons-based educational environments, participation moves beyond tokenistic inclusion toward shared authority and collective responsibility, fostering democratic subjectivities grounded in collaboration, mutual recognition, and care. Overall, the presentation argues that educational commons operate as laboratories of democracy, where everyday practices of togetherness generate new imaginaries of learning, citizenship, and institutional life. By combining theoretical reflection with empirical evidence from Libcommons and related projects, it contributes to broader debates on how local practices of commoning can be connected to processes of systemic educational transformation.

BRIDGING FORMAL AND NON-FORMAL LEARNING AS EDUCATIONAL COMMONS: THE INTEGRATION OF THE DELIVERY MUSEUM AND SCUOLA DIFFUSA IN REGGIO EMILIA

Laura Landi (Università di Modena e Reggio Emilia, Italy) · **Iride Sassi** (Officina Educativa, Municipal Educational Services) · **Claudia Landini** (IC Einstein (Reggio Emilia)) · **Chiara Pelliciari** (Civic Museums of Reggio Emilia) · **Sharon Venturelli** (Officina Educativa, Municipal Educational Services) · **Irene Lonidetti** (IC Einstein (Reggio Emilia)) · **Chiara Bertolini** (Università di Modena e Reggio Emilia, Italy)

Museum Education | Widespread Education | collaborative learning environments

This contribution examines an attempt to sustain pedagogical innovation through the deliberate integration of two complementary learning experiences situated at the intersection of formal and non-formal education in Reggio Emilia, Italy: the Delivery Museum (DM) and Scuola Diffusa (SD), a form of Widespread Education. Research conducted by the Centro di Ricerca su Insegnanti ed Innovazione Didattica (CERIID) at the University of Modena and Reggio Emilia has documented the effectiveness of out-of-school learning experiences in enhancing student motivation, promoting meaningful learning, supporting inclusion and democratic participation to learning, and fostering students' metacognitive awareness. However, a recurring challenge remains: the effects of such experiences tend to fade once students return to the routines of school life, and teachers find it difficult to sustain more participatory and democratic pedagogical approaches in classroom settings. In December 2025, Reggio Emilia Civic Museums brought thirty objects to a primary school (DM), creating a freely accessible space in which classes were invited to organise learning activities around museum artefacts and to reflect on curatorial practices. In January 2026, one class subsequently participated in SD — organised by Officina Educativa, the educational department of the Municipality of Reggio Emilia — spending a week immersed in an architecture exhibition, engaging in observation, inquiry, and collaborative reflection alongside teachers and educators through processes of co-researching, co-designing, and co-teaching. The educators from the Museum and Officina Educativa, the classroom teachers, and a CERIID researcher collectively designed the integration of the two experiences. To make the connection explicit for students, a mosaic from DM was brought into the SD exhibition space. Adults anticipated that students would recognise both experiences as inquiry-based, and anticipated reflection on "design" as a shared process across contexts. Following SD, the researcher conducted two focus groups with students, investigating their perceptions of learning, peer relationships, and metacognitive strategies. The photovoice methodology was employed to explore students' representations of the wonder of learning, the beauty of knowing, the challenges of learning, and the strength of collaborative inquiry. Results indicate that students recognised skills developed in DM — observation, inquiry, collaborative problem-solving — as directly transferable to SD. Both image sets were drawn upon in the photovoice activity, confirming the meaningfulness of each context. Notably, certain concepts, such as the beauty of knowing, were more frequently represented through DM imagery. Students demonstrated an emerging capacity to identify and articulate strategies for enhancing their own understanding. Moreover, they recognized the power of learning in groups, with both adults and peers. Exchanging ideas, changing points of view, asking and answering questions collectively, emerged as ways not only to enhance understanding and learning, but also to discover the marvel of knowledge and buster motivation for all. For teachers, the collaborative design of research instruments deepened their understanding of students' learning processes and enriched their observational practices. Reflective dialogue among all adult participants generated renewed pedagogical insight into how teaching methodologies might be transformed to foster more participatory and democratic approaches to learning.

EDUCATIONAL COMMONS AND YOUTH ACTIVISM: REINTERPRETING PROCESSES OF CHANGE IN RURAL SCHOOLS THROUGH A BOURDIEUSIAN LENS

Mauro Giardiello (University of Roma Tre, Italy) · **Rosa Capobianco** (University of Roma Tre, Italy)

youth activism | education as common good | school

Bourdieu's theoretical perspective has almost always been employed to interpret the processes that reproduce inequalities. This contribution, however, aims to explore the possibility of applying the Bourdieusian model to the analysis of transformation processes, situating it within the paradigm of education as a common good (Laval and Vergne, 2021). In literature, the paradigm of education as a common good is understood as a process that redefines the educational experience, structuring itself through participatory and co-design practices that enhance subjectivization. The aim of this paper is to understand how practices of "educational commons" can foster youth activism (Conner et al. 2024) and foster individual and community change in rural areas affected by depopulation and community fragmentation. Using the categories of field, habitus, and cultural capital, we analyze how the transformation of the educational model produces a reconfiguration of the educational field through the attempt to subvert the rules of the game and the dominant doxa. This process involves a restructuring of young people's habits, challenging the hierarchies of epistemic and symbolic power and the vested interests of dominant social groups. This implies a shift in their positions as legitimate agents of knowledge capable of interpreting, producing, and disseminating processes of change. The study applies this theoretical framework to a revealing case study of a school located in a rural community in southern Italy (Giardiello and Capobianco, 2026). The research, based on a qualitative approach, analyzed the film club project using unstructured interviews with the teacher who conceived the project and with families, and focus groups with students. The results show that education as a common good can not only be a transformative tool, redefining young people's capital and habits, but also allows us to observe the emergence of forms of resistance stemming from an adult-centric culture and limitations related to the difficulties in creating synergistic and non-self-referential networks among community stakeholders.

SCHOOLS AS INFRASTRUCTURES FOR COMMUNITY COMMONING: PARTICIPATION, SHARED SPACES AND COMMUNITY DEVELOPMENT IN NORWEGIAN MUNICIPALITIES

Rita Agdal (Western Norway University of Applied Sciences, Norway)

commoning | asset-based community development | governance

Schools as Infrastructures for Community Commoning: Participation, shared spaces and community development in Norwegian municipalities Educational research increasingly explores the idea of the commons as a way of understanding collective responsibility for learning, knowledge and democratic life. Yet less attention has been paid to how practices of "commoning" may emerge around schools as part of broader community development processes. Commoning is understood here as collective practices through which communities organise, maintain and govern shared resources and social

relations (McGinnis & Ostrom, 2014). In the cases explored here, young students identify resources in their neighbourhoods and invite residents to participate in activities, collaboration, and collective stewardship of emerging community spaces. The paper asks under what conditions school-based participation processes led by children and youth can develop into collective practices resembling commoning in local communities. The study draws on collaborative research with Norwegian municipalities that have experimented with asset-based community development (ABCD) (Kretzmann & McKnight, 1993) approaches to strengthen child and youth participation in local communities (Agdal et al., 2019). Through participatory action research and long-term collaboration between researchers and municipal practitioners, the study analyses a set of initiatives where school pupils and youth groups engaged in identifying local resources, initiating activities, and mobilising residents around community projects. The findings suggest that school-based participation processes can sometimes evolve into collective practices resembling commoning, where local actors jointly organise activities, develop meeting places, and take shared responsibility for maintaining community initiatives. Young people not only participated in decision-making but also mobilised peers and adults, organised activities, and contributed to the development of meeting places and shared initiatives in their neighbourhoods, bridging activities in and around the schools. However, the cases also demonstrate that such processes are fragile and uneven. Sustained collective practices were more likely to emerge when three conditions converged: mobilization led by young people, connector roles and facilitation within municipal organisations, and access to accessible spaces where networks could develop through discussions and activities over time. Schools and other public facilities often functioned as initial infrastructures that enabled these practices to develop. These conditions enabled the gradual formation of communities of practice around shared initiatives, a key feature of commoning processes. The paper contributes to discussions on commons and education by highlighting how school-centred participation may extend into neighbourhood contexts and support emerging practices of commoning, linking educational participation with broader processes of democratic community development. The cases also speak to broader debates on the drivers and constraints of commoning. While some perspectives emphasise commoning as emerging primarily outside or in opposition to formal institutions, others explore how institutional arrangements may support commons-based practices. The Norwegian cases suggest that in welfare-state contexts, public infrastructures and facilitative municipal roles may act not only as potential constraints but also as enabling conditions for children and youth-driven collective practices and emerging forms of commoning.

LIBRARIES AS EDUCATIONAL COMMONS FOR DEMOCRATIC CULTURE AND INCLUSIVE LEARNING

Arnau Palou (University of Vic, Spain) · **Eduard Ramírez** (University of Vic, Spain) · **Jordi Collet** (University of Vic, Spain) · **Jasmina Cumeras** (University of Vic, Spain)

Libraries | educational commons | democratic culture

At a time of democratic backsliding, widening inequalities, and growing barriers to knowledge access, public institutions face the challenge of creating environments where participation and shared responsibility are experienced rather than proclaimed. This communication asks: how can public libraries function as commons-based infrastructures that embed democracy in everyday learning practices? The analysis draws on findings from the European Union Erasmus + funded project LibCommon (Universities and Libraries as Commons-Based Innovative Environments for Learning, Civic Engagement and Democracy). Methodologically, the communication presents a qualitative case study from the Catalan context, combining semi-structured interviews with cultural policy experts and field visits to two contrasting library models: the Biblioteca Gabriel García Márquez in Barcelona and the Bibliobuses of the Xarxa de Biblioteques Municipals de Barcelona.

The comparative approach enables an examination of how commons-based principles are operationalised across fixed and mobile infrastructures. The Biblioteca Gabriel García Márquez exemplifies institutional openness through participatory and inclusive design. Initiatives such as Ràdio Maconda, a professional community radio studio enabling collective cultural production, demonstrate how libraries can redistribute cultural authority, lower symbolic barriers, and foster co-creation. Through project-based methodologies supported by professional equipment and staff facilitation, users create podcasts and radio programmes on cultural, social and literary topics. The studio collaborates with schools and local groups, hosting interviews, book-club productions and youth-led projects. This initiative expands literacy beyond traditional format, strengthens media literacy and fosters civic engagement, transforming the library into a platform for collective expression.Radio Maconda also increases participation among diverse groups and reinforce the library's role as an inclusive, socially responsive cultural hub. The Bibliobús model, by contrast, embodies territorial inclusivity by extending professional library services to small and rural municipalities lacking permanent infrastructure. Bibliobus are mobile library services operating in the province of Barcelona since 1995. They travel along pre-established routes to serve 152 small and rural municipalities, typically with populations with less than 3,000 inhabitants. Many of these towns lack the resources to maintain a permanent library. As a travelling cultural hub, it reduces geographic and economic inequalities while sustaining local participation through coordinated activities with schools and community actors. Taken together, the cases reveal two interconnected dimensions of democratic culture: ensuring that institutions are open to diverse publics and actively reaching those otherwise excluded. That is, that public libraries understood as common goods can become "Palaces for the people" (Klinenberg, 2019). However, the findings also highlight a deeper governance question: democracy in libraries is not secured solely through universal access, but through participation in defining norms, priorities, and collective meanings. The public value of commons libraries therefore lies in their capacity to respond to collective needs, reduce social and cultural inequalities, and sustain shared civic spaces where differences are negotiated rather than segregated. That is, rather than simply providing access or support, libraries are called upon to cultivate commons-based infrastructures based on values of shared governance, co-creation, mutual care, and democratic participation. By conceptualising libraries as commons-based civic infrastructures, this research contributes to debates on public institutions, inequality, and everyday democracy

LEARNING TOGETHER IN PUBLIC SCHOOL: CONVIVIALITY AND THE PEDAGOGY OF THE COMMONS

Stavroula Stoumpou (University of Thessaly, Greece)

Pedagogy of the commons | Conviviality | Public school

This study re-envisions the role of public school through the Pedagogy of the Commons approach (De Lissovoy, 2011; Pechtelidis, 2023; Pechtelidis et al. 2023). At its core lies the notion of conviviality, the art of coexisting in equality and reciprocal interdependence (Illich, 1973; Les Convivialistes, 2014; Bollier & Helfrich, 2019). The research sought out to explore whether, and to what extent, counter-hegemonic pedagogical practices and forms of commoning can unfold within public education, and how schools may function as sites that host such practices without abandoning their institutional character. Adopting a critical action-research design (Kemmis et al., 2014), nine sixth-grade primary school students participated in an extracurricular program where they co-designed Educational Escape Rooms. This collective endeavor

fostered practices of co-creation, peer learning, and shared decision making. Data, collected through participant observation, reflective focus groups, a field diary, and pedagogical artefacts, were thematically analyzed (Braun & Clarke, 2006). Findings reveal the potential of convivial commoning as a pedagogical process within public school. Students cultivated collectivity, while conflicts served as opportunities for preserving and strengthening relationships, thereby establishing a positive and engaging atmosphere.

TODDLER'S NARRATIVE COMMONS IN AESTHETIC LITERACY EVENTS: DEMOCRACY AS A WAY OF LIFE IN EARLY CHILDHOOD EDUCATION AND CARE

Robert Lecusay (Stockholm University, Sweden) · **Liselott Mariett Olsson** (Malmö University, Sweden)

toddlers | narrative commons | aesthetic literacy events

Pedagogue and philosopher John Dewey defined democracy as more than a societal system where citizens make choices and express their opinion (Dewey 1916). He defined democracy in terms of an ongoing co-construction of a communicative culture, "a way of life", in education and society (Dewey 1939). In an important reading of Dewey's work, James Carey (1989) draws out the shared root of the words common, community, and communication: persons live in community by virtue of what they hold in common, and communication is the process by which they come to hold things in common. The task of early childhood education and care (ECEC) is thus to create a way of life that accommodates the ongoing, communicative co-construction of common culture, knowledge, and values across generations. To promote such a way of life in ECEC today is challenging. Across large parts of the world, ECEC is since long subject to a forceful commodification that erodes democracy, equity and inclusion in education (Roberts-Holmes & Moss 2021; Vandenbroeck, Lehrer & Mitchell 2024). In Sweden, these values are now framed as problems to be solved through children's early acquisition of the national language – a logic that reduces communication to transmission, education to instrumental teaching of cognitive linguistic skills, and that, remarkably, lacks scientific grounding and risks undermining the very democratic, equitable and inclusive practices it claims to promote (Lecusay, Olsson & Nilsson, in press; Olsson, Lecusay & Dalsgaard 2023). To counter this, we draw on an on-going government-funded project designed to study how children's narratives and commons may be stimulated in what we call Aesthetic Literacy Events (ALEs) – playful explorations of language that activate both body and mind and that carry the potential of enhancing both children's cognitive language-development and more equitable and inclusive education (Olsson, Lecusay & Dalsgaard 2023). We focus on one of the project's constituent studies concerning the development and field-testing of a philosophical-pedagogical theory of ALEs. This includes educational commons theory (Pechtelidis & Kioupkiolis 2020; Cappello et al. 2024; Olsson, Lecusay & Nilsson 2024), philosophical perspectives on language and social formation (Bergson 1896/1988; Deleuze & Guattari 2004) as well as cultural-psychological theories of children's narratives (Bruner 1991, Nelson 1996). These theoretical perspectives, we argue, make it possible to understand even the youngest children – toddlers' – development of narratives and creation of commons as intertwined and co-emergent processes that may be stimulated in ALEs. We make this case through examples from fieldwork in Swedish preschools where we engaged with toddlers' everyday activities as a way of field-testing and refining our developing theoretical framework. Through vignettes of a group clay activity and a moment of playful, humorous interaction, we show how toddlers' narrative activity and creation of commons constitute moments in

which culture, knowledge, and values are communicated and co-constructed. This takes place in preschools that through including elements of ALEs in their daily activities have managed to create a way of life that may constitute a space of togetherness in which democracy is not taught but lived.

THE EDUCATIVE COMMUNITY AND EDUCATIONAL COMMONS: A PROCESSUAL ANALYSIS OF CHANGE IN A CONTEXT OF URBAN VULNERABILITY

Gianna Cappello (University of Palermo, Italy) · **Marianna Siino** (LUMSA University, Italy)

educational commons | impact evaluation | urban vulnerability

This paper engages with the debate on the relationship between education and democracy, arguing that the democratic relevance of educational processes cannot be reduced to individual outcomes alone, but also concerns participation, shared responsibility and cooperation within local contexts. From this perspective, the paper presents an evaluative study on the impact of the Comunità Educante Evoluta (CEE) project, implemented in the Zisa-Danisinni area of Palermo, to explore the conditions under which an educational intervention may generate transformations that outlast the project and open up the possibility of forms of educational governance oriented to the common good. The case is situated in an urban context marked by structural vulnerability and educational poverty, understood not as immediate conditions, but as the outcome of layered historical, urban and relational processes. Theoretically and methodologically, the paper adopts a processual and relational perspective on social change, consistent with a theory-based, realist and qualitative approach to evaluation. Within this framework, impact is not conceived as a linear causal relationship between intervention and outcome, but as a complex, gradual and multilevel process reconstructed through plausible attribution, generative mechanisms and contextual conditions (Abbott, 2016; Archer, 2015; Giddens, 1984; Pawson, 2016; Westhorp, 2018). Accordingly, the research design distinguishes between micro, meso and macro levels in order to capture transformations in the experiences of children and families, in the professional repertoires of educational actors, and in the network and governance configurations of the local area. The methodological strategy employs tools capable of capturing change in its experiential, symbolic, relational and temporal dimensions. Findings show that the most relevant effects of the intervention do not primarily lie in measurable school outcomes, but in cultural shifts, relational transformations and reorientations of educational practices. At the macro level, the study highlights a process through which education is redefined as a shared responsibility, no longer understood in exclusively school-centred terms. At the meso level, stronger forms of collaboration emerge among schools, practitioners, families and local actors. At the micro level, change takes shape through processes of recognition, motivation, trust and empowerment, leading to shifts in the ways subjects relate to

others, to themselves and to educational experience. The educative community thus emerges as a lived relational configuration. At the same time, the study highlights the fragility of these processes. Change is recognised as real, yet not fully stabilised: it remains exposed to contextual discontinuities, actor variability and the lack of stable institutional arrangements capable of sustaining it over time. From this perspective, the paper reads the CEE case as a threshold between project-based educational action and educational commons. Rather than documenting an established commons, the evaluation makes visible the conditions under which practices of educational commoning may consolidate over time. In this sense, the case study shows how democracy is constructed within educational practices, and how participation, togetherness and shared responsibility may emerge within processes of building an educative community, while remaining exposed to the risk of reversibility in the absence of recognition and institutionalisation (Cappello et al., 2024; Cappello & Siino, 2023).

OUR CARNIVAL!: CHILDREN LEARNING AND LIVING DEMOCRACY THROUGH BEING INVOLVED IN LOCAL AUTHORITY DECISION MAKING

Emmy Papanastasiou (Democritus University of Thrace, Greece) · **Efthymia Penderi** (Democritus University of Thrace, Greece) · **Katerina Gioftsali** (Democritus University of Thrace, Greece) · **Ioulia Ntousi** (Democritus University of Thrace, Greece) · **Sophia Voudilaki** (Democritus University of Thrace, Greece)

Citizenship | Democracy | Early Childhood Education

One of the main contemporary issues in education is facilitating every child to develop democratic citizenship, as it is important to have an active participation in decision making based on its maturity and interest in matters of its everyday experience (Correia et al., 2022; Pechtelidis, 2018). The importance of such participation and acquisition of democratic values is underscored in National Constitutions and Educational Curricula in alignment with the Convention on the Rights of the Child. Participatory and democratic pedagogy is based on the notion of the "child as a citizen of today" supporting the idea that children can have a role in the development of community practices through not only becoming visible, but also being involved in decision-making processes. Despite the rising interest in young children as active citizens, their participation in local authorities' decisions is still limited. This paper presents an educational program, implemented in several early childhood educational settings in Alexandroupolis, Greece, as part of the teacher students' internship program in the 4th year of their studies in the Department of Educational Studies in Early Childhood, at Democritus University of Thrace. The intervention was based on an educational project-based scenario, which student teachers developed with their academic mentors and revised taking into account kindergarten teachers' input and children's ideas. Children were facilitated to be actively engaged in the life of their community, proposing ways to enrich the municipality's carnival celebrations for the following year. Their proposals were sent to the mayor for consideration. This way, children embodied an alternative discourse of their agency, that constructing them as active, competent, informed and interested citizens. Being engaged in a lived practice of democratic participation within shared spaces of togetherness, they enacted democratic practices and were empowered to feel that they could make a difference to their community. The presentation concludes with suggestions regarding more inclusive interactions between children and local governing bodies.

LEARNING TO BELONG? A QUALITATIVE CRITICAL INQUIRY INTO SPACES UNDERGOING URBAN REGENERATION

Alessia Polidori (University of Milano-Bicocca, Italy)

urban regeneration | public pedagogy | adult learning and education

European policies often frame urban public spaces as key sites for political and social development (European Commission, 2025). Space – and cities more specifically – it is argued, have become increasingly important to how we live, how economies work and how power functions. Furthermore, recent policy and theory-based frameworks on Adult Learning and Education (ALE) recognise citizenship education and civic participation as core dimensions of lifelong learning (UNESCO Institute for Lifelong Learning, 2022; UNESCO, 2021). Urban space thus emerges as an environment for informal learning that is practical, embodied, and relational (Grummell, 2010; Livingstone, 2001, 1999). From this perspective, learning takes place, that means it always happens "in location" (Colley, Hodkinson, & Malcolm, 2003; Lave & Wenger, 1991), even beyond formal educational circuits and settings. Participatory-oriented theories in adult education further suggest that informal learning is inseparable from a sense of belonging. To learn entails being part of, becoming a legitimate participant and member, while belonging itself requires to learn norms, values, identities related to the context to which we belong (Lave & Wenger, 1991). However, according to a critical perspective space is never neutral, but rather an entagled network of historical, cultural and social relationships (Massey, 2005): understanding space therefore requires critically questioning how it is represented, who has access to it, and who holds the power to construct discourses and thus to construct knowledge about it. Urban regeneration processes provide a particularly revealing key case in which to examine these dynamics, as they actively reshape the material, symbolic and normative conditions of (public) space. The contemporary phenomenon of regeneration is frequently framed in policy discourses as a participatory and inclusive process of spatial transformation, involving various actors in a multilevel engagement, fostering civic and democratic education. Yet experiences of belonging and legitimacy are unevenly distributed, and inclusion and participation often remain rhetorical (Barron, 2022; Trawalter et al., 2021; Fincher et al., 2014). My research aims to investigate the conditions under which belonging, or a sense of distance or alienation, is learnt and reconfigured in public spaces undergoing urban regeneration, and how this shapes perceptions to be part of, or marginal to, collective urban life. The research is based on an in-depth interpretative case study (Yin, 2018; Merriam, 1989) combining ethnographic observation, walking interviews and focus groups with differently positioned participants involved in a regeneration process in a medium-sized city in northern Italy. Initial findings highlight a number of tensions: between the perceived openness of the space and its actual accessibility, between civic imaginaries of public space and forms of private management, and between rhetoric and effective participation in public affairs, resulting in the perception of limited influence and disengagement. By analysing belonging as a form of informal learning embedded in spatial experience and transformation, this research contributes to rethinking urban regeneration as a public pedagogy (Biesta, 2012). In this sense, it becomes a formative setting in which to develop a language of critique and possibility and where dispositions towards participation and civic agency can be encouraged-learnt or discouraged-taught.

CHILDREN AS SOCIAL ACTORS IN HERITAGE EDUCATION PRACTICES: CO-CONSTRUCTION OF KNOWLEDGE IN REAL-WORLD LABS

Ludovica Sebastiano (Free University of Bozen-Bolzano, Italy) · **Simone Seitz** (Free University of Bozen-Bolzano, Italy) · **Francesca Berti** (Free University of Bozen-Bolzano, Italy) · **Sonia Cabral Matos** (Free University of Bozen-Bolzano, Italy) · **Ingrid Kofler** (Free University of Bozen-Bolzano, Italy)

Heritage Education | Childhood Studies | Educational Design-Based Research

The present contribution suggests heritage education as a field for promoting citizenship practices among children. It highlights its potential to cultivate their awareness as social and cultural actors capable of generating change within their everyday environments, while encouraging their active participation in and engagement to the common good. In its most recent conceptualization, heritage education is understood as a participatory process, oriented toward the co-construction of knowledge about what is recognized as heritage, rather than the mere transmission of information (Del Gobbo et al., 2018; De Nicola & Zuccoli, 2016). Within this framework, heritage is no longer conceived as a set of fixed assets, but as a social and cultural process, continuously transformed and re-signified (Smith, 2006), shaped by the interplay between past, present, and future. Accordingly, heritage is not a self-evident given; rather, it acquires meaning in relation to the futures that are imagined and negotiated (Harrison et al., 2023). Also, international agendas (UNESCO 2003; CoE, 2005) attach central relevance to the role of society in identifying, meaning-making, and care for heritage, sustaining a progressive democratization in this field (Cirino, 2017). However, children's voices regarding heritage remain significantly under-researched (Ginzarly & Srour, 2021; Smith, 2013), highlighting the need to explore their relationship with it. From a relational and intergenerational perspective (Moran-Ellis, 2021; Eßer et al., 2016), children are understood as competent social actors who actively participate in the co-construction of heritage in dialogue with adults (Sebastiano et al., 2025). Based on these considerations, this contribution presents an interdisciplinary study that combines educational and design research, with the aim of gaining a deeper understanding of how children reflect and co-construct heritage. The methodological framework adopted is Educational Design-Based Research (van den Akker et al., 2006, McKenney & Reeves, 2012), which conceptualizes research objects as epistemic, processual, and unfinished, requiring iterative processes of shared exploration and reflection to co-construct knowledge. This perspective resonates with the understanding of heritage as a collective and socially situated phenomenon, continuously shaped through social practices between subjects as well as between subject and material (Reckwitz, 2003). The ongoing empirical study, conducted in shape-by diversity area, within non-formal educational settings, involves children aged 8-12 in Real-World Labs (Parodi et al., 2023). These are conceived as creative and dialogic environments, where participants are engaged as active actors. Through material-based stimuli, introduced to render the otherwise abstract concept of heritage more accessible and tangible, children are invited to explore, negotiate, and co-construct their understandings of heritage in relation to shared individual and collective experiences. From this perspective, RWLs are framed as transformative and democratic spaces where heritage becomes a means to reflect on what is recognized as meaningful in the present, identify common goods, imagine possible futures, and experiment with practices of care (Sebastiano, 2025). By including children's perspectives within processes of heritage co-construction, this contribution proposes an understanding of heritage education as a democratic, participatory, and future-oriented practice, capable of nurturing situated forms of participation and citizenship in increasingly complex socio-cultural contexts characterized by superdiversity (Vertovec, 2023).

SPACES AND TIMES OF DEMOCRATIC EDUCATION

Sergio Leali (LAIF - L'Associazione Istruzione Famigliare, Italy)

Spaces of Commons | Democracy | Unschooling

Democracy presupposes the recognition of others and participation in the decision-making and management processes of social life. For this to be achieved, intention in these directions and the concrete possibility of its occurrence are necessary. Recognition of others is closely linked to cultural awareness, ethical solidarity, ongoing study, and an organic educational focus on these presuppositions. Democratic participation refers to the involvement of the individual in their physical and spiritual reality. The democratic process therefore unfolds on two levels: the spiritual and the material-physical; these two levels intersect in continuous meaningful interactions. Can it therefore be thought that learning democracy is, or should be, limited to a specific context? Rather, since it is a learning process that extends well beyond the time of "compulsory education", it requires methods, times, and places that can encompass the complexity of reality. Transcending the narrow confines of formal education is an automatic consequence of this concept. Informal and non-formal learning thus come into play (Vezzola, 2020). This new paradigm deconstructs the categories of learning times and life, and the places where they occur (Leali 2025). The places themselves, both material and immaterial, are open to an educational-planning interpretation and use that positions them as providers of (democratic) meaning (Rossi, 2018). The paper aims to investigate the adequacy of contemporary "material and immaterial spaces" within the context of the democratic evolution of societies (Augé, 2009). At the same time, it will be illustrated how unschooling seams to be more suitable than others to develop the democratic presuppositions and the opportunities that informal and non-formal learning and "spaces of commons" can offer learners.

The Child is a Citizen: Democratic Experience, Participation and Rights in the Early Age

PANEL CONVENORS: Emiliano Macinai (Università di Firenze, Italy); Rossella Certini (Università di Firenze, Italy)

PANEL KEYWORDS: Childhood, Citizenship, Democracy

The panel is proposed for the section: 6. Inclusion, Difference, Equality, Diversity, Citizenship, and Social and Cultural Justice in the Education–Democracy Nexus Since the early twentieth century, the theme of education for citizenship represents one of the foundational pillars of progressive pedagogy. The thought and experience of John Dewey continue to be an essential reference for understanding the role that democratic education can play in the social and political inclusion of children. At the same time, the extension of human rights to childhood, which was consolidated at the end of the twentieth century, has introduced a new horizon for pedagogical planning, starting from the idea of the child as citizen (Moro, 1991). With these premises in mind, and referring to the topic of the call "Childhood: Building the Foundations of Active Citizenship from Early Age," the panel aims to gather contributions that focus on the following thematic issues: 1) deepening and revitalizing, according to Dewey's theoretical perspective (1899), the principle of "democratic experience"; 2) pedagogical perspectives in the Convention on the Rights of the Child (1989) and the child oriented approach in education; 3) reflections, projects, and experiences of democratic education based on the principles of Inclusion, Diversity, Equality, and Citizenship dedicated to childhood. The goal is to offer a multidisciplinary space to rethink the connection between education and democracy, recognizing "childhood" as a generative space for rights, relationships, and genuinely democratic practices.

DEMOCRATIC EXPERIENCE AND PRAXIS

Dimitris Alexakis (University of Crete, Greece)

John Dewey | democratic experience | communication

For John Dewey democracy is not just a form of government but "a mode of associated living" (Dewey 1916, 93). So education for democratic citizenship should not be limited to the knowledge of certain political institutions and procedures, but it concerns children's experience of living in a democratic community. Moreover, according to John Dewey "experience is primarily an active-passive affair" (Dewey 1916, 147) and not cognitive. Thus, the question that arises is what kind of activities should children undergo in order to have a democratic experience in their school community. In this paper, I argue that in his early writings John Dewey gives emphasis to productive work and he supports that the schools fail to be transformed in democratic communities because of the lack of it (Dewey 1897). This is one of the reasons why Laboratory School's curriculum was organized based on certain occupations of constructive work, such as cooking, carpeting and weaving. This early perspective seems to overlook the significance of communication to democratic experience. As Honneth & Farrell (1998) note, the disregard of communication is due to the wider disregard of the necessity of an autonomous political sphere. In his work after 1916, John Dewey makes a communicative turn (Biesta 2006) and he develops a richer analysis about human communication as the peculiar way of human interaction and its importance in democratic communities. However, his distance from actual pedagogical experimentation didn't allow him to elaborate how this new notion of communication can be integrated in pedagogical practices. Although scholars such as Stitzlein (2020) have already indicated how we can integrate Dewey's notion of communication in the teaching process, I argue that Dewey's analysis can also help us to recognize the importance of communication beyond teaching as it concerns the whole arrangement of school's everyday life. Moreover, I argue that following Dewey's thought on the interrelation between children's activities and democratic experience in school communities, we should be critical to his exclusive emphasis on constructive work and employ our pedagogical imagination in order to integrate care-work in the pedagogical procedures.

PLAYING TOGETHER TO BUILD NEW DEMOCRATIC AND INCLUSIVE WORLDS: THE EXPERIENCE OF OFFICINA KOINÈ

Claudia Ciccardi (Università Milano Bicocca, Italy) · **Paola Zonca** (Università degli Studi di Torino, Italy)

open-ended play ECEC participation

From early childhood, education for democratic citizenship can be understood not only as a value to be transmitted but as a lived and shared experience. From this perspective, the paper presents the experience of Officina Koinè, a Children and Families Center created as a participatory laboratory of democratic education based on unstructured play. The pedagogical approach adopted by Officina Koinè is grounded in the idea that play - when it is free, non-directive, and intergenerational - constitutes an inclusive language that foster and generate participation, relationship and shared meaning-making, thus becoming a concrete practice of citizenship for both children and adults (Biffi, 2023). This experience fits within a theoretical framework that considers learning and democratic education as social and cooperative experiences (Dewey, 1916; Elia, 2021). At Officina Koinè, educators, children, parents, and “adulti di casa” share play spaces built through the use of unstructured and open-ended materials, devoid of any specific prescribed function. This methodological choice fosters universal accessibility and the absence of hierarchies and predetermined uses, allowing each participant to contribute to the construction of the experience according to their own possibilities, languages, and cultures (Antonacci, 2023). Play thus becomes a democratic device that enables the renegotiation of roles, knowledge, and positions, opening up more horizontal and inclusive relationships. In addition to outlining the pedagogical approach adopted by the service, the paper aims to present and analyze the evidence emerging from observations conducted during play experiences, from focus groups with parents and educators, and from co-reflection sessions activated within the working group (Dalberg et al., 2024). From these moments of participation, several recurring dimensions emerge: play as a space to fostering relation; open-ended materials as facilitators of cooperation, negotiation, and divergent thinking; adult participation as an opportunity for mutual learning; and the construction of a sense of community belonging even among culturally and socially diverse families (Moss, 2012). The extension of the project into the city’s public spaces- through the experience of Officina Urbana, which brings unstructured play into squares and parks- also shows how play can reconfigure the everyday places of citizens into inclusive and accessible environments (Granata, 2021; Nuti, 2024). This experience engage families distant from formal educational services and foster a sense of participation and belonging. From this perspective, unstructured and open-ended play emerges as a cultural and political practice to counter educational models centered on performance and measurability, opening spaces for imagination and co-learning and foster the possibility for children and adults to recognize themselves as active members of a community, rather than merely as users or consumers of services (Biesta & Montà, 2023). The paper therefore seeks to offer a reflection on the role of open-ended play as a democratic experience in early childhood, proposing Officina Koinè as an example of how education can become a generative practice for new inclusive worlds, in which childhood is not only the recipient of rights but a living space for building new democratic possibilities.

CHILDREN'S EQUALITY RIGHTS: THE RELEVANCE OF EDUCATIONAL GUIDANCE FROM THE FIRST STAGES OF LIFE

Dalila Maria Esposito (University of Florence, Italy)

educational guidance | childhood | diversity

Educational guidance, as a key tool for the academic and educational success of every student, plays a fundamental role in deconstructing gender stereotypes and prejudices that still limit and influence the life choices of young people today. The current reality of children's and adolescents' rights is the result of a slow and difficult historical process of transformation that has changed the image of childhood from a marginal, misunderstood and ignored age to a specific stage of human life in which the unfinished child finally becomes a subject of law and a social actor. In order to legitimise their voices, children should not be considered passive recipients of education but active agents involved in shaping the context in which they live, as well as their own development. The right of children to express themselves and their potential translates into the creation of educational pathways that promote autonomy, critical thinking and the ability to make conscious choices. In this sense, with the help of educational guidance, children are encouraged to explore their interests, recognise and overcome stereotypes, and embrace their inclinations, thus promoting balanced and inclusive growth. Within the framework of the rights and equal opportunities of children and adolescents, guidance is a key tool for ensuring that everyone has a fair path to personal and professional growth and development, free from inequality and discrimination. An intersectional approach recognises the complexity of the guidance process, highlights its dimensions and multiple aspects and ensures alignment with educational policies and teaching activities. This promotes flexible and personalised guidance, valuing individual and collective experiences. Promoting guidance pathways from childhood onwards is essential to ensure that everyone has the same rights and opportunities to education and work, fostering greater awareness of oneself, one's abilities and one's aspirations.

BEYOND FORMAL PARTICIPATION: ENACTING AGENCY THROUGH ASSEMBLIES AND DECISION-MAKING IN THE CO-DESIGN OF SCHOOL SPACES

Anna Rita Piazza (Università degli Studi di Firenze, Italy)

Agency | Participatory decision-making | Co-design of school spaces

In contemporary educational debates, the concept of agency has become a recurring keyword in reflections on democratic education and childhood. Often interpreted as an intrinsic quality of the child or as an individual competence to be fostered, agency risks being framed as a neutral and transferable attribute, almost independent of the relational and institutional conditions that make its enactment possible. Starting from the idea of children as citizens in the present, agency is situated within a broader reflection on democratic experience in early educational contexts. Rather than being reduced to the transmission and acquisition of civic values or formal competences, it concerns the construction of conditions that enable meaningful participation and shared action. In this perspective, agency does not simply coincide with the possibility of choice or self-expression; rather, it entails participation in processes that generate recognisable effects within one's own context, in this case the school environment. The empirical core of this contribution consists of participatory workshops conducted as part of a doctoral research project involving primary and lower secondary school

classes. These workshops, focused on the co-design and transformation of school spaces, are analysed not so much in terms of their design outcomes, but rather through the decision-making processes that underpin them. A central role is played by student assemblies, understood as pedagogical devices for public deliberation. During these moments, proposals developed within small groups are presented, discussed, and collectively reformulated. The assembly thus becomes a space where dynamics of leadership, conflict, alliance, and mediation are made visible, and where decisions are not reduced to simple voting procedures but are constructed through argumentation, negotiation, and engagement with concrete constraints, such as safety regulations involved in modifying school spaces. It is within the assembly space that agency emerges as a situated practice: not merely the individual expression of preferences, but participation in a collective process capable of shaping shared decisions. The comparative analysis shows that, despite similar declared objectives, participatory practices produce different outcomes depending on the context. In some cases, agency takes the form of an increased awareness of the possibility of influencing one's environment; in others, it assumes a more transformative dimension, challenging spatial and organisational arrangements predefined by adults. These are not different forms of agency, but situated enactments, shaped by school culture and social context. Furthermore, a gap emerges between the principles of democratic education and everyday practices: participation is often reduced to choices within pre-defined boundaries, resulting in predominantly formal experiences. Agency thus appears not as an acquired condition, but as a process that depends on the organisational and relational conditions that make it possible. From this perspective, early educational contexts can be understood as spaces in which democratic participation is not assumed, but constructed through concrete and shared practices.

RIGHT TO INTERCULTURAL CHILDHOOD: TOWARDS A SOCIO-PEDAGOGICAL COMMITMENT IN AN INTERCULTURAL, INTERSECTIONAL AND DECOLONIAL PERSPECTIVE

Zoran Lapov (University of Florence, Italy)

intercultural childhood | epistemic justice | intercultural intersectional and decolonial perspective

In order to ensure justice and well-being in social, cultural, political, economic, and other spheres of human life, it is necessary to start by guaranteeing epistemic justice from an early age (Fricker, 2007). This principle is achieved in segments and realised in stages, and in order to get there, it is essential to allow young users of knowledges and practices inherent in human diversity to experience childhood, and subsequently their adult and democratic citizenship as interactive, participatory, and constructive experiences. To be achieved, this goal certainly requires training and educational programmes that should find support in a pedagogy built on a perspective that branches out into three lines of action: intercultural, intersectional, and decolonial (Mignolo & Walsh, 2018). Thereby, the present reflection aims to explore avenues of a socio-pedagogical commitment that proves capable of promoting epistemic justice in both formal and informal contexts of personal growth, so that children can experience an intercultural childhood and, therefrom, a more equitable, more supportive, more inclusive, possibly peaceful, hence more broadly intercultural citizenship.

PEDAGOGICAL PROFESSIONALISM AS A PROMOTER OF INCLUSION AND RIGHTS AT SCHOOL: A CASE STUDY IN TUSCANY

Christian Distefano (University of Florence, Italy)

Tuscan Inner Area | School Pedagogist | Inclusion

The classification of a territory as an inner area implies the recognition of specific socio-territorial characteristics and structural criticalities that may hinder local development processes and affect the quality of life of the resident population, particularly that of children. In Italy, this category includes territories characterized by geographical marginality, socio-economic and educational fragility, and a significant distance from the main centres providing essential services, especially in the fields of education, healthcare and transportation. With the aim of counteracting these dynamics of territorial marginalization and the phenomena of depopulation and social exclusion, in 2013 the National Strategy for Inner Areas (SNAI) was launched, promoted by the Italian Agency for Territorial Cohesion within the framework of the 2014–2020 European Structural and Investment Funds programming (Agenzia per la Coesione Territoriale, 2021). At the national level, the Strategy identified 72 inner areas characterized by low population density and a high ageing index. Within the context of the Tuscany Region, three inner areas were selected, including the Unione dei Comuni della Val di Bisenzio (Vaiano, Vernio and Cantagallo, in the province of Prato), which also presents significant criticalities in the educational and school sector. Indeed, according to surveys conducted in recent years, the school population shows a significant percentage increase in girls and boys with Special Educational Needs within the two Comprehensive Institutes in the area. Due to these school and territorial vulnerabilities, these students risk becoming particularly exposed to phenomena of social exclusion and to a lack of adequate attention and responses to situations of fragility. If the school represents a place of educational care (Certini, Distefano, 2024; Mortari, 2025) and democratic participation (Dewey, 1951) - offering everyone the opportunity to "bring out" their own uniqueness and welcoming, with appropriate tools, the many possible situations of childhood vulnerability (also in respect of everyone's right to education) - then it has the responsibility to include within its staff professional figures capable of promoting both social and individual well-being, as well as inclusive practices (Crispiani, 2022; Iori, 2018; Miatto, 2023; Premoli, 2024; Premoli, 2025). About this perspective, a doctoral research project was conducted in the territories of Vaiano, Vernio and Cantagallo, experimenting the inclusion of a pedagogist within school and local contexts in order to promote targeted and multi-perspective interventions aimed at preventing and counteracting possible forms of school marginalization and social exclusion, while expanding everyone's opportunity to take part in the entire educational process through appropriate tools and within a democratic framework (Legge 27 dicembre 2017, n. 205; Legge 15 aprile 2024, n. 55; Ministero dell'Istruzione, dell'Uni-

versità e della Ricerca, 2020). This contribution, after providing an overview of the school-territorial criticalities of the Unione dei Comuni della Val di Bisenzio, aims to present the main results of the research in order to promote reflections on the need to introduce pedagogical professionals within Italian school contexts.

THE RIGHT TO FEEL: MUSICAL IMPROVISATION AS A PRACTICE OF DEMOCRATIC PARTICIPATION IN EARLY CHILDHOOD

Ester Giamberini (University of Florence)

Music | Childhood | Rights

Contemporary debates on early childhood education increasingly recognize children as active citizens capable of participation and meaning-making within democratic communities and entitled to exercise their rights within educational contexts (Commissione Europea, 2021; Consiglio d'Europa, 2022). However, educational practices often privilege the cognitive and linguistic dimensions of democratic experience, while the sensory, emotional, and relational foundations of it remain marginal (UNESCO, 2021; Nussbaum 2010). Drawing on Luigina Mortari's reflections on freedom and education, democracy requires citizens capable of thinking and acting in unexpected ways. As Mortari argues, "Totalitarianism asserts itself only by depriving citizens of their capacity to invent new worlds, because democracy vitally requires citizens who think in unexpected ways and who cannot be found -either in thought or in action- where those who hold power would like them to be in order to govern them" (Mortari, 2018, p. 106). Starting from this reflection, the paper explores the meaning of feeling and the right to feel as fundamental educational dimensions for the construction of democratic citizenship from early childhood. Article 31 of the UN Convention on the Rights of the Child recognizes children's right to participate freely in cultural and artistic life (United Nations, 1989). Yet this right should not only be interpreted as access to cultural activities, but also as the opportunity to develop the capacity to perceive, express, and interpret emotions, relationships, and experiences through shared artistic practices. In this perspective, feeling means being present: inhabiting the time of experience and developing that relational sensitivity that makes free and responsible action within a shared space possible (Dewey, 1934; Biesta, 2013; Mortari, 2015). The capacity to think and act in unexpected ways -identified by Mortari as a vital condition for democracy- finds a meaningful pedagogical analogy in the practice of musical improvisation. Making music together can be understood as a genuine training ground for presence, where individuals immerse themselves in the vital flow of plural relationality through which each person shapes their humanity (Small, 1998; Branca, 2012; Zbranca et al., 2022; Higgins 2024). The relational dimension of making music clearly emerges playing together: through this process, musicians gradually learn to "breathe in unison," building a form of shared attunement (Murakami & Ozawa, 2019). In this sense, musical experience -particularly collective improvisation- offers a unique pedagogical context for developing what can be described as micro-democratic competences that sustain children's participation in shared social life: attentive listening, the ability to suspend one's own intervention, openness to the unexpected, responsiveness to others, and the co-construction of meaning within a shared process. Improvisation re-

quires participants to remain present in the unfolding moment and to respond through gestures, sounds, pauses, and silences, practicing democratic relationality (Consiglio d'Europa, 2018; Bertinetto, 2021; Eurydice 2025). This contribution therefore argues that collective musical improvisation can function as an early pedagogical laboratory of democratic participation, where children experience -through listening, responsiveness and co-creation- the relational competences that sustain democratic life, cultivating aware citizens capable of engaging creatively with the sonic and social worlds they inhabit (Cambi, 2016).

BETWEEN DEMOCRACY AND AUTONOMY: EDUCATING FOR THE SOCIETY OF THE FUTURE

Gabriele Lugaro (CED Centro per l'Educazione al Digitale A.P.S., Italy)

democracy childhood resistance

Can autonomy serve as the guiding principle for educating for democracy? Drawing on the teachings of John Dewey, Lamberto Borghi believed that education should have the task of fostering freedom, sociality, and universality, as well as autonomy of thought and volition, while avoiding any form of indoctrination or brainwashing. Education toward this autonomy represented "a living experience of democratic life," arguing that "in a school where the thoughts and volitions of students are cultivated according to these forms of freedom, I already glimpse a democratic society in the making" (1952). Borghi also wondered how schools could fulfill their mission in a world suffering from the "constant, growing, and systematic pressure of governments, parties, and economic groups" that work "to create subjects, soldiers, partisans, or to develop technical skills in a specific branch of production—fragments of men and non-men" (1952). His words remain highly relevant today: schools continue to be a battleground for economic and political interests, and even when educational institutions are established that are autonomous and independent of institutionalized power structures, they fail to guarantee the "universality" envisioned by Borghi. In the postwar period, the pedagogical debate he engaged in with Dina Bertoni Jovine proves extremely valuable for reflecting on today's schools, their influences, and their prospects. Jovine, following in the footsteps of Suchodoloski's socialist pedagogy and Gramsci's thought, criticized pedagogical activism for an excess of spontaneity and a tendency to focus solely on the current needs of students, based on the conviction that

"education limited to the present was at the same time the best preparation of the student for the future" (1957). The pedagogical vision put forward by Jovine, on the other hand, considered it fundamental to link the education of the child with the perspectives of pedagogy and socialist political thought: to view "man in a concrete way, in a specific place in history (...) at the crossroads of the incessant struggle of the new against the old (...) The problem of choosing cultural values rises to the importance of a major social issue; the orientation of individuals depends on general solutions" (1957). We live in a society permeated and governed by the special interests of large financial, technological, and military conglomerates, while politics—having progressively lost the influence it once held in the days when Borghi and Jovine were writing—flounders helplessly, attempting to exert an ideological influence on the school system that is increasingly shaped by the spread of "democracies." What cultural values can we promote to educate for democracy? Can we truly foster autonomy in today's society? What experiences of democracy can we offer to children in 2026, shielding them from the influence of neoliberal, authoritarian, and war-driven economic policies? By attempting to synthesize the thought of L. Borghi and D.B. Jovine, we will identify some trajectories, imagining democratic and participatory experiences free from the interests of large private monopolistic groups and authoritarian ideology, while attempting to outline renewed resistant pedagogical and democratic approaches (2022).

UNSCHOOLING FOR DEMOCRACY - DEMOCRACY FOR UNSCHOOLING

Nunzia Vezzola (LAIF (L'Associazione Istruzione Famigliare), Italy)

Unschooling | Democracy | Citizenship

Unschooling is often seen as a sort of escape from school, which is mainly considered as a guarantee for democracy. As a consequence, unschooling is mostly perceived as an anti-democratic form of education, as a way to avoid social duties, solidarity, respect for institutions, and the social dimension in general, as a way to keep away from what is "different" and from the difficulties and challenges you face at school. This might be caused by a misunderstanding or a lack of knowledge about unschooling. In fact, being per definition a child-led and non-coercive learning path (Holt 1967), unschooling can be seen as a democratic approach to education, where learning happens naturally (Vezzola, 2020) through life experiences in everyday society, by encouraging participation in daily decisions, collaboration, and social awareness and by nurturing fairness, respect, and empathy (Piffero, 2019). Children learn from an early age that their voices matter and this prepares them for lifelong engagement and social justice. In this way, children are recognized as present-day citizens who can make decisions and are encouraged to engage in community action and social responsibility. So, children can experience a democratic, respectful, negotiation- and participation-based way of growing, learning and relating to people from very different backgrounds, conditions and origins (Leali, 2025). This paper aims to show some experiences of democratic education based on the principles of equality and citizenship in unschooling.

Democratic Participation, Commons and Inclusion in Education

PANEL CONVENORS: Barbara Mazza (University of Sapienza, Italy)

PANEL KEYWORDS: Democratic Participation, Commons, Inclusion

The panel explores democratic participation, commons, and inclusion in educational contexts, examining how innovative practices can promote active citizenship, sharing, and equal opportunities. The contributions cover various areas: from the use of sport as a political-cultural provocation and pedagogical tool to rethink criteria of humanity, including experiments and challenges arising from enhanced games, to the role of sports educators as engaged intellectuals in disinterested education; from the use of digital and virtual technologies to rethink inclusion in sports education, to Paralympic sport and inclusive governance, highlighting practices and perspectives of local actors in an Italian pilot project. Further contributions analyze youth policies as drivers for urban regeneration and social innovation in the Mediterranean context, with the "Galattica" case in Puglia, and youth social innovation practices as processes of commoning in the inner areas of Basilicata, investigated through a multi-sited ethnographic approach.

SPORT AS POLITICAL-CULTURAL PROVOCATION AND PEDAGOGY FOR NEW CRITERIA FOR HUMANITY: THE EXPERIMENT AND THREAT OF ENHANCED GAMES

Luca Bifulco (Università degli Studi di Napoli Federico II, Italy) · **Alberto Maria De Mascellis** (Università degli Studi di Udine, Italy)

Enhanced Games | sport canon | human criteria

This paper reflect on Enhanced Games and their ambition to bring about value and cultural transformation, which includes the idea of developing an underlying pedagogy for humanity and its relationship with technical and scientific development. The contribution is based on a thematic analysis (Topic Modeling) and discursive analysis of the journalistic representation of this sports movement, given an acquired knowledge domain based on the deepening of official documents about the phenomenon. Enhanced Games are a mega-sporting event in which athletes are invited to achieve the best performance ever recorded in three specific areas – swimming, track & field, and weightlifting – with the possibility of taking substances considered doping in official competitions, if this is declared and under the supervision of medical teams. From a political and cultural view, the Enhanced Games organization aims to challenge and redefine various canonical principles of sport, while openly positioning itself within its commercialized and spectacularized dimension. Behind this proposal to redefine the sporting canon lies a broader political and cultural challenge. Enhanced Games occupy a liminal area where the boundaries between different conceptual and social categories are called into question: natural and artificial, morality and dishonesty, health and disease, performance and amateur sport, legality and illegality, individual and system, right and obligation, freedom and coercion, innovation and conservation, honor and dishonor. While the project aims to highlight the social and conventional nature of these categories, it also seems to reveal a specific political and ideological orientation, with political-economic implications. Thus, "The First Declaration on Human Enhancement" emphasizes individual freedom and full sovereignty over one's own body, autonomy from coercion, and the right to take calculated risks, in compliance with national laws and health protection. It also emphasizes the need to promote technical and scientific innovation and to support the continuous development of human potential, while maintaining transparency and fairness in sports competition. These positions seem to reflect the influence of currents of thought that are not neutral from a cultural, economic, political, and social perspective. In its current plans, the organization of the Games – presenting itself as a pioneering group in human development – proposes socialization based on a new set of values and renewed human criteria, indirectly promoting an unstoppable change in the reinvention of society. Against a cultural backdrop based on innovation, technical-scientific solutionism, and libertarianism, it proposes – through the field of sport – a cultural reform of the relationship between technology and personal and social development, suggesting a meta-morphosis of social, legal, institutional, political, regulatory, and relational practices, primarily in the sporting context, but fundamentally useful for a cultural pedagogy with a broader social impact. That is to say, a value system – representative of certain political and economic elites – celebrating technical rationality, trust in ingenuity and technical-scientific

innovations to solve humanity's challenges, growth without constraints, individual liberation, the consecration of criteria of effectiveness and productivity, indirectly redesigning the framework of civil and citizenship rights and duties, as well as the relationship with technology and its risks.

CITIZEN SCIENCE AS A BRIDGE BETWEEN SCIENCE EDUCATION AND DEMOCRACY EDUCATION

Ville Johannes Mäki (University of Jyväskylä, Finland)

Citizen science | Science education | Democracy education

Citizen science as a concept and practice has gained a lot of interest in the 21st century. Citizen science is commonly understood as voluntary public participation in scientific research by non-professional citizens. This participation can include gathering data for research, interpreting and analysing data or co-creating the whole research with scientists (Bonney et al., 2009). One of the defining features of citizen science is that participating citizens are not themselves the subject of study (Open Science Coordination in Finland, Federation of Finnish Learned Societies, 2022). Alongside citizen science there is also citizen social science and citizen humanities. In my own work I understand citizen science in the Finnish context where the word "tiede" (science) covers all the different academic disciplines. Therefore, my usage of the word citizen science contains also citizen humanities and citizen social science. Citizen science has been seen to contain great potential for conducting science education in both informal and formal settings (see e.g. Bonney et al., 2009; Lüsse et al., 2022). In the context of formal education citizen science can for example provide a way to foster critical thinking and problem-solving (Shah & Martinez, 2016) as well as to enhance multidimensional understanding of the relevance of science (Lüsse et al., 2022). In the research concerning different educational aspects of citizen science there has also been discussion about the democratic possibilities of science education based on citizen science (see e.g. Mueller & Tippins, 2012; Gray et al., 2012; Oesterle et al., 2019). These studies have given a critical look to themes such as community, power-relations, local knowledge, nature of participation, critical agency, and the role of marginalized students. In my own work I want to join this discussion by studying citizen science through the lenses of democracy education (see e.g. Männistö, 2020; Rautiainen et al., 2023). Democracy education contains the notion that democracy should be included to education in three different ways. The practice of education should be democratic, the content of education should be about democracy (i.e. critical understanding about society), and the relationship between schools and larger society should be interactional (Männistö & Fornaciari, 2017; Tomperi & Piattoeva, 2005). In my research I will

compare these three aspects of democracy education with notions raised in the earlier studies concerning citizen science and science education. My goal is to broaden our understanding about the relationship between citizen science, democracy and education, and offer new insights on how citizen science could act as a form of democracy education.

NOT TECHNICIANS OF KNOWLEDGE BUT INTELLECTUALS FOR A DISINTERESTED EDUCATION IN SPORT

Castagno Giovanni (Esquilino Fc ASD, Italy)

Hegemony | social change | public space

It's difficult to measure the contribution that an intellectual like Antonio Gramsci made to the development of political thought during the twentieth century. Even under the most extreme conditions, the Sardinian philosopher managed to advance a series of lines of inquiry that became central to the historical and sociological disciplines. But above all, by his example, Gramsci demonstrated how an intellectual who truly wanted to take responsibility for being consistent with his own ideas should act. We also owe to him the idea that theory and practice must be intimately linked in any process of social transformation. And at the heart of this conviction is the reasoning put forward in notebook number 12 of the work carried out in prison, which laid the foundation for a more comprehensive reflection on the relationship between politics and pedagogy, and between pedagogy and militancy. This framework provides a very broad framework in which the intimate relationship that Gramsci believed had to be established between those who performed an educational role (the teacher, as we would say today) and those who found themselves in the position of receiving stimuli (the student) emerges, demonstrating how this relationship was much more complex than was generally perceived within the organizations of the workers' movement. The relationship between school, democracy, the construction of socialism, the economy, and culture were framed in those pages within a comprehensive, rather than unilateral, vision of education, because Gramsci was seeking to organize a complex political-educational framework and to imagine the role that school could play for those who cared about the defeat of fascism and the affirmation of socialism. This reflection is crucial if we apply it to the world of sport, because it helps us understand how negative and unacceptable, for anyone who cultivates the desire to see our society transformed in a progressive direction, the idea that one can separate these closely related spheres is. Educating informed citizens is a goal that cannot be separated, except at great cost, from an athlete's development, regardless of the technical level one aims to help them achieve. The value of sport and the possibilities for transforming or reproducing what already exists are part of a dialectic that is too often resolved by penalizing a global vision and instead affirming a partial and very limited specialization, the social and political costs of which are very high. Only by freeing

ourselves from this vision and from a "technical" approach to sport will we be able to build contexts not exclusively devoted to the reproduction of what already exists, but instead functional to its transformation. Through Gramsci and others many authors who have been inspired by his work in various ways, we will attempt to demonstrate how it is even more important today than ever before to reclaim a space within a phenomenon that is becoming pervasive in our society, whose consequences in terms of cultural and political regression are, in our opinion, devastating.

YOUTH POLICIES AS DRIVERS FOR URBAN REGENERATION AND SOCIAL INNOVATION IN THE MEDITERRANEAN CONTEXT: THE CASE "GALATTICA" IN PUGLIA, ITALY

Domenico Emiliano (Università degli Studi di Bari Aldo Moro, Italy)

Youth Policies | Urban Regeneration | Social Innovation

In the contemporary Mediterranean context, marked by rapid socio-economic transformations and brain drain; it is crucial to understand how to support young people in becoming agents of change. In this regard, youth policies contribute to evolving the welfare system from a traditional protective form toward an innovative and enabling one (Minervini, 2016). They play a fundamental role in providing personal and professional growth opportunities for young people who currently face increasingly significant challenges such as unemployment, social exclusion, inequalities, job insecurity, and mental health issues. This contribution reconstructs the evolution of youth policies in the Puglia Region, focusing particularly on "Galattica – Rete Giovani Puglia" as a paradigm of collaborative governance and participatory urban regeneration. Through a sociological lens, the study investigates the socio-spatial transformations of the measure, drawing from the theoretical corpus of third places (Oldenburg, 1989) and third spaces (Bhabha, 1994; Soja, 1996)—viewed as spaces of cultural hybridity where identity, belonging, and social justice are negotiated. The methodology adopts a mixed-methods approach based on the principles of realistic evaluation, combining focus groups with policy makers, semi-structured interviews with 9 regional youth workers, documentary analysis, and a multiple case study. This top-down logic allows for the reconstruction of strategies, challenges, and opportunities emerged during the first implementation cycle of the measure, providing a privileged perspective on governance mechanisms and implementation processes to understand "what works, for whom, in what circumstances, and why" (Pawson & Tilley, 1997). The Galattica policy represents the evolution of Puglia's regional urban regeneration strategies, activating 96 local "Nodes" as proximity spaces for providing information, orientation, and support, following a logic of co-design and shared governance based on the suspension of traditional institutional rules. Through the thematic mapping of 1,519 events promoted in local plans and 172 regionals program activities designed to meet identified local needs, the research categorizes five intervention clusters: economic and professional empowerment; rights and social inclusion; civic participation and active citizenship; personal development and well-being; culture, creativity, and sustainability. Preliminary results highlight a transformative impact, such as socio-spatial changes and youth empowerment but also reveal governance challenges. In conclusion, this research intends to contribute to the debate on collaborative governance models in public policy, highlighting how experimenting with innovative forms of co-design can generate more effective solutions for the territorial and collective needs of young people navigating the phase currently defined as "emerging adulthood" (Arnett, 2000). Through a sociological reflection on the Apulian model, the study explores the transformative potential of youth policies in countering the marginalization

and commodification of urban space, highlighting how investing in the human and social capital of new generations can trigger urban regeneration processes capable of responding to the contemporary challenges of youth unemployment and the crisis of democratic participation.

territory | inclusion | Paralympic Sport

In the current institutional and scientific debate on the relationship between sport and disability in Italy, there is a growing need to strengthen coordination between public, private and third sector actors through more robust territorial analysis (Cerbara, 2024). Statistical evidence shows that people with disabilities continue to experience structural disadvantage, often associated with more acute forms of material deprivation than the rest of the Italian population (Istat, 2019; UISP, SVIMEZ and Sport e Salute, 2023). In this context, disability cannot be defined exclusively in relation to the oppression caused by physical barriers, the spatial organisation of territories, or as a product of stigmatising representations, the result of categorising stereotypes produced by social, political and cultural processes of normalisation (Vadalà, 2013; Oliver, 2015; Travaglini, 2020) oriented towards integration rather than inclusion. While acknowledging the concrete limiting role of architectural structures, it is argued that it is the disabling power inscribed in dominant social models (Lettieri, 2013; Oliver, 2015) that determines the conditions of access, recognition and participation in democratic life. Within this scenario, marked by a broader crisis of democracy and the ability of individuals to influence decision-making processes (Oliver, 2015), Italian Paralympic sport takes on a dual significance. On the one hand, it reflects the discrimination faced by people with disabilities, as evidenced by the persistent lack of adequate facilities and limited participation in collective sporting life. On the other hand, it represents a field of innovation and experimentation for people with disabilities, in which, through shared and co-designed sporting activities, they are able to develop alternative forms of disabled subjectivity (Roets and Braidotti, 2012; Abrams, 2015), dismantling the myth of autonomous individuality and social utility (Vadalà, 2013; Travaglini, 2020), enhancing the capacity for action (Mura and Zurru, 2013; Oliver, 2015; Beneduce and Taliani, 2021) and determining processes of self-recognition freed from stigmatising and stereotypical views of disability (Jarman et al., 2002). Furthermore, sport has a unique ability to influence urban spaces: the need for dedicated infrastructure makes sport a privileged area for implementing inclusive and sustainable policies capable of generating positive effects that go beyond the initial objectives. Sport and disability are a strategic field of action for building, together with the communities concerned, a shared and self-determined culture of inclusion. In this context, the paper presents the initial results of a pilot study conducted in Italy, aimed at exploring the perspectives and practices of local actors involved in organising sporting activities for people with disabilities, with the aim of contributing to the definition of more effective and participatory models of inclusive governance.

YOUTH SOCIAL INNOVATION AS A PROCESS OF COMMONING IN THE INNER AREAS OF BASILICATA: A MULTI-SITED ETHNOGRAPHY

Miriam Matteo (University of Salerno (Italy), Italy)

youths | social innovation | inner areas

When bottom-up social innovations emerging within civil society arise in response to collective needs that are not met by institutions or the market (Moralli, 2019; 2022), they can evolve into processes capable of reshaping collective imaginaries, social representations, and dominant rhetorics. In particular, when such practices become rooted in local contexts, they may contribute to the creation of spaces of sharing and cooperation that take on the characteristics of social and educational commons. Drawing on an exploratory study of the practices and processes of social innovation promoted by young people under 35 living in Basilicata (South of Italy) and active in third sector organizations engaged in the social regeneration of the region's inner areas, this contribution investigates how these initiatives generate spaces of collective learning, shared responsibility, and democratic participation. The analysis follows the young promoters of these initiatives through a multi-sited ethnography (Marcus, 1995), exploring practices, processes, and narratives of social innovation both on site and online, and observing how they contribute to the construction of forms of commoning within local territories. The choice of Basilicata is linked to the fact that it is the southern Italian region experiencing the highest demographic decline (-7.4% in 2023, Svimez 2024) and the highest percentage of inner areas (Vespasiano, 2023), which are often characterized by difficulties in accessing essential services (education, healthcare, infrastructure) and by limited employment opportunities. In this context, some youth-led initiatives promote practices of territorial regeneration that transform social and cultural spaces into environments of sharing, learning, and collective care. Against a dominant narrative that portrays these territories as "points of escape," the young people involved reinterpret them as "vanishing points" from which to imagine and practice new forms of cooperation. Through these practices, local spaces become contexts in which knowledge, responsibility, and participation circulate horizontally among participants, contributing to the construction of democratic imaginaries grounded in the co-production of collective solutions. The contribution therefore proposes to interpret youth social innovation practices in inner areas as processes of commoning that generate forms of collective learning and new practices of democratic citizenship in marginalized territories.

Democratic Practices, Expansive Learning and the Commons in Education

PANEL CONVENORS: Magdalini Kolokitha (University of Thessaly, Greece); Angeliki Lazaridou (University of Thessaly, Greece)

PANEL KEYWORDS: Democratic Practices, Expansive Learning, Commons

The panel explores democratic practices, expansive learning, and the commons in educational contexts, examining how innovative experiences and laboratories can promote participation, shared responsibility, and social transformation. The contributions cover various areas: from cultivating democratic education in schools through playful learning and children's agency, to the contradictions and staff mobility that emerge when open classrooms become closed, observed in early childhood change laboratories; from change laboratory experiences with practitioners working with severely marginalized populations in Varese, to the reconceptualization of social intervention with children and families, shifting from individual and reactive approaches to systemic and participatory strategies. Further contributions investigate expansive learning within civic movements, fostering democratic activation, deliberation, and advocacy to address socio-ecological crises, as well as school principals' governance practices in emergency contexts, transforming bureaucracy and standard procedures into commoning practices.

WHEN OPEN CLASSROOMS CLOSE: CONTRADICTIONS, STAFF MOBILITY, AND EXPANSIVE LEARNING IN A KINDERGARTEN CHANGE LABORATORY

Daniele Morselli (Free University of Bolzano, Italy)

Change Laboratory interventions | systemic contraddictions | expansive learning

This contribution analyses how a kindergarten engaged in a Change Laboratory (CL) intervention navigated intertwined expansive and regressive learning cycles while attempting to implement an open-classroom model. Grounded in CHAT, contradictions are historically accumulated structural tensions that drive transformation (Engeström, 2015). Rather than surface conflicts, contradictions operate at different levels: primary within components, secondary between components, tertiary between old and emerging models, and quaternary between interacting activity systems. These tensions may generate transformative agency, yet they may also produce resistance and regression when not collectively worked through (Sannino, 2010). The RQ is: How did layered contradictions, intertwined with staff mobility, shape expansive and regressive learning cycles during the implementation of an open-classroom model in a kindergarten? After a two-year relocation due to renovation works, the school reopened in September 2024 in a building architecturally designed for open classrooms. Teachers initially attempted to implement open spaces but quickly reverted to closed sections. This revealed a secondary contradiction between spatial tools and entrenched organisational rules (Morselli & Weyland, 2025), confirming that architectural change alone does not transform pedagogical practice. Between March and June 2025, the CL facilitated collective analysis of mirror data and surfaced primary contradictions embedded in the traditional model, particularly tensions between inclusive pedagogical values and segmented routines. Teachers jointly modelled an open-classroom object of activity, initiating an expansive cycle. However, staff turnover in September 2025 altered the subject collective, intensifying tertiary contradictions between the emerging model and residual habits. The arrival of new children further amplified secondary contradictions between object, rules and division of labour. A legionella outbreak in November caused a quaternary contradiction between the school and public health authorities. When the school re-opened in February 2026, tensions deepened. Divergent pedagogical models—particularly different child's conceptions and the newly arrived children's acclimatisation—clashed with the practical management of everyday routines. In February 2026, a decisive refusal to reopen shared spaces marked a regressive turning point. In agreement with three teachers strongly committed to the model, it was decided to suspend further implementation and resume CL sessions in September, when a central opponent of the reform would retire. This case demonstrates that expansive learning is fragile when contradictions around the pedagogical object remain only partially elaborated. Architectural redesign and procedural innovation cannot substitute for explicit negotiation of the underlying image of the child and the corresponding pedagogical model. Second, the study highlights that staff mobility can intensify contradictions by destabilising collective memory and fragmenting transformative agency (Haapasaari et al., 2016). Sustainable democratic innovation requires sustained dialogical spaces in which competing pedagogical visions can be made explicit and worked through. The findings suggest

that more sustained CL cycles and explicit discussion of the image of the child are necessary conditions for consolidating expansive learning in early childhood education. Rather than viewing regression as failure, the study reframes it as part of the historical movement through which educational change unfolds.

SCHOOL PRINCIPALS' DISASTER PREPAREDNESS GOVERNANCE: FROM BUREAUCRACY TO COMMONING PRACTICES

Magdalini Kolokitha (University of Thessaly, Greece) · **Angeliki Lazaridou** (University of Thessaly, Greece)

Preparedness | Commoning Practices | Disaster Governance

This paper examines the realisation of official school disaster preparedness directives through principals' practices, framed by an educational commons perspective to discuss the formulation of disaster governance in schools. Theoretically, this paper aims to contribute and develop the evolving argument related to educational commons (Pechtelidis, 2020) by focusing on the areas of disaster education and policy related realisation. Focusing on the Greek policy context, at the commencement of each academic year, all primary and secondary schools are furnished with an official directive entitled "Implementation of Civil Protection and Civil Defense Guidelines in School Units." (MofERAS, 2024) School units are thereby obligated to operationalize these guidelines, with principals charged with formulating, executing, and enacting emergency protocols addressing critical incidents, such as fires, extreme weather events, technological disasters, and Chemical, Biological, Radiological, and Nuclear (CBRN) incidents. Drawing on qualitative data from eight purposively sampled principals at public primary and junior high schools in flood-affected areas (diverse by location, size, and socioeconomic profile), this study explores how they interpret, adapt, and implement national guidelines. Data from two 2.5-hour focus groups fostered discussions on policy comprehension, enactment, leadership efficacy, and support gaps, structured around four themes: policy implementation, performance, responsibility/emotions (readiness, efficiency, effectiveness), and recommendations. Inductive thematic analysis (Creswell, 2014; Bryman, 2016) revealed educational commons as a performed but not recognised practice by the school principals, refocusing the discussion from bureaucratic policy implementation and policy realisation to enacted practices based on educational commons, even though they are not recognised as such. The data highlight the shifting focus from bureaucratic compliance to emergent, collective governance in disaster preparedness governance.

