(Un)Making Europe: Capitalism, Solidarities, Subjectivities
13th ESA Conference | Athens | 29.08.2017 – 01.09.2017

Europe can be made or unmade, and this is especially true since the 'Great Recession' of 2008. European society, and even the very idea of Europe, is under threat.

First, the inherent contradictions of **capitalism** are obviously stronger than we thought: Greece, where the emphatic idea of “Europe” originated, has experienced severe austerity measures; Europe has seen a deepening of neo-liberal politics, threats to what remains of the welfare state and increasing inequality. **Second, solidarities** are fragmented in and between societies across Europe. The new world economic crisis formed a context for both the constitution and the undermining of solidarities. On the one hand, from the Arab Uprisings to the various Occupy and Indignados movements – and their manifestations at the level of political parties – we have seen rebellions by citizens demanding political change. On the other hand, refugees fleeing wars have been denied human rights and their lives have been threatened by the closure of borders and the lack of a coordinated European strategy. **Third, subjectivities** are formed that do not only result in resistance and protest, but also in apathy, despair, depression, and anxiety. Authoritarianism, nationalism, racism, xenophobia, right-wing extremism, spirals of violence, and ideological fundamentalisms have proliferated throughout the world, including in Europe.

As a result, the promise of Europe and the geographical, political, and social borders of Europe have been unmade and this 'unmaking' poses a profound challenge for sociology and the social sciences more generally. It is in this context that the European Sociological Association's 2017 Conference takes place in Athens at the epicentre of the European crisis. The **underlying question** for the conference is:

How and where to should a sociology that matters evolve? How can sociology's analyses, theories and methods, across the whole spectrum of ESA's 37 Research Networks and various countries, be advanced in order to explain and understand capitalism, solidarities and subjectivities in the processes of the making, unmaking and remaking of Europe?

Table of Contents

13 th ESA Conference.....	3
Table of Contents	4
The President's Welcome	7
The LOC Chair's Welcome	9
Types of Sessions	11
Opening Ceremony & Opening Plenary	12
Special Evening Plenary.....	14
Closing Ceremony and Closing Plenary.....	16
Semi-Plenary Sessions	
SP01: The Structural Transformation of Europe's Public Sphere in the Age of Extremes	19
SP02: Migration in Times of Europe's Economic Crisis	20
SP03: The Sociology of Sustainable Food Consumption	22
SP04: Questioning Boundaries of Age and Place: Child Refugees in an Uncertain Europe	23
SP05: Anatomy of the Greek Crisis	25
SP06: (Un)Making Europe.....	26
SP07: (Un)Making Capitalism	27
SP08: (Un)Making Solidarities	29
SP(09): (Un)Making Subjectivities	30
SP10: Right Wing Extremism and Islamist Extremism in Europe: Similarities and Differences	32
SP11: Care Labour and Affective Labour in the Global Care Chain.....	33
SP12: The Transformation of Capitalism in Eastern Europe	35
SP13: Public Sociology and Public Intellectuals in Times of Europe's Crisis.....	36
Mid-Day Specials	
MD01: ESA Lecture Series (1) - The Future of Sociological Research.....	38
MD02: ESA Discussions: Assessing Sociology - Research and Impact Assessments and their Implications	39
MD03: Meet the Editor: The European Journal of Social Theory at 20 Years	40

MD04: Academic Freedom Under Threat in Europe	40
MD05: Author Meets Critics: Claus Offe's book "Europe Entrapped".....	41
MD06: Author Meets Critics: Jo Littler's book "Against Meritocracy: Culture, Power and Mythos of Mobility".....	42
MD07: ESA Lecture Series (2) - Sociology Today.....	43
MD08: ESA Discussions: Interdisciplinarity in Times of Budget Cuts and University Restructuring - Advancement or Demise of Sociology?.....	45
MD09: Meet the Editors: How to Write A Journal Article and Get It Published	46
MD10: Meet the Funders: Sociology at its best - Everything you want to know about the ERC Grants	47
MD11: Meet Civil Society Actors: Migration in Greece	48
MD12: Author Meets Critics: Victor Roudometof's book "Glocalization: A Critical Introduction"	49
MD13: Author Meets Critics: Clyde W. Barrow's book "Towards a Critical Theory of the State".....	50
Research Networks & Research Stream Sessions	
RN01 - Ageing in Europe	54
RN02 - Sociology of the Arts	92
RN03 - Biographical Perspectives on European Societies	131
RN04 - Sociology of Children and Childhood	139
RN05 - Sociology of Consumption	161
RN06 - Critical Political Economy.....	201
RN07 - Sociology of Culture	223
RN08 - Disaster, Conflict and Social Crisis.....	234
RN09 - Economic Sociology	247
RN10 - Sociology of Education	268
RN11 - Sociology of Emotions	316
RN12 - Environment and Society.....	345
RN13 - Sociology of Families and Intimate Lives	380
RN14 - Gender Relations in the Labour Market and the Welfare State	425
RN15 - Global, transnational and cosmopolitan sociology	442
RN16 - Sociology of Health and Illness	456
RN17 - Work, Employment and Industrial Relations	501
RN18 - Sociology of Communications and Media Research	536
RN19 - Sociology of Professions	571
RN20 - Qualitative Methods.....	582
RN21 - Quantitative Methods.....	600

RN22 - Sociology of Risk and Uncertainty	616

RS17 - 100 Years Charles Wright Mills: Sociological Imagination Today	996
Index	1000

The President's Welcome

Make this meeting matter. The relevance of the theme, world-famous keynote speakers, holding in Greece the debate on *(Un)Making Europe* which stresses the overreliance on *capitalism*, austerity measures and evaporating *solidarities* in Europe, are necessary, but in practice not sufficient for a successful conference. Make our exchanges relevant, with your presentation, pointed questions and, on the part of session chairs, by the strong encouragement of stimulating discussions!

Sociology. The project of questioning reality began in Greece, and sociology from the start shared in this task of highlighting dominant forms of understanding in societies (and science) that limit knowledge, by working towards more fitting kinds of understanding.

Sociologists have been analysing the negative impact of the Great Recession of 2008-9 on European societies, but which of the categories employed truly penetrate thought and action beyond our discipline? Microeconomics, austerity, and neoliberalism on the proactive side, nationalism, xenophobia, and right-wing extremism as forms on the reactive side both persist. While extreme intrasocietal inequalities are aggravated further by *intersocietal* imbalances (see wage dumping by 'strong' export economies) that no longer can be balanced with currency adjustments, mainstream microeconomics omits the "social". Consequently, current debates about proactive and reactive 'ideas' keep bolstering the political ontology of a Hobbesian (cultural, partly violent) war of all against all, thus subverting Emile Durkheim's call for a new "organic" *solidarity* in societies whose stability and integrity is threatened..

ESA. Despite our best intentions, even this community of 3500 delegates representing 77 countries probably will not save the world (not in one fell swoop). Our *subjectivities* increasingly are becoming subject to the spread of precarious careers, numeric research assessments, and tough competition for shrinking resources. For me, it is obvious that scholars must join forces to discuss and decide how to reanimate the idea and the practice of science as a group of peers.

ESA must provide spaces for free knowledge exchange. 37 ESA Research Networks (RN) selected papers by sociologists representing heterogeneous fields and views. Bottom-up construction of new 'Research Streams' (RS) has been invited as well as, for the first time, bottom-up abstract submission for semi-plenaries. The ESA world is flat.

Countervailing the latter, the commercialisation of science has been marching forward, necessitating strong responses. First, to keep a set of journals in 'public' hands (against the dominant corporate ownership of journal titles). Secondly, to create a third ESA journal, 'European Sociological Debate,' which, if it receives the support of ESA RNs, National Associations and members, will facilitate a broader exchange of sociological thought beyond linguistic and regional boundaries within Europe. Thirdly, against the intensified 'innovation' rhetoric in EU research funding and shrinking social science resources, in collaboration with others, to develop a more active voice for social science in Europe and EU research policy.

In order to enable a less dependent, stronger, and active ESA, we are currently restructuring our conference and headquarters operations, and developed a new strategic plan, database, logo, and website. This is a bottom-up community for all sociologists. We are thrilled that you are here!

Thank you. No one could be here without the *enthusiastic work* around the clock by Apostolos G. Papadopoulos (Local Organisers), Dagmar Danko (ESA office), Athanasios Lakrintis (Harokopio), Nikos Leandros (Panteion), Andreia Batista Dias (ESA), Veronika Riedl, Thomas Caubet, Christine Frank (all ESA interns), as well as Christian Fuchs (Conference Committee) and all other members of the ESA Executive Committee including 100 RN/RS ESA coordinators. My sincerely thanks to all for making possible this conference!

Should you still yearn for more wisdom, take a walk up to the Acropolis! Enjoy ESAAthens 2017!

Frank Welz

President of the European Sociological Association

The LOC Chair's Welcome

We are very proud to host the European sociological conference with a theme that strikes right at the heart of current discussions over the sustainability of a common European future. The (sub)theme with its triad of concepts signifies an interaction of forces that will define the future of Europe and its peoples.