Change Laboratory | Marginalization | democratic space

The Change Laboratory (Virkkunen & Newnham, 2013), developed within the theoretical framework of Cultural-Historical Activity Theory (CHAT), is an interventionist methodology aimed at promoting expansive learning, collective transformation, and organizational innovation in complex social and work activity systems (Engeström, 1987; Engeström & Sannino, 2021; Engeström et al., 1999). It supports collective processes of analysis and transformation through the surfacing and elaboration of structural contradictions that traverse object-oriented activity systems (Engeström et al., 2024), while also functioning as a dialogic, reflective, and democratic space for adult learning. This contribution presents an experience of the Change Laboratory implemented within the Working Table/Groupon Severe Social Marginalization of the Municipality of Varese (Bonometti & Ferri, 2025). The process involved approximately thirty actors engaged in services for individuals at high risk of marginalization, providing a context for adult education grounded in informal and interprofessional exchange. From this perspective, the laboratory served not only as a device for organizational development but also as a democratic learning space in which subjects from diverse organizations negotiated meanings, made systemic contradictions visible, and constructed a shared object of work. The intervention, conducted between November 2024 and February 2025, consisted of six sessions facilitated by five researchers from the University of Insubria and the Catholic University, under the scientific supervision of A. Sannino. The primary objective was to transform the local approach to severe marginalization through the co-design of innovative solutions, grounded in a systemic and historically situated analysis of emerging issues. The process aimed at a reconceptualization of the shared object of activity, redefining marginalization no longer as an individual condition to be addressed fragmentarily, but as a systemic, relational, and territorially constructed object. This cultural and conceptual reconfiguration fostered the emergence of a collective agency —understood as the subjects' capacity to take control of their activity—oriented toward transforming practices and inter-service relations. A central methodological pillar was the principle of double stimulation: selected empirical data (critical episodes, problematic cases, documentary evidence) were returned to participants to make systemic contradictions visible and stimulate reflective processes oriented toward change (Sannino, 2016). Participants identified tensions between established practices and complex, changing needs, highlighting service fragmentation, weak interorganizational integration, and the absence of a shared strategic vision. Historical analysis and examination of concrete cases clarified the systemic nature of the issues, while the activity triangle model enabled analysis of relations among subjects, tools, rules, community, division of labor, and object. On this basis, the group outlined a zone of proximal development and co-designed innovative responses: a dynamic mapping of territorial resources, a multidimensional and multi-agency team, and a physical coordination space among public and private actors. These outcomes can be read as concrete mediations of collective agency and as indicators of a new democratic capacity for interorganizational action. Overall, the Varese case illustrates how the Change Laboratory, in interprofessional contexts of adult education, can support processes of conceptual redefinition akin to concept formation in the wild, democratic learning, and the construction of new territorial coalitions.

RECONCEPTUALIZING SOCIAL INTERVENTION WITH CHILDREN AND FAMILIES FROM INDIVIDUAL AND REACTIVE TO SYSTEMIC AND PARTICIPATORY. A CHANGE LAB

Diego Di Masi (University of Torino, Italy) · **Chiara Sità** (University of Verona, Italy)

Interprofessional Collaboration | Concept formation | Expansive learning

Background In the Italian child protection system, Pronto Intervento Minori (PIM) offers the first response to emergency situations involving children and families (homelessness, undocumented families, transition to residential care for children in severe risk). Bronfenbrenner (1979; 2005) connects learning and development to ecological transitions. In the bio-ecological model, changes in relations, roles, and activity have a high developmental potential. However, the critical point experienced by professionals in the PIM's activity is the risk to operate in a routine, merely reactive way, and to reduce both children and family agency, and creative space for professionals. Following a major reorganization of emergency social interventions in the municipality, the PIM working group has launched a Change Lab (Virkkunen, Newnham, 2013) with two researchers to better define its approach and function within the welfare system in Milan. Aims The research aims to explore the reconceptualization of the motive of PIM during a Change Lab using the lens of expansive learning and concept formation in the wild (Engestrom, 2024). Methods The data collection and analysis followed two interconnected lines. An ethnographic research using observation of team meetings, document analysis, interviews and focus groups with key stakeholders (PIM team, social workers from the municipality, psychologists, coordinators, local welfare manager, consultants from the municipality, educators and psychologists working in residential care, and a mother) was aimed at both describing the organizational culture of PIM and identifying key elements that could be used as second stimuli during the Change Lab sessions. The Change Lab sessions, recorded and analyzed through content analysis aimed to identify the emerging conceptualizations of PIM's work. CL entailed: the historical analysis of PIM and its changes due to new global phenomena (migration, wars...) that have shaped the identity and functions of PIM over the years; analysis of current professional practice and its challenges. Results During the Change Lab sessions, professionals recognize a distance between their work and the current representation of themselves and their organization as "emergency experts" whose intervention is limited to responding quickly to immediate, mostly instrumental needs. Exploring the actors' experience and trajectories during this phase led the group to work on a new conceptualization: while previous narratives defined PIM as an "emergency room" focused on providing first aid and referring the "patient" to a social care service once stabilized, the new conceptualization describes PIM professionals as actors who take care not only for individual needs but also for the developmental potential of systems during transitions, thus re-defining their motive and positioning from an individually-targeted, reactive and deficit-focused model to an activity system that is participatory and "collaboratively responsive" (Edwards et al., 2009). This concept engages professionals in a reconceptualization of their work as a systemic action that can sustain a democratic reconfiguring of the social care system in the city, starting from the most challenging transitions experienced by children and families.

EXPANSIVE LEARNING IN CIVIC MOVEMENTS: DEMOCRACTIC ACTIVATION, DELIBERATION, AND ADVOCACY TO CONFRONT SOCIO-ECOLOGICAL CRISES

Mattia Favaretto (Free University of Bozen-Bolzano, Italy)

expansive learning | civic movements | socio-ecological governance

Cities facing socio-ecological crises increasingly rely on civic initiatives to articulate alternative developments. Venice exemplifies these dynamics. Over recent decades, overtourism, environmental degradation, and the commodification of public spaces have threatened the social and ecological survival of the Venetian lagoon. In response, civic movements have sought to reconfigure the relationship between the city and its wetland ecosystem. Yet these initiatives often remain fragmented and face resistance from institutional and commercial actors. In Venice and elsewhere, research rarely examines the learning processes through which civic actors develop heterogeneous coalitions capable of addressing such complex challenges. This study therefore investigates how democratic processes emerge through expansive learning in civic movements confronting socio-ecological crises. The research draws on Cultural-Historical Activity Theory (CHAT), particularly its fourth-generation focus on coalitions of activities addressing shared societal challenges. Empirically, it is conducted as a formative diagnosis of Venice's civil society, combining participatory engagement with qualitative analysis. An embedded case design focuses on three civic movements addressing interconnected issues: Coordination No Incinerator (environmental health and industrial pollution), Poveglia for Everybody (commoning of abandoned public islands), and High Residential Tension (housing justice and opposition to touristification). Data include documentary materials, observations in sixty-one meetings, and twenty-five interviews. The analysis reconstructs how these movements organise around contested socio-ecological challenges and how their activities expand through coalition-building across social sectors and governance levels. The findings show that civic activities emerge in relation to distinct object regions such as environmental degradation, housing unaffordability, and the mismanagement of public assets. Civic engagement often begins through the contestation of public policies and economic interests affecting common goods and the ecosystem. These conflicts reveal systemic contradictions in local governance and stimulate collective learning. Civic movements initiate expansive learning by reframing local problems as cross-sectoral and multilevel challenges, enabling cooperation with scientists, public officials, and policy advocates. Through these processes, heterogeneous coalitions form and develop shared understandings of the challenges they confront. Across the cases, democratic dynamics become visible through three interconnected processes: activation, as civic actors mobilise around shared socio-ecological concerns; deliberation, as coalition partner remodel problems and solutions; and advocacy, as these coalitions coordinate action to influence institutional agendas and public debate. By sharing contradictions and co-developing new practices, civic and institutional actors progressively align their work around emerging collective objects. Examples include collaborations on environmental biomonitoring, proposals for the co-management of public islands, and civic campaigns addressing tourism regulation. These developments show how expansive learning within civic movements can generate new democratic capacities and contribute to the transformation of socio-ecological governance. Building on this diagnostic work, the research outlines prospective formative interventions aimed at supporting the long-term development of these coalitions. The proposed post-doctoral project advances this agenda by examining how fourth-generation formative interventions can support new models of socio-ecological governance. It seeks to examine and sustain the civic movement advocating the legal personhood of the Venice Lagoon. The study focuses on heterogeneous coalitions of civic, institutional, and scientific actors learning to represent ecosystems politically and legally, enabling democratic innovation in socio-ecological governance.

CULTIVATING DEMOCRATIC EDUCATION IN SCHOOLS: PLAYFUL LEARNING AND CHILDREN'S AGENCY

Maria Barbara Donnici (Fondazione Reggio Children, Italy) · **Bruna Elena Giacopini** (Fondazione Reggio Children, Italy)

children's agency · democratic education · inquiry-based learning

This contribution examines how children and adults exercise political and democratic agency within schools through Reggio Emilia-inspired pedagogical experiences. Central to this idea is recognizing also children as active citizens whose questions encourage reflection and reveal their capacity to influence social life and regenerate the desire to learn. The investigation involves three Italian public primary school classes where children engaged in inquiry-based processes on identity, inclusion, and democratic participation. Their projects highlight the visible impact of children's voices and actions beyond the school community. The main focus is how democratic values, such as recognition of the uniqueness of every voice, respect for diversity, interdependence, and the right to take risks and revise one's thinking, are enacted in daily classroom life. Teachers, inspired by John Dewey's principles, create environments in which democracy is experienced rather than merely described. Adults support children's playful inquiry and reflective discussions, enabling experimentation and dialogue as legitimate ways of learning. This approach recognizes children as active participants in meaning-making and social negotiation, capable of influencing micro-societies within classrooms and broader school communities. Methodologically, this study adopts a practice-based, qualitative approach focused on teachers' experiences. By analyzing materials shared by teachers, it explores how democratic values are enacted in everyday classroom activities. Besides relying on direct observation or intervention with children, the research draws on teachers' accounts of inquiry-based projects on identity, inclusion, and democratic participation, underlying both the strategies employed and the ways children's agency and participation were perceived and supported. The findings reveal that democracy emerges in everyday school life: children observe differences, ask questions, negotiate meaning, and recognize the legitimacy of multiple voices. Playfulness and shared inquiry are central pedagogical tools, fostering creativity and collaborative decision-making. In addition to this, intergenerational dialogue enables children to articulate concerns and develop capacities for collective agency and give adults the opportunity for a deeper understanding of different perspectives. These experiences challenge assumptions that political participation and civic competence arise later in life, showing that intentional pedagogical choices can transform schools into microcosms of democratic society. By situating children as co-participants in civic life, this work contributes to positioning the role of schools in democratic engagement. It makes visible how participatory and reflective educational practices cultivate active citizenship for both students and educators, showing that democracy can be both learned and enacted through everyday classroom experiences.

Ageing with Disability, Life Projects and Democratic Citizenship: Rethinking Special Pedagogy for Older Adults

PANEL CONVENORS: Filippo Gomez Paloma (University of Cassino and Lazio Meridionale, Italy); Claudia Maulini (University Parthenope, Napoli); Enrico Miatto (Iusve, Mestre (Ve)); Chiara Gentilozzi (University Giustino Fortunato, Benevento); Antonio Cuccaro (University Niccolò Cusano, Roma)

PANEL KEYWORDS: AWD, self-determination, Life Project

Democratic education is lifelong and must include older adults who have lived with disability since childhood or early adulthood. Ageing with disability (AWD) raises specific challenges: early onset of frailty, fragmented welfare systems, and the risk of "double vulnerability" due to ageism and ableism. The panel addresses AWD as a crucial testing ground for the education–democracy nexus. Building on international frameworks (UN CRPD, EU Disability Strategy) and recent reforms that introduce individualized, participatory life projects, the panel explores how special pedagogy can translate rights into everyday practices of inclusion for older persons with disabilities. Particular attention is given to self-determination as a human right and pedagogical principle, the design of "Life Project" that integrate social, educational and care dimensions, and the role of communities and long-term care services in sustaining quality of life and active citizenship in later life. We welcome theoretical, empirical and methodological contributions that: (a) analyse AWD between disability and ageing studies; (b) explore narratives of older persons with disabilities and their families, including co-ageing and "voicelessness"; (c) investigate community-based and intergenerational practices, as well as digital and technological inclusion, that counter isolation and institutionalization; (d) discuss professional training for educators and practitioners as democratic "brokers" between law, services and everyday life. The panel aims to gather scholars and practitioners from pedagogy, sociology, social work and gerontology to reframe ageing with disability not as a mere problem of care, but as a time of citizenship, learning and participation.

THE EXCESSIVE OBJECT OF AGEING WITH DISABILITY: CRISIS OF PEDAGOGICAL MODELS OF DEVELOPMENT AND REFRAMING OF THE LIFE PROJECT

Riccardo Sebastiani (Link Campus University, Italy) · **Sara Pellegrini** (Link Campus University, Italy)

Disability Ageing Autonomy

The contribution approaches Ageing with Disability (AWD) not as a specialist topic, but as a critical lens. When duration truly enters the scene rather than remaining a biographical detail, core educational categories reveal their normative character. Development, conceived as cumulative progression; education, framed as preparation for adulthood; autonomy, equated with independence: these concepts hold only as long as the life course appears linear. AWD disrupts this linearity and compels theory to make explicit what usually remains implicit, the assumption that adulthood represents stability and dependency merely an incident to be corrected. AWD compels us to acknowledge that vulnerability is not a deviation from a presumed "normal" course of life, but an ordinary dimension of human experience that may re-emerge or intensify along trajectories rarely unfolding in linear ways. From this awareness, it becomes difficult to treat autonomy as a boundary separating those deemed "fit" to participate in social contexts from those excluded. Such a distinction cannot be demonstrated or validated objectively; rather, its substance takes shape within the web of relationships and material conditions surrounding the person. When discontinuity and fragmentation within service systems weaken support structures, choice may remain formally recognized yet lose substance in lived experience. It becomes a procedurally sound formulation that struggles to withstand the pressures of everyday life. Self-determination, though strongly affirmed in normative frameworks, risks remaining unprotected, asserted at the level of principles, yet fragile precisely at the moments when it most requires safeguarding. AWD unsettles a long-standing and largely unexamined assumption, namely the idea that development coincides with an orderly progression in which competencies accumulate over time, as if life followed an upward trajectory. When attention shifts to lived realities and their dynamics, this image begins to falter and life paths reveal interruptions and discontinuities. At that point, attempts to reduce development to measuring what has been "accumulated" become inadequate, and a new urgency emerges: to understand what enables continuity to be sustained, and how transitions can be navigated without losing the supports holding experience together. What ultimately makes the difference is not so much the increase in skills, nor their certification, but the possibility of remaining within the spaces that shape one's life, dwelling, relationships, education, work, participation, even when circumstances fracture or reconfigure. As long as the implicit normative horizon presupposes a linear, autonomous, stable life trajectory, largely free from disruption, vulnerability, dependency, ageing, and illness tend to be regarded as exceptions to be managed, or as

problems to be contained or corrected. AWD redirects attention precisely to this point: not to what is declared, but to what endures over time. It compels us to ask whether a person is able to remain within social contexts, to make decisions, to participate, and not to be excluded when life becomes more fragile.

VIRTUAL MUSEUMS AS PEDAGOGICAL INFRASTRUCTURES FOR INCLUSION AND DEMOCRATIC PARTICIPATION IN LATER LIFE

Alessia Sozio (Unipegaso, Italy) · **Rolando Fiore** (MIM, Italy) · **Tonia De Giuseppe** (Università Giustino Fortunato, Benevento, Italy)

Virtual museum · cultural participation · intergenerational learning

We present a small-scale pedagogical experiment focused on a visit to a virtual museum, designed as an inclusive educational environment that encourages participation, recognition, and democratic belonging among older adults with disabilities or social vulnerability. Within the field of Special Pedagogy, the project reimagines the museum visit as a community-based educational practice where access to cultural experiences becomes a means to counteract isolation, passivity, and marginalization. The theoretical framework is based on a bioecological perspective, which posits that development and participation are shaped by the dynamic interaction between individuals and their relational, institutional, and cultural environments (Bronfenbrenner, 1979; Bronfenbrenner & Morris, 2006). From this view, the virtual museum serves as a meso-level pedagogical space linking personal biography, digital mediation, and community life. This idea is further supported by Berthoz's concept of simplexity, emphasizing the need to create learning environments that make complex concepts accessible through adaptive, meaningful, and embodied mediation (Berthoz, 2012). The intervention is also guided by the neuroeducational and embodied approach developed within the ECS framework, which highlights the interconnectedness of body, cognition, affect, and context in inclusive learning (Gómez Paloma & Damiani, 2021). The virtual visit extends beyond digital reality to become an embodied-relational experience, structured through guided interaction, narrative activation, and reflective participation. Reflecting on simplex didactics and educational technologies reinforces this perspective by emphasizing the pedagogical value of digitally mediated environments in fostering active participation, meaningful interaction, and the development of transversal skills, rather than merely offering passive consumption (Di Tore, 2020). Within this framework, and consistent with inclusive pedagogical approaches rooted in relational care and participatory accessibility, inclusion is viewed not as a compensatory response to deficits but as an ecological and existential condition related to the quality of educational settings, recognition of subjectivity, and the capacity for genuine participation in shared cultural life (Corona & De Giuseppe, 2017; De Giuseppe, 2024). At the policy level, the project aligns with current European, international, and national frameworks that acknowledge the educational and social importance of cultural participation. "Culture and Health report: Time to Act" advocates for stronger integration of cultural policy, wellbeing, and public inclusion, while the WHO scoping review "What is the evidence on the role of the arts in improving health and well-being?" (Fancourt & Finn, 2019) provides solid evidence that arts participation significantly contributes to quality of life, social connectedness, and overall wellbeing. In Italy, this approach is further reinforced by the recent alignment between the Ministry of Culture and the Ministry of Health. Methodologically, the pilot involves a small group of older adults and may include younger participants in a structured intergenerational activity. The process includes pedagogical reception, brief digital support, an accessible and dialogic virtual visit, and a final co-narrative exercise. The expected outcomes focus on strengthening cultural agency, digital confidence, intergenerational exchange, and recognizing cultural access as a practice of democratic citizenship in later life.

ALGORITHMIC CITIZENSHIP IN AGEING: ARTIFICIAL INTELLIGENCE, COGNITIVE DELEGATION AND THE DEMOCRATIC RIGHTS OF OLDER PERSONS WITH DISABILITIES

Monica Di Domenico (University of Salerno, Italy) · **Fabrizio Schiavo** (Indire) · **Pio Alfredo Di Tore** (University of Cassino and Southern Lazio)

algorithmic citizenship | ageing with disability | cognitive delegation

With the progressive embedding of generative artificial intelligence in social and institutional life, the question of who retains the epistemic agency necessary to participate authentically in democratic processes acquires growing pedagogical relevance. This contribution examines the intersection of ageing, disability and AI from the perspective of Special Education and philosophy of education, arguing that older persons with disabilities represent a privileged vantage point from which to observe a structural dynamic, particularly in contexts of digital access to healthcare services, welfare provision and public information, where the immediate availability of AI-generated responses may reduce genuine cognitive engagement, producing a condition in which discursive fluency tends to replace the active construction of knowledge and judgement. Drawing on the concept of algorithmic citizenship (Di Tore et al., 2024) and on the foundational insight of McLuhan and de Kerckhove that media function as cognitive environments reshaping the conditions of knowledge (de Kerckhove, 1995; McLuhan, 1964), the paper argues that generative AI reconfigures the socio-technical conditions within which democratic participation, self-determination and the construction of life projects become possible or constrained. When AI systems anticipate needs, pre-formulate choices and smooth the cognitive friction necessary for deliberation, they risk replacing inclusive design with forms of structural cognitive delegation— a subtle yet decisive erosion of the right to think and decide. The analysis is situated within the framework of the United Nations Convention on the Rights of Persons with Disabilities (CRPD, 2006), which recognises legal capacity and political participation as non-negotiable dimensions of human dignity throughout the life course. In this context, Special Education is called to move beyond functional accessibility towards what the paper conceptualises as epistemic accessibility: the design of AI-mediated environments that support older persons' capacity to question and reinterpret their understanding of the world. This reorientation is developed in dialogue with Latour's actor-network theory (2005) and with the Foucauldian notion of dispositif (1980), in order to examine how AI systems constitute regimes of visibility that may open or close the space for deliberation. From a methodological standpoint, the paper adopts a theoretical–conceptual approach, developing its argument through a critical engagement with philosophical and pedagogical literature as well as science and technology studies, in dialogue with perspectives on algorithmic explainability in education (Selwyn, 2019; Williamson, 2019) and with disability studies addressing life projects and citizenship in later life (Priestley, 2003; Simplican et al., 2015). The paper concludes by proposing pedagogical principles for the design of AI in contexts of disability in later life: the preservation of deliberative space, the recognition of embodied cognition as a constitutive dimension of democratic agency (Varela et al., 1991), the promotion of intergenerational digital solidarity, and the recognition of education in later life as an infrastructure for critical participation. Against a reductive assistive paradigm, inclusive education for older persons with disabilities is thus reinterpreted as a site of epistemological and political resistance: not an additional layer of welfare provision, but a pedagogical condition for democratic quality.

"GIVING VOICE" TO AGING: NARRATIVE AS A PEDAGOGICAL PRACTICE OF DEMOCRATIC CITIZENSHIP

Giulia Mauti (Università degli Studi di Cassino e del Lazio Meridionale, Italy) · **Claudia Spina** (Università degli Studi di Cassino e del Lazio Meridionale, Italy)

active aging | storytelling | democratic citizenship

This paper reflects on the paideutic value of narrative logos in aging as a tool for promoting democratic citizenship. The heuristic-hermeneutic focus is on the educability of the person (Spina, 2024) in old age and on storytelling as a pedagogical device (Ricoeur, 2002; Demetrio, 1996; Spina, 2018), capable of both giving "voice" to life stories (Bruner, 2002, 2006) and fostering invigorating intergenerational exchanges. Starting from some preliminary considerations, centered on Lifelong Learning and the Pedagogy of Active Aging (the process of developing and maintaining functional capacity, which enables well-being in old age), we come to understand the elderly as a "human heritage of memories and historical-socio-cultural roots" (Cianfriglia, 2024, p. 11). Considering active aging a "scenario of participation, activity, and generativity" (Baschiera, Deluigi, Luppi, 2014, p. 13), a possible path for accompanying the elderly can be found in educational programs rooted in narrative logos. From this perspective, we consider the narrative experience as a paideutic practice that, at the same time, takes the form of recognition (Ricoeur, 2005; Spina, 2025) and a practice of citizenship. Through storytelling/whether recounting others' stories or one's own, an individual is able to recognize their own history, reinterpret the meanings of aging, and assert their presence in public and community spaces (Arendt, 2016). It should also be noted that, in confronting the fragility of old age, the spoken word fosters a fruitful dialogue with younger generations, offering them memory and testimony of times past. By countering forms of social invisibility (which often also characterize aging with disabilities), storytelling becomes a fundamental element in supporting processes of authentic communication, participation, recognition, and inclusion; dimensions that underpin democratic citizenship.

PROGETTO DI VITA E RELAZIONE DI CURA PER L'ANZIANO

Daniela Persechini (Università degli Studi di Cassino e del Lazio Meridionale, Italy)

Older age | life plan | care relationship

Title: Life Planning and Care Relationships for the Elderly Daniela Persechini Adjunct Professor at the University of Cassino and Southern Lazio; d.persechini@unicas.it This article explores the relationship between special education, neurodidactics, and care policies as they pertain to the elderly population, with a particular focus on the life plan as a tool for active inclusion and on democratic citizenship as an indispensable value. In a demographic context undergoing profound transformation, rethinking educational and care models for the elderly represents one of the most urgent challenges of contemporary pedagogy. The progressive aging of the population in Western countries demands a profound reflection on the social, educational, and healthcare structures that govern the lives of older adults. In this scenario, special education is called upon to move beyond traditional boundaries to rigorously and creatively examine the educational, relational, and identity-related needs of older adults. This is not merely a matter of care or rehabilitation, but of recognizing the full educational subjectivity of the elderly: their capacity to learn, participate, make choices, and contribute to collective life. Longevity, far from being exclusively a biomedical issue, emerges as a pedagogical and political phenomenon. Quality of life in old age depends increasingly on access to inclusive educational settings, the availability of supportive care networks, and the recognition of citizens' rights even during periods of greatest vulnerability. Special education for the elderly offers a new and urgent approach to life planning. Conceiving a life plan for an older person, even in conditions of frailty or disability, means recognizing that every stage of life holds potential, desires, and rights that deserve to be addressed. Building a shared life plan requires the professionals involved to possess skills in deep listening, narrative facilitation, and co-design with the individual and their family and social network. In this way, the care relationship—when guided by pedagogical principles—becomes both an educational act that values the individual and promotes their participation (countering the passivity typical of traditional care models) and a political and pedagogical act that defines the kind of community we wish to be.

LIFE PROJECT AND AGEING WITH DISABILITY: PEDAGOGICAL PERSPECTIVES FOR QUALITY OF LIFE

Claudia Maulini (Parthenope University, Italy) · **Antonio Cuccaro** (università Niccolo Cusano) · **Enrico Miatto** (istituto Universitario Salesiano Venezia)

Ageing | Disability | Life Project

The significant increase in life expectancy among persons with disabilities has made visible a profound demographic and social transformation that challenges educational and welfare systems: the ageing of individuals who have lived with a disability since childhood or adulthood (ageing with disability). Unlike disabilities acquired in later life, this phenomenon entails a cumulative stratification of biological, social, and institutional vulnerabilities, requiring a pedagogical rethinking of self-determination, participation, and quality of life across the life course. This theoretical and argumentative contribution lies at the intersection of special education, ageing studies, and policy analysis. It draws upon the United Nations Convention on the Rights of Persons with Disabilities (2006), the European Disability Strategy 2021–2030, and the recent Italian disability reform (Law 227/2021; Legislative Decree 62/2024). Within this framework, the individual, personalised and participatory life project is analysed not merely as an administrative tool, but as a pedagogical device

ensuring continuity and safeguarding active citizenship in older age. Ageing with disability reveals a "middle ground" between welfare systems: older persons with disabilities risk being neither fully recognised within mainstream ageing services nor adequately supported within adult disability services. This fragmentation leads to discontinuities in support, reduced opportunities for participation, and processes of double stigmatisation (age and disability) that undermine agency. From this perspective, educating for inclusive citizenship means challenging custodial and protectionist approaches and promoting enabling environments in which individuals are recognised as rights-holders capable of contributing to community life, even in advanced age. Particular attention is devoted to the narrative and participatory dimension. Recent literature highlights the limited presence of the direct voices of older persons with intellectual disabilities in research and decision-making processes. This raises a crucial pedagogical issue: the need to create spaces for listening, accessible communication tools, and co-design practices capable of making self-determination effective. In this sense, multidimensional assessment grounded in the ICF framework and the shared construction of the life project can become key levers for integrating health, relationships, housing, and social participation into a coherent and personalised plan oriented towards quality of life. The contribution outlines several operational directions for a pedagogy of inclusive ageing: (1) ensuring educational and project continuity across the life course; (2) integrating socio-health and educational dimensions; (3) valuing subjective well-being and meaningful relationships; and (4) strengthening local networks and co-programming practices with third-sector organisations. Within this perspective, special education functions as a translational device between formal rights and everyday practices, contributing to the construction of inclusive communities capable of sustaining active and self-determined citizenship in older age. Ageing with disability should therefore not be framed as a merely assistential emergency, but as a test case for inclusive democracy: educating for active citizenship entails guaranteeing continuity, dignity, and participation throughout the entire life course.

LIFE PROJECT IN AGEING WITH DISABILITIES (AWD): THE ROLE OF ANIMAL-ASSISTED INTERVENTIONS (AAI)

Paola Pela (Università degli Studi di Macerata, Università degli Studi "Gabriele d'Annunzio" Chieti - Pescara, Italy) · **Chiara Gentilozzi** (Università Pegaso, Italy)

Ageing with disability (AWD) | Quality of life | Self-determination

The challenges associated with ageing with disabilities (AWD), highlight the importance of moving beyond welfare models and adopting measures capable of transforming the expected legislative objectives (Law 227/2021; Legislative Decree 62/2024) into meaningful experiences, resulting in a real improvement in the quality of life (Giaconi, 2015; Schalock & Verdugo, 2006) for individuals and communities. The intentional and continuous construction of a personalised life plan

throughout the entire lifespan, which guarantees constant access to fundamental rights (CRPD), is preparatory to the prevention of secondary vulnerabilities for older persons with disabilities, providing a solid basis for identity and relationships. To this end, Animal-Assisted Interventions (AAI) can be particularly important as they aim to promote experiences that involve not only the motor sphere, but also the emotional and cognitive dimensions of individuals, with positive effects on individual well-being, social participation and the perception of quality of life in older people (Badin et al., 2022; Dincer et al., 2022), suggesting a possible preventive function with regard to the development of frailty. In Italy, The National Guidelines for Animal-Assisted Interventions (Ministry of Health, 2015) define objectives, methods of intervention and the rights of those receiving assistance, highlighting the importance of training and the involvement of various professionals (doctors, veterinarians, educators, animal assistants, etc.), who are essential in forming a team of operators capable of ensuring the effectiveness of the approach on both a therapeutic and educational level. Contact with animals represents an emotional exchange in which the person with disabilities is an active participant, encouraging the rediscovery of residual abilities and openness to the outside world. Starting from these premises, this paper empirically explores the educational role of AAI in fostering an environment conducive to health promotion (World Health Organisation [WHO], 1986), self-determination and inclusion (Del Bianco, 2024), with a particular focus on the path towards ageing with disabilities. The aim is to highlight best practices, the methods adopted and the relational climate that translate current regulations into concrete actions of participatory democracy, focusing on the role of AAI as a possible contribution to strengthening the socio-environmental adaptation skills of participants with disabilities and supporting the transition to old age. The survey documents the activities of a centre specialising in AAI, in particular with horses and dogs, through observation of the intervention settings, interviews, and collecting testimonies from participants and operators, with the intention of providing a choral and authentic narrative that highlights the potential of the proposed approach in preventing vulnerability and combating isolation and early institutionalisation of elderly people with disabilities. The research also aims to offer a critical reflection on the role of the educator, not only as a facilitator of the educational process, but also as a democratic mediator, capable of contributing synergistically, in collaboration with the local community, institutions and families, to Life Projects aimed at guaranteeing dignity and rights to people with disabilities, even in the most advanced stages of life.

PLAY FOR OLDER ADULTS WITH DISABILITIES, THROUGH THE LENS OF LOCAL ACTORS AND THE SCIENTIFIC COMMUNITY: AN EXPLORATORY STUDY

Laura Menichetti (Università degli Studi di Firenze, Italy) · **Dmitry Samoylov** (Università degli Studi di Firenze, Italy)

play experience · elderly people · stakeholders

Introduction. This study examines play as a pedagogical, cultural, and political resource to foster active ageing among persons with disabilities, contributing to the international debate on Ageing with Disability. Gameplay is conceptualized as a vital bridge connecting rights, self-determination, and everyday inclusive practices across the stages of life. It serves as a primary instrument for operationalizing active citizenship and lifelong learning. Methodology. This exploratory study employed a qualitative empirical design centred on focus groups. This technique was selected to elicit nuanced opinions, motivations, and strategic proposals from a multi-stakeholder perspective involving political, social, and educational

actors. The sample comprised 15 stakeholders from the Metropolitan City of Florence, spanning various professional and voluntary sectors. Audio recordings were transcribed verbatim and analysed using thematic analysis to identify emerging themes, points of convergence, and dissonances within the data corpus. Results. The analysis of turn-taking revealed an iterative renegotiation of the concept of play and its practical applications; this confirms the polysemy of ludic methods documented in the literature. Regarding Ageing with Disability, three primary research trajectories emerged: a) territorial mapping of past experiences and current services; b) analysis of factors modulating participation and engagement levels; and c) project optimization coupled with the collection and assessment of enhancement proposals. The participants have perceived a gap, across these themes, in targeted local policies, with such responsibilities largely delegated to the third sector. Discussion. From the perspectives of special education and critical gerontology, ludic activity can be proposed as a practice capable of bolstering the agency of older adults and their sense of community belonging. Self-determination is framed not merely as an individual skill to be developed, but as a human right to be secured through the design of enabling environments, accessible contexts, and support networks. In this light, local ludic services emerge as pivotal spaces for deconstructing stereotypical representations of ageing and dependency, thereby promoting participation and mutual aid even for individuals with significant functional limitations. Conclusions. The findings suggest that it would be beneficial to use play as part of a reconceptualization of active aging in an inclusive form, linking it to other stages of life (for instance promoting it in early adulthood) and not reserving it for specific “categories” (with or without impairments, including those resulting from age). It is imperative to frame play as a rights-based pedagogical principle and to formulate the ludic experience within an evidence-based conceptual framework, promoting a local ludic culture free from stereotypes and prejudices.

LIFE PLANNING IN AGING WITH DISABILITY BETWEEN ASSISTANCE AND CARING RELATIONSHIPS

Alessandra Lo Piccolo (Università degli Studi di Enna Kore, Italy) · **Daniela Pasqualetto** (Università degli Studi di Enna Kore, Italy) · **Laura Andolina** (Università degli Studi di Enna Kore, Italy) · **Letizia Pistone** (Università degli Studi di Enna Kore, Italy)

Life Project | Aging with Disability | Caring Relationships

In educational and social services addressing people with disabilities, the concept of a life project has progressively assumed a central role in supporting developmental pathways, transitions to adulthood, and the construction of forms of social participation. However, when individuals enter the stage of old age, this planning dimension often tends to weaken. In many care contexts, advancing age coincides with a gradual reduction in spaces for self-determination and with the strengthening of predominantly assistance-oriented intervention models, in which decisions related to everyday life are increasingly mediated by service organizations (Genga & Lattanzio, 2015). This transformation raises significant questions for contemporary special education. People who have lived with disability since childhood or early adulthood are now experiencing increasingly longer life trajectories, bringing to light new educational, relational, and social needs. In this scenario, there is a risk that advancing age may be interpreted primarily as a phase of progressive dependency, in which

the life-planning dimension gradually loses meaning (United Nations Economic Commission for Europe, 2021). This contribution proposes a pedagogical reinterpretation of the concept of life planning in later life, questioning interpretations that confine it mainly to the early stages of existence or to transition phases related to disability. Through a theoretical-critical reflection that intertwines Disability Studies and special education, the paper interprets the life project as a dynamic and continuous process that accompanies the individual throughout the entire life course. From this perspective, attention shifts from the mere planning of services to the enhancement of life stories, meaningful relationships, and lifelong learning opportunities that sustain identity continuity and social participation (Regional Council, 2021). This perspective is also in dialogue with the Capability Approach (Sen, 2000; Nussbaum, 2012), which interprets well-being as the real opportunity to choose and pursue meaningful forms of life, and with the bio-psycho-social model of disability promoted by the ICF (WHO, 2001), which highlights the role of social and cultural contexts in supporting or limiting opportunities for participation. Within this framework, the contribution highlights the educational value of the caring relationship (Mortari, 2006), understood not merely as an assistance-based response to need, but as a relationship capable of recognizing the person in the entirety of their biographical experience and in their possibility to continue orienting their own existence (Hesse, 2002). From this perspective, rethinking life planning in aging with disability means acknowledging existential projectuality as a constitutive dimension of human dignity, even in conditions of greater fragility. Special education can therefore offer a significant contribution in promoting educational and social practices capable of supporting quality of life, participation, and democratic citizenship throughout the entire life course, counteracting the reduction of aging with disability to a merely assistance-based issue (Applewhite, 2017).

AGEING WITH DISABILITIES BETWEEN AGEISM AND ABLEISM: TOWARDS A SPECIAL PEDAGOGY OF DOUBLE VULNERABILITY

Giovanna Amendola (University of Cassino and Lazio Meridionale, Italy) · **Fortunata Romano** (MIM) · **Rosa Yessenia Barros** (University of Cassino and Lazio Meridionale, Italy) · **Pio Alfredo Di Tore** (University of Cassino and Lazio Meridionale, Italy)

Ageing with disability (AWD) | double vulnerability | ageism

Ageing with disability (AWD) is one of the most relevant and insufficiently explored theoretical and practical issues in contemporary special pedagogy (Jeppsson Grassman & Whitaker, 2012). Older people who have lived with a disability since childhood or early adulthood face a condition of double structural vulnerability, determined by the convergence of ageism (Butler, 1969) and ableism, i.e. cultural and institutional devaluation (Campbell, 2009; Goodley, 2014; Devlin & Pothier, 2006). This requires a theoretical reinterpretation of the epistemological foundations of special education (Jeppsson Grassman & Whitaker, 2012; Shakespeare, 2018). This contribution interprets AWD as a complex pedagogical phenomenon, bringing together Disability Studies (Goodley, 2014; Devlin & Pothier, 2006), critical gerontology (Jeppsson Grassman & Whitaker, 2012) and democratic education theory. The CRPD (2006) and the European Disability Strategy 2021–2030 (European Commission, 2021) highlight how the intertwining of ageism and ableism contributes to the marginalisation of older people with disabilities, fuelling a structural risk of social and institutional invisibility. The Life Project, introduced by recent national regulatory reforms on disability, is analysed as a theoretical and operational tool to combat double vulnerability, promoting the integration of social, educational and care dimensions while respecting the self-determination of the individual (Wehmeyer, 2005). The importance of support communities as democratic mediators in

transforming recognised rights into practices of authentic inclusion (United Nations, 2006; European Commission, 2021) is highlighted, restoring epistemic centrality to those who risk 'voicelessness' in decision-making processes (Walmsley, 2001; Strnadová & Walmsley, 2018). Special education for older people with disabilities must establish itself as a driver of emancipation and social change, promoting a culture of inclusion so that no one is left behind on life's journey (Goodley, 2014; Oliver, 1990).

Beyond Compensatory Inclusion: Disability, Neurodiversity and Spatialized Inequalities in Education

PANEL CONVENORS: Marco Romito (Università di Milano-Bicocca, Italy); Miriam Serini (Università di Milano-Bicocca, Italy)

PANEL KEYWORDS: Neurodiversity, Critical Disability studies, intersectionality

Research has long shown how educational institutions operate as sites in the reproduction of inequalities, defining which subjectivities, forms of knowledge and behaviours are deemed valid. Policies, teaching practices, assessment procedures and pedagogical tools establish what counts as appropriate learning, acceptable behaviour and legitimate participation. Within this framework, disability and neurodivergence emerge as differences to be disciplined, compensated for, or made compatible with pre-established organisational and pedagogical arrangements. Normalization manifests through classificatory practices, compensatory tools, assessment regimes and pedagogical routines that act upon nonconforming bodyminds, orienting them toward self-regulation, productivity and behavioural conformity. These processes operate not only through policies, practices and evaluation, but also through the material and spatial fabric of educational institutions: dedicated offices, support classrooms and segregated pathways can produce micro-segregations that subtly redefine belonging and legitimacy. These dynamics shape who can participate fully and who risks marginalisation as a learner or student. Space thus emerges as a central actor in the production of difference and in shaping access to educational justice, understood as the real capacity to learn, be represented and take part in the democratic life of educational institutions. The panel welcomes empirical and theoretical contributions that address related questions (for example: how normalization shapes bodies, behaviours and learning opportunities? which spatial dispositifs produce inclusion or exclusion? and how educational justice can be reimagined beyond deficit logics and compensatory interventions?) and that critically engage with the conceptual and methodological challenges of researching disability, neurodivergence, space and normalization in contemporary educational institutions.

NAVIGATING THE NORMALIZATION APPARATUS: AN AUTOETHNOGRAPHIC CRITIQUE

Martina Visentin (University of Padova, Italy)

Autoethnography | Neurodiversity | Normalization

This contribution addresses the tension between the institutional "space" of the Italian school system and the lived reality of neurodivergent development, specifically through the dual lens of a researcher and a mother of a child with AuADHD (Autism Spectrum Disorder and ADHD). By employing autoethnography as a critical qualitative methodology, the study investigates how contemporary educational institutions continue to operate as "normalization dispositifs," even within a framework of formal inclusion.The analysis first explores how normalization shapes bodies and behaviors in the classroom. Through the detailed narration of navigating standardized educational environments, the study reveals how the

"ideal student" remains a neurotypical construct. For the AuADHD child, learning opportunities are often contingent on their ability to perform proximity to this norm. The research highlights how the Italian system, despite its progressive rhetoric, often defaults to a deficit logic: the child is viewed through a medicalized lens, where inclusion becomes a process of correcting behavioral 'outliers' rather than restructuring the environment. Central to this critique is the examination of spatial and institutional dispositifs. The paper analyzes the Individualized Education Plan (IEP/PEI) not merely as a tool for support, but as a site of negotiation between the child's unique neurodevelopmental profile and the school's rigid structural demands. I argue that the frequent turnover of special needs teachers and the fragmentation of resources function as 'exclusionary dispositifs' within an inclusive space. These systemic barriers create a paradoxical burden on families, who must individually compensate for institutional shortcomings, effectively privatizing the labor of care and inclusion. To reimagine educational justice beyond compensatory interventions, the study proposes a shift toward a neurodiversity-affirming framework. This approach challenges the desirability of standardized curricula, suggesting that justice is not found in 'leveling' the student to meet the system, but in creating flexible, stable, and professionally supported environments that recognize neurodiversity as a form of human variation. Methodologically, this work addresses the epistemological challenges of researching disability through a rigorous autoethnographic reflexivity. Rather than merely amplifying marginalized voices, the study centers on the researcher's positionality as a 'scholar-mother', inhabiting the tension between the analytical distance of the sociology of education and the lived, embodied experience of neurodivergence. Autoethnography is thus employed as a critical tool to bridge the gap between institutional observation and the subjective nuances of the field, transforming personal narrative into a site of theoretical inquiry. This reflexive stance allows for a deeper interrogation of how the researcher's own presence and dual identity shape the production of knowledge. In conclusion, this contribution calls for a systemic transformation that redistributes responsibility equitably between institutions and families. By deconstructing the 'normalization' apparatus, the study contributes to the panel's objective of rethinking how space, policy, and practice can be realigned to foster individual growth and social integration, moving finally from a model of 'compensation' to one of 'affirmation'.

INDISPENSABLE YET INEDUCABLE: DISABILITY, DISPLACEMENT, AND THE SPATIAL POLITICS OF INCLUSION IN EDUCATION IN EMERGENCIES

Giada Costantini (Boston University, United States of America)

disability | displacement | education in emergency

Disability-inclusion has become a central commitment within global education and humanitarian policy.[i] Within the field of Education in emergencies (EiE), children with disabilities are increasingly framed as a priority, invoking the principle of "leaving no one behind." Yet in practice, they remain among the most marginalised within education interventions.[ii] Across many displacement contexts, they are significantly less likely to enrol in school, frequently redirected toward parallel segregated services, or deemed "unsuitable" for existing educational provision. The persistent gap between policy commitments and lived realities raises critical questions about how inclusion is conceptualized and operationalized within EiE systems. Drawing on critical disability theory, the paper examines EiE as a field in which the educability of displaced bodies and minds with disabilities is continuously negotiated, classified, and regulated through Western ableist vulnerability assessments, disability hierarchization processes, and programmatic inclusion frameworks. These mechanisms operate as governance technologies that implicitly determine which children are considered includable and educable within educational spaces. Displaced children with disabilities thus occupy a paradoxical position: they are indispensable to humanitarian actors to get funding, yet marginal to the operational logics that structure educational provision.[iii] In

humanitarian contexts, educational provision typically unfolds across fragmented institutional landscapes composed of NGO-run learning centres, rehabilitation services, temporary classrooms, and specialized support programmes. While these arrangements are frequently justified as mechanisms for accommodating diverse needs, they reproduced forms of exclusion. Rather than transforming pedagogical practices or institutional structures, these systems tend to evaluate children according to their capacity to comply with existing ableist norms of learning, behaviour and performance. The analysis builds on empirical research conducted with Syrian refugee families, their children and local disability organizations in Lebanon in 2022. Interviews with parents, children, and different organizations' representatives, revealed a widespread perception that EiE responses prioritize children with disabilities considered easier to include—particularly those with mild or physical impairments—while children with severe or complex disabilities remain largely excluded from both mainstream and specialized educational provision. Parents often reported that their children had been refused by both mainstream schools and specialized institutions, highlighting how some children are positioned as effectively beyond the limits of educability within existing humanitarian systems. The paper argues that these differentiated regimes of inclusion are closely linked to the political economy of humanitarian governance. Within an increasingly competitive humanitarian quasi-market[iv], organizations are incentivized to prioritize interventions capable of demonstrating rapid, measurable outcomes and cost-efficiency. Disability inclusion is therefore often incorporated into project proposals as a marker of compliance and competitiveness, while the structural transformations required to include children with more complex disabilities remain largely unaddressed.[v] At a moment marked by escalating conflicts and displacement alongside significant funding contractions across the humanitarian sector, critically reassessing how inclusion is conceptualized and implemented in EiE becomes particularly urgent. By examining how humanitarian education systems produce differentiated regimes of inclusion and exclusion, the paper contributes to debates on disability, spatialized educational inequalities, and the limits of inclusion in contexts of displacement.

COUNTERACTING THE NORMALIZATION OF DISSIDENT IDENTITIES: PEDAGOGICAL REFLECTIONS EMERGING FROM NEUROQUEERNESS

Eleonora Marocchini (Institute for Globally Distributed Open Research and Education) · **Chiara Borelli** (University of Bologna) · **Mariangela Scarpini** (University of Parma)

Neuroqueer | Black Pedagogy | Behavioral Conformity

The present contribution addresses the mechanisms through which educational institutions and care practices operate as sites for the reproduction of inequalities by disciplining subjectivities that diverge from statistical normality and normative normalcy. The paper explores the historical and conceptual intersection of violent re-educational practices aimed at normalizing neurodivergent and queer identities, under the pretense of "evidence-based" care (Shkedy et al., 2021). The analysis is framed within the critique of Black Pedagogy, an approach that characterizes both historical and contemporary educational postures, not merely defined by explicit physical violence but by a subtle, deep-seated intent to "bend the

will" of the individual, omologating their originality to fit pre-established standards of productivity and behavioral conformity (Rutschky, 2015). Such practices are often normalized within educational routines and justified as being psychologically and pedagogically sensible, yet they result in the depersonalization of the student and the restriction of their existential horizon. Through the lenses of Critical Autism Studies, Queer Theory, and Neurodiversity Studies, we propose that normalization manifests through the imposition of neuro-normativity as well as hetero-normativity within educational structures as well as society at large, and that this is not an isolated degeneration of an otherwise sensible clinical and pedagogical paradigm, but a structural feature of clinical-inspired approaches to what is still known as "special pedagogy", rooted in a pathologizing perspective on autistic and otherwise neurodivergent people's ways of interacting (Marocchini, 2023). In order to do so, we problematize the shared roots of behavioral approaches to autistic people's care and education, such as Applied Behavior Analysis, and what are now described as "conversion therapies" for queer identities, both of which historically aimed to make marginalized subjects "indistinguishable from others" (Pyne, 2020). These regimes of assessment and treatment exercise epistemic injustice (Fricker, 2007) where a dominant group imposes its interpretative paradigm on the lived experiences of marginalized groups, often disregarding their voices and agency. The contribution reflects on how these dynamics are embedded in the material and spatial fabric of institutions, where micro-segregations as well as neurotype and gender "cages" (Biemmi & Leonelli, 2017) limit what is considered appropriate participation. Through practical examples – such as the forced development of eye contact in autistic children (Korkiakangas, 2018) or the rigid gender-coding of school activities – we argue that educational "inclusion" can become a paternalistic exercise of power that fails to grant real equality. Without a radical change in paradigm, inclusion risks remaining a process where the dominant group maintains the power to decide who belongs and under what conditions of conformity. Lastly, we seek to reimagine educational justice beyond deficit logics and compensatory interventions. We propose a shift towards an "education to possibilities" and existential planning (Bertin & Contini, 2004), which recognizes the responsibility of individuals towards their own lives and their right to transcend pre-constituted conditions. We conclude by calling for a neuroqueering (Walker, 2021) of educational systems, deconstructing power dynamics and intersectional oppressions to foster a collective liberation that values every variation of human nature as having equal dignity and opportunity.

COMPENSATED OR CONFORMED? SPATIALIZED INEQUALITIES IN EDUCATION

Stefania Laguardia (Independent Researcher, Italy)

Inclusive education | Learning environments | Disability and migration

This article examines the mechanisms through which educational institutions include or exclude students with disabilities, focusing on the intersection between pedagogical practices, institutional organization, and spatialized inequalities. Drawing on critical disability studies, neurodiversity perspectives, and intersectional approaches, it highlights the gap between theory and practice and analyzes how structural arrangements determine which students can fully participate in school life. The analysis considers processes such as the pairing of students with disabilities with support teachers, the scheduling of support staff—often misaligned with individual learning needs—and the dual role of educators responsible for both teaching and educational support. In practice, this work frequently prioritizes routine instruction over inclusive and personalized practices. Mechanisms that limit participation, such as exemptions from subjects or activities and the "push–pull out" strategies described by Ianes and Canevaro, often remove students from mainstream classrooms rather than adapting teaching to diverse learning profiles. The Individualized Education Plan (PEI) often remains a bureaucratic

document, failing to reflect genuine opportunities for learning, autonomy, and inclusion. Educational guidance and tracking are particularly critical. Recommendations for students with disabilities often follow prescriptive, predictive trajectories, directing them toward pathways considered "more suitable" based on reduced expectations or stereotypical assumptions about their abilities. Guidance thus risks reproducing inequality by restricting access to broader educational opportunities and shaping constrained academic and professional futures. Another key dimension concerns the intersection of disability and migrant background. Students positioned within this double marginality may face cumulative exclusion stemming both from disability-related barriers and from linguistic, cultural, or social challenges associated with migration. Teachers' cognitive biases and implicit expectations can exacerbate this, as linguistic or cultural difficulties may be misinterpreted as cognitive deficits, reinforcing segregated educational pathways and limiting full participation. The empirical basis of this study derives from the author's direct experience as both classroom and support teacher, integrating systematic observations, case studies, and professional reflection with existing literature. Spatial arrangements—such as the positioning of teachers and students in classrooms—and the material organization of learning environments significantly influence participation and access to educational justice. Conceptualizing the environment as a "third educator" highlights its role in fostering meaningful participation, enabling students with disabilities to exercise autonomy, engage in learning, and be recognized as legitimate participants in school life. Insufficient teacher recruitment criteria and training, alongside a lack of specialized pedagogical competencies, further exacerbate inequalities and hinder inclusive education. Policy insights point to the need for frameworks that move beyond deficit-based approaches, emphasizing students' capabilities, autonomy, and right to belong. Overall, the study demonstrates how the design and implementation of support mechanisms can either reinforce structural inequalities or open pathways toward a more equitable, participatory, and just school system.

WHEN THEY'RE ALL SPECIAL NEEDS: SOCIALLY SHAPED EDUCATIONAL NEED AND THE LIMITS OF COMPENSATORY INCLUSION IN URBAN NAPLES

Marilena Ricciardi (Università degli studi di Salerno, Italy) · **Paola Torrani** (Neuro-Gems Neurodiversity Think Tank)

neurodiversity | educational justice | socially shaped educational need

This paper examines learning difficulties in lower-secondary schooling in Naples through a sociological critique of "ordinary inclusion" in the Italian context. Taking school dropout and formative failure as indicators of system-level barriers, it asks how educational institutions recognise, organise, and allocate support in settings where vulnerability is widespread rather than exceptional. It also considers whether Montessori and other child-centred pedagogies can materialise within the classificatory structures of Italian integrazione, or whether they too risk being absorbed into compensatory logics that limit democratic participation to those officially recognised as "included." The paper argues that many difficulties that emerge in everyday classrooms are not adequately captured by the prevailing grammar of identification, compensation, and individualised response that underpins SEND/BES procedures and the much-celebrated integrazione scolastica (Marsili, Morganti, & Signorelli, 2021). Drawing on Slee's (2021) critique of how inclusive education can remain structurally tied to classificatory logics, the paper foregrounds a broader field of socially shaped educational need: difficulties of attention, literacy, motivation, participation, and emotional regulation that are patterned by socio-spatial inequality yet only partially legible through formal categories. Support is typically activated only after bureaucratic recognition, leaving large zones of vulnerability pedagogically unmanaged or informally absorbed by school professionals and local actors. Empirically, the paper draws on thematic analysis of interviews with a secondary school teacher, a school principal, a community educator, and a social worker working across three boroughs with contrasting socio-economic and demographic profiles. Despite this territorial variation, the material converges on diffuse learning difficulties, fragile or delegating family support, discontinuous and politicised services, and the growing role of schools and Third Sector organisations as compensatory infrastructures of care and mediation. These convergences suggest that educational vulnerability in Naples cannot be reduced to a single marginal neighbourhood or institutional setting, but recurs across contrasting urban contexts through mechanisms of under-support, service discontinuity, and uneven access to help. From this perspective, ordinary inclusion appears less as an environmental transformation than as a selective distribution of exceptions to those who cross thresholds of recognisability. Although framed through the language of rights, it remains tied to classificatory practices and compensatory interventions that individualise need without reconfiguring either the classroom or the wider ecology in which schools operate. The more educational vulnerability diffuses, the more schools are required to compensate through informal commitment, overstretched practitioners, and territorially uneven arrangements rather than through proportionate and durable structures of support. Treating Naples not as a local anomaly but as an urban lens, the paper shows how socio-spatial inequality shapes both the limits of current inclusive arrangements and the conditions under which democratic pedagogy becomes thinkable and practicable. In this respect, Montessori pedagogy offers an important point of contrast: mixed-age groupings, prepared environments, and relational practices embed participation and support in the ordinary design of schooling rather than granting them only after formal recognition (Lillard, 2005; Lillard & Else-Quest, 2006). The paper, therefore, asks what institutional, spatial, and territorial barriers prevent such democratic arrangements from becoming ordinary rather than exceptional in Italian schooling.

RETHINKING SPACE IN INCLUSIVE ASSESSMENT: NEURODIVERGENCE AND THE STRUCTURAL LIMITS OF SUPPORTS IN ASSESSMENT PRACTICES IN HIGHER EDUCATION

Linda Murphy (University College Cork, Ireland) · **Therese Kenna** (University College Cork, Ireland) · **Blanca Escudero Fontan** (University College Cork, Ireland)

Neurodivergence | Assessment | Space

Higher education institutions continue to show inequalities through assessment practices, pedagogical accommodations and institutional norms that define legitimate forms of participation and learning (Davis 2013; Dolmage 2017). Within higher education, neurodivergent students are frequently supported through compensatory accommodations, such as extra time, separate rooms or reduced distraction environments, rather than through structural transformations of assessment design and educational spaces (Nieminen 2022; Tai, Ajjawi & Umarova 2021). While these measures aim to facilitate participation, they remain embedded in normative assumptions about attention, productivity and appropriate academic behaviour, reflecting broader processes of normalisation and addressing diversity of neurodivergent student cohorts (Campbell 2009). Different disability studies and spatial theory emphasise that space is not neutral but actively shapes belonging, participation and inclusion (Ahmed 2012). Yet the spatial organisation of assessment (e.g. examination halls, quiet rooms, or separate spaces) remains overlooked within inclusive assessment research. These spatial dynamics structure how students inhabit academic environments and how they are positioned in relation to institutional norms, often producing microsegregations that subtly redefine legitimacy and belonging (Wong 2024; BartPlange et al. 2025). For neurodivergent students, whose sensory, cognitive and affective experiences are deeply shaped by environmental conditions, assessment spaces can function simultaneously as supports and barriers. Large exam halls may amplify sensory overload, anxiety or attentional challenges, while separate rooms may reduce these pressures but raise feelings of difference, visibility or institutional othering. This empirical paper draws on qualitative data from focus groups with neurodivergent students at University College Cork, conducted as part of the Inclusive Assessment Project at UCC, funded by the Irish Higher Education Authority, that aims to adopt a whole-of-institution approach to inclusive assessment. The research sought to understand how neurodivergent students navigate assessment spaces, the expectations of assessment spaces and emotional responses to spatial conditions. Participants were asked how space directly shaped their capacity to engage meaningfully with assessment tasks, and the spatial characteristics that enable a sense of belonging or created feelings of non-belonging. The findings reveal that assessment spaces are not neutral backgrounds but active in shaping learning, participation and identity. They can enable or constrain students' ability to demonstrate knowledge, influence their confidence and self-perception, and affect their relationship with the institution and their peers. By emphasising the lived experiences of neurodivergent students within UCC's assessment infrastructure, the paper argues that rethinking assessment through a spatial lens is essential for moving beyond compensatory models of inclusion. By integrating insights from inclusive assessment, Universal Design for Learning and spatial justice in assessment, it argues that meaningful educational justice requires transforming not only assessment formats and design but also the material and spatial conditions under which assessment takes place (Hamraie 2017).

F.03

Deaf Inclusion as a Democratic Imperative

PANEL CONVENORS: Alessandra Faggiotto (Università di Macerata, Italy); Donata Chiricò (Università Magna Graecia – Catanzaro, Italy); 4) Dolza Enrico (3; Danilo Del Piro (Università della Calabria, Italy)

PANEL KEYWORDS: inclusion, deafness, Deaf Culture

When talking about people with disabilities, popular imagination tends to represent only some kinds of disabilities: after all, you can easily recognise a person with mobility disability or someone who is blind. Incredibly, d/Deaf people are often invisibilised. While the discourse about inclusion and accessibility is extending to more and more disabilities, d/Deaf and hard-of-hearing people worldwide continue to face social, cultural, and structural barriers that limit access to fundamental rights, such as education, information, public services and participation. These obstacles include inadequate accessibility provisions, incomplete specific training for special needs teachers, the marginalization of Sign Languages and Deaf Culture. Furthermore, some fossilized stereotypes about deafness seem to persist across different national, institutional, and historical settings. Opening on international perspectives from Deaf Studies, Linguistics, Inclusive Pedagogy, History of Education, this panel aims to explore deafness through linguistic, cognitive, cultural, historical, social and educational dimensions. It welcomes interventions reflecting on how dominant ideas about language, ability, communication, and what counts as “normal” shape social and school practices and may limit d/Deaf people’s and students’ agency. Both theoretical and empirical contributions on successful examples of accessible and inclusive educational environments (e.g. bilingual models, multimodal and visual teaching approaches, Universal Design for Learning) or projects about advocacy/ self-advocacy are also gladly accepted. The panel also encourages reflections on how d/Deaf identities, stories, linguistic and cultural practices could meaningfully inspire or be integrated into both social policies and educational governance.

DEAFBLIND INCLUSION: TACTILE COMMUNICATION AND PERSONALIZED APPROACHES AS EDUCATIONAL IMPERATIVE

Samantha Marsili (Marsili, Italy)

Tactile | Communication | Personalized

Deafblind individuals face a unique condition of dual sensory impairment, requiring tailored tactile and visuo-gestural communication strategies to foster autonomy and social inclusion. This abstract explores deaf inclusion (extended to deafblindness) as a democratic imperative, focusing on healthcare accessibility in Italy and aiming to promote interdisciplinary training for educational and healthcare professionals. Grounded in normative and rehabilitative evidence, it outlines empathetic pathways that leverage residual sensory capacities, transforming barriers into opportunities for democratic participation. Recognized as a distinct disability under Italian Law 107/2010, deafblindness combines low vision and hearing loss—congenital or acquired—precluding standard visual/oral communication and necessitating tactile approaches like Tactile Italian Sign Language (LISt). In LISt, the recipient places hands on the signer's to perceive signs through touch, haptic feedback (taps, pressures on arm/shoulder), and neutral body signals (knee, back), enabling intuitive turn-taking. Lacking standardized therapy, early multiprofessional interventions—educational, rehabilitative, technological (communicators, switches)—enhance cognition, motor skills, and relationships, mitigating isolation. In healthcare/educational settings, objectives include: assessing residual sensory functions for personalization; employing tactile Manimateria for empathy between hearing and deafblind individuals; team integration for autonomy. The Lega del Filo d'Oro exemplifies rehabilitative pathways (44% pluriminorized cases in 2023), advocating inclusive welfare. This aligns with the panel, proposing democratic education on deafblindness to advance EU rights (2004) and active participation. Keywords: deafblind inclusion, tactile communication, democratic accessibility References ● Legge 24 giugno 2010, n. 107. ACCESS TO HEALTHCARE SERVICES AND DEMOCRATIC INCLUSION OF THE DEAF COMMUNITY

Luigi Sifanno (Università degli Studi di Bari "Aldo Moro", Italy) · **Maria Elena Quadrato** (Università degli Studi di Bari "Aldo Moro", Italy)

Accessibility | Democratic Inclusion | Healthcare Services

Access to healthcare services represents a crucial juncture in the exercise of citizenship and in the relationship between individuals and institutions, as it is within these contexts that fundamental rights are translated into concrete practices and power relations. Healthcare constitutes a particularly sensitive space, characterized by informational asymmetries, conditions of vulnerability, and a strong dependence on communication between citizens and professionals. In this framework, the presence of communication barriers directly affects the possibility of exercising rights in a full and effective manner. For the Deaf community, such barriers assume a structural relevance, since communication is not an ancillary element of the care pathway, but rather an essential condition for decisional autonomy, informed consent, and the establishment of trust in healthcare institutions. Despite the formal recognition of the right to health, the lack of services designed according to accessibility criteria continues to produce often invisible forms of exclusion, transforming legally guaranteed rights into merely nominal rights. This contribution analyzes access to healthcare and public services as a matter of substantive democratic inclusion, challenging a conception of accessibility understood solely as a technical accommodation or an emergency solution. The intervention is situated within a broader reflection on the accessibility of healthcare services, including their increasingly digital dimension, interpreted as a structural requirement of equality and as a condition for the effective exercise of citizenship. Through a critical perspective that intertwines disability studies, democratic theory, and the analysis of public institutions, this contribution highlights how inclusion cannot be reduced to a logic of concession or individual adaptation, but must be recognized as an organizing principle of healthcare policies and public services. From this standpoint, accessibility emerges as a fundamental parameter for assessing the democratic quality of healthcare systems and as a central element in the construction of a truly inclusive citizenship.

A PHENOMENOLOGICAL INVESTIGATION INTO THE PERCEPTION OF LONELINESS IN DEAF ADULTS

Sara Alfia Nicotra (Università degli Studi di Messina, Italy) · **Patrizia Giuseppina Longo** (Università degli Studi di Catania, Italy) · **Paola Pennisi** (Università degli Studi di Messina, Italy)

Deafness | Loneliness | Speech and Language Therapy

The experiences of deaf adults transcend the purely sensory domain and cannot be fully captured through audiological measures alone. From a phenomenological-clinical standpoint, deafness constitutes a transformation in one's very "being-in-the-world," reshaping the perception of social space, the modalities of communication, and the embodied sense of self. In this context, the body emerges as the primary medium of expression and relational engagement. Loneliness, therefore, should not be reduced to a voluntary social withdrawal; rather, it may be understood as the manifestation of a progressive disruption in intersubjective processes (Döge et al., 2025; Heffernan et al., 2022). Such experiences are further intensified by the communicative and relational demands imposed by auditory impairment - heightened interpretative effort, sustained vigilance, increased visual attention to faces and lip movements, and cognitive fatigue. When these adaptive efforts are not adequately supported through rehabilitation (Rostkowska et al., 2021), deaf adults may experience communicative isolation and a pervasive sense of social "invisibility" (Bott & Saunders, 2021; Shukla et al., 2020). Grounding the body as a foundational dimension of experience and meaning-making, this study explores the subjective experiences of ten deaf adults (with congenital or acquired deafness) who use hearing aids and/or cochlear implants, recruited within a speech-language rehabilitation setting. The research adopts a qualitative design, combining questionnaires on lived experience with a narrative role-playing task. Participants were invited to produce three brief texts, each addressed to a different interlocutor: a family member, an unfamiliar peer living with the same clinical condition, and their therapist. In each text, they described daily challenges, bodily sensations associated with listening, and the principal communicative difficulties encountered in everyday life. The study seeks to examine how, and to what extent, the narration of subjective experience is shaped by the addressee and by the quality of the relational and emotional bond. Specifically, the study aims to observe how deaf adults ascribe meaning to their experiences and whether they modulate the communication of their lived experience as the relational distance from the interlocutor increases. Analysing potential communicative variations - namely, which aspects of experience are emphasized, downplayed, or left unspoken - may reveal which experiential dimensions are more easily shared and which tend to remain implicit, particularly within formal care contexts. These findings have direct implications for the clinical understanding of the individual experience and, consequently, for the planning of rehabilitative interventions. From a phenomenological-clinical perspective, it becomes essential for hearing rehabilitation professionals to listen empathically to deaf individuals, attuning to even the less explicit facets of their clinical experience. This approach integrates objective assessment tools with systematic attention to subjective characteristics, thereby informing more effective rehabilitative strategies and support adaptive processes that respect how deaf individuals ontologically reorganize their experience.

BETWEEN INCLUSION AND REPRESENTATION. POLITICS, POWER AND AGENCY IN THE ITALIAN DEAF COMMUNITY

Beatrice D'Aversa (LIS School "Gruppo SILIS") · **Alessio Di Renzo** (Lab LaCAM, ISTC CNR) · **Anna Lo Bello** (LIS School "Gruppo SILIS") · **Amir Zuccala** (ENS; Sapienza University)

deaf community | social injustice | active participation

In the Italian public debate, deaf people are predominantly portrayed as recipients of accessibility measures rather than as active participants in decision-making processes and knowledge production. Inclusion thus tends to be framed in terms of external technical-instrumental measures (interpretation, translation, subtitling) and internal ones (hearing aids), while the issue of exclusion from the spaces where policies, priorities, and models of citizenship are defined remains less addressed. This paper aims to describe the Italian Deaf community from an internal perspective, highlighting how forms of social injustice manifest not only in access to services but also in limited participation in educational, cultural, and institutional governance. Even the most recent legislation directly concerning the deaf community, Law 69/2021, while representing a historic step in the recognition of LIS, is nevertheless focused almost exclusively on the training and stabilization of interpreters, treating them primarily as a technical tool, without addressing more broadly the issues related to rights, representation, and the active role of the deaf community in decision-making processes; its implementation is producing ambivalent effects. Nor has it encouraged the creation of deaf spaces, such as the establishment of Italian/LIS bilingual schools, specific vocational training programs, or new fields of study in line with practices in other countries, such as training in Deaf Studies. Many expectations that have developed over the years remain unmet, as has been the case in other countries (De Meulder et al., 2019): linguistic recognition has not automatically translated into a structural strengthening of the autonomy, leadership, and creativity of Deaf people in educational, professional, and cultural contexts. At the same time, those who did not support the recognition of LIS express dissatisfaction with the perceived imbalance of resources toward the linguistic dimension at the expense of other services. This paper will analyze how this scenario contributes to reorganizing the field of demands, fueling new tensions and redefining political priorities. Particular attention will be given to the dichotomies that tend to polarize public discourse and which, despite the passage of time, have not seen substantial changes: deaf-mutes/deaf-speakers vs. signers/oralists; the deaf community or the signing community; gesture/word vs. sign/word; LIS vs. Italian; individual autonomy according to the hearing model vs. isolation in the "deaf ghetto." These are oppositions that often oversimplify a far more complex reality, characterized by diverse paths and multiple affiliations, making for a more nuanced approach capable of valuing the diversity within the Deaf community (Kusters et al., 2017; Leigh, 2017; Monaghan et al., 2003), which is also evident in light of studies conducted outside the Global North (Friedner & Kusters, 2015; Green, 2024; Kusters et al., 2024). The paper argues that the inclusion of deaf people must be interpreted as a democratic imperative: not only ensuring access, but promoting effective participation in decision-making processes and recognizing the epistemic authority of the deaf community as a competent partner in defining policies that affect it. From this perspective, the challenge is not merely to increase accessibility tools, but to rethink the relationships between representation, power, and knowledge production.

THE INCLUSION OF DEAF PEOPLE IN THE ITALIAN SCHOOL SYSTEM: HISTORICAL, EDUCATIONAL, AND DEMOCRATIC PERSPECTIVES

Sofia Montecchiani (University of Chieti-Pescara (Italy), Italy)

History of Education | Deaf people | Democratic evolution

The relationship between education and democracy is closely linked to the concept of inclusion and to the ability of institutions to ensure that all individuals have equal opportunities to participate in processes of personal development and learning, while maintaining high standards of educational provision. Within this framework, the historical trajectory of the inclusion of people with sensory disabilities in the Italian education system is a significant case study, as it demonstrates the nation's democratic progress and civic commitment. With particular reference to deaf or hard-of-hearing people, this paper aims to examine the process that led first to integration and later to inclusion within the school system. In order to do so, it will analyse both legislative developments and paradigm shifts in the pedagogical field. These will be linked to the transformation of the very concept of disability, special education, and teacher training. Adopting a historical-educational perspective, the study anchors the Italian experience within broader European debates on inclusive education and the democratic mission of learning institutions. It is no coincidence that the history of deaf education has long been characterised by tensions between competing epistemological and pedagogical models, particularly the opposition between sign-language-based education and oralist approaches, traditionally associated with two leading figures: Charles-Michel de l'Épée and Samuel Heinicke. In Italy, specialised institutes for deaf students historically represented the primary pathway to schooling for deaf children. However, while these institutions ensured access to education, they also reproduced segregated educational frameworks, which denied access to public schooling and the opportunity to participate in national civic life. Later, during the 20th century, legislative awareness of social issues became increasingly crucial. The proposal of an initial approach to integrating people with sensory disabilities into the wider debate on the function of education and school was made by Giovanni Gentile. In 1923, as Minister of Education, he applied the principle of compulsory education for the first time to "the blind and the deaf-mute" as well; however, it was only following the reforms of the 1970s and the 1990s that a genuine change was brought into the school system, thereby establishing Italy as a true pioneer in the field of inclusive education. These reforms redefined schools as democratic institutions responsible for fostering participation, equity, and social and individual recognition of people with disabilities. However, deafness gives rise to particular challenges, which intersect with linguistic, cultural, and communicative dimensions. These, in turn, challenge traditional assumptions about teaching, learning, and participation in the classroom. These issues have significant implications for democratic education, as they require educational systems capable of recognising diversity while ensuring equal access to knowledge and personalised solutions. This study therefore sets out to explore the relationship between the Italian educational experience and the changing concepts of disability, welfare policies and education, with a view to gaining a deeper understanding of how historical trajectories have shaped contemporary meanings and how, even today, they can prove useful in the development of processes aimed at inclusion and active citizenship.