The message of the conference theme is conveyed excellently by organizing this event in Greece which has been the main referent of the 2008/9 financial crisis and the 'European crisis' bound together. Therefore this conference states the urgent need to discuss, in depth, not simply the nuts and bolts of the multiple crises as well as their implications for the European citizens, but more importantly to explore the options and drivers connected to the remaking of the so-called 'European project'.

It is a brave move to take the responsibility of co-organizing this conference in Greece. By doing so, we manifested our intention to force academia and wider public in Greece into a wider dialogue over Europe and the quest for democratic solutions. Moreover, the strengthening of sociology as a discipline and sociological thinking have been major concerns in a country that moans under the burden of neoliberal policies and austerity measures. Responding to the excessive pressures of recession, inequalities, political realism, economic rationality and effectiveness, Greek academics and concerned citizens have often raised their claims over development, social justice, democracy, human rights and social resilience. These are also shared by many academics and others across Europe.

Despite the many challenges we faced during the preparation of this major conference, we discovered that the undertaking of our 'common European sociological project' was an exciting and rewarding experience through which many people were engaged and shared the objective of empowering sociologists and social scientists within a wider setting defined by regressive and utilitarian economic and political thinking. As we progressed with the

organization of the event, we realized that there is a critical mass of people with whom we shared our vision, which has been an incentive for us to excel in tasks to get a pleasant event to all participants and followers.

The joint venue of the conference is offered by the two public universities collaborating in the organization of the conference. We are grateful to the rectors and the staff in both universities for facilitating the success of the conference.

I owe special thanks to Frank Welz (Chair of the ESA), Christian Fuchs (ESA Conference Committee) and Dagmar Danko (ESA Executive Coordinator) for their collaboration. All the members of the Athens LOC have worked really hard for accomplishing the targets we set from the very beginning, but I would like to thank in particular to Nikos Leandros (LOC/ Panteion University), Maria Nikolaidou (LOC/ Harokopio University), Despina Papadopoulou (LOC/ Panteion University), George Mavrommatis (LOC/Harokopio University), Laoura Maratou-Alipranti (LOC), Athanasios Lakrintis (Harokopio University), Loukia-Maria Fratsea (Harokopio University), Aleka Theofili (Harokopio University), Nicos Kourachanis (Panteion University) and Georgina Stefou (PCO) for all the hard work to ensure the success of the conference. Finally, our endeavor would not materialize without the assistance of over 200 volunteers, the majority of whom come from the two universities.

I would like to express my warm welcome to each and everyone to the 13th ESA Conference in Athens!

Apostolos G. Papadopoulos

Chair of the Local Organising Committee

Types of Sessions

While Research Network (**RN**) and Research Stream (**RS**) sessions cover the immense variety of sociological inquiry, Plenary, Semi-Plenary and Mid-Day Special sessions offer the opportunity to share a few core debates. All session formats will include time for open discussion.

Plenaries include the Opening Plenary, the Special Evening Plenary and the Closing Plenary. Plenaries address the main conference theme.

Semi-Plenaries (SPs) discuss the main conference theme from the viewpoint of different fields of research. SPs are based on proposals made by the ESA Research Networks. For the first time, some SPs were also open to abstract submission. SPs promote discussion between speakers, next to that with participants. Four SPs are organised by the Executive Committee. One SP is organised by the Local Organising Committee.

Mid-day Specials (MDs) comprise various session formats: ESA Lecture Series, Author-Meets-Critics, a few special topical sessions and more. MDs are offered in one hour sessions at lunchtime. MDs are shorter sessions especially devised for engaging discussions with conference participants.

Research Network (RNs) sessions feature research papers submitted in response to the open conference Call for Papers. The majority of sessions is organised by ESA's 37 active Research Networks. RNs are open to all ESA members. They are based on democratic rules. All RNs hold a business meeting at the conference (on Thursday, 31 August, in the evening after the last regular session). New members are cordially invited to join one or several RNs of their choice.

Research Stream (RSs) sessions are made by sociologists from several European countries who come together to organise sessions on very specific sociological topics. RSs are self-organised bodies with a loose structure which is determined by the researchers who join the stream. Previous to the Call for Papers, a 'Call for RS proposals' has been distributed to all ESA members. While some RSs are regularly organising biennial meetings at ESA conferences, other RSs offer ad hoc sessions on the spur of the Athens conference topic.

Roundtable (RT) sessions are being introduced for the first time. They should foster interactive lively debates. At this year's conference, there will be three RTs on Thursday, 31 August in the afternoon, for presenters from RN10, RN18 and RN25. The room is the largest conference room at the Intercontinental Hotel, Aphrodite II. In each RT session, there will be several tables with presenters. Please note that no technical equipment is supplied at the Roundtable Sessions. Please prepare a presentation that will not require a laptop or projector.

Opening Ceremony & Opening Plenary (Un)Making Capitalism

Session Chair:

Christian Fuchs, University of Westminster

David Harvey, City University of New York, United States of America

When Money Betrays Value

Chinese policy makers rate August 15th 1971 as one of the most important dates in world history. On that day President Nixon announced that the peg of the dollar to gold (at \$35 an ounce) was to be broken, thus breaching the dialectical relation that had long built up within capitalism between social labour and its representation in the material form of the money commodities. This set in train a shift in the historical and geographical development of capitalism that brought a strange mix of excessive though often spectacular urban development and violent dispossessions, extractions and repressions that constitute our present reality, explaining why we are more and more focused on building cities for people, institutions and even governments to invest in rather than cities for all to live in.

SHORT BIOGRAPHY:

David Harvey is Distinguished Professor of Anthropology and Geography at the Graduate Center of the City University of New York (CUNY) and author of various books, articles, and lectures that have been prominent in the development of modern geography as a discipline and in the advancement of geographical and spatial analysis in Marxist and critical analysis. He is the author of books such as "Seventeen Contradictions and the End of Capitalism" and "The Enigma of Capital and the Crises of Capitalism", which was one of The Guardian's Best Books of 2011. Among his other books are "A Companion to Marx's Capital", "A Short History of Neoliberalism", "The New Imperialism", "Limits to Capital", and "Social Justice and the City". Professor Harvey has been teaching Karl Marx's Capital for nearly 40 years. He was director of the Center for Place, Culture and Politics at the CUNY from 2008 to 2014.

Eva Illouz, Hebrew University of Jerusalem, Israel

Evaluation, Valuation, and Devaluation: Sexuality and the Techno-Capitalist Self

This presentation wants to show how the three main activities of the capitalist economy – evaluation, valuation and devaluation – have been transferred into the realm of sexuality.

SHORT BIOGRAPHY:

Eva Illouz has been Professor of Sociology at the Hebrew University in Jerusalem since 2006 and a Directeur d'Etudes at the School for Advanced Studies in the Social Sciences (EHESS) in Paris since 2015. She researches how emotional life has been transformed by capitalism and by the culture of modernity. Her studies on emotions, consumer society and media culture are regarded as milestones in the study of emotions and relations in the modern world. She is the author of books such as "Consuming the Romantic Utopia: Love and the Cultural Contradictions of Capitalism" (Honorable Mention for the Best Book Award, American Sociological Association, 2000), "Cold Intimacies: The Making of Emotional Capitalism" (2007), "Saving the Modern Soul: Therapy, Emotions, and the Culture of Self-Help: Therapy, Emotions, and the Culture of Self-Help" (2008), "Why Love Hurts: A Sociological Explanation" (Best Book Award, Alpine Philosophy Society in France, 2012), "Hard-Core Romance: Fifty Shades of Grey" (2014). Professor Illouz was the first woman President of Bezalel Academy of Art and Design Jerusalem.

Special Evening Plenary (Un)Making Europe

Session Chair:

Frank Welz, ESA President, University of Innsbruck

Yanis Varoufakis, University of Athens, Greece

What Comes After Europe's Failed Neoliberal Experiment? The Case for an Internationalist European New Deal

The EU was founded as a corporatist project whose purpose was to take economic policy decisions out of the liberal democratic process across Europe. Once it developed a common currency condemned to unravel at the sign of the next global financial crisis, both the new currency and the neoliberal mantra that enveloped it at the level of ideology degenerated into a source of deflationary policies and increasing authoritarianism – both at odds with the logic of liberal democracy and dream of prosperity that the EU depended upon for its legitimacy and coherence. The pressing question for progressives now is: Can this EU be saved? Is it worth saving? Yanis Varoufakis' answer turns on DiEM25's proposal for an internationalist European New Deal.

SHORT BIOGRAPHY:

Yanis Varoufakis read mathematics and economics at the Universities of Essex and Birmingham and subsequently taught economics at the Universities of East Anglia, Cambridge, Sydney, Glasgow, Texas and Athens, where he holds a Chair in Economic Theory. He is also Honoris Causa Professor of Law, Economics and Finance at the University of Torino, Honorary Professor of Political Economy at the University of Sydney, Visiting Professor of Political Economy at King's College, London, and Doctor of the University of Sussex Honoris Causa. His latest books include *Adults in the Room: My struggle against Europe's Deep Establishment* (2017); *And the Weak Suffer What They Must? Europe, Austerity and the Threat to Global Stability* (2016); *Economic Indeterminacy* (2014), and *The Global Minotaur: America, Europe and the Future of the World Economy* (2011).

In January 2015 he was elected to Greece's Parliament and served

as Greece's Finance Minister (until July 2015). During his term he experienced firsthand the authoritarian inefficiency of the European Union's institutions and had to negotiate with the Eurogroup, the European Central Bank and the International Monetary Fund. Varoufakis resigned the finance ministry when he refused to sign a loan agreement that perpetuated Greece's debt-deflationary cycle. In February 2016 he co-founded DiEM25, the Democracy Europe Movement, which has grown in numbers across Europe since then.

Donatella della Porta, Scuola Normale Superiore, Italy

Social Movements in the European Crisis. Still A Time of Critical Europeanism?

As trust in the European Union is dramatically falling amongst its citizens, research on alternative visions of Europe 'from below' appears all the more relevant. Civil society organizations linked to the so called 'left-libertarian' movement family have long voiced progressively more critical positions about the EU, yet at the same time promoted 'another Europe' and Europeanized their organizational networks and action strategies. Like the labour movement during the development of nation-states, progressive social movements seemed destined to play a valuable role in pushing for a social and democratic Europe. Accordingly, at the beginning of the millennium cosmopolitan activists of the Global Justice Movement developed critical visions of Europe, elaborating complex reforms for EU policies and politics. While social movement studies, along with other areas of the social sciences, have assumed increasing Europeanisation, recent developments have challenged this view. In particular with the advent of the financial crisis, progressive social movements seem to have moved back to the national and local levels, engaging very little or not at all with the EU and questions of Europe more generally (Kaldor & Selchow 2012). To what extent critical Europeanism has ceded terrain to Euroscepticism, including within this alter-European vision, is a central question I seek to address in this talk.

SHORT BIOGRAPHY:

Donatella della Porta is Professor of Political Science, Dean of the Institute for Humanities and the Social Sciences and Director of the PD program in Political Science and Sociology at the Scuola Normale Superiore (SNS) in Florence, where she also leads the Centre on Social Movement Studies (Cosmos). Between 2003 and 2015 she has been Professor of Sociology at the Department of Political and Social Sciences at the European University Institute. Her latest books are "Late Neoliberalism and its Discontents", "Movement Parties in Times of Austerity" and "Where did the Revolution go?". In 2011, Professor della Porta received the Mattei Dogan Prize. The main topics of her research include social movements, political violence, terrorism, corruption, the police and protest policing.

Closing Ceremony & Closing Plenary (Un)Making Subjectivities

Session Chair:

Apostolos G. Papadopoulos, Harokopio University

Wendy Brown, University of California

How Did the Extreme Right Become the Party of Freedom?

Contemporary right wing political movements heralding nationalism, nativism and traditional (Christian) values are often said to be ushering in a new era of “illiberal democracy.” Yet these movements generally march (and troll) under a banner of freedom and charge their opposition with political values that curtail, endanger or forthrightly assault freedom. What part has neoliberal reason played in this development? What novel formulation of freedom, fuelled by what kinds of social and psychic energies, and legitimated by what supplementary principles, has inadvertently emerged from three decades of neoliberalised politics and everyday life in Western “democracies”?

SHORT BIOGRAPHY:

Wendy Brown is Class of 1936 First Professor of Political Science at the University of California Berkeley, where she also teaches in the interdisciplinary graduate program in Critical Theory. As a scholar of historical and contemporary political theory, she has established new paradigms in critical legal studies and feminist theory. In recent years, her work has focused on neoliberalism and the political formations to which it gives rise. Her latest books include “Undoing the Demos: Neoliberalism's Stealth Revolution”, “The Power of Tolerance” (with Rainer Forst) and “Walled States, Waning Sovereignty”. Professor Brown is also a frequent contributor to debates about the predicaments and future of public higher education. She is a 2017-18 Guggenheim Fellow and UC President's Humanities Fellow.

Hartmut Rosa, University of Jena, Germany

(Un)Making Subjects of Growth: Dynamic Stabilisation and the Resonance Conception of Subjectivity

The lecture will present a heuristically schematized account of the core features of the modern, capitalist social formation (section 1), of the crises and pathologies it necessarily creates (section two), and of a possible way to transform or revolutionize this formation in the sense of a fundamental paradigm shift (section three). The contribution starts from the assumption that we can only understand society's fabric and its dynamics if we simultaneously look at its structural ('objective') features and its cultural (or 'subjective') underpinnings which provide the (motivational) energy for social life to progress and evolve. The paper will argue that the two sides always go together in the sense of an 'elective affinity' (Max Weber), which implies that we cannot assume that structure always prefigures or pre-determines culture – or the other way round. Hence, the keynote will explore the intrinsic connection between the dominant forms of modern subjectivity and the mode of structural reproduction of modern society with a view to the 'desire' for growth, acceleration and innovation on the one hand and to the socio-economic imperatives which structurally 'enforce' the ensuing logic of escalation on the other hand.

In order to put forward the claim in the most straightforward and bold way possible, the line of argument is this: 1) Structurally, capitalist modernity can be defined as a social formation which can only reproduce itself in the mode of 'dynamic stabilization', i.e. through incessant growth, acceleration and innovation. 2) Culturally, this social formation is driven by a 'Triple-A-Aspiration' or 'Triple-A-Approach', i.e. by the desire to make the world 'accessible', 'available' and 'attainable' to an ever larger degree. 3) Structurally, this leads to pathologies of 'desynchronization' (such as the ecological crisis, the crisis of democracy and the burnout-crisis), while culturally, the triple-A-approach to the world leads to 'alienation'. Thus, while the formation of modern subjectivity is culturally geared and structurally forced towards an 'escalatory' approach to the world, modern subjects are in danger of 'losing' this very world on both counts: 'Objectively' by destroying instead of appropriating their natural surroundings, and 'subjectively' by experiencing the world as dead, silent and grey as well as illegible. 4) Therefore, a fundamental paradigm shift is needed that structurally replaces dynamic stabilization with a mode of 'adaptive stabilization' and which culturally replaces the triple-A-approach with a 'resonance' conception of the good life. Resonance in this sense is defined as an alternative mode of relating to the world which is 'not' geared towards increasing the horizon of what is available, attainable and accessible, but which develops 'responsible', dialogical relationships in three dimensions: with 'things' (material resonance), with 'people' (social resonance) and with life or the world as a totality (vertical resonance).

SHORT BIOGRAPHY:

Hartmut Rosa is Professor of Sociology at the Institute of Sociology at the Friedrich Schiller University of Jena and Director of the Max Weber Center for Advanced Cultural and Social Studies at the University of Erfurt, Germany. He has worked with the New School for Social Research in New York and the Universities of Augsburg, Duisburg-Essen and Manheim. His research interests are the sociology of time and identity formation and he is considered to be a leading representative of the new critical theory. He is the author of "Social Acceleration", "High Speed Society, Social Acceleration, Power, and Modernity" and "Acceleration: Towards a Critical Theory of Late Modern Temporality". Professor Rosa is co-editor of the peer-reviewed journal *Time & Society*.

Semi-Plenary Sessions

SP01: *The Structural Transformation of Europe's Public Sphere in the Age of Extremes* with Ruth Wodak and Nicolas Demertzis

Session Chairs:

Roy Panagiotopoulou, National and Kapodistrian University of Athens

Romina Surugiu, University of Bucharest, Faculty of Journalism and Communication Studies

Ruth Wodak, Lancaster University, United Kingdom

“Protecting Fortress Europe”: Identity Politics, Right-Wing Populism, and the Negotiation of “Borders” and “Benchmarks” in National and EU Arenas

Major tensions are governing the debates about refugees on the European stage and in the 28 EU nation states, focused on questions such as 'How many refugees can a nation state cope with?'; 'Which kind of refugees/who should be allowed in?'; 'How will we integrate them?' and 'How to protect Europe/Schengen from illegal migrants/terrorists, etc.?' Europe's “peace-keeping mission” has been back-grounded, refugees have been transformed into commodities, moved from one place to the other. Other discourses, however, foreground the various European and UN treaties, signed by all EU member states, and draw historical analogies between crises of the past (Second World War, 1956, 1968, 1981, 1989, 2001) and the present. Various scape-goats have emerged in these debates: the EU institutions, Greece and Italy, young male (Muslim) refugees, the so-called 'good people' (Gutmenschen) who are too naive, etc. Nationalistic and nativist border- and body politics have become part and parcel not only of the radical right rhetoric but of the political mainstream, advocating a “politics of fear”. These debates imply struggles about how to justify/legitimize the various measures needed to protect Europe from refugees. In my lecture, I trace the genealogy of these debates both on the European as well as national (mainly Austrian) stage while analyzing a corpus of TV interviews, newspaper and news agency reports as well as interviews with leading protagonists in systematic qualitative and quantitative ways.