THE EDUCATIONAL AND SOCIETAL VALUE OF DIVERSITY BASED ON LSF

Jeremie Segouat (Université Toulouse Jean Jaures, France) · **Jean-François Piquet** (Université Toulouse Jean Jaures, France)

Inclusive Pedagogy | Deaf-Hearing Collaboration | Social Cohesion

Our proposal wish to highlight the richness and complexity of the mixed teaching environment we have, which fosters a shared democratic practice through cultural, linguistic, and professional mutual understanding. We will do so by presenting the audiences involved (Deaf/hearing, professionals/academics) (Ristic, 2022)(Mohd Rashid and al., 2026), the

funding models (university funding for students, ministerial funding for academic professionals), facility arrangements (dedicated recording rooms, classrooms, offices, safety measures), pedagogical collaborations (project-based approach, collaborative practices among students) (Kordić and al., 2023), and pedagogical adaptations (visual teaching supports, extensive use of video) (Howerton-Fox ans al., 2024)(Golos and al., 2023)(De Raeve, 2015). The Department of Translation, Interpreting and Mediation (D-TIM) trains – among others – French to French Sign Language (LSF) translators, French to/from LSF interpreters, and LSF mediators at the Master's level, under the "European Master of Translation" (EMT) label of excellence. Students, whose first language is either LSF (primarily Deaf individuals) or French (primarily hearing individuals), can join the program in the first year of their Bachelor's degree, with LSF as the primary subject taught, and French or English respectively as the second subject. At the Master's level, Deaf students can then choose translation or mediation, while hearing students choose interpretation. From the first year of the Bachelor's (L1) to the final year of the Master's (M2), these students take an increasing number of shared courses. Once language foundations are consolidated in L1, the curriculum focuses on LSF-based subjects such as translation, linguistics, and Deaf Studies, as well as more technical fields related to the specific option chosen in the Master's program. The teachers are either Deaf or hearing, and largely signers, which allows for direct teaching in LSF; otherwise, interpretation is provided to ensure course accessibility. These teachers are professionals in their fields (teaching, translation, mediation, interpreting) as well as academics, ensuring a rich educational experience with varied perspectives. One of the academics is a Deaf associate professor attached to the department. The accessibility provided relies on funding allocated either to the students by the university for classes, conferences, and seminars, or to the Deaf associate professor by the Ministry of Higher Education, for internal meetings. These teachers are also involved in reflections on the program's evolution and in student evaluations at the end of the last year of the Master (thesis defense, practical exams), ensuring the training remains in constant alignment with field requirements. Furthermore, our program develops a project-based pedagogy in partnership with local and national Deaf or hearing organizations to implement accessibility solutions for events requiring, for example, interpretation, translation, communication, or subtitling. Students lead these projects under the supervision of a faculty advisor, complementing their theoretical university learning. We also foster collaborative pedagogy within various courses to encourage sharings between students, utilizing specific room arrangements, video usage, and visual and multimodal teaching aids.

A DEMOCRATIC SCHOOL BEFORE DEMOCRACY: CHARLES-MICHEL L'ÉPÉE AND THE BIRTH OF SIGN LANGUAGE

Donata Chirico' (UNIVERSITÀ "MAGNA GRAECIA" - Catanzaro, Italy)

Audism | Body | Sign-word bilingualism

In the history of Western education, the earliest known institution is the Academy of Athens. Founded by Plato in 387 BCE, he remained its preeminent teacher throughout his life. As the locus of a multifaceted philosophical tradition spanning 916 years, the Academy still comprised disciples and masters when it was forcibly closed by Emperor Justinian in 529 CE. This event marked the final act of a ruthless policy of cultural hegemony that had persisted for over a century and a half, representing the culmination of the Roman Empire's project of enforced Christianization. Before this suppression—and before the study of original Greek philosophical sources was criminalized—it was within this very Academy that the foundational work of our philosophical reflection on language originated: the Cratylus. This dialogue serves as a

testament to the absence of preconceived biases regarding the use of visual-gestural modalities of language. This crucial awareness, established by Plato, remains discernible at least until Augustine's De Magistro (389 CE). Within a few short decades, however, this entire heritage of knowledge and observations concerning Deaf individuals and visual-gestural communication was effectively erased from history. It would not be until the 18th century that these themes were revisited and systematically addressed. Furthermore, it was necessary for philosophy to reclaim the autonomy stripped from it by the pervasiveness of religious dogma and theology, eventually asserting itself as properly "enlightened" (Kant 1784). It is no coincidence that this period reflects a worldview in which corporeality and its performances are conceptualized as a disparate apparatus of self-governance—as an act of agency rather than mere mechanical execution (Condillac 1746, 1754). The resulting concept of the subject is of profound interest, as it emphasizes that the subject exists insofar as it "works" toward a conversion of its own naturalness—primarily a bodily one. This naturalness does not, and must not, represent a predestined state or a privilege to be wielded against those (animals, children, disabled individuals, women, non-European populations) who might appear to lack it due to their perceived "distance" from a presumed ideal form. Moreover, this aligns with the perspective of the compelling socio-political framework known today as Crip Theory (McRuer 2018). Above all, it is the vision that inspired the "pedagogical-linguistic heresy" (Chiricò 2016) expressed by Charles-Michel de L'Épée when he established the first school for the Deaf in history in Paris. This institution was entirely unprecedented for its time. Even by contemporary standards, it remains avant-garde, particularly for its bilingual sign-word character and its advocacy for the education of Deaf people as a public responsibility. In a pre-revolutionary France that would wait until the Constitution of 1793 to affirm that "education is the need of all" (Art. 22), L'Épée realized a democratic school prior to the formal advent of democracy.

INCLUSION OF DEAF INDIVIDUALS IN HOSPITAL SETTINGS: LIS AND DEAF CULTURE TRAINING AS A DEMOCRATIC IMPERATIVE

Daniele Polignano (libero professionista, Italy)

Deaf inclusion | LIS training | healthcare accessibility

In the healthcare sector, the inclusion of Deaf individuals remains a critical democratic challenge. Communication barriers frequently compromise equal access to care, thereby exacerbating health disparities for the Deaf community. This abstract examines the panel's focus on Deaf inclusion as a democratic imperative, analyzing accessibility within Italian hospitals and the necessity of training healthcare personnel in Deaf culture and Italian Sign Language (LIS). Drawing upon clinical experience and empirical research, this study highlights how linguistic and cultural misunderstandings—such as inaccessible centralized booking systems (CUP), opaque medical reports, and lip-reading obstructed by surgical masks—violate the constitutional right to health (Art. 32) and perpetuate social exclusion. The Deaf community constitutes a distinct linguistic and cultural group, with LIS officially recognized under Law 71/2021. Nevertheless, hospital interactions often pathologize deafness rather than embracing Deafhood. Empirical insights derived from interviews with Deaf patients and LIS interpreters reveal significant systemic inefficiencies: anxiety stemming from misunderstandings, diagnostic errors, and social isolation. These factors contribute to poorer primary care outcomes compared to hearing populations

(Fellinger, 2005). Proposed strategies emphasize visual-centric approaches—including direct eye contact, optimal lighting, transparent masks, and simplified written communication—alongside the integration of cultural mediators and LIS interpreters, positioned laterally to maintain a patient-centered focus. Mandatory Continuing Medical Education (ECM) provides nurses, physicians, and healthcare assistants (OSS) with the fundamentals of LIS (the manual alphabet and key signs such as "where is the pain?"), empathetic protocols, and cultural sensitivity. This approach transforms disability into a multidisciplinary asset. Furthermore, the post-COVID implementation of telemedicine featuring remote LIS interpreting enhances health equity. These initiatives align with the principles of democratic inclusion and foster participation, echoing the panel's call for interdisciplinary dialogue across education, policy, and culture.

TRANSLATION TO AND FROM SIGN LANGUAGE AS A DEMOCRATIC PROCESS OF INCLUSION

Pietro Celo (Università di Parma, Italy)

Italian Sign Language (LIS) | inclusion | intermodal translation

Italian Sign Language (Lingua dei Segni Italiana, LIS), used by the Deaf community in Italy and long recognized as an element of its intangible cultural heritage, represents not only a privileged tool for everyday communication but also an expressive medium for the production of information and knowledge within the Deaf community. In recent years, LIS has been increasingly involved in a process of dialogue with formal education through bidirectional translation practices: on the one hand, school texts in Italian are translated into LIS; on the other, thoughts, questions, and reflections originally expressed through signing are rendered into spoken/written Italian. This contribution aims to analyze translational processes within educational interpreting and schooling contexts involving Italian Sign Language, both from and into LIS, in order to investigate the specific features of intramodal–intermodal translation of knowledge and information between languages of different modalities. To this end, a perspective grounded in sensory experience and in the reconstruction of textual meaning is not excluded but rather foregrounded, understood as the final act of reciprocal inclusion between Deaf and hearing individuals.

DEAFHOOD: EVALUATING AN ITALIAN EQUIVALENT

Cassandra Dagani (Università di Parma, Italy)

Suffixation | meaning | sign language studies

The paper deals with the neologism Deafhood, coined by the British deaf activist Paddy Ladd (1952–). This concept marks a pivotal shift in discourse on deaf people, reorienting the understanding of deafness from a predominantly medical model to a socio-cultural and identity-based framework. This article offers a contrastive analysis of the English suffixes -hood and -ness and their potential Italian counterparts -ità and -itudine. It investigates the translatability of the term Deafhood into Italian by assessing the viability of sorditudine as a morphologically and semantically appropriate equivalent. Then, from the viewpoint of linguistics there will be examined the capacity of the proposed Italian translation to convey Deaf

cultural identity and status in contrast to the clinical notion of sordità (deafness). The theoretical framework discussed hitherto cannot ignore themes such as inclusion and democracy, fundamental cornerstones in the reflection on the relationship between the deaf and hearing communities.

SIGN LANGUAGE AND LINGUISTIC DEMOCRACY AT SCHOOL: THE CASE OF ITALIAN DEAF STUDENTS

Maria Tagarelli De Monte (Università degli Studi Internazionali di Roma (UNINT), Italy) · **Danilo Del Piro** (Università della Calabria, Italy)

Deaf Education | Italian Sign Language | Teacher Training

The history of deaf education in Italy is one of inclusion combined with or alternated by isolation and differentiation (Stokoe, 1960; Chiricò, De Monte, 2025). In the past 50 years, general education in Italy has been profoundly transformed by laws tending to the inclusion of children with disabilities in mainstream education, creating professional roles to support their path to socialization and learning (such as support teachers and communication assistants; De Monte, 2023; 2025). However, despite the experience gained over the years, inclusion still seems far off for those students coming from a multilingual background or showing particular difficulties with spoken Italian. In the case of deaf students, these findings are also consistent with international literature on deaf literacy in spoken and written language. Deaf children, in fact, experience difficulties that are often correlated to the limits in the exposure to language, as well as possible differences in the way written and spoken languages are cognitively processed (Marschark, Knoors, 2020; Anastasiou et al., 2015; Fabbretti, Tomasuolo, 2006). Deaf children, later adults, thus experience limits in their opportunities, which is the opposite of what democratic learning should look like. To better understand the social, cultural, and scholastic system in which deaf children grow, and the way in which it sets a background for deaf literacy, further investigation into the scholastic path of deaf children is necessary. In a recent research on the linguistic needs of deaf students in mainstream education in Italy, data were also collected on their family background, as well as the preparation of teachers on deaf-related topics and sign language. The results confirmed literacy problems in the deaf learners (De Monte, 2025; 2026), as well as the importance of building a solid network of prepared professionals around the deaf pupil. In Italy, such professionals are support teachers and communication assistants; the former are part of the school staff, the latter are hired only in case of children with specific communication issues, such as, often, deaf children. As the name recalls, communication assistants are hired to mediate communication within the classroom, often specializing in sign language and deaf-related issues. Given their preparation, they act in a way that is often similar to school interpreters. Yet, they are poorly considered professionally and economically, their formation lacking standard and their inclusion in the scholastic system often left to cooperatives that manage their allocation but not their recognition. As a consequence, deaf learners lose another chance for inclusion. In this presentation, an overview of the national situation regarding the inclusion of deaf children in mainstream education will be provided to discuss the meaning of democratic learning in a context where languages are not equally represented nor accessible for deaf children. In support of the discussion, the first-hand experience of a deaf communication assistant with a bimodal bilingual background will be introduced and discussed, to show how scholastic dynamics and low professional recognition affect the well-being of deaf learners at school.

INCLUSIVE DESIGN IN EDUCATION FROM A DEAF STUDIES PERSPECTIVE: INSIGHTS ON DEAF EPISTEMOLOGIES AND LEARNING PRACTICES

Federica Baroni (Università degli studi di Bergamo, Italy) · **Luca Des Dorides** (Università degli studi di Milano-Bicocca, Italy)

Deaf Studies | Education | Universal Design for Learning

Disability Studies (DS) represent a horizon characterized by the interdisciplinarity of research fields engaged in examining paradigms for understanding and interpreting disability and its constructs (Albrecht & Seelman, 2003). Despite the differences among interpretative approaches, their shared premise is the move beyond an individual-medical view in favour of the social model (Oliver, 1996). The educational application of this approach, as expressed by authors associated with Disability Studies in Education (DSE), shifts the focus from individual deficits to barriers imposed by contexts (Barnes & Sheldon, 2007), promoting instructional design based on the Universal Design for Learning (UDL) framework (Rose & Meyer, 2002). With convergences and divergences, Deaf Studies also move beyond the medical-individual model to investigate the cultural, linguistic, and social dimensions of deafness as a way of being in the world (Ladd, 2003; Bauman & Murray, 2014). This perspective, however, is largely absent from discourses and practices concerning the social and educational inclusion of deaf people. What can Deaf Studies contribute to theories and practices in deaf education, both internationally and nationally? Which aspects of UDL are most relevant for addressing the multicultural, multilingual, and multimodal challenges that frequently characterize the education of deaf students? How might concepts such as “audism” (Humphries, 1975), “Deafhood” (Ladd, 2003), and “Deaf gain” (Bauman & Murray, 2014) contribute to uncovering inequalities, indirect discrimination, and subtle forms of marginalization that persist within Italian schools? How might the adoption of Deaf epistemologies, alongside the presence of Deaf academics, serve to mitigate manifestations of mistrust toward the educational experiences of Deaf families with Deaf children, or regarding deaf young people’s access to higher education? This contribution aims to examine the principal trajectories initiated by international Deaf Studies in education, their intersections with the emerging italian strands of Disability Studies (Goodley et al., 2018), and the most promising UDL guidelines for implementing inclusive instructional design for deaf students in a practical and achievable manner. Beyond the general inclusive principles of UDL - such as the right to equitable access to contexts and content - this framework is particularly valuable for accessible teaching practices for deaf students, as it provides guidelines for designing and implementing curricula and materials aligned with their learning styles. These range from “Designing Multiple Means of Engagement” (for example, addressing identity and the valorization of different languages and cultures, which is especially relevant for signing Deaf students and/or those from multilingual family contexts), to “Designing Multiple Means of Representation”, which offers essential guidance for producing accessible learning materials, and finally to “Action & Expression”, a principle encouraging all learners to express their ideas and knowledge through multiple means and modalities (including different languages, communicative systems, and codes, ranging from structured sign languages to digital expressive forms) (Baroni & Des Dorides, 2025).

LISTENING WITH THE BODY: THE PERFORMATIVITY OF BOBÒ AND CHRISTINE SUN KIM

Vincenza Costantino (Università degli studi "G. d'Annunzio" Chieti-Pescara, Italy)

Performing arts | Corporeal listening | Deaf studies

This paper stems from the consideration of arts, specifically performing arts, as expressive possibilities to be enhanced in educational contexts, in the optic of building a more inclusive and democratic society. The process of aesthetic reception and creative production highlights the experiential and relational dimension, gathered from John Dewey's studies on the connections between art, experience, and nature. The path proposed here offers food for thought and critical references on the centrality of the body and on corporeal listening in theatrical and educational relationships. In the pedagogical field listening is considered an indispensable condition in order to build educational dialogue, whereas in theatrical relationships listening appears as a direct consequence of the actor's communication, which seems to arise on stage from silence. Often focused on what reaches the audience from the stage, we forget that what the performer offers is the product of listening. The actor's body is one that presents itself to the spectator's gaze, a "speaking" and "acting" body, but we forget that it is, first and foremost, a body that "feels." A contemporary theatrical production has highlighted how listening is an essential aspect of performance and how this ability is not the result of mere cochlear competence but rather of a widespread sensoriality. Deserving of particular consideration are the works of two deaf artists: Vincenzo Cannavacciulo aka Bobò and Christine Sun Kim. Bobò (1936-2019) was an Italian deaf-mute artist that worked with Pippo Delbono's company since the play "Barboni" of 1997 until death. Christine Sun Kim (1980-) is an American deaf sound artist, performer, and activist based in Berlin. The comparison of the performances of these two artists, very different in background and poetic language, aims to offer a glimpse on how the artistic practices of deaf people can overturn stereotypes about deafness and open new horizons for research in social pedagogy, in Deaf and Performance Studies, and ultimately inspire new approaches in social policies and offer new tools for educational governance.

In Praise of the Margin. The Representation of "Other Bodies" Between Disabling Devices and Practices of Self-Determination

PANEL CONVENORS: Martina De Castro (Roma Tre University); Alessandra Maria Straniero (University of Calabria); 3) Tantari Leonardo (1; Fabio Bocci (Roma Tre University)

PANEL KEYWORDS: Bodies, Media Representations, Disabling Processes

Desiring, self-determined bodies that position themselves within the social palimpsest as "other" with respect to the hegemonic narrative are often subjected to practices of repression, censorship, and incorporation. Media representations - both audiovisual and otherwise - offer emblematic examples of how bodies perceived as "monstrous," "alien," or "odd" (disabled, excessive, defective, "foreign," "sexually non-normative") are encoded through narrative devices that reproduce hierarchies and stigma, seldom challenged by mainstream audiences. Over time, a rich body of theoretical and experiential work has developed, ranging from Freak Studies to Crip Studies and Critical Disability Studies. This body of knowledge has contributed to shaping two main areas of inquiry and action: the critical observatory, aimed at analysing the content, rhetoric, and mechanisms through which non-conformity is represented; and the experimental laboratory, devoted to fostering grassroots, intersectional counter-narrative practices. Within this framework, education and democratic pedagogy play a crucial role. They provide tools for cultivating critical perspectives capable of recognising and dismantling exclusionary discourses, and they promote educational processes grounded in participation and circulation of inclusive imaginaries. A democratic pedagogy does not merely denounce symbolic inequalities; it fosters transformative postures. The Panel aims to serve as a space for dialogue among theoretical approaches, studies, research outcomes, and individual and collective experiences that enrich both the critical observatory and the experimental laboratory. It seeks to illuminate the media processes through which social, cultural, and political dis/ability is produced and reiterated, and to share practices capable of critically disarticulating the narratives that delimit and classify the human.

WHY ABNORMAL? CONTEMPORARY RELEVANCE OF THE FRENCH INSTITUTIONALIST MOVEMENT AGAINST ASYLUM CUSTODY

Pietro Savastio (Università di Torino, Italy)

psychiatry | institution | abnormals

This contribution aims to investigate the relationship between studies on "les anormaux" in Michel Foucault and the French institutionalist movement's research on the "débiles mentaux". While Foucault's studies reconstruct the genesis and emergence of a psychiatric power aimed at normalizing and confining deviant subjects, the psychoanalytic theories of Maud Mannoni and the practical experiments of Oury outline a path for removing children from the institutional circuits of medicine and pedagogy. This demonstrates that the movement for deinstitutionalization in France drew on diverse contributions which were able to (i) reconstruct the discourses of psychiatric power, (ii) oppose them with a counter-theory grounded in psychoanalytic anti-alienism, and (iii) offer practical experiments differently dealing with the spectrum of abnormality. In his studies on the abnormal, Foucault insists on the emergence of a medical power that, through psychiatry, attempts to impose a normalization of behavior. On the one hand, a general theory of degeneration took shape; on the other, it was supported by a wide institutional network of control, internment, and care, situated at the boundaries of medicine and justice. This network functioned both as a structure for receiving the abnormal and as a defense of society. From that point onward, a technique of normalization and segregation was tasked with taking charge of the irregular individual. Indeed, still in the postwar period in France, les débiles mentaux are placed in an institutional circuit of care and treatment that was essentially custodial in nature. In this sense, for Mannoni, the "transformative" effect — rather than merely "descriptive" — produced by diagnosis is very clear. So, she emphasizes the condition of emergence of the symptom reducing the organic explanation and instead pointing to the living conditions and situations that cause the "illness" to arise. The evolution of the patient in different contexts, in fact, challenges the notion of organic deficiency. From an operational standpoint, it was Oury who developed the most promising responses along these lines. He organized space and time in the classroom in such a way as to enable a series of operations allowing children to exercise agency and speech within their living environment. Against the institution that compels silence, his techniques enable the classroom to become an open and therapeutic space capable of healing or providing prophylaxis—an environment within which it becomes possible to evolve, also through the recovery of autonomy and speech. Thus, while in Foucault there is a denun-

ciation of a power of normalization exerted upon the deviant child, the theories of Mannoni are able to disavow the theoretical foundations of segregation. Oury's practices, in turn, offer a set of solutions through a counter-institutional form of schooling capable of welcoming the child rather than psychiatrizing them. All this constituted the theoretical and practical background for the emergence of a season of (de)institutional reforms in favor of people with disabilities, the mentally ill, the mad, and the abnormal of every kind. Rediscovering this legacy is particularly valuable today, at a time when new institutionalizing tendencies are reappearing in institutional practices and political orientations.

CRIP WITCHES: RECLAIMING POWER AND KNOWLEDGE FROM MARGINALIZED BODYMINDES

Sofia Righetti Nottegar (University of Verona, Italy)

witch studies | disability studies | pedagogy of resistance

Throughout Western history, certain embodied subjectivities have been constructed as deviations from the dominant social order. Among these, the figure of the witch and the figure of the disabled person emerge in particularly emblematic ways, both inscribed within genealogies of marginalization that have produced representations of bodies perceived as monstrous and deviant (De Castro, Zona, & Bocci, 2022; Federici, 2004; Goffman, 1986). In cultural and media narratives, the witch is frequently portrayed as a deformed and morally suspicious bodymind, associated with dark powers and forms of knowledge not legitimized by patriarchy (Stanmore, 2024). Similarly, disabled bodies have historically been subjected to processes of stigmatization and control, constructed as defective or unproductive in relation to normative paradigms of productivity (Barnes,2016). Through such representations, media and visual cultures contribute to reproducing bodily hierarchies and to delineating the boundaries of the normative human. Despite the growing scholarly attention devoted to these fields of research, the intersection between disability and representations of the figure of the witch remains largely underexplored, particularly with regard to the ways in which disabled bodymindes have historically been associated with forms of deviance and monstrosity analogous to those attributed to the witch. This paper brings Witch Studies and Critical Disability Studies into dialogue in order to investigate how the witch and the disabled person have historically been produced as "other subjectivities" within cultural and socio-political regimes of normalization. Drawing on Crip Theory (McRuer, 2006), Feminist Disability Studies (Garland-Thomson, 2002; Kafer, 2013), and recent developments in Witch Studies (Chaudhuri & Ward, 2025), it explores the convergences between historical processes of persecution targeting non-normative embodied capacities and forms of knowledge that have contributed to defining the limits of what is considered acceptable and legitimate. If, on the one hand, the figure of the witch and that of the disabled person have been used to mark the boundaries of the normative human, on the other they are today the object of processes of symbolic and political reappropriation. In several contemporary contexts, particularly within feminist and queer movements, witchcraft is being rearticulated as a spiritual and political practice that creates spaces of agency and collective care (Sollee, 2017). In some grassroots communities, contemporary witchcraft practices become spaces in which marginalized subjectivities reclaim their bodies and their forms of knowledge, challenging ableist and patriarchal narratives that have historically rendered them objects of stigma and shame. Through a theoretical and interdisciplinary approach, this contribution therefore proposes to read the figure of the witch not only as a symbolic figure of marginality but also as a political and pedagogical practice of resistance (Hundley, 2020). The reappropriation of the witch can thus be interpreted as a form of

crip counter-narrative: an imaginative and communal dispositif that redefines the relationship between the body, the mind and processes of political and identity reclamation, opening spaces for practices of care and self determination grounded in the embodied knowledges of marginalized subjectivities.

LIBERATING THE GAZE: BODILY DIFFERENCE IN SPORT AND THE PEDAGOGICAL CHALLENGE OF INCLUSION

Martina Petrini (Università degli Studi "G. d'Annunzio" Chieti-Pescara, Italy)

sport | disability | critical pedagogy

Contemporary media representations of disability in sport frequently oscillate between two dominant narrative frames: the depiction of the disabled body as a site of fragility, lack, or physical limitation, and the celebration of the disabled athlete as an exceptional figure capable of overcoming bodily constraints through extraordinary effort. Although apparently opposed, these representations rely on a shared assumption: the implicit centrality of an able-bodied model of performance against which bodies are interpreted and evaluated (Garland-Thomson, 1997; Mitchell & Snyder, 2013; Straniero, 2020). Within this framework, sport emerges as an ambivalent cultural space. On the one hand, sporting cultures may reinforce ableist imaginaries by reproducing ideals of skilled movement and physical competence (DePauw, 1997; DePauw & Gavron, 2005; Howe & Parker, 2012). On the other hand, sport may also become a transformative pedagogical laboratory in which these assumptions are exposed and questioned. In this sense, the performances of athletes with disabilities reveal the situated and plural character of bodily action, showing that movement is not a universal model to be reproduced but an embodied interpretation shaped by specific bodily possibilities (Goodley, 2011; Siebers, 2013). This paper develops a theoretical analysis drawing on disability studies and critical pedagogical perspectives (Oliver, 1996; Goodley, 2011). It examines the educational implications of these tensions, suggesting that sport can be understood both as a context in which dominant representations of the body are reproduced and as a space where alternative understandings of movement and corporeality may emerge. The bodily performances of athletes with disabilities may generate embodied counter-narratives that challenge conventional images of disability and highlight the creative and interpretative nature of human movement (Purdue & Howe, 2012). If dominant representations of disability shape the ways bodies are perceived within sporting cultures, education may play a crucial role in questioning and reinterpreting these imaginaries. One of the central pedagogical challenges lies in what might be described as the liberation of the gaze on bodies and movement, understood not simply as the replacement of negative stereotypes with more positive images. Rather, it involves fostering forms of awareness and critical reflection that enable individuals to recognise and question the assumptions shaping their perception of bodily difference (hooks, 2020;2023). In this perspective, sport may be reinterpreted not only as a field in which normative ideals of the body are reproduced, but also as a pedagogical space capable of transforming the ways bodily difference is perceived, understood, and experienced.

AUTISM AND PREJUDICE. HOW CINEMA SHAPES THE COLLECTIVE IMAGINARY

Martina De Castro (Roma Tre University, Italy) · **Carmela Albanese** (Roma Tre University, Italy)

Neurodiversity | stereotypes and prejudice | audiovisual media

This contribution presents the preliminary results of a study conducted with students enrolled in the Primary Education Degree Programme at the Department of Education Sciences of Roma Tre University, who are involved in a research-training project carried out as part of the Inclusive Education Laboratory (channel 5) and aimed at deconstructing stereotypes about neurodivergent people, particularly those with autism. At the beginning of the Laboratory, the students, organised into groups, are asked to provide a definition of "autism" and to describe some characteristics of people on the spectrum. The aim of this activity is to bring to light stereotypical or prejudicial narratives that may already be ingrained in trainee teachers and that derive from previous educational experiences and media content. In this sense, it is interesting to map the degree of adherence of the sample to certain rhetorical devices inherent in disability, such as pietism, supercrip or normal diversity (Vadalà, 2013), but also to interpretative models such as the biomedical model, which view disability as an individual tragedy (Oliver, 1990; Bocci, 2021), and autism from the perspective of deficits and/or lacks with respect to an almost undisputed neurotypical norm. The process of critical analysis of established conceptual structures is initiated by the workshop facilitators through the viewing of images from mainstream films and television series, presented as case studies aimed at demonstrating how audiovisual narratives have played a fundamental role in the dissemination of an autistic extremotype (Brekhus, 2018) in the collective imaginary (Albanese, 2023), producing misrepresentation (Murray, 2008) of the condition. By sharing alternative interpretative lenses – such as those of Disability Studies (Goodley et al., 2013; Monceri, 2025) and Critical Autism Studies (Valtellina, 2020) – the training process itself can proceed, supported by audiovisual products that deal with autism in a more multifaceted and intersectional way (De Castro, 2023), introducing into the discourse identity variables that have a significant impact on the autistic experience, such as sex/gender, race, social class and sexual orientation.

ABLEISM, UR-FASCISM, MEDIA-SOCIAL CONTROL AND PSEUDO-INCLUSIVE PRACTICES. FIRST OUTCOMES OF AN EXPLORATORY SURVEY

Fabio Bocci (Department of Education, Roma Tre University, Italy) · **Virginia Benedetti** (University of Macerata, Phd Course in TEACHING & LEARNING SCIENCES (curriculum inclusion)Ableism, Ur-Fascism, Media-Social Control and Pseudo-Inclusive Practices. First outcomes of an Exploratory Survey) · **Barbara Centrone** (Department of Education, Roma Tre University, Italy) · **Martina De castro** (Department of Education, Roma Tre University, Italy) · **Alessandra Straniero** (Department of Mathematics and Computer Science, University of Calabria) · **Leonardo Tantari** (University of Macerata, Phd Course in TEACHING & LEARNING SCIENCES (curriculum inclusion)Ableism, Ur-Fascism, Media-Social Control and Pseudo-Inclusive Practices. First outcomes of an Exploratory Survey)

Ableism | Ur-Fascism | policies for controlling social media representations

We are living in a historical moment characterized by the hegemony of social control by elites who wield socio-political and, above all, economic and financial power. Those who deviate from the standards deemed convenient and productive, in light of the logic that these same elites consider to be in their interests and in the maintenance of their hegemony, are paying the price. Thus, in a civil society increasingly prey to a collective sense of learned helplessness, we are witnessing a structural redefinition of DEIA policies, not only in the United States, to international endorsement of genocidal actions (e.g., against the Palestinian people), to the glorification of war as a security measure to defend one's identity borders, and to the consequent arms race. The ableist glorification of the MAGA model, exported around the world, is a derivative of the presence of Ur-Fascism, a concept developed by Umberto Eco in 1995. According to Eco, the archetypes of Ur-Fascism are: 1) cult of tradition and syncretism; 2) rejection of modernism; 3) cult of action; 4) disagreement as betrayal; 5) fear of difference; 6) individual or social frustration; 7) obsession with conspiracy theories; 8) glorification of the enemy; 9) permanent war and opposition to pacifism; 10) popular elitism and contempt for the weak; 11) cult of heroism and death; 12) machismo; 13) qualitative populism; 14) newspeak. In order for Ur-Fascism – now embodied by MAGA supremacism in the US and nazi-fascist movements throughout Europe – to take hold, it must find fertile ground. This is generally composed of those who profit from the growth of right-wing extremism (which has always been used as an armed wing to impose a certain world order) and the most vulnerable sections of the population, who are most exposed to identity and security rhetoric and fascinated by false promises of an imminent new golden age. The strategy of affirmation relies on the manipulation and distortion of communication, on toxic narratives that distort the truth, on the delegitimization of the opponent (the enemy), and on the discrediting of scientific knowledge and intellectual thought, which are branded as anti-popular. Noam Chomsky analyzed this phenomenon by developing the ten laws of power or the ten rules of social control and media power: 1) strategy of distraction; 2) introduce a false problem to provide a demagogic response; 3) gradualize political decisions; 4) present an unpopular decision as painful but necessary; 5) infantilize communication; 6) appeal to emotion; 7) promote widespread functional illiteracy; 8) encourage the public to be complacent with mediocrity; 9) induce guilt; 10) know individuals better than they know themselves. Based on these premises, the results of an exploratory survey on the perception of the presence and incidence in the contexts of life (work and beyond) of the sample investigated of ableist, ur-fascist, media-social control, and pseudo-inclusive practices will be presented. This survey is fueled by the need, as suggested by Eco, to unmask its new forms of Ur-Fascism active today in Italy and around the world.

BODIES OUT OF FRAME FILM AND TELEVISION REPRESENTATION OF DISABILITY IN THE ITALIAN SCHOOL, BETWEEN OBJECTIFICATION AND SELF-DETERMINATION.

Francesca Caprino (INDIRE, Italy)

Critical Disability Studies | Visual History | Audiovisual Culture

This paper is part of a broader research project dedicated to the analysis of the representation of Italian schools in audiovisual media, an investigation conducted on "atypical" historical sources from a Visual History of Education perspective, which led to the collection and examination of over three hundred works produced from the post-war period to the present day (Caprino, 2025). Building on this repertoire, the study intends to reflect on the construction of the imaginary and the representation of "non-conforming" bodies within the school system, with reference to disability. The analysis investigates how cinema and television have codified the presence within educational institutions of those who, due to disabilities, neurodivergences, or learning difficulties, often intersected with conditions of socio-economic marginality, are classified as "different" or "deviant." Starting from the assumption that such identities are not merely biological data but products of specific institutional disabling devices (Oliver, 2023) that tend to fragment the unity of the human into rigid categories (Gardou, 2006), the contribution explores the persistence of narratives oscillating between objectification (often of a clinical nature) and potential paths of self-determination. In fictional works, documentaries, and "cinegiornali" (newsreels), the figures of children and adolescents with disabilities are often at the center of spectacularizing narratives, bent to the logic of stereotypes (Bocci, 2025; Schianchi, 2023) or functional to the staging of other characters (the "courageous mother," the "counter-current teacher"), relegating "difform" identities to a passive role. Other productions, outside the mainstream (such as the works of De Seta and Mangini), are instead capable of challenging this gaze, restoring subjectivity and political agency to "out of frame" bodies, while simultaneously revealing what the institution has often sought to normalize or hide. Through the lens of Critical Disability Studies, the paper will analyze how certain film and television narratives manage to dismantle the rhetoric of deficit, acting as a "critical observatory" that reveals the dynamics of privilege and oppression within the peculiar Italian educational context, recognizing the "other" subject as an agent of desires and resistance. The objective is to offer a reflection on how audiovisual media can act both as tools for the reproduction of exclusionary practices and as laboratories for the construction of more democratic and inclusive imaginaries of school and society.

REPRESENTING DISABILITY AND PRODUCING ALTERITY IN CINEMA: THE ACADEMY AWARDS AS A CASE STUDY OF NARRATIVE RECOGNITION

Andrea Fiorucci (University of Salento, Italy) · **Giorgia Cazzato** (University of Salento, Italy)

Disability representation | Cinematic self-narration | Film analysis

This paper critically examines the representation of disability in cinema by exploring how institutional recognition systems contribute to the consolidation of dominant narrative models. Moving beyond the identification of recurring stereotypes, the study focuses on the cultural, rhetorical, and symbolic mechanisms through which particular representations of disability are selected, legitimized, and publicly rewarded. The Academy Awards serve as a case study because of their central role in defining artistic value and amplifying specific cinematic imaginaries within the global film industry. Methodologically, the study adopts a multidisciplinary and textual approach grounded in film analysis, drawing on film studies, disability studies, and the analysis of social communication. Film analysis is understood here as a critical practice aimed at deconstructing the cinematic text in order to understand its functioning, meaning, and technical organization, while relating these dimensions to broader semantic and social processes (Bellour, 2000; Bateman & Schmidt, 2013). This framework also engages disability as a rhetorical and cultural construct, shaped by ways of knowing, valuing, and seeing bodily difference within normative regimes of representation (Cherney, 2019). Through this perspective, the paper argues that cinema does not merely represent disability but actively participates in producing it as alterity. Contemporary film culture has expanded the number of disability-related stories, yet this increase has not necessarily corresponded to a more inclusive or authentic participation of disabled actors and creators (Ghosh, 2022). On the contrary, dominant representations often remain shaped by ableist discourses, spectacular framings, and misrepresentational myths that convert disability into an exceptional condition to be consumed emotionally and symbolically (Kearney et al., 2019; Lopez, 2025). Particular attention is devoted to Oscar-recognized films, which frequently exemplify these dominant paradigms. The analysis suggests that many award-winning films rely on spectacular and performative logics capable of transforming alterity into exception, pain into entertainment, and vulnerability into spectacle. In this sense, institutional recognition often appears to depend less on the capacity to portray disability in its lived complexity than on the ability to move, inspire, redeem, or morally reassure audiences. Such mechanisms reinforce disabling discourses in which acquired or embodied difference is narratively organized through drama, loss, and emotional excess rather than through ordinary, situated complexity (Botha & Harvey, 2024). These dynamics shape not only how disability is shown, but also who is authorized to narrate it. The recurrent casting of non-disabled actors in disabled roles confirms a persistent asymmetry between represented subjects and narrative authority, while disabled performers continue to be underrepresented or framed as exceptional rather than artistically authoritative (Ghosh, 2022). In response, the paper foregrounds cinematic self-narration as a transformative practice. When disabled subjects directly participate in the construction of their own stories, representation shifts from external mediation to narrative self-determination. This shift challenges dominant regimes of recognition and opens the possibility of a more inclusive public space of storytelling, in which disability is no longer framed as spectacle but recognized as an integral dimension of human and social experience.

GOING FLAT AS COLLECTIVE SELF-DETERMINATION: COUNTER-NARRATIVES OF POST-MASTECTOMY BODIES

Carla Gueli (Università Roma Tre, Italy)

self-determination mastectomy disability

Breast cancer is the most commonly diagnosed cancer among women in Italy (53,686 cases). Post-mastectomy breast reconstruction, which is also performed for psychosocial benefits, is carried out using implants in 80.6% of cases, using autologous tissue in 5.3%, while in 14.1% of cases, no reconstruction is planned. According to the 2024 Report of the National Registry of Breast Implants, among prosthetic reconstructions, 59.5% are performed at the time of tumor removal and 40.5% at a later stage. For tens of thousands of women, therefore, in the face of such profound bodily and identity-related changes, informed consent and awareness of the physical and psychological consequences of reconstructive surgery are fundamental. This article offers a reflection grounded in the experience of a self-organized group of women who, following a breast cancer diagnosis and mastectomy, collectively assert their right not to undergo breast reconstruction automatically and immediately, based on the idea that the consequences and complications of reconstruction may not outweigh the aesthetic and perceptual benefits. Although the idea is widespread in the medical field that restoring a self-image closer to that prior to mastectomy can help patients recover more quickly, the availability of the option to choose not to undergo reconstruction could instead prevent medical complications (infections and scarring, reduced function reduced function of the pectoral muscle, increased risk of postoperative complications, etc.). The pressure to undergo reconstruction—often presented as the preferred option within clinical pathways—can thus be interpreted as a normalizing practice that intertwines biomedical power, gender expectations, and ableist narratives (El Kotni, Sigonneau 2023). In this sense, the loss of characteristics culturally coded as feminine—hair, breasts, nails—places many patients on the margins of gender recognizability. This paper examines how non-reconstruction is made socially conceivable or, conversely, hindered; which discursive and institutional practices contribute to constructing the post-mastectomy body without reconstruction as a "missing" body; and how an initially individual experience can transform into a collective practice of self-determination, visibility, and activism. Methodologically, the work reconstructs national and international activist practices, public testimonies, materials produced by the groups, the results of an internal analysis, and interviews conducted with women who have initiated collective actions for visibility. The focus is on how women narrate their confrontation with clinical and social expectations, with prosthetic imaginaries, and with the implicit demand to "become legible" again as whole female bodies. The hypothesis is that the choice not to reconstruct does not emerge as a private or residual option, but rather as a collective practice of self-determination that challenges the obligation to make amends, undermines ableist and heteronormative standards of femininity, and expands the democratic conditions of recognition. From this perspective, these women's activism generates not only mutual support but also political and pedagogical knowledge, as it transforms individual experience into public discourse, makes non-reconstruction conceivable as a legitimate possibility, and restores to post-mastectomy bodies the right to appear without shame, without compensation, and without normalization.

DISABLED BODIES IN CINEMATIC REPRESENTATIONS: A CRITICAL CBSERVATORY TO SHED LIGHT ON OUR OWN VIEWS

Leonardo Tantari (Università Roma Tre)

Disability | Cinematic Representations | Collective Imagination

Since the dawn of cinema, cinematic representations have played a crucial role in shaping individual and collective identities and the corresponding social imaginaries. From this perspective, film images cannot be considered neutral (Hall & Du Gay, 1996), nor can the cinematic apparatus itself (Guattari, 2017). The imagery produced by cinema has, in fact, contributed since its inception to the staging of disability, participating in its definition and construction as a cultural object (Longmore, 1985; Norden, 1994; Bocci, 2005; 2012; 2014; 2025; Bocci & Domenici, 2013; Bocci & Straniero, 2020; Bocci, Straniero & Tantari, 2024; Schianchi, 2023). An analysis of the ways in which cinema portrays disability and diversity on screen allows for a deeper understanding of the socio-psycho-cultural implications of these processes, as well as the perspectives and viewpoints of those who produce and stage these portrayals. It also allows us to examine the forms and ways in which disabled bodies are portrayed, identifying the discursive rhetorics (Vadalà, 2013) that permeate the cinematic medium. Building on these theoretical premises and in line with previous studies (Bocci & Bonavolontà, 2020; Bocci & Tantari, in press), this paper presents the initial findings of a qualitative-quantitative study conducted as part of a broader doctoral project. The study aims to establish a critical observatory on the representation of disability and diversity on screen, through the analysis of the knowledge and perceptions expressed by a group of subjects selected as a convenience sample. In this context, cinematic representations of disability and diversity serve as analytical tools (Lapassade, 1974; Gueli, 2018; Bocci, 2020; 2025), bringing to light the contradictions of the social system, which, through its reproductive apparatus (Illich, 2019), utilizes mainstream audiovisual media—starting with cinema but also including other media products such as television series—to reaffirm a hegemonic vision based on productive and performative standards.

Learning Together, Participating Fully: Inclusion and Difference as Educational Resources

PANEL CONVENORS: Sara Mori (Indire, Italy); Francesca Storai (Indire, Italy); Serena Greco (Indire, Italy); Elsa Maria Bruni (Università degli Studi "G. d'Annunzio" Chieti – Pescara)

PANEL KEYWORDS: Educational democracy, Student dignity, Inclusive schooling

The panel will offer a critical discussion of the links between educational democracy, equity and inclusion within contemporary school systems. Socio-educational inequalities are increasingly evident at international level in learning processes and students' trajectories. Democratic education is considered a right that enables all learners to participate and succeed (Varsik, 2022). From this perspective, the principle of human dignity, understood as a pedagogical category that guides care, support and recognition of each learner's needs and potential (Bruni, 2024), is a key condition for rethinking equity and participation in schools. Many countries are implementing reforms to make schools more capable of embracing difference through evidence-based approaches, inclusive co-teaching models and personalised learning strategies (Florian, 2019; Norwich, 2023). While the Italian model of inclusive schooling is often recognised internationally for its value-based foundations, everyday practice does not automatically ensure equitable outcomes. This discrepancy between principles and practice raises questions about the role of schools as spaces for citizenship, dialogue, shared responsibility, and the recognition and development of all students' potential The panel aims to clarify the conditions, limitations and potential through which inclusive schooling can sustain lived school democracy. It welcomes theoretical and empirical contributions that analyse, discuss and evaluate: (1) teachers' professional competence for inclusion; (2) co-teaching and collaboration; (3) the impact of inclusive practices on equity; (4) fair and inclusive assessment; (5) the role of socio-economic and cultural contexts; (6) leadership for an equitable and inclusive school culture; and (7) international comparisons with organisational models that differ from the Italian model.

A BRIDGE BETWEEN ITALY AND JAPAN: THE OECD "INFINITY PROJECT" FOR PROMOTING INCLUSION AND SHARED EDUCATIONAL PERSPECTIVES ACROSS CULTURES

Mariagrazia Marcarini (University of Bologna, Italy) · **Isabella Bennardi** (University of Bologna, Italy)

Infinity Project-Italy-Japan Bridge | Inclusion | Minimum Viable Product

This paper presents the results of the survey conducted as part of the OECD "Infinity Project," developed in collaboration with the University of Bologna. The study involved three Italian schools and three Japanese schools. The aim was to promote inclusion and well-being by developing a Minimum Viable Product (MVP) (Blokdyk, 2021), documented in an e-book. The "Infinity Project" was born from an initiative originally proposed by Japan, inheriting the spirit of the "Tohoku School Project," launched to support students in overcoming the triple disaster (tsunami, earthquake, and nuclear power plant accident resulting from the Great East Japan Earthquake in March 2011) and to rebuild the spirit of sharing in their communities through various actions (2012–2014). Following a visit by the OECD Secretary-General, local education authorities, schools, and adult leaders participated in a project aimed at demonstrating the progress of the recovery process from the perspective of rebuilding buildings and communities in the Tohoku region. The results were presented at a major event in Paris in 2014. The idea behind the initiative was that by participating in this ambitious program, based on collaborative and project-based pedagogy, students would acquire advanced leadership skills. The results achieved contributed to the launch of the "Future of Education and Skills" project. 2030" (from 2015) to emphasize some of the key underlying concepts and constructs of the OECD Learning Compass (2019). Japanese students involved in co-creating the Learning Compass expressed a desire for a global initiative, suggesting project-based learning. This initiated "Project Infinity" with an inclusive vision, believing that students can shine and thrive when they believe that "the sky is the limit," overcoming challenges, barriers, and walls that separate them. The survey conducted in the three Italian schools assessed the impact of the MVP in terms of co-evolution, inclusion, and transformation of student relationships. Teachers were asked six questions to understand how inclusive teaching strategies and the shift from a lecture to an active-participatory approach (Cottini, 2018; 2022) had changed the classroom climate. Key factors include shared emotional engagement, language diversity (Agliotti & Fabbro, 2006; Cafiero, 2009), and working in small, cooperative groups (Johnson & Johnson, 1998). Student Agency (Sokol et al., 2015; Sokol, Hammond, Kuebli, et al, 2015; Vaughn, 2021) is essential for fostering collaboration, inclusion, and co-evolutionary processes (Canevaro, 2008; Sandri, 2019). The

findings underscore the value of an integrated, international approach to improving inclusion, equity, democracy, and school well-being. They further demonstrate how participatory and inclusive practices foster shared growth and how the Italian approach to inclusion can foster interest and curiosity where special classes and special schools still exist.

RETELLING STORIES, RESTARTING LIVES: EVALUATING UNIVERSITY EMPOWERMENT AND ORIENTATION TRAININGS THROUGH NEURODIVERGENT YOUNG ADULT SELF-NARRATIVE TURNING-POINTS

Giulia Aguzzi (Università per Stranieri di Siena, Italy)

Neurodivergent | Self-narrative | Empowerment Identity

Self-narrative studies represent a key approach to addressing identity challenges - such as a lack of or low self-esteem, scarce sense of agency and inadequate application of study strategies -frequently experienced by neurodivergent young adult students, generally defined as having 'special needs', at the beginning of their academic careers. Through a year-long training with a specialized tutor, students are guided to retell their own story and reconsider their divergent functioning, moving beyond the traditional 'normal vs different' or 'healthy vs ill' dichotomies. The goal is to rediscover their potential, agency and capability to manage their academic choices, ensuring access to the full range of opportunities, regardless of their 'neuroprofile'. The training program is also used to help students effectively activate the support services offered by the University in order to develop the agency for their autonomous journey beyond university years. The results, on one hand, are considered a key element in evaluating the efficacy of the empowerment and tutoring program, aimed at enhancing university services and fostering greater equity among the student community. On the other hand, these results are used to engage in dialogue with further research on teacher training program regarding inclusive methods, in order to monitor and improve their perception of student identity, overcoming cultural biases and prejudices.

SCHOOLING INCLUSION: GENESIS, FRAGILITIES, AND PERSPECTIVES OF THE ITALIAN MODEL

Francesca Caprino (INDIRE, Italy) · **Simone Consegnati** (INDIRE, Italy)

School Inclusion | History of Education | Falcucci Report

The Italian model of school inclusion represents a unique case on the international stage, the product of a historical period characterized by exceptional civil, political, and pedagogical ferment. Despite the awareness of implementation limits—often linked to resource shortages, discontinuity in teaching support, and sometimes fragmented practices—the Italian system remains a unicum, maintaining a continuity and coherence unparalleled in European and global educational contexts. From a regulatory perspective, the genesis of this model can be traced back to the 1975 Falcucci Commission's final report (Caprino & Consegnati, 2026) and the subsequent Law 517/1977 (Pavone, 2017). These documents constitute fundamental historical turning points that sanctioned a radical paradigm shift, redefining the school as a stronghold of universal citizenship. To reconstruct the origins and scope of the inclusive model, it is necessary to frame these phenomena within the cultural ethos of the time, marked by the profound social changes of the 1960s that culminated in the 1968 uprisings. In this context, the educational institution—whose classist and selective nature had already been masterfully analysed by Don Lorenzo Milani—was radically called into question. Similarly, the segregative practices towards the "other," typical of "total institutions," were dismantled during those same years by the Basaglian revolution. This ferment transformed the rejection of exclusionary logics into a project for the transformation of the civil fabric. Thus, the abolition of differential classes and special schools responded to the need to remove obstacles to democratic participation, in full harmony with the constitutional mandate. The contemporary landscape appears profoundly altered. Following the decline of great collective ideologies and the crisis of social solidarity, a technocratic-corporate model has

emerged, dominated by individualism and an often obsessive pursuit of performance (Arena, 2025). Schools are increasingly pressured by rhetorics oriented towards competitiveness and a misunderstood notion of merit—a phenomenon reflected in growing scepticism towards inclusion (Ianes & Augello, 2019), which risks reintroducing exclusionary logics. This trend is mirrored in a renewed public debate that fluctuates between a nostalgic yearning for the school of the past—supported by certain institutional and intellectual figures—and a rising hostility, particularly visible in the informal contexts of social networks. Here, school inclusion is often derided as a mere exercise in 'political correctness,' in a climate that frequently disqualifies the entire pedagogical discipline. Conversely, conflicting cultural elements can be found, such as the international rise since the 1990s of the social model of disability (Schianchi, 2021), reflected in more recent guidelines (UN Convention on the Rights of Persons with Disabilities, 2006) and the emergence of Disability Studies (Medeghini, 2015). With this contribution, we intend to propose a critical comparison between the historical and social background that led to the Italian model of school inclusion and the current one. The aim is to reflect on the democratic resilience of school inclusion and to understand which elements can safeguard, in a rapidly transforming social context, a pluralistic and solidary vision of school and society.

BEYOND THE LANGUAGE BARRIER: AN IMMERSIVE SERIOUS GAME PROMOTING EQUITY AND PARTICIPATION IN SECONDARY SCHOOLS

Fabiola Camandona (Università degli Studi di Torino, Italy)

serious game | virtual reality | intercomprehension stategies

Socio-educational inequalities restrict access to cognitive and social experiences, placing students from disadvantaged backgrounds at a disadvantage. In the field of foreign languages, authenticity plays a fundamental role as a space for developing semantic and grammatical skills, contributing to greater cultural integration (Chiappelli, Leoncini, 2025). For those with a low socio-economic status, the school environment becomes crucial as it represents the only accessible space for linguistic diversity and plurality. Furthermore, the use of innovative approaches such as immersive experiences can serve as a bridge to enhance the multilingual repertoire through authentic engagement, strengthening learners' linguistic and cultural identity, with a view to treating multicultural classes as a resource rather than an obstacle (Ritterfeld, Lüke, 2020). Through the use of immersive technologies such as virtual reality, it is possible to access a variety of safe and often realistic environments in which the learner can learn and overcome the geographical and financial barriers that limit real-world mobility (Berrezueta-Guzman, Daya, 2025). Sociological and language teaching literature agrees that a student's linguistic repertoire is profoundly influenced by the family environment (Cook, 2012; Pavlenko 2007). Students from families with high cultural capital are often exposed to a variety of linguistic stimuli that facilitate the acquisition of new languages. Conversely, students from disadvantaged backgrounds may perceive the foreign language as a foreign and inaccessible system. Intercomprehension addresses precisely this issue, overturning the hierarchy of knowledge: it does not require students to erase their linguistic identity in order to adopt a new one, but invites them to explore their own roots (including dialects) to decode related languages (Garbarino, Leone, 2022). The Time to S.P.R.I.C. project – Shared Pathways for Romance languages, Intercomprehension and Cycling in virtual reality – stems from the need to create a synergy between theoretical foundations and a concrete educational product that can be used within the school system. At the hub of the project is an immersive, multilingual serious game set in the Susa Valley, where, at each stage, a linguistic input is presented in a different Romance language (French, Spanish, Portuguese, Catalan or Romanian),

accompanied by personalised and adaptive feedback (Camandona, Corino, 2025). This approach promotes metalinguistic awareness and respects individual learning paces, ensuring that no student is left behind due to prior gaps in knowledge, thereby enabling a vision of language education that places equity and democracy at its core. These technologies are not merely 'add-ons' to traditional teaching, but tools that allow us to rethink access to knowledge.

INDIRE-TRAINING COURSES FOR THE SPECIALISATION OF SUPPORT TEACHERS: PARTICIPANTS' FINAL FEEDBACK

Serena Greco (Istituto Nazionale di Documentazione, Innovazione e Ricerca Educativa-INDIRE, Italy) · **Sara Mori** (Istituto Nazionale di Documentazione, Innovazione e Ricerca Educativa-INDIRE, Italy) · **Francesca Storai** (Istituto Nazionale di Documentazione, Innovazione e Ricerca Educativa-INDIRE, Italy) · **Elsa Maria Bruni** (Università Telematica degli studi IUL)

support teacher | inclusive teacher education | perceived competences

Abstract The specialised support teacher plays a pivotal role in inclusive schooling. This is not only because of the support they provide to students with disabilities, but also because of their contribution to creating equitable, participatory and diversity-sensitive educational contexts. Current literature shows that this professional role cannot be reduced to a technical function alone; rather, it requires the integration of pedagogical and didactic expertise, relational competence, collaborative working, and shared educational responsibility (Gaspari, 2016; Canevaro & Ianes, 2024). From this perspective, the education of support teachers becomes meaningful when it promotes the acquisition of operational tools and the development of a reflective professional stance oriented towards educational care, the recognition of personal dignity and the design of meaningful, personalised learning pathways (Bruni, 2024a; Bruni, 2024b). Recent studies on initial teacher education and the competencies of inclusive teachers also emphasise the importance of connecting specialist knowledge, perceived self-efficacy, socio-emotional sensitivity and the capacity to collaborate with colleagues, families and local services (Bocci et al., 2021; Longo & Di Carlo, 2024; Morganti, 2018). Within this framework, this study examines the perceived outcomes of the training delivered by INDIRE under Ministerial Decrees 75 and 77. It compares the two training pathways and explores differences across school levels. The analysis is based on a final questionnaire completed by participants at the end of the programme. Of the 9,354 trainees in the reference population, 3,760 completed the questionnaire, corresponding to 40.2% of the total population. The self-report instrument consisted of three quantitative sections based on a four-point Likert scale, covering opinions on the training received, the perceived impact on the professional role and perceived competences for inclusion. Overall, the findings portray a broadly positive picture. The highest evaluations concern personal and professional growth, increased awareness of the support teacher's role and acquisition of useful perspectives for inclusive practice. Conversely, areas requiring improvement include collaboration with local services, participation in local inclusion networks, and extending inclusive practice beyond the school context. A consistent advantage for DM 77 was revealed when the two pathways were compared. Participants who undertook the DM 77 pathway reported a mean score of 3.51 for their training experience, compared with 3.43 for those who undertook the DM 75 pathway. Similar gaps emerge in perceived impact on the professional role (DM 77 = 3.43; DM 75 = 3.28) and perceived competence for inclusion (DM 77 = 3.46; DM 75 = 3.36). The most evident differences concern practical activities, the use of technologies, relationships with external services, and the recognition of the support teacher's role within

the school organisation. Significant differences also emerge across school levels. Overall, teachers in preschool and upper secondary education show the most positive profiles, whereas lower secondary teachers systematically report less favourable evaluations. Taken together, these findings suggest that training is perceived as more meaningful when it strengthens technical competence alongside awareness of the educational mandate, relational responsibility and the capacity to act within inclusive ecosystems. This is consistent with studies on inclusive teacher professionalism and support teacher education (Menichetti & Piccioli, 2022; Marchisio et al., 2024).

THE IMPACT OF THE EBISS PROGRAM FOR LEARNING TO STUDY IN A LIFELONG LEARNING PERSPECTIVE

Claudia Dirodi (Sapienza Universita` di Roma, Italy) · **Irene Stanzione** (Sapienza Universita` di Roma, Italy) · **Marianna Traversetti** (Sapienza Universita` di Roma, Italy)

study strategies · SLD · upper secondary school

School inclusion (UNESCO, 2017) represents a founding principle of the Italian education system and is aligned with Goal 4 of the 2030 Agenda for Sustainable Development, which promotes quality, equitable and inclusive education for all. Italy, a pioneer in Europe in the field of inclusion (Law 517/1977; Law 104/1992; Law 170/2010; Ministry of Education, University and Research, 2012), has consolidated the principle of integration, gradually extending legal and pedagogical protection to students with other Special Educational Needs (SEN). In continuity with the international framework that understands democratic education as a right enabling the participation and success of all students (Varsik, 2022), this study adopts the principle of human dignity as a pedagogical category that orients care, support and recognition of each learner's needs and potential (Bruni, 2024). From this perspective, the study addresses the educational challenge of promoting evidence-informed strategies that are genuinely inclusive of everyone and of each individual (Hattie, 2017) for teaching how to study, with the aim of fostering the development of a functional study method (Chiappetta Cajola & Traversetti, 2017). Such a method is conceived as a structured set of strategic, cognitive, metacognitive and motivational factors that can nurture an active attitude towards learning and enable students to exercise control over their own learning processes, thus enhancing each learner's capacity to "learn how to learn" (Council of the European Union, 2018) within a lifelong learning perspective. In this sense, the study method is conceived as a primary compensatory measure (Cornoldi et al., 2010), within which other compensatory tools and dispensatory measures can be organised, shared and accepted. Within this inclusive perspective, it is therefore crucial that teachers make systematic use of strategies with proven effectiveness (Mitchell & Sutherland, 2020), capable of supporting students with SEN throughout their entire school trajectory. Specifically, this contribution presents the results of a quasi-experimental study (Stanley & Campbell, 1996) involving seven upper secondary schools in the Lazio and Abruzzo regions, following a targeted teaching intervention designed according to the principles and methodological criteria of Evidence-Based (Informed) Education (Calvani, 2025). The intervention is oriented towards promoting the acquisition of an effective study method for all students, including those with Specific Learning Disorders (SLD). The study led to the design and implementation of the Evidence-Based Inclusive Study Strategies- EbISS Programme, articulated in two main components: a specific training course for

teachers of the experimental classes and, subsequently, the implementation in those classes of a didactic kit built around the core components of the study method. The evaluation of the EbISS Programme was conducted through the administration of standardised tools at pre-test and post-test in both the experimental and control groups. The analysis of the results aims to highlight the conditions, limits and potential through which inclusive, evidence-informed study strategies can contribute to making school a space of lived citizenship, dialogue, shared responsibility and recognition of the potential of all students.

TRAINING TEACHERS IN SHARED REFLEXIVITY THROUGH THE AUTHENTIC INCLUSIVE TASK: A RESEARCH-BASED TRAINING PATH IN A COMPREHENSIVE INSTITUTE IN ROME

Alessia Travaglini (Guglielmo Marconi University, Italy) · **Flavia Di Donato** (Guglielmo Marconi University, Italy) · **Francesco Claudio Ugolini** (Guglielmo Marconi University, Italy)

Teacher training | inclusion | authentic task

Teacher training represents an essential challenge for building truly inclusive contexts which, to be effective, requires a radical and transversal change in teaching practices, considered not only from a pragmatic point of view, but also from a socio-symbolic-cultural perspective (Baldacci, 2023; Bocci, Guerini & Travaglini, 2021; Mura, 2019). This is a challenging process, requiring the joint investment of all professionals involved in educational processes, and in relation to which there are still various types of critical issues (Fedeli & Munaro, 2022). Indeed, perplexity emerges among teachers regarding the possibility of applying methodologies and approaches based on co-education, as well as a widespread resistance – especially in secondary school – to perceiving educational contexts as "naturally" habitable by everyone, regardless of the recognized and observed skills (Canevaro & Ianes, 2024). To stem the separation between educational professionals, especially between curricular and support teachers, it is necessary to implement training courses that allow all participants to feel authentically part of a process of shared growth and collaboration (Lombardi, 2024): in this way it is possible to establish a research community (Mezirow, 2003), in which the different members, supporting each other within a process of change, are called to analyze the strengths and criticalities of what has been undertaken. In this sense, the synergy between university and educational institution is a key element capable of ensuring innovation and a push towards change (Di Donato, 2025). Based on these premises, the aim is to present the results of a research-based training program, still ongoing, involving 16 teachers from a comprehensive institute in Rome focused on the design and implementation of authentic inclusive tasks (Travaglini, 2025) in the classes entrusted to them. Specifically, the researchers' objective was twofold: a) to investigate the effectiveness of the inclusive authentic task in relation to some variables observed in the classes involved in the learning path. In this sense, particular attention was paid to observing the social and prosocial skills of the students; b) observing the impact of the training program on the quality of collaboration

between teachers, as well as on the increase in educational practices inspired by coeducation. Specifically, the training process is marked by three different phases: ex ante, aimed at identifying the most relevant training needs; ongoing, focused on the design and implementation of interventions; ex post, aimed at sharing the experiences of teachers, as well as identifying the strengths and critical issues identified both in relation to the training path, both in relation to a possible revisitation of the research tools proposed by the researchers. To achieve these goals, the research-based training process is configured as an idiographic study aimed at detecting the changes observed in the participants: for this reason, it involves the use of questionnaires and focus groups, to be applied at the different phases of the process, according to a perspective that aims to consider the outcomes of the intervention in light of the trajectories of professional change of the teachers involved (Passalacqua et al., 2025).

EDUCATIONAL INCLUSION AND ECONOMIC CITIZENSHIP: RETHINKING LIFE PLANS FOR STUDENTS WITH DISABILITIES

Luca Refrigeri (University of Molise, Italy)

Inclusive Education | Economic Citizenship Disability | Life Planning

In recent decades, educational inclusion has been recognised as one of the fundamental principles of inclusive education. In many education systems, and particularly in the Italian model, it is grounded in the right of students with disabilities to participate in mainstream classroom life and to follow standard curricula. This institutional achievement, often regarded as a distinctive feature of the Italian system, nevertheless raises a crucial question: is participation in classroom life sufficient to prepare students with disabilities to face adult life independently? The concern lies in the risk that educational inclusion may remain largely confined to the formal school setting, without fully translating into social inclusion and, above all, labour market inclusion. The key question, therefore, is whether the educational pathways offered in schools are truly capable of developing the skills needed to live independently in society. Among these, one dimension still appears to be largely overlooked within inclusion policies and practices: economic citizenship. The ability to understand the value of money, manage a personal budget, plan expenditure, develop savings strategies, and administer one's own resources represents a fundamental competence for individual autonomy. For people with disabilities, these skills acquire even greater significance, as they directly affect their ability to lead an independent life, manage personal income—such as pensions or other forms of financial support—and participate meaningfully in social life, especially when family support is no longer available. Despite its evident relevance, economic and financial literacy is rarely incorporated into school curricula or students' life plans. Educational practices tend to prioritise participation in traditional subject-based curricula, even when these are only weakly connected to the real prospects for independence of the most vulnerable students. This situation creates a tension between curricular inclusion and social inclusion, raising questions about the very meaning of educational equity. This paper argues for the need to explicitly introduce economic and financial literacy into the life plans of students with disabilities. Schools should promote educational pathways focused on understanding income from work, managing a personal budget, developing a propensity to save, and acquiring the ability to make informed economic decisions in everyday life. Drawing on the capability approach, the paper proposes rethinking

educational inclusion as a process aimed at fostering the real conditions for autonomy and participation in social life. From this perspective, economic citizenship becomes an essential dimension of social equity and a structural element in shaping the life plans of students with disabilities. A truly inclusive school should not merely ensure that students are present in the classroom, but should prepare them to live in society with practical tools for autonomy. Among these, the ability to understand and manage money, plan one's budget, and develop savings habits represents a fundamental condition for transforming inclusion from a formal principle into a real opportunity for participation and independence in adult life.

SCUOLA DELL'INFANZIA AS AN EDUCATIONAL INTERSTICE: DOCUMENTARY ACTION RESEARCH ON THE ITALIAN EARLY CHILDHOOD CURRICULUM

Francesca Capone (Università di Torino) · **Maria Gagliano** (Università di Torino; I.C. Rivalta (TO)) · **Serena Allena** (I.C. Rivalta (TO)) · **Paola Pagin** (I.C. Rivalta (TO)) · **Barbara Peretti** (I.C. Rivalta (TO)) · **Maddalena Zafettieri** (Università di Torino; I.C. M.L. King Grugliasco (TO))

Early Childhood Curriculum | Practitioner-Based Action Research | Participatory Practices

In the Italian educational landscape, early childhood education has developed through specific institutional and pedagogical trajectories. What is today known as Scuola dell'Infanzia, serving children aged three to six, was formally established in 1968 and pedagogically redefined through the Orientamenti per la scuola dell'infanzia (1991). Initially aimed at social and family support, particularly to enable women's labour participation, it gradually shifted toward a child-centred approach emphasizing agency, relational learning, play, and multiple symbolic languages (Malaguzzi, 1995). This orientation resonates with international perspectives on active, participatory learning and curriculum as a relational process emerging from interactions among children, adults, and contexts (Clark, 2017; Luini, 2025). Over the past decade, governance and the conceptual framework of early childhood education in Italy have undergone significant reconfiguration. The establishment of the Sistema Integrato 0-6 introduced a systemic perspective connecting early childhood services and preschool education. Subsequent national curricular and policy developments have reshaped discourse surrounding early childhood education, reopening the debate on preschool identity within a broader educational continuum and on the relationship between consolidated pedagogical traditions and evolving policy frameworks (Silva, 2018). Comparative curriculum research has shown how early childhood curricula often become "sites of struggle" where different visions of childhood, learning, and educational purposes confront each other (Soler & Miller, 2003). This contribution presents outcomes of a practitioner-based action research project conducted by a group of preschool teachers who collaboratively engaged in critical documentary analysis of national policy texts regulating early childhood education. The inquiry aimed to reinterpret the evolving identity of preschool education within the integrated 0–6 system and a developmental curriculum spanning 0 to 19 years (Cerini, 2018). Through collegial discussion, the research group identified five analytical categories: (1) the centrality of the child and the educational purposes of preschool education; (2) the implicit curriculum and learning environment; (3) the explicit curriculum and its articulation through the campi di esperienza; (4) vertical and horizontal continuity across educational transitions; and (5) teacher professionalism and reflective practice. The analysis revealed both continuity and shifts. Core principles persist, while recent policies increasingly emphasize organisational and systemic dimensions. Preschool identity emerges as relational and collectively constructed through practices, institutional frameworks, and policy developments (Bocci, 2025; Bruzzo, 2025). The research is framed within a difference-oriented perspective on inclusive education (Demo, 2025) and a broad conception of inclusion as expanding participation and learning for all children (Booth & Ainscow, 2008), treating diversity as a resource for shared learning and democratic engagement. The study demonstrates that curriculum discourses influence children's participation, recognition of differences, and sense of democratic belonging. By combining documentary analysis with practitioner inquiry, it argues that redefining preschool identity is not only a technical policy matter but also a cultural and political issue

concerning early childhood's role in democratic society. The analytical framework developed serves as a reflective tool for collaborative practitioner inquiry, supporting critical examination of curriculum discourses and their implications for inclusive, participatory, child-responsive educational practices. The project later extended its analysis to policy texts incorporated into the 2025 Indicazioni Nazionali.

SOCIOEMOTIONAL DEVELOPMENT WITHIN THE UNIVERSAL DESIGN FOR LEARNING CLASSROOM

Anna Berti (Libera Università di Bolzano, Italy) · **Vanessa Macchia** (Libera Università di Bolzano, Italy)

universal design for learning | inclusive teaching | mixed methods

In a progressively more varied educational landscape where socio-educational inequalities are increasingly evident, planning for diversity and utilizing inclusive evidence-based approaches becomes fundamental in ensuring everyone's participation and success (OECD, 2023). In this respect, the Universal Design for Learning (UDL) framework offers a notable contribution, as it centers on the learner, their choices and educational trajectories. More specifically, UDL is funded on the concept of natural learner variability and revolving around the idea of removing barriers from the curriculum, planning for such variability and having each pupil´s preferences and needs become an integral part of their learning process (Meyer & Rose, 2014) Both international and national research has demonstrated positive effects of UDL, more specifically various studies have reported increased performance and learning outcomes in various subjects and across grades (Almeqdad et al., 2023; Ok et al., 2017). Similar positive effects have also been observed regarding other outcomes, such as students' engagement (Sokal & Katz, 2015). These effects specifically are fundamental to the UDL framework itself as it does not concentrate on students' capabilities but instead underlines their continued development as "expert learners". These are pupils who develop characteristics such as: motivation, self-efficacy and self-esteem, (Meyer & Rose, 2014). However, while an increase in the first has been observed in various studies, literature has generally not focused on the effects of UDL on the other characteristics mentioned or to other aspects of students' socioemotional development (Kapoor, 2024). Notably, such qualities are not only important within the UDL framework but have been found to have vital implications for students' educational outcomes. Furthermore, disparities in such characteristics between children from different socioeconomic backgrounds have also been observed and further perpetrate educational inequities (Huang, 2011; Jansen et al., 2015; Paulus et al., 2021). The current study aims to examine how students' socioemotional development is impacted when UDL is utilized in the classroom. It is expected that UDL can foster such development and consequently reduce educational inequity. The study will involve pupils from grade 5 in primary school and their teachers. Additionally, it will employ a mixed methods approach, utilizing both quantitative and qualitative instruments to measure children's socioemotional development. For example, children´s self-concept will be measured through a validated self-report questionnaire: the third edition of the Piers-Harris Self-Concept Scale (Piers et al., 2023); while engagement will be assessed through class observations. Teachers will receive specialized UDL training

and will be then asked to implement it in their classroom. The training's main purpose is for teachers to acquire not only knowledge of the framework but also engage them in the design of lessons and learning units following its principles. Moreover, the study will include semi-structured interviews with teachers so to understand how they used UDL within the classroom and possible changes in their professional role and instructional decision-making during the implementation. During the conference, the author will present in more detail both the design of the study, its procedures, materials and the training devised for participating teachers.