SHORT BIOGRAPHY:

Ruth Wodak is Emerita Distinguished Professor of Discourse Studies at Lancaster University, UK, and affiliated to the University of Vienna. Besides various other prizes, she was awarded the Wittgenstein Prize for Elite Researchers in 1996 and an Honorary Doctorate from University of Orebro in Sweden in 2010. In 2011, she was awarded the Grand Decoration of Honour in Silver for Services to the Republic of Austria. She is member of the British Academy of Social Sciences and member of the Academia Europaea. 2008, she was awarded the Kerstin Hesselgren Chair of the Swedish Parliament (at University Orebro). She is co-editor of the journals *Discourse and Society*, *Critical Discourse Studies*, and *Language and Politics*. She has held visiting professorships in the University of Uppsala, Stanford University, University of Minnesota, University of East Anglia, EUI, Florence, and Georgetown University. In 2017, Ruth holds the Willy Brandt Chair at Malmo University.

Ruth has published 10 monographs, 27 co-authored monographs, over 60 edited volumes and ca. 400 peer reviewed journal papers and book chapters. Recent book publications include *The Politics of Fear. What Right-wing Populist Discourses Mean* (Sage, 2015; translation into German: *Politik mit der Angst. Zur Wirkung rechtspopulistischer Diskurse*. Konturen, 2016); *The discourse of politics in action: 'Politics as Usual'* (Palgrave),

Nicolas Demertzis, National and Kapodistrian University of Athens, Greece

The Multifaceted European Public Sphere(s): Socio-Cultural Dynamics

Three overriding focal points deserve special attention: (a) the structural re-transformation, and (b) the unfettered emotionality of the public sphere in European societies, which center stage (c) the prospects of democracy for the decades to come. These points assume radical ambivalence as to the structuration of publicity and politics in postmodern information society. It is not that ICT just boost or vitalize democracy through participatory media, citizen journalism, social media, peer-to-peer technology, etc. It can also burst democracy to the extent that surveillance directed by governments and companies, the dark internet, and the narcissistic bias of the social media may refeudalize civil sphere and dissolve the very idea of the public interest. Although the emotions-politics nexus has been ever present, the more the information society assumes the form of the society of the spectacle the more the emotive expressions in public unleash unregulated. The emancipatory dimension of this dynamics is coupled by regressive affective reactions debilitating rather than empowering individualization processes. The “emotional public sphere” is formed by all media content; gone are the days where the media were telling us what to think about; through their emotional agendas they tell us what to feel about as well.

These ambivalences stem from four major factors: i) the intense commercialization of the cyberspace; ii) the neo-liberal pattern of homo debitor; iii) the cyber war against terrorism, and iv) the incremental informalization of manners and emotions. Thus a crucial question is likely to be re-posed in the neoliberal milieu: can the public sphere be effectively reconstituted under radically different socioeconomic, political and cultural conditions? Is democracy possible?

SHORT BIOGRAPHY:

Nicolas Demertzis is Professor at the Department of Communication and Media Studies, National and Kapodistrian University of Athens. He has published extensively in Greek and English journals and collective volumes. His academic and research interests include political sociology, political communication, and the sociology of emotions. Between 2004 and 2010 he has been Dean at the Technical University of Cyprus, where he established the Department of Communication and Internet Studies, and the 2010-2013 period he was the President of the Greek State Scholarships Foundation (IKY). Currently, he is the Director and President of the Administrators Board of the National Centre for Social Research (EKKE).

Free Movement Revisited – Labyrinths of Transnational Social Security for EU migrants

Based on a comparative three-year project TRANSWEL (2015-2018) I discuss results from qualitative fieldwork of European Union (EU) internal migrants in terms of securing their (transnational) social rights. Comparing four EU

country pairs (Hungary-Austria/E. Scheibelhofer, Poland-UK/E. Carmel, Bulgaria-Germany/A. Amelina, Estonia-Sweden/A. Runfors) in a mixed methods approach we analyse the implications of 'free movement' for EU migrants moving from a so-called 'new' member state to an 'old' one. Based on 100 problem-centred interviews in the eight countries mentioned above, we comparatively investigate migrants' perceptions of and experiences with the respective (transnational) social welfare systems. This entails the access to social benefits as well as the transnational portability of social rights of migrants.

We will conclude that social inequalities are highly reproduced by the complexity and the ambiguousness of most regulations within the EU social security systems. Social stratification is accelerated as one-time working migrants with no care obligations at young or middle age with high cultural and economic capital can realise the promise of free movement within the EU to a much higher extent than all other groups diverging from this ideal type. Free movement as one corner stone of the European Union thus needs to be re-evaluated in light of our empirical results: the labyrinths are such that many Europeans cannot secure their social security even if they are employed and contributing to the social security systems of the EU countries they are (transnationally) living in.

SHORT BIOGRAPHY:

Elisabeth Scheibelhofer is Associate Professor in Sociology at the Department for Social Sciences, University of Vienna. Her works focus on migration, mobility and qualitative methods. Her research interests include more specifically migration and mobility of EU migrants within and outside of the EU as well as refugee studies with a focus on the experiences of refugees in rural areas. Currently, she works in the Norface project TRANSWEL on transnational social security of EU migrants (2015-2018) in which she has the overall responsibility of qualitative interviews with migrants and their significant others in eight EU countries. Publications and research also cover questions of interpretive methods such as qualitative in-depth interviews, participant observation and qualitative network analysis. She was the initiator and first chair of the ESA Research network 35 "Sociology of Migration". Currently, she is part of the editorial board of the journal "Oesterreichische Zeitschrift fuer Soziologie" (Springer).

Guglielmo Meardi, University of Warwick, United Kingdom

European Dilemmas Over Free Movement of Workers: Do Control and Openness Exclude Each Other?

European migration has highlighted deep dilemmas over the compatibility of social protection and movement and on the social boundaries of welfare. These dilemmas came to a political crisis with the referenda against freedom of movement in Switzerland in 2014, and to leave the EU in the UK in 2016.

This presentation looks at the evidence of public opinion, public debates, and associational policies in a number of European countries (UK, Switzerland, Norway), as well as Canada, which is often portrayed as a 'model' by European politicians, going back to the EU enlargement and through critical cases such as the 'British jobs for British workers' strikes of 2009. It attempts to assess how far free movement of workers is really incompatible with social protection, and how far 'control' and 'openness' are really mutually exclusive.

The presentation identifies, more specifically, those dimensions of free movement that have become socially disruptive, and the variety of social responses that have emerged. It discusses the extent to which labour market regulations, social policies and social organisations can address social concerns over free movement while being perceived as 'fair' by both local and migrant groups, in order to 're-embed' free movement of workers into local employment regimes. It will conclude with the identification of social propositions and experiments that go in the direction of fairness as 'controlled openness' as an alternative to the emerging polarisation between 'control' and 'openness'.

SHORT BIOGRAPHY:

Guglielmo Meardi (Laurea Milan, DEA EHESS Paris and PhD EUI Florence) is Professor of Industrial Relations and Director of the Industrial Relations Research Unit at the University of Warwick, UK. After a decade of studying the 'labour movement', especially in Central Eastern Europe (see for instance his 'Labour Movements' entry in the

ISA's Sociopedia), in the last decade he shifted his research towards the 'movement of labour', again especially from Central Eastern Europe. His analysis of labour migration between the eastern and western EU member states is framed in an 'Exit/Voice/Disloyalty' paradigm, as outlined in his book 'Social Failures of EU Enlargement: A Case of Workers Voting with their Feet' (Routledge 2012). He is currently working on a study of the link between migration and labour standard regulations post-Brexit. Guglielmo has held visiting positions at universities and academies of sciences in Belgium, Canada, France, Germany, Hungary, Italy, Poland, Spain and Slovenia.

SP03: *The Sociology of Sustainable Food Consumption* with Julie Guthman and Lotte Holm

Session Chairs:

Peter Oosterveer, Wageningen University

Stefan Wahlen, Wageningen University and Research

Julie Guthman, University of California, United States of America

Forked: On the Limits of Shopping for Sustainability and Towards a Food Activism That Matters

The theory of change driving sustainable food consumption is that consumers should pay more for food that is produced more ethically and ecologically. The market will then respond to changes in consumer demand and eventually food production will transform to be more sustainable and just. Drawing on her research on California's organic and strawberry industries, Professor Guthman will problematize this theory of change, spelling out some of the limits of approaches that depend on consumer purchasing. She will give particular attention to the paradoxes of voluntary food labels in times of economic recession. Her talk will culminate with a discussion of what food politics could and should look like in the age of Donald Trump.

SHORT BIOGRAPHY:

Julie Guthman is a geographer and professor of social sciences at the University of California at Santa Cruz where she teaches courses primarily in global political economy and the politics of food and agriculture. She has published extensively on contemporary efforts to transform food production, distribution, and consumption, with a particular focus on the race, class and body politics of "alternative food." Her publications include two multi-award winning books: *Agrarian Dreams: the Paradox of Organic Farming in California*, *Weighing In: Obesity, Food Justice and the Limits of Capitalism*, and a recently released edited volume entitled *The New Food Activism: Opposition, Cooperation, and Collective Action*. She is the recipient of the 2015 Excellence in Research Award from the Agriculture, Food and Human Values Society, and has received fellowships from both the John Simon Guggenheim Memorial Foundation and from the Radcliffe Institute for Advance Study for 2017-2018. Her latest research has examined the effects of the methyl bromide phase-out on California's strawberry industry.

Lotte Holm, University of Copenhagen, Denmark

Coping with Economic Restraint: Everyday Food Consumption Practices And Environmental Sustainability

Most research on household's reactions to food budget restraint address low-income groups in countries characterised by large socio-economic differences. In the Western world, such studies have mostly been conducted in Anglo-Saxon countries, while in Scandinavian societies, such as Denmark, it has been maintained that the Social-Democratic welfare regime ensures that no-one needs to be deprived of basic necessities such as food. However, following the global capitalist crisis in 2008, broader parts of the population experience economic unrest and various degrees of pressure on food budgets have become more common in Danish households.

In Denmark, sustainable food consumption is high on the political agendas and organic food purchase is the

highest in the world. But what happens when people react to economic turbulence and attempt to reduce food expenditure? I will discuss results from a Danish project which analyses how households cope with economic restraint. The project Food in Turbulent Times combines in-depth qualitative inquiry with analyses of panel data and a representative survey of Danish households. The focus will be on how pressure on food budgets is experienced and handled in different social contexts, and how differentiated household food consumption relates to sustainability and climate change. The significance of attitudes towards climate friendly food consumption relative to routinized food consumption practices will be highlighted, as will relations between climate friendly and healthy food consumption practices.

SHORT BIOGRAPHY:

Lotte Holm, PhD and MSc in Sociology, is Professor at the Department of Food and Resource Economics, University of Copenhagen. Dr Holm's research centers around food and eating ranging from comparative population studies of changing eating patterns in modern life to in-depth qualitative investigations of e.g. the multiple meanings of food, food and gender identity, lay perceptions of food and health and risk, obesity and bodyweight management. I was a partner in the Trust in Food project which investigated institutional change in the food safety regulatory systems in EU and six European countries following the BSE crisis. Her recent projects include Governing Obesity, addressing specific experiences of individuals subjected to different kinds of obesity interventions, Food in Nordic everyday Life, analysing changes in everyday eating rhythms and patterns in four Nordic countries, and Food in Turbulent Times, focusing on food budget restraint in Denmark.

SP04: *Questioning Boundaries of Age and Place: Child Refugees in an Uncertain Europe* with Pascale Garnier and Rachel Rosen, Sarah Crafter

Session Chairs:

Nigel Thomas, University of Central Lancashire

Griet Roets, Ghent University

Pascale Garnier, University Paris 13, France

"Children of Calais": Precarious Lives Between French and English Borders

Since the beginning of November 2016, the jungle of Calais has been dismantled and around 1.900 "un-accompanied children" have been obliged to leave it. Most of them have been sent to the "centres d'accueil et d'orientation" (CAO, reception and guidance centre) recently opened in France and some of them have been accepted into England. This presentation aims to highlight how children's lives are highly vulnerable in a situation of liminality, a concept introduced by Van Gennep (1908), as the core stage of the "rites of passage", characterized by the ambiguity or confusion of the identities of people between separation and integration. This situation of liminality involves three dimensions: the liminality of space between borders of national states, the liminality between the absence and presence of their family, which emphasize the liminality of their age, as "children" and "not children". Together they give rise to an unliveable life as human beings.

As "un-accompanied" minors, children are at the same time inside and outside their family, having to live independently and to take responsibility for their own lives, but at the same time they are dependent or claiming that they belong to a family. To be a child means to have his/her identity rooted in one's family, in terms of social class, nationality, race and ethnicity, religion and culture, including the various meanings of age and family in his/her culture. This situation of liminality between being with and without a family, between dependency and independency troubles the binary dichotomy between children and adults.

SHORT BIOGRAPHY:

Pascale Garnier's PhD (EHESS, Paris, 1992), under the supervision of Luc Boltanski, was about an historical sociology of childhood in France, analysing how competences and best interests of children are matter of debates and tests. Within a pragmatic approach of children's life, adults' practices and material culture, her researches consider age categorizations as political and moral orders. Recent publications: "Childhood as a Question of Critiques and Justifications", *Childhood*, 21(4), 2014); "Between young children and adults: practical logic in families' lives", in L. Alanen, L. Brooker & B. Mayall (eds.). *Studying Childhood with Bourdieu*, 2015); "For a pragmatic approach of children's citizenship", in H. Warning & K. Fahnoe (eds.), *Lived citizenship on the edge of society*, forthcoming); *Sociologie de l'école maternelle* (PUF, 2016); *Recherches avec les jeunes enfants: perspectives internationales* (avec S. Rayna, P. Lang, 2017). She is professor in education sciences, head of the research team Experice, in Paris 13 University, Sorbonne Paris Cite.

Rachel Rosen, University College London, United Kingdom &

Sarah Crafter, Open University, United Kingdom

Media Representations of Child Refugees: From Dubs to Doubt

The image of Alan Kurdi, the Kurdish-Syrian toddler and refugee who drowned in the Mediterranean, galvanised an international outcry following its widespread circulation by global media outlets. This is considered the moment when the 'horrific human costs' of migration hit home for the European public (Daily Mail, 2015). Concurrently, there are concerns about rising right-wing populism and anti-migrant sentiment, with the media both documenting and instigating such views (Bleich, Bloemraad et al. 2015). In this paper, we consider ambivalent media representations, focusing specially on separated migrant children. We analyse coverage in five English tabloids between the introduction of the 2016 Dubs Amendment, which committed to relocating an unspecified number of unaccompanied minors to the UK, until the demolition of the refugee camp in Calais, where much media attention focused on the plight of children. Drawing on Crawley (2011), we suggest that child refugees are, on the one hand, represented as vulnerable and in need of saving and, on the other, treated as a risk and a problem to British society and institutions for reasons of both security and cost. We argue that the media can simultaneously sustain such contradictory views by preserving an essentialised view of the child, grounded in racialized, Eurocentric and (neo)liberal norms. By taking a temporal view of tabloid coverage, we highlight the increasing contestation of the authenticity of child refugees as they began arriving in the UK under Dubs, and raise questions about the political implications of framing hospitality in the name of 'the child'.

SHORT BIOGRAPHIES:

Rachel Rosen is a Lecturer in Childhood at UCL Institute of Education. Her research spans sociology of childhood and materialist feminist thought, with a focus on unequal childhoods, migration and social reproduction. She is co-author of *Negotiating Adult-child Relationships in Early Childhood Research*, which develops a Bakhtinian ethics of answerability, and is currently co-editing *Feminism and the Politics of Childhood: Friends or Foes?*

Sarah Crafter is a Senior Lecturer at The Open University. Her theoretical and conceptual interests are grounded in sociocultural theory, transitions, critical or contested ideas of 'normative' development and cultural identity development. Her recent work focused on the practice of child language brokering (translating and interpreting for parents who do not speak the local language following migration).

Currently, Rosen and Crafter are collaborating on research about separated child migrants' experiences of care, and caring for others, as they navigate the complexities of the UK's asylum-welfare nexus.

SP05: Anatomy of the Greek Crisis with Maria Petmesidou and Nicos Mouzelis

Session Chair:

Sokratis M. Koniordos, University of Crete

Maria Petmesidou, Democritus University of Thrace, Greece

Welfare Reform in Greece: A Major Crisis, Crippling Debt Conditions and Stark Challenges Ahead

The presentation tracks the unfolding of the Greek crisis and examines the main policy reform options in the context of the conditions imposed by the “rescue-deals”. A raft of significant reforms since 2010 in labour market policies, social insurance and health and social care are assessed according to whether and to what extent fiscal consolidation has been balanced with concerns about improving protection and redressing inequalities, or whether standards of social protection have been forced ever lower.

Undoubtedly, neo-liberal austerity is the mantra of social adjustment under the successive bailout agreements. A “fightback” stance rejecting austerity and its neo-liberal assumptions in an attempt to reassert neo-Keynesianism acquired broad political significance with SYRIZA's rise to power, which tapped into the discontent resulting from the harsh austerity measures. However, the government's failure to translate the anti-austerity stance into a realistic economic policy and negotiate a better deal for Greece seriously narrows the scope for reform towards a sustainable redistributive welfare state.

The major questions raised are: How will the ongoing reforms impact upon the social structure, social cleavages and conflicts? More importantly, how will they impact on the large middle class strata in Greek society? Will the outcome be “a race to the bottom” in wages and social welfare? Could, instead, a socially-embedded form of liberalization and flexibilisation be followed (for example, along the lines of social investment)? These issues are examined in the light of a broader debate on welfare transformation in Europe and the changing socio-political cleavages and solidarities.

SHORT BIOGRAPHY:

Maria Petmesidou (Ph.D. Oxford University) is Professor of Social Policy at Democritus University (Greece) and Fellow of CROP/ISSC (Comparative Research on Poverty/International Social Science Council). She has published extensively on social policy and welfare reform in Greece and Southern Europe. Most recently she co-edited the books: *Economic crisis and austerity in Southern Europe: Threat or opportunity for a sustainable welfare state?* (London: Routledge, 2015) and *Child poverty and youth (un)employment and social exclusion* (Stuttgart: Ibidem, 2016). She is co-ordinating research on policy learning and transfer in the field of youth employment policies (funded under the EC FP7 programme).