DANCING AMONG DESKS; THE ROLE OF THE BODY AND MOVEMENT IN THE INTERCULTURAL SCHOOL

Fernando Battista (Link Campus University, Italy)

bodies intercultural democracy

The body is the place where the cultural and political representation of the individual is enacted, and it appears as the product of a rhizomatic system that renders it mutable and polysemic, a material reality made of flesh and bones, but also a construct shaped by clothing, habitus, and symbolic devices. This complexity positions the body in liminal spaces, boundary territories without a defined belonging, where identities and meanings intertwine in hybrid forms. From this emerge different ways of conceptualizing the body: the body-as-matter, bearer of signs open to semiotic interpretation, the lived and embodied body rooted in phenomenological perspectives; the technological and cyber body, as in Haraway's analyses (1995); the political body in Butler (1993), Arendt (1998), Foucault (1975) and Bauman (1992). The body becomes a site where power, resistance, and possibilities for transformation are inscribed. This political body becomes a space of rights, expression, and participation inviting us to rethink educational contexts as places where each bodily subjectivity may be recognized, protected, and valued. Educating through and about the body therefore means cultivating democratic practices based on listening and reciprocity. Although dance is not intrinsically political, it acquires political significance when it occupies and transforms cultural and social spaces. Starting from these premises, this contribute investigates the meaning of dance as a political and social practice and explores the pedagogical role of the body and movement in intercultural schools (Massa 1986), in order to understand how dance can contribute to the democratic, critical and relational formation of individuals.

THE INTEGRATED THEATRE WORKSHOP BETWEEN INCLUSION AND WELLBEING: A STUDY IN PRIMARY SCHOOLS

Eleonora Ferracci (Università di Roma Tor Vergata, Italy)

integrated theatre workshop · school well-being · inclusion

In recent years, well-being at school has been, and continues to be, a pedagogical and educational priority. In line with the objectives of Agenda 2030, it is necessary and urgent to identify barriers, facilitators and methodologies that can guarantee equitable, inclusive and quality education. With this in mind, this study aims to explore the effects of integrated theatre workshops on the wellbeing of pupils, with and without Special Educational Needs (SEN), in the second cycle of primary school in suburban contexts. The study is the result of a collaboration with the Laboratorio Teatrale Integrato Piero Gabrielli, a multidisciplinary organisation based in the Lazio region that runs annual theatre workshops with an integrated and inclusive approach. The research design adopted is quantitative, with experimental groups and pre/post intervention surveys using the Questionari per la valutazione del benessere scolastico e identificazione dei fattori di rischio (Tobia & Marzocchi, 2024). The sample consists of pupils from four schools selected through a public call for applications by the Teatro di Roma, for a total of eight classes belonging to the second cycle of primary school. The identification of this target group was based on two reasons: on the one hand, evidence in the literature suggests that wellbeing tends to decline with the start of secondary school, while on the other hand, we wanted to highlight the intrinsic multimodal and inclusive nature of theatre workshops in peripheral schools, which are often characterised by a high number of pupils with SEN. The data analysis involved the use of descriptive statistics to detect any variations in the overall scores of all the subscales examined; in addition, statistical correlations between the items and the relevant subscales were performed using Pearson's index. The results show significant changes in all subscales, albeit with differences and methodological limitations typical of pilot studies. However, these results suggest some future prospects that can be outlined to investigate the relationship between the artistic, educational and inclusive dimensions more rigorously.

THE HETEROGENEITY OF NEEDS IN THE SCHOOL SYSTEM: AN ANALYSIS OF THE LEVELS OF INCLUSION AND PARTICIPATION OF STUDENTS WITH DISABILITIES

Alessandra Battisti (Italian Statistics Institute, Italy) · **Sara Corradini** (Italian Statistics Institute, Italy) · **Lucia Martinez** (Italian Statistics Institute, Italy) · **Claudia Di Priamo** (Italian Statistics Institute, Italy)

School · disability · participation

"Inclusion is a transformative process that ensures the full participation of all children, young people and adults in quality learning opportunities, while respecting and valuing diversity and eliminating all forms of discrimination in and through education.' Inclusion represents a commitment to making schools and other educational settings places where everyone is valued and belongs and where diversity is seen as enriching" (UNESCO, 2019). The Italian school system has a long tradition of inclusive education, that began in the 1970s. Since then, legislation has evolved to guarantee students with disabilities and those with other special educational needs the right to personalized education. Law 104/92 establishes

the right to education and schooling from birth, guaranteeing the right to education and instruction for persons with disabilities within educational institutions of all levels and types. Therefore, an inclusive school should put in place all available facilitators and remove any barriers to learning and participation for all students. However, the conception of rights and benefits was rooted in a medical-individual model of disability that remains evident, even in recent legislation, thereby impeding innovation in this area (Ianes, Dremo & Dell'Anna, 2020). The annual survey 'Scholastic inclusion of students with disabilities' started in 2008 and allows monitoring of various aspects of the inclusion of students with disabilities over time. The survey comprises two parts. The first part is a census addressed to all schools in Italy and aims to assess the more objective aspects of inclusion in the educational/learning offer. The second part is a sample addressed to a sample of students with disabilities representative of the reference population. This part aims to explore students' epidemiological characteristics, the aids used, unmet needs and aspects related to participation. Finally, the survey uses also a set of questions borrowed from the ICF to explore the functioning levels of students with disabilities. This study uses survey data to analyze the levels of inclusion of students with disabilities within the school context. The aim is to identify the main critical issues still present in the education system and the positive signs and effective practices that foster participation. Particular attention is devoted to describing the heterogeneity of educational needs that characterizes the school population. Based on information collected on individual students, the study proposes classifying them into homogeneous groups according to types of need and levels of participation. This provides a more systematic interpretation of the data and helps to identify possible intervention pathways.

AACCESSIBILITY: COGNITIVE ACCESSIBILITY AS A LEVER FOR EQUITY, PARTICIPATION, AND DEMOCRATIC SCHOOLING BETWEEN SCHOOL AND COMMUNITY

Maria Paola Fortuna (I.C. Guicciardini, Italy)

accessibility inclusion equity

In the international debate on democratic schooling, inclusive education is widely acknowledged as a prerequisite for equity, participation, and the recognition of every student's potential. However, research consistently shows a persistent gap between inclusive principles and everyday school practices, contributing to socio-educational inequalities in learning outcomes and participation. In this context, cognitive accessibility emerges as a key pedagogical and ethical condition for transforming inclusion into lived democratic experience. This contribution presents "AACcessibility", an ongoing action-research project developed in an Italian lower secondary school, which investigates the role of Augmentative and Alternative Communication (AAC) in fostering equitable participation and democratic engagement within and beyond school settings. Grounded in the professional practice of a specialised support teacher, the project reflects the importance of teachers' inclusive competences as a driver of systemic change rather than as an individual or compensatory response to disability. The main aim of "AACcessibility" is to promote a culture of cognitive accessibility by reframing AAC as a universal pedagogical resource. This approach challenges deficit-based models and aligns with inclusive frameworks that emphasise participation, shared responsibility, and recognition of human dignity. From this perspective, the project highlights how inclusive teaching practices can contribute to equity not only for students with special educational needs but for the entire student population. A central element of the project is a structured collaboration between the school and a local cultural institution in Rome, Palazzo Merulana, exemplifying cross-sectoral co-design and distributed leadership for inclusion. Three eighth-grade classes were involved in the creation of a symbol-based version of the museum catalogue through a multi-phase process: critical reflection on different dimensions of accessibility; experiential learning within the museum environment; linguistic analysis and simplification of specialised texts; translation into symbols using open-source AAC software; and collective metacognitive discussion on communicative and representation-

al choices. This process foregrounded collaboration among students and teachers and positioned learners as active contributors to inclusive cultural production. Findings from the project suggest that AAC-based inclusive practices can positively impact equity by enhancing access to content, supporting diverse learning trajectories, and fostering civic competences such as participation, dialogue, and responsibility. Students experienced democratic schooling not only as a formal principle but as a concrete practice, becoming agents of accessibility within their community. The contribution further addresses an international dimension through a second strand of the project involving the translation and adaptation of "Inclusion Man" from Spanish to Italian, an inclusive comic book developed in Spain. This activity supports cross-cultural dialogue on disability rights, challenges stereotypical representations, and promotes agency and active citizenship, while also strengthening linguistic and interpretative competences. In conclusion, the paper discusses the conditions, limits, and potential of cognitive accessibility as a pedagogical device for a "lived" democratic school, offering insights into how inclusive practices, teacher professionalism, and school–community partnerships can jointly contribute to more equitable and participatory education systems.

INCLUSIVE PLANNING IN K-12 EDUCATIONAL SETTINGS THROUGH GENAI: A SYSTEMATIC REVIEW

Silver Cappello (Free University of Bolzano-Bozen, Italy) · **Anna Frizzarin** (IPRASE, Italy) · **Heidrun Demo** (Free University of Bolzano-Bozen, Italy)

GenAI | inclusive planning | systematic review

With the rapid advancement of Generative Artificial Intelligence (GenAI), an expanding body of research has examined its impact on educational contexts. Former reviews have mapped the breadth of its applications and identified emerging trends, outlining both potentialities and challenges (Bahroun et al., 2023). Among these, a growing strand of research suggests that GenAI may also represent a significant resource for fostering inclusion processes in classroom and schools (De Mutiis et al., 2025; Lata, 2024). Research at the intersection of AI and inclusion, however, remains relatively recent and still fragmented. Some authors have, for example, analysed the impact of AI on learning outcomes and engagement among students with Special Educational Needs (SEN), the barriers encountered by educators in adopting AI-based solutions, and the ethical, pedagogical, and organisational challenges related to its implementation (Julien, 2024; Melo-López et al., 2025; Pagliara et al., 2024; Tsirantonaki & Vlachou, 2025). Overall, the literature indicates promising developments but also underscores the need for critical reflection on teacher pedagogical agency, ethical judgement, and the risk of reproducing existing inequalities. Inclusive planning constitutes a professional practice in which GenAI can meaningfully support teachers (Wang et al., 2025; Westover, 2025; Zanon et al., 2024). Planning can be understood as a complex professional competence that integrates teachers' knowledge, skills, values, and attitudes, all of which are essential to effective and high-quality teaching (Munthe & Conway, 2017). Within inclusive education, planning is particularly demanding. It involves not only responding to the diverse social and individual learners' characteristics and life histories but also creating learning environments that are attentive and responsive to these differences. This entails ongoing critical reflection on individual biases, assumptions, and attitudes toward diversity. At the same time, teachers are required to navigate and mediate among fragmented policies and regulatory frameworks operating at different levels (e.g., international discourses on inclusion, national inclusion policies, curriculum standards) (Demo et al., in press). In this context, AI could act as a supportive tool in addressing the cognitive, organisational, and reflective dimensions of inclusive planning, making it more sustainable for teachers (Bucchiarone et al., 2024; Moundridou et al., 2024). On this background, the present study aims to systematise recent international empirical and applied research investigating the contribution of Generative Artificial Intelligence (GenAI) to inclusive planning processes in K-12 educational setting. A systematic review

was conducted following the PRISMA protocol (Page et al., 2021) to synthesise studies published between January 2023 and January 2026. The search was conducted on 23 February 2026 across three databases (ERIC, Scopus, and Web of Science) and yielded a total of 1,714 records after duplicate removal. Currently, a blind screening of these records is realised based on predefined inclusion and exclusion criteria. The analysis of the studies in the review will combine thematic and deductive approaches, drawing on existing literature to define coding categories for data extraction. The review's findings are expected to guide the development of reflective AI-supported instructional practices that promote inclusive teaching and learning, providing practical insights for designing learning environments responsive to diverse student needs.

BETWEEN REGULATORY REFORM AND LIVING PRACTICE: THE NUPE 2 PROJECT AS AN INVESTIGATION INTO INCLUSION AND EQUITY IN PRIMARY SCHOOLS

Amalia Lavinia Rizzo (Roma Tre University, Italy) · **Donatella Visceglia** (Roma Tre University, Italy) · **Alessia Tomei** (Roma Tre University, Italy) · **Ester Caparrós Martín** (University of Malaga (Spain)) · **Nieves Blanco Garcia** (University of Malaga (Spain))

School Inclusion | Educational Equity | Teacher Training

This paper presents the "Nupe-2" project, promoted by the University of Malaga in collaboration with the Universities of Barcelona, Valencia, Madrid, Cadiz, Gran Canaria, Roma Tre, UniKore, and Verona, which is scheduled for completion in June 2027. The project aims to investigate how legislation influences and is implemented within school practices in Italy and Spain, particularly concerning the development of the concepts of equity and curriculum personalization, the realization of full special and inclusive education, the construction of teacher identity, and the specific training dedicated to these areas. Specifically, this contribution presents the work conducted by the Research Group at Roma Tre University through a case study involving a comprehensive institute (Istituto Comprensivo) located in the Garbatella district of Rome. The research is situated within a period of profound transformation in the Italian school system, characterized by the revision of the Indicazioni Nazionali (National Guidelines) and an intense cultural and pedagogical debate. Within this context, critical questions emerge concerning equity, initial teacher training, curriculum fragmentation, and the

management of special educational needs, which is often experienced in conditions of professional isolation. The methodological approach integrates various qualitative instruments: unstructured and structured classroom observations (including lectures, group work, assessments, and informal moments); observations of teachers; narrative interviews with key institutional figures (principals, classroom teachers, and support teachers); and focus groups conducted with primary and lower secondary school teachers. The findings offer significant insights, suggesting a need to reinforce structured spaces for teacher collaboration, to promote ongoing, practice-based professional development, to support an integrated curricular approach, and to develop policies that enhance the community dimension of the school.

Neurodiversity, Education, and Social Justice

PANEL CONVENORS: Marco Cadavero (Alma Mater Studiorum Università di Bologna); Anna Salerni (Sapienza Università di Roma, Italy); Silvia Zanazzi (Università degli Studi di Ferrara, Italy)

PANEL KEYWORDS: Neurodiversity, Education, Social Justice

Neurodiversity refers to the natural variability of human neurocognitive functioning—the plural ways in which we attend, sense, move, communicate, and learn. The panel invites proposals that move beyond deficit-based and medicalized frameworks to consider neurodivergence as an epistemic, social, and democratic resource. This paradigm concerns the various conditions of neurodivergence that may entail special educational needs, as well as the potentially limitless neurological variability found among individuals. The term "neurodiversity" should therefore not be associated with disability and special education, but with the differences and neurological variability that characterize and represent the richness and expressive capacities of human beings. Indeed, we are all neurodiverse, since neurodiversity is a subset of the broader concept of biodiversity. Embracing the concept of neurodiversity in the worlds of education, training, and work thus means adopting a perspective of equity, democracy, and social justice, with a view to excellence for all and for each person. The panel aims to articulate an intersectoral and eco-social approach to education—across early childhood, schools, higher and adult education, workplaces, and other contexts —that recognizes neurological diversity as part of biodiversity and as a condition for excellence. By centering equity, voice, and social justice, we ask how education can shift from remediation to transformation, building environments in which different minds can flourish and contribute to democratic life.

UNVEILING HETEROGENEITY IN COGNITIVE FATIGUE: A METHODOLOGICAL FRAMEWORK FOR ASSESSING INDIVIDUAL DIFFERENCES IN SCHOOLCHILDREN

Margarita Bogdanova (Università degli Studi della Campania "Luigi Vanvitelli", Italy) · **Davide Di Palma** (Università degli Studi della Campania "Luigi Vanvitelli", Italy)

Cognitive fatigue | reaction time variability | educational equity

Cognitive fatigue affects learning. Loss of concentration and impulsivity are often interpreted by teachers as a lack of motivation, which can lead to stigmatization and educational inequality. Many studies rely on average data, making it difficult to distinguish how differently children react to cognitive load. This methodological proposal for a doctoral project describes the design of a study aimed at identifying markers of cognitive fatigue. Using a sample of 250-300 schoolchildren (ages 9-13), we propose using reaction time variability and ex-Gaussian distribution parameters (specifically tau). The analysis will take place in three stages. First, we will apply latent profile analysis to performance metrics from

sustained attention tasks (specifically, the SART) to identify hidden behavioral patterns and compare them with teacher evaluations. Second, we will check whether these patterns persist after 6-9 months, while controlling for sleep and stress levels. In the third stage, we will evaluate executive functions specifically inhibitory control and working memory which may explain these differences. The goal of this project is to shift the focus from correcting children's behavior to supporting the cognitive mechanisms that require attention.

INCLUSIVE SCHOLARLY ECOLOGIES: REIMAGINING THE SCHOOL WITHIN THE AUTISM SPECTRUM THROUGH BEST PRACTICES AND SYSTEMIC HABILITATIVE INNOVATION'

Valentina Perciavalle (Università degli studi di Catania, Italia) · **Maria Luisa Boninelli** (Università degli studi di Catania, Italia)

autism spectrum | AAC (Augmentative and Alternative Communication) | video modeling

The aim of this contribution is to establish the parameters for the systemic regeneration of the educational institution, with the objective of collaboratively creating neuro-affirmative educational and formative ecosystems. The aim is to move away from inflexible performance-based standards and towards an educational approach that acknowledges the diversity of neurocognitive abilities as an essential component of learning. Adopting an inclusive approach, educational and didactic practice avoids oversimplification, instead embracing profound complexity — one capable of harmonising the empirical evidence of inclusive habilitative strategies with an ethic of radical hospitality. Overcoming the limitations of a purely custodial or welfare-based model, this research elevates the habilitative dimension to the fulcrum of educational practice. Here, habilitation is not construed as mere functional correction, but as the proactive empowerment of autonomy and cognitive architecture through the regeneration of learning environments. The architecture of this systemic innovation is substantiated by the integration of proven-effective iconic-symbolic mediators. Firstly, Augmentative and Alternative Communication (AAC) is examined within the framework proposed by David Beukelman and Pat Mirenda, which is elevated to a democratic infrastructure of thought in this study. This is manifested through practices such as adopting communication boards and environmental engineering (modelling), which are designed to transform the school setting into a 'speaking context' where forced silence gives way to self-expression. Simultaneously, the study analyses the heuristic value of Carol Gray's Social Stories. These instruments decode human interactions using a hermeneutic approach, offering students narratives and visual scripts that provide a sense of direction in the face of relational uncertainty, thereby reducing the mental distress caused by social unpredictability. Video modelling, a technique refined by James Buggey's research, complements this apparatus by leveraging the prevalence of visual processing channels to facilitate the acquisition of functional practices and complex behavioural sequences. By observing filmic models, students learn to understand and carry out a range of actions, from managing school routines to making small decisions every day. This helps them avoid the burden of having to speak in front of others, which can feel overwhelming and cause anxiety. In this way, educational and didactic action is configured as a systemic process that empowers not only individuals, but also the entire educational community, promoting an epistemology of cognitive pluralism. Thus, inclusive education rejects a model of schooling that is limited to mere hospitality. Instead, it is a constantly regenerating, scientifically grounded and humanly dense sanctuary that guarantees every student on the autism spectrum the inalienable right to a life trajectory oriented towards self-actualisation.

FROM CLINICAL INTERVENTION TO UNIVERSAL EDUCATION: THE STARC PROTOCOL FOR SOCIO-EMOTIONAL LITERACY IN AN INCLUSIVE SCHOOL

Michele Galloni (CuoreMenteLab Social Enterprise, Italy) · **Marco Cadavero** (CuoreMenteLab Social Enterprise, Italy; University of Bologna, Italy)

Neurodiversity | Social Skills Training | Socio-Emotional Literacy

Social skills training (SST) programmes have traditionally been delivered to autistic adolescents in clinical settings, framing social difficulties as individual deficits requiring remediation. The neurodiversity paradigm challenges this assumption, reframing cognitive differences as natural human variation and calling for a “coexistence of differences” rather than assimilation into normative standards (Singer, 1999; Acanfora, 2022). Drawing on Neurodiversity Pedagogy (Cadavero & Salerni, 2022) and Universal Design for Learning (CAST, 2024), this paper asks what happens when a structured SST protocol designed for autistic adolescents is recontextualised as universal socio-emotional education for an entire school population — and what institutional conditions support or hinder this shift, now endorsed by Italian Law No. 22/2025 on non-cognitive and transversal skills in schools. The project “Socio-Emotional Literacy at School” (Alfabetizzazione socio-emotiva a scuola), co-funded by Associazione Spazio Asperger ONLUS and Fondazione Varrone, applied the STARC protocol (Social Training and Affective Regulation Curriculum), developed by CuoreMenteLab and grounded in the PEERS programme (Laugeson & Frankel, 2010) and Cognitive Affective Education (Attwood, 2004), to the entire student body of a lower secondary school in central Italy. Following earlier Italian work transposing clinical autism protocols into mainstream education (Agrillo, Zappalà & Aiello, 2019), around 150 students (aged 10–14) from a heterogeneous, non-screened school cohort participated regardless of diagnostic status. The protocol comprised 32 weekly two-hour sessions on conversational skills, non-verbal communication, affective regulation, and bullying management. Teaching staff received concurrent training in cognitive-behavioural social coaching. Methodologically, the study adopts an exploratory single-case design (Yin, 2018), treating the project as a bounded case of protocol transposition from clinical to educational setting. The case is analysed through triangulation of three data sources: (1) a quantitative baseline collected from 82 students and 68 parents using validated measures of social knowledge (TAASK-R), social self-statements (SISST), social responsiveness (SRS-2), emotional distress (DASS-21), and socialisation quality (QSQ); (2) practitioner field notes on implementation processes and barriers; and (3) institutional correspondence documenting the school–research relationship. Post-intervention data collection was largely prevented by the school’s failure to facilitate follow-up: no student post-test data and only 11 parent questionnaires were obtained. The paper, therefore, does not claim programme effectiveness but uses the case to analyse the conditions and limits of universalising a neurodiversity-informed protocol. The case yields three analytic insights. First, the baseline offers a descriptive profile of socio-emotional functioning in a non-clinical school cohort through instruments usually confined to clinical research. Second, making the hidden curriculum of social interaction explicit for all students repositions socio-emotional learning as a universal educational entitlement rather than a compensatory service for a few, a matter of educational equity and de-stigmatisation. Third, implementation data reveal the institutional fragility of this shift: oversized groups, uneven teacher engagement, and the collapse of agreed research procedures constrained both pedagogical continuity and evaluative rigour. The paper argues that the value of neurodiversity-informed social learning lies not in normalising individual students but in transforming the peer environment, with implications for inclusive pedagogy, school–research partnerships, and socio-emotional literacy as a question of social justice.

TEACHING PHYSICS TO NEURODIVERGENT STUDENT: WHICH METHODOLOGIES FOSTER EFFECTIVE LEARNING?

Emanuele Zito (Università degli Studi di Palermo, Italy) · **Claudio Fazio** (Università degli Studi di Palermo, Italy)

Neurodiversity | physics education | laboratory learning

This study mainly aims to investigate which methodology - between "Explicit Instruction" [1] and "Inquiry-Based-Science-Education" (IBSE) [2] is best suited for one neurodiverse physics student at the University of Palermo and whether the modern technology such as ChatGPT can support the execution of four laboratory activities selected by the researchers, namely the study of Ohm's law, the study of the charging and discharging process of a capacitor, the study of the magnetic field generated by solenoid carrying direct current and the verification of the Faraday-Neumann-Lenz law. It is worth noting that the last experiment was conducted over 43 days to analyze whether the neurodivergent student maintained the ability to use the laboratory instruments and remembered the earlier laboratory activities, as the last aim of the research. To gain a better understanding of the learning processes implemented by the neurodivergent student, the researchers had him experience three different situations in the physics laboratory. One with only one of the researchers acting as a guide, one with a neurotypical group of students (a neurotypical person is an individual whose neurological, cognitive, and behavioral functioning aligns with what is considered typical or standard within the general population) and one where the neurodivergent student worked alone. In all these situations, ChatGPT was available to use as a lab-partner. In the study, qualitative data collection methods, such as participant observation [3] and semi-structured interviews [4], and Interpretative Phenomenological Analysis (IPA) methods [5, 6, 7] were used to collect and analyze the answers and perceptions of the one neurodivergent student.

COSMIC ROOTS: NEURODIVERSITY AS A RESOURCE FOR EXPLORING CONNECTIONS BETWEEN COSMOS AND EARTH

Leonardo De Deo (Dept. of Physics and Astronomy, University of Bologna, Via Gobetti 93/2, 40129 Bologna, Italy; INAF - Osservatorio di Astrofisica e Scienza dello Spazio di Bologna, Via Gobetti 93/3, 40129 Bologna, Italy) · **Bartolo Giuseppe Dimattia** (Dept. of Food and Agricultural Science, Viale Fanin 46, 40127 Bologna, Italy) · **Luca Bergonzini** (Dept. of Medical and Surgical Sciences, Via Massarenti, 9, 40138 Bologna, Italy) · **Lorenzo Bernini** (Conservatorio di Musica "B. Maderna – G. Lettimi", Corso Comandini 1, 47521 Cesena, Italy)

Neurodiversity | Astronomy | Interdisciplinarity

In a context marked by widening inequalities in access to scientific knowledge, ensuring equitable participation becomes a matter of democratic relevance. This contribution presents Cosmic Roots, a science communication project developed for people with mild intellectual disabilities and diverse cognitive profiles, exploring how astronomy-based non-formal learning can foster equitable and neurodiversity-informed practices that promote social justice. Rather than approaching disability through deficit-based or medicalized frameworks, the project adopts a neurodiversity perspective that recog-

nizes variability in perception, cognition and expression not as a limitation but as an epistemic and relational resource. Developed through a collaboration between the University of Bologna and Associazione Volhand, an organization supporting people with disabilities, the project engages participants as co-creators of meaning within multisensory and dialogical activities. Central to this approach is the physical and symbolic connection between Cosmos and Earth, so that astronomy becomes a narrative bridge linking stellar processes to ecological cycles. This process is mediated through personal reinterpretations of scientific concepts, including artistic and musical practices. Within this framework, cognitive and neurological variability becomes a collective resource that enriches interpretation, and expands the range of meanings. The project is grounded in the principles of Universal Design for Learning [1], which provide guidelines for designing educational experiences that accommodate diverse perceptual, cognitive and expressive needs. It also dialogues with inclusive outreach experiences such as “Stelle per Tutti” of the Unione Astrofili Italiani, and responds to recent reviews that call for broadening inclusive practices towards cognitive diversity [2]. Over more than three years of activity, the project addressed the following research questions: (1) How can astronomy-based initiatives be designed to value neurocognitive diversity as a resource? (2) What forms of agency and collective identity emerge when participants are positioned as knowledge-makers? (3) In which ways can science act as a mediator of social cohesion and democratic participation? Methodologically, the project combines: in-person discussion meetings; participatory workshops integrating science, ecology, music and the arts; public outreach events; and educational visits to observatories and cultural institutions. A distinctive feature is the creation of an experimental garden, where cultivating wheat varieties becomes an embodied exploration of solar energy transformation on Earth. This dimension reinforces the conceptual link between neurodiversity and biodiversity, situating human variability within a broader ecological framework. Impact has been periodically assessed through questionnaires, focus groups and semi-structured interviews. Findings indicate increased perceived scientific competence, strengthened self-confidence, reinforced group cohesion, and a deepened sense of belonging [3, 4, 5]. Participants report feeling recognized and valued for their unique ways of thinking and expressing themselves. The project has recently expanded through the publication of an illustrated book [6], and new music laboratories that explore alternative narrative languages. Overall, Cosmic Roots illustrates how astronomy-based non-formal learning can move from compensatory to transformative inclusion. The project demonstrates how neurodiversity can enrich the ways in which scientific phenomena are interpreted and understood, functioning as both an epistemic and democratic resource.

BLOOM IS MASLOW: LEARNED EPISTEMIC HELPLESSNESS, NEURODIVERSITY, AND THE FALSE HIERARCHY BETWEEN WELLBEING AND THOUGHT

David Vagni (Institute for Research and Innovation in Biomedicine - Italian National Research Council (IRIB-CNR), Italy) · **Marco Cadavero** (University of Bologna, Italy)

epistemic helplessness | epistemic initiative | pedagogy of differences

A widely endorsed principle in educational discourse holds that “students need Maslow before they can Bloom”: basic psychological needs must be satisfied before higher-order thinking becomes possible. Ellis, Kirby, and Osborne (2023/2025) appropriately question whether Maslow’s needs should be conceived as a hierarchy at all, and demonstrate that neurodivergent learners’ higher-order cognitive abilities can actually interfere with apparently simpler tasks, inverting Bloom’s taxonomy. These observations open a door that this contribution walks through: the Maslow–Bloom relationship is not merely non-hierarchical — it is circular, and the prevailing educational model systematically breaks the loop. The mechanism proposed is Learned Epistemic Helplessness (LEH): a self-reinforcing condition, installed by chronic authority-dependent instruction, in which the expectation that one’s thinking is irrelevant, the behavioral extinction of initiative, and

the affective association of independent thought with anxiety converge into stable epistemic passivity. The drives LEH suppresses — curiosity, exploratory play, effectance, the drive to explain (Panksepp, 1998; Gopnik, 1998; White, 1959; Ryan & Deci, 2017) — are not higher-order achievements atop Maslow's pyramid. They are basic psychological needs whose frustration produces the very symptoms — anxiety, disengagement, loss of agency — that we interpret as evidence that the student "is not ready" for higher-order thinking. Suppressing Bloom damages Maslow. For neurodivergent learners, the causal direction can be inverted entirely. The autistic child whose exceptional explanatory drive (Rutherford & Subiaul, 2016) is frustrated by conformity-rewarding environments does not first need "stabilizing": systematizing is their regulatory mechanism. The child with ADHD, whose dopaminergic system is under-engaged (Volkow et al., 2009), does not need "calming down" before engaging in demanding cognition: intrinsic challenge activates the self-regulation the classroom demands. Twice-exceptional learners face the sharpest version: told to Maslow before they can Bloom, while Bloom is precisely how they Maslow. The system reads the resulting distress as confirmation these students were not ready — a self-fulfilling prophecy that LEH renders visible and falsifiable. In response, Epistemic Initiative (EI) is proposed: a four-phase method that restores the Bloom–Maslow loop by inverting the traditional learning sequence. Crucially, EI does not reassert the primacy of doing over instruction (Dewey's learning by doing), nor of instruction over doing (traditional pedagogy): it asserts the primacy of autonomous model construction before both — before experimenting and before receiving formal teaching. The student first builds their own explanatory model, however rudimentary, then compares it against epistemically diverse sources (Wineburg & McGrew, 2019), identifies where it fails, and reflects on the process itself. The empirical foundation draws on Productive Failure (Kapur, 2014), the self-explanation effect (Chi, 2000), and desirable difficulties (Bjork & Bjork, 2011). Within the "pedagogy of differences" framework advanced by Cadavero and Salerni (in Ellis et al., 2025), LEH and EI supply the cognitive-motivational mechanism that connects intersectional analysis to classroom transformation: understanding not only which differences are marginalized, but how authority-dependent instruction installs epistemic passivity, and what operative sequence can reverse it. Bloom is Maslow. The task is to stop breaking the loop.

INVISIBLE TARGETS AT SCHOOL: CAMOUFLAGING, CYBERBULLYING AND OVERLOOKED RISKS FOR GIRLS WITH MILD AUTISM

Letizia Cavalli (Salesian Pontifical University (UPS) - Rome, Italy) · **David Vagni** (Institute for Research and Innovation in Biomedicine - Italian National Research Council IRIB-CNR)

autistic girls | cyberbullying | critical pedagogy

Autistic students experience peer victimization at dramatically higher rates than neurotypical peers, with prevalence reaching 73% versus 10% (Fisher & Taylor, 2016). Yet this disparity conceals a further layer of invisibility shaped by the intersection of gender and neurodivergence: autistic girls, who engage in social camouflaging more extensively and at greater personal cost, are systematically overlooked by detection systems and anti-bullying interventions too often built

upon neurotypical and androcentric norms. Camouflaging is positively correlated with victimization (Trundle et al., 2023), producing a paradoxical cycle: autistic girls suppress neurodivergent traits precisely to avoid bullying (Cage & Troxell-Whitman, 2019), but the resulting appearance of competence leads educators to underestimate their vulnerability and withdraw support. Indeed, 65.9% of parents report that camouflaging directly reduced school assistance (Zhuang et al., 2023). Later diagnosis, more common among girls, is associated with both greater camouflaging and more severe costs (Goscicki et al., 2025). Online, autistic girls face elevated risks of sexual harassment, while cyberbullying prevention programs rarely address the unique online safety needs of autistic young people (Triantafyllopoulou et al., 2022). This paper frames such dynamics as a form of what Fricker (2007) terms epistemic injustice, both testimonial, in that autistic girls' accounts of suffering are discredited when their behavior appears "typical," and hermeneutical, in that educational systems lack the interpretive resources to recognize camouflaging as distress rather than adaptation. As Fisher et al. (2025) argue, neuro-normative epistemic injustice operates systemically within education, so that struggling neurodivergent children are treated as pathological outliers rather than as indicators of environmental failure. Drawing on critical pedagogy (Freire, 1970), we argue that standard anti-bullying frameworks operate as what Freire would call a "banking" approach to safety: they deposit universal protocols (peer reporting, behavioral markers, social-emotional curricula) into contexts presumed to be neutral, ignoring the power asymmetries that shape whose vulnerability is legible and whose remains structurally erased. We further argue that gendered expectations of social conformity compound neurotypical ones, producing a double bind in which autistic girls must perform both femininity and neurotypicality to access belonging. From the perspective of neurodiversity pedagogy (Cadavero & Salerni, 2022), which proposes to recognize neurological variability as a central variable for educational sciences alongside cross-cultural and gender pedagogies, camouflaging should be read not as evidence of successful inclusion but as a systemic signal of environmental failure. This requires a shift from remediation of individual deficits to what we term neurodiversity-informed critical prevention: anti-bullying approaches that move beyond universal programs, which, even with general populations, prove effective only when tailored to specific risk profiles (Formella & Cavalli, 2018), and incorporate multi-informant assessment not reliant on neurotypical expressions of distress; that involve neurodivergent voices in program design, following the participatory epistemology central to both Freirean and disability-rights traditions; and that integrate school-based identity support, such as group interventions fostering autistic identity construction among adolescent girls (Travaglione, Cavalli, & Vagni, 2021), aimed at reducing the perceived necessity of camouflaging by creating contexts where neurological difference constitutes a legitimate form of participation in democratic school life.

NEURODIVERSITY AS EPISTEMIC JUSTICE: COGNITIVE DEMOCRACY AND DECOLONIAL PERSPECTIVES FOR TRANSFORMING EDUCATION

Giorgio Poletti (University of Ferrara, Italy)

epistemic Justice | cognitive democracy | decolonial pedagogy

In recent decades, the concept of neurodiversity has increasingly challenged deficit-oriented perspectives on neurological difference, proposing instead that cognitive variability is a natural and valuable dimension of human diversity (Kapp, 2020; Dwyer, 2022). Within educational discourse, however, neurodiversity is still frequently framed in terms of accommodation, remediation, or support for students identified as having special educational needs. While these approaches have contributed to greater awareness and inclusion, they often leave unquestioned the epistemic norms that structure educational institutions and define what counts as legitimate knowledge, learning, and intelligence. This paper argues that neurodiversity should be understood not only as an issue of inclusion but as a matter of epistemic justice (Fricker, 2007). From this perspective, educational systems can reproduce forms of testimonial injustice, in which neurodivergent individuals' perspectives and experiences are dismissed or undervalued, as well as hermeneutical injustice, where dominant interpretive frameworks fail to adequately represent neurodivergent ways of understanding the world. Addressing these injustices requires moving beyond compensatory models toward a broader transformation of educational epistemologies. The study draws on theoretical perspectives from epistemic justice, cognitive democracy, and decolonial education to develop a conceptual framework for interpreting neurodiversity as a resource for plural knowledge ecologies. Cognitive democracy theories emphasize that democratic societies depend on the coexistence of diverse forms of knowledge, perspectives, and problem-solving strategies (Santos, 2018). Similarly, decolonial scholarship highlights how dominant epistemologies often marginalize alternative ways of knowing (Mignolo & Walsh, 2018). When viewed through this lens, neurodiversity can be interpreted as a form of cognitive plurality that enriches collective intelligence and expands the boundaries of educational knowledge. In this context, the paper explores three interconnected research questions: how neurodiversity can be interpreted as a matter of epistemic justice within contemporary educational systems, and consequently how prevailing educational norms and institutional practices produce epistemic exclusions that affect neurodivergent students. This ultimately leads to a further research and educational question: how educational environments might be reimagined as democratic ecologies of knowledge, capable of supporting diverse cognitive styles and ways of knowing. To address these questions, the paper develops a philosophical-pedagogical analysis that connects neurodiversity to broader debates on social justice, knowledge pluralism, and democratic participation in education. Particular attention is paid to the role of learning environments, pedagogical design, and knowledge representation in shaping the epistemic conditions in which diverse cognitive perspectives can be expressed and valued. Recent research suggests that inclusion policies in higher education frequently remain limited to procedural accommodations rather than addressing deeper structural inequalities embedded in knowledge systems and curricula (Clouder et al., 2020; Botha & Gillespie-Lynch, 2022). By linking neurodiversity with epistemic justice and cognitive democracy, this paper proposes a shift from integration to epistemic transformation, where educational institutions become spaces for cultivating diverse cognitive perspectives and forms of understanding. Ultimately, embracing neurodiversity as epistemic justice means recognizing that the plurality of minds is not merely a challenge for education but a fundamental condition for democratic knowledge societies capable of responding creatively to the complexity of contemporary global challenges.

DEMOCRATIC SCHOOLS IN THE NETHERLANDS: THE BLOSSOMING OF NEURODIVERSITY

Paola Amoruso (Radboud Universiteit, Netherlands, The)

Neurodiversity | Education | Social Justice

Students with neurodivergent profiles and learning differences often struggle to find recognition and a sense of belonging within conventional educational systems (Fisher et al. 2025). Even as awareness of neurodiversity grows, many schools remain organized around implicit expectations about how students should behave, and learn (Zawidzki 2008, Lynch & Lodge, 2024). As a result, the experiences and perspectives of neurodivergent students are rarely taken seriously when educational pathways are designed. This can lead to forms of epistemic injustice, in which students' own understandings of their learning, educational and personal needs are overlooked within public schooling contexts (Zembylas 2023). This paper explores what an alternative educational environment looks like, by presenting a qualitative case study of democratic schools in the Netherlands that attempt to organize their educational practices around more just and inclusive principles (Bergman, van, and Meerbeek-Zwetsloot 2024). Rather than treating neurodivergence as a deviation from the norm or something that needs to be accommodated through special measures, the school approaches neurological variability as a natural and valuable aspect of human diversity (Chapman 2021). In this sense, neither neurodivergence nor neurotypicality functions as the standard against which students are measured. Instead, the school starts from the assumption that diversity of minds, interests, and ways of learning is the ordinary condition of any educational community, including teachers as well as students (Strijbos & de Bruin 2025). The paper first describes some of the philosophical and organizational principles that shape the democratic structure of the school. Particular attention is given to its participatory governance, the emphasis placed on student agency, and the alternative ways in which evaluation and educational progress are understood (Angélique Del Rey 2018). These elements aim to create an environment where students are not primarily defined through diagnostic labels or perceived deficits, but are recognized as individuals capable of shaping their own learning paths. The paper also reflects on how such an educational model relates to questions about future opportunities and participation in society. A common concern is that highly flexible and self-directed forms of education might make it more difficult for students to enter the labor market. However, the experience of this school suggests that when students are given meaningful agency and responsibility for their learning, they are able to develop trajectories that are both personally meaningful and compatible with later professional paths. Students' own accounts of their experiences at the school suggest noticeable improvements in well-being, self-confidence, and engagement with learning. These testimonies point to the possibility that educational environments grounded in democratic participation and recognition of neurocognitive diversity can foster forms of flourishing that are often difficult to achieve in more standardized systems. The paper concludes by addressing a remaining challenge. While democratic and neurodiversity-affirming schools can offer promising alternatives to traditional education, they are often small and relatively difficult to access. An important question for future research and educational policy is therefore how similar educational principles might be implemented more broadly, and how such opportunities could become available to students from less economically privileged backgrounds.

NARRATING NEURODIVERSITY. A PHENOMENOLOGICAL INQUIRY INTO THE LIVED EXPERIENCES OF PRE-SERVICE EDUCATORS

Marco Cadavero (Alma Mater Studiorum - Università di Bologna) · **Anna Salerni** (Sapienza Università di Roma) · **Silvia Zanazzi** (Università di Ferrara, Italy) · **Valeria Friso** (Alma Mater Studiorum - Università di Bologna)

neurodiversity education social justice

In the contemporary educational landscape, neurodiversity is increasingly recognized not as a set of deficits to be cured, but as the natural variation in how human beings think, feel, move, perceive, and communicate. This paradigm shift demands that future educators move beyond a purely diagnostic lens toward a social justice perspective that values cognitive differences. This contribution explores how undergraduate students in Education Sciences at Sapienza University of Rome and the University of Ferrara, as well as graduate students at the University of Bologna, perceive and internalize neurodiversity. Viewing neurodiversity as a broad spectrum of human communication and thought, we aim to reveal the core attitudes that influence how future educators will practice inclusion in their professional practice. To capture the essence of these perceptions, this study employs a phenomenological methodology, focusing on participants' lived experiences. Phenomenology allows us to move past abstract theories and delve into the subjective meanings students assign to their encounters with neurodiversity. The research design is structured in two distinct phases: Individual Reflection: students are first asked to engage in an introspective exercise, documenting personal encounters with neurodiversity in school, family, or professional settings. They are encouraged to record significant moments, whether positive or challenging. Collaborative Storytelling: participants then form small groups to share their reflections and co-construct a narrative artifact (a story, presentation, or multimedia product). These stories, which may be real, imagined, or a hybrid of both, serve as collective representations of what they deem essential to communicate about neurodiversity from their future educator standpoint. The resulting artifacts are analyzed using thematic analysis to identify recurring patterns of meaning, metaphors, and tensions that characterize the students' understanding of diverse cognitive profiles. The primary goal of this research is to unearth the implicit perceptions of future educators regarding neurodiversity. We hope to achieve the following outcomes: Understanding student perspectives: we want to see whether students still view neurodiversity as a medical problem to be solved or as a natural human difference to be valued. We also aim to understand the emotions—such as anxiety, empathy, or confidence—that arise when they face these differences. Improving professional training: by identifying where students feel confused or harbor unconscious biases, we can design better university courses. This will help us provide future educators with the specific tools and support they need to work effectively in inclusive environments. Enhancing reflective practice: demonstrate how narrative and phenomenological tools can be integrated into university curricula to foster self-awareness and ethical responsibility. Ultimately, this study seeks to inform the design of transformative training programs. By analyzing the stories students tell, we can better prepare them to build educational environments where neurodivergent individuals are not just "included," but are truly understood and valued for their unique ways of being in the world.

OPAQUE FOR WHOM? NEURO-ALGO-DIVERGENT PERSPECTIVES IN THE DIGITAL SOCIETY

Giacomo Astorri (University of Bologna, Italy)

generative artificial intelligence | neurodiversity | social justice

The advent of Generative Artificial Intelligence (GenAI), now massively present across various sectors of our society, raises concerns of various kinds. A close examination of current educational research regarding teaching-learning processes in relation to GenAI reveals apprehensive discussions about cognitive diminishment (Fasoli et al., 2025; Kosmyna et al., 2025) and the compromise of individual agency. This occurs in contexts where algorithmic efficiency overshadows individual talents, rendering subjects "neuro-inferior" when compared to the capacity of prominent large language models to process data, identify recurring patterns, and provide formally adequate answers to complex questions. Furthermore, considering the pervasiveness and design features of these "enunciation-producing machines" (Mackenzie, 2017), individual autonomy could effectively become a "collateral victim," leading to increased standardization and, for neurodivergent individuals, greater social exclusion. However, this perspective risks obscuring the emancipatory potential of GenAI for neurodivergent subjects. This contribution explores how GenAI, if integrated within an ethical and transparent framework and mediated by good pedagogical principles, can transform from a threat into an essential cognitive prosthesis for those who have historically encountered barriers in developing their academic (among others) agency. Through the concept of "artificial agency" (Floridi, 2025), a pedagogy is proposed that does not chase algorithmic performance, but instead values the "slowness of the human gesture" as a space for empowerment. This approach aims to prevent social exclusion and guarantee the right to personalized learning, driven by individual needs and mediated by GenAI. In this way, a genuine protection of individual specificity could be ensured through the lens of social justice, leveraging the high potential of GenAI systems in a profoundly democratic sense

NEUROSPHERE: DESIGNING THE "AUTISTIC CITY" THROUGH NEURODIVERGENT CULTURE AND INCLUSIVE URBANISM OUTLINE:

Eleononora Varriale (Neurosphere, Italy)

Neurodiversity | Neuroqueer | development

This panel explores the intersection of neurodiversity and urban design, moving beyond traditional accessibility toward the innovative concept of the "Autistic City." Drawing on the framework of "Neurotribes" and the emerging "Neurosphere," the session examines how urban environments can be reimagined to accommodate diverse sensory profiles and cognitive patterns. Modern cities are predominantly designed for "neurotypical" standards, often resulting in sensory overload, unpredictable environments, and rigid social expectations that marginalize neurodivergent individuals. This panel argues that integrating neurodivergent culture into urban planning—focusing on sensory regulation, "soft" social interfaces, and predictable spatial hierarchies—does not merely benefit autistic citizens but creates a more livable, resilient city for all. We will discuss how the "Neurosphere" acts as both a digital and physical layer of support, fostering community agency and

radical inclusion. By shifting the paradigm from "pathology" to "human variation," we aim to define new interdisciplinary guidelines for the "Right to the City." Key topics include the creation of urban decompression zones, the reduction of sensory friction in public infrastructure, and the role of inclusive housing. The panel brings together urban planners, sociologists, and advocates to foster a dialogue that celebrates cognitive plurality as a cornerstone of future sustainable cities.

COMMUNICATIVE ACCESSIBILITY AND SOCIAL JUSTICE: CO-EVOLUTION AND NEURODIVERSITY IN PRIMARY SCHOOL

Isabella Bennardi (Università degli studi di Bologna, Italy) · **Patrizia Sandri** (Università degli studi di Bologna, Italy)

Neurodiversity Coevolution Accessibility

This paper presents the outcomes of an inclusive educational project implemented in a fourth-grade primary school classroom, aimed at fostering the full participation of a pupil with autism spectrum disorder, Level 3 (DSM-5). The project frames communicative accessibility as a prerequisite for equity and as a driver for social justice in school settings: ensuring that each learner has real—not merely formal—opportunities to be present, understand, express themselves, influence classroom activities, and feel a sense of belonging. From this perspective, social justice does not coincide with the "integration" of an individual student; rather, it entails transforming the classroom's implicit rules—such as timing, language practices, assessment, and participation structures—which often privilege those who communicate and learn according to normative standards. The intervention integrated a cooperative language workshop (Johnson & Johnson, 1998) with the use of Augmentative and Alternative Communication (AAC; Cafiero, 2009), in line with principles of inclusive teaching (Cottini, 2018; Sandri, 2015), a socio-constructivist framework (Vygotsky, 2001), and the co-evolution paradigm (Canevaro, 2008; Sandri, 2019). A co-evolutionary lens conceptualizes neurodiversity as a dynamic relationship between individual and context: rather than intervening on a "deficit," the approach redesigns environments, mediations, and interactions so that difference does not generate exclusion. In terms of social justice, this shifts the focus from individual adaptation to the collective responsibility of the school community to remove barriers and redistribute opportunities for learning and recognition. Operationally, the programme included narrative and meaning-making activities in small groups, with cooperative roles, shared communicative routines, and AAC supports (symbols, communication boards, scripts, guided choices) to facilitate comprehension, expression, and turn-taking. The cooperative dimension fostered peers' shared responsibility, countering dynamics in which support is delegated exclusively to the teaching assistant and promoting participation that is not "assisted" but legitimized within ordinary classroom practices. AAC functioned as a tool for the democratization of communication: by making instructions, exchanges, and productions accessible, it expanded pupils' opportunities to take the floor (including through non-verbal modalities) and to be heard. The outcomes indicate a gradual increase in the pupil's communicative and relational initiatives, greater continuity in interactions with classmates, and improved quality of participation. In parallel, peers developed skills in listening, mediation, and the recognition of multiple forms of communication. Overall, the experience highlights how accessibility diapositives and co-evolutionary practices can operate as everyday actions of social justice: reducing participation inequalities, preventing marginalization, and building belonging through reciprocal learning.

A "DOOR" AS AN INCLUSIVE, DEMOCRATIC, TRANSFORMATIVE TOOL. NEURODIVERSITY, SYSTEMIC PERSPECTIVE, PROCESSES OF INCLUSION AND COEVOLUTION IN THE EDUCATIONAL COMMUNITY

Mariagrazia Marcarini (University of Bologna, Italy) · **Donatella Di Franco** (Istituto Comprensivo F.S. Cabrini - Plesso Tommaso Gulli Scuola Secondaria Primo Grado)

Neurodiversity Coevolution Equity

The project "A Door to Welcome", carried out in first-year lower secondary school class, originated from the students' desire to facilitate the inclusion of a classmate with Autism Spectrum Disorder, R., who was unable to cross the classroom door and attended lessons alone in the adjacent room (Mostafa, 2008; Bogdashina, 2021). This situation of self-isolation prompted his classmates to reflect on how to welcome him: for them, it represented exclusion and inequality (Booth&Ainscow, 2014; Demo, 2015; d'Alonzo, 2018; Cottini, 2019, 2025) and injustice. The art teacher, urged by R.'s classmates, discovered that he meticulously drew subway station signs, an interest that fascinated him, and developed with the students the project "A Door to Welcome". The project is grounded in the principles of inclusive education (Cottini, 2018; Sandri, 2019), cooperative learning (Dishon&O'Leary, 1984; Dunn&Dunn, 1978), differentiated classroom (Tomlinson, 1999, 2001, d'Alonzo, 2016) and in key concepts (Marcarini, 2016): coevolution (Canevaro, 2008; Sandri, 2019), affordance (Gibson, [1979], 1999), semantotopic approach (Franceschini, 1995), legibility (Lynch, 1960; Kaplan, S., 1987), integrative framework (Zanelli, 1986), and world-environment relationship (Mustacchi, 2002), within a perspective of equity and democracy. The project have two phases. The first starting from reflections on the symbolic function of the "door" (Biedermann, 2004), sliding doors were built from recycled materials and installed in the classroom, creating an environment similar to a subway carriage (Hall, 1969; Kaplan, S., 1987; Mura, 2011; Gaines et al., 2018). Through this mediation, R. gradually became familiar with the classroom space until, in the second year, he definitively entered the classroom and participated in school activities with his peers. The following year, the students asked to continue the project by adding a new symbolic element, "The Support," namely the handhold ring to grab for safety. This second phase aimed to foster reflection on personal potential with particular attention to an equity-oriented perspective (Sen, 1982) within an inclusive framework that means "embracing an ethic of justice" (Sandri, 2019, p. 109), so students may contribute to helping, involving, and including others by focusing on the person and their specific characteristics (Cottini, 2025), in order to recognize and understand their own developmental process in which neurodiversity could become both a resource and a strength and also an opportunity to understand that each of them is different and that everyone must have the same opportunities according to a democratic vision Each student, including R., reflected on their own character considering how they could support other people. All created a ring on which they wrote the type of support they could offer. Welcoming R. into the classroom by finding an appropriate strategy fostered a transformation in all students, as each learned to recognize neurodiversity and to accept the characteristics and ways of functioning of every individual within a vision of reciprocity aimed at developing a democratic relational approach. It offered everyone to enrich their learning within a friendly micro-context of coevolutionary respect (Sandri, 2019), to develop a culture of differences and citizenship within a welcoming environment for all (Cottini, 2025).

BEYOND COMPENSATORY INCLUSION: PARENTS' PERSPECTIVES ON SCHOOL AND SOCIAL PARTICIPATION AMONG NEURODIVERGENT CHILDREN IN ITALY

Simone Consegnati (INDIRE, Italy) · **Enrico Palladino** (Associazione Italiana Persone Down (AIPD))

Neurodiversity | Inclusive Education | Parents' Perspectives

In current debates on neurodiversity, education, and social justice, inclusion is increasingly understood not as a set of compensatory measures aimed at "fixing" individuals, but as the transformative capacity of educational and social environments to welcome difference, enable meaningful participation, and make rights and dignity concrete in everyday life. From this perspective, families' viewpoints are a central source of knowledge: parents witness how opportunities and barriers are continuously produced through the interaction of schools, services, informal networks, and local communities, shaping learning trajectories, belonging, recognition, and overall quality of life. This framing resonates with the "Pedagogy of Parents", which values families' experiential knowledge and educational competence, and acknowledges their role as active interlocutors in the relationship with institutions (Tortello & Pavone, 1999). This paper presents a mixed-methods study conducted in Italy on parents' lived experiences and representations of their children's school and social inclusion in the context of neurodivergence, with Down syndrome as the most frequently encountered condition (Dal Molin & Bettale, 2005). The study aims to: describe how families define and assess "real" inclusion by distinguishing between attendance, active participation, and recognition; identify organisational, relational, and instructional factors that support or hinder full participation at school and in social life; and examine sport and extracurricular activities as educational settings connected to well-being, autonomy, and citizenship, and as potential bridges between school inclusion and broader social inclusion (Contardi, 2016). The research adopts a mixed-methods design. The quantitative component is based on approximately 300 original questionnaires completed by parents of children and young people aged 3 to 20. The questionnaire covers five areas: background information on the person with disability and the family; relationships and social inclusion at school; the educational pathway and inclusive educational practices; sport and extracurricular activities; and an open final section for additional comments and recommendations. The qualitative component consists of 20 in-depth interviews with parents, aimed at reconstructing both parents' and children's pathways and recurring turning points in family experience, including: the "first communication" of the diagnosis/condition, relationships with schools and the construction of educational alliances, future-oriented concerns regarding social and employment inclusion, leisure time as a space for sociality, well-being, and autonomy development, and relationships with institutions—across rights, bureaucracy, and recognition. Integrating quantitative and qualitative evidence allows the

study to connect patterns emerging from the questionnaires with the explanations and meanings articulated in parents' narratives. In particular, parents' accounts highlight a crucial distinction between inclusion as mere attendance and inclusion as full participation: being physically present in the classroom does not automatically translate into being recognised, actively engaged, and supported in building meaningful relationships (Moletto & Zucchi, 2013). The "Pedagogy of Parents" lens further supports an interpretation of these accounts as situated educational competence: parents bring not only needs and requests, but also grounded interpretations, strategies for fostering autonomy, and everyday mediation practices that negotiate expectations, institutional constraints, and what local contexts concretely make possible.

BETWEEN INCLUSION AND NEURODIVERSITY: FUTURE EDUCATORS' CONCEPTIONS IN AN AI-MEDIATED EDUCATIONAL CONTEXT

Silvia Zanazzi (Università degli Studi di Ferrara) · **Massimo Marcuccio** (Alma Mater Studiorum - Università di Bologna, Italy) · **Maria Elena Tassinari** (Alma Mater Studiorum - Università di Bologna, Italy)

Neurodiversity | Inclusive education | Artificial intelligence in education

In the contemporary debate on neurodiversity (Singer, 2016; den Houting, 2019), neurocognitive differences are framed either as deficits requiring compensation or as expressions of inherent human variability, with distinct implications for educational planning (Chapman, 2023). Within this framework, this contribution reports findings from an exploratory study examining university students' attitudes toward AI in educational interventions (Holmes, Bialik, & Fadel, 2019) for people with disabilities, using neurodiversity as an interpretative lens to analyse emerging conceptions. The study was designed as an attitude survey using a direct technique and a pre-experimental design. Data were collected through a two-part questionnaire (35 open and closed questions), interspersed with a video stimulus illustrating the use of AI to support communication for people with profound and multiple intellectual disabilities (PIMD). Neurodiversity served as an analytical tool to distinguish deficit-oriented representations from those framing difference as human variability, while also revealing tensions within this distinction (Clouder et al., 2020; OECD, 2017, Quigley & Gallagher, 2025; Ellis, Kirby, & Osborne, 2025). The sample included 342 Education Sciences students at the University of Ferrara, predominantly female (95.3%), with over half already working in educational settings. Data were analysed through qualitative thematic analysis, following a recursive deductive–inductive process aligned with the reflexive approach (Braun & Clarke, 2021) and supported by MAXQDA. Results indicate a favourable stance toward AI as a tool to enhance communication, personalisation, and inclusion. Students emphasised the educational relationship and empathy, alongside ethical concerns such as privacy, technological dependence, and replacement of human roles. However, interpreted through neurodiversity, responses reveal a predominantly assistive-compensatory configuration. Neurocognitive difference is represented as a condition requiring support rather than as natural variability or an epistemic resource reshaping educational contexts. This outcome must be considered in relation to the empirical device adopted. The video presented an extreme case of PIMD, eliciting representations centred on support needs and testing the applicability of neurodiversity in situations of severely compromised functioning. The study thus exposes a theoretical tension concerning the extent to which neurodiversity can operate as an interpretative framework in such contexts without obscuring the dimension of need (Jaarsma & Welin, 2012). This tension frames how far the findings align with a transformative understanding of neurodiversity. Compatibility appears uneven: while value-based elements (rights, dignity, equal opportunities) are well established, ontological and epistemological dimensions remain limited. Conceptions prioritise individual adaptation over contextual reconfiguration. The video stimulus produced an emotional-legitimising effect, reinforcing openness to AI without substantial conceptual restructuring. These findings are discussed in light of tensions within neurodiversity and in relation to proposals for a pedagogy of neurodiversity (Cadavero & Salerni, 2022; Cadavero et al., 2024). The study highlights the need to equip

future educators with theoretical tools to distinguish compensatory from transformative approaches. Interpretative caution is required: direct techniques may encourage socially desirable responses; the pre-experimental design limits causal inference; and the analysis remains interpretative. Overall, while students show a strong ethical commitment to inclusion, further theoretical development is needed to critically integrate neurodiversity into debates on technology and education.

BEYOND THE SCORE: EMBODIED MUSIC LEARNING AND NEURODIVERGENCE AS AN EPISTEMIC RESOURCE

Susanna Zanella Cavallero (Università degli Studi Roma Tre; Universität Münster – Musikhochschule Münster) · **Giuseppe Pantano** (Università degli Studi Roma Tre; Université de Lorraine - IDEA research Unit) · **Amalia Lavinia Rizzo** (Università degli Studi Roma Tre)

Neurodiversity | Democratic Music Education | Embodied Learning

Drawing on neurodiversity perspectives, the study reframes the cognitive profile of the music student not as a deficit to be addressed, but as an epistemic resource that reveals the limits of narrow competence models. From a social justice standpoint, inclusion requires more than individual accommodations; it demands a redefinition of what counts as legitimate musical knowledge. Recognising multiple ways of knowing and making music enables more democratic and equitable learning environments in which different cognitive styles are not merely supported, but valued. In many formal music education settings, the ability to accurately read and interpret written notation is widely treated as a primary sign of musical competence. Students are often evaluated on how quickly and precisely they translate a score into sound, and such criteria shape how progress and talent are recognised (Dahl, 2009; Kivijärvi & Väkevä, 2020). However, musical literacy goes beyond the ability to read musical notation to encompass a range of skills and knowledge, from understanding and interpretation to listening and cultural awareness, enabling individuals to make music in a thoughtful and informed way (Mills & McPherson, 2006). For this reason, when competence is measured mainly through the speed and accuracy with which notation is decoded, a complex set of abilities is reduced to a single skill. This approach reflects a narrowing of the concept rather than a necessary condition for being musically literate. Within this framework, not all learners have an equal footing. In particular, the cognitive demands of reading music scores, which include rapid symbol processing, rhythmic organization, and the integration of visual and motor systems, may pose a challenge for students with a specific learning disorder (SLD) (Oglethorpe, 2002). When these skills are used as the main assessment criteria, students whose cognitive processing differs from this model risk being perceived as less competent, even if they demonstrate strong musical perception, expressive depth, attentive listening, or refined bodily coordination. Therefore, the question that arises is not only how students perform, but also how competence is defined and which forms of musical knowledge are considered legitimate. Against this background, this paper uses a case study of a violin student with dyslexia to examine how alternative pathways to musical understanding can become visible when pedagogical priorities shift. When teaching moved away from a primary emphasis on rapid notation decoding and towards embodied practices — focusing on posture,

movement coordination, listening, and sound production — different forms of musical knowledge emerged. The student's development shows how musical understanding can be constructed through sensory, motor, and relational processes, rather than primarily through symbolic interpretation.

Nurturing Inclusivity: Care Practices and the Transformation of Higher Education

PANEL CONVENORS: Maurizio Merico (University of Salerno, Italy); Anna Fausta Scardigno (University "A. Moro" of Bari, Italy); Antonietta De Feo (University RomaTre, Italy); Martina Visentin (University of Padua, Italy)

PANEL KEYWORDS: higher education, care, inclusivity

We invite submissions for a panel exploring the multifaceted role of care in higher education, both within and beyond university walls. This panel aims to foster dialogue between two interconnected dimensions of care reshaping our understanding of inclusive educational environments. We examine often-overlooked care responsibilities of academic and administrative staff outside the university. Inspired by the "Towards the care-full university" report (Anglia Ruskin University, 2025), we challenge the "care-free university" paradigm that assumes staff are unburdened by care duties. We encourage papers exploring innovative policies and practices promoting a "care-full university" that recognizes the impact of care responsibilities on well-being, work-life balance, careers, and retention. We're particularly interested in perspectives considering the gendered nature of care work and its intersections with class and disability. We also welcome contributions examining care practices within educational contexts, especially those highlighting neurodiversity-affirmative approaches and intersectional perspectives. These paradigms view neurodiversity, gender, and other aspects of human variation as valuable starting points for reimagining educational spaces, relationships, and pedagogies. We invite theoretical and empirical studies addressing how institutions can care for employees and diverse student populations, exploring how this dual focus can transform organizational structures, policies, and practices towards greater inclusivity. Potential topics include care responsibilities and academic careers, gender/class/disability in care work, neurodiversity-affirming practices, intersectional approaches to inclusive education, and visions for a truly "care-full university." The proposal has been submitted on behalf of the Scientific Council of AIS - EDU, Italian Sociological Association, section of "Sociology of Education"

CARE-LESS GOVERANCE: HOTSPOT APPROACH, EDUCATIONAL EXCLUSION, AND THE POLITICS OF CARE IN EURO-MEDITERRANEAN MIGRATION POLICY

Martina Riccardi (Università degli Studi di Bari Aldo Moro, Italy)

care | migration | Mediterranean

Over the last decade, the European Union has increasingly adopted migration governance tools based on the externalization of border control that, while presented as emergency responses to migration flows, have produced systemic effects on the fundamental rights of people on the move. Among these effects, the erosion of the right to education for migrant and refugee children stands out as a particularly severe form of institutional carelessness: a structural failure to recognize and respond to the needs, vulnerabilities, and aspirations of the most fragile subjects caught within these governance regimes. This paper analyzes the impact of these policies in the Euro-Mediterranean context, understood as a social and political border space, where access to educational contexts – understood here as the full continuum of educational participation, whether formal schooling or broader learning environments – is fragmented, conditioned by security logics, and often relegated to parallel and marginal measures. Drawing on the ethics of care literature and adopting an intersectional perspective, it is going to be examined how the spread of the hotspot approach has institutionalized a form of "careless governance" that operates as a sorting and confinement mechanism at landing points, rendering children systematically invisible to regular educational systems. In Greece and Italy, in particular, minors remain excluded from schooling for months due to infrastructural, linguistic, and organizational shortcomings. In third-country partner states, the situation is

even more severe, as children are held in informal detention conditions incompatible with any form of education and access to schooling is conditioned by legal status, spatial segregation, and child labor. These conditions generate structural forms of educational segregation that are not incidental but are reproduced by design – the predictable outcome of policies that prioritize containment over care. Framing these dynamics through the lens of the politics of care, this contribution argues that the normalization of educational exclusion in border zones constitutes a specific form of structural injustice, based on the systematic withdrawal of care from those who need it most. Care, in this reading, is not merely a relational or affective practice but a political and institutional responsibility. The absence of care in migration management and its consequences on access to education – be it deliberate or a result of negligence – reproduce cycles of intergenerational poverty, instability, and exclusion. This paper calls for a radical rethinking of migration governance, one that moves beyond the logics of emergency and containment and recenters care as a foundational political principle, capable of protecting the right to education and, ultimately, the full spectrum of human rights for all people on the move.

'NOW YOU SEE ME, NOW YOU DON’T'? THE IN/VISIBILITY, MIS/RECOGNITION AND INTERSECTIONALITY OF CARERS IN UK ACADEMIA

Marie-Pierre Moreau (Anglia Ruskin University, United Kingdom)

Care | higher education | inclusion

Once the preserve of the White middle-class male and ‘unencumbered’ scholar, ‘Western’ academia has considerably diversified over the past fifty years. In particular, many students and academic staff now hold some form of caring responsibilities. Yet academic excellence continues to be associated with the ‘bachelor boy’ as Cartesian dualisms, which produce academic identities through a denial of emotional domestic, physical and domestic matters, still permeate academic cultures. The physical and normative dissociation of academia and care, already ingrained in the Cartesian ideals, is also reactualised through the (gendered) discourses of the managerial university and of intensive parenting (read ‘mothering’) – two ‘greedy institutions’ which surveillent and command undivided loyalty and full availability from the scholar and the parent. Such a climate has led to claims that Western, contemporary, academic cultures are masculinist, ‘careless’ or even ‘toxic’. While an ethics of care and care work are not the preserve of those ‘with caring responsibilities’, this group offers a unique lens to explore the way care/rs are positioned by/in academic cultures as they cannot easily renounce these. The

paper draws on several inter-related projects conducted in UK universities since 2010. These projects have involved conducting questionnaire surveys and interviews with a range of staff and students. Altogether, these projects have generated an important body of data regarding the experiences of student and staff carers in Higher Education and how these experiences are shaped by university policies and cultures and their 'care regimes'. The paper uses the notion of the 'space invader' and of (gendered, classed, racialised) 'care order', 'care regime' and 'care practice', echoing in this Matthew's and Connell's similar distinction about gender, to conceptualise the relationship between care/rs and academia, and to provide an insight into the lives of carers, most of which are women. It focuses on three related aspects emerging from the data: the invisibilisation of care/rs, their mis/recognition and the intersectionality of their experiences, always mediated, inter alia, by gender, class and race. Ultimately, this paper is an attempt to further the development of a sociology linking areas of society and of people's lives (in this case, care and academia) which have historically been constructed as mutually exclusive, pointing to the changes needed so that academia becomes more care-centric or 'care-full''.

N/A

THE CARE-FREE RESEARCHER MYTH: A COMPARATIVE STUDY

Martina Visentin (University of Padova, Italy)

Care-blindness | Academic Careers | Caregiver Status

In the contemporary neoliberal university, "academic excellence" is closely linked to the figure of the "Ideal Academic": an individual expected to have total temporal availability, constant international mobility, and an uninterrupted record of high productivity. This model, however, relies on the myth of the "care-free" researcher—someone free from domestic responsibilities and personal dependencies. This figure is constructed as a "bodyless" subject, entirely detached from the physical and emotional demands of daily life. By rewarding only those who can sacrifice their personal time, the institution treats the researcher's life as a linear resource rather than a complex human experience. This means that fundamental life realities—such as pregnancy, the management of a disability, the daily commitment of caring for an elderly parent, or the need for geographic stability in a system that often forces academic nomadism—are frequently viewed as 'interruptions' or failures, rather than natural parts of a professional career. This paper investigates the "care-blindness" within Italian Higher Education Institutions (HEIs), exploring how institutional rules and discourses marginalize those who perform care work. Based on Marie-Pierre Moreau's theoretical framework, this research examines how the Italian academic system treats care not as a universal human condition, but as a private obstacle to professional merit. This invisibility creates a deep tension between the daily lives of researchers and the rigid expectations of the institution. This gap disproportionately affects women and the "sandwich generation"—those simultaneously caring for children and elderly relatives. The study uses a comparative qualitative methodology to analyze three major Italian universities: the University of Padua, the University of Bologna, and the University of Trento. By reviewing Gender Equality Plans (GEPs), Positive Action Plans, and administrative regulations, the research maps different institutional responses to the "care crisis." While Padua and Bologna (as "mega-universities") show the friction between inclusive rhetoric and administrative rigidity, Trento stands out as a benchmark. It has formally established a "Student-Caregiver Status" and obtained "Family Audit" certification, showing a deeper integration of care into its institutional identity. The analysis reveals a significant "decoupling" between political intent and actual practice. While official documents celebrate diversity and work-life balance, career evaluation criteria (such as VQR and ASN standards) continue to penalize "non-linear" career paths. This failure reinforces gender inequality and professional insecurity. In conclusion, this work argues for a paradigm shift: moving beyond the basic rhetoric of "work-life balance" toward a Caring University model. The study proposes a standardized "Caregiver Status" to mitigate inequality, rebalance power dynamics, and finally recognize care as a core part of academic life rather than a hidden liability.

UNSUSTAINABLE PASSION. PRACTICES OF CARE IN ACADEMIA BETWEEN INVISIBILIZATION AND RADICAL RESISTANCE

Cuerpa In Ricerca (Collettivo femminista, Italy)

Feminist Epistemologies & Care-full university | Embodiment & Ethics of Care | Social Reproduction

This paper investigates the "care-less university" paradigm from a feminist perspective. It argues that neo-liberal academic work is consistently built on disembodied subjects, removing bodily needs, vulnerabilities, and care responsibilities, with diverse effects along axes of gender, class, and ability. Cuerpa in ricerca is a feminist collective that employs an embodied approach to academic research and praxis. It stems from a process of collective reflection rooted in bodily experiences and practices, in dialogue with "Western" feminist perspectives on care, social reproduction and the body (Pulcini 2020; Tronto 2015; Butler 2004; Federici 2004; Dalla Costa 1972; Del Re 2015) and decolonial feminist elaborations from the "Global South" (Segato 2023; Gago 2020; Anzaldua 1987; Lugones 2024; Bhattacharya 2017). The paper shows how university institutions tend to invisibilize the embodied dimension of academic work, especially of women and LGBTQAI+ scholars, thus affecting well-being, careers, permanence, and the possibility to establish healthy relationships with students and colleagues. To counteract this tendency, the collective will discuss some practices of radical resistance to move from theory to praxis. We ask to rethink academia as a 'care-full' institution, capable of recognizing bodies as territories and territories as bodies (Cabnal 2019)– the academic body as interconnected thinking flesh. From this perspective, care emerges not as a private matter, but as an institutional responsibility and a transformative principle for an education that produces situated knowledge, citizenship, inclusion, participation, and self-determination.

PRACTICES OF CARE AND INCLUSION IN HIGHER EDUCATION: THE CABES QUESTIONNAIRE AS A TOOL FOR INSTITUTIONAL LISTENING

Daniela Maggi (Department of Human and Social Sciences, e-Campus University, Italy) · **Fabio Lucchini** (Department of Human and Social Sciences, e-Campus University, Italy) · **Aurora De Biasio** (Department of Human and Social Sciences, e-Campus University, Italy) · **Tania Moretta** (Department of Theoretical and Applied Sciences, e-Campus University, Italy) · **Venusia Covelli** (Department of Theoretical and Applied Sciences, e-Campus University, Italy)

Institutional care | University inclusion | Psychological well-being

This contribution presents a monitoring questionnaire developed within the activities of the CABES Committee (University Committee for Students with Special Educational Needs) at eCampus University, together with its first administration to students benefiting from the measures provided under the CABES resolution. The instrument was designed to collect information on the academic experience of students using the support measures offered by the University. It is explicitly conceived not as a tool for assessing academic performance, but as a device for institutional listening, aimed at understanding whether students feel supported, whether existing measures remain appropriate to their current needs, and whether revisions or new forms of support may be required. From this perspective, the questionnaire may be interpreted as a device of institutional care, consistent with a vision of the university as a "care-full" space, capable of recognising differentiated needs and translating inclusion into organisational practice (Moreau et al., 2025). Methodologically, this is an ad hoc questionnaire for institutional monitoring, predominantly quantitative but with qualitative openings, consisting of 41 items organised into 9 sections: general information on the course of study; progression through the degree programme; use and effectiveness of the measures set out in the resolution; quality of teaching and learning materials; relationships with teaching staff and administrative services; emotional well-being and study experience; relationship with the CABES Support Office; currently perceived needs; and request for contact. The instrument combines closed questions, multiple-response items, frequency and rating scales, as well as optional open-ended questions, thus collecting both summary indicators and narrative elements useful for interpreting students lived experiences. From a sociological perspective, the questionnaire frames university inclusion as a relational and organisational process, not reducible to formal access to compensatory measures alone (Cardano et al., 2021). Questions concerning academic progression, credits acquired, use of examination sessions, and the perceived causes of delays make visible the factors affecting students' continuation in higher education, including health conditions, organisational difficulties, relationships with lecturers, family problems, and work commitments. From a pedagogical perspective, the instrument investigates the adequacy of support measures in teaching activities and examinations, the quality of lessons, materials, recordings, and study supports, as well as the improvements that students consider necessary. The focus is therefore not limited to individual compensation but extends to the inclusive quality of the learning environment, in line with Universal Design for Learning and with approaches that take the variability of learning as a starting point for rethinking teaching practices and pedagogical mediation (CAST, 2024). The psychological dimension emerges in the sections devoted to psychological well-being and students' quality of life, with particular attention to the emotional aspects of university experience. In this way, the instrument shifts attention from academic performance alone towards psychological well-being, belonging, and self-efficacy, recognised as central factors in students' participation and persistence in higher education (Ryan & Deci, 2020; Thomas, 2012; Granieri et al., 2021). Overall, the CABES questionnaire may be interpreted as a multidimensional device of institutional care, capable of transforming inclusion from a formal measure into a reflective and transformative practice within higher education.

Teachers' Emotions, Agency and Professional Capacity for Inclusion within the Education–Democracy Nexus

PANEL CONVENORS: Donatella Poliandri (Invalsi – Italian National Institute for the Evaluation of Education, Italy); Letizia Giampietro (Invalsi – Italian National Institute for the Evaluation of Education, Italy); Umberto Pagano (University "Magna Graecia" of Catanzaro, Italy)

PANEL KEYWORDS: Teacher Agency, Socio-emotional Dimensions of Teaching, Inclusive Schooling

Inclusive education is increasingly recognised as a core condition for democratic schooling, yet its enactment takes place in school environments marked by social tensions, fragmentation and competing expectations. Teachers are called to sustain inclusive practices that respond to disability, neurodivergence, cultural and linguistic diversity, and forms of difference, while negotiating demands from students, families, colleagues and institutional frameworks. This work requires emotional labour and interpretative judgement. When teacher education —both initial and in-service—privileges procedural compliance over emotional, relational and reflective capacities, teachers may struggle to uphold accessibility, participation and recognition of difference as democratic values, especially in contexts affected by structural inequalities and educational poverty. Teachers' self-efficacy is closely linked to well-being and to their capacity to sustain inclusive pedagogies. Limited preparation, unclear guidance or insufficient formative support can heighten stress and undermine professional agency. Emerging technologies hold potential for more responsive and differentiated teaching yet may generate uncertainty or perceived loss of expertise when teachers are not supported through training and organisational capacity-building. Evaluation and accountability frameworks also shape teachers' emotional experience of inclusion. While they can support reflective practice and collective learning, they risk being perceived as external pressure when disconnected from participatory governance. This panel invites interdisciplinary contributions examining how emotional labour, self-efficacy, training and professional conditions shape teachers' capacity to enact inclusive education as a democratic practice. We welcome work on emotional competence and teacher agency; capacity-building for the meaningful use of emerging technologies; and evaluation processes that foster equitable, accessible and socially just school cultures.

HYBRID COMMUNITY OF PRACTICE FOR SUSTAINABLE CRITICAL PEDAGOGY IN ICT-INTEGRATED MATHEMATICS TEACHING AMONG PRE-SERVICE TEACHERS

Anastasia Gordon (Cape Peninsula University of Technology, South Africa)

Community of Practice | Critical Thinking | ICT-integration

Purpose: This study explores pre-service teachers' (PSTs) professional agency and ICT use to foster critical thinking and create democratic learning spaces in the mathematics classroom. It examines the challenges PSTs encounter in integrating ICT for critical thinking and the role Communities of Practice (CoP) play in shaping PSTs pedagogical practices. Additionally, it proposes a sustainable critical pedagogy framework in ICT-integrated Mathematics Teaching for PSTs. Study's Main Question: How can hybrid CoPs be leveraged to develop a sustainable critical pedagogy framework in ICT-integrated Mathematics Teaching among PSTs? Problem Statement: Mathematics education is of paramount importance, yet South African learner outcomes remain low compared to international benchmarks, as shown by the Trends in International Mathematics and Science Study report, National Senior Certificate results and provincial Systemic Tests. South Africa's Department of Education has identified teachers' limited capacity to foster critical thinking in the 4th Industrial Revolution (4IR) classroom as a key constraint. Despite current interventions such as Initial Teacher Education programmes and Continuous Professional Development initiatives, these efforts have had limited impact. Methodology: This study employed a qualitative, interpretive paradigm with a case study research design. The research was conducted at a University of Technology located in the Western Cape, South Africa. A purposive sample of seven (n=7) mathematics PSTs divided into two hybrid CoPs was investigated. Questionnaires, document analysis, observations and focus group interviews was used as data collection tools to gain in depth insight and understanding. The study used Kress and Van Leeuwen's (2001) multimodal discourse analysis as the main analytical tool as well as Braun and Clarke's (2006) Thematic Analysis. Theoretical Framework: This study is guided by combining Freire's (1970) critical pedagogy, Wenger's (1998) CoP and Mishra and Koehler's (2006) Technological Pedagogical and Content Knowledge (TPACK) framework, providing a comprehensive and integrated approach to understand how PSTs developed their ICT-integrated Mathematics teaching practices to foster critical thinking. Research findings: PSTs widely acknowledge the benefits of ICT integrated critical pedagogy, however, often lack the agency and capacity to implement it. PSTs encounter several challenges in integrating ICT for critical thinking. PSTs leveraged CoPs effectively to build a shared understanding and repertoire to increase and

improve their agency and ICT integrated critical pedagogy practice. Educational importance: This study proposes a sustainable critical pedagogical framework for ICT-integrated mathematics teaching among PSTs, aimed at fostering critical thinking. It contributes to policy and practice by addressing the theory–practice gap in ICT integration by leveraging CoPs and demonstrates how technology can be used pedagogically to promote critical thinking. Connection to the conference theme: This study directly aligns with the conference theme specifically, with Panel C.04: Teachers' Emotions, Agency and Professional Capacity for Inclusion within the Education–Democracy Nexus. This study foregrounds PSTs agency as central to democratic schooling. Rather than treating technology as neutral, the research explores how digital practices can foster dialogue, collaboration and problem-posing teaching, key principles of democratic education. The study additionally demonstrates how PSTs agency and professional capacity influence their ICT-integrated teaching practices to foster critical thinking.

Emotional-Relational dimensions | Teacher Professional Development | Transdisciplinary research

The global crises and educational emergencies of recent decades have fostered new awareness and generated innovative lines of research and action, initiating a productive dialogue between researchers and professionals across multiple levels. This dialogue aligns with the paradigm of complexity and with the conceptualization of educational communities as ecosystems. Although schools are increasingly engaged in experimentation and innovation, their initiatives are not always coherent or clearly oriented and grounded in robust and shared scientific frameworks, thereby generating the risk of fragmentation and conceptual ambiguity. A paradigmatic example is the renewed emphasis on the emotional, affective, and relational dimensions as central to quality learning and to individual and contextual well-being within a co-development perspective. Contemporary health models (World Health Organization, 2001), together with advances in neuroscience, have confirmed longstanding insights from experienced educators and philosophical, psychodynamic, and pedagogical traditions regarding their importance. At the institutional level, such dimensions have been variously codified within educational frameworks as essential "competencies" or "skills" for students and, to a lesser and less coherent extent, for teachers. These are broad and heterogeneously defined constructs that encompass complex, multifactorial dimensions and processes for which traditional scientific models often prove insufficient. Balconi (2024), in line with Martha Nussbaum's philosophical perspective (2001), defines emotions as a "value-based state," understood as a system that cognitively interprets and explains the relationship between the self and the world. This value-based and rational system is grounded in an implicit biophysical, bodily substrate that substantiates it and cannot be overlooked in light of its evolutionary and educational implications, in line with the principles of Embodied Education (Damiani & Gomez Paloma, 2018; 2025). This abstract therefore aims to present the theoretical framework and initial applications of a transdisciplinary approach to the understanding and development of emotional-relational competencies. The approach is grounded in Embodied Cognition models and integrates contributions from neurobiology and physics. It has been preliminarily implemented at the Laboratory for Research and Development of Teachers' Emotional-Relational Competences (LAB-CERD) at the University of Modena and Reggio Emilia. A distinctive feature of LAB-CERD is its focus on teachers, which provides an

opportunity for critical reflection on emotional, social, and relational dimensions—considering their limitations, risks, and potential—beginning with persistent definitional challenges. As noted by Scheirlinckx et al. (2023, p. 3), “There has been broad interest from different fields, such as education, psychology, pedagogy, and labor economics, in constructs associated with Social Emotional Skills (SEMS) of teachers. Despite this interest, no clear consensus exists regarding the definition of teacher SEMS and the core skill constructs this domain should encompass.” More specifically, our framework is informed by the Extended Mind perspective (Clark, 2008) for teacher training and professional development. It seeks to enhance recognition of the teacher’s role as an “epigenetic environmental factor,” conceptualized as a regulator of the educational biophysical field through embodied emotional processes. The paper concludes by outlining the Laboratory’s initial training initiatives, which are structured around the operationalization of transdisciplinary principles and constructs such as the educational field, group synchronization, and consciousness.

BUILDING CAPABLE SCHOOLS: ENHANCING TEACHERS' PROFESSIONAL CAPACITY FOR INCLUSION THROUGH A NATIONAL EVIDENCE-BASED TRAINING NETWORK

Ivano De Luca (Istituto Comprensivo Statale Di Taviano "Francesco Dimo", Italy) · **Simone Aldo Buonporto** (IDCERT Società Benefit srl) · **Sandra Calzolaro** (Istituto Comprensivo Statale Di Taviano "Francesco Dimo", Italy) · **Fabio De Vita** (Istituto Comprensivo Statale Di Taviano "Francesco Dimo", Italy) · **Susanna D'Amato** (Istituto Comprensivo Statale Di Taviano "Francesco Dimo", Italy) · **Federica De Blasi** (Istituto Comprensivo Statale Di Taviano "Francesco Dimo", Italy) · **Emanuela Tenuzzo** (Istituto Comprensivo Statale Di Taviano "Francesco Dimo", Italy) · **Simona Belloni** (Istituto Comprensivo Statale Di Taviano "Francesco Dimo", Italy)

Inclusive Education · Teacher Professional Development · Evidence-Based Practices

The increasing complexity of neurodiversity in contemporary classrooms poses significant challenges to educational equity and social justice. In the Italian context, the traditional approach to inclusion has often relied on ethical principles and generic pedagogical care, sometimes lacking the technical frameworks required to address severe behavioral and developmental needs effectively. This gap frequently impacts teachers' emotional well-being and professional agency, leading to feelings of inadequacy and burnout when facing complex educational scenarios. This contribution presents the conceptual framework, implementation strategy, and early outcomes of "Scuola Capace" (Capable School), a large-scale national professional development project funded by the European Union (NextGenerationEU) under the Italian National Recovery and Resilience Plan (PNRR). Led by the Comprehensive Institute "Francesco Dimo" (Taviano, Italy) as the lead institution, the project established a massive network of over 100 schools across the country, aiming to train 315 educational professionals (teachers, educators, and school staff). The core purpose of the project is to shift the inclusive paradigm from "generic welcoming" to "competent inclusion" by equipping school personnel with evidence-based practices derived from Applied Behavior Analysis (ABA). Specifically, the training aligns with the Registered Behavior Technician (RBT®) framework, adapted for the public school ecosystem. The methodology involves a 50-hour asynchronous active e-learning path that transcends traditional transmissive models. It incorporates video-modeling, branching scenarios, and practical simulations of behavioral interventions, data collection, and functional assessment. This model is designed to be highly scalable and permanently accessible through a digital "Repository of Inclusion," ensuring long-term sustainability and continuous professional development beyond the project's lifecycle. Within the education-democracy nexus, this initiative argues that true democratic schooling is achieved only when teachers possess the technical capacity and professional agency to guarantee equitable learning opportunities for all students, particularly the most vulnerable.

By mastering evidence-based strategies, teachers move from a state of emergency management to proactive educational design. This paper will discuss the organizational challenges of managing a massive inter-institutional network, the pedagogical implications of integrating behavioral sciences into the Italian inclusive tradition, and the potential of targeted, high-level professional development to foster a deeply democratic, neurodivergent-friendly school environment. Ultimately, the "Scuola Capace" model demonstrates how systemic policy funding can be leveraged to build grassroots professional capacity, transforming the abstract right to education into a concrete, measurable, and inclusive daily practice.

TEACHER SELF-EFFICACY AND AFFECTIVE DIMENSIONS TO SUPPORT THE PROFESSIONAL DEVELOPMENT OF INCLUSIVE TEACHERS: AN EXPLORATORY STUDY

Lucia Scipione (Università Modena e Reggio Emilia, Italy) · **Paola Damiani** (Università Modena e Reggio Emilia, Italy)

Teacher Self-Efficacy | Inclusive Education | Teacher Professional Development

Teacher Self-Efficacy (TSE), defined as teachers' beliefs in their capability to positively influence student learning and behavior even under challenging conditions (Tschannen-Moran & Woolfolk Hoy, 2001), represents a crucial indicator of professional quality (Cardarello et al., 2017). The significant body of research has shown that teachers with high levels of TSE are characterizes by openness to pedagogical innovation (Sharma et al., 2012) and professional resiliency in dealing with the complexities of contemporary school environments (Skaalvik & Skaalvik, 2007). The concept of TSE in particularly pertinent in the context of inclusive education. In fact, teachers with a strong sense of efficacy in dealing with diversity among students are likley to display more positive attitudes toward inclusion education and to engage in more equitable and student-centered educational practices (Forlin et al., 2011; Sharma et al., 2012; Aiello et al., 2017; Pintus et al., 2021). Recent research also highlights the relevance of teachers' professional learning in developing their sense of efficacy in inclusive education settings. In addition, a systematic review carried out by Wray et al. (2022) also confirms that targeted training and direct experience are key predictors of TSE in inclusive contexts, highlighting the role of peer collaboration and mentoring in developing theoretical knowledge that is effectively applied to professional practice. Given the complexity of contemporary educational environments, research approaches that also consider quantitative data and a deeper analysis of teachers' perceptions and professional meanings appear particularly valuable. This exploratory study investigates the dimensions that support an inclusive teaching perspective by analyzing the relationship between perceived teaching efficacy and attitudes toward inclusion through an integrated methodological approach. The sample consists of pre-service teachers enrolled in the specialization course for support teaching (n = 136) and in-service teachers who obtained the specialization within the last five years (n = 20).The quantitative phase employs the Teacher Sense of Efficacy Scale (TSES), in the version validated for the Italian context (Cardarello et al., 2017; Pintus et al., 2021), focusing on teachers' perceived efficacy in implementing inclusive and innovative instructional strategies. In parallel, the Scale of Attitudes toward Collective Inclusion (SACI) (Castellana et al., 2023; Castellana De Vincenzo, 2025) is administered. This instrument was selected for its alignment with the Profile of Inclusive Teachers (European Agency, 2012) and for its attention to affective and behavioral components related to inclusive practices. To deepen the interpretation of these aspects, the study also incorporates open-ended questions and focus groups aimed at exploring processes of interprofessional scaffolding and uncovering latent dimensions related to inclusive professional identity (Maienza, 2020; Valenza et al., 2025). Preliminary findings confirm the influence of training experiences on teachers' sense of efficacy and describe the attitudes toward inclusion expressed by pre-service teachers in relation to their perceived ability to implement student-centered strategies. Qualitative results highlight empathy and interprofessional collaboration as key components of inclusive educational practice. These findings contribute to informing the development of teacher education pathways aimed at fostering a transformative form of inclusive professional agency.

BUILDING INCLUSIVE AGENCY THROUGH TEACHER COLLABORATION: CLASSROOM AND SPECIAL EDUCATION TEACHERS IN ITALIAN SCHOOLS

Sara Romiti (INVALSI, Italy) · **Letizia Giampietro** (INVALSI, Italy) · **Monica Perazzolo** (INVALSI, Italy) · **Graziana Epifani** (INVALSI, Italy) · **Donatella Poliandri** (INVALSI, Italy)

Teacher Collaboration | Inclusive Education | Teacher Agency

The literature has emphasized the interdependent relationship between professional collaboration and teacher agency in inclusive education (Li & Ruppar, 2020). Teacher agency can be understood as both an individual and collective capacity to create inclusive learning communities based on shared knowledge, skills, and collaboration, reflecting a shift from teaching as a solitary practice to teachers working together (Lyons et al., 2016). In school systems integrating special education, agency is relational, representing the situated capacity to work with others in interpreting problems and co-constructing social practices (Paloniemi et al., 2023). While professional collaboration generally involves shared responsibility for improving students' achievement and well-being (Hargreaves, 2019), collaboration between classroom teachers (CTs) and special education teachers (SETs) presents distinctive features. Such collaboration is supported by emotional consonance, mutual recognition and agreement on educational values (Jortveit & Kovač, 2022). Key dimensions include collaborative planning and teaching, encompassing various co-teaching models (Friend et al., 2010). However, research has highlighted the persistence of the "one teach, one assist" model, accompanied by asymmetries in power, responsibility, and professional recognition (Paulsrud & Nilholm, 2023). In the Italian debate, inclusive teaching has increasingly been recognized as the responsibility of the whole school (Cottini, 2017). Nevertheless, studies have documented persistent difficulties in developing co-teaching practices and discrepancies between normative expectations and everyday school practices (Ghedin & Acquario, 2023; Cardinali et al., 2025). This study investigates how collaboration between CTs and SETs is understood and experienced by Italian teachers and identifies facilitating and hindering factors shaping the construction of inclusive agency. The research questions are: Which features of professional collaboration for inclusion do teachers identify? What factors facilitate or constrain the development of teachers' inclusive agency? The study is based on a qualitative content analysis of semi-structured interviews conducted with 28 CTs and 31 SETs using a data-driven coding strategy (Schreier, 2012). Participants were selected through purposive sampling from 11 primary and 13 lower secondary school classes in central Italy (Lazio). Preliminary findings indicate that teachers recognise the importance of co-planning as a lever in developing targeted inclusive interventions and negotiating shared pedagogical responsibilities. At the same time, significant systemic constraints—particularly in lower secondary education—are highlighted. Multiple

forms of co-teaching emerge, that move beyond the “one teach, one assist” model and incorporate co-planned pedagogical strategies, such as drama-based activities. Some participants report mutual professional recognition and describe their roles as complementary, suggesting that collaboration can foster the development of collective, inclusive agency. Nonetheless, relational tensions and professional ambiguities persist. Some teachers report difficulties in being fully recognized in their professional role, while others struggle to perceive colleagues as genuine resources for inclusive practice. These dynamics reveal the fragile and negotiated nature of collaborative processes through which teachers build and renegotiate their agency in inclusive settings. Overall, the study provides evidence of a gradual shift toward more reciprocal and recognition-based forms of collaboration that may foster the development of individual and collective agency for inclusion. Such developments, however, require sustained institutional and policy support to become structurally embedded within school practice.

BUILDING DEMOCRATIC CONTEXTS: PARTICIPATION, ENGAGEMENT, AND TRANSFORMATION THROUGH THE TNE METHOD

Silvia Rossi (Comune di Perugia) · **Edoardo Renzi** (University of Perugia, Italy) · **Alessandra Valastro** (University of Perugia, Italy)

Educational democracy | Agency | Participation

This contribution, grounded in an interdisciplinary framework, fits within the contemporary pedagogical debate that recognizes the school as an agent and a “vital organ of democracy” (Calamandrei, 1950), called upon to foster educational conditions capable of supporting a democratic, equitable, and peaceful development of contemporary societies (Pastori et al., 2022). From this perspective, the right to educational democracy requires that school systems guarantee not only formal access to education but also the full, active, and meaningful participation of every student in the life of the school community. This implies a rethinking of teaching practices and teachers’ professional attitudes, so that valuing differences becomes a systemic resource for learning and identity development. The research presents the preliminary results of a pilot project conducted in the province of Perugia involving forty preschool and primary school teachers over an eight-month period. The training program, carried out in collaboration with the Center for Democratic Initiative of Teachers (CIDI - Centro di Iniziativa Democratica degli Insegnanti), was structured into six training units and was guided by the “Everyone No One Excluded” (TNE - Tutti Nessuno Escluso) method, with the aim of responding to the growing relational complexity of contemporary classrooms and promoting a reflective professional posture among teachers. Methodologically, the study is based on a qualitative investigation aimed at exploring changes in teachers’ participation dynamics and professional self-perceptions. Data were collected through three focus groups, conceived as spaces for collective reflection that allowed changes in teachers’ perceptions and experiences to emerge. Indeed, it is the teachers themselves who, alongside improvements in the classroom climate (inclusion of isolated children and relational fluidity), report a

profound transformation of their professional posture. The analysis reveals strong emotional and operational engagement, as well as greater attention to problem-solving and conflict management, elements that can be traced to the activation of transformative agency (Fabbri, 2025). The most significant change concerns the reframing of educational time, involving a slowing down of school rhythms as well as a new recognition of themselves as agents capable of co-constructing enabling environments. Overall, the findings suggest that teachers' professional empowerment and the development of students' relational agency are interconnected processes that require organizational contexts open to reflection and pedagogical experimentation. The TNE method was perceived not only as a set of techniques (such as the circle, counting, or listening games), but as a genuine "work on oneself" capable of restructuring the professional habitus of teachers. Despite the challenges that emerged related to organizational fatigue, the TNE method emerges as a potentially useful operational tool to support participation, group cohesion, and the construction of educational environments oriented toward equity and social justice.

TEACHERS' EMOTIONS AND PROFESSIONAL AGENCY IN DATA-INFORMED SCHOOL GOVERNANCE

Donatella Poliandri (INVALSI - Italian National Institute for the Evaluation of Education, Italy) · **Graziana Epifani** (INVALSI - Italian National Institute for the Evaluation of Education, Italy) · **Letizia Giampietro** (INVALSI - Italian National Institute for the Evaluation of Education, Italy) · **Monica Perazzolo** (INVALSI - Italian National Institute for the Evaluation of Education, Italy) · **Sara Romiti** (INVALSI - Italian National Institute for the Evaluation of Education, Italy)

Teacher Emotions | Teacher Agency | Data-Informed Decision Making

Educational systems are increasingly characterised by forms of data-informed governance in which schools are expected to rely on evidence, indicators and digital infrastructures to support educational improvement. In Italy, this orientation has been institutionalised through the National School Evaluation System introduced by DPR 80/2013, which requires schools to produce a Self-Evaluation Report (RAV)and engage in structured school improvement processes. Within this framework,teachers are progressively involved in practices of data-informed decision making and evidence-informed practice supporting organisational reflection and school development(Brown & Malin,2022;Mincu & Romiti,2022).At the same time,these developments unfold within broader processes of datafication and platformisation of education,where digital platforms and data infrastructures increasingly mediate professional work and decision-making(Perrotta & Selwyn,2019).Rather than interpreting teachers' emotional responses to these transformations as individual resistance to innovation, this study approaches emotions as situated indicators of how teachers experience and negotiate emerging forms of data-informed school governance. Drawing on sociocultural perspectives on teacher identity and vulnerability(Kelchtermans,2005; Lasky,2005) and studies on the emotional practice of teaching(Hargreaves, 1998), the analysis interprets emotions as signals of how teachers position their professional role within evolving evaluation frameworks. In this perspective, professional agency is not conceived as an individual attribute but as a context-dependent capacity shaped by organisational conditions, professional cultures and opportunities for participation. The study is based on qualitative interviews with 25 teachers working in five Italian upper secondary schools selected through purposeful sampling to represent different institutional profiles, territorial contexts and student populations. The sample includes general, technical and vocational schools located in metropolitan centres as well as in semi-urban and peripheral areas. Interviewees also represent different professional roles within schools, including teachers responsible for digital innovation,school evaluation,mentoring of newly appointed staff,newly appointed teachers,and teachers elected to school governing bodies. Data were analysed through a structured content analysis approach inspired by the conception of content analysis as inquiry (Losito, 2007). A data matrix was created with interviews as rows and thematic domains derived from the interview protocol as columns. The analysis focused on four areas:the role of data in school functioning,perceived constraints in the use of data,professional competences related to data use,and broader concerns regarding governance and participation.Findings reveal a pattern of professional ambivalence rather than resistance toward data

practices.Teachers recognise the potential value of data for informing pedagogical and organisational decisions.At the same time, they express concerns related to interpretative complexity,transparency,exposure to judgement and insufficient institutional support.These concerns are rarely directed at data or technologies themselves;rather,they reflect uncertainties about the organisational conditions through which data are produced,interpreted and used within schools.Emotions such as caution, uncertainty and professional fatigue emerge particularly where training,mediation and collective decision-making processes appear weak.Therefore, teachers' emotional responses also illuminate the democratic dimension of school governance, revealing how far data practices are perceived as shared professional resources or as externally driven accountability devices.The study suggests that these emotional responses offer a useful analytical perspective for understanding how data-informed governance is experienced in everyday school practice and how the expansion of data infrastructures may reshape teachers' professional space of participation and responsibility.

TEACHER AGENCY AND INCLUSION: CONSTRAINTS AND STRATEGIES IN HIGH COMPLEXITY SCHOOLS

Graziana Epifani (Invalsi - Italian National Institute for the Evaluation of Education, Italy) · **Letizia Giampietro** (Invalsi - Italian National Institute for the Evaluation of Education, Italy) · **Monica Perazzolo** (Invalsi - Italian National Institute for the Evaluation of Education, Italy) · **Sara Romiti** (Invalsi - Italian National Institute for the Evaluation of Education, Italy) · **Donatella Poliandri** (Invalsi - Italian National Institute for the Evaluation of Education, Italy)

Teacher agency | inclusion | student well-being

Teacher agency is a concept that has been widely examined in educational research, though its definition remains debated due to diverse theoretical perspectives (Andreoli et al., 2022). Educational research has increasingly emphasized the relationship between teacher agency and school inclusion, showing that teachers' intentional actions are key to promoting inclusive practices (Pantić, 2015, 2017; Corsi, 2024). From this viewpoint, inclusion is seen as a broad process involving all students, rather than just those with disabilities, and addressing the multiple forms of diversity present in educational settings (Lascioli, 2014). In this context, inclusive teacher agency refers to teachers' capacity to actively shape educational environments, influencing practices, relationships, and educational meanings (Biesta & Tedder, 2007; Biasi et al., 2014; Ciraci & Isidoro, 2017). Implementing inclusive practices plays a pivotal role in enhancing student well-being (Hannigan et al., 2019; Boyle et al., 2023). Based on these assumptions, we conducted interviews with 15 teachers responsible for school evaluation and improvement plans in 15 Italian schools, characterized by a high presence of students with special educational needs (such as students with a migrant background, specific learning difficulties, etc.) and socio-emotional difficulties (including anxiety, low self-esteem, behavioral disorders, and family problems). The study aims to explore: 1) the conditions that influence teacher agency, focusing on enabling and constraining factors, and 2) the strategies through which teachers negotiate constraints to promote inclusion and student well-being. The interviews were analyzed using thematic analysis (Braun & Clarke, 2006) to identify and interpret patterns of meaning. Findings show that constraints on teacher agency are multidimensional. First, context-related constraints emerge, including the lack of structured procedures and protocols for the inclusion of students with a migrant background, the high turnover of special education teachers, the lack of resources for school psychological support, and the limited availability of innovative technological tools. Second, socio-relational constraints were identified, such as weak collaboration and support among

colleagues, limited collaboration with external professionals (such as cultural mediators, psychologists, and local services), and weak educational partnerships with families. Finally, a few interviews highlight personal constraints, mainly related to teachers' perceived lack of adequate competencies in managing students with educational and relational difficulties. According to interview data, teachers implement diverse strategies to address these challenges and promote students' inclusion and well-being. Specifically, they act: 1) at the individual level, through active listening to students' needs and mentoring activities; 2) at the classroom level, by promoting project-based activities such as workshops, theatre-based activities, remedial and enrichment courses, and peer tutoring among students; 3) at the community level, by strengthening collaboration within the internal school community (teachers, school leaders, and families) and with external resources (experts, psychologists, and local services). The study shows that teacher agency contributes to enacting inclusive practices by supporting inclusion as a democratic process and promoting student well-being within the school community. The findings suggest that effective teacher action can operate across three levels—individual, classroom, and school community—, highlighting teacher agency as a situated, relational, and systemic process.

EMOTIONAL DEMANDS, PROFESSIONAL AGENCY AND THE DEMOCRATIC SUSTAINABILITY OF INCLUSION: EVIDENCE FROM TALIS 2024 ITALIAN DATA

Laura Palmerio (INVALSI, Italy) · **Carlo Di Chiacchio** (INVALSI, Italy) · **Sabrina Greco** (INVALSI, Italy)

Inclusive education | Teacher stress | TALIS

Inclusive education is widely seen as a cornerstone of democratic schooling, built on participation, recognition, and accessibility (UNESCO, 1994; WHO, 2001; UN, 2006). But turning these ideals into everyday classroom practice requires ongoing emotional and instructional effort from teachers. Through the lens of the Job Demands–Resources (JD-R) framework (Demerouti et al., 2001), adapting lessons for diverse classrooms, especially for students with special education needs (SEN) and language difficulties, constitutes a substantial job demand. At the same time, personal resources such as self-efficacy are believed to safeguard teachers' well-being and enhance their sense of professional agency (Dicke et al., 2018; Granziera et al., 2020). This study examines whether inclusion demands in Italian lower secondary schools are associated with teacher stress and self-efficacy, and whether personal resources mitigate these effects. Using TALIS 2024 teacher microdata for Italy (ISCED 2), we distinguish between structural and perceived inclusion demands. Structural demands refer to the reported share of students with SEN in a classroom (none; 1–10%; >10%). Perceived demands are measured through teachers' self-reported stress related to modifying lessons for students with SEN. We analyze general work-related stress and standardized measures of overall and SEN-specific self-efficacy as outcomes. All analyses use teacher sampling weights and replicate weights, in accordance with international large-scale assessment standards. The results show that both structural and perceived inclusion demands are associated with higher levels of teacher stress. Teachers working in classrooms where more than 10% of students have SEN report significantly higher stress compared

to those with none. However, the strongest predictor of stress is not classroom composition itself, but the perceived instructional demand of adapting materials and teaching practices. When structural composition and perceived demand are modeled together, the effect of perceived demand remains strong, while the structural effect diminishes. Inclusive instructional demands are also negatively associated with both overall and SEN-specific self-efficacy. In other words, the more stress teachers report from adapting instruction for students with SEN, the less professionally competent they tend to feel. Although higher overall self-efficacy is associated with lower stress, it does not fully buffer the impact of inclusion demands. Even teachers who perceive themselves as highly capable experience elevated stress under sustained inclusive instructional pressures. SEN-specific self-efficacy does not significantly moderate this relationship. Collectively, these findings highlight a central tension. Inclusive education is normatively essential to democratic schooling, but it also generates emotional demands that cannot be managed through individual commitment alone. Consistent with JD-R research, personal resources such as self-efficacy reduce overall strain, yet they do not eliminate the stress associated with ongoing inclusive adaptation. Inclusion, therefore, emerges not only as a pedagogical responsibility but as a question of democratic sustainability. Without supportive organizational conditions and collective structures, the emotional labour required to realize inclusive values may erode teachers' well-being and professional agency. Strengthening inclusive education ultimately means creating the emotional and institutional conditions that enable teachers to live out democratic principles in their daily practice.

IN TUNE WITH INCLUSION - DESIGNING IN-SERVICE PROFESSIONAL DEVELOPMENT FOR INSTRUMENTAL MUSIC TEACHERS IN INCLUSIVE CONTEXTS: TEACHERS' PERSPECTIVES

Desiree Calzavara (Libera Università di Bolzano, Italy)

Instrumental music teachers | Professional development | Design-based research

In recent decades Italy has been experiencing a growing diffusion of instrumental practice in compulsory education thanks to middle schools with a focus on music (SMIM) (Spadolini, 2022). In these schools, students who request and pass an orientation test can attend three additional hours of instrumental, music theory, and ensemble lessons per week (Ministero dell'Istruzione e del Merito, 2022). Recent studies suggest that SMIMs could be less inclusive than the rest of the school system, at least in the sense that they do not host as many students with specific learning disorders or disabilities as the average for schools at the same level (Chiaro, 2022). Such a pattern might be linked to the possible gaps in instrumental teachers' training in an inclusive perspective highlighted by previous studies, as well as critical issues related to collaboration and inclusive practices (Rizzo, 2022). Nevertheless, instrumental teachers' own attitudes, perceptions, and professional needs remain largely unexplored. My research focuses on the professional development of instrumental music teachers in SMIMs in Trentino, Italy. The central research question is: How can in-service professional development be designed to support instrumental music teachers working in inclusive school contexts, from the teachers' own perspectives? The study will adopt a design-based research (DBR) methodology (Lehrer, 2019). DBR allows for iterative design, implementation, and evaluation of interventions directly in the school context, emphasizing teachers' beliefs (Dignath et al., 2022), attitudes (Kielblock, 2018), and situated practices as key elements in fostering inclusive teaching. Here, inclusion is considered broadly, focusing on equitable participation and learning opportunities for all students, rather than targeting specific groups or using formal labels. The exploratory phase of the study will begin with focus

groups involving school principals and other staff members to investigate their point of view on the training needs for a specific professional development program for instrumental music teachers. In the meantime, questionnaires aimed at exploring and comparing attitudes toward inclusion, self-efficacy, patterns of collaboration, and the perceived effectiveness and relevance to practice of the training already attended will be administered to instrumental music teachers and teachers of other subjects. Findings from both data sources will then be presented to instrumental music teachers and used to elicit a discussion on their perceived needs. This first mixed-methods data collection will inform the design of a context-sensitive in-service training program. Expected findings include a deeper insight into instrumental teachers' perspectives on inclusion, the identification of key professional development needs, and the development of a training model.

REDISCOVER HUMAN SIMILARITIES THROUGHT DIVERSITY. THE NARRATIVE APPROACH TO IMPLEMENT EMPATHY DURING TEACHER TRAINING PROGRAMS FOR INCLUSION

Giulia Aguzzi (Università per Stranieri di Siena, Italy)

Teacher Agency | Empathy | Inclusive Schooling

More than fifteen years after the Italian Law 170/2010 which recognised Dyslexia and all Specific Learning Disorders (SLDs), significant amount of training hours for teacher on inclusion; even after the recognition of Neurodiversity as the leading paradigm to adsress the special educational needs, ensuring a truly inclusive and accessible school enviroment remains a challenge. On one hand, teachers often feel burdened by improperly used practices that cannot guaratee results nor prevent the growth of resentement and cultural prejudices. On the other hand, students with special needs internalize the same prejudices, and that leads them, particularly at the beginning of the university years, to hide their special needs or to apply inadecuate coping strategies in study challenges. This study proposes a solution aimed at decreasing teachers' perception of otherness and conflict towards students with special needs, specifically by enhacing their empathetic abilities to recognise a common human level. Using an interdisciplinary narrative approach, this study compares different supplementary phases in a standard teacher training course. One group watches a selected tv series featuring a neurodivergent main character. The second experimental group reads a selected novel in witch a neurodivergent character appears too. Both are involved in specific engaging narrative activities designed from narrative approach works to promote closer identification with neurodivergent characters. Both groups are interviewed both before and after the steps, to mesure the empathetic levels, self-efficacy perception and desired attitudinal changes. A control group, which follows only the standard course and is also interwied, establishes the baseline to evaluate the efficacy of the narrative intervention, a stroger human connection and shared humanity experience. The post-training collected data demonstrate that both cognitive and affective empathy are significantly enhanced by the narrative approach, showing higher outcomes compared to the control group. Moreover, a specific section of the study analyzed teachers' perceptions of neurodiversity by applying the same parameters used in previous research on student self-narratives, thereby highlighting a significant 'perception gap' between professional beliefs and lived experiences. The narrative approach, through both tv seris watching and novel reading, facilitates significantly the bridging of this bias gap, fostering a deeper and more effective empathetic relationship. This shift results in a reduction of perceived 'otherness' too, as well as an increased teachers'

sense of self-efficacy and wellbeing. This methodology seems to promote a stronger democratic sense of justice regarding learning rights, dismantling the 'special vs. normal' dichotomy in favor of a more human-centered and inclusive teaching practice.

FROM MULTIMEDIA TO MULTISENSORY ROOM: A PRELIMINARY INVESTIGATION INTO NEW PERSPECTIVES FOR INCLUSION AND TEACHERS' PROFESSIONAL COMPETENCIES

Paolo Lucattini (University of Molise, Italy) · **Filippo Bruni** (University of Molise, Italy) · **Marta De Angelis** (University of Molise, Italy)

Multimedia | multisensory environments | teacher training

Multimediality has been widely examined and increasingly adopted over recent decades. On one hand, it has been linked to the gradual consolidation of digital technologies; on the other, it has become an essential tool for inclusive processes. While the sensory saturation of visual and auditory channels has been acknowledged in broad terms, multimediality has assumed a more specific relevance for inclusion—exemplified by frameworks such as Universal Design for Learning. The principle of offering multiple modes of representation is now widely accepted. However, several limits persist. First, despite numerous initiatives in sensory education, teaching practice remains largely centered on vision and hearing, with other senses relegated to the background. Second, not all multimedia applications are effective: Mayer's experimental studies demonstrate principles that distinguish multimedia use that fosters genuine learning from uses that generate only emotionally gratifying engagement without cognitive benefits. Third, there is a consequent need for appropriate teacher training. Multisensory rooms open new possibilities beyond traditional multimedia formats: they enable methodological approaches and practical activities responsive to different forms of neurodiversity and to the varied cultural, linguistic, and social backgrounds present in classrooms. Beyond predominantly therapeutic uses, these environments have become increasingly common internationally in special schools. Approaches are highly heterogeneous: primarily passive, recreational uses coexist with more active, pedagogically oriented applications. These international practices are not easily transferable to the Italian context, where, over the last decade, cultural initiatives and training events have promoted the spread of multisensory environments in mainstream schools—often without aims strictly tied to disability. Some of the limitations identified for multimedia re-emerge at another level for multisensoriality: multisensory exposure alone does not automatically produce positive outcomes. Effectiveness depends on the modes of use, making teachers' professional competencies essential to integrate the necessary emotional engagement with an equally necessary cognitive dimension grounded in their own training. From this perspective, a first step is to analyze the perceptions of pre-service teachers to assess not only conceptual familiarity with multimedia and multisensoriality but also professional representations, expectations, and perceived criticalities. For this exploratory study, a questionnaire was administered to early childhood and primary teacher trainees. The instrument—composed of four sections (demographic/contextual data; theoretical and practical knowledge on multimedia and multisensoriality; pedagogical representations of multisensory rooms; professional training needs)—aims to capture both informational levels and emerging professional postures and training needs. Results provide actionable insights for rethinking initial teacher education with an inclusive, multisensory orientation.

LEADING FOR DEMOCRATIC INTELLIGENCE: TEACHER AGENCY, EMOTION, AND EPISTEMIC STEWARDSHIP IN INCLUSIVE SCHOOLS

Chris Brown (University of Southampton, United Kingdom) · **Ruth Luzmore** (University of Southampton, United Kingdom)

Teacher agency | Democratic intelligence | Inclusive education

Inclusive education is widely recognised as a democratic imperative, requiring schools to support participation, recognition of difference, and equitable learning opportunities for all students. Yet inclusive practice increasingly takes place within educational environments marked by epistemic fragmentation, including contested knowledge claims, polarisation, performative accountability pressures, and growing uncertainty linked to digital technologies and social change (Biesta, 2021; Gamote and Hyman, 2025). In such contexts, teachers are not only pedagogical practitioners but key epistemic actors, required to exercise judgement about evidence, values, emotions, and competing interpretations of need. This paper argues that teachers' capacity to enact inclusive education as a democratic practice depends critically on the alignment between professional agency, emotional labour, and the epistemic conditions shaped by leadership and organisational design. Drawing on the framework of democratic intelligence, the paper conceptualises inclusion as a system-level achievement rather than an individual disposition. Democratic intelligence refers to the capacity of educational systems to reason, learn, and act wisely under conditions of complexity and difference, and emerges from the interaction between individual epistemic capacity and organisational epistemic infrastructure (Brown, 2018). From this perspective, teachers' emotional experiences - such as uncertainty, moral tension, care, frustration, or professional vulnerability - are not peripheral to inclusion but central to how judgement is exercised in practice. Emotional labour becomes particularly salient in inclusive contexts involving neurodiversity, disability, and cultural difference, where procedural guidance is insufficient and teachers must interpret ambiguous situations while sustaining relationships and trust. The paper introduces epistemic stewardship as a leadership and organisational responsibility: the deliberate shaping of cultures, routines, and governance arrangements that enable teachers to engage productively with evidence, disagreement, and uncertainty without emotional overload or erosion of professional agency (Edmondson, 2019; Smith, 2020). It is argued that when accountability and evaluation frameworks prioritise compliance over collective sense-making, teachers' emotional strain intensifies and their capacity for inclusive judgement diminishes. Conversely, when schools operate as epistemic infrastructures - supporting psychological safety, structured professional dialogue, and participatory decision-making - teachers are better positioned to integrate emotional awareness with inclusive practice (Brown and Poortman, 2023). The paper further considers the implications of emerging technologies for inclusive education, suggesting that their democratic potential depends less on technical capability than on whether teachers are supported to interpret, contest, and use them confidently within shared epistemic norms (Biesta, 2021). The analysis concludes by outlining implications for teacher education, professional learning, and evaluation, arguing for a reorientation toward emotional competence, dialogic capacity, and epistemic judgement as foundational to inclusive schooling within democratic societies.

DEMOCRATIC PROFESSIONALISM, TEACHER AGENCY, RELATIONAL GOVERNANCE, PROFESSIONAL CAPITAL; SOCIAL-EMOTIONAL LEARNING

Mohammed Elmeski (Faculty of Educational Sciences, University Mohammed V, Morocco)

Professionalism agency governance

Democratic schooling depends not only on formal participatory structures but on the professional capacity of teachers to enact public purposes within politically and economically demanding reform environments (Biesta, 2011). While scholarship increasingly foregrounds teachers' emotions and agency as central to inclusive practice (Zembylas, 2007; Priestley, Biesta, & Robinson, 2015), these dimensions are often framed as individual or dispositional attributes rather than as governance-mediated democratic capacities. This paper advances the concept of democratic professionalism, arguing that teacher agency is structurally conditioned by institutional legitimacy (Evetts, 2009), relational trust and professional capital (Hargreaves & Fullan, 2012), and broader political-economic contexts that shape the public purposes of education (Gramsci, 1971). Teachers may be understood, in Gramscian terms, as public intellectual actors situated within civil society whose work mediates between state reform agendas and lived community realities. Their ability to exercise democratic agency depends not only on technical competence but on emotionally sustainable professional environments that reinforce dignity, belonging, and relational accountability. From this perspective, teachers' emotions constitute part of the affective infrastructure through which democratic commitments are sustained, negotiated, or weakened. Drawing on scholarship in social-emotional learning (Elmeski & Bentahar, 2024), professional collaboration (Romiti, Florek, & Elmeski, 2025), and systems thinking in educational leadership (Elmeski, 2021), the paper develops a three-level analytical framework. At the micro level, teachers' social-emotional competencies and sense of professional dignity shape their engagement with inclusion as a civic practice. At the meso level, relational governance—collaborative cultures, shared norms, and distributed expertise—mediates the translation of policy into practice. At the macro level, governance coherence determines whether reform discourse, accountability mechanisms, and institutional supports align in ways that enable agency rather than produce compliance. The urgency of this analysis emerges from reform contexts where education is central to renegotiating the social contract. In Morocco, large-scale reforms are unfolding amid persistent youth unemployment pressures and human capital challenges (World Bank, 2022), territorial inequalities in educational access and outcomes (OECD, 2018), and heightened expectations of institutional accountability articulated in Framework Law 51.17 and the New Development Model (Commission Spéciale sur le Modèle de Développement, 2021). In such political-economic conditions, education systems are tasked simultaneously with promoting inclusion, improving measurable outcomes, and restoring public trust. These pressures intensify the emotional terrain of teaching. Rather than presenting a national case study, this contribution mobilizes reform dynamics as a comparative lens to illuminate structural tensions observable across systems confronting social fragmentation and institutional strain. The paper concludes by proposing indicators of democratic professional capacity that complement performance metrics with measures of relational trust, emotional sustainability, and perceived governance coherence. In doing so, it seeks to open dialogue between evaluation institutions, policy scholars, and teacher education programs committed to renewing democratic schooling through structurally supported professional agency.

TEACHING AND INCLUSION: FINDING A BALANCE BETWEEN EMPATHY AND ARTIFICIAL INTELLIGENCE

Jessica Mazzuca (University of Catanzaro Magna Graecia, Italy)

empathy | artificial intelligence | inclusive education

An education capable of going beyond technical and incomplete frameworks, focusing on the importance of the relationships it creates, is essential to building meaningful connections that foster authentic human exchange, enriching both the individual and the community. This is possible because education is not just an intellectual endeavor, it is also a social endeavor. However, if education begins with the intention of opening spaces, it sometimes ends up closing them. What brings education back onto the tracks of its natural process is an invisible thread, silently unfolding around us: empathy. Friedrich Nietzsche reminds us of this when, with his critique of the culture of passive knowledge, he warns against an education reduced to mere transmission. Because without emotion, education is reduced to a sterile exercise, incapable of truly impacting the lives of individuals and the well-being of the community. Without emotion, there is no true understanding, nor change. If education remains limited to methodological skills alone, it loses its most profound dimension: that of forming individuals capable of thinking, feeling, and transforming the world. Emerging technologies could help in this regard, offering the potential for more responsive and differentiated teaching. The integration of artificial intelligence (AI) and emotional intelligence represents the real challenge for contemporary education. If AI represents the ability to process information and provide responses, emotional intelligence is the ability to understand, manage, and value one's own and others' emotions. It is not a choice between opposites, but a balance to be cultivated. Educating both intelligences: this is today's challenge to make education inclusive, a fundamental condition for a democratic society.

REINTRODUCING THE EARLY WOMEN SOCIOLOGISTS: EFFECTS ON UNIVERSITY TEACHING AND PEDAGOGICAL PRACTICES

Chiara Ferrari (Università Cattolica del Sacro Cuore, Italy)

Early Women Sociologists | Sociology Teaching | Pedagogical Transformation

Although sociology became institutionalised in the nineteenth century within industrial and patriarchal societies (Jedlowski, 2009), women actively contributed to its early theoretical, methodological, and empirical development (McDonald, 1994). However, as the disciplinary canon took shape - privileging predominantly male figures (Deegan, 1991) - their contributions were marginalised according to a logic of "gender and knowledge politics" (Lengermann and Niebrugge, 1998). Sociology thus constructed its presumed epistemological neutrality from a male standpoint, removing gender as a foundational category (Arango, 2005). Since the 1970s, a systematic rediscovery of the Early Women Sociologists (EWS) has taken place (Santagati et al., 2023), progressively expanding beyond the Anglophone context and reconstructing a more inclusive genealogy of the discipline. Much of this recovery has been promoted by scholars working within academia, who have conducted archival research, edited volumes, and revised university curricula. This study explores the pedagogical implications of this canon revision by asking: what is the effect on university teaching of the recent introduction of the EWS into sociology programmes? Beyond adding new content, does their inclusion reshape teachers' professional agency, emotional engagement, and capacity to enact inclusive and democratic pedagogies? An international literature review identified 106 scholars specialising in the EWS. An online survey explored their research-teaching activities and professional networks. Network-analysis items enabled the identification of 13 key professors involved in disseminating EWS scholarship. These professors (from Spain, Italy, Mexico, Colombia, Brazil, and the United States) were interviewed through semi-structured interviews, including a section devoted to teaching practices and professional experiences. Preliminary findings highlight three main dimensions. First, the EWS articulated a conception of the subject as situated and particularised rather than abstract. This epistemological orientation appears to foster more inclusive pedagogical approaches attentive to lived experience and social positioning. Professors report strong processes of identification with these authors, describing how teaching their texts enhances their sense of professional meaning and

reflexivity. This emotional involvement supports their capacity to sustain participatory learning environments. Second, students similarly display processes of identification, recognising elements of their everyday experiences in these texts, which are then reframed within a collective and theoretically grounded perspective. This results in at least three effects: (1) increased interest and enthusiasm for the discipline; (2) higher levels of emotional engagement and participation; and (3) the emergence of further educational demands. Third, the introduction of the EWS appears to foster a rethinking of teaching practices among university lecturers. It is not merely a matter of adding new texts or new names to the syllabus, but of transforming the mode of teaching itself: the hierarchical dimension of the classroom is attenuated in favour of greater horizontality; circular seating arrangements are preferred; materials produced by the EWS (writings, letters, experience-based texts) are used to stimulate students' sociological imagination. In this sense, revising the canon becomes not only an epistemic intervention but also a professional and emotional resource for teachers. The classroom is reconfigured as a more inclusive and democratic space, where theory and lived experience interact and knowledge is co-constructed through participatory practices.

AN EMPIRICAL STUDY OF CIRCLE SINGING AS A METHODOLOGY TO PROMOTE INCLUSION AND ENHANCE TEACHER COMPETENCES IN HIGHER EDUCATION

Giuseppe Pantano (Roma Tre University, Italy - Université de Lorraine) · **Susanna Zanella** (Roma Tre University, Italy - Universität Münster – Musikhochschule) · **Amalia Rizzo** (Roma Tre University, Italy)

Circle Singing | inclusive education | teacher training

This contribution presents an empirical study conducted at Roma Tre University that examines Circle Singing as an inclusive methodology for developing disciplinary and socio-relational skills and student wellbeing, while also functioning as a teacher-training tool within higher education (Pantano & Rizzo, 2025). Framed within a critical reading of postmodernity (Lyotard, 1985), the pervasive influence of social media (Lancet, 2024), and the fragmentation of identities (Wang, 2022), this study proposes an embodied practice which fosters the emotional and relational development of both teachers and students, while simultaneously supporting the acquisition of linguistic and musical skills. Given the challenges posed by contemporary society "professional education is not education for understanding alone; it is preparation for accomplished and responsible practice in the service of others" (Shulman, 2005, p. 53). Indeed, in educational contexts such as schools and universities, educators bear the responsibility of guiding students toward recognising the other as a value, preventing tendencies toward exclusion, and instead fostering pathways of openness, understanding, and dialogue. Confrontation with alterity renders an inclusive orientation of educational action indispensable. In schools, this implies fostering the full expression of learners' potential by embracing plurality and difference through the creation of social bonds grounded in shared affinities (Benasayag & Schmit, 2003), while also drawing on the transformative potential of arts-based learning methodologies. Within this framework, music can serve as a privileged instrument for promoting interculturality and fostering inclusive educational environments (UNESCO-KACES, 2010), while also proving particularly effective in arousing and regulating emotions (Juslin et al., 2010) and in supporting the development of socio-relational and reflexive competences. The musical laboratory particularly fosters the experience of flow (Csikszentmihalyi, 2003), especially in collective improvisation (Sawyer, 2012), which offers a privileged setting for continuous shifting between self and other. Moreover, singing has been shown to enhance mood (Clift & Hancox, 2010), generating feelings of euphoria or "singer's high" (Jacob et al., 2009), and helping to build a sense of community and friendship among all participants, including teachers (MacDonald, Kreutz & Mitchell, 2012). Community music also fosters lifelong learning, especially in the presence of students with special educational needs, enabling both personal and collective wellbeing to flourish alongside the development of musical disciplinary competences. Widely disseminated through the work of Bobby McFerrin, Circle

Singing positions difference as a resource, intentionally directing the educational focus toward the plurality of individuals involved in generating a collective, engaging experience. In particular, the present quali-quantitative study investigates a Circle Singing laboratory conducted at Roma Tre University between October and December 2025 (Pantano & Rizzo, 2025). The intervention involved 104 students and employed standardised digital tools (PROMS, SpeechAce) to assess musical and linguistic outcomes. Questionnaires and focus groups were used to evaluate socio-relational dimensions and wellbeing indicators. Preliminary analyses underpin statistically significant improvements in musical and linguistic competences, which correlate with an increased sense of belonging, reduced performance anxiety, and enhanced bodily awareness. Focus groups and questionnaires further highlighted students' positive engagement with the methodology, with the majority indicating that they intend to incorporate Circle Singing into their future teaching practice.

GENERATIVE AGENCY, CAPABILITY, AND WELL-BEING IN INCLUSIVE TEACHING PRACTICES

Daniela Gulisano (Università degli Studi di Catania, Dipartimento di Scienze della Formazione, Italy) · **Paolina Mulè** (Università degli Studi di Catania, Dipartimento di Scienze della Formazione, Italy)

Teacher agency inclusive teaching practices

When examining the teaching profession and professionalism to observe the qualitative nature of action—alongside aspects of competence, knowledge, care, pride, and a sense of belonging—a pivotal role is played by the effective interpretation of educational practice. This becomes the primary focal point for new perspectives in study and research. In this sense, the context in which teachers operate daily is constantly evolving, encompassing diverse cultures and existential conditions. This requires calibrated, person-centered planning that extends beyond mere knowledge acquisition toward the attainment of a generative, competent, and enabling agency capable of increasing methodological-didactic awareness. The teacher as an agent of change and an "expert-in-action" in active and laboratory-based methodologies emerges as one who takes responsibility for their role within the school institution. They become a true resource within a complex organization that constantly needs to enhance its level of skills and internal capabilities to address emerging and unforeseen challenges. In synthesis, capacity-in-action is interpreted as functioning (agency) and as a necessary condition for determining human specificity and freedom of action. On this subject, the leading scholar Amartya Sen defines capability as this human faculty to utilize the dense network of relational resources, often identified as social capital: 'competence to act, hybridization, and dense synergistic interaction between material and immaterial forms of the man-world, person-life context relationship.' In other words, drawing also from Martha Nussbaum's definition, the capability approach focuses on the uniqueness of the person, their dignity, and the real spaces of opportunity available to them. Thus, a new dimension of educational and didactic action takes shape, implying the need to rethink the meaning and purpose of the teacher's professional practice. In this direction, a central role is played by the quality and well-being of teacher training, whose profile must be defined as inclusive. Indeed, the possibility of navigating the complexity of the

current educational system lies in adhering to the values that define the inclusive teacher's profile, as updated in 2022 by the European Agency for Development in Special Needs Education (TPL4I). Consequently, within this work—starting from the guidelines developed by the European Agency regarding the 'Profile of Inclusive Teachers'—a National exploratory survey was conducted following the primary research paradigm on original data. The objective is to investigate the quality of the profile and the professional competences/capabilities of the inclusive teacher, aiming for a substantial renewal of teaching practices and inclusive planning processes for a school truly dedicated to developing the talents and potential of each and every student.

The Realm of Ableist Meritocracy: Unmasking Practices of Pseudo-Inclusion Within the Italian Education System

PANEL CONVENORS: Marianna Piccioli (Università degli Studi di Roma "Foro Italico", Italy); Simona D'Alessio (Grids – Gruppo di Ricerca Inclusione e Disability Studies, Italy); Giuseppe Vadalà (Grids – Gruppo di Ricerca Inclusione e Disability Studies, Italy); Fabio Bocci (Università degli Studi Roma Tre, Italy)

PANEL KEYWORDS: Inclusion, Disability Studies, Ableism

In a time when the democratic role of public schooling and inclusive education is being challenged, this panel seeks to offer a crucial space for dialogue concerning various forms of resistance aimed at constructing and preserving a constitutional, equitable, and just educational system. The session invites scholars whose work actively critiques and opposes the ableist and performative vision intrinsically linked to the ideology of merit, both within educational contexts and the broader society. We welcome studies and critical analyses of culture and research methodologies that position education as a collective public matter. Submissions should focus on areas of inquiry that promote genuine inclusive processes by targeting the elimination of institutionalized forms of discrimination and oppression, particularly disabling practices and ableism. We are keenly interested in proposals that offer strategies for active participation and cultural and political transformation. Presentations grounded in theoretical perspectives, such as Disability Studies (DS) and Critical Disability Studies (CDS), are particularly encouraged. These approaches offer innovative frameworks for analyzing policies and cultural practices, and for carrying out research, enabling us to identify the multifaceted forms of discrimination and exclusion, and propose viable pathways for systemic change.

DECONSTRUCTING ABLEISM IN TEACHER EDUCATION: REFLEXIVITY, HABITUS, AND REPRESENTATIONS OF DISABILITY

Alessandra Maria Straniero (University of Calabria, Italy)

Teacher Education | Ableism | Professional Habitus

International and national educational policies recognize teacher education as a strategic lever for promoting inclusive schooling. Nevertheless, a substantial body of research highlights a persistent gap between the normative discourse on inclusion and everyday educational practices. This gap can be attributed, at least in part, to the endurance of social representations of disability grounded in deficit-oriented and ableist paradigms, which continue to implicitly shape teachers' attitudes, educational expectations, and instructional choices. This contribution offers a theoretical and

methodological reflection on teacher education as a privileged space for the deconstruction of perceptions and attitudes toward disability, positioning professional reflexivity as a central formative device. Drawing on the theoretical framework of social representations and the concept of professional habitus, the paper examines how tacit cognitive schemes, doxic beliefs, and embodied dispositions orient educational action – often below the threshold of conscious awareness – thereby reproducing practices that contradict the principles of inclusive education. From this perspective, teacher education cannot be reduced to the transmission of technical or methodological competencies, but must be understood as a transformative process aimed at critically interrogating the dominant educational imaginary surrounding disability. Particular attention is devoted to reflexivity as a practice capable of making visible the cultural assumptions underpinning teaching practices and of activating processes of critical reworking of professional experience. The contribution discusses a range of reflective training devices – including the narration of practices, professional and autobiographical writing, the analysis of instructional planning, professional journaling, and dialogic peer exchange – conceived as tools for bringing to the surface stereotypes, automatisms, and implicit attitudes toward disability. These devices enable teachers to critically examine the distance between inclusive discourses and enacted practices, fostering a transformation of professional habitus toward greater awareness, critical engagement, and inclusivity. The aim of the paper is to offer theoretical and methodological insights for rethinking teacher education as an ethical and political practice, capable of supporting the development of a reflective teaching professionalism oriented toward educational justice and the construction of genuinely inclusive educational practices.

PRACTICING DEMOCRACY AND INCLUSIVE EDUCATION THROUGH PHILOSOPHY FOR CHILDREN IN PRIMARY SCHOOL

Arianna Vennarucci (Istituto comprensivo Claudio Abbado, Italy)

philosophy children inclusion

This contribution presents and discusses a Philosophy for Children (P4C) project implemented in a primary school within a comprehensive institute in Rome. The project is designed as an innovative and inclusive pedagogical practice aimed at fostering democratic schooling through dialogical inquiry, critical thinking, and participatory learning processes. In a contemporary educational context increasingly shaped by standardization and homogenizing curricular models, the teaching of philosophy is conceived as a form of pedagogical resistance, capable of preserving plurality, subjectivity, and critical reflection within schooling. Grounded in the theoretical framework of Philosophy for Children, as developed by Matthew Lipman and later expanded by international scholarship, the project is carried out over one academic year with students aged 8–10. Philosophical inquiry sessions are integrated into the regular curriculum and structured around the Community of Inquiry model. Through shared reading of philosophical stimuli, collective question generation, and dialogical discussion, pupils are encouraged to express their viewpoints, listen to others, justify their reasoning, and collaboratively construct meaning. This process supports inclusive participation by valuing diverse cognitive styles, linguistic repertoires, and lived experiences, thus challenging normative and deficit-based conceptions of learning. The project explicitly addresses the democratic and inclusive dimension of schooling by positioning students as active participants in knowledge construction. Classroom dialogue functions as a micro-democratic space in which rules of discussion are co-constructed, authority is shared, and differences are recognized as epistemic resources. In this sense, philosophical inquiry counters the logic of standardization by resisting the reduction of students to measurable performances and instead

affirming their voices as singular, relational, and socially situated. Curriculum teachers work alongside trained P4C experts, who co-facilitate inquiry sessions, model philosophical dialogue, and support teachers in adopting a facilitative rather than transmissive role. This collaborative approach contributes to the creation of an inclusive learning environment in which all students, including those at risk of marginalization, can participate meaningfully. By fostering critical questioning and reflexivity, P4C offers children conceptual tools to recognize and challenge stereotypes, implicit biases, and taken-for-granted assumptions that often underpin processes of exclusion, oppression, and discrimination. Qualitative data are collected through classroom observations, students' reflective journals, audio recordings of discussions, and teachers' field notes. The analysis highlights developments in students' argumentative skills, dialogical dispositions, and openness to plural perspectives. Moreover, the P4C approach contributes to reshaping classroom relationships, promoting mutual respect, cooperation, and a stronger sense of belonging within the learning community. This paper argues that Philosophy for Children represents a powerful pedagogical innovation capable of strengthening democratic and inclusive practices in primary education. By embedding philosophical inquiry into everyday school life and by proposing the project on a yearly basis, the initiative demonstrates how democratic schooling can be cultivated from an early age, not merely as a curricular topic but as a lived educational experience. The contribution concludes by reflecting on the implications for teacher education and on the sustainability of P4C practices within comprehensive school systems committed to resisting standardization and promoting social justice through education.

THE ILLUSION OF INCLUSION: DECIPHERING THE ABLEIST AND PERFORMATIVE APPARATUS WITHIN THE NEW ITALIAN NATIONAL GUIDELINES 2025

Marianna Piccioli (Università degli Studi di Roma "Foro Italico", Italy)

Systemic Ableism | National Guidelines 2025 (Italy) | Performative Meritocracy

In un panorama educativo italiano che storicamente si dichiara inclusivo, le politiche scolastiche recenti sembrano orientarsi verso una "pseudo-inclusione" che maschera—sotto la retorica del talento e della personalizzazione—un ritorno a logiche neoliberiste e abiliste. Questo contributo propone un'analisi critica delle "Linee Guida Nazionali 2025" (Indicazioni Nazionali 2025) attraverso la lente degli Studi Critici sulla Disabilità (CDS), con l'obiettivo di smascherare come il sistema educativo continui a funzionare come strumento di normalizzazione. The analysis focuses on three main problematic nodes identified within the ministerial text. First, the construction of the notion of "talent" is examined: although presented as a universal potential, it is framed as the "active and situated expression of cognitive resources," effectively establishing a value parameter based on performance. This approach transforms merit into an "ableist realm" where success is the individual's responsibility, marginalizing anyone with non-conforming functioning or divergent processing speeds. Secondly, the study analyzes the persistence of normative bodily and cognitive standards in the areas of physical and digital competence. The pursuit of "precision," "finalization of movement," and "speed" in developmental milestones reflects a view of the body and mind as machines to be optimized, ignoring disability epistemologies and the concepts of interdependence. Finally, the intervention highlights how the language of "deficit compensation," despite attempts at terminological updates, maintains a firm medical and individual perspective on disability. This paradigm prevents genuine cultural transformation, reducing inclusion to a technical management of "diversity" so as not to disturb the pace of the "normal" classroom. The objective of this presentation is to demonstrate how these guidelines, by promoting rigid autonomy and an exclusionary meritocracy, act as disabling practices. In conclusion, trajectories of resistance based on critical pedagogy and disability justice will be proposed, shifting the focus from "subject performance" to the "transformation of contexts" for an authentically constitutional and equitable educational system.

THE ROLE OF ABLEISM IN PRODUCING MICRO-EXCLUSION

Francesca Marotti (University of Florence, Italy)

Micro-Exclusion | Ableism | Inclusive Education

The Italian school system was a pioneer in the deinstitutionalization of education, being the first to welcome all students into the regular education system and establishing inclusive education as its current guiding principle. However, the practical implementation of this principle remains fraught with challenges. Within the Italian academic landscape, research informed by the Disability Studies perspective has exposed systemic flaws in the inclusive process, which often culminate in practices of exclusion and discrimination. Specifically, since the early 2000s, processes of micro-exclusion have been brought to light. In line with this theoretical framework, an observational study was conducted across two primary schools in the Tuscany region to identify contemporary phenomena of micro-exclusion within school contexts. The findings revealed that such practices persist across seven key domains: language, physical spaces, temporal organization, interpersonal relationships, instructional design, educational provision, and assessment. This contribution aims to analyze these phenomena through the lens of Critical Disability Studies to understand which elements, typical of ableism, drive their manifestation. From the analysis of the observed phenomena, it emerges that the school system remains deeply rooted in an ableist paradigm. Firstly, there is a noticeable "pollution" of language, resulting from both implicit and explicit categorization processes that reflect a marked prevalence of the individual-medical model. Secondly, the constant reference to the norm triggers separation at multiple levels. Processes of instructional design and assessment, alongside the organization of educational provision, all based on the concept of homogeneity and the ideal of the "average student", render those who do not fit this canon victims of normalization, adaptation, compensation, and simplification, at best. At worst, these students face exclusion from learning and socialization, leading to the creation of parallel tracks delegated solely to the support teacher. Furthermore, this phenomenon of delegation is reflected in the interpersonal dynamics within the class group. Finally, the normative organization of space induces push-out phenomena toward environments constructed for specific categories of students based on their impairment, thereby shifting the focus back onto the individual rather than the context. The school has struggled to embrace the challenge of being transformed by diversity,

which continues to be interpreted as a deviation from a norm, a condition to be reduced to facilitate assimilation. The necessary shift toward inclusive education, understood as a radical transformation of the system, has yet to be fully realized. It is, therefore, essential to reclaim an authentically inclusive perspective: one that shifts the focus away from the "non-normative" student to examine the disabling context and deconstruct the dominant ableist ideologies from which exclusionary and discriminatory practices derive.

THE NON-NEUTRALITY OF THE EDUCATIONAL GUIDANCE OF STUDENTS WITH DISABILITIES: AN ETHNOGRAPHY OF SCHOOL TRANSITIONS

Luca Fabris (Univeristy of Bologna, Italy)

Disability · Guidance · Ethnography

The research is based on a year of ethnographic observation of three groups of students at different stages of their education in four schools in Bologna: two second-year classes in lower secondary school; two classes in the first two years of upper secondary school; and a group of young adult activists with disabilities. Integrating socio-anthropological literature and Disability Studies, the study focused on how guidance practices contribute to the construction of a representation of disabled people by teachers and help to propose to young disabled people an identity to internalise and an educational trajectory to adhere to, producing a looping effect specific to the school field. These representations correspond to imaginaries and educational opportunities that privilege medical-functional needs over personal aspirations. Secondly, through a socio-material analysis of guidance practices, it observed in action some guidance devices - teaching materials, "consigli di orientamento" and differentiation of the PEI - which contribute to the over-representation of students with disabilities in technical and vocational education. This streaming is facilitated by a process of "platformisation" of guidance (Unica) which centralises the collection of information and reduces the complex educational process of choice to a predetermined future to adhere to. The school life stories of the group of young adult activists have served as a tool to shed light on the material and cultural barriers in the students' experiences and their strategies of resistance and rebellion against the destinies offered to them. Can the human being be a project? A project of whom and for whom?