Nicos Mouzelis, London School of Economics and Political Science, United Kingdom

The Crisis in Europe and Greece: The Impact on Identities

The presentation analyses the basic developments leading to the crisis; as well as the impact these developments had on the “de”construction of European identities.

SHORT BIOGRAPHY:

Nicos Mouzelis is Emeritus Professor of Sociology, London School of Economics. He has written extensively in the sociology of organizations (*Organization and Bureaucracy*, Routledge & Kegan Paul, 1967), sociology of development (*Modern Greece: Facets of Underdevelopment*, Macmillan, 1978; *Politics in the Semi-Periphery: Early Parliamentarism and Late Industrialisation in the Balkans and Latin America*, Macmillan, 1986); social theory (*Post-Marxist Alternatives*, Macmillan, 1990; *Back to Sociological Theory*, Macmillan, 1991; *Sociological*

Theory: What Went Wrong?, Routledge, 1995; Modern and Postmodern Social Theorising, Cambridge University Press, 2008), and sociology of religion (Modernity and Religion: Secularization, Fundamentalism, Ethics (in Greek), Polis, 2014).

SP06: *(Un)Making Europe* with Stefan Immerfall and Kostas Maronitis

Session Chair:

Kathrin Komp, Helsinki University

Stefan Immerfall, University of Education at Schwabisch Gmund, Germany

Keeping Unity, Preserving Diversity: European Possibilities Beyond Integration Overextension

How to stop Europe drifting apart? To simplify, two therapies to get out of this quagmire circulate: “less Europe” and “more Europe”.

There are serious problems with both visions. “Less Europe” could mean little or no Europe in the end. As Prime Minister Cameron's botched referendum strategy aptly demonstrated, opening up Pandora's Box of public sentiment may easily backfire. The second proposal is even less likely. European politicians are understandably loath to put any constitutional change before the electorate. Implementing a financial and social redistribution system of any serious size would cause massive opposition.

My presentation takes a distinct sociological approach for analysing the European integration crisis. Such an approach focuses on the societal basis of European integration and on the relationship between societal and political integration. It is heavily indebted to historical comparativists like Stein Rokkan and their work on the structuring of territorial politics. How, then, to strike a balance between the needs of diversity and the need to form a coherent whole?

The European Union is a union of nation-states with long and variegated histories which continue to show in welfare institutions, economic styles and political cultures. A unified regulatory scheme does not comply with the historically entrenched diversity between Europe's macro-historical regions and the lingering power of its nation-states as a locus of attachment. The task is to organize integration on the basis of Europe's diversity and not against its diversity. Examples of flexible rules, strategies and institutions to accommodate European diversities will be discussed.

SHORT BIOGRAPHY:

Stefan Immerfall is Professor of Sociology at the University of Education at Schwabisch Gmund and founding Director of its Master Program on Intercultural Studies. He has taught at the Universities of Passau, Mannheim, Grand Valley (Michigan, USA) and North Carolina at Chapel Hill (USA). His main research interests cover education, health and well-being, and comparative social and economic analyses. Immerfall's book publications include the “Handbook of European Societies. Social Transformations in the 21st Century” (with Goran Therborn) and “Freizeit” (“Leisure”, with Barbara Wasner). He currently works on the revised edition of his textbook “Europa – politisches Einigungswerk und gesellschaftliche Entwicklung” [Europe – political unification and social developments].

Kostas Maronitis, Leeds Trinity University, United Kingdom

Is this the End of Federalism? The Immigration Crisis and the Remaking of Europe

This presentation argues for a new theoretical framework regarding the emerging structure of the EU through the

prism of the current immigration crisis.

Greece provides the empirical material for this paper. Located at the borderlands of the EU, Greece occupies a strange position between federalism and inward looking social formations where membership depends on blood relations. Drawing on policy documents (Dublin Regulation; Refugee Centres and Hotspots; Refugee Relocation System) and on the political rhetoric of sovereignty and border control the paper introduces the concept of Europia. Europia shifts the debate from the binary of Federalists and Eurosceptics to the capacity of immigration to create utopian and dystopian visions about the European project. Europia exists between the sociological analysis of immigration and an imaginary future of the EU viewed through the prism of hope and crisis. As a result, Europia serves as an analytical tool for a series of actions and mentalities concerning the way immigration authorities construct dystopian environments for immigrants and refugees; the way states understand cultural homogeneity as a political utopia; the way the arrival and presence of immigrants contributes to a dystopia of a torn social fabric; and the way immigrants and asylum seekers view Europe as a utopia of prosperity, rule of law, and freedom.

The presentation concludes by arguing for a renewed understanding of European citizenship independent of national belonging that will ultimately democratize the EU.

SHORT BIOGRAPHY:

Kostas Maronitis is Lecturer in politics and media at Leeds Trinity University, UK. His research interests focus on the political theory and policies of immigration and European integration. He has published articles on immigrant detention and human rights, networks of protest, cosmopolitanism and citizenship, the politics of fear, and diasporic cultural practices. Kostas Maronitis is the author of the book *Postnationalism and the Challenges to European Integration in Greece: The Transformative Power of Immigration* (2016) published by Palgrave MacMillan.

SP07: (Un)Making Capitalism with Lara Monticelli and Paul Raekstad

Session Chair:

Christian Fuchs, University of Westminster

Lara Monticelli, Scuola Normale Superiore, Italy

Embodying the Critique to Capitalism in Gloomy Times. Theoretical Perspectives and Potential Research Horizons on Emerging 'Real Utopias'

In recent years, terms like 'sharing economy', 'industry 4.0', 'collaborative economy' have become the buzzwords in academic research and public debate – gaining prominence in tandem with the growth of digital capitalism. While much has been said about the ways in which digital technology is transforming entire swathes of the economy and constructing new forms of exchange, the predominant tendency has been the reification and expansion of modern capitalism, aimed at maximizing profits and reproducing exploitative mechanisms towards workers, natural resources and the environment. Within this critical juncture in the development of capitalism cooperatives, political consumerism and alternative lifestyles are being adopted and advocated by a growing number of social groups.

Moreover, recent contributions like Erik Olin Wright's 'Envisioning Real Utopias' (2010), Hartmut Rosa's reflections on acceleration and de-synchronisation in contemporary capitalism (2010), Klaus Dorre and colleagues' 'Sociology, Capitalism and Critique' (2015) and D'Alisa et al. 'Degrowth. A Vocabulary for a New Era' (2015), among others, are giving a new momentum to concepts like 'resilience', 'real utopias', 're-politicisation' of everyday life, 'de-colonisation of the imaginary' and 'transition'. These emerging themes are influencing the

academic discourse and research agenda in fields like political economy, sociology and social movements studies. In light of this, the paper attempts to provide with an original theoretical framework focusing on collective and community-based practices that aim at 'embodying' the critique to consumerist and capitalist societies. These include co-housing, eco-villages, intentional communities and transition towns which are increasingly widespread and inter-connected examples of how people are trying to concretize, not without effort, 'real utopias' (Wright 2010).

SHORT BIOGRAPHY:

Dr Lara Monticelli is currently an independent research fellow, awarded by the FBML Foundation (Italy), working on her project titled 'Laboratories of Change' in collaboration with researchers at the Dutch Research Institute for Transitions in Rotterdam. The project focuses on the (re)emergence of community-based social movements (e.g. intentional communities, eco-villages, transition towns) as living laboratories experimenting with practices of resilience and resistance to environmental, economic and societal challenges. She is especially interested in how these movements politicize and re-configure everyday life, thus representing radical attempts to embody the critique to contemporary capitalism. She has also co-founded and co-chaired two international conferences, creating a vibrant forum for the discussion of this emerging research agenda at the annual SASE meetings (Berkeley 2016, Lyon 2017). Prior to this, she worked as a post-doctoral research fellow at the Institute for Humanities and Social Sciences at Scuola Normale Superiore di Pisa (Italy). Her other research has been centered on the study of non-conventional political participation, and combines perspectives from the sociology of work, social movement and political participation studies.

Paul Raekstad, University of Amsterdam, Netherlands

Freedom, De-Alienation, and Revolution

This paper examines the theory of alienation and its implications for thinking about social revolution to unmake capitalism. After briefly discussing the importance of the theory of alienation to different forms of contemporary anarchist and Marxist theory and practice, I reconstruct Marx's theory of alienation as a diagnosis of how capitalism thwarts human freedom. This in turn raises important questions about the requirements of successful de-alienation – a question rarely given the attention it deserves. A politics of de-alienation requires, I argue, not only rejecting capitalism and the state, but also a commitment to prefigurative politics. Prefigurative politics is necessary for developing revolutionary subjects with the powers and capacities, motivations, and consciousness required for replacing unfree, alienated social relations and institutions with free and unalienated ones. Finally, I compare and assess three contemporary models of de-alienation: the autonomist Marxist model of John Holloway; the more state-involved model of 21st Century Socialism; and the anti-statist model of anarcho-syndicalism. All three provide models of de-alienation that stress the importance of prefigurative politics in some sense, but each suffers from distinct shortcomings. Holloway's autonomist model fails to provide an adequately social conception prefigurative politics; 21st Century Socialism faces concerns about the long-term viability of combining prefigurative economic and political microcosms with retaining hierarchical state structures; and anarcho-syndicalism confronts questions about lacking emphases on institutions of transition – rather than just struggle – and inadequate recognition of community organising. Nevertheless, I argue that an updated anarcho-syndicalist model offers the most plausible vision of anti-capitalist struggles of de-alienation.