ACHIEVEMENT AND ACHIEVEMENT DIFFERENCES IN PRIMARY EDUCATION: INEQUALITY-CRITICAL REFLECTIONS ON A DISCOURSE ANALYSIS OF EDUCATIONAL POLICY

Sara Baroni (Free University of Bolzano-Bozen, Italy) · **Simone Seitz** (Free University of Bolzano-Bozen, Italy) · **Anna Schwermann** (Free University of Bolzano-Bozen, Italy) · **Aline Lupa** (Free University of Bolzano-Bozen, Italy)

Discourse analysis · inequity · achievement

Achievement is not a neutral educational category but historically and politically framed and produced within "discourse-practice formations" (Ricken & Reh 2018). Since decades it is furthermore a crucial element of educational scientific research (Black & Wiliam, 1998; Agrusti, 2021; Piscozzo & Stefanel, 2022). Referring to Foucault's concept of dispositif (2002), achievement can be understood as part of a complex ensemble of discourses which powerfully structure social

practices within school as an institution (Seitz et al., 2024a). Starting from here, this contribution addresses the question of which ideas of achievement and achievement differences are conveyed through educational policy documents in the Italian inclusive educational system. In a sub-study of a cross-national research project, discourse analyses on educational policy documents (2001-2020) on primary education from Italy and Germany were conducted (APrA: "Achievement: A social practice in Primary School. An International Comparative Analysis on Germany and Italy" DFG-JOINT, 2025–2027; Free University of Bozen-Bolzano; Carl von Ossietzky University Oldenburg). In this context and based on the sociology-of-knowledge approach to discourse (SKAD; Keller 2013), we problematize the phenomenon "achievement" as a discursive construct that is historically shaped within intertwined complexes of power and knowledge (Foucault, 2002). The sampling process of the discourse analysis combined deductive and inductive procedures, that led to a data corpus of 20 analyzed documents regarding primary education in Italy (and the Autonomous Province of Bozen-Bolzano), valid or issued between 2001-2020. The analysis was conducted by adapting coding strategies of Grounded Theory (Glaser & Strauss, 2017) to the requirements of SKAD and the specific knowledge interests of this study (Keller, 2013). The reconstruction of the discourse related to Italy uncovered a strong focus on individualized acquisition of competences being embedded into tensions between logics of meritocracy and educational equity (Boarelli, 2019; Seitz, Baroni & Schwermann, 2026 in press). As assessment translates learning processes into visible and measurable forms, achievement functions as a societal contribution of each. This manifests itself in the subjectification of all students as autonomous achieving subjects and future contributors to society, while the institutional structures foster personality development by valuing, on the one hand diversity and on the other hand, deserving behavior and merit. In our presentation, we critically reflect on the derived concepts of autonomy of the individual and relate it to implicit hegemonial concepts of ability and their close connection to normalcy (Stojanov, 2018; Migliarini, D'Alessio & Bocci, 2018; Seitz et al., 2024b) which change meaning in the light of meritocratic dynamics of achievement enhancement – even within an inclusively structured educational system. This study therefore contributes to the internationally oriented, inequality-critical reflection on achievement-related discourses and their significance for the (re-)production of normality, difference, and educational inequality at the level of (inclusive) primary education.

CRIPPING MERITOCRACY: ABLEIST PERFORMANCE AND NORMATIVE BODIES IN CONTEMPORARY EDUCATION

Barbara Centrone (University of Roma Tre, Italy)

Crip studies | meritocracy | normativity

In contemporary educational discourse, meritocracy is frequently presented as a neutral principle meant to reward talent, effort, and individual commitment. Yet a growing body of critical scholarship has shown how meritocratic systems are embedded in normative assumptions about productivity, autonomy, and performance. These assumptions reflect broader socio-economic structures shaped by neoliberal capitalism, which tends to evaluate human worth according to the capa-

city to perform efficiently within competitive environments. This paper approaches meritocratic ideology through a crip lens, engaging with the emerging field of Crip Studies, a transdisciplinary framework that extends Crip Theory by integrating multiple epistemological and methodological perspectives. Building on the insights of Disability Studies and Queer Theory, Crip Studies interrogate the normative systems that regulate bodies, identities, and ways of living, making visible how different structures of oppression operate together and reinforce one another (Centrone, 2025). From this perspective, meritocratic ideology can be understood as structurally ableist. As Robert McRuer argues, modern societies operate through the implicit expectation of compulsory able-bodiedness, a normative standard that assumes bodies should be autonomous, efficient, and constantly capable of performing within capitalist temporalities (McRuer, 2006). Educational institutions play a key role in reproducing these expectations, evaluating students according to standardized criteria of performance, discipline, and developmental normality. Seen through a crip perspective, ableism does not only affect disabled people, it organizes a broader hierarchy of bodies based on their capacity to conform to socially sanctioned norms: bodies that interrupt expectations of productivity, autonomy, or linear development—such as disabled, chronically ill, or neurodivergent bodies—are often positioned as deviant within meritocratic frameworks. At the same time, bodies that destabilize dominant gender norms and reproductive expectations, including trans and queer subjects, can similarly challenge the normative order that meritocratic ideology seeks to stabilize (Butler, 1990). These dynamics are also connected to dominant relational norms. Recent work on mononormativity has highlighted how capitalist societies tend to naturalize the monogamous couple as the legitimate form of affective and sexual life, shaping expectations around intimacy, care, and social reproduction (Vasallo, 2022). When examined from a crip perspective, these norms appear closely tied to broader systems of normalization that privilege stable, productive, and socially recognizable forms of life. Within this framework, meritocracy functions not simply as a mechanism of evaluation but as a technology of normalization that contributes to producing hierarchies among bodies and identities. In the Italian education system, such dynamics often coexist with discourses that formally promote inclusion. The result is a configuration that can be described as pseudo-inclusion: institutional practices that appear inclusive while continuing to reproduce normative expectations about bodies, abilities, and identities. Mobilizing the analytical tools offered by Crip Studies, this paper argues that addressing ableist meritocracy requires more than expanding access to existing educational structures. It requires a critical examination of the normative assumptions that underpin educational institutions and a rethinking of educational practices in ways that foreground interdependence, collective responsibility, and epistemic plurality.

DISABILITY STUDIES AND DEMOCRATIC SCHOOLING

Simona D'Alessio (istituto comprensivo Octavia, Italy - GRIDS) · **Giuseppe Vadalà** (GRIDS - Gruppo di Ricerca Inclusione e Disability Studies) · **Marianna Piccioli** (Università 'Foro Italico') · **Fabio Bocci** (Università Roma Tre)

Disability Studies inclusive education equity

The workshop introduces the crucial role played by Disability Studies for the development of a democratic school. It analyses the importance of Disability Studies as a critical theoretical framework against which to analyze and investigate processes and policies that can contribute to the development of inclusive education in schools and in society as a whole. Inclusive education is addressed as a key factor for the development of a just, equitable and democratic school. Drawing upon an analysis of the theoretical premises that have supported the development of Disability Studies both at national and international levels, the workshop will provide an opportunity of presenting the results from a research study conducted in a comprehensive school located in the outskirts of the city of Rome, investigating intersectionality focusing, in particular, at disability and migration issues. The final purpose is to engage teachers and school practitioners, in general, to reflect upon their practices and to adopt a Disability Studies perspective to unmask potentially discriminatory practices that can prevent the creation of a democratic school systems despite our intentions of doing otherwise.

MERITOCRACY, INCLUSION, AND THE BOUNDARIES OF FAIRNESS IN SCHOOLING: EVIDENCE FROM A SURVEY EXPERIMENT IN ITALY

Rosa Bellacicco (University of Turin, Italy) · **Tania Parisi** (University of Turin, Italy) · **Sara Romanò** (University of Turin, Italy)

Meritocracy | Inclusion | Ableism

In contemporary educational debates, inclusive policies are increasingly framed as a potential threat to meritocratic ideals such as competition, performance, and individual achievement. This tension can be understood within the broader framework of ableism, defined as a system of beliefs and practices that constructs able-bodiedness and able-mindedness as the normative standard of what is considered "normal," competent, and fully human (Campbell, 2009; Goodley, 2014; Wolbring, 2014). Within educational systems, these norms are often embedded in meritocratic discourses that frame achievement as the outcome of individual effort and ability, while obscuring the structural conditions that shape students' opportunities to succeed. As a result, accommodations and support measures intended to promote equity may be perceived as unfair advantages that undermine the principle of merit (Littler, 2017; Mitchell & Snyder, 2015; Bellacicco et al., 2022). Such perceptions reflect what scholars describe as the normalization of ableist expectations within schooling, where curricula, assessment practices, and institutional routines implicitly privilege certain forms of cognitive, behavioral, and bodily performance (Broderick & Lalvani, 2017; Bolt, 2017; Parekh, 2023). Importantly, ableism does not operate only through overt hostility or explicit discrimination. It also takes more subtle and socially normalized forms, such as paternalism, pity, or overprotective attitudes, which may contribute to the marginalization of students perceived as less able to meet normative expectations of performance (Nario-Redmond, 2020). As Parekh (2023) argues, educational systems often reproduce ableism through apparently neutral mechanisms such as evaluation practices, curricular pacing, and resource allocation, which can systematically position some students as less capable or less deserving of full participation. In this sense, meritocratic logics may function as a powerful cultural framework that legitimizes exclusion while maintaining the appearance of fairness.The study relies on a factorial survey experiment administered to a representative sample of approximately 2,000 individuals in Italy. Two vignette experiments examine how respondents evaluate educational decisions involving students in difficulty. The first vignette (3×2 design) assesses whether interrupting the regular curriculum to support students with different types of difficulties is considered appropriate. The experiment varies the school track (lower secondary school, vocational hospitality institute, scientific high school) and the reason for interruption (COVID-19 learning loss vs. special educational needs). Results show that respondents are more likely to consider pandemic-related disruptions legitimate, while special educational needs are perceived as a weaker justification for modifying the curriculum. The second vignette (3×3 design) explores teachers' decisions to reassign a role in a school play from a student with different types of difficulties to another. The student's condition (anxiety, disability, or no specific reason) and the decision-making context (demanding parents, precarious employment contract, or neutral context) are experimentally manipulated. Risk-laden contexts significantly increase the likelihood of marginalizing the struggling student. Overall, the findings highlight how meritocratic beliefs and institutional pressures may legitimize subtle forms of

ableism, revealing the tensions between inclusion and meritocracy within contemporary schooling. These results contribute to ongoing debates on the contradictions of merit-based educational systems and the challenges of building genuinely inclusive schools.

REFLECTIONS ON INTERMEDIATE LEADERSHIP AS A RESOURCE FOR INCLUSION IN ITALIAN SCHOOLS: THEMES AND ISSUES FROM A DISABILITY STUDIES PERSPECTIVE

Maria Antonietta Maggio (Università degli Studi di Parma, Italy)

Instrumental Function for Inclusion | Disability Studies | intermediate leadership for inclusion

Can we consider intermediate leadership as a potential promoter of real change in inclusive practices in Italian schools? This paper aims to answer this question from the perspective of Disability Studies, which emphasizes that: -in Italian schools, exclusionary practices still exist that refer to paradigms that are considered obsolete (D'Alessio, 2011; Ferri, 2015); -everyone's actions are guided by their own value framework, and understanding it allows them to recognize existing limitations (Travaglini, 2020); -there are ethical issues in the approach to disability that must be considered first (Piccioli, 2020). Intermediate leadership is made up of teachers who support the Headmaster by filling specific roles in areas that each school identifies as significant to its needs. The focus is on teachers with Instrumental Function for Inclusion, who manage all organizational, educational, and teaching aspects related to students with SEN. Specifically, for students with disabilities, they also support special education teachers in designing the Individualized Educational Plan and in defining pathways and experiences related to the Life Project. These two aspects emerged significantly in the results of an exploratory study conducted in the Specialization Course for Support Teachers at the University of Parma (IX edition). Trainee support teachers, asked in a specific structured Workshop, shared their views on the role of the Instrumental Function, describing them as "expert" and capable of sharing a "culture of inclusion" with the professional community, which they recognized as specific to each school. This "culture of inclusion", considered in conjunction with the lack of a unified regulatory profile and the absence of a specific training program, highlights the urgent need to further investigate this role, which remains defined only in each "Piano dell'Offerta Formativa" (in which each school discloses its organizational choices based on identified needs). Specific training programs, based on the Disability Studies perspective, would: -direct interest in the true potential of the Instrumental Function role; -accompany those in the role towards an informed reflection on the implications of their choices; -overcome the disparities that still represent an obstacle to the development of a quality school (D'Alessio, 2015); -support the attention of teachers who hold these roles to their own framework of values. A training program would promote a vision of the role of the Instrumental Function teacher as an "ally" (Oliver, 1990) of people with disabilities, who can therefore act according to specific beliefs (Barton, 2011), making choices and promoting practices capable of transforming cultures (Booth & Ainscow, 2014), and developing inclusive education from a Disability Studies perspective (Piccioli, 2020). The research, though conducted in a limited context, confirmed that teachers share the idea that this role is a strategic for inclusion, for example in supporting planning for students with disabilities. Recognizing the potential of intermediate leadership in improving inclusion means reaffirming that change is a process that must be supported. Incorporating Disability Studies into educational programs would enable this change to be supported anchoring it in pedagogical thinking grounded in solid values and culture (Piccioli, 2025).

Toward an Embodied Crip Pedagogy: Activism, Interdependence, and Democratic Transformation in Educational Spaces

PANEL CONVENORS: Barbara Centrone (University of Roma Tre, Italy); Elisa Costantino (University of Genova, Italy); Sofia Righetti Nottegar (University of Verona, Italy); Alice Scavarda (University of Torino, Italy)

PANEL KEYWORDS: crip pedagogy, activism, body

In contemporary educational contexts characterised by the resurgence of ableist, racist, classist and cisheteropatriarchal norms, the body becomes the primary site where democratic participation is negotiated. Disabled, queer and otherwise marginalised subjects increasingly encounter surveillance, discipline and normative regulation that shape their right to inhabit educational spaces and to be recognised as full democratic agents. The panel adopts a crip lens as an epistemological and methodological foundation, following the formulation of the emerging field of Crip Studies (Centrone, 2025; McRuer, 2006) that weave together contributions from diverse fields that centre the body as a pedagogical and political site shaped by intersecting structures of power and develops multidimensional tools to interrogate how hierarchies of gender, race, class, disability and sexuality are produced, sustained and contested. This approach allows us to analyse how ableist and cisheteropatriarchal logics operate within educational institutions while generating tools for reimagining democratic participation through embodied, interdependent and socially just pedagogical practices. It repositions the body as a relational and political entity, foregrounding vulnerability and ecosociality as foundations for democratic coexistence (Costantino et al., 2025). We welcome theoretical and empirical papers on: – the interrelationship between disability and other identity axes in education and activism; – manifestations of compulsory able-bodiedness in schooling and teacher–student relations; – how crip theory challenges compulsory able-bodiedness in pedagogical and activist spaces; – the role of educational ICT in fostering or hindering oppressive practices; – activism resistance strategies (care practices, minority stress management, etc.); – pedagogical resistance strategies (self-training, shared knowledge production); – embodied pedagogical approaches, including comics and applied theatre.

CRIPPING DISPARITIES OF SUPPORT: RECONFIGURING DISABILITY, SUPPORT, AND PARTICIPATION IN HIGHER EDUCATION

Francesca Peruzzo (University of Birmingham, United Kingdom)

reasonable adjustments | assemblage | activism

This paper examines how everyday negotiations around 'support' in higher education in England function as sites where democratic and equitable participation is materially enabled or constrained. It draws on the multi-institutional project Addressing Disparity of Support: co-creating CPD and guidelines on reasonable adjustments with disabled students, developed in continuity with earlier research on disabled student activism in higher education (Peruzzo and Raaper, 2024) and in collaboration with the grassroots organisation Disabled Students UK (DSUK). Using a participatory design with disabled student co-researchers, the study approaches Reasonable Adjustment Plans (RAPs) not as administrative provisions but as arrangements that organise recognition, legitimacy, and presence within university life. The paper therefore shifts the analytical question from whether support works to how institutions come to know, define, and govern disability. To address this, the project develops an ecological approach informed by neo-materialist thought (Allan and Youdell,

2019), in which disability is analysed as an assemblage involving students, funding systems, administrative procedures, built environments, digital platforms, diagnostic documentation, affects, and embodied expertise. This perspective makes visible how participation depends on how relations between bodies, timetables, lecture capture systems, evidentiary categories, and accountability metrics are configured. Ableism thus operates infrastructurally, distributing capacities across human and non-human elements instead of residing solely in attitudes or prejudice. Support infrastructures here function as regulatory pedagogies in which norms of normalcy and deviance are produced (Sandahl, 2003). Adjustments are typically organised through compensatory logics requiring students to repeatedly narrate impairments and establish credibility and validation (Peruzzo, 2022). In Dolmage's (2017) terms, higher education maintains a 'logic of accommodation' that preserves institutional norms while relocating adaptation onto individuals. The result is conditional inclusion, according to which participation is permitted insofar as students align themselves with bureaucratic temporalities and evidence-informed practices. The study adopts co-production extended by crip pedagogy (McRuer, 2006) and crip epistemologies (Johnson & McRuer, 2014). Disabled student co-researchers co-designed surveys, analysed qualitative responses from students and staff, and co-developed training resources. The findings reveal dynamics operating across temporal, organisational, and relational scales. First, support is temporally misaligned with embodied experience, where administrative predictability conflicts with fluctuating conditions, producing interruption and fatigue. Second, responsibility is redistributed downward, making inclusion an individual managerial task performed through reminders, explanations, and negotiation. Third, support generates relational asymmetries in which staff uncertainty is stabilised through students' ongoing pedagogical labour. The analysis moves from RAPs as administrative devices, to regulatory pedagogies, and finally to sites where democratic participation is organised through socio-material relations. Participation emerges not from formal entitlement but from how institutions configure time, communication, environments, and responsibility across human and non-human actors. Institutional redesign becomes necessary, in which access shifts from an individualised burden to a collectively maintained capacity. Disabled students' knowledge and lived experience thus operate not as supplementary perspectives but as organising principles for imagining disabled futures (Kafer, 2013; Johnson & McRuer, 2014) and re-orienting higher education policy and practice toward a more equitable and democratic university experience.

GIVING "BODY" TO RESEARCH: EMBODIED INQUIRY AND CRIP PEDAGOGY FOR THE DEMOCRATIZATION OF EDUCATIONAL CONTEXTS

Giovanni Gottardo (University of Siena, Italy) · **Francesca Bulletti** (University of Siena, Italy)

Embodied Inquiry | Crip Pedagogy | Fibromyalgia

This contribution aims to show the potential of Embodied Inquiry (Thanem & Knight, 2019; Leigh & Brown, 2021; Ferri, 2022) as a research methodology focused on empowerment and the possibility of being a sounding board for the voice of disabled people and bodies (Oliver, 2023; Gottardo, 2025a), thereby democratizing research and educational contexts. Starting from studies on embodiment (Gomez Paloma, Raiola & Tafuri, 2015) and Crip Studies (Valtellina, 2024; Centrone, 2025), a survey conducted with women with fibromyalgia will be presented, aimed at intercepting the knowledge generated by bodies about bodies themselves. Crip Studies is an interdisciplinary and critical field which, starting from Crip

Theory (McRuer, 2006), addresses identity, intersectional and multi-perspective dimensions (Costantino, Centrone & Bocci, 2025), often not considered within Disability Studies (Romano, 2025). The aim is to identify and unmask the construct of ability as an imposed norm, a canon that defines what is normal and desirable (Bocci & Straniero, 2020), while proposing to subvert it. Embodied Inquiry, as a research methodology focused on the body as a perceptive, communicative, and expressive tool (Leigh & Brown, 2021), moves precisely in this direction: considering the uniqueness and specificity of everyone. This research methodology, developed from neuroscience studies, seeks to capture bodily experiences, inscribed in the body, which are often difficult to communicate in words (Gottardo, 2025b). Thus, people with disabilities do not "disappear" from research (Giaconi et al., 2000), but become its heart, and the marginality and silence of their bodies (Bocci, 2000) becomes protagonism and a living voice. Through the presentation of a survey involving 10 women with fibromyalgia, we want to show how research can be configured as a practice attentive to the rhythms of the body, its suffering and fatigue, respectful of crip time (Kafer, 2013). A research practice conducted within a theater workshop, a protected space, a "suspension of life" (Cappa, 2016), where each woman is free to be herself, vulnerable, fragile, beyond the logic of 'normality' and performativity. A research practice that, through a multimodal approach using tools such as artistic performance, the production of artefacts and reflective writing, gives voice to and values the experience of women with a chronic illness that is (in)visible and often not recognized as a disability (Pieri, 2023). A research practice in which the researchers continually question their own position to avoid falling into the "easy way out" of epistemic injustice (Fricker, 2007), recognizing themselves as an "instrument" of amplification, at the service of women with fibromyalgia. A practical research approach that does not talk about disability but seeks to create knowledge from this perspective. A perspective that allows us to rethink places of education, to transform them into places of resistance, into democratic places (bell hooks, 1998).

CRIP ACTIVISM AS PEDAGOGY OF RESISTANCE: INTERDEPENDENCE, CARE, AND COLLECTIVE LEARNING AS PRACTICES OF SOCIAL JUSTICE

Sofia Righetti Nottegar (University of Verona, Italy)

crip activism · crip studies · disability justice

Within the emerging debates in Critical Disability Studies, crip activism can be understood as a space for the production of pedagogical practices and strategies of resistance capable of interrogating the ableist logics that permeate educational and social spaces. In contexts characterized by the strengthening of neoliberal and cisheteropatriarchal norms, disabled bodies and minds are frequently subjected to regulatory mechanisms that determine who can participate, under which temporal regimes, and according to which capacities (Russell, 2019). In this scenario, crip activism develops collective practices that make these normative regimes visible and produce alternative forms of social organization and knowledge production (Kafai, 2021). This paper situates itself at the intersection of Critical Disability Studies, Crip Theory (McRuer, 2006), and Disability Justice (Sins Invalid, 2016), placing these perspectives in dialogue with critical pedagogy (Freire, 1970; hooks, 1994; Giroux, 2011). Within this framework, crip activism is interpreted not only as a sociopolitical practice but also as a pedagogical space in which activist and educational strategies of resistance are developed for the broader community, disabled and non-disabled alike. On the one hand, crip communities develop practices of collective care, mutual support, and coping with minority stress that challenge the material and symbolic effects of ableism and other systems of normative oppression. On the other hand, these practices generate processes of self-education and shared knowledge production that configure activism as a site of collective learning oriented toward care and social justice (Piepzna-Samarasinha, 2018). Through the analysis of these practices, this paper argues that crip activism, grounded in cripistemology (McRuer & Johnson, 2014) and in the collective production of knowledge, can be interpreted as a form of critical pedagogy capable of fostering agency, interdependence, the political imagination of desirable futures (Kafer, 2013), and the democratic transformation of educational spaces. This reflection aims to contribute to the development of the field of crip studies (Centrone, 2025; McRuer, 2006), particularly to its articulation as a pedagogy of resistance. From this perspective, the analysis of crip activist practices makes it possible to explore how crip studies may offer theoretical and methodological tools for rethinking education as a relational and interdependent practice oriented toward social justice.

CRIPPING THE SENSE OF PLACE: DISABILITY, URBAN ACCESSIBILITY AND SPATIAL BELONGING

Sonia Bragaglia (Università Roma Tre, Italy) · **Barbara Centrone** (Università Roma Tre, Italy)

Social geography · sense of place · crip theory

In humanistic and social geography, the concept of sense of place has long been used to describe the affective, symbolic and experiential relationships that people develop with the environments they inhabit (Tuan, 1977). These reflections, however, have often implicitly assumed a normative subject able to move through space without encountering structural barriers. Drawing on Crip Theory (McRuer, 2006) and the emerging interdisciplinary field of Crip Studies (Centrone, 2025), this contribution proposes a re-reading of the notion of sense of place through the lens of disability understood as a socially produced barrier. When cities, infrastructures and institutions are organised around able-bodied norms, disabled

people encounter environments that are not only partially accessible but also socially and symbolically unwelcoming. Disability geography has shown how spatial organisation can reinforce patterns of exclusion (Gleeson, 1999). At the same time, recent transfeminist analyses highlight how urban space reflects the needs and movements of a presumed universal subject, historically aligned with cisheteropatriarchal, able-bodied and economically privileged norms (Rosenkranz, Castelli & Olcuire, 2023). Space thus functions as a dispositif that regulates visibility, mobility and legitimacy. From a crip perspective, these dynamics become particularly evident when considering the everyday spatial experiences of disabled and neurodivergent people navigating environments that are not designed for their bodies and sensory worlds (Parrella & Villani, 2023). Repeated encounters with architectural barriers, sensory overload or normative expectations of bodily performance reshape the lived relationship between bodies and places, often generating ambivalent forms of attachment, estrangement or avoidance. This perspective is particularly relevant for educational environments, where spatial accessibility directly affects participation, recognition and the possibility of inhabiting institutions as democratic subjects. Bringing crip theory into dialogue with human and urban geography, the paper argues that accessibility should be understood not merely as a technical adjustment but as a political issue concerning spatial justice and democratic participation. Rethinking urban and educational environments through disabled experiences opens new possibilities for imagining spaces grounded in interdependence, care and relational forms of belonging.

PERSONAL ASSISTANCE AS CRIP FREEDOM: CARE, AUTONOMY AND SELF-DETERMINATION FOR DISABLED LGBTQ+ SUBJECTIVITIES

Elisa Costantino (Università degli Studi di Genova, Italy) · **Barbara Centrone** (Università Roma Tre, Italy)

Personal assistance | self-determination | disability

Although the right to Independent Living was formally recognised in Italy through the ratification of the UN Convention on the Rights of Persons with Disabilities (CRPD) via Law no. 18/2009, which commits the State to guarantee “freedom of choice and full participation in the community” (Art. 19), this right remains largely unmet. According to the European Union Agency for Fundamental Rights, services supporting Independent Living in Italy remain highly fragmented and characterised by strong regional disparities, with a persistent reliance on familistic care models that limit disabled people’s autonomy and opportunities for self-determination (FRA, 2022). Within contemporary contexts marked by ableist and cisheteropatriarchal norms, care arrangements become a crucial site where bodies are regulated and democratic participation is negotiated. Familistic systems of care often function as dispositifs of surveillance and control that restrict disabled people’s capacity to inhabit social spaces as autonomous subjects. For LGBTQ+ disabled people, these dynamics take on particular significance. Research shows that LGBTQ+ individuals frequently experience discrimination or silence within family contexts, which may become even more constraining when family members are also primary caregivers (European Commission, 2020). Recent studies further demonstrate that LGBTQ+ disabled people often encounter infantilisation, censorship and discrimination within care systems, directly affecting their capacity to express sexual and relational identities (Abbott et al., 2025; Kempapidis et al., 2024; Smith et al., 2025). This paper draws on a qualitative research project investigating the intersectional discrimination experienced by LGBTQIAP+ disabled people (Centrone & Costantino, 2025). Through semi-structured interviews, the study explores how different care arrangements shape the possibility of self-determination, focusing specifically on the role of personal assistance as a practice of freedom and crip self-determination (Centrone, 2025; Costantino, Centrone & Bocci, 2025). The analysis examines how the difference between accessing non-familial personal assistance and depending on family caregivers affects individuals’ ability to express their sexual identity, build relationships and inhabit their bodies in self-determined ways. Within a crip epistemological framework that interrogates the co-extensivity between compulsory able-bodiedness (McRuer, 2006) and normative re-

gimes regulating sexuality and intimacy, the paper analyses how familistic care systems may reproduce forms of control, invisibility and segregation. The central argument is that the possibility of choosing and training one's personal assistant constitutes a material condition of freedom and a prerequisite for the full expression of the self. Personal assistance, in this perspective, can function not only as a support service but also as a political infrastructure enabling democratic participation and relational autonomy. Reframing care through a crip perspective therefore allows us to understand personal assistance as a form of embodied resistance to ableist and cisheteronormative regimes of care. By foregrounding interdependence and collective responsibility, crip care practices open possibilities for reimagining autonomy, desire and participation beyond familistic and institutional models, enabling disabled LGBTQ+ bodies to emerge as political and relational subjects.

THE PEDAGOGY OF ABSENCE: DISABILITY, ARTISTIC TRAINING AND THE LIMITS OF ACCESS TO THE PERFORMING ARTS

Simone Chiacchiararelli (Università degli studi di Bari "Aldo Moro", Italy)

Disability | Performing Arts Training | Crip Pedagogy

Although the performing arts are often framed as spaces of experimentation and bodily freedom where norms can be challenged, training in the performing arts continues to be structured around implicit models of corporeality, normative pedagogical practices and technical standards that presuppose a substantial uniformity of bodies. This paper interrogates artistic training as a key site where a first selection of bodies occurs, shaping which corporealities gain access to professional artistic pathways. This process affects both the presence—or absence—of certain bodies on the contemporary stage and the forms of embodied representation that the performing arts system makes imaginable. In the Italian context — within which this research is currently situated — schools and academies of theatre and dance, like many performance venues, first present problems of architectural inaccessibility. In cases where this first obstacle can be overcome, other barriers of a pedagogical nature quickly emerge. Training techniques, curricula and teaching models continue to be built around a form of compulsory able-bodiedness that implicitly works to redraw the boundaries of who can participate in artistic training. Even if such barriers were to be surpassed, a third dimension of exclusion would still remain, operating on a cultural level: both the educational system and the professional field of the performing arts rarely make space for such bodies. As a consequence, this produces an absence of models, references and political imaginaries. As a result, many people with disabilities are unable to access institutional artistic training, turning instead to demanding informal pathways or abandoning professional training altogether. Paradoxically, performative practices often become accessible mainly through inclusive contexts and forms of so-called social theatre. While this research does not seek to demonize these experiences, it highlights how they rarely lead to professional artistic pathways and instead function as channels of access that seldom challenge this structural configuration. The result is an extremely limited presence of disabled artists. This system feeds a vicious circle: the limited number of artists with disabilities produces a reduced presence of these corporealities on stage; reduced visibility generates few models and forms of representation; and the

absence of such models makes it harder for many disabled people in the audience to imagine their own bodies in those spaces. In this way, the system tends to produce a continuous self-reproduction of absence. Building on these considerations, the paper examines artistic training as a central mechanism through which the absence of disabled bodies in the performing arts is produced, drawing on an initial mapping of training pathways in theatre and dance academies in Italy. Situating itself at the intersection of performance, disability, queer, and crip studies, the research also explores how certain contemporary artistic practices challenge this configuration by experimenting with alternative modes of transmitting and training the performative body. From this perspective, experiences developed by choreographer and performer Chiara Bersani suggest the emergence of an embodied crip pedagogy, capable of redefining access to training and performance through the use of disability as method.

Inclusion Beyond Crisis: Navigating Diversity, Inequality, and Social Justice in the Schooling of Ukrainian Refugee Students in the Czech Republic

PANEL CONVENORS: Martin Fico (Masaryk University, Czech Republic (Czechia)); Jarmila Bradová (Masaryk University, Czech Republic (Czechia)); Miroslav Jurčík (Masaryk University, Czech Republic (Czechia)); Lenka Ďulíková (Masaryk University, Czech Republic (Czechia)); Oksana Yuriyivna Stupak (Masaryk University, Czech Republic (Czechia)); Štefánia Sokolová (Masaryk University, Czech Republic (Czechia))

PANEL KEYWORDS: diversity in schools, refugees, education

This panel explores how Czech primary and lower-secondary schools address diversity, inclusivity, and multidimensional inequalities in the context of the large-scale arrival of Ukrainian refugee students after 2022. Based on a comprehensive research project that combines multiple methods, building on earlier research initiated at the start of the migration wave (Hlaďo et al., 2024; Šeďová et al., 2024), the panel examines how schools navigate the complex intersection of cultural differences, educational needs, and social justice. Ukrainian refugee students represent a unique group: they are forcibly displaced yet often arrive with relatively high prior educational attainment and socio-economic backgrounds. Their sudden transition into a new linguistic, curricular, and social environment brings to the forefront systemic inequalities and hidden mechanisms of exclusion within host schools. The panel examines how schools strive to create inclusive environments that value diversity while also addressing disparities in access to support, academic opportunities, and relational inclusion. Attention is devoted to how school leaders, teachers, and supporting staff interpret inclusivity, how students experience diversity in everyday interactions, and how families navigate new educational systems under conditions of displacement. The discussion highlights the tensions between formal commitments to inclusion and the practical constraints that reproduce inequalities, such as limited resources, varying school readiness, and unequal distribution of support services. By situating refugee inclusion within broader debates on diversity, equality, and social justice, the panel offers an interdisciplinary dialogue on how schools can more effectively respond to the overlapping challenges of diversity in democratic education systems.

"FINDING MY PLACE AT SCHOOL": PUPIL PERSPECTIVES ON THE INCLUSION OF UKRAINIAN STUDENTS IN CZECH CLASSROOMS

Miroslav Jurčík (Masaryk University, Czech Republic (Czechia)) · **Martin Fico** (Masaryk University, Czech Republic (Czechia)) · **Oksana Stupak** (Masaryk University, Czech Republic (Czechia)) · **Jarmila Bradová** (Masaryk University, Czech Republic (Czechia)) · **Lenka Ďulíková** (Masaryk University, Czech Republic (Czechia))

Refugee inclusion | Ukrainian pupils | Czech pupils

The Russian invasion of Ukraine in 2022 fundamentally reshaped educational realities across Europe and led to a substantial increase in the number of Ukrainian pupils in Czech schools. The Czech Republic is among the countries hosting the highest proportion of people under temporary protection (Eurostat, 2025), which places significant demands on schools to ensure equitable access to education and to support the meaningful participation of newly arrived pupils. Although national and international policies emphasise inclusive education, a persistent gap remains between these aspirations and pupils' everyday experiences (Ainscow, 2020; Slee, 2018). This study focuses exclusively on the perspectives of Ukrainian and Czech lower secondary pupils and explores how they experience the inclusion of Ukrainian classmates in school life. The study adopts a qualitative design based on semi-structured interviews with 16 Ukrainian and 16 Czech pupils from four lower secondary schools in the South Moravian Region. Data were analysed using thematic analysis, with attention to experiences of communication, classroom participation, peer relationships, and perceived support. Findings indicate that Czech language proficiency is a central precondition for participation. Ukrainian pupils describe language as key to independence, confidence, and active engagement, while Czech pupils identify language differences as the main barrier to communication. At the same time, maintaining the Ukrainian language serves an important emotional function for newly arrived pupils and helps them cope with initial uncertainty. Social inclusion emerges as a gradual and relational process rather than an automatic outcome of classroom placement. Friendships and informal peer support play a crucial role in reducing anxiety and strengthening Ukrainian pupils' sense of belonging. However, a tendency towards linguistic clustering persists, which can limit broader peer interaction. Ukrainian pupils also report uncertainty about academic expectations and fear of making mistakes, which constrains their willingness to participate. The findings demonstrate that pupil interviews provide indispensable insight into the subtle, everyday mechanisms of inclusion that are not always visible from an institutional perspective. They suggest that effective support goes beyond language instruction alone and

requires systematically creating opportunities for safe communication, cooperation, and relationship-building among peers. For practice, this implies the need to design teaching and school activities that actively foster participation, amplify pupils' voices, and contribute to making diversity a normal and valued feature of the school community rather than an exceptional condition requiring special treatment.

NAVIGATING THE GAP: SOCIOLOGICAL PERSPECTIVES ON THE INCLUSION OF REFUGEE STUDENTS IN CZECH SCHOOLS

Lenka Ďulíková (Masaryk University, Department of Education) · **Miroslav Jurčík** (Masaryk University, Department of Education) · **Martin Fico** (Masaryk University, Department of Education) · **Oksana Stupak** (Masaryk University, Department of Education) · **Jarmila Bradová** (Masaryk University, Department of Education)

Inclusive education | Refugee integration | Pedagogical dilemmas

The 2022 refugee crisis acted as a catalyst that exposed the deep-seated structural characteristics of the Czech education system. This presentation uses the integration of Ukrainian pupils as a case study to explore the broader sociological dimensions of inclusion within a historically homogeneous environment. Using Bronfenbrenner's ecological systems theory, the contribution analyzes the friction between high-level policy expectations (the macrosystem) and the lived reality of the classroom (the microsystem). We argue that in the absence of robust external scaffolding, the responsibility for complex social integration has been transferred almost entirely to individual actors within the school. Through the lens of Norwich's framework of pedagogical dilemmas, the presentation examines the shifting professional identity of teachers who find themselves navigating the gap between traditional academic roles and the immediate necessity of crisis intervention. We focus on how educators negotiate these conflicting demands in an environment where professional boundaries are being redefined on the fly. Consistent with the conference theme, the core of the contribution lies in the thesis that current inclusive practices represent a form of "fragile improvisation." Specifically, we discuss the friction between the rigid "institutional logic" of the school and the precarious "survival logic" of refugee families. By framing these challenges as sociological phenomena rather than mere administrative hurdles, the analysis questions the limits of a system that relies on individual teacher dedication instead of intentional structural design. The findings suggest that without addressing this systemic vacuum, the Czech education system remains in a state of managed emergency rather than moving toward genuine inclusion.

TEACHERS AS BORDER GUARDS? NARRATIVE FRAMING OF UKRAINIAN REFUGEES IN CZECH SCHOOLS

Štefánia Sokolová (Masaryk University, Czech Republic (Czechia)) · **Martin Fico** (Masaryk University, Czech Republic (Czechia)) · **Lenka Ďulíková** (Masaryk University, Czech Republic (Czechia)) · **Miroslav Jurčík** (Masaryk University, Czech Republic (Czechia)) · **Jarmila Bradová** (Masaryk University, Czech Republic (Czechia)) · **Oksana Yuriyivna Stupak** (Masaryk University, Czech Republic (Czechia))

narrative framing | refugees | attitudes

Migration has become one of the current social issues shaping contemporary European education systems, placing teachers at the forefront of negotiating diversity and inclusion in everyday school practice. Rather than being neutral transmitters of curricular content, teachers actively interpret social phenomena and construct meanings that influence classroom climates, peer relations, and the educational trajectories of students with migrant backgrounds (Woodcock & Anderson, 2024). This paper examines narrative frames as key cognitive and discursive tools through which Czech lower-secondary school teachers make sense of migration (Seiger et al., 2025), with a specific focus on perceptions of migrants from Ukraine. Drawing on recent typologies of migration narratives, the study distinguishes between inclusive frames (solidarity- and victimization-oriented) and exclusive frames (crisis- and xenophobia-oriented), which represent contrasting ways of interpreting migrants' presence and societal impact (Bayerl et al., 2023). Understanding the psychological and attitudinal foundations of narrative frames is crucial for designing policies and professional development initiatives that foster inclusive school environments. The main aim of the study is to investigate how the affective, cognitive, and behavioral components of teachers' attitudes toward migrants from Ukraine, conceptualized within the ABC model of attitudes, predict identification with inclusive and exclusive narrative frames. In the Czech context, understanding how teachers perceive migrants from Ukraine is essential for establishing functional and inclusive educational policies (Pivarč, 2024). The project addresses three interrelated research questions: (1) How are affective, cognitive, and behavioral attitudes toward migrants from Ukraine structured among Czech lower-secondary school teachers? (2) To what extent do these components predict teachers' endorsement of inclusive and exclusive narratives? (3) Are there identifiable profiles of teachers based on combined attitude patterns and narrative orientations? By linking psychological attitude components with narrative framing, the study offers an integrative perspective that connects individual dispositions with broader discursive structures, particularly as inclusion is driven more by social learning than by specific organizational techniques (Ainscow, 2020). Methodologically, the project employs an advanced quantitative design based on a survey administered to Czech lower-secondary school teachers. Structural Equation Modeling (SEM) combined with Path Analysis will then be used to test direct and indirect relationships between attitude components and narrative frames. Additionally, Multivariate Analysis of Variance (MANOVA) will be applied to examine group differences across selected sociodemographic and professional characteristics. The study is expected to generate both theoretical and practical contributions. Theoretically, it advances understanding of how individual-level attitudes translate into narrative positioning within educational contexts. In practice, the findings will inform teacher education and professional development by identifying attitudinal patterns associated with inclusive framing, thereby supporting targeted interventions aimed at democratic schooling, educational equity, and the strengthening of inclusive school cultures.

EDUCATIONAL SUPPORT AND PUBLIC OPINION: EXPERIENCES OF UKRAINIAN CHILDREN AND PARENTS IN CZECH LOWER SECONDARY SCHOOLS

Oksana Yuriyivna Stupak (Masaryk University) · **Martin Fico** (Masaryk University) · **Jarmila Bradová** (Masaryk University) · **Miroslav Jurčík** (Masaryk University) · **Lenka Ďulíková** (Masaryk University)

diversity in schools | Ukrainian refugees | education

Since February 2022, hundreds of thousands of Ukrainian families have been forced to leave Ukraine due to the full-scale aggression of the Russian Federation, seeking safety in other European countries. Czechia was among the first to open its borders and provide material, humanitarian, educational, and moral support to Ukrainians. At the same time, the country's education system faced a number of challenges related to the integration of Ukrainian children who did not speak Czech, experienced stress, and encountered difficulties adapting to a new environment. The aim of this qualitative study is to examine how Ukrainian pupils and parents perceive the support their children receive in Czech schools, as well as to determine how public opinion about Ukrainians in Czech society influences the educational process and interactions among pupils. The research was conducted in four lower secondary schools in Brno in 2025 as part of a grant-funded project supported by the Czech Science Foundation. The empirical data were collected through semi-structured interviews with 16 Ukrainian pupils and 16 Ukrainian parents. The findings show that most Ukrainian pupils feel supported by Czech teachers and classmates both in the learning process and in extracurricular activities. This support is reflected in help with homework, participation in group projects, and additional lessons in the Czech language. At the same time, newly arrived students more often communicate only within Ukrainian peer circles due to the language barrier. Parents reported difficulties in finding a place for their child in a school, particularly in 2024–2025, but emphasized the friendliness and openness of teaching staff. They also noted a lighter academic workload and the absence of obligatory homework in Czech schools compared with Ukrainian schools. A separate aspect of the study concerned the impact of changing public attitudes towards Ukrainians on the adaptation of families. Although most respondents did not report personal experiences of discrimination, some parents noted caution in the public use of the Ukrainian language and a tendency to communicate mainly within the Ukrainian community, remaining in a kind of "social bubble." At the same time, these factors, according to the respondents, do not have a significant impact on their children's academic performance at school. The results obtained have practical significance for improving inclusive approaches in the Czech education system. They highlight the importance of intercultural support aimed at ensuring psychological well-being, meeting educational needs, and promoting the social integration of Ukrainian children into Czech society.

FICTIONAL CLASSMATES, REAL BIASES: EXPLORING PEER INGROUP AND OUTGROUP DISTINCTIONS THROUGH A VIGNETTE-BASED EXPERIMENT

Martin Fico (Masaryk University, Czech Republic (Czechia)) · **Nikol Králová** (Masaryk University, Czech Republic (Czechia)) · **Lenka Ďulíková** (Masaryk University, Czech Republic (Czechia)) · **Oksana Yuriyivna Stupak** (Masaryk University, Czech Republic (Czechia)) · **Miroslav Jurčík** (Masaryk University, Czech Republic (Czechia)) · **Jarmila Bradová** (Masaryk University, Czech Republic (Czechia))

prejudice | intergroup bias | vignette experiment

The increasing diversification of primary and lower secondary education in the Czech Republic provides an important context for examining peer responses to migration-related categories. The demographic composition of Czech primary schools has changed significantly since the Russian invasion of Ukraine in 2022. As of March 31 2025, there were 46,806 Ukrainian pupils enrolled in Czech elementary and secondary education, representing approximately 3.1 % of all students at these levels, with Ukrainians remaining the largest group of foreign-national pupils in the system. Ukrainian students account for the majority of foreign pupils, followed by Vietnamese and Slovak pupils, who together with Ukrainians and Russians comprise the vast majority of non-Czech nationalities in Czech schools (Ministry of Education, Youth and Sports

of the Czech Republic, 2025). These shifts have intensified everyday intergroup contact in classrooms and raised questions about how Czech children perceive and interact with peers from different national and ethnic groups in their educational environment. Current state of knowledge suggests that even minimal social categorization can activate ingroup–outgroup distinctions (Tajfel & Turner, 1979). Contemporary work on intergroup bias further demonstrates that prejudice in late childhood and early adolescence often manifests in subtle or latent forms rather than overt hostility (Brewer, 1999; Dovidio et al., 2010). In school contexts, such bias may be expressed through reduced willingness to cooperate, social distancing, or passive bystanding in exclusion situations rather than explicit rejection. Developmental research on ethnic and migration-related attitudes indicates that these patterns are already observable in middle childhood (Raabe & Beelmann, 2011). Building on this theoretical framework, we employ a vignette-based experimental design (Atzmüller & Steiner, 2010; Shadish, Cook, & Campbell, 2002) conducted in the Czech Republic. Students aged approximately 11–15 are randomly assigned to experimental conditions in which they read short, realistic school scenarios. The design manipulates two dimensions: A) the fictional classmate's citizenship (Czech, Slovak, Ukrainian, Vietnamese, Russian, or unspecified) and B) ethnicity (Roma vs. unspecified/majority appearance). This factorial structure allows us to examine whether both national belonging and ethnic cues independently shape the social and behavioral reactions of lower secondary school students toward their fictional classmates. The dependent variables capture declared social and behavioral reactions, measured using a Likert-type scale. These include indicators of prosocial intentions (e.g., willingness to cooperate, befriend, or support the classmate) and social distancing or exclusionary tendencies (e.g., avoidance or reluctance to interact). The main research question asks whether students' declared reactions differ depending on the fictional classmate's citizenship and ethnicity. This comparative dimension allows us to explore whether broader socio-political and educational contexts moderate peer responses to newly arrived Ukrainian students and other immigrants. The study contributes to research on intergroup relations in adolescence by providing experimentally grounded evidence from real school populations across Czech lower secondary schools. The findings aim to inform discussions on school inclusion policies and early interventions addressing subtle forms of intergroup bias in increasingly diverse classrooms.

ECHOES OF HOME : HOW CZECH PARENTAL ATTITUDES TOWARDS UKRAINIANS IN CZECH SOCIETY SHAPE PEER RELATIONS BETWEEN CZECH AND UKRAINIAN STUDENTS

Jarmila Bradová (Masaryk University, Czech Republic (Czechia)) · **Lenka Ďulíková** (Masaryk University, Czech Republic (Czechia)) · **Miroslav Jurčík Jurčík** (Masaryk University, Czech Republic (Czechia)) · **Martin Fico** (Masaryk University, Czech Republic (Czechia)) · **Oksana Stupak** (Masaryk University, Czech Republic (Czechia))

parental attitudes · Ukrainian displacement · social inclusion

The 2022 Russian invasion of Ukraine fundamentally reshaped educational realities across Europe, leading to a substantial increase in Ukrainian pupils within the Czech school system. While national policies emphasize inclusive education, a gap remains between institutional aspirations and students' everyday social experiences. This study explores the research question: What impact does Czech parents' opinion towards Ukrainians in Czech society have on relations between Ukrainian and Czech students? Adopting a qualitative design, the study utilizes semi-structured interviews with 16 Czech parents of lower secondary pupils in the South Moravian Region. Data were analyzed using thematic analysis to identify how parental discourse regarding social dynamics and national identity influences their children's peer interactions with

Ukrainians classmates. The findings reveal that parental attitudes function as a hidden curriculum through four primary dimensions. First, the linguistic burden of integration establishes Czech proficiency not merely as a skill, but as a moral metric of effort and a threshold for social acceptance. Second, a distinction emerges between instrumental and transformative views of inclusion: while some parents focus purely on the blending in of Ukrainian pupils, a significant subset perceives the inclusive classroom as a future asset, equipping their children with social competencies for a globalized world. Third, the study identifies a home-to-school attitude transfer, where parental skepticism reinforces linguistic clustering, while parental appreciation for diversity fosters deeper peer-to-peer relationship building. Finally, these dynamics suggest meritocratic expectations of belonging, where social inclusion is viewed as a status Ukrainian pupils must earn through proactive motivation. As an implication to teaching practice, these findings suggest that student inclusion does not occur in a vacuum; rather, effective support necessitates a triadic approach involving the school, the student, and the home. To foster a truly democratic school community, schools must actively engage parents to reframe diversity as a long-term societal asset. This shift is essential for transforming the presence of displaced pupils from an exceptional condition into a standard, valued feature of the school environment.

TEACHING FORCED MIGRANTS IN CZECHIA: CHALLENGES OF DIVERSITY AND NECESSARY SUPPORT SYSTEMS

Tereza Švadová (Masaryk university, Czech Republic (Czechia)) · **Jana Veličková** (Masaryk university, Czech Republic (Czechia)) · **Alice Brychová** (Masaryk university, Czech Republic (Czechia)) · **Petr Pytlík** (Masaryk university, Czech Republic (Czechia)) · **Hana Svobodová** (Masaryk university, Czech Republic (Czechia))

diversity | forced migration | teachers needs

In 2022, the Czech Republic received the highest number of forcibly displaced persons from Ukraine per capita within the European Union (Ministry of the Interior of the Czech Republic, 2022). As a consequence of these migration waves, more than 40,000 pupils of Ukrainian nationality enrolled in Czech primary schools within a single school year (StatIS 2021/2022–2022/2023, Ministry of Education, Youth and Sports). The number of pupils and families experiencing psychological, economic, housing, and legal insecurity also increased (PAQ Research, 2022). The integration of pupils was further hindered by language barriers and limited system capacity, resulting in an uneven burden placed particularly on schools and teachers in regional capitals. This situation revealed previously underexamined mechanisms of exclusion operating at multiple levels of the Czech education system. The discussion focuses on the perspective of educational professionals, their need for further training and methodological support as key preconditions for providing quality support to pupils, and simultaneously raises questions regarding professional motivation and the financing of language and other forms of support. Building on these premises, the Czech part of an international project (with Germany, Poland, Ukraine, and Hungary) will be presented. This project examines the professionalisation of pre-service and in-service teachers working with forced migrant students in lower and upper secondary schools, as well as the resulting classroom diversity. It addresses the question of what teachers need in this field and how they would like to be educated or trained. Based on the findings, an online course will be developed to address the professional development needs of teachers in this field. Ten interviews were conducted: eight individual interviews with teachers and two focus groups – one on-site with six teachers and another online with six pre-service teachers. Initial findings indicate that teachers have a clear need for practical pedagogical strategies to ensure that classroom diversification benefits both forced migrants and Czech students. In particular, they emphasise the importance of individualised teaching that is sensitive to multilingualism,

cultural diversity, and experiences of trauma, addressing the needs of students with migration experience. They also highlighted the need for a clearer comparison between the Czech educational system and curricula and those of students' countries of origin. At the system level, a need for a navigation guide to the infrastructure of available counselling facilities was mentioned. Last but not least, support instruments or strategies for teachers' wellbeing are also reported to be needed. An introduction to the newly developed training course for educators will be included in the presentation. Overall, the presentation aims to contribute to an interdisciplinary dialogue within the panel on how schools, particularly teachers, can more effectively respond to the overlapping challenges of diversity in democratic education systems, and how teacher education can better address teachers' needs in coping with this challenge.

Bias, Schooling, and Trajectories in STEM: How to Go Beyond the Gender Gap

PANEL CONVENORS: Marialuisa Villani (Department of Political and Social Sciences, University of Bologna, Italy); Alessia Macagno (Department of Psychology, University of Turin, Italy); Francesca Bianchi (Department of Biomedical Sciences for Health, University of Milan, Italy); Francesca Arnaboldi (Department of Biomedical Sciences for Health, University of Milan, Italy); Silvia Facchinetti (Department of Economics, Management and Quantitative Methods, University of Milan, Italy)

PANEL KEYWORDS: Gender bias, STEM education, Educational inequalities

Persistent gender disparities in Science, Technology, Engineering, and Mathematics (STEM) are neither uniform across disciplines nor explained by innate differences in ability. Research shows that boys and girls start school with comparable early numeracy skills, yet large-scale longitudinal evidence indicates that a mathematics gender gap, absent at school entry, becomes significant after a few months of schooling and consolidates within the first year. This points to schooling processes, rather than biology, as a key site where inequalities are produced. Gendered expectations from teachers and families, assessment regimes that reward competitiveness and speed, school cultures that present some STEM fields as "naturally" masculine, and peer dynamics that normalise boys as "suited" to maths and technology shape students' self-perceptions and trajectories. These mechanisms operate differently across disciplines: while some life sciences have become more gender-balanced, areas such as mathematics, physics, computer science, and engineering remain male-dominated and symbolically exclusive. This panel examines how biases embedded in teaching practices, assessment regimes, family expectations, peer cultures, and school organisations structure students' pathways across STEM disciplines. It explicitly welcomes interdisciplinary contributions from sociology, educational studies, psychology, and related fields, and is open to all methodological approaches, including quantitative analyses, qualitative inquiry, mixed-method designs, and intervention-based studies. The panel also encourages cross-country and comparative work. Drawing on these diverse perspectives and on large-scale evidence of the early emergence of gender gaps, it discusses how schools can build more equitable learning environments, support girls' identification with STEM, and challenge the cultural assumptions that constrain their educational choices.

BEYOND ASPIRATIONS: GENDER STEREOTYPES, EDUCATIONAL EXPECTATIONS AND STEM CHOICES AMONG ITALIAN UPPER-SECONDARY STUDENTS

Marialuisa Villani (University of Bologna, Italy) · **Alessia Macagno** (Università degli Studi di Torino) · **Silvia Facchinetti** (3Università degli Studi di Milano) · **Francesca Arnaboldi** (3Università degli Studi di Milano) · **Francesca Bianchi** (3Università degli Studi di Milano)

STEM | Gender Gap | Educational Inequalities

Gender inequalities remain deeply embedded within STEM (Science, Technology, Engineering and Mathematics) fields. In Italy, only 16.6% of women aged 25–34 hold a STEM degree compared with 34.5% of men (ISTAT, 2023). This gap reflects the persistence of cultural stereotypes and the limited visibility of female role models in scientific careers(Bilimoria & Lord, 2014; Cheryan et al., 2017). Previous research highlights how social and professional role models shape educational aspirations and influence both students' and families' decision-making processes regarding educational pathways (De Vita & Giancola, 2017; Jaoule-Grammare 2024). Although girls increasingly display higher expectations toward tertiary education (OECD 2025), contributing to the ongoing feminisation of higher education in Italy, STEM fields remain strongly gendered. Structural and cultural mechanisms coexist: while women's investment in higher education has expanded across Western countries, traditional beliefs portraying STEM disciplines as more suitable for boys continue to influence educational choices, reinforced by gendered performance expectations in mathematics during schooling. Educational expansion therefore coexists with persistent gendered representations of professions. The project WHEN – Women in science: wHere wE staNd? investigated gender stereotypes related to STEM careers among upper-secondary students, examining how these perceptions shape educational and occupational expectations and how social origin interacts with university choice processes (Arnaboldi et al. 2025). The study involved 1,642 students enrolled in the fourth and fifth year of upper-secondary schools who participated, between 2023 and 2025, in university orientation initiatives organised by the University of Milan. For the present analysis, we focus on students attending Scientific Lyceum (Italian academic-track upper secondary school) programmes. The analytical sample includes 430 students who completed the pre-intervention questionnaire and a subsample of 205 students who completed both pre- and post-intervention surveys. Data were analysed using paired-sample t-tests, chi-square tests and ANOVA. Preliminary findings reveal persistent gender stereotypes: male students tend to underestimate female peers' mathematical abilities, while female students identify work–family reconciliation as a major perceived barrier to scientific careers. However, post-intervention results indicate a reduction in stereotypical perceptions, particularly among female students, who report lower levels of discouragement related to the

perceived incompatibility between scientific careers and private life. By linking gender stereotypes, social origin and educational expectations within a pre–post intervention design, this study contributes to understanding how gender inequalities in STEM are produced not only through structural constraints but also through anticipatory processes shaping students' imagined futures and perceived opportunity structures (Jaoule-Grammare 2024).

teachers' training · gender gap · STEM education

Many studies, especially in science education research, investigate how gender stereotypes (GS) may affect teachers' teaching attitudes and practices [1-3] and, also, students' attitudes [4] and interest towards STEM disciplines [5]. GS may act, implicitly and explicitly, in school context [6-8]: for example reinforcing the idea that individuals have different chance to succeed in STEM fields on the basis of their gender. Thus these stereotypes may contribute to discourage girls to choose certain study areas, such as engineering or physics, that result to be male dominated fields and, at the same time, may discourage boys to study disciplines, such as biology, that results to be female dominated [9]. Despite the large number of studies investigating how GS influence the teachers and the students, very little of this research filters through and have an impact on school practice, in particular in Italy. This is mainly due to structural shortcomings in teacher training that in our country fails to offer teachers structured training focused on enabling them to access the latest studies in the field of Research in Education and in Science Education. This clearly emerge from the analysis of the curricula of the courses for Italian perspective teachers including only 16 CFU (1 CFU ranges from 5 to 8 hours of lessons) addressing discipline content and, only in some cases, pedagogical content knowledge [10]. To address this issue, supported by a large collaboration of Unified Guarantee Committee (CUG) of Research Institutions and Universities, we develop a wide initiative focused on supporting teachers to develop competences useful to design and implement Research-Based Teaching-Learning activities specifically focused on supporting their students to recognize and deconstruct GS thus to allow students to make more informed choices about their future. We considered that many different and intertwined causes contribute to the existence and persistence of GS: the socio-economic context in which individuals live, family context, teachers' and peers' attitudes and ideas, etc. As these factors are related to many different research fields, we involved colleagues from different research areas – e.g. sociology, psychology, linguistics, etc - in teachers' training to support participants to delve deeper into the latest results from research addressing GS in different areas. Researchers and teachers co-designed activities to be implemented in classrooms. These activities included the design of a structured interview protocol that students' will use to interview male and female STEM researchers. All the interviews will be part of a Podcast sponsored by the network of the involved CUG. Overall about 90 teachers were involved in our initiative. To assess the pilot edition of the initiative, we collected qualitative feedback from both the involved teachers and researchers. In particular, teachers shared with us notes and observations about the training course and the activities implemented in classrooms. These feedback from these notes and observations will be the base for revising topics addressed in the first edition of the initiative and to improve the co-designed teaching-learning activities. We will present details of our teaching training initiatives describing results from the pilot implementation.

INVISIBLE BARRIERS AND GENDER SEGREGATION. VOICES IN DIALOGUE FROM A STUDY ON PROMOTING FEMALE PARTICIPATION IN STEM FIELDS

Chiara Bove (Università di Milano-Bicocca, Italy) · **Alessandra Mussi** (eCampus University) · **Caterina Rapini** (Università di Milano-Bicocca, Italy) · **Maddalena Sottocorno** (Università di Milano-Bicocca, Italy)

STEM | educational segregation | occupational segregation

Italian data show a persistent underrepresentation of women in the STEM-related learning path (European Commission, 2025). Similar trends are evident in the percentage of women employed in the technical, IT and engineering work sectors. CNEL-ISTAT data confirm that the gender gap is still an issue that affects the careers and learning trajectories of young women, both in terms of horizontal segregation (greater concentration in a small number of professions) and vertical segregation (effective access to qualified professions or top positions within organizations) (Freguja et al., 2025). Persistent gender stereotypes contribute to this picture, which translate into social and family influence from childhood (Ghigi, 2019; Biemmi & Mapelli, 2017; Sità, 2025). In pedagogical terms, it is important to understand how gender stereotypes and expectations manifest in the cultures and practices of educational institutions and actors, whether they are formal, informal, or non-formal. Observing this phenomenon, it emerges that not only visible barriers affect girls and young women's paths, but also invisible ones are based on implicit educational models of parents, teachers and other subjects with care responsibilities, often translating into a real orientation conditioned by gender (Mapelli et. al, 2001; Hussénius, 2020; De Gioannis, 2022; Bonvini et al., 2023). To prevent educational inequalities, it becomes important to decode the formative cultures that run through the daily lives of girls at school, in the family and in the world of peers (Biemmi, 2020; Lopez, 2022) to invest in those protective factors that can help reduce the gender gap. In this framework, this presentation offers insights based on three workshops, conducted as part of the international project "STAR Girls - Supporting Talent & Ambition in Renewable Energy Sector for Girls" (Erasmus PLUS), with the aim of promoting greater participation of young girls in the clean and renewable energy sector, through mentoring paths. The workshops have involved professionals from the technical sectors, human resources managers, teachers and representatives of the educational world, researchers and scholars. The workshops were designed as opportunities for discussion and dialogue about the obstacles and facilitators of women's participation in STEM-related training and professions. The first outcomes

highlight consolidated barriers, alongside less visible aspects. Some female participants shared their experiences entering contexts perceived as "men-only worlds," expressing their fears and strategies for negotiating belongings (Hussénius, 2020). The need to question not only careers traditionally precluded to girls but also those implicitly precluded to boys emerges. This makes visible how gender stereotypes act in both directions in the construction of professional imaginaries (Ottaviano & Persico, 2020). Finally, a broader reflection on the meaning of entering STEM for girls emerges: not only as a functional choice for employability or individual success according to neoliberal logic, but also as a meaningful choice capable of opening up perspectives of agency, transforming contexts, and redefining professional identities.

FEMALE EDUCATIONAL EXPANSION WITHOUT CONVERGENCE IN STEM: PERSISTENT GENDER SEGREGATION IN ITALIAN HIGHER EDUCATION

Carmela Spicola (Studiosa indipendente, Italy)

gendered educational segregation | STEM | gender socialization

In Italy, despite the significant growth in women's participation in higher education, the distribution of fields of study continues to display marked gender polarization. In particular, women remain underrepresented in technological, engineering, and digital fields, while continuing to be overrepresented in the humanities, education, and health-related disciplines. This paper addresses this empirical puzzle by investigating the reasons behind the persistence of disciplinary segregation in university choices despite the expansion of female education and the introduction, over the last decade, of numerous national and European initiatives aimed at promoting girls' access to STEM disciplines. This paper analyses the evolution of university enrolments by gender in Italy over the period 2014/2015–2024/2025, with particular attention to STEM fields. The analysis is based on administrative data from the Ministry of University and Research and combines the examination of enrolment shares with the calculation of Duncan's dissimilarity index, in order to assess whether the expansion of women's participation in tertiary education has translated into greater convergence in field-of-study choices or whether the structure of segregation has remained substantially stable over time. The findings show that, over the decade under consideration, the gender distribution of enrolments has remained strongly polarized. Women remain markedly underrepresented in engineering, computer science, and digital technology fields, while women remain the majority in the humanities, education, and health-related disciplines. The dissimilarity index shows limited fluctuations, but no trajectory of structural convergence. This stability is particularly significant, as it persists despite a decade of national and European initiatives aimed at promoting girls' access to scientific and technological disciplines from the school years onward. The absence of a convergence dynamic suggests that educational segregation can hardly be interpreted exclusively in terms of individual aptitude differences or reduced exposure of female students to scientific and mathematical subjects during schooling. Such an interpretation is also not fully consistent with the fact that gender polarization does not affect all STEM fields uniformly. Rather, the findings appear more compatible with approaches that

emphasize the role of socialization processes, role expectations, and the symbolic representations associated with different fields of study in shaping educational and professional aspirations. In this perspective, schooling constitutes an important, though not exclusive, node within processes that remain insufficiently explored and that also unfold within broader cultural, familial, and professional contexts. Taken together, this evidence offers a longitudinal empirical contribution to the discussion on the persistence of educational segregation in Italian higher education and calls for greater attention to the cultural, social, and professional contexts within which educational choices take shape.

MEASURING SCHOOL-RELATED GENDER BIAS: INSIGHTS FROM A NEW AD HOC ITALIAN SURVEY

Alessandro Concas (Università degli Studi di Cagliari, Italy) · **Mariano Porcu** (Università degli Studi di Cagliari, Italy) · **Isabella Sulis** (Università degli Studi di Cagliari, Italy) · **Cristian Usala** (Università degli Studi di Cagliari, Italy)

gender bias | Item Response Theory | Italian school system

Gender disparities in educational and career pathways emerge early in development and persist throughout the life course, with girls and boys exhibiting divergent patterns in subject performance, educational track selection, and occupational aspirations. These differences are shaped substantially by parental gender biases that influence children's perceptions, attitudes, and educational decisions from early schooling onward [1][2]. Despite growing recognition of this phenomenon, literature reveals significant measurement limitations: most existing instruments lack rigorous psychometric validation, fail to integrate assessment across multiple educational domains (i.e. subjects, school tracks, and professional roles), and focus disproportionately on STEM-related biases while neglecting complementary stereotypes in humanities and social sciences[3]. This study addresses these gaps by developing and validating a psychometrically sound instrument to measure school-related gender bias, administered to two nationally representative samples: 2,215 parents of adolescents aged 12–16 and 1,916 young adults aged 18–25. Data were collected through a structured online questionnaire administered between July and August 2025 as part of the EduCAR Youth project. Both samples were drawn using quota sampling stratified by geographical area and municipality size to ensure national representativeness, and are balanced by gender and age. We employed Item Response Theory (IRT) to construct the measurement scale, using a two-parameter logistic (2PL) model to convert pattern of responses in a latent trait score indicating the degree of presence of gender bias [4] [5]. Exploratory factor analysis revealed a clear unidimensional structure in both samples, with the first factor explaining approximately 70% of total variance. The instrument consists of 11 items covering three domains: academic subjects (i.e., mathematics, literature, social sciences), school tracks (i.e., classical lyceum, scientific lyceum, technical institutes), and professional roles (i.e., engineering/IT professions, leadership positions, care-oriented professions). The scale performed consistently across both samples, demonstrating excellent internal consistency (ω = 0.95), high item discrimination (parents: 1.94–3.35; young adults: 1.92–3.13), satisfactory fit statistics, and a TIF > 15 peaking at higher levels of the latent trait. Differential Item Functioning analysis supported partial measurement invariance, with 9 out of 11 items functioning equivalently across samples. Young adults (M = 0.45, SD = 0.70) showed significantly higher gender bias than parents (M = 0.18, SD = 0.59; Kruskal–Wallis Test, $p < .001$). In the parents' sample, gender bias was significantly higher among fathers, parents of boys, younger parents, residents of Central and Northern Italy, and those with either high or low occupational status. Higher bias was also associated with the use of private tutoring, remedial lessons, and local educational support services, as well as expectations that children would attend technical rather than academic secondary tracks. In the young adults' sample, higher bias levels were found among men,

residents outside the Islands, workers compared with students, those not planning to have children, and individuals with lower levels of education. The validated 11-item scale offers a brief, psychometrically robust tool for screening gender bias across educational domains in both research and applied settings. Future research should examine longitudinal relationships between bias and educational outcomes, test cross-cultural generalizability, and incorporate implicit measurement approaches [3].

Bourdieu and Beyond: Connecting Critical Theories to Rethink Educational Inequalities

PANEL CONVENORS: Flora Petrik (University of Tübingen, Germany); Aina Tarabini (Universitat Autònoma de Barcelona, Spain)

PANEL KEYWORDS: Bourdieu, theory, social justice

Bourdieu's work has been central to understanding how education contributes to the reproduction of social hierarchies. His analyses showed that schools not only distribute knowledge but legitimise unequal relations by valuing particular social practices, cultural dispositions, and forms of learning. Although education is often celebrated as a site of democratic participation, empirical research continues to demonstrate how institutional routines of classification and evaluation sustain exclusion. To grasp these dynamics today, Bourdieusian concepts must be revisited not as fixed explanatory models but as theoretical tools that remain open to ongoing revision, refinement, and critique, so as to better capture the evolving configurations of power that shape contemporary education. At the same time, Bourdieusian sociology has been criticised for overemphasising reproduction while underemphasising transformation, for attributing limited agency to learners and educators, and for insufficiently engaging feminist, postcolonial, and decolonial knowledge. Rather than rejecting Bourdieu on these grounds, this panel seeks to take these critiques as entry points for theoretical dialogue, that moves Bourdieu into conversations with epistemologies that unsettle dominant norms and expand what counts as educational knowledge. We argue that understanding the relationship between education and democracy today requires frameworks that forge theoretical bridges to (re)imagine social justice not merely as redistribution but as relational justice and collective transformation. The panel invites theoretical contributions that put Bourdieusian concepts into dialogue with critical perspectives such as care ethics, intersectionality, and post-structuralist approaches. Through this dialogue, the panel aims to refine analytical vocabularies for studying inequality while expanding imaginaries of democratic education.