SHORT BIOGRAPHY:

Dr. Paul A. Raekstad is a Postdoctoral Research Fellow at the University of Amsterdam, who previously completed a PhD and lectured at the University of Cambridge. Current research focuses on realism, democracy, the legitimacy of economic institutions, and radical political theory more broadly. Works can be found here:

SP08: *(Un)Making Solidarities* with Ipek Demir and Pekka Juhani Sulkunen

Session Chair:

Marta Soler-Gallart, University of Barcelona

Ipek Demir, University of Leicester, United Kingdom

(Un)Making Europe: How to make sense of the contemporary 'politics of resentment'?

My paper will discuss the (un)making of Europe in the context of contemporary issues over difference in Europe. It will rethink the relationship between diasporas, cosmopolitanism and multiculturalism in order to make sense of identity, difference, conflict, crisis and resistance in contemporary Europe, including the 'politics of resentment' which governs the European social and political sphere.

There is currently a growing opposition to both multiculturalism and to cosmopolitan ideals in Europe. The backlash against multiculturalism is accompanied by an anti-immigration and nationalist sentiment, challenging cosmopolitan values. The 'threat' from one is conflated with the other, presented as a menace poised against, and ready to puncture, European identity, culture, civilization and values.

However, rather than seen as bedfellows, cosmopolitanism and multiculturalism have come to be constructed as adversaries. Many social commentators and scholars appeal to cosmopolitanism's Enlightenment origins, taking Kant's theories on cosmopolitanism as a basis. Cosmopolitanism is what the desirable Europeans did and aspired to; the 'undesirable' 'parochial' ethno-religious communities of Europe, on the other hand, did something we did not like very much: they did multiculturalism. What is interesting is that this backlash against multiculturalism did not only come from the usual suspects. Sociologists, for example, Beck (2011: 54), Delanty (2011: 650), and Glick-Schiller et al (2011: 401) have also been critical of multiculturalism, or used multiculturalism as a foil when defending cosmopolitanism (See Demir 2016 for a criticism of this). This juxtaposition of cosmopolitanism against multiculturalism is all the more perplexing given that both cosmopolitanism and multiculturalism question the upper hand that the hegemonic national subjects hold, and attempt to increase the participation of all, including minoritized groups, as equal civic and political citizens within and across nation-states. Debates on Brexit and immigration have tapped into this existing dislike of multiculturalism (and the associated loss of privilege). This is borne out with numbers we have on Brexit which show that multiculturalism tops the list of social ills for Brexiters (81%) over and above immigration (80%) – even if slightly. In my paper I will explore such issues, including the extent to which resistance to both cosmopolitan values and multiculturalism we see in Europe today can be seen as a deep yearning for an old Europe where people knew their place, especially the immigrants, or non-whites or those from the colonies. I will attempt to uncover how without a proper understanding of the backlash against multiculturalism and racial diversity in Europe, we cannot make sense of contemporary Europe, including its making and unmaking.

SHORT BIOGRAPHY:

Ipek Demir (PhD, Sussex) is an Associate Professor in Sociology at the University of Leicester, UK. She was previously an ESRC Postdoctoral Fellow at the University of Cambridge. Demir's work sits at the intersections of the fields of diaspora studies, ethno-politics, race and identity, nationalism, indigeneity, global politics as well as social and critical thought. She has carried out empirical research on Kurdish and Turkish diasporas, funded by the AHRC. Her latest article is entitled: 'Shedding an Ethnic Identity in Diaspora: De-Turkification and the Transnational Discursive Struggles of the Kurdish Diaspora', published in *Critical Discourse Studies* (Feb 2017). She is the founder and co-coordinator of BSA's Diaspora, Migration and Transnationalism Study Group and the former Vice-Chair of ESA's Sociology of Migration Research Network.

Pekka Juhani Sulkunen, University of Helsinki, Finland

Causality or Justice? Contradicting Principles of Regulating Problematic Consumption in Consumer Society

Evidence-based public policy usually requires proof of causality as its justification. The causes of problems must be identified and demonstration of the effectiveness of specific measures is a condition for their application. "What works?" is a standard requirement for regulation of problematic lifestyles or consumption. The requirement of causality is often in a strange contradiction with justice. In many lifestyle issues such as excessive eating, gambling, drinking or other behavioural problems causality usually cannot be demonstrated. We do not know, for example, whether poverty is a cause or a consequence of gambling, overconsumption of food, drink or other deleterious consumption patterns. Neglect of policy in these cases means violation of our intuitive concept of justice. This paper applies Adam Smith's theory of justice to deal with the problem. In his *Theory of Moral Sentiments* he advances the idea that justice is the fundamental moral sentiment for the maintenance of social order and solidarity. It is based on the passion of anger but must be qualified and regulated by reason. The paper argues that justice rather than causality should take priority in social policies that aim at social cohesion and order.

SHORT BIOGRAPHY:

Pekka Sulkunen is Professor Emeritus of Sociology, University of Helsinki. He was President of the European Sociological Association 2011-2013. He is a member of the Finnish Academy of Science and Letters. His research interests are the public sector governance, power and democracy, social theory, and addictions. Recent publications include: *The Saturated Society* (Second Edition 2016); *Society on its own. The sociological promise today* (*European J. of Cultural and Political Sociology* 2014); *Autonomy against Intimacy* (*Telos* 156/2011); *The Kurdish Question: The Black Holes of Democracy* (*Telos* 171/2015). *The Consumer Society and the Social Bond: the Neoliberal Turn in Norway* (2015); *The Images Theory of Addiction* (2015). Currently lecturing on "The sociological promise from the Enlightenment to Postmodern Critics". Principal author of an international collaborative book *Gambling, Science and Public Policy* (Oxford University Press, forthcoming 2018).

SP09: (Un)Making Subjectivities with Anastasia Denisova and Nayia Kamenou

Session Chair:

Monica Massari, University of Naples Federico II

Anastasia Denisova, University of Westminster, United Kingdom

Viral Storytelling and Subjectivity in Social Networks: How Personalised Contributions via Memes, Gifs, Hashtags and Comments Affect the Deliberation of Mainstream and Alternative Politics

Since the proliferation of social networks a few decades ago, users have embraced new modes of storytelling and

discussing social and political grievances online. In addition to blogging, microblogging, commenting, liking and sharing, they have also started to exploit the more fragmented bits of communication, namely Internet memes, gifs, hashtags and other seemingly “incomplete” texts.

Brexit and the US presidential campaign of the 2016 saw the use of memes in both traditional and digital politics – politicians employed memes to attract audience to their discourses; whilst other voices were emerging online, aiming to ride the waves of user-generated vitality on social networks and resists to the dominant discourse.

This research studies the impact of viral storytelling and digital communication on the political discourses in social networks. It amalgamates the studies on the attention deficit that has been identified among the Internet publics in the 2010s, emotional storytelling for political activism, affective publics and creative emotional deliberation of politics in the digital space. It also aims to draw the links between the personalised expressions of grievances and opinions, to the formation of collective mobilisations and narratives. This approach aims to link the existing studies on affective publics, alternative political activism and digital storytelling with the need to acknowledge the blurring lines between personalised and collective political discussions; understanding the ways how individualised subjectivities turn into mainstream yet often reverberate back into subcultures.

SHORT BIOGRAPHY:

Dr Anastasia Denisova is a Lecturer in Journalism at the Communication and Media Research Institute (CAMRI), University of Westminster. Before starting her academic career, she worked as a journalist in Russia for over a decade; she keeps writing for the Independent, Global Voices and other media platforms. Anastasia has published her academic research on alternative digital politics, microbloggers, satire and Internet memes in *Media, Culture & Society*, *Demokratizatsiya*, *Comparative Sociology*, among others. She received awards for best presentations at academic conferences (such as Oxford Internet Institute's recognition). Currently, she is looking at viral cultures and memes in the Western digital politics; the role they play in propaganda, populism and citizen deliberation. For further information you can visit Dr Denisova's personal webpage.