HABITUS DISRUPTION AND RELATIONAL JUSTICE: WORKING-CLASS PARENTS IN MIDDLE-CLASS SCHOOLS

Manuela Mendoza (Universidad de O'Higgins, Chile)

Habitus disruption | Recognition and misrecognition | School mix

This paper examines how working-class parents in Chile make sense of their children's attendance at predominantly middle-class schools, which stand out as unusually socioeconomically mixed within one of the most segregated education systems in the OECD (Molina & Lamb, 2022). Focusing on parents' narratives, it asks what forms of inclusion, misrecognition, and ambivalent belonging are generated when families enter fields dominated by middle-class norms, and how these experiences invite a reworking of Bourdieusian concepts in dialogue with critical theories of recognition, emotion, and postcoloniality. Empirically, the paper draws on a qualitative multiple-case study of two socioeconomically mixed schools in Santiago that enrolled students from diverse class backgrounds. Through in-depth interviews with working-class

parents, the study explores how they interpret the benefits and costs of their children's participation in middle-class school spaces, paying attention to everyday practices of dress, food, parental involvement, and financial contributions as key sites where classed boundaries are negotiated and reproduced. Analytically, the paper mobilises Bourdieu's concepts of habitus, capital, and field to examine how working-class parents acquire a "feel for the game" of middle-class schooling and how misfits between dispositions and institutional expectations produce moments of habitus disruption (e.g., Bourdieu, 1990; Bourdieu & Wacquant, 1992). Building on elaborations such as Ingram and Abrahams' (2018) notion of habitus interruption, the analysis shows that parents oscillate between reconciliation, destabilisation, and reconfirmation of their working-class orientations as they attempt to support their children's schooling while preserving dignity and self-worth. These negotiations illuminate not only processes of symbolic domination but also the fragile emergence of "third spaces" in which new, more hybrid ways of inhabiting school fields become possible (Bhabha, 1994). At the same time, the paper argues that a Bourdieusian lens centred on reproduction and misrecognition is insufficient to fully grasp these dynamics, and thus brings Bourdieu into dialogue with feminist, recognition, and postcolonial perspectives. Drawing on Fraser (1995; Fraser & Honneth, 2003), the analysis conceptualises inclusion as a matter of redistribution, recognition, and representation, showing how school policies that promote socioeconomic mix may still function as "misrecognition regimes" when working-class families are positioned as grateful beneficiaries rather than as equal interlocutors. Insights from Skeggs and Reay highlight the emotional and moral dimensions of class (Reay, 2015; Skeggs, 1997). Postcolonial critiques further expose how class hierarchies intersect with racialised imaginaries and colonial legacies of servitude in Latin America (Bhabha, 1994). By situating Bourdieusian concepts in conversation with these critical frameworks, the paper contributes to the panel's aim of rethinking educational inequalities through "Bourdieu and beyond." It advances a theorisation of inclusion as relational justice that requires not only access to prestigious schools but also the revaluation of working-class identities and practices on their own terms.

EVERYDAY INTIMACIES OF EARLY YEARS PRACTITIONERS: GOSSIP AS SYMBOLIC POWER IN THE EARLY CHILDHOOD WORKFORCE IN ENGLAND

Ruby Juanita Brooks (Manchester Metropolitan University, United Kingdom)

Early childhood | gossip | gender

Bourdieu's work has been central to analysing how education reproduces inequality through the unequal distribution and recognition of capital. Yet less attention has been paid to the intimate, relational practices through which power is negotiated within feminised educational workplaces. This paper brings Bourdieusian theory into dialogue with feminist perspectives on care and relational labour to rethink everyday informal talk, commonly dismissed as 'gossip', as a site of symbolic power. Drawing on qualitative interviews with women practitioners in the early years workforce in England, the study examines how gossip shapes professional relationships, mediates authority, and produces social distinction within a gendered and classed field. Mobilising Bourdieu's concepts of habitus, symbolic violence, and masculine domination, the analysis demonstrates how gossip simultaneously reproduces professional hierarchies and enables subtle forms of resistance. Through everyday exchanges, practitioners negotiate moral worth, competence, and belonging: processes central to the maintenance and contestation of symbolic power. However, the paper also argues that Bourdieusian accounts of reproduction require expansion to adequately capture the relational and affective dimensions of care work. Feminist insights

into intimacy and relational labour illuminate how women's gossip constitutes a form of situated knowledge production, often devalued within professionalisation discourses. Recent moves to regulate practitioners' talk in the name of professional standards risk silencing these relational practices and reinforcing symbolic hierarchies. By repositioning gossip as both a mechanism of distinction and a resource for collective knowledge-making, this paper suggests that attending to everyday intimacies is crucial for reimagining social justice in education as relational and collective, rather than solely redistributive.

THE AFFECTIVE FIELD OF SCHOOLING: RETHINKING BOURDIEU THROUGH CARE

Aina Tarabini (Autonomous University of Barcelona, Spain)

Bourdieu | Affective field | Educational inequality

This paper reconceptualises the educational field as an affective field, arguing that care, emotional labour and relational dynamics are not peripheral to schooling but constitutive of its structuring logic. While Bourdieu's concepts of habitus, capital and field have been central to analyses of educational reproduction (Bourdieu, 1986), the affective dimensions of schooling have rarely been theorised as integral to the organisation of the field itself. Building on Diane Reay's work on emotional capital (Reay, 2000, 2004) and Kathleen Lynch's theorisation of affective equality and love labouring (Lynch, 2009), this paper extends a Bourdieusian framework to foreground care as a central mechanism through which educational hierarchies are reproduced and contested. The paper makes three conceptual contributions. First, it proposes the notion of the affective field of schooling as an analytical lens that integrates affective relations into the core dynamics of habitus formation, capital accumulation and position-taking. Rather than "adding" emotion to Bourdieu, I argue that affective relations shape the field's hierarchies of legitimacy, recognition and belonging, and are therefore constitutive of learner identities and educational trajectories (Bourdieu, 1986; Reay, 2004). Second, the paper distinguishes analytically between emotional capital (as resource), care-related emotional labour (as practice) and affective inequality (as outcome), demonstrating how these dimensions interact to reproduce classed and gendered hierarchies within schools (Reay, 2000; Lynch, 2009). Third, drawing explicitly on Lynch's framework of affective equality, it argues that educational disadvantage entails not only cognitive deprivation but also affective marginalisation: unequal access to recognition, emotional security and relational support that are foundational to learning (Lynch, 2009). These theoretical developments are grounded in empirical sensitivity through the LEARNER project, which examines learner identities and trajectories in secondary education. Using selected vignettes from interviews and observations with teachers, students and families, the paper illustrates how care circulates, is demanded and differentially valued within everyday school life. Teachers are increasingly positioned as emotional buffers in contexts of intensified socio-economic inequality; families' unequal emotional resources shape expectations and learner identities; and students themselves engage in peer care and emotional labour that often remains institutionally invisible. By foregrounding care as a structuring principle of the educational field, this paper repositions affect at the centre of debates on educational inequality and learner formation. In doing so, it advances a dialogue between Bourdieu, Reay and Lynch and offers new analytical tools for mapping the affective economies through which schooling reproduces – and potentially transforms – social hierarchies.

ILLUSIO AND THE MISRECOGNITION OF BELONGING IN HIGHER EDUCATION

Nicola Ingram (University College Cork, Ireland) · **Ryan Wilkinson** (University of Leeds) · **Kirsty Finn** (University of Manchester)

illusio misrecognition belonging

In this paper we focus on Bourdieu's concept of illusio. We are interested in its utility for making sense of the ways institutional conceptions of 'belonging' have become the 'go-to' policy and practice response for managing entrenched inequalities and disparities in student experience in Higher Education. Within different national contexts belonging has a long conceptual history within educational research and it has been considered by sociologists of education with nuance and care (e.g. Hurtado & Carter 1997; Finn 2017; Thomas KC 2018; Gravett & Ajawi 2021). Notwithstanding this long-standing academic engagement, belonging has however, come to represent a codified set of initiatives and discourses that are increasingly taken up and deployed by policy makers and sector leaders as part of a crisis management apparatus that seeks to 'deal with' deeply ingrained structural inequalities (e.g. mental health and well being, attainment differentials by race, class and gender). This is particularly heightened within the UK where the commodification and individualisation of HE has continued unabated for thirty years. In this context belonging is misrecognised as an individualised commodity to be acquired through induction to the 'feel for the game' (Bourdieu 1990, p.66) in the higher education field rather than something that requires deep structural change. We bring illusio into conversation with institutional conceptions of belonging to offer a theorisation of the processes through which the structural conditions that shape inequalities are silenced and misrecognised in policy and practice responses. Illusio denotes the condition of being so caught up and invested in the game, that the game itself goes unquestioned, and can account for the misrecognition of belonging as a commodity delivered through conformity to existing field structures. This framing of belonging is dressed as a means of delivering change whilst simultaneously maintaining the existing field structure and doxa. We argue that this creates a toxic illusio where the surface appearance of commitment to institutional change obscures the reality of immovable institutionalised structures of inequality. We show that for the maintenance of inequalities not only is it necessary for those directing or implementing policy to be under the spell of the illusio, but for the system to continue to exist and reproduce itself, institutions need the perceived beneficiaries of belonging agendas to similarly recognise, buy into and ultimately conform to the rules of the game. The paper demonstrates that through countless acts of recognition (Bourdieu 1990) - brought about by everyday practices that reproduce the commonsense position that belonging is something to strive for and for institutions to endow – a toxic illusio of belonging is generated. This creates the conditions under which belonging as an agenda goes unquestioned and institutional belonging practices and activities are misrecognised as addressing inequalities when they are all the while obfuscating the structural conditions of their existence.

SOCIAL MOBILITY AS SUBJECTIVATION: BOURDIEU AND BUTLER IN DIALOGUE

Flora Petrik (University of Tübingen, Germany)

First-generation students University Inequality

Transitions to university continue to be structured by classed, racialised, and gendered inequalities, even in systems marked by expansion and widening participation. For upwardly mobile students, entry into higher education is frequently tied to experiences of dislocation, misrecognition, and struggle (Bathmaker et al., 2016). Bourdieusian scholarship has been central to analysing these processes, particularly through the concepts of habitus, field, and capital (Reay, 2018). At the same time, Bourdieu has often been criticised for privileging reproduction over transformation and for leaving insufficient room for the contingent, conflictual, and psychosocial dimensions of practice (Rieger-Ladich, 2017). Con-

sequently, scholars have sought to read Bourdieu in more dynamic ways. This includes, most prominently, Lahire's work on dispositions (Lahire, 2003), as well as more recent contributions in the sociology of education that aim at grasping the complexity of subject formation under conditions of inequality (Manzano et al., 2026). This paper adds to these debates by bringing Bourdieu into dialogue with Judith Butler in order to develop a more differentiated account of educational upward mobility. The paper draws on a biographical case study from a wider qualitative study on first-generation students in Austria (Petrik, 2025). Its empirical focus is the educational trajectory of a female student from a Turkish working-class family who enters university through a non-traditional route and encounters repeated forms of institutional and interpersonal devaluation. Methodologically, the paper works with biographical-narrative interview material and reconstructive interpretation. Theoretically, it asks how experiences of first-generation students can be understood when habitus-theoretical perspectives (Bourdieu, 1984) are connected to Butler's account of subject formation (Butler, 1997). Upward mobility is approached as a contradictory process of subjectivation unfolding in the tension between recognition and resistance. Bourdieu makes it possible to grasp how students' dispositions are shaped by classed histories and how universities privilege forms of cultural ease and familiarity that first-generation students are less likely to inherit. Butler helps to sharpen the analysis of how students are called into being through powerful acts of interpellation: as deficient, unsuitable, extraordinary, or legitimate. This perspective directs attention to the question of how first-generation students become intelligible as students, how they are positioned within the university, and how they negotiate injurious and enabling interpellations. The dialogue between Bourdieu and Butler proves particularly productive when approached through two concepts: dispositions and fields. Dispositions shape receptivity to acts of interpellation in both Butler's sense of psychic disposition and Bourdieu's understanding of a system of socially formed dispositions. In their interplay, they condition whether subjects become susceptible to forms of address that reproduce educational inequality or to those that enable them to overcome educational barriers. Acts of interpellation, however, do not unfold on neutral terrain. They are embedded in specific biographical, institutional, and social contexts that correspond to the social space. Bringing field theory into dialogue with a theory of subjectivation therefore allows educational transitions by upwardly mobile students to be analysed as powerful processes in which social (non-)reproduction and subject formation are mutually constituted.

SOME INSIGHTS ON RECOGNITION AND HIGHER EDUCATION: FROM BOURDIEU'S FIELD-CENTRED APPROACH TO HONNETH'S NORMATIVE PERSPECTIVE

Carlos Palma-Amestoy (Pontificia Universidad Católica de Chile, Chile)

Bourdieu | Honneth | recognition

Pierre Bourdieu's theory has been useful for exploring and understanding transitions and experiences associated with educational inequalities. By applying his fundamental triad made up of habitus, field and capital (Bourdieu, 1990), as well as other sophisticated ideas such as illusio, social magic and symbolic violence (Ingram & Allen, 2019; Nairz-Wirth et al., 2017; Wilkinson et al., 2026), to name just a few, researchers around the world have been able to disentangle educational gaps and divisions in their respective contexts. Following this line of research, this paper focuses on one of the most fundamental concepts in Bourdieu's theoretical framework: recognition (Bourdieu, 2000), which has often been overlooked or taken for granted. In doing so, I aim to expand Bourdieu's ideas on the matter by linking them to Axel Honneth's

(2005) contributions. Thereby, this paper shows how some essential elements of Honneth's perspective on recognition can complement Bourdieu's ideas in exploring educational inequalities, particularly in relation to the field of higher education. Empirically, this paper draws on data from two studies in Chile of students at different stages of their educational trajectories. The first group comprises students from intermediate and lower positions in the social space who are in the process of transition from school to higher education, while the second group consists of students at elite universities from working-class or less privileged social backgrounds. Considering these cases, this paper reflects on how Honneth's ideas – e.g., the struggle for recognition, disrespect, and ideological forms of recognition (Honneth, 2005, 2012) – can shed light on students' experiences of social inequalities and meritocratic striving in higher education within contemporary societies. Overall, this paper shows how Honneth's critical theory and concepts can strengthen Bourdieusian analysis of educational inequalities.

STRUCTURED HYBRIDITY AND THE DEMOCRATIC STRUGGLE OVER EDUCATIONAL PURPOSE

Shilpi Saini (Dream a Dream, India) · **Sreehari Ravindranath** (Dream a Dream, India) · **Apoorva Bhatnagar** (Dream a Dream, India) · **Amit V Kumar** (Dream a Dream, India) · **Joseph Thomas Rijo** (Dream a Dream, India)

Educational Purpose | Symbolic Power | Democratic Education

The purpose of education is frequently presented in policy discourse as self-evident and technical: raising learning levels, enhancing human capital, ensuring inclusion. Yet to ask what education is for is a normative and political question about the forms of knowledge legitimised, capacities valued, and desired futures. Far from being settled, the purpose of education constitutes a field of struggle. Drawing on Bourdieu's concepts of field, doxa, and symbolic power (Bourdieu, 1977; 1991; Bourdieu & Wacquant, 1992), this paper conceptualises educational purpose as a structured terrain in which multiple narratives coexist, yet are differentially institutionalised through classificatory regimes. Symbolic power operates through the naturalisation of these classifications, rendering certain purposes necessary and marginalising others. Educational inequality, in this framing, is not only a matter of unequal resources but of symbolic stratification: some aspirations acquire institutional force, while others remain rhetorically affirmed yet structurally weak. The struggle over purpose therefore organises hierarchies of recognition, determining which capacities and futures are rendered legitimate. The contemporary policy moment—particularly in the Global South contexts—is not characterised by a singular dominant doxa, but by what we term 'structured hybridity': the layering and partial incorporation of emerging narratives (well-being, holistic development, inclusion, cultural rootedness) within enduring developmentalist and technocratic architectures. Pluralism of purposes here does not imply equality. Coexistence occurs under asymmetrical conditions in which measurable, performance-oriented purposes are more readily convertible into standards, assessments, funding streams, and accountability mechanisms. The argument is grounded in the India leg of a qualitative, participatory study examining how narratives about the purpose of education shape systems transformation and children's opportunities to thrive. Our analysis of India's National Education Policy 2020, alongside dialogic Exploration Circles with educational actors, reveals a 'foundational–measurable–future-ready–cultural–inclusive' architecture of purpose. While equity and well-being are prominently articulated, the policy's operational levers—standards, assessments, and governance reforms—continue to privilege measurable and performance-oriented rationalities. This selective convertibility produces layered inequalities of recognition, instrumentality, and futurity. Emerging relational aims are incorporated, yet often subordinated to technocratic logics. This hybridity is mirrored at the level of system actors who articulate economic mobility, cultural continuity,

democratic participation, and human flourishing as simultaneous aspirations. Yet these purposes are differentially convertible into institutional instruments. As a result, thriving-oriented narratives frequently circulate as moral commitments without equivalent structural force. The paper argues that the relationship between education and democracy cannot be understood solely through civic outcomes. Democracy is at stake in the struggle over whose definitions of educational purpose become authoritative, institutionalised, and materially consequential. By theorising structured hybridity, the paper refines analytical vocabularies for studying educational inequality beyond redistribution alone, foregrounding the role of symbolic power in organising plural purposes. Introducing thriving as a relational horizon, it expands imaginaries of democratic education toward dignity, belonging, care and collective flourishing. Rather than prescribing a singular purpose, the paper examines how plural purposes are negotiated within unequal symbolic terrains—and with what consequences for every child's opportunity to thrive.

THE PARADOX OF INSTITUTIONALIZED CARE: HABITUS, REFLEXIVITY AND THE LIMITS OF TRANSFORMATION

Jelena Stefanovic (University of Milan, Italy)

Habitus | Care Ethics | Educational integration

This paper brings Pierre Bourdieu into dialogue with care ethics to examine the implications of educational integration policies targeting students from disadvantaged backgrounds (low socioeconomic status, immigrant origin, and their intersection). Drawing on 71 in-depth interviews with teachers, administrative staff, students, and parents in four lower secondary schools on the periphery of Milan, the empirical analysis explores how institutionalized practices intended to promote integration may paradoxically constrain care's transformative potential. The argument is not that teachers do not care; their intentions and efforts are evident. However, analysis of the empirical material suggests that care is shaped by the habitus of those who provide it. Where significant misalignment of habitus exists between teachers and students from disadvantaged contexts, care risks operating through reciprocity rather than responsiveness. In Joan Tronto's (1993) ethics of care, responsiveness requires attending to the other's expressed position rather than extending to them what one would consider care for oneself. Reflexivity – the capacity to interrogate one's dispositions and assumptions – is crucial for responsiveness and thus the enactment of care that is transformative; yet institutionalization may weaken it. In Zygmunt Bauman's (1993) terms, institutional arrangements can anesthetize moral reflection by delegating responsibility to procedures. At the same time, teachers act as street-level bureaucrats (Lipsky, 1980), whose discretionary space can enable context-sensitive and responsive practice. However, analysis of interviews suggests that the proliferation of institutional solutions may limit the potential of this space by implying that inequalities have already been adequately addressed. Under these conditions, a double-layered symbolic violence may emerge: first, through the universalism of schooling, which presents itself as neutral while reproducing inequality; and second, through integration policies shaped by the habitus of those who design and implement them. What appears as integration may therefore function as another veil obscuring relations of domination. The paper concludes that care can become transformative only when institutional arrangements cultivate reflexivity, enabling teachers to respond to students' needs rather than relying solely on standardized procedures. By situating Bourdieu in conversation with care ethics, the analysis refines the conceptual vocabulary for understanding educational inequalities and highlights the importance of institutional design in enabling or constraining the transformative possibilities of care in schools.

RETHINKING EDUCATIONAL INEQUALITY THROUGH TASTE: A BOURDIEUSIAN ANALYSIS OF STUDENTS' DISPOSITIONS TOWARDS LEARNING

Paula Arboix Caldentey (Autonomous University of Barcelona, Spain)

Taste | School learning | Dispositions

Students' dispositions towards school and learning are neither neutral nor equally distributed (Tarabini, 2023). Building on Pierre Bourdieu's sociology of education (Bourdieu & Passeron, 1977; 1979; Bourdieu, 1984), research has long shown how schools privilege ways of feeling, thinking and acting historically associated with the middle classes, thereby contributing to the reproduction of social hierarchies. Yet, the processes through which these affinities become embodied as durable dispositions remain underexplored. This paper proposes to revisit Bourdieu's concept of taste, as elaborated in Distinction (1984), to analyse the unequal construction of students' emotional dispositions towards learning at school. Conceptualising taste as a symbolic-affective disposition embedded in the habitus opens up a notion that is often psychologised or naturalised through the ideology of natural gifts (Bourdieu & Passeron, 1977). Following Bourdieu, taste is understood not as an individual preference but as a socially constituted disposition that appears natural and self-evident (Bourdieu, 1984). Precisely because of this misrecognised character, taste plays a key role in legitimising power relations and obscuring the social conditions underpinning educational inequalities. In school settings, what counts as "good taste" in learning -valued forms of knowledge, expression, participation, and relation to school- is defined by dominant groups and protected by symbolic boundaries (Skeggs, 2004). As such, taste operates as a mechanism of differentiation and exclusion, positioning students hierarchically within educational institutions. Empirically, the paper draws on findings from a qualitative research project that examines the unequal constitution of young people's dispositions towards school learning in terms of their taste and distaste. The study combines seven focus groups, twenty-one semi-structured interviews, and a four-month ethnography conducted in two secondary schools with different pedagogical projects. Participants were students aged 13-14 from diverse social backgrounds. Particular attention is paid to the intersections of class and gender, and to how these interact with institutional contexts to shape differentiated relations to knowledge, pedagogical methods, and school cultures. The findings reveal patterned inequalities in how students develop symbolic-affective orientations towards school learning. While some students experience consonance between their habitus and the dominant norms of schooling, facilitating smooth trajectories and a sense of belonging, others experience misalignment, producing forms of distaste that manifest as disengagement or the feeling that "school is not for them." By foregrounding taste as an analytical bridge between habitus, affect, and institutional practices, the paper contributes to refining Bourdieusian approaches to the study of educational inequality. More broadly, it suggests that recognising and challenging the symbolic boundaries that define "legitimate" taste in schooling may open possibilities for more relational and democratically just educational practices.

ROOTS AND LEAVES: RETHINKING THE RELATIONSHIP BETWEEN HABITUS AND IDENTITY

Sara Gil (Universitat Autònoma de Barcelona, Spain) · **Martí Manzano** (Universitat de Barcelona) · **Aina Tarabini** (Universitat Autònoma de Barcelona, Spain)

Habitus | Identity | Educational inequalities

The concepts of habitus and identity are central in the sociology of education. However, their longstanding relation has been under-theorised. Despite their prominence in analyses of inequality, these terms are frequently conflated, used interchangeably, or treated in isolation, leaving their conceptual articulation unresolved. This communication seeks to bridge this gap by drawing on Pierre Bourdieu's (1990, 2000) theory of practice alongside significant feminist sociology

extensions—notably the work of Diane Reay (2015), Nicola Ingram (2019), and Louise Archer (2003) —while also engaging in a dialogue with Stuart Hall's (2019) theorization of identity and identifications. In our presentation, we argue that a precise analytical distinction between habitus and identity is essential for understanding how social structures and individual agency interact within educational fields. Integrating these traditions, the framework conceptualizes habitus through the lens of scholars like Reay, who highlights its emotional and psychosocial dimensions, and Ingram, who explores "habitus under tension" during social mobility. Furthermore, it incorporates Archer's focus on identity as a performative and relational act through which individuals seek recognition and negotiate belonging. Together, these perspectives show that while habitus orients what feels natural or desirable, identity becomes most visible in moments of friction or misalignment between dispositions and social fields. Central to this proposal is the metaphor of a tree: habitus represents the "roots"—a hidden but stable structure that draws on the "soil" of structural position to nourish social action. In contrast, identifications are the "leaves"—visible, exposed, and constantly reshaped by the "wind and light" of situational conditions. While habitus operates at a pre-reflexive level with a degree of stability, identifications are more flexible, situational, and potentially reflexive, allowing agents to negotiate who they are in response to specific contexts. Our paper develops a relational model of identification structured around four key dimensions: becoming, positioning, interacting, and enabling. First, identifications are processes of "becoming" rather than fixed essences, emphasizing the ongoing, processual nature of self-construction. Second, "positioning" highlights how identifications are forged within the frames of available discourses and "doxas" in a particular social field. Third, the "interacting" dimension underscores that identities are constructed through intersubjective recognition or misrecognition in everyday social encounters. Finally, "enabling" accounts for the mobilization of material and symbolic capitals—economic, social, cultural, and symbolic—required to sustain specific identifications. This framework strengthens intersectional analysis by showing how multiple axes of power, such as class, gender, and ethnicity, are mediated through both embodied dispositions and situational identity work. By distinguishing between durable dispositions and situated negotiations, the model provides researchers with heuristic tools to examine how educational inequalities are lived and reproduced. Ultimately, the communication advocates for a non-deterministic reading of Bourdieu that recognizes the possibility of transformation while remaining anchored in the structural realities that shape individuals' trajectories.

'I NEED TO LEARN HOW TO TALK': SOCIOLINGUISTIC REFLECTIONS ON HABITUS AND DOXA IN FIRST-GENERATION UNIVERSITY STUDENTS NARRATIVES

Marco Romito (Università degli Studi di Milano-Bicocca) · **Andrea Renee Leone-Pizzighella** (Marie Skłodowska Curie Individual Fellow, Eurac Research)

Bourdieu | First-generation students | linguistic anthropology

In this contribute we use Bourdieu as a bridge between the sociology of education and the linguistic anthropology of education to analyze the ways in which first-generation university students narrate their entry into and experience in the university field. By analyzing sociological interviews, course assignments and focus-groups with methodological lens from the language sciences (analysis of narrative), we ask: what becomes tellable about language, self-presentation and belonging when FGS recount their first steps into university? And how do those tellings reveal both symbolic exclusion and the micro-conversions through which students navigate 'the game' of university participation? The analysis outline how FGS, during the transition from school and family to university, recognize the university as a relatively distinct field and consequently adopt, embody, and enact a habitus which—given their social and schooling trajectories—enables them to take up positions within it.

Can the Children Speak? Ethical Conundrums in Fostering Young People's Participation in Research and Education

PANEL CONVENORS: Greta Persico (University of Milano-Bicocca, Italy); Ale Blue Santambrogio (University of Enna "Kore", Italy)

PANEL KEYWORDS: Children, participation, ethics

The purpose of the panel is to identify and address ethical dilemmas that arise from research and educational practices with children and adolescents, acknowledging these groups as often marginalized by a widespread adultcentric system. On the contrary our aim is to explore how to value children and adolescents' expertise, with particular attention to marginalised groups (on the basis of gender, sexuality, race, class and ability) in order to challenge social, educational, epistemological and cultural injustice. Recognising age as a key factor in marginalising and oppressing children, prompts ethical questions related to their participation in research and education. These questions directly address the positioning of the researcher or educator. How is power negotiated within asymmetrical relationships? How can this power be leveraged for the benefit of children? How do researchers or educators position themselves when operating within oppressive contexts? The panel also addresses the complexities of visibility and invisibility, participants' protagonism and privacy, as well as recognizing children's needs. Relevant questions arise about the legitimacy and intellectual property of knowledge and any artefacts produced by young people while stressing methods and processes involved in assessing the outcomes of research or educational projects. We welcome contributions on the following topics with regard to both research and educational experiences: - Theoretical proposals and critical analyses relating to ethical issues involving children from marginalised groups; - Negotiation processes in involving children, including their adults caregivers; - Informed consent collection processes; - Participatory methodology including visual and creative methods; - Co-construction and dissemination of knowledge.

REFLEXIVITY, RESPECT, AND CLASSROOM DIAGRAMS: METHODOLOGICAL INSIGHTS FOR EXPLORING STUDENT PERSPECTIVES ON STUDENT–TEACHER RELATIONSHIPS

Maria Giulia Tongiani (University of Southampton, United Kingdom)

student voice | student teacher relationships | reflexivity

In this paper, I draw from my research exploring how adolescents in Italy make sense of their relationships with teachers to discuss the potentialities and challenges of engaging with students reflexively to gain a deeper understanding of school experiences. I conceive student-teacher relationships (STR) as a dynamic, affective and dialogic relationship between individual students and teachers emerging from their reciprocal (re)actions within the physical, social and ideological setting of the school (Cook-Sather, 2002; Woods, 1978). I extend these ideas to the research framework, drawing from the student voice notion of dialogue as listening and speaking seriously and with respect, recognising the legitimacy of both adult and youth perspectives (Bourke and Loveridge, 2018; Grion and Cook-Sather, 2013). Respect has been a core value and the methodological foundation for foregrounding students' perspectives in the research and its output, without fully relinquishing interpretative power as the researcher. To translate these premises into practice, critical reflexivity has been embedded in the research from the planning stages to the analysis of the data, following the principles of reflexive thematic analysis. 42 semi-structured interviews were conducted with middle and high school students (ages 13–17) and teachers, online and in-person, between January and April 2025. During the interviews, participants were asked to complete a blank classroom diagram, placing their teachers/students, themselves, and factors that contribute to shaping STRs. Inspired by socio-spatial mapping and relational diagramming approaches, the task allowed participants not only to represent their perceived relational space of the classroom but also to convey experiences through verbal and non-verbal means, supporting those who have a harder time expressing themselves (Donnelly, Gamsu and Whewall, 2020;

Bagnoli, 2009; Umoquit et al., 2008). In addition, two focus groups with volunteer student participants were conducted in late May 2025 to establish a dialogue among them, the researchers and the ongoing analysis. The research presented tried to address the tensions of engaging with young people in a study led by an adult researcher. On the one hand, using the diagrams as part of semi-structured interviews helped different voices to emerge and foster respect and reflexivity throughout the research. Framing relationships in context, the diagram allowed for mediating abstraction and situatedness, as participants represent relationships and dynamics that are meaningful to them within the context in which they exist. Not less importantly, it helped the researcher and participants explore and reflect on aspects of experience that would otherwise have remained untapped. Indeed, the diagram became a tool for reflecting on my positionality as a former student and researcher in becoming, as I created one ahead of the first interview. Nonetheless, the research process presented ethical and practical dilemmas of participation and epistemological power, heightened by the demands of working between two countries (the UK and Italy) with different education systems, cultures, and policies, such as the recruitment of student participants and the power dynamics of the interview encounter. Ultimately, the paper offers methodological insights into how we can value young people's perspectives while navigating the ethical dilemmas of their participation in research.

QUESTIONINGS, SILENCES, AND CESSIONS OF POWER. PRACTICES AND REFLECTIONS THROUGH PICTURE BOOKS

Sara Marini (SCOSSE aps, Italy) · **Elena Fierli** (SCOSSE aps, Italy) · **Giulia Franchi** (SCOSSE aps, Italy)

questionings picturebooks gender-stereotypes

This contribution offers a reflection on education on differences from an intersectional and transfeminist perspective, developed through the experience of the association Scosse and the project Leggere senza stereotipi (Fierli et al. 2015; 2020). At its core lies the role of the picturebook as a mediating device that can reproduce cultural models and gender stereotypes (Gianini Belotti 1978; Turin 2003; Chabrol Gagne 2011), but also open spaces for imagination and normative deconstruction. This tension between "domestication" and "resistance" (Bruel 2022) characterizes a device that carries within itself a "semantic duplicity" (Campagnaro 2014): stories for young children are written and illustrated, but they are also selected and mediated by adults. This dichotomous relationship is deeply infused with power, and it becomes even more pronounced in the case of wordless picturebooks. In this specific type of books, since reading does not depend on the comprehension of written language, meaning is constructed through an open dialogue with images. These images function as open questions, inspiring infinite responses and legitimizing multiple interpretations of the narrative through visual storytelling. This mechanism removes from adults the exclusive authority over reading, interpretation, and mediation, resulting in an inevitable and radical cession of power. Within this framework, the practice of questioning emerges as a privileged pedagogical method for fostering critical awareness and a plurality of perspectives (Gamberi et al. 2010; Ghigi 2019). Through the analysis of picturebooks and comics for children, it becomes evident that "children's questions" constitute a driving force in the construction of the self, in line with Cooley's (1922) dialogical conception of the mind and with Freire and Faundez's (1985) "pedagogy of the question." Dialogue, circle time, and conversational circles (Muntoni 2005; Ginzburg 2017) are practices that restore authority and space for autonomy to children's thoughts

and processes, fostering a co-production of meanings and a horizontal form of learning grounded in listening, negotiation, and self-determination. This kind of literature also reveals children's ability to competently address issues of gender and to question stereotypes that are internalized at an early age (Ellemers 2018; Fabes, Martin, Hanish 2019). Since 2016, practices of questioning aimed at children and adolescents have been promoted through the project Fammi capire, which focuses on representations of bodies and sexualities in illustrated books. In dialogue with symbolic interactionism (Rinaldi 2016), this project makes it possible to create spaces for collective reflection and to observe how identities and sexual meanings are produced and negotiated in situated interaction. International literature also confirms the willingness and expressive urgency of younger generations with regard to gender identities and experiences (Ryan et al. 2013; Martino et al. 2016; Bartholomaeus et al. 2017; Perry et al. 2019). Finally, radically deconstructive questioning practices aimed at challenging cis-heteronormativity and hierarchies of privilege (Borghi 2020; Paechter 2017; Lingiardi, Vassallo 2011) stand in contrast to "judging questions," normative devices, and evaluative approaches. Educating children to ask questions from an early age thus becomes a transformative lever for denaturalizing the gender order and promoting inclusive, plural, and legitimizing environments for all subjectivities.

WHO OWNS THE CAMERA? STUDENT VOICE, VISUAL POWER AND THE POLITICS OF PARTICIPATION IN SCHOOLS

Chiara Dina Paganuzzi (University of Milano-Bicocca, Italy)

Children rights | Student Voice | Participatory Video

In post-democratic educational systems, student participation is frequently institutionalised yet substantively neutralised, reduced to consultative rituals within adult-centric governance structures (Sousa & Ferreira, 2024; Fielding, 2013; Hope, 2012a; Lundy 2007). Against this backdrop, this paper presents preliminary insights from an ongoing comparative doctoral project, "RE-DE-PART - Remagining Democratic Participation", investigating how participatory and visual methodologies can both document and reconfigure democratic participation in secondary schools. Grounded in the UNCRC (1989) and

operationalised through Lundy's model of participation comprising space, voice, audience, and influence (Lundy, 2007; Lundy et al., 2011), the research adopts a qualitative, comparative (Yin, 2018) and participatory design (Pastori, 2017; Mantovani 2007) across three European upper-secondary schools characterised by distinct governance configurations. Particular attention is devoted to participatory video (Colucci, 2016; Lunch et al. 2006) and online video elicitation (Tobin et al., 2010) as epistemic, pedagogical and political devices capable of unsettling adult-centric regimes of knowledge production. Rather than positioning young people as informants, participatory video reconfigures them as narrative agents and co-constructors of meaning. Through video diaries and collaboratively produced micro-documentaries, students document lived experiences of listening, exclusion, deliberation and influence. These artefacts are subsequently mobilised in transnational online video elicitation sessions, enabling dialogical comparison across contrasting democratic ecologies. The methodology thus becomes not only a tool of inquiry but a site where democratic practice is enacted and contested (de Lange & Geldenhuys, 2012; Rogers, 2016). However, this repositioning generates acute ethical tensions. First, power asymmetries persist even within participatory designs: who frames the research questions, curates visibility, and ultimately authorises dissemination? Second, visibility itself is ambivalent. While participatory video amplifies voice and challenges epistemic marginalisation, it simultaneously exposes participants to institutional scrutiny, reputational risks and the politics of representation. Third, questions of epistemic authority emerge: are students recognised as legitimate interpreters of democratic life, or are their narratives reabsorbed into adult analytic frameworks? Preliminary findings from the two highly participatory schools suggest that visual methodologies cultivate reflexive awareness of participation as lived power, revealing both enabling infrastructures (deliberative assemblies, sociocratic circles, negotiated curricula) and subtle reproductions of hierarchy. In the Italian case, operating within a more traditional governance structure, participatory video acts as a catalyst for intergenerational dialogue and as a lever for subsequent participatory intervention aimed at redistributing influence. The paper argues that participatory video, when embedded within a critically reflexive and ethically negotiated framework, can contribute to epistemic justice by challenging credibility deficits and supporting students as legitimate knowers (Fricker, 2007; Burroughs & Tollefsen, 2016). Yet such transformation demands sustained negotiation of consent as process, collaborative management of research outputs, and a grounded redistribution of power. The question, therefore, is not merely whether children can speak or film, but whether educational institutions are willing to be transformed by what they reveal.

SPEAKING BETWEEN ACCOUNTABILITY AND PROTECTION: ETHICAL AND METHODOLOGICAL CHALLENGES IN PARTICIPATORY RESEARCH WITH LGBTIQ ADOLESCENTS

Ale Blue Santambrogio (GenderLens APS, Italy) · **Elena Tubertini** (University of Verona, Italy) · **Federica De Cordova** (University of Verona, Italy) · **Chiara Sità** (University of Verona, Italy)

child-centered research | LGBTIQ adolescents | democratic participation

The present contribution will address a methodological reflection on the CLICK project "Connecting Families, Educators and Policymakers to Improve the Well-Being of LGBTIQ Children Through an Intersectional Approach". The project seeks to enhance the well-being of LGBTIQ adolescents (14-18) by addressing gender-based violence and discrimination through an intersectional, child-centered, multi-actor framework involving youth, families, educators, and key policy-makers. Community-based participatory research (Fine & Torre, 2019; Puckett, 2017) aims to center the lived experiences of minoritized individuals and is widely employed in psychosocial field to actively engage queer individuals (Clements et al., 2025). Our contribution will reflect on the meaning of constructing democratic research with adolescents whose lives and accountability are shaped by age-based discrimination and intersecting inequalities of gender, sexuality, race, class, and ability, as well as their need for protection (Mayo & Rodriguez, 2019). Rather than assuming adolescents' participation in action-research as inherently emancipatory (James, 2007), we will explore the ethical and methodological challenges of making their participation meaningful, safe, active, and rooted in social justice. CLICK adopted an interdisciplinary and mixed-methods design combining focus groups, surveys, and semi-structured interviews. Adolescents were engaged through diverse creative and dialogical tools intended to re-center their perspectives and recognize them as experts of their own lived experiences (Giorgi et al., 2021). The project also established a Children Advisory Board, where adolescents were recognized as key consultants, ensuring the rigorous implementation of the research, the soundness of the results, and the effectiveness of the outputs. We will discuss how facilitation practices were intended to decentralize adult authority and how institutional constraints (i.e., ethical committees, protection obligations, and funding frameworks) simultaneously enable and limit youth democratic participation. We will discuss the need to balance between fostering visibility and active participation on the one hand and ensuring privacy and safety on the other. Therefore, a focus will be placed on the procedures for informed consent and confidentiality (Martínez Muñoz & Velásquez Crespo, 2021). Addressing discrimination, violence, and identity requires navigating consent, GDPR-compliant data management, and child protection protocols while keeping in mind the physical and psychological safety of adolescents who may have not yet disclosed their queer identity to their families or schools. We will conclude by addressing questions of justice and co-construction of knowledge. While the needs and perspectives of young people, their well-being, and community resistance are key components of the project, transforming adolescents' narratives into policy recommendations can raise significant issues of interpretation, intellectual ownership, and potential epistemic extractivism (Furman et al., 2019). A central inquiry will be to determine who speaks on behalf of whom in dissemination processes, and how the voices of young people are translated into institutional language. Drawing on ongoing fieldwork, we will discuss how enabling adolescents to "speak" in research is not merely a matter of technique, but of democratic accountability. Within this framework, participation becomes a space where democracy is practiced, contested, and redefined. A reflexive model of child-centered research could conceptualize democracy not as a normative peripheral concern, but rather as an open-ended methodological challenge.

MORE THAN A THOUSAND WORDS: THE PHOTOGRAPHIC ARCHIVE OF THE PIOUS INSTITUTE OF THE DEAF IN MILAN

Francesca Di Meo (Pio Istituto dei Sordi, Italy) · **Luca Des Dorides** (Università degli Studi di Milano - Bicocca)

Deaf Schools | Epistemic Justice | Public History

The use of photos to represent educational experiences is a common practice at least from the XIXth century that has left traces of educational practices and ideologies. Yet, alongside other sources relating to the cultural heritage of education, it is only in recent times that they have used for a renewed history of education that broadens the horizons beyond the focus on educators and teaching methods (Julia, 2010; Becchi, 2010; Ferrari, 2010; Zoppi, 2016; Dussel, 2013; del Pozo, 2020). In the 2021 the Pio Istituto dei Sordi Foundation in Milan has started a reorganization project of its photographic archive relating to the life of the Istituto Sordomuti Poveri di Campagna di Milano. This project has created a fonds of over 1.000 photos that concern the life of the institution between 1852 and 1967 with the aim of filling a serious documentary gap in the documentation relating to the history of education of deaf people in Italy. It is a fundamental documentation for the history of the Italian Deaf education because it concerns the era of the special school for deaf and their overcoming resulting from the so-called “inclusion law” (Law no. 517 of 1977). This material allows us to refine our considerations about the public image of deaf people in the era of the institutionalization. This image has been very little studied and the reference sources are mainly those relating to the sector-specific press focused on two main roles: “the unhappy one” and “the benefactor” (Des Dorides, 2020). According to this narrative script, Italian press represented deafness by systematically resorting to rhetorical terms and constructions that confined deaf people in subordination. The photographs, however, evoke a more complex image that is closer to the students' perspective: that of a place of relationships and growth in which many students, often for the first time, constructed their own world of relationships and self-image (Debé&Des Dorides, 2024). This collection was digitized, catalogued and it is now available to the public in digital format. In 2024, on the occasion of the 170th anniversary of the foundation of the Pio Istituto dei Sordi, this perspective was the key for the realisation of a photographic exhibition with augmented reality content: “More than a thousand words”. Drawing on the concept of epistemic injustice (Fricker, 2007) and the ideas of the Public History of Education (Herman et. al., 2022; Bandini, 2023), this exhibition, aimed at enhancing this cultural heritage, had the main objective of giving back to the community, with mainly visual sources, an alternative key to the experience of special schools for the deaf in Italy. Thanks to the development of a native app the use of images, archive documents and bibliographical sources merged with the stories of former pupils that come to life thanks to augmented reality allowing for in-depth multimedia content (texts, images and LIS videos). The aim of this paper is to illustrate the solutions adopted for the realization of the photographic exhibition and the approaches adopted to share processes and outcomes.

Caring Literacy Education: Transforming Hatred and Violence in Divided Societies

PANEL CONVENORS: Tammy Shel (Aboody) (Max Stern Academic College of Emek Yezreel, Israel); Natalie Baruch (Ben-Gurion University of the Negev); Miriam Awad Morad (University of Haifa The Israel Democracy Institute)

PANEL KEYWORDS: Caring literacy, Education, Media Literacy

Reducing hatred and violence, while promoting critical thinking, is education's main challenge. This is especially difficult in the context of the Jewish-Palestinian conflict. Hostile patriarchal forces, including those influencing social media and AI, often intervene to serve their own interests. This interference adds layers of complexity, including widespread gaslighting, that make it harder to address these influences. The challenge now is to overcome these barriers during an era of overwhelming media and offer hope to children. I suggest the concept of caring literacy, which aims to undermine violent and dominating narratives in content. This panel invites scholars to submit abstracts that explore the importance of caring literacy in resisting hatred and violence through educational practices focused on care. A key question in the philosophy of caring education is how to overcome the obscuring of our shared humanity within educational systems that serve the patriarchal interests, and how to resist the reproduction of violent structures. Learning through caring literacy can be emancipatory, transformative, and subversive to these hostile forces because it springs from the duality of conflicts and reconciliation within relationships. It provides nurturing pathways for coping with conflicts. However, this approach requires the amalgamation of lived experience with critical thinking in pedagogy and learning through the integration of ethnographic research with a philosophical analysis (ethnophilosophy). It enables learners to undergo Buber's transition from I-It to I-Thou. Although Jews and Palestinians are often seen as adversaries, there exists a unique shared humanity between them that should be fostered and maintained.

CARING LITERACY AS INSTITUTIONAL PRACTICE: EMPATHETIC INQUIRY, REFLECTIVE AUTHORITY, AND DE-ESCALATION IN ARAB SCHOOL LEADERSHIP

Maysoun Shehadeh Ershead (Sakhnin College Academic College for Teacher Education, Israel) · **Marcel Amasha** (Sakhnin College Academic College for Teacher Education, Israel) · **Yasser Awad** (Sakhnin College Academic College for Teacher Education, Israel)

Caring Literacy | Educational Leadership | Divided Societies

In divided societies marked by protracted conflict, structural inequality, and normalized forms of symbolic and relational violence, educational leadership is often required to manage crises while operating within systems shaped by fear, hierarchy, and reactive authority. These challenges are particularly acute in Arab schools in Israel, where school leaders work under conditions of political marginalization, chronic uncertainty, and heightened social tension. In such contexts, educational institutions are frequently pressured to prioritize control, compliance, and rapid response, often at the expense of care, reflection, and shared humanity. This paper advances the concept of caring literacy as an institutional and pedagogical capacity that enables educational leaders to resist escalation, transform professional language, and re-humanize organizational practices. Caring literacy is understood not as an individual moral trait, but as a set of learnable, collective practices embedded in professional routines, decision-making processes, and leadership discourse. It offers a way to address conflict, fear, and anger without reproducing the very structures of domination and exclusion that sustain violence. Drawing on a multi-case qualitative study conducted in two Arab localities in Israel, the paper examines the design and implementation of empathetic inquiry as an architecture of critical professional development within municipal leadership forums and school-based professional learning communities. Empathetic inquiry is a structured dialogical methodology that supports leaders in working with emotionally charged professional dilemmas through four recurring stages: creating a holding space, articulating a live dilemma, engaging in multi-perspectival reframing, and generating de-escalatory courses of action. Through this process, emotional experience is not suppressed or privatized, but translated into collective professional judgment. Methodologically, the study integrates ethnographic observation, longitudinal documentation of leadership discourse, and design-based research. Within this framework, moments of crisis and conflict are treated as opportunities for institutional learning rather than as failures to be managed through coercion. Empathetic inquiry functions as a mediating practice that enables leaders to slow down reactive responses, attend to relational dynamics, and reframe authority as ethical and reflective rather than hierarchical. The findings highlight three interrelated transformations. First, a shift in professional language from blame, urgency, and moralization toward precision, responsib-

ility, and relational accountability. Second, the emergence of reflective authority, grounded in care and shared meaning-making rather than control. Third, the institutionalization of caring literacy as a mechanism of de-escalation, allowing schools to interrupt cycles of symbolic violence and respond to conflict in ways that sustain dignity and trust. By conceptualizing care as a form of literacy rather than a personal virtue, this study contributes to broader debates on education in divided societies. It demonstrates how caring literacy can operate as a counter-force to securitized, patriarchal, and media-driven narratives that normalize domination and obscure shared humanity. The paper argues that embedding care within institutional practices offers a viable pathway for educational leadership committed to reducing violence and fostering ethical responsibility under conditions of conflict.

CARING LITERACY IN EDUCATION - TOWARD AN EMANCIPATORY RHETORIC BEYOND FEAR AND VIOLENT PATRIARCHAL DOMINATION

Tammy Shel (Aboody) (Max Stern Academic College of Emek Yezreel, Israel)

Caring literacy | Education | Media Literacy

A key question in the philosophy of caring education is how to resist education that obscures our shared humanity and reproduces violent patriarchal cognition. The starting point of caring emphasizes that humanity is one interconnected web, and thus any rupture at one end resonates everywhere. We are inherently involved in dialectical relationships that demand navigating conflicts. Therefore, education rooted in care emphasizes human dignity through critical, reflective learning. It is essential for reconciliation and resistance to structural violence, as a compass's trajectory. The intricate paradigm that governs the conflicts in the Middle East, and in this abstract, the Palestinian-Israeli conflict, requires a delicate and courageous vision due to the domination of structured violent patriarchy on either side. Reducing hatred and violence while promoting critical thinking is a primary challenge in education. This is especially difficult in the context of the Jewish-Palestinian conflict, in the era of the inflation of AI platforms and social media outlets' false gaslighting information. An education grounded in caring as a literacy challenges the perspectives of the patriarchal ruling class and illuminates the hidden agendas that sustain its power. The question is, how to do that? How can we expose the manipulative motivations that endanger lives by instigating violence and wars? How can education overcome the forces that distort learning, particularly in history and religion, to maintain conservative, patriarchal power? Caring literacy embodies emancipatory epistemological resistance to patriarchal domination through critical reflection grounded in the inherent trajectory of lived experiences that share a common humanity. Hostile patriarchal forces, including those influencing social media and AI, intervene primarily to advance their own interests, complicating efforts to challenge them through widespread gaslighting. Caring literacy seeks to counter these violent barriers, offering hope to children by undermining dominating narratives through lived experiences. In the absence of caring leadership, caring orientation becomes an act of epistemological resistance to structured conservative patriarchy. This abstract, therefore, explores the ways in which caring literacy can resist hatred and violence across learning contexts, whether in PK–12, higher education, or non-formal educational settings. The process of deconstructing and reconstructing our knowledge based on ethos and myths is crucial to establishing emotionally attuned and caring learners and citizens. It is comparable to the challenge of learning a new language. It necessitates the nurturing of cognitive habits of perceiving safety and security in terms of human kindness. Caring literacy offers the humanization of the formidable 'other' beyond the strict framework that governs our consciousness. Caring literacy enhances our responsibility to the humanity of the formidable 'other,' e.g., Palestinians and Jews, in the amalgamation of content learning with the lived experiences of the learners. This approach makes the tight

link between the personal and the public and political spheres and vice versa. It is vital to add that although Jews and Palestinians are often seen as adversaries, there exists a unique shared humanity between them that should be fostered and maintained. Hence, education that emanates from caring literacy, that amalgamates philosophy with lived experiences, is vital.

DEMOCRACY AND THE FREEDOM OF EXPRESSION OF TEACHERS: THE CASE OF ISRAEL

Moran Svorai (The Hebrew University of Jerusalem, Israel)

The Right to Education | Freedom of Expression | Professional Responsibility

Israel, a country characterized by deep political, ideological, and normative divisions both across and within communal groups, has long been marked by persistent controversy over the aims of education and the extent to which critical thinking is encouraged within the education system. These debates are inseparable from foundational questions concerning the distinction between political education and ideological indoctrination, and the proper goals of education. More than seventy-five years after its establishment, debates over the right to education and its proper nature in such a complex society remain deeply salient. Against this backdrop, the lecture examines the legitimate limits of teachers'

freedom of expression and their pedagogical responsibility to foster critical thinking, in light of the current legal framework and the need to safeguard relevant values. Since the outbreak of the war in Israel and the Gaza Strip, a central question has become increasingly acute: how should educators act in such a context, and what obligations and limits should govern their role? Of particular note is the Baruchin case, which addresses teachers' freedom of expression and their pedagogical commitment to engaging students with current events, including questions related to the Israeli–Palestinian conflict in general and the war in particular; however, the case was decided on technical grounds by a Regional Labor Court and therefore does not constitute binding precedent. Other incidents that have not reached the courts include cases in which teachers were summoned to internal inquiries for attempting to discuss current events in class and foster critical thinking; cases in which teachers were summoned to hearings due to opinions expressed outside the school, including on social media; and cases in which teachers were effectively barred from employment within the Ministry of Education following short-term arrests – later found to be unlawful – arising from pro-democracy demonstrations conducted outside the workplace. Recent research indicates that many teachers – especially Arab teachers and those holding left-wing views – experience fear regarding the expression of their opinions, leading to self-censorship and undermining their ability to engage students in meaningful discussion of current events. Taken together, these measures give rise to a demonstrable chilling effect. That effect was intensified by formal political interventions, including a controversial 2024 amendment empowering political officials to dismiss teachers and reduce budgets on the basis of alleged "terrorist" expressions, without adequate procedural safeguards. This amendment is pending before the Supreme Court. The lecture opens with a critical survey of Israel's existing legal framework and then proposes reform grounded in educational theories that emphasize the duty to engage students with current events, cultivate critical thinking, and refrain from ideological indoctrination. It also draws on international law, as well as regional and domestic teachers' ethical codes. The analysis further emphasizes students' rights – particularly those of K–12 pupils – to a humanistic, values-based education. It proposes a new approach grounded in lessons drawn from the South African Constitution concerning the right to education, and in the application of restorative justice to educational challenges, enabling students to imagine and evaluate alternative futures.

CLASSROOM POWER AND DEMOCRACY: JEWISH AND ARAB TEACHERS' RESPONSES TO SCHOOL BULLYING IN JERUSALEM

Vered Zioni-Koren (Hebrew University of Jerusalem, Israel)

School bullying | Teacher responses | Ethno-national dynamics

Bullying and peer violence are pervasive phenomena among adolescents, occurring within relatively permanent social groups and often with minimal support for victims. Research indicates that bullying is a complex, multi-level phenomenon influenced by inter- and intra-individual factors. Exposure to violence has both immediate and lifelong effects on physical and mental health and can negatively impact psychological and social well-being. In Israel, bullying is a significant concern, with both verbal and physical forms being common. Local studies document rising incidences of bullying and a decreasing average age of involved students, mirroring international trends. Teacher-student relationships play a pivotal role in shaping classroom social dynamics. Negative school climates, where beliefs supporting aggression prevail, correlate with increased bullying. Conversely, victimization is less common when teachers are perceived to disapprove of bullying and maintain positive relationships with students. Students' perceptions of teacher interventions influence their willingness to report bullying, highlighting the importance of teacher practices in mediating classroom violence. This study adopts a critical sociological perspective to examine how Jewish and Arab teachers in Jerusalem interpret, negotiate, and respond to incidents of student bullying. Teachers' responses are conceptualized as socially situated practices shaped by institutional norms, power relations, and ethno-national contexts, rather than as merely technical pedagogical decisions. The study asks whether—and how—responses to school violence differ between Jewish and Arab teachers within the same urban educational space. It investigates variations in disciplinary practices, modes of intervention, and the meanings attributed to violent incidents. Special attention is given to teachers' reliance on formal disciplinary mechanisms, involvement of school authorities, engagement with parents, and use of exclusionary measures such as suspension or expulsion. These practices are analyzed not only as responses to individual incidents but also as reflections of differential positioning within the Israeli education system and its broader socio-political structures. Focusing on Jerusalem, a city marked by profound ethno-national, political, and symbolic tensions, situates teachers' responses to bullying within a contested social landscape. Despite growing research on school violence, relatively little attention has been paid to how teachers' disciplinary practices are embedded in relations of power, minority-majority dynamics, and unequal institutional constraints. This gap is particularly evident in Israel, where education functions not only as a pedagogical arena but also as a site of social regulation and political meaning-making. The study employs qualitative research design. Data are collected through in-depth, semi-structured interviews with Jewish and Arab high school teachers in Jerusalem. Analysis combines inductive thematic exploration with theory-informed deductive interpretation, allowing identification of recurring patterns in teachers' narratives and situating them within broader theoretical discussions on discipline, authority, institutional power, and ethno-national relations. Through comparative analysis, the study illuminates how responses to school bullying are shaped not only by professional norms but also by differential access to authority, legitimacy, and institutional support, highlighting the intersection of pedagogy, power, and democracy in a divided urban educational context.

CARING LITERACY AND NATIONALIST MASCULINITY: INFORMAL EDUCATION AND THE MOBILIZATION OF MARGINALIZED YOUTH

Natalie Baruch (Natalie Baruch, Israel)

Israeli–Palestinian Conflict | Nationalist Masculinity | caring literacy

This paper analyzes how Jewish supremacy organizations, such as LEHAVA (Prevention of Assimilation in the Holy Land), mobilize and instrumentalize marginalized young Jewish men in Jerusalem as agents of nationalist activism. Drawing on the framework of caring literacy, the paper proposes a sociological reading of LEHAVA as an informal educational arena in which gender, nationalism, and demographic anxiety converge. Operating within Israel's far-right political landscape, LEHAVA seeks to prevent romantic relationships between Jewish women and Palestinian men, framing such relationships as existential threats to Jewish continuity and sovereignty. While commonly understood as a political extremist organization, this study conceptualizes LEHAVA as a site of gendered socialization that transforms socio-economic marginality into nationalist masculinity. Through qualitative analysis of public discourse, media representations, organizational materials, and secondary scholarly literature, the paper explores how adolescents and young adults internalize and reproduce ethnonational narratives during critical stages of identity formation. In this process, vulnerability, precarity, and experiences of social exclusion are reframed as moral missions centered on protection, honor, and collective survival. Within LEHAVA's ideological framework, Jewish women, particularly from marginalized backgrounds, are symbolically constructed as bearers of demographic and cultural continuity. Simultaneously, Palestinian men are portrayed as demographic and moral threats, thereby reinforcing a binary logic of protection and danger. The regulation of female sexuality becomes central to nationalist masculinity, positioning young men as guardians of communal boundaries. The paper argues that this mobilization functions as a form of informal pedagogy. Through protests, campaigns, digital media, and public performances, young men are socialized into a model of militant and protective masculinity grounded in notions of "family honor," demographic anxiety, and religious-national redemption. Masculinity and nationalism thus become mutually reinforcing categories through which belonging, pride, and self-worth are constructed. Importantly, the paper situates this process within broader tensions surrounding Jewish identity in contemporary Israel, particularly among marginalized youth seeking recognition and collective dignity in contexts marked by socio-economic inequality and cultural dislocation. LEHAVA's appeal, therefore, cannot be understood solely in ideological terms but must also be examined as a response to unmet needs for affiliation, meaning, and esteem. The paper concludes by asking how such movements can be critically addressed without reproducing the very dynamics of exclusion they mobilize. Drawing again on caring literacy, it suggests that alternative models of masculinity rooted in relational responsibility, empathy, and inclusive belonging—cultivated from early childhood—may offer a democratic counter-framework to nationalist extremism. By reframing masculine strength within the training of street counselors and youth workers—shifting emphasis from control and patriarchal protectionism toward care-based relational engagement—this approach opens new possibilities for rethinking masculinity, identity formation, and social cohesion in divided societies.

FROM AUTHORITY TO INSPIRATION: RECLAIMING RELIGIOUS NARRATIVES FOR DEMOCRATIC CIVIC COMPETENCE AND CARING LITERACY

Miriam Awad Morad (University of Haifa, The Israel Democracy Institute)

Critical Caring Literacy | Religious Narratives | Democratic Civic Education

In the current so-called “post-truth” era, a significant gap has emerged between universal liberal values and personal-communal identities, particularly within traditional and minority societies such as Arab society in Israel. This dissonance often leads to the alienation of students from democratic civic education, which is frequently perceived as an external imposition that threatens cultural and religious roots (Youniss, 2011). Drawing on my doctoral research regarding the concept of truth and my professional work at the Israel Democracy Institute, this paper proposes a transformative pedagogical model that treats religious texts as a source of inspiration rather than a source of authority. The core of this proposal is the development of a “critical caring literacy”. Unlike traditional religious education that emphasizes dogmatic obedience, this approach treats religious texts as ethical and philosophical landscapes. By critically engaging with scriptures that advocate for human dignity, justice, and peace, learners can discover that universal values are deeply embedded within their own heritage. This aligns with the classical philosophical tradition of Al-Farabi (1964), who viewed the pursuit of truth as the ultimate path to human happiness, and with contemporary efforts to balance the communitarian, civic, and liberal aims of Islamic education (Saada, 2022). This model is currently being implemented through my field-based initiatives among young people in Arab society in Israel within non-formal educational frameworks. The goal is to cultivate democratic civic competence that fosters partnership with Jewish society based on shared universal foundations. However, this pedagogy does not ignore the asymmetrical power relations and the structural complexities inherent in the Jewish-Palestinian conflict (Shel Aboody & Paul-Binyamin, 2025). Rather, it employs an ethnographic-philosophical approach (“ethnophilosophy”) to bridge lived experience with philosophical analysis, allowing students to navigate their identity while resisting violent or exclusionary narratives. By reclaiming religious narratives to support equality and liberty, we foster a critical religious education that allows for reflection within the faith tradition (Saada & Magadlah, 2021). This facilitates Buber’s (1970) transition from “I-It” to “I-Thou,” where the “Other” is no longer an adversary of values but a partner in a shared moral quest. Ultimately, this approach offers a compass for divided societies, promoting a shared humanity that honors particularity while upholding the inviolable dignity of all individuals (hooks, 2003).

Decolonial Researches between Pedagogical Horizons and Critical-Participatory Methodologies

PANEL CONVENORS: Rosita Deluigi (Unimc – University of Macerata, Italy); Paola Dusi (Univr – University of Verona, Italy); Davide Zoletto (Uniud – University of Udine, Italy)

PANEL KEYWORDS: Decolonial Research, Participative Methodologies, Critical Pedagogy

The decolonization of knowledge (and, along with it, of ontology) is identified as a fundamental task of decoloniality, aimed at re-subjectivising colonial (sub)objects. From the position of a critical pedagogy within the discourse between the Global North and South, it is crucial to engage in committed dialogue towards an epistemic disobedience and reconstruction of social justice. The recognition of multiple expressive, cognitive, and experiential forms will serve as the cornerstone of a transformative research process. This pathway - grounded in the theoretical and methodological principles of decolonial pedagogy and participative research in various articulations, including dialogue and exchange with Indigenous perspectives -, will be discussed with scholars in an inter-transdisciplinary approach. The panel intends to raise awareness about different ways of conceiving existence and knowledge, particularly with those grounded in non-extractivist relationships with the Earth and other living beings. The contemporary world in which we are immersed, on one hand, challenges us through the voices of the Other - their anthropology, their epistemic approaches - while on the other hand, it expresses socio-cultural and political pressures that continue to deny legitimacy to individuals and groups who embody non-predominant ways of life and knowledge. In light of the struggle against several and severe forms of injustice, it's urgent to seek new epistemic, methodological, and practical foundations for both educational and existential pathways. The panel will be a place in which cultivate new interpretive frameworks for socio-economic, political and educational dynamics, as well as methodologies and tools for their deconstruction and reconstruction.

PERFORMING TRANSENSUS: NAVIGATING NEOLIBERAL CONSTRAINTS AND DECOLONIAL HORIZONS IN THE INTRACOMP PROJECT

Marta Milani (University of Verona, Italy) · **Sara Salmi** (University of Verona, Italy) · **Emanuela Piccolo** (University of Verona, Italy)

Transensus | Cultural Democracy | Epistemic Justice

Contemporary cultural policies often frame intercultural competence as a measurable, individualized skill aligned with neoliberal and technocratic models of integration (Biesta, 2011). While these approaches aim to standardize inclusion, they tend to shift responsibility onto individuals and short-term projects, obscuring the structural asymmetries and epistemic injustices that shape cross-cultural encounters. As a result, interculturalism is frequently reduced to fragmented, project-based interventions rather than engaging with its broader political and institutional dimensions (Dervin, 2022; Milani, 2018). This presentation argues that Intercultural and Transcultural Competence (ITC) should instead be understood as a dynamic, generative praxis: a relational process continually negotiated within conditions of institutional constraint and power imbalance. Drawing on the INTRACOMP project as its primary site of inquiry, the study examines how practitioners engage in the labor of "staying with tension"—specifically the friction between grassroots activism and bureaucratic survival. Grounded in the INTRACOMP Manifesto for Cultural Democracy, the research adopts a post-qualitative, narrative methodology utilizing Story-Based Collective Enquiry. This approach foregrounds reflexivity and methodological reciprocity, resisting extractive research paradigms. Central to the theoretical framework is the concept of Transensus—an agonistic space where differing values are mutually acknowledged without forced consensus—shifting the focus from social integration toward the subjectification of the political actor. Through the analysis of INTRACOMP's diverse contexts—from the Institute of Papua New Guinea Studies, where Indigenous dance decolonizes research paradigms, to the Italian Third Sector, where cultural competence is embedded in informal community mechanisms—the paper conceptualizes the project as a "living infrastructure." This site reveals how practitioners must navigate the "coloniality of care" to translate grassroots creativity into the quantifiable evaluation regimes required by international funding bodies. The findings suggest that decolonial pedagogies must embrace the unfinished, processual nature of inter-cultural work. Rather than seeking technocratic closure, inclusive cultural practice depends on sustaining institutional fragility as a space for collective imagination. It concludes that cultural difference functions not as a problem to be managed, but as a democratic resource through which cultural democracy can be practically enacted.

EMBRACING PLURALITY: RETHINKING MIGRANT IDENTITIES AND EDUCATIONAL PRACTICE THROUGH A COMPLEX EPISTEMOLOGY

Federica Matera (University of Turin, Italy) · **Giulia Gozzelino** (University of Turin, Italy)

Children Migrations | Partecipatory Research | Transnational Identities

Recognizing dynamism as a constitutive feature of human beings and multiplicity as a primary characteristic of contemporary identities, this paper underscores the necessity and urgency of developing research postures, practices, and competencies capable of countering single-story narratives and embracing disorientation, creativity, and cultural pluralism within the framework of a complex epistemology. Contemporary societies are traversed by separatist, assimilationist, and differential exclusion policies that generate rigid categorizations, impoverish interpretative models, and lead to social isolation and identity closure. Marked by a profound crisis of democracy—one that rejects intercultural encounters within hyper-complex societies—spaces of sociality, education, and culture increasingly appear characterized by segmentation and marginalization. These tendencies privilege orientations that celebrate homogenization among groups, lineage, and identity fixity, while fearfully rejecting mobility and cultural hybridization. This conception of identity, together with the emergency-driven representation of migration—promoting the "control of the foreigner" and reinforcing prejudice—is supported and amplified by: (a) securitarian and homogenizing rhetorics that depict migration as flows, waves, or invasions; (b) migration policies in the Italian context that implement pushbacks, blockades, expulsions, the strengthening of borders, and restrictions on family reunification and residence criteria; and (c) ethnocentric educational orientations and guidelines. Within this scenario, migrant children and adolescents, reunified and unaccompanied, represent one of the most socially vulnerable groups. The paper considers them as privileged witnesses both to the systematic violation of rights and to processes of empowerment, resilience, and the co-construction of new cultures, narratives, and visions. These processes restore depth, multidimensionality, and transnationality to migrant histories and identities, situated between forms of continuity and generative crossings. Adopting a critical pedagogical perspective, the contribution reflects on initial findings emerging from observations and interviews conducted within a participatory research project carried out at the University of Turin in collaboration with Diskolé APS and Renken ETS. The protagonists of this process are young adults who reinterpret their experiences as migrant minors through the lenses of education,

culture, and civic participation. In dialogue with researchers and educators, they critically problematize their trajectories, contributing to the shared construction of knowledge, to the decolonization of minds and practices, and to the re-signification of migratory experiences within educational and social contexts.

RECENTERING EPISTEMOLOGIES AND LANGUAGES IN CONDITIONS OF VULNERABILITY: REFLECTIONS FROM THE PERSPECTIVE OF CRITICAL AND DECOLONIAL APPLIED LINGUISTICS

Marta Guarda (Eurac Research, Italy) · **Giorgia Andreolli** (Eurac Research, Italy)

multilingualism vulnerability epistemic (in)justice

In today's increasingly multilingual and mobile societies, educational spaces gather individuals whose identities, languages and knowledges are shaped by complex historical and personal trajectories. Despite such heterogeneity, a monolingual paradigm (Gogolin, 2008) still prevails within many European school systems—i.e., the assumption, rooted in assimilationist, deficit-oriented and implicitly (neo)colonial ideologies, that schooling should operate through one dominant standard language. Such habitus continues to structure educational practices and the very ontology of what counts as legitimate knowledge. This contributes to the reproduction of vulnerability through forms of epistemic injustice (Fricker, 2007), whereby knowledges associated with dominant language communities are prioritized, while the linguistic repertoires and epistemic bases of minoritized and migranticized (Dahinden 2025) communities are marginalized and misframed. From the perspective of critical and decolonial applied linguistics (e.g., Menezes de Souza 2025), this contribution interrogates how these hierarchies operate as mechanisms of epistemic exclusion. It does so by connecting theoretical and critical considerations with a reflection on our experiences as researchers in the multilingual context of Alto Adige/Südtirol. Here, a growing number of minoritized and migranticized languages coexist alongside the three official languages (German, Italian, Ladin). The latter constitute the foundation for a strict separation into three distinct

educational systems. The intersection of historical and more recent forms of multilingualism makes Alto Adige/Südtirol a particularly revealing site, as it highlights structural conditions that can crystallize inequalities. Forms of such inequalities are evident in the persistent epistemic imbalance between dominant and non-dominant languages, whereby perceived economic value and cultural desirability contribute to positioning some speakers and groups in more vulnerable positions within the educational system (Guarda, 2025; Wand, 2023). Against this backdrop and following Causevic et al. (2020)'s invitation to show how epistemologies in conditions of vulnerability can be actively and critically (re)centered, this contribution presents insights from two research projects: an ethnographic study with families experiencing the transition from kindergarten to primary school, and a participatory action research project with primary school teachers. Both projects aim to reposition linguistically minoritized and migranticized students and families as competent knowers and speakers. Building on relational pedagogy (Gravett et al., 2021; Huzar, 2025), translanguaging (García & Li Wei, 2014), and transknowledging (Ennser-Kananen et al., 2024), the presentation explores possibilities for (re)constructing educational and research relationships in ways that foster connection and reciprocity, and where multiple languages and knowledges can co-exist without being appropriated or hierarchized. In particular, it will exemplify the potential of an approach that, starting from the assumption of intellectual equality among all subjects (Huzar, 2025), recognizes linguistic and epistemological diversity as a resource and fosters transformative practices capable of challenging linguistic hierarchies that generate vulnerability, promoting connections based on increased solidarity and understanding (Badwan, 2022).

BECOMING LEGIBLE: MIGRANT WOMEN'S SITUATED NARRATIVES BETWEEN SKILL FORMATION, WORK AND RECOGNITION

Francesco Vittori (University of Verona, Italy) · **Paola Dusi** (University of Verona, Italy)

Decolonial Pedagogy | Migrant Women | Adult Education

Skill development and language courses for migrants are often portrayed as neutral and empowering approaches that facilitate participation, employability, and social integration. In Italy, programs offering Initial Vocational Education and Training (IVET) and Italian as a second language (L2), often provided by CPIAs (in Italian, Centri Provinciali per l'Istruzione degli Adulti), are viewed as essential tools for fostering inclusion and civic recognition (Gabrielli et al., 2020). However, when analyzed through decolonial and critical pedagogical perspectives (Smith, 2012; Santos, 2014), language and vocational training emerge as ambivalent dispositifs that not only develop practical and linguistic competencies but also establish regimes of legitimacy, recognition, and conditional belonging. This paper conceptualizes vocational education and language training as pedagogical spaces shaped by normative and epistemic orders governing access to recognition and social intelligibility. The study is based on a qualitative analysis of 33 semi-structured interviews conducted in person

with adult migrant workers living in Italy as part of the SKILLS4JUSTICE Horizon Europe project. Data were analyzed using thematic analysis (Braun & Clarke, 2014), employing a hybrid deductive–inductive approach (Swain, 2018). Within this broader dataset, the paper foregrounds six narratives of migrant women, approached as situated epistemic positions (Haraway, 1988). These narratives reflect diverse life trajectories. A young Tunisian woman, recently a mother, migrates from an economically unstable background and views language learning and employment as pathways to stability, yet finds herself confined to domestic labor. An Albanian widow with two children, after years of financial dependence within her marriage, migrates seeking autonomy but is limited to cleaning work. A young Cameroonian woman leaves her homeland with her girlfriend due to social and personal constraints, seeking to live and love freely while pursuing recognition and professional fulfillment. Additionally, three older women from Eastern Europe (Moldova and Ukraine) migrate to support transnational families and enter long-term care work. Despite their varied backgrounds, these women's paths predominantly converge in feminized and socially undervalued sectors of employment. This convergence should not be read as a direct outcome of IVET and L2 education, but as a pattern shaped by broader institutional and normative frameworks within which skill formation and language training may participate in aligning migrants' trajectories with socially devalued labor niches. Findings indicate that educational and training pathways are experienced as both necessities and regulatory thresholds. Institutional norms privilege standardized linguistic performances while marginalizing plurilingual repertoires and embodied communicative practices, thereby reinforcing dominant constructions of legitimacy (Haraway, 1988). Participants' narratives reveal experiences of linguistic inadequacy, self-discipline, and conditional recognition. These dynamics align with Benasayag and Schmit's (2003) analysis of the internalization of normative expectations. Rather than representing individual failures, these stories illustrate patterned processes of gendered incorporation (Itzigsohn & Giorguli-Saucedo, 2005), where legal precarity and survival imperatives constrain educational participation and occupational mobility. By emphasizing the situated voices of migrant women, this paper contributes to decolonial debates on education, migration, and epistemic justice, highlighting how language education functions as a political and pedagogical site where recognition (Dusi, 2020), legitimacy, and exclusion are continuously structured and negotiated.

HIDING AND SEEKING THE ITALIAN COLONIAL PAST: AN ANALYSIS OF IMAGES INSERTED IN HISTORY TEXTBOOKS FROM 1950 TO PRESENT DAYS

Alessia Mastropietro (Sapienza Università di Roma, Italy) · **Gabriele Di Carlo** (Sapienza Università di Roma, Italy) · **Ariela Desio** (Università degli Studi di Firenze, Italy) · **Chiara Prometti** (Sapienza Università di Roma, Italy) · **Francesco Petraglia** (Sapienza Università di Roma, Italy) · **Giovanna Leone** (Sapienza Università di Roma, Italy)

colonial images · textbooks images · Italian colonial history

This paper analyses changes in time of educational tools meant to make young Italian students aware of their in-group colonial history, proposing that this kind of study can give relevant insights on how broader socio-psychological processes are gradually facing this difficult past. Immediately after the swift collapse of the so-called Italian colonial "Empire", a social denial (Cohen, 2001) silenced for decades the severe crimes committed during the colonial invasions. Moreover, an enduring social myth, depicting Italians as good fellows, incapable of cruelty ("Italiani brava gente", Del Boca, 2005), sometimes also surfacing today, heavily biased the Italian societal discourse about the colonial past. Finally, even when history scholars proved beyond doubt the occurrence of these past crimes (Labanca, 2002), a self-censorship (Bar-Tal,

2017) advised not to touch on this matter, presenting it as inconvenient or out of date. The gradual unfolding of these processes consolidated a "social amnesia" that still persists (Leone & Sarrica, 2017). In this societal frame, in the first decade of 2000s narratives on colonial crimes were finally included among manuals' contents, although briefly and somewhat reluctantly (Leone & Mastrovito, 2010; Cajani, 2013). While other popular narratives on this period (provided by literature, movies, games, etc.) still lacked, school became the main place where young generations were made aware of their in-group past history, even in its cumbersome traits, contributing to build, share, or challenge a colonial imaginary (Gabrielli, 2015). In the context of formal education, history textbooks play the central role of highly legitimated narrative artifacts (Sakki, 2025). Today, in Italian contemporary intercultural context, history textbooks provide to the new classrooms narratives addressing both to colonizers and colonized descendants. In our study we decided to focus on the use of images that only recently received a keener attention, due to their influence on cognitive and emotional reactions of readers (Gabowitsch & Topolska, 2023). We longitudinally analyzed the images siding the narrative on Fascist colonial episodes, reviewing 21 Italian history textbooks, from 1950 to present days. Interestingly, results showed that the use of images varied in three time periods, and allowed to distinguish qualitatively different kinds of images gradually emerging. In a first period, ranging from 1950 to 1980, following an initial absence of images, geo-historical maps began to appear, and were consistently present from this period on. In a second time period, starting from the 1990s, documentary photographs - often depicting the shocking colonial violence committed by Italians - and magazine covers or newspaper front pages sided the maps. Finally, in a third time period, from the 2000s onwards, explicit Fascist propaganda images were introduced in textbooks to complement the other kinds of images. Afterwards, in-depth qualitative semi-structured interviews addressing young students, both Italian and Italian of second generation (N=20) were conducted, exploring their emotional and cognitive reactions when presented with these different kinds of images.

DECOLONISING HEALTHCARE COMMUNICATION: INTERCULTURAL TRAINING FOR PROVIDERS IN THE INTERCOMSALUD PROJECT

Carmen Merino Cabello (University of Alcalá, Spain) · **Sofía Antequera-Manzano** (University of Alcalá, Spain) · **Andrea Sanz de la Rosa** (University of Alcalá, Spain) · **Candelas Bayón Cenitagoya** (University of Alcalá, Spain)

Intercultural competence · Healthcare provider training · Decolonial pedagogy

The following proposal presents the Spanish national project Intercomsalud as an example of culturally sensitive research grounded in participative methodologies and critical pedagogy. The project addresses structural inequalities in healthcare communication affecting migrant women in settings where linguistic, cultural and epistemic barriers often lead to exclusion and reduced quality of care (Pena Díaz, 2023; Cox & Maryns, 2021). Since the training offer regarding intercultural matters for healthcare providers is very limited in Spain (Álvaro Aranda, 2025), the Intercomsalud project proposes training methodologies addressed at providers that discuss interculturalism from a decolonial approach, attempting to eliminate unconscious bias and increase understanding when communicating with migrant patients. Methodologically, Intercomsalud adopts an interdisciplinary and participatory design. Its initial empirical phase, that took place in 2025, involved ethnographic observation and videorecording of clinical encounters between providers, migrant patients and,

when available, an interpreter/intercultural mediator. Then, a specific tool was designed to analyse intercultural competence based on the affective, cognitive and behavioural processes of healthcare providers (Chen & Starosta, 1996; Deardorff, 2015) when interacting with patients from different backgrounds. Data gathered and analysed during this phase was then used in the creation of a training course addressed at healthcare providers and aimed at improving intercultural awareness and sensitivity. The course was conceived within a critical pedagogical framework that encourages trainees to question assumptions about knowledge, authority and patient–professional relationships, fostering cultural sensitivity and the questioning of institutional routines that might increase power asymmetries. Through practical exercises, reflective practices and intercultural discussion, the goal of the course is to increase the communicative abilities of healthcare providers in an intercultural medical setting and decrease the unconscious bias regarding cultural matters. The materials will be taught in 2026 both as an online and an onsite course to healthcare staff within the Community of Madrid, in Spain, and then tested by means of qualitative surveys to determine the potential of a wider application at a national level. The present proposal will showcase course, based on the analysis of intercultural competence of healthcare professionals, and then discuss the teaching and learning experience by means of qualitative surveys. The final goal of the Intercomsalud project is contributing to the improvement of healthcare services for migrants, fostering decolonial practices and introducing training options for healthcare providers working in intercultural contexts.

EDUCATORS' CONCEPTIONS OF CHILD PARTICIPATION: IMPLICATIONS FOR EDUCATIONAL DEVELOPMENT IN KHARTOUM STATE, SUDAN

Gofran Khalfalla (The Aga Khan University, Institute for Educational Development, Eastern Africa, Sudan)

Participation | indigenous knowledge | emancipatory pedagogy

Gofran Murtada Kamal Khalfalla The Aga Khan university, Institute for Educational Development, East Africa gofran-mkk@gmail.com Abstract: The research project explores child participation as a transformative approach within the educational context of Khartoum State, Sudan. In a setting marked by both traditional pedagogical practices and cultural participatory roots, the study explores the communal participatory conceptualizations that are shaped by Khartoum's distinct realities shaped by decades of conflicts and social disparities. The analysis aims to enrich understanding of participatory frameworks -particularly the Child-to-Child approach- through the specific realities experienced in Khartoum state. The study focuses on educators as key agents in this process, recognizing their position as potential catalysts for development (Heikka et al., 2022; Joshi, 2022). Drawing on Paulo Freire's emancipatory pedagogy, the research acknowledges that educators may simultaneously be victims of oppressive educational structures and perpetuators of practices that limit child agency (Hederman, 1982). This duality makes understanding their conceptions crucial for meaningful educational development. The main research question guiding this inquiry is: How do educators in Sudan conceptualize child participation, agency, and active citizenship, and how do these understandings shape their educational practices? This question is explored through a theoretical framework combining constructivism (both cognitive and social) and Freirean emancipatory pedagogy, allowing for examination of how meanings are constructed individually and collectively within specific sociocultural contexts. The Child-to-Child approach serves as a proposed response - a pedagogical methodology and development intervention built on participatory principles that positions children as active agents in their own learning and community development (Hawes, 1988; Vaghela, 2021). The research explores how this approach interacts with indigenous participatory traditions. As external actors -such as International Non-Governmental Organiza-

tions- increasingly influence educational provision, often guided by agendas detached from local knowledge (ElAsad, 2025; Higgins & Novelli, 2020), it becomes crucial to understand how Sudanese educators define participation. Doing so is an act of epistemic justice: it reclaims indigenous knowledge, values local expertise, and promotes educational development rooted in Sudan's pedagogical conceptions. International participatory education frameworks establish certain definitions of participation, agency, and active citizenship, usually crafted for stable environments. However, decades of unrest and persistent inequality in Sudan have likely led to distinct interpretations and subtleties in these concepts. Communal practices grounded in indigenous participatory culture have helped sustain communities amid prolonged crises. Therefore, educational projects with participatory aims must draw on existing cultural practices to be effective. The study's significance lies in its potential to inform culturally responsive educational interventions in Sudan. By centering educators' voices and examining their lived experiences and conceptualizations, the research aims to bridge theory and practice, connecting documented participatory roots in Sudanese culture with the position of children as active citizens in educational settings. Findings will contribute to more nuanced understandings of how international educational frameworks can be meaningfully adapted and implemented in fragile and conflict-affected contexts, moving beyond uniform approaches toward context-sensitive pedagogical transformation. This research holds significance for Education in Emergencies scholarship, participatory pedagogies, and educational development practice in conflict-affected regions.

COMMUNITY BASED PARTICIPATORY RESEARCH: A METHODOLOGICAL APPROACH AS A PRACTICE OF DECOLONISATION. THE EXPERIENCE OF THE D@RTS HORIZON PROJECT

Cristina Balloi (University of Verona, Italy)

Community Based Participatory Research | Decoloniality | Cultural Literacy

Community Based Participatory Research (CBPR) represents a methodological approach that is widely established within the fields of Medicine and the Health Sciences (Coughlin et al., 2017), where it has emerged in response to the historical exclusion of minorities and vulnerable groups from public health policies and interventions. This methodological framework is characterised by the collaboration between researchers and communities aimed at building trust, sharing power, fostering co-learning, strengthening community assets and resources, promoting capacity building, and examining and addressing needs identified by the community itself (Israel et al., 2012). Grounded in the active participation of communities in research processes, CBPR seeks to rebalance power relations between researchers and research participants, promoting a more inclusive production of knowledge. Although its use has progressively expanded into other areas of the Social Sciences, the field of education remains one of the most marginal. A broader application in this field could provide an opportunity to deconstruct approaches, methodologies, and methods in order to reconstruct new balances and new research relationships between researchers and the 'researched', who in many cases remain constrained by the predominant use of scientific approaches that are insufficiently oriented toward a decolonial perspective on research and on the recognition of communities, citizens, and minority knowledge (Walsh, 2007). Within CBPR, the role of the researcher also shifts, becoming an opportunity to critically engage with one's own positionality and with the interpretation of power relations (Forster & Forster, 2023), as well as to experiment with decolonial data collection tools and analysis methods. This paper aims to present the experience of implementing CBPR within an ongoing research project funded by Horizon Europe, focused on the development of a Cultural Literacy Competences Portfolio through the practice

of Performing Arts (music, drama, and dance). Four target communities are involved in Serbia, Italy, Germany, and Norway. Children, adolescents, and adults are engaged in a methodological process inspired by CBPR. The research has demonstrated the potential of this method as an opportunity to work through a decolonial perspective, understood as an emancipatory possibility within the research process itself, as it recognises community members as holding equal dignity in the production of knowledge (Gorman & Garnett, 2009), which is co-generated and co-produced. It has also revealed the practical demands that such an approach entails. Among these, the community engagement phase is crucial for its role in the process, yet it also represents a challenge in balancing the project's limited timeframe. This paper presents reflections on the challenges and opportunities that CBPR offers as a decolonial perspective for research in European projects.

DECOLONIAL DISCOURSES AND THE PROFESSIONAL BECOMING OF TEACHERS IN SOUTH AFRICA

Zayd Waghid (Cape Peninsula University of Technology, South Africa)

Decoloniality | Epistemic Justice | Critical Teacher Education

In the contemporary global era, grounded in social and epistemic justice, critical teacher education is pivotal towards transforming intersectional discrimination, neoliberalism, and the legacies of colonialism. The continued dominance of the Eurocentric knowledge paradigm of the Global North in the South continues to create tension in education. Educators, in particular, have an essential role to play in cultivating students' awareness and criticality around how social and cognitive injustice can be disrupted, specifically by developing students' need to critically scrutinise how knowledge is produced, whose lives, voices, and knowledges are valued, and how current biases can be addressed. This research explores how discourses of (de)coloniality shape Teacher Education in South Africa. Pre-service teachers' responses were analysed using Grounded Theory methodology, interpreted through the lens of critical and decolonial theories. Drawing on interviews with student teachers from a South African university, we investigate how these discourses are perceived, internalised, challenged, or reinterpreted by future educators situated within varying historical legacies and institutional frameworks. Our aim is not only to compare how (de)colonial narratives shape student teachers' understandings of their profession. This study first critically examines the structures, relations, and conditions of knowledge production, its dissemination and educational practices in the South African education context. We draw specifically on those postcolonial theories that advance knowledge through pragmatic application of Indigenous Knowledge Systems and decolonising pedagogical approaches to develop critical global citizens. We aim not only to add diverse perspectives, but also to re-examine existing curricula and priorities, if and, how these cultivate socially conscious and responsible students. Second, we present results from interviews conducted with student teachers, the aim of which was to discover what decolonisation means to them and its impact on their pedagogical professionalism. The study aims to identify overlaps and differences in their conceptions and to provide insights into opportunities for further research, teaching and international exchange. One focus is the discussion of the development of a professional identity that encompasses critical analysis of social interaction in an educational context.

BEYOND ACADEMIC HEGEMONY: UNDERCOMMONS, POPULAR EDUCATION, AND DECOLONIALITY

Lisa Stillo (Roma Tre University, Italy) · **Aurora Bulgarelli** (Link Campus University)

undercommons | popular education | epistemic injustice

Critically interrogating the academic ecosystem while being part of it is neither a simple nor a self-evident undertaking. As Harney and Moten (2013) suggest, reflecting critically on the world of the universitas from the position one occupies within it may risk producing an excess of mannerism and a form of professionalization that operates primarily at the individual level, benefiting the single academic rather than communities. In this sense, the communities in question are those that are marginalized, Indigenous, subaltern, and all those forms of alterity that inhabit and experience the system. The relationship between academia and the worlds of the undercommons/subaltern/oppressed/colonized (Bhabha, 1994; Freire, 1968; Harney and Moten, 2013; Spivak, 1988) can be interpreted through a dual mechanism: on the one hand, the appropriation and assimilation of the knowledge of those considered subaltern, to the advantage of dominant knowledge and the refinement of cultural colonialism; on the other hand, the devaluation of non-Western epistemologies. This process has allowed the university to legitimize itself as a hegemonic center of knowledge production, albeit at the cost of the systematic erasure of the original cultural matrices from which such knowledge emerges. This contribution proposes to reflect on the dynamics of epistemic injustice that, still today, shape the ways of understanding and acting in the world (De Sousa Santos, 2014), attempting to circumvent the logics of extraction and/or devaluation of other forms of knowledge and recognizing their vital necessity in educational contexts. With the awareness that education and training may function as mechanisms for reproducing marginalizing social dynamics (Freire, 1968; Bourdieu and Passeron, 1970; Illich, 1971), the paper seeks to advance a decolonial reflection on the logics through which institutional spaces too often become interpreters of monocultural visions, to the detriment of the contributions of the knowledge of alternative subjectivities (Spivak, 1988; Smith, 1999; Borghi, 2020; hooks, 1994; Lorde, 1984; Zakaria, 2022). In this regard, the paper intends both to recover the perspectives and practices of popular education—particularly those connected to Latin American contexts (Gadotti, Torres, 1993; Puiggrós, 2016) —as spaces capable of valuing forms of knowledge, experiences, bodies, and subjectivities often rendered invisible by dominant narratives and institutions, and to engage with certain experiences of social movements for civil rights that embody an otherwise (Mignolo & Walsh, 2018), often perceived as uncanny (Spivak, 1999) and frequently considered subaltern and minoritarian.

FEMINIST AND DECOLONIAL CLASSROOMS: LEARNING WITH BELL HOOKS

Antonietta De Vita (University of Verona, Italy)

Feminist and Decolonial Classrooms | Engaged pedagogy | Critical pedagogy

This presentation explores the pedagogical thought of bell hooks and its relevance for feminist and critical approaches to teaching in contemporary higher education. Drawing on a teaching experience developed within a university course on feminist epistemologies and philosophies, the contribution reflects on the transformative potential of the classroom when it is conceived as a relational and participatory space of learning. The presentation will discuss how the encounter with hooks' work - particularly Teaching to Transgress: Education as the Practice of Freedom - has informed and illuminated a teaching practice aimed at creating a classroom environment based on dialogue, participation, and critical reflection. Within this framework, the classroom is understood not simply as a place for the transmission of knowledge, but as a community of learning in which students' voices and experiences are recognized as meaningful elements in the educational process. A central focus of the presentation concerns hooks' concept of engaged pedagogy, which challenges hierarchical and transmissive models of education. In contrast to traditional approaches based on the passive reception of information, engaged pedagogy emphasizes participation, shared responsibility, and the co-construction of knowledge. Teaching thus becomes a relational practice grounded in mutual recognition and in the development of critical awareness. The discussion will also situate hooks pedagogical vision within the broader tradition of critical pedagogy, highlighting in particular the influence of Paulo Freire. Freire's critique of the "banking model" of education and his understanding of education as a practice of freedom strongly shaped hooks' approach to teaching. At the same time, hooks extends this framework through a feminist and intersectional perspective that addresses the interconnected structures of sexism, racism, and class inequality within educational institutions. Special attention will be devoted to the experiential and political dimensions of learning that emerge in hooks' work. Her reflections are deeply connected to her own experience as a Black woman navigating the tensions between segregated schooling and predominantly white academic environments. These experiences contribute to the development of a pedagogical perspective centered on recognition, difference, and the possibility of transforming the classroom into a space where diverse subjectivities can emerge and be heard. Finally, the presentation will consider the holistic dimension of hooks' pedagogy, also influenced by the teachings of the Buddhist monk Thich Nhat Hanh, which emphasizes the integration of mind, body, and spirit in the learning process. From this perspective, teaching involves the whole person and requires the creation of an educational environment based on trust, openness, and shared engagement. By reflecting on these theoretical and pedagogical perspectives, the presentation aims to contribute to current debates on feminist pedagogy and transformative learning, suggesting that hooks' engaged pedagogy offers a powerful framework for reimagining the university classroom as a space of critical dialogue, collective learning, and intellectual freedom.

Decolonizing and Queering Education: Intersections of Power, Epistemic Justice, and School Practices

PANEL CONVENORS: Giuseppe Burgio (University of Enna "Kore", Italy); Stella Rita Emmanuele (University of Enna "Kore", Italy); Lavinia Pia Vaccaro (University of Enna "Kore", Italy)

PANEL KEYWORDS: Decolonial studies, queer pedagogy, education

This panel proposes a dialogue between queer and decolonial pedagogy to examine how contemporary educational institutions continue to reproduce hierarchies of gender, race, and sexuality within globalized metropolitan contexts shaped by neocolonial dynamics. In such settings, structures of power—race, class, gender—configure learning environments that ostensibly promote democratic values while frequently sustaining colonial and patriarchal arrangements. Both approaches share a critical and intersectional epistemological stance aimed at exposing sedimented power relations and demonstrating that educational processes are historically situated and inherently political. Queer pedagogy (Lugones, 2007) highlights how modern schooling has normalized a binary and patriarchal order, while decolonial studies (Walsh & Mignolo, 2018) reveal that this order is embedded in a broader colonial project of modernity that has imposed Eurocentric models of the body, family and citizenship. The panel invites theoretical, empirical, and ethnographic contributions that, through decolonial and intersectional lens (Collins, 2019), explore how curricula, teaching practices, and institutional cultures can be reimagined in democratic terms. The aim is to understand whether, and under what conditions, pedagogy can be decolonized by bringing postcolonial theory, intersectionality and critical pedagogy into conversation to redefine education as a space of emancipation, participation and plurality. We particularly welcome contributions that examine: the subversion of hegemonic masculinities; intersections of power within forms of oppression and resistance in contexts marked by migration, borders, and gender norms; processes of decolonizing school practices that integrate racialized and gendered perspectives; and forms of epistemic justice and pedagogical approaches that promote democracy and collective agency, including within digital environments.

FEMINIST, DECOLONIAL AND ANTIRACIST YOUTH ACTIVISM AS TRANSFORMATIVE PEDAGOGIES: REIMAGINING GENDER, CITIZENSHIP, AND HUMAN RIGHTS EDUCATION IN ITALY

Tiziana Chiappelli (University of Siena, Italy)

Feminist pedagogy | Intersectionality | Human rights education Youth activism Gender justice

Gender equality remains a crucial horizon for democratic renewal, yet contemporary educational systems continue to reproduce deep gendered and racialised hierarchies. This paper explores how feminist and antiracist youth activism can function as a transformative pedagogical force for rethinking gender, citizenship, and power in education. Drawing on qualitative research with young women and LGBTQ+ activists with migratory backgrounds in contemporary Europe, the study examines how grassroots practices emerging from feminist collectives, online platforms, and community-based networks create alternative spaces of learning beyond institutional schooling. These activist environments operate as informal pedagogies in which gender norms, racialised exclusions, and colonial legacies are critically contested through intersectional and embodied forms of knowledge production. In contrast to dominant curricula that often neutralise or marginalise feminist and queer perspectives, these practices articulate education as a site of struggle, recognition, and empowerment. Young activists challenge restrictive understandings of belonging and citizenship, exposing how gendered power is intertwined with migration regimes, socioeconomic vulnerability, and cultural othering. The paper adopts an intersectional and decolonial lens to analyse how these learning spaces disrupt Eurocentric and patriarchal assumptions embedded in educational institutions. In line with feminist pedagogy, the findings highlight the role of storytelling, counter-narratives, collective care, and cultural production as tools for building critical consciousness and political agency. These practices not only support individual empowerment but also foster solidarities and forms of inclusive leadership that contribute to gender-just democratic imaginaries. Particular attention is paid to how activist pedagogies confront gender norms relationally, including the negotiation of masculinity, community expectations, and institutional resistance. Rather than positioning gender equality as a formal policy goal, these experiences reveal it as an ongoing educational process grounded in lived realities and collective mobilisation. The paper argues that integrating feminist, queer, and intersectional approaches inspired by grassroots activism into Human Rights Education and citizenship

education can enhance their transformative potential. In a context of rising gender backlash, xenophobia, and democratic erosion, such pedagogical practices offer crucial insights for dismantling gender hierarchies and reimagining education as a democratic project of social justice, plural belonging, and emancipation.

EDUCATING FOR PLURAL DESIRE: DECOLONIZING AFFECTIVE AND SEXUAL EDUCATION

Stella Rita Emmanuele (Università di Enna Kore, Italy)

affective and sexual education | queer pedagogy | coloniality of gender

Affective and sexual education represents one of the fields in which the persistence of the coloniality of gender (Lugones, 2007) most clearly manifests itself within contemporary educational institutions. Despite formal references to rights, respect for differences, and the promotion of well-being, school-based dispositifs often continue to reproduce a hetero-normative, binary, and Eurocentric vision of the body, the family, and citizenship, inscribing young subjectivities within normative frameworks that hierarchize desires, relationships, and forms of life. Drawing on the dialogue between queer pedagogy and decolonial studies, this contribution critically interrogates the pedagogical genealogies of affective and sexual education in modern schooling, showing how they have historically been constructed as an integral part of the colonial project of modernity. From this perspective, the body is not merely an object of education but a political dispositif through which symbolic boundaries are produced between normality and deviance, legitimacy and marginalization, full citizenship and conditional citizenship. The paper proposes an intersectional rereading of sexual education as a space for the production of governable subjectivities, highlighting the connections between racialization, sexuality, gender, and class within curricula and teaching practices. Through the analysis of institutional documents, educational guidelines, and teaching materials, it shows how the centrality of the heterosexual model, the nuclear family, and binary sexual difference continues to implicitly structure educational pathways, marginalizing queer, trans*, migrant, and racialized experiences. In dialogue with critical pedagogy, public pedagogy, and the perspective of epistemic justice (Collins, 2019), the contribution explores the potential of a decolonial approach to affective and sexual education, capable of recognizing situated knowledges, embodied narratives, and youth agency as pedagogical resources. Decolonizing affective and sexual education thus entails not only expanding curricular content but radically transforming educational epistemologies, shifting the focus from the normalization of bodies to the valorization of plural desires, relationships, and forms of belonging. The aim is to redefine affective and sexual education (hooks, 1994) as a democratic space of participation, recognition, and co-construction of plural citizenships, in which subjects can critically negotiate the power dispositifs that traverse their bodies and lives. In this sense, pedagogy is configured as a political practice of liberation, capable of challenging the colonial legacy of education and opening educational possibilities grounded in social justice, desire, and the dignity of all forms of existence.

UNIVERSALISM AND INNOCENCE AS TECHNOLOGIES OF CHILDHOOD: A QUEER AND DECOLONIAL READING OF CHILDREN'S RIGHTS

Simone Colli Vignarelli (University of Milano-Bicocca, Italy)

Children's rights | epistemic justice | queer and decolonial theory

Childhood can be understood as a permanent social structure (Qvortrup, 2004), historically and culturally situated, whose meanings are produced and transformed through discourses, practices, and institutional dispositives (Foucault, 1976; Robinson, 2013). From this perspective, childhood is not a natural state, but a discursive construction through which children's access to knowledge is regulated and their bodies and subjectivities are governed. Within this framework, the United Nations Convention on the Rights of the Child (UNCRC, 1989) represents a crucial epistemic and political turning point, as it recognises children as rights-bearing subjects in the present rather than as adults-in-the-making or future citizens (Macinai, 2013; Qvortrup, 2008). As an international human rights treaty, the UNCRC is not neutral. However, in its interpretation and implementation, it contributes to the stabilisation of a normative image of childhood. In this context, this paper highlights how the UNCRC is grounded in an exclusively age-based approach (Frödén & Quennerstedt, 2020), which has contributed to overlooking and marginalising other forms of injustice and oppression affecting children. In doing so, it reproduces the myth of the universal child (Davis & Marsh, 2022), which operates as a regulatory parameter, obscuring other forms of oppression, such as race, social class, gender, sexuality and ability. In close continuity with this dynamic, the myth of the universal child tends to consolidate itself through the construction of childhood as innocent (Robinson, 2008, 2013). If universality abstracts childhood into an apparently neutral and homogeneous figure – one that reflects Western, white, and colonial imaginaries – innocence provides its moral foundation by constructing the child as naturally pure and in need of protection from everything related to gender and sexuality. The construct of innocence reproduces the boundaries between what is considered appropriate or inappropriate, sayable or unsayable, educable or dangerous for children. Precisely because it presents itself as an unquestionable moral truth, innocence operates as a regulatory technology that desexualises childhood and contributes to the production of the normative adult citizen-subject through early processes of heteronormalisation (Robinson, 2008, 2013; Colli Vignarelli, 2025). In this sense, universality and innocence are conceptualised as technologies of childhood governance that render childhoods deviating from these norms less intelligible and legitimate. Therefore, adopting a queer and decolonial perspective could contribute to the deconstruction of the binary and heteronormative norms that regulate bodies and subjectivities from early childhood, while challenging the homogenising universalism that obscures historical, cultural and material differences. This approach can critically subvert and re-signify children's rights and the very idea of childhood, thereby opening space for the plural recognition and epistemic legitimisation of all childhoods.

ITALIANNESS AS A RACIALISED REGIME OF TRUTH: WHITENESS AND BELONGING IN HISTORY AND CIVIC EDUCATION

Alessia Frola (University of Bristol, United Kingdom)

Racialised Italianness | Whiteness | History and Civic Education

Across Europe, renewed nationalist discourses and authoritarian turns have intensified struggles over collective memory, belonging, and the meaning of the nation. Schools are central to these struggles. While formally tasked with promoting democratic values and inclusion, they remain key sites where normative conceptions of national identity are reproduced through curricula, pedagogical practices, and everyday interactions. This presentation examines how racialised Italianness is produced, sustained, and contested at the intersection of history and civic education in upper-secondary schools, contributing to the decolonisation of dominant narratives of personhood and citizenship by challenging the construction of "othered" individuals as external to Italianness and foregrounding their constitutive role in its historical formation. In Italy, individuals racialised as the "Other" continue to encounter exclusionary discourses shaping how citizenship and belonging are imagined and regulated across civic, political, and educational spaces. Since the 1990s, intercultural education policies have sought to address growing ethnic and racial diversity. Yet these interventions largely frame diversity as a problem to be managed, reproducing an implicit "we/Other" epistemic position (Burgio & Vaccaro, 2023) rather than interrogating the foundations of Italianness. National identity thus appears coherent, morally unified, and implicitly white, while racialised difference is constructed as external to the national body. The literature shows how Italianness has been constituted through whiteness and Catholicism, and the myth of "Italians, good people" - a discourse of self-ascribed moral exceptionalism that legitimised colonial expansion and sedimented narratives of national innocence across Fascism and the post-war Republic (Del Boca, 2005; Giuliani & Lombardi-Diop, 2013). Yet these perspectives have only partially informed research and practice in history and civic education. Rather than treating these subjects as neutral, the research conceptualises them as epistemic sites where authoritative narratives of the past intersect with normative prescriptions of civic virtue, shaping the present and producing racial hierarchies of belonging. Drawing on Foucauldian understandings of discourse (Bacchi & Bonham, 2014; Foucault, 1972), assemblage thinking (Deleuze & Guattari, 1987), and Hall's (2017) conceptualisation of race as a floating signifier, Italianness is approached as a contingent and unstable formation continuously rearticulated through educational knowledge and practice. The study combines critical discourse analysis of national curricula with ethnographic fieldwork in upper-secondary schools in Turin. Particular attention is paid to students positioned as "standard" or "unmarked" Italians to examine how normative whiteness is reproduced through seemingly neutral teaching practices. Teachers' interviews and participatory workshops reveal how colonial histories are marginalised, racial continuities disavowed, and emotional tensions emerge when dominant narratives and language are unsettled. Initial findings suggest that race operates as a structuring yet marginalised dimension of educational discourse, generating epistemic injustice that renders certain histories and racialised subjectivities peripheral. At the same time, moments of ambiguity and contestation expose the instability of these regimes of truth and point to the pedagogical possibility of decolonising national narratives. By interrogating how Italianness is normalised and whitened in schooling, the study contributes to debates on epistemic justice in postcolonial Italy and reflects on the potential of critical pedagogy to unsettle racialised common sense within education.

QUEER STORIES IN THE LANGUAGE CLASSROOM: ARTS-BASED LITERACY PRACTICES AND EPISTEMIC JUSTICE IN PRIMARY ELT

Federica Clementi (University of Stavanger, Norway)

Queer pedagogy | children's literature | arts-based literacy

Contemporary discussions on democratic education emphasize classroom practices that foster dialogue and active participation in shared processes. From the perspective of critical pedagogy, education is understood not merely as the trasmission of knowledge, but as a social and political practice through which learners engage with questions of power, representation, and justice (Freire, 1970; hooks, 2014; Giroux, 2020). In English Language Teaching (ELT), literary texts frequently serve as sites where cultural knowledge is introduced and negotiated. Yet classroom materials often reproduce normative representations of gender, family, and identity. While research on critical and inclusive language pedagogy has expanded, sexuality and gender continue to be marginalized in primary education. As a result, heteronormative assumptions continue to shape what counts as legitimate cultural knowledge and whose experiences become visible within classroom discussions. This contribution presents findings from a qualitative classroom intervention conducted in two fifth-grade English classes in Norway, involving thirty puoils. The intervention explored how queer children's literature and arts-based literacy practices might support more inclusive and participatory forms of classroom dialogue. The teachng sequence centered on the graphic novel series The Tea Dragon Society (O'Neill, 2017, 2019, 2021, which portrays a fictional community characterized by diverse identities, abilities, and relational practices. Through shared reading, discussions, and creative responses, pupils engaged with the narrative by producing drawings, poems, and sculptures that interpreted the characters, their relationships, and stories. The dataset includes recordings of classroom discussions, photographs and scans of student artwork, field notes, and short interviews with five participants. Drawing on queer pedagogy and intersectional perspectives on knowledge and power (Crenshaw, 1989), the study approaches literary engagement as a potential site of epistemic justice in language education. From a decolonial perspective, queering classroom texts and interpretive practices can disrupt dominant knowledge hierarchies that privilege normative narratives of identity, belonging, and social relations, opening space for alternative ways of understanding community and difference. Such an approach resonates with broader conceptions of democratic education that emphasize encounters with plurality within shared educational spaces (Biesta, 2020). The analysis show that arts-based literacy activities can create interpretative spaces in which the pupils collaboratively explored the subject and engaged with the narrative. Multimodal responses provided multiple entry points into literary engagement and language use. Arts-based literacy activities created interpretative spaces in which pupils collaboratively explored and engaged with the narrative. Multimodal responses supported participation by allowing them to interpret and articulate their opinions through different expressive forms. Integrating queer children's literature and arts-based literacy practices functions as an epistemic intervention in primary ELT, enabling pupils to engage with diverse perspectives, supporting a more plural and democratic form of classroom knowledge-making. More broadly, the study demostrates how everyday literacy practices in primary ELT can contribute to epistemic justice by expanding whose experiences and perspectives are recognized within classroom dialogue.

LIMITS AND CONDITIONS FOR A DECOLONIAL PEDAGOGY: A DOCUMENT ANALYSIS OF THE ITALIAN GUIDELINES ON INTERCULTURALITY

Charaf El Bouhali (Università degli Studi di Padova, Italy) · **Roberta Berlingó** (Rutgers University, USA)

Decolonial Pedagogy | Document Analysis | Intercultural Education

This contribution is based primarily on an awareness of its own positioning about decolonial and intersectional theories. Unlike the conventional goal of reaching some sort of normative judgment, the present document analysis we propose is aimed at exploring how texts shape the epistemological and democratic potential of education. We are aware of the need to clarify the distinction between the levels of institutional documents and the level of decolonial theories. The research starts from an exploration of the conditions under which such decolonization would be conceivable, instead of beginning with the assumption that decolonization is not possible or that it has potentially already been achieved. The preliminary premise of this research is that, while the Italian ministerial guidelines use inclusive and pluralistic language in formulating the curriculum, there may be implicit epistemic hierarchies that do not really allow for a structural reconfiguration of the curriculum in decolonial terms. The research explores how the Italian ministerial guidelines configure a decolonial reconfiguration of the curriculum and under what epistemic conditions it is conceivable. The analysis takes an exploratory approach. It seeks to identify the ways in which the school curriculum develops through its discursive and epistemic frameworks. The aim is to determine how these frameworks support or hinder the possibility of rethinking educational practice, including school curricula, in a direction oriented towards emancipation and the enhancement of diversity. The research question is as follows: What are the democratic knowledge and perspectives shaped by the Italian ministerial guidelines, and how do they help or hinder a decolonial reconceptualisation of educational practice? Although the analysis does not intend to engage in an evaluation of the political will of the ministerial guidelines, the aim is to identify the particularities of certain discursive configurations and their impact on the epistemic boundaries through which democratic education is imagined. Documents considered for research purposes: La via italiana per la scuola interculturale e l'integrazione degli alunni stranieri [''The Italian way to intercultural schooling and the integration of foreign students''], 2007 Linee guida per l'accoglienza e l'integrazione degli alunni stranieri [''Guidelines for the reception and integration of foreign students''], 2014 Diversi da chi? Raccomandazioni per l'integrazione degli alunni con cittadinanza non italiana [''Different from whom? Recommendations for the integration of students with non-Italian citizenship''], 2015 Orientamenti interculturali. Idee e proposte per l'integrazione di alunne e alunni provenienti da contesti migratori [''Intercultural guidelines: Ideas and proposals for the integration of students from migratory backgrounds''], 2022 A preliminary document analysis suggests that the Italian ministerial guidelines use inclusive and democratic language, but do not really question colonial epistemic hierarchies. The ministerial guidelines formally recognise diversity but do not go beyond a knowledge framework that underpins the school curriculum and intercultural guidelines, which does not allow for an effectively decolonial approach. At the same time, although decolonial pedagogy is never explicitly mentioned, these institutional documents highlight certain conditions that could facilitate a dialogue from a decolonial perspective, such as the critique of ethnocentrism and assimilationism and the appreciation of culture and language.

BEYOND KNOWLEDGE HIERARCHIES: A QUALITATIVE INQUIRY INTO EPISTEMIC JUSTICE AND ADOLESCENT PARTICIPATION

Giuseppe Li Rosi (università di enna kore, Italy)

epistemic justice | gender hierarchies | queer pedagogy

This paper offers an interdisciplinary analysis of forms of epistemic justice in contemporary educational contexts. Drawing on the notion of epistemic injustice (Fricker, 2007) and subsequent theoretical developments, I aim to investigate how inequalities in epistemic credibility, access to interpretative frameworks, and participation in knowledge production impact educational practices and democratic processes. The paper argues that promoting collective agency requires learning environments capable of recognizing epistemic plurality and redistributing interpretive power (Freire, 2018). Methodologically, I will employ a qualitative approach based on focus groups (Frisina, 2010) among adolescents aged 15 to 18. This methodology allows us to observe dynamics of recognition, exclusion, and negotiation of meaning, consistent with a perspective on epistemic justice oriented toward the valorization of plural voices. The empirical analysis is complemented by a theoretical-critical reflection on the role of digital environments as potentially enabling but ambivalent spaces: while they can broaden access to knowledge and support collaborative practices, they also risk reproducing epistemic hierarchies through algorithmic logics and visibility asymmetries (Fricker, 2016). My aim is to highlight that a queer and decolonial pedagogy oriented toward epistemic justice must integrate dialogical practices, critical digital skills, and participatory models, strengthening democracy as a daily educational practice and challenging current educational institutions that reproduce hierarchies of gender, race, and sexuality.

REPRODUCING AND RESISTING NORMATIVITY: QUEER AND DECOLONIAL INSIGHTS FROM A LOWER SECONDARY SCHOOL IN ANDALUSIA

Lavinia Pia Vaccaro (Università Kore di Enna, Italy)

Decolonial pedagogy | Queer pedagogy | Power negotiation

Within the framework of European educational policies, contemporary schools are formally tasked with promoting democratic citizenship, inclusion, and equal opportunities. However, they remain permeated by tensions, ambivalences, and processes that reproduce social inequalities. Schools thus emerge as environments marked by a profound paradox: on the one hand, they present themselves as institutions grounded in democratic principles; on the other, they are historically situated spaces, traversed by normative regimes that shape bodies, identities, and possibilities for action. Simultaneously, schools are the sites where democracy is taught and learned, acknowledging that democratic values cannot merely be transmitted through instruction but must be experienced, negotiated, and co-constructed through relationships among all

participants, understood as reflexive and critical actors within the educational setting, and through the mediation of the world (Freire, 2004). Consequently, teaching practices, curriculum, discipline and institutional culture often reflect the relational dynamics of contemporary society, which Walsh (2013) characterizes as capitalist, patriarchal, Western, and Christian-centered since 1492. This perpetuates the challenge of constructing genuinely inter-relational contexts capable of ensuring recognition, participation, and legitimacy for all subjectivities. This contribution adopts the perspective of the coloniality of power (Quijano, 2002) as a set of relational dynamics permeating everyday educational practices, shaping the exercise of authority, the legitimization of knowledge, and the positioning of students and teachers. Within school contexts, these dynamics manifest through the coloniality of knowledge (Lander, 2000), being (Maldonado-Torres, 2007), and gender (Mendoza, 2023), which operate, respectively, in the curricular decisions, in the construction of implicit hierarchies of humanity and value, and in the processes regulating bodies and identities. The study situates itself at the intersection of queer pedagogy, decolonial theory, and critical postcolonial pedagogy, in dialogue with intersectionality (Collins, 2019), presenting findings from a case study (Stake, 1998) conducted in a fourth-year class of Educación Secundaria Obligatoria (ESO) in Andalusia. The research explores pedagogical relationships in a heterogeneous and multicultural context drawing on the written and oral material recollected from personal participant observation in classroom, focus groups with students and semi-structured interviews with curricular teachers (Spanish language, Latin, history and geography, biology, English). Particular attention is paid to the pedagogical triangle (Houssaye, 1988)—knowledge, students, teachers—to investigate modes of teaching, content, and processes of engagement and positioning of the subjects. Through the Thematic Analysis (Braun & Clarke, 2013) of field notes, interviews, and focus groups, and in dialogue with queer and decolonial perspectives, the study reflects on how everyday pedagogical interactions may reinforce, reproduce, or occasionally destabilize dominant regimes of gender, normativity, and legitimacy, interrogating the conditions under which pedagogy can be reconceptualized as a space for emancipation, participation, and plurality.

QUEER PEDAGOGY AND CHILDREN'S LITERATURE: INTERSECTIONAL AND DECOLONIAL READINGS

Marta Selleri (Univeristà degli studi di Enna "Kore", Italy)

queer pedagogy | children's literature | intersectionality

Adopting an intersectional (Collins 2019) and queer and decolonial (Borghi 2020) theoretical perspective, this contribution aims to analyze the representation of queer subjectivities in contemporary Italian-language children's literature, questioning its pedagogical potential within educational processes. Children's literature is one of the cultural and mass media devices that, through the production of representations, contributes to guiding the processes of socialization and identity construction in younger people, serving both as a space for the reproduction of social norms and as a possible terrain for transformation (Barsotti 2023; Forni 2022). This contribution proposes an analysis of some case studies – picture books and graphic novels published in Italian over the last twenty years – that depict subjectivities that do not conform to gender norms, a type of production that has seen significant growth in recent years (Fierli et al. 2016; 2020; 2022). Children's literature is investigated here as a symbolic space in which dynamics of exclusion, violence, and normativity can emerge, but also as a place of political and pedagogical imagination capable of making marginalized subjectivities visible (Sciurba & Bell 2020). Inspired by the theoretical reflections and practical proposals of Rachele

Borghi (2020), studies on queer pedagogy (Mayo & Rodriguez 2019), and the pedagogical thinking of Paulo Freire (2002), which lead to the adoption of an intersectional methodological and epistemological approach (Collins 2019), this contribution – starting from the conviction that there is and should be a virtuous circle of exchange between theoretical reflections and educational practices between academic research and the school context – has a twofold objective. The first is to read these books from a queer pedagogy perspective, not limiting the analysis to the dimension of representation alone – which would risk 'normalizing' queer identities and co-opting them into a system that remains de facto hetero-cisnormative (Trujillo 2015) – but by questioning these works with regard to the processes of constructing normality, in order to understand whether and how they are actually capable of queering children's literature and the processes of growing up (Britzman 1995). The second objective is to propose tools that can be used in the debate on the processes of decolonization of school practices (hooks 2020; Muraca 2021), highlighting how some works of children's literature can contribute to integrating decolonial and gender perspectives in educational contexts, or how they can, on the contrary, reflect and reproduce a colonial and cisgender gaze.

BEYOND THE CANON: COMICS, QUEERNESS, AND ALTERNATIVE LITERACIES AS SITES OF EPISTEMIC RESISTANCE IN SCHOOL CURRICULA

Valentina Baeli (University of Catania, Italy)

Curricula | Queerness | Critical Pedagogy

School curricula are never neutral. The selection of texts, genres, and knowledge forms that enter the classroom is always an act of power – one that legitimizes certain ways of knowing while rendering others invisible. Drawing on the frameworks of queer pedagogy and epistemic justice, this paper argues that traditional school curricula in Italy operate as normalizing technologies that systematically marginalize non-canonical forms of cultural production and non-normative subjectivities. In doing so, they reproduce what Miranda Fricker (2007) calls epistemic injustice: a form of harm that silences subjects by denying legitimacy to their ways of knowing and narrating the world. This silencing is not accidental but structural, as bell hooks (1994) reminds us when she frames the classroom as a potential site of liberation – one that is, however, too often organized around the reproduction of dominance rather than the affirmation of plural voices. The paper focuses on three interconnected domains that remain largely absent from official school curricula: comics and graphic novels, queer themes and identities, and alternative or non-mainstream writing addressed to adolescents. Each of these areas represents not merely a gap in literary provision, but a structural exclusion that reflects deeper epistemological assumptions about what counts as legitimate knowledge, aesthetically valid form, and culturally worthy content. As Apple (2004) has argued, the official curriculum encodes a particular version of cultural hegemony; what is left out is as revealing as what is included. Schirripa (2020) further situates this dynamic within the Italian context, showing how critical pedagogy must contend with institutional inertia and the persistence of conservative curricular frameworks that

resist the inclusion of subaltern knowledges. Comics and graphic novels, despite decades of scholarship attesting to their cognitive and narrative complexity (McCloud, 1993), continue to be treated as peripheral or subliterary within school reading lists. Their absence is symptomatic of a broader logocentric bias that privileges the written word in its most traditional forms. Queer themes and identities remain largely invisible in school settings, where heteronormativity functions as an unmarked default – a silent norm that shapes what can be said, read, and imagined within institutional walls. As Giroux (2024) argues, schools are not simply sites of instruction but of cultural production, where certain identities are rendered legible while others are pushed to the margins. For queer adolescents, this exclusion is particularly crucial: it forecloses access to narratives and imaginaries through which non-normative selves might be recognized and validated (Kumashiro, 2002; Sedgwick, 1990). Mayo (2024) further highlights how critical pedagogy must actively confront heteronormativity as a form of epistemic violence, rather than treating sexuality as a private matter exterior to the political work of education. This paper contends that the exclusion of these forms from school curricula is not incidental but constitutive: it reproduces what Mignolo and Walsh (2018) describe as the “colonial matrix of power”, which operates through the control of knowledge and aesthetic value. Decolonizing the curriculum means, therefore, not simply adding marginalized voices to an otherwise unchanged structure, but fundamentally questioning the epistemological hierarchies that govern curricular legitimacy.

INTERSECTIONS OF INVISIBILITY: A QUANTITATIVE ANALYSIS OF THE TRANS* BPOC COMMUNITY’S SCHOOL EXPERIENCES IN EUROPE

Richard Bourelly (Sapienza Università di Roma, Italy) · **Ale Blue Santambrogio** (Università degli Studi di Enna "Kore", Italy)

decolonisation education trans students

Educational institutions often function as sites of coloniality, where Eurocentric and cis-heteronormative standards dictate the boundaries of “acceptable” bodies and identities (Foucault, 1975; Mayo & Blackburn, 2019; Sánchez Sáinz, 2019). For trans* individuals belonging to racialised minorities (BPOC), the school environment becomes a complex nexus of intersectional oppressions, where they experience the dichotomy of intersectional invisibility (gender identity) and hypervisibility (racialised background) (Hennekam & Dumazert, 2023). This contribution examines these intersections through a secondary analysis of the European Union Agency for Fundamental Rights (FRA) LGBTIQ Survey III (2024), focusing on a weighted subsample of 23,101 trans* respondents, aged 15-30, who attended school in the EU. Within the sample, 1,118 identify as a minority based on ethnicity or migrant background, and 576 identify as a minority based on skin colour. Drawing on the dialogue between queer pedagogy and decoloniality (Mayo & Blackburn, 2019; Sánchez Sáinz, 2019), the study utilises binary logistic regression models to investigate racialisation, specifically based on skin colour, affected and still affects trans* individuals’ school environment, while accounting for the compounding effects of region, gender identity, sexual orientation and age. The results reveal a significant vulnerability surplus among racialised respondents. In fact, white individuals exhibit a significantly lower likelihood of actively avoiding gender expression through their physical appearance (OR=0.77; $p<.05$) compared to their BPOC peers. This finding suggests that the intersection of transphobia and skin-colour-based racism exerts a disciplinary pressure that forces BPOC trans* students into strategic invisibility as a survival mechanism. Furthermore, the logistic regression on school climate confirms that being white is a protective factor, as they are less likely to experience a hostile school environment (OR = 0.79; $p<.05$) compared to their BPOC counterparts. While dimensions such as access to gendered spaces and direct hostility by peers and teachers appear to

affect all trans* students, the general school climate and the freedom of gender expression remain deeply affected by racism due to hyper visibility. The authors argue that these findings demonstrate a form of normativity (Foucault, 1975), biopower (Foucault, 1978), and epistemic injustice (Fricker, 2007), whereby the school system's inability to accommodate intersectional identities forces BPOC trans* individuals into invisibility. To support all trans* people, institutional practices must move beyond superficial "acceptance" that does not take into consideration intersectionalities, addressing the structural racism, cisnormativity and binarism that continue to configure learning environments as sites of exclusion rather than spaces of recognition.

OBSERVING THE DIFFERENCE: PEDAGOGICAL OBSERVATION, AESTHETIC EDUCATION AND EPISTEMIC QUEER JUSTICE

Emanuele Liotta (Università degli studi di Catania, Italy)

aesthetic education | pedagogical observation | queer pedagogy

This contribution explores the political and epistemological implications of pedagogical observation within contemporary educational contexts, marked by global inequalities, migration, queer invibilitation and persistent colonial legacies. Starting from the premise that observation in education is never a neutral act, the paper argues that observating educational processes means participating in the costruction of what becomes visible, intelligible, and legiitimate wthin educational discourse (Freire, 1970; Bourdieu & Passeron, 1970). In this sense, observation constitutes not only a methodological tool but a situated practice that must be collocated in the filed of epistemological studies, and that shapes the ways educational realities are interpreted and governed. This reasoning can be lowered in a field of research that looks at educational institutions in which structures of power related to class, race, gender and sexuality continues to organize access to recognition, partecipation and knowledge. Can pedagogical observation, therefore, become a critical practice capable of exposing the mechanism through which educational inequalities are normalized and reporoduced? Critical pedagogical traditions have long emphasized that education and observation alike are inherently political processes, oriented by specific systems of values and forms of knowledges (Freire, 1992; Lugones, 2003). Moreover, in this framework, the paradigm of aesthetic education offers an important theorical lens: drawing on pragmatic and phenomenological traditions, aesthetic education conceives learning as an experiential and relational process in which perception interpretation and meaning-making become central dimensions of knowledge (Dewey, 1934). From this perspective, observing educational processes means cultivating and attentive and reflexive gaze capable of perceiving the symbolic, relational and affective dimension of educational experience (Cambi, 2014). Engaging in dialogue with decolonial and queer perspectives, the paper proposes to rethink observation as a relational and reflexive practice that can contribute to forms of epistemic justice within educational contexts. Rather than reducing educational marginalization to individual deficits or measurable outcomes, this approach interprets inequalities as historically and socially produced phenomena embedded in institutional practices and symbolic structures (Bourdieu & Passeron, 1970). Pedagogical observation thus becomes a form of aesthetic and political engagement with educational reality: a practice oriented not toward the normalization of difference but making visible what resists simplification and is forced to remain marginalized and to stay underneath the dominant educational narratives. Such an approach resonates with critical and pedagogical reading of LGBTQIA+ subjectivities as a critical place for the renegotiation of social pacts, analyzing the educational curvatures of representations (understood as aesthetic devices of symbolic transmission), with attention to the processes of stigmatization, cultural

memory and the tensions between visibility, normalization and desire. An aesthetic education in queer curvature, and a pedagogical observation projected to aim attention on it, can be assumed as a pedagogical practice capable of reactivating recognition and citizenship, contributing to the construction of bonds based on the plurality of experiences.

Democracy of Care: Rethinking Networks and Relationships of Counter Gender-Based Violence

PANEL CONVENORS: Anna Grazia Lopez (University of Foggia Italy); Isabella Loiodice (University of Foggia Italy)

PANEL KEYWORDS: gender violence, care, relationship; networks; education

Gender-based violence is a form of social injustice that silently and sometimes imperceptibly traps victims in vicious circles from which they struggle to escape. Lack of awareness, feelings of shame, and economic dependence on the abuser are among the main factors that lead women to hide the violence they suffer. Similarly, these are factors that make it difficult to detect the phenomenon outside the home. The panel aims to promote interdisciplinary dialogue through contributions that explore and problematize the following themes: - deconstruct distorted ideas about caregiving dynamics that have patriarchal roots, are learned from role models, and reproduced within emotional relationships: it is within these relationships that the most brutal acts of violence sometimes occur, which are not always visible or perceptible outside the home. In this way, family contexts and emotional relationships become a privileged theater for abuse, mistreatment, and dehumanization, often due to an unhealthy idea of home, care, love, and affection; - understand the role played by the educational community and the inter-institutional network in intercepting the phenomenon and training teachers, law enforcement officers, administrative technicians and, more generally, all operators involved in the prevention and combating system; - raise awareness of the recognition of violence in close relationships and promote recognition processes through the design of self-narrative and reflective educational practices. Scholars who wish to respond to this call are invited to submit contributions that address one or more of the proposed thematic areas.

RETHINKING MASCULINITY, CARE, AND GENDER-BASED VIOLENCE: TOWARD SHARED RESPONSIBILITY IN CARE PRACTICES

Sabina Leoncini (UNISI, Italy)

gender | care | education

Despite the significant progress achieved in recent decades toward greater gender equality, social stigmatization of men who engage in roles traditionally associated with femininity—such as childcare, education, and domestic work—continues to persist. Empirical evidence consistently shows that care work, both paid and unpaid, remains largely feminised. Within this context, many men experience social pressure to distance themselves from what is perceived as feminine in order to conform to binary gender norms and reinforce a socially recognised masculine identity. This distancing from femininity does not merely involve the rejection of specific roles, but also entails the devaluation of qualities culturally associated with care, such as empathy, emotional attentiveness, and relational responsibility. As a result, fields in which these qualities are central—particularly early childhood education and caregiving—remain marginal within dominant representations of masculinity. These dynamics contribute to the reproduction of rigid gender divisions, reinforcing occupational segregation and the unequal distribution of domestic and emotional labour. Addressing these patterns requires the active involvement of families in a critical reflection on the social construction of femininity and masculinity. Encouraging a more

flexible and relational understanding of gender roles can help reveal how the sharing of care responsibilities represents not a loss of identity, but an opportunity for individual and collective enrichment. In this perspective, the recognition of so-called “new fathers”—men who actively engage in childcare and household management—is particularly significant. These fathers embody alternative models of masculinity that challenge hegemonic norms and offer younger generations more inclusive gender references. Educational initiatives within schools and family contexts play a crucial role in promoting awareness of gender stereotypes and fostering more egalitarian representations of social roles. At the same time, media and cultural narratives can contribute to normalising the image of caring and emotionally involved fathers, moving beyond persistent stereotypes of masculinity based on distance, authority, or control. Social policies, particularly those supporting paternity leave and work–life balance, are also essential in creating the structural conditions necessary for a more equitable sharing of care work. Importantly, these transformations are closely linked to the prevention of gender-based violence. Research has widely shown that rigid and hierarchical models of masculinity—grounded in dominance, emotional suppression, and power over others—constitute significant risk factors for violent behaviours. Promoting masculinities centred on care, empathy, and shared responsibility can therefore contribute to challenging the cultural foundations of gender-based violence and fostering more respectful and non-violent relational models.Only through a broader cultural shift that dismantles gender stereotypes at both symbolic and structural levels will it be possible to envision a society in which care is no longer considered a “female domain,” but a shared space of social responsibility, personal development, and the construction of more equal and violence-free gender relations.

THE CONSTRUCTION OF THE IDENTITY OF WOMEN WITH DISABILITIES AND THE INVISIBILITY OF VIOLENCE: A LITERATURE REVIEW

Federica Lapietra (University of Bologna, Italy) · **Elena Malaguti** (University of Bologna, Italy)

gender-based violence | identity of women with disabilities | invisibilization process

Despite the growing international attention to the issue of gender-based violence and the framework of commitments outlined by the 2030 Agenda for Sustainable Development, which identifies the elimination of all forms of violence against women among its priorities, the experiences of women with disabilities, in relation to this issue, continue to occupy a marginal space within both the scientific and political context. The available scientific literature suggests that gender-based violence against women with disabilities is shaped by multiple determinants, including restrictive gender norms, social stigmatization, dynamics of dependency within care relationships, and intersectional discrimination in access to support services. National and international published studies, although limited, have long converged in recognizing women with disabilities exposed to a higher risk of violence, in all its forms, than women without disabilities; however, the phenomenon remains largely invisible, both in more intimate and interpersonal contexts and in social and institutional settings, such as health and social care services and gender-based violence prevention and response centres. Starting from a critical re-reading of a selected corpus of studies on gender-based violence against women with disabilities – identified within a scoping review aimed to map the literature on the identity construction process of women with disabilities – The present contribution aims to analyse some of the main reasons underlying the invisibilization of gender-based violence against these women. Adopting an intersectional and socio-ecological perspective, the analysis offers a critical reflection on the need to promote further research lines aimed at deepening the understanding of cultural models and educational practices oriented toward the recognition of hidden violence. At the same time, it highlights the urgent need to strengthen the network of services engaged in the prevention of and response to violence, with particular attention to accessibility and the protection of the rights of women with disabilities.

BIOGRAPHY FOR YOUNG READERS, CO-RESEARCH NETWORKS AND CULTURAL PREVENTION OF GENDER-BASED VIOLENCE: THE BIBI PROGRAMME AS A NATIONAL MODEL

Marnie Campagnaro (University of Padova) · **Ilaria Filograsso** (University of Chieti-Pescara, Italy)

Biography for children | gender imaginaries | violence prevention education

Gender-based violence is rooted not only in social structures but also in symbolic imaginaries formed from early childhood. Biography for young readers, as a genre structured around role modelling and exemplarity, plays a decisive role in shaping gendered representations of agency and professional legitimacy. The BIBI Programme (Biografie e Biofiction d'Infanzia) responds to this challenge by developing a national model based on co-research networks and cultural prevention. The programme is a biennial national research and educational initiative funded by the Italian Presidency of the Council of Ministers – Department for Equal Opportunities through a competitive public call for research and intervention projects aimed at preventing violence against women and promoting effective institutional networking practices. It brings together universities, local authorities, schools, socio-educational services, and specialised publishers across Italy within a structured, multi-level collaborative framework grounded in participatory research. The project is situated within contemporary scholarship that conceptualises biography for young readers as a complex and historically regulated genre shaped by tensions between documentation, narrative construction, visual mediation, and reader positioning (Beauvais, 2020; Douglas, 2022). Historically structured around dynamics of exemplarity and normativity (Eaton, 2006), biography functions as a powerful device of symbolic modelling, contributing to the construction of gender imaginaries and professional role representations. Recent research has demonstrated how contemporary biographies, particularly those dedicated to women, oscillate between empowerment narratives and new forms of responsibilisation, while also reproducing subtle normative expectations, meritocratic individualism, and depoliticised accounts of structural inequality, thereby

revealing the complex ideological implications embedded in gendered constructions of authority, agency, and professional recognition (Couceiro, 2022; Campagnaro, 2025; Filograsso, 2025; Malpezzi, 2024). Within this framework, BIBI adopts illustrated biography as a transformative pedagogical device aimed at reshaping children's gender imaginaries between the ages of 3 and 14. Through corpus-based iconotextual analysis, participatory reading practices, teacher training, and structured classroom experimentation, the programme works on the pluralisation of professional aspirations and the deconstruction of stereotypical associations between gender and social roles. In dialogue with approaches that interpret biography as an interplay between modelling, iconicity, and symbolic construction (Malpezzi, 2025), BIBI promotes narrative forms that include vulnerability, conflict, error, and identity negotiation, thereby moving beyond purely heroic and idealised representations (Jurich, 1972). A distinctive feature of the programme is its co-research architecture. The network functions as an epistemic infrastructure in which researchers, educators, and institutional partners collaboratively design, implement, and evaluate educational interventions. This model enables comparative experimentation across territories, systematic pre- and post-intervention data collection, and the integration of literary analysis, empirical research, and policy-oriented dissemination (Campagnaro & Ferrari, 2025). The paper will outline the programme's theoretical foundations, describe the structure of its participatory research network, discuss the iconotextual and pedagogical criteria guiding corpus selection and classroom implementation, and present preliminary findings emerging from experimental phases. It will argue that biography-based symbolic modelling can operate as a structural mechanism of primary prevention by intervening on the cultural roots of gender inequality and expanding the horizon of professional roles perceived as socially legitimate and attainable.

NETWORKING: POLICIES, STRATEGIES AND TOOLS TO COMBAT GENDER BASED VIOLENCE

Francesca Dello Preite (Università di Firenze, Italy) · **Caterina Mellace** (Università di Firenze, Italy)

gender violence networking

The paper presents the results of the participatory action research project "Gender education, fight against stereotypes and prevention of gender violence", developed by the FORLILPSI Department of the University of Florence in collaboration with the Municipality of Livorno as part of the Memorandum of Understanding for the prevention, contrast and taking charge of gender-based violence. The research was created to accompany the Municipal Anti-Violence Network in the systematization of organizational and communication processes, supporting the construction of a theoretical-operational model aimed at implementing the interdependence between partners necessary to operate in a systematic and reticular way. The first phase of the project (June-December 2024) involved the analysis of the context and the needs of the partners, carried out through monthly meetings of the Operational Table. These moments have fostered mutual knowledge, the reconstruction of the skills and practices of the different bodies and the development of shared tools, including the Grid of Competences, the Map of Intervention Actions and the Map of Relations between Partners. This work has made it possible to start drafting the Guidelines, conceived as a guideline device to define collaboration methods, criteria for taking charge and common strategies for prevention and contrast. The Guidelines aim to direct the actions of each

actor with a view to interdependence and collaboration and to support the entire path of women, from the emergency moment to social and work reintegration. The second phase (January-September 2025) involved evaluation, monitoring and training within the network. Through a questionnaire administered to all partners, feedback was collected on collaborative processes and the impact of the actions taken, which were then discussed in plenary. At the same time, training and self-training initiatives have been activated aimed at strengthening the professional and relational skills of the members of the network, with particular attention to inter-institutional communication and integrated case management. The third phase (October-December 2025) included a specific training course on risk assessment, divided into three steps: mapping of the tools used by the partners; days of theoretical and methodological training and participatory workshops; development of shared communication strategies to ensure effective and timely transmission of information. This work responds to the need to overcome the fragmentation of approaches and to build a common language, an essential condition for coordinated and coherent care. The results obtained so far highlight a network in progressive consolidation, capable of improving the quality of care and awareness of the roles of individual partners. The project is therefore configured as a transformative process in the making, aimed at strengthening the network as an integrated and responsible system, capable of promoting a territorial culture based on collaboration, effective communication and the empowerment of women.

VIOLENCE AS A "FORM OF LOVE": INTERNALISED PARENTING MODELS AND THE DEVELOPMENT OF EMOTIONAL RELATIONSHIPS

Alessandra Altamura (Università degli Studi di Foggia, Italy)

emotional relationships | normalisation of violence | parenting models

Thanks to the Istanbul Convention, violence against women has been explicitly recognised as a serious violation of human rights (Art. 3); a violation that often occurs silently and is difficult to detect, particularly within family settings and intimate relationships. This difficulty can be attributed not only to structural factors – such as economic dependence, feelings of shame or fear of retaliation – but also to the presence of distorted cultural representations of care, love and emotional relationships, which contribute to normalising or rendering invisible the many facets of violent behaviour. From a pedagogical perspective, one of the elements that needs to be addressed is the parenting models learned by women who are victims of violence. The ways in which one learns to care for others, to experience emotional relationships and to interpret gender roles are, in fact, deeply influenced by the models observed and internalised through family experiences. These models can also lead to an inappropriate (uncritical) interpretation of certain behaviours that risk being perceived as “normal”, as signs of love. This paper is part of the PRIN PNRR 2022 Phoenix research project. In particular, it draws on an analysis of interviews conducted with mothers who are victims of violence and who took part in the project’s activities. The narratives shared, and subsequently analysed, highlight how (and to what extent) learned and internalised parenting models can significantly influence the processes of attributing meaning to relational experiences, sometimes contributing to a distorted or partial interpretation of emotional dynamics. From this perspective, there is a clear need to promote educational programmes capable of making these learned models visible –and thus subjecting them to critical scrutiny – fostering processes of awareness and the development of new concepts of care and love, this time based on mutual recognition, respect and dignity.

RISK AND PROTECTIVE FACTORS IN THE RESILIENCE OF MOTHERS SURVIVORS OF VIOLENCE: A REFLEXIVE THEMATIC ANALYSIS

Angelica Disalvo (Università di Foggia, Italy)

Resilience | Gender-based violence | Social justice

In line with the literature on the topic (Cyrulnik, Malaguti, 2005; Malaguti, 2005) and within an ecosystemic perspective (Kumpfer, 2002; Richardson, 2002), resilience is understood as a process that is activated in the presence of adversity and that can be supported or hindered by different factors at the individual, relational, and contextual levels. These elements may function as either risk or protective factors depending on a person's life history and on the subjective meanings attributed to life events. This paper aims to highlight the main risk and protective factors related to resilience (Fernández-Álvarez, Fontanil, Alcedo, 2022) identified through a thematic analysis of interviews conducted with mothers who are victims of violence and who participated in the PRIN "Phoenix" project (Lopez, 2026). On the one hand, the findings highlight the need to strengthen the cohesion of the relational and inter-institutional network supporting mothers who are victims of violence; on the other hand, they underscore the importance of promoting self-awareness and self-love throughout women's lives. These issues place social justice and responsibility and the direction of educational policies at the center of efforts to combat this phenomenon.

FROM HEGEMONY TO RECIPROCITY: PHILOSOPHIES OF EDUCATION ON GENDER, EMBODIMENT, AND DEPENDENCE

Giuseppina D'Addelfio (Università degli studi di Palermo, Italy)

Care | Recognition | Embodiment

In recent years, the term "patriarchy" has urgently returned to public debate, for reasons that are clear to everyone. But what are the deeper meanings of this term today? There is certainly an often overlooked and underestimated patriarchy in the dynamics of care and family relationships, where hegemonic representations of the relationship between masculine and feminine shape them. These hegemonic representations are not always easy to detect, including those that allude to a generic "equality" effectively modeled on the masculine order as well as to a "complementarity" that is, upon closer

inspection, only a combination of stereotypes. The aim of this contribution is, first of all, to address some of these neglected forms of hegemony within affective relationships, also referring to recent research on adolescence (Istat 2025; Save the Children, 2025, 2026; Vinciguerra 2024; Pasta-Santerini 2025; Toffanin, Gius, Cremonesini 2026). Furthermore, since in pedagogical perspective it is necessary to design innovative educational paths to overcome hegemonic logics in the direction of reciprocity, the contribution intends to argue how this overcoming requires a deepening of the philosophy of education that helps to rethink embodiment, fragility, and dependence. These can be meant as human co-existentials in a phenomenological sense (Heidegger 1976 – Fink 2018), that characterize our human condition and that, however, are today deformed by widespread neoliberal ideologies that reinforce logics of domination and oppression. On the other hand, new logics of mutual recognition are to be implemented. In this perspective, to deconstruct hegemonic and patriarchal logics, the contribution proposes a parallel reading of the texts of Rita Laura Segato, bell hooks, and Eva Feder Kittay. Although their theoretical paths are different and distinct, their common effort is to address the rethinking of human embodiment as the first tool for struggle and overcoming the various forms of patriarchal hegemony in contemporary society.

Ecofeminist dialogues across History of Education and Children's Literature

PANEL CONVENORS: Dalila Forni (Università dell'Aquila, Italy); Claudia Cirella (Università Lumsa)

PANEL KEYWORDS: ecofeminism, history of education, children's literature

This panel aims to foster a critical dialogue on ecofeminism within the fields of the History of Education and Children's Literature. Ecofeminism highlights the parallel and interconnected oppressions of women and nature, asserting that hierarchical and patriarchal systems of domination exploit both. Within the panel's framework, stories and educational practices are conceived as key tools to promote gender equality, ecological justice, and non-hierarchical relationships with the natural world and with oppressed groups. The panel seeks to study how different historical pedagogies have framed the relationship between gender and the environment and how children's literature has been enacting ecofeminist representations. We welcome papers that explore History of education through an ecofeminist lens and contributions that examine how both contemporary and historical children's narratives actively dismantle patriarchal and anthropocentric views. The panel encourages interdisciplinary approaches that bridge educational history, literary analysis, and critical theory. We particularly welcome proposals addressing, but not limited to, the following areas: Gender and eco-pedagogy between history of education and literary representations, Present and past narratives or educational practices that challenge anthropocentric, patriarchal and capitalist perspectives, Historical efforts to integrate gender and eco-critical ethics into both formal and informal educational contexts, The relation between gender and nature in textbooks and manuals, Eco-gender gaps in educational contexts and youth fiction, The connection between climate anxiety and gender in both youth fiction and educational areas.