Nayia Kamenou, De Montfort University, United Kingdom

On Precariousness and Emancipation: Female Political Subjectivities and Agency in the Greek Far-Right

Why do women join far-right parties? How do they position themselves in relation to their party's ideology? What is the impact of their political agency on party ideology, organization, structure, and strategies? Answers to these questions are important for fully understanding the current thriving of a much-dangerous phenomenon that threatens hard-won democracy. This article offers novel responses to these questions through the study of the Greek Golden Dawn (GD), as one of the far-right parties in Europe that have been successful at recruiting women. It links party politics and gender and politics literature by examining GD women's political subjectivities and agency. It employs a women-centered, close-up, internalist approach to the study of the topic and a qualitative research design. It thematically analyzes empirical ethnographic data from participant observation and interviews with GD women politicians and seasoned activists and documents that appear on the GD's official website and on the blog of the GD Women's Front. It challenges arguments that women are affiliated to far-right parties through men. It shows that GD women have managed to construct a catch-all, flexible, and coherent gender discourse that is becoming central to GD's ideological and policy positions. It also highlights the ways through which gender is employed by the far right to augment its support base, especially when structural conditions are ripe. Therefore, it argues that such gender discourse could lead to an increase in the popularity and support of far-right parties among women and men with diverse views about gender and politics, both in Greece and elsewhere.

SHORT BIOGRAPHY:

Dr Nayia Kamenou is a VC2020 Lecturer in the School of Applied Social Sciences at De Montfort University, Leicester, United Kingdom. Dr Kamenou's research is interdisciplinary and cuts across political science, sociology and gender studies. Her research interests include gender, sexuality, and political agency. She conducts research and has published work on the interrelations between nationhood, ethnic identities, gender, and sexuality; the

impact of Europeanization on lesbian, gay, bisexual, trans*, queer, and intersex rights, identities, and activism; women's participation in far-right parties and the formation of gendered political agency and identities within the far right; women's role in peace-building processes; representations of gender and sexual identities in cinema; the impact of law and policy on trans* identities and political mobilization. Dr Kamenou's work is firmly committed to political and social concerns and to the development of possible interventions for their resolution.

SP10: *Right-Wing Extremism and Islamist Extremism in Europe: Similarities and Differences* with Esther Webman and Zbynek Tarant

Session Chair:

Karin Stogner, University of Vienna

Esther Webman, Tel Aviv University, Israel

Islamism's Manichean Vision and the Jews

In his analysis of classical and contemporary perspectives on antisemitism, Sociologist David Norman Smith shows that antisemitism is a social construction of Jews as enemies. He adopts Norman Cohn's assertion that "the deadliest form of antisemitism...has little to do with real conflicts of interest between living people, or even with racial prejudice as such...[It is] rather a conviction that Jews – all Jews everywhere in the world – form a conspiratorial body set on ruining and then dominating the rest of mankind." This teaching appeared to be specifically modern, forming a decisive extension of the late medieval view that Jews are "mysterious beings, endowed with uncanny, sinister powers." Everyday religious and cultural strife had given way to a global dualism, a Manichean vision of a world divided between Jewish evil and Gentile good.

I adopt Smith's contention to argue that the Islamist worldview is typical to the Manichean vision of a world, and show that Islamism is an apocalyptic ideology which seeks to redeem the world from the ills of modernism, capitalism, imperialism, and the Jews, perceived as the embodiment of all things anti-Islamic. It reinforces a dichotomous worldview of good and evil, believers and non-believers, the House of Islam and the House of war, which can be reconciled only with the ultimate victory of Islam.

SHORT BIOGRAPHY:

Dr. Esther Webman is the head of the Zeev Vered Desk for the Study of Tolerance and Intolerance in the Middle East, and a senior research fellow at the Dayan Center for Middle Eastern Studies and the Stephen Roth Institute at Tel Aviv University. Her research is focused on Arab discourse analysis, mainly Arab Antisemitism and Arab perceptions of the Holocaust. She has published extensively on these topics and participated in numerous conferences. Her book, *From Empathy to Denial: Arab Responses to the Holocaust*, co-authored with Prof. Meir Litvak, won the Washington Institute for Near East Policy's Gold book prize for 2010, and was published in Hebrew in 2015.

Zbynek Tarant, University of West Bohemia, Czech Republic

Attitudes of the Czech Far-right Scene to Islam, Islamism and Islamophobia

My presentation explores the various attitudes of the Czech Neo-Nazis towards the various actors, states and peoples of the Muslim world. The presentation is intended to raise issues that might become crucial for the debates about national security and possibilities of collusion between the far-right and the Islamist movements. For this purpose, I will use an interdisciplinary approach that includes anthropological fieldwork, social network analysis (SNA) and methods of qualitative analysis of electronic and printed far-right propaganda materials. My

goal is to describe the surprising diversity of attitudes by the Czech far-right that could range from open hostility to a more or less disguised affinity. By exploring the conflicting images of Muslims in the neo-Nazi thought (“immigrants” vs. “anti-Zionist fighters”), my presentation will name the factors that might be responsible for policymaking of the far-right about the muslim cultural space. This allows me to define the theoretical conditions, under which certain mutual cooperation between the neo-Nazis and the Islamist movements could or could not be possible. I will describe the neo-Nazi version of ethnopluralism that enables the neo-Nazis and other far-right movements to support the regime of Bashar al-Assad in Syria, or the Hizballah movement in Lebanon, while maintaining their strong anti-Immigration agenda. Further exploration of anti-immigration rhetorics will show how islamophobia is being connected and misused for the purpose of antisemitism and what do such accusations reveal about foreign inspirations and broader geopolitical perspectives of the Czech antisemitic scene.

SHORT BIOGRAPHY:

Zbynek Tarant, Ph.D. was born in 1982 in the former Czechoslovakia (today's Czech Republic). After graduating at the University of West Bohemia in the field of Cultural Anthropology of the Near East, he continued his studies at the same institution, where he got his Ph.D. in 2012. While his main topic of research is the history of holocaust memory and its institutions in the State of Israel and the USA (the theme being the topic of his dissertation, defended in 2012), he became actively involved in the research of contemporary antisemitism since 2006. His specialty is monitoring of cyber-hate and analysis of emerging threats in the contemporary Central European antisemitism.

SP11: *Care Labour and Affective Labour in the Global Care Chain* with Konstantina Davaki and Lise Widding Isaksen

Session Chairs:

Maria Carmela Agodi, University of Naples Federico II

Michael Meuser, TU Dortmund

Konstantina Davaki, London School of Economics, United Kingdom

On the Global and Local Intersections of Care and Technology-Assisted Reproduction: Internet-Mediated Surrogacy in Greece and Cyprus

This presentation examines issues of surrogacy in the context of two EU countries (Greece and Cyprus) which share significant characteristics. Both are or have been subject to EU-imposed austerity programmes; both are entry points to Europe; finally, they are the only EU member states which allow altruistic surrogacy.

The presentation analyses the impact of recession and austerity policies on the supply of surrogate mothers in the two countries for commercial purposes.

The presentation will focus on the narratives of prospective surrogates and intended parents involving the notions of solidarity, altruism, sisterhood, as well as the role of the mainstream and social media in informing the public debate on the issue.

To examine the above, the presentation will use desktop research methods to identify websites providing surrogate services. The content of such websites is expected to give a sense of the extent of online-arranged surrogacy in the two countries. We will also analyse interviews given to the media by gynaecologists and intended parents, available on the web and identify the ways in which the phenomenon is communicated to the media. In addition, through scrutinising the relevant blogs and social media we will attempt to analyse the contributions and comments of the surrogates themselves using critical discourse analysis, so as to identify the perspectives of surrogates and the ways in which their experience is presented online.

SHORT BIOGRAPHY:

Dr Konstantina Davaki is Research Fellow in Social Policy at the London School of Economics. Her main research interests are gender, comparative social policy, bioethics, care, work/life balance, violence against women, mental health and welfare ideologies in a globalised world. Since 2010 she has been advising the Committee on Women's Rights and Gender Equality (FEMM) of the European Parliament. Her academic publications include articles in peer-reviewed journals, book chapters and reports: Davaki, K. (2017) 'Surrogacy arrangements in austerity Greece: policy considerations in a permissive regime' in Davies, M. (ed) *Babies for Sale?: Transnational Surrogacy and the Politics of Reproduction*, Zed Books; Davaki, K. (2016) *Demography and Family Policies from a Gender Perspective*, DG IPOL, European Parliament; Davaki, K. (2016) *Differences in Men's and Women's Work, Care and Leisure Time*, DG IPOL, European Parliament; Brunet, L. Davaki, K et al. (2013) *A Comparative Study in the Regime of Surrogacy in EU Member States*, DG IPOL, European Parliament.

Lise Widding Isaksen, University of Bergen, Norway

Changing Welfare Regimes and Migrant Care Work

In this presentation, I will examine how new trends in welfare policies now intersect with gender, employment and migration policies. The local gender egalitarian dual earner/dual carer family model is supported by the welfare state's recruitment of care workers with migrant background and refugees. How migrant care workers' production of care services in Norway might influence gender dynamics in paid and unpaid care work in receiver and sender countries, is an important question for future research.

As the global care chain concept was pioneered in the USA, a context with an absence of collective and public provision of care, the conceptual framework has to be extended when shifting focus to Europe and Scandinavia to include migrants taking jobs in public care services and welfare institutions.

The reconciliation of work and family care is today one of the most pressing problems in most European societies.

As the care work regimes in Nordic contexts are being characterized by the drives for efficiency, productivity and flexibility, work force policies are geared to finding a flexible and available workforce. One result is that present care work regimes increasingly rely on migrant workers; the majority of them are women often arrived in Norway as labour migrants or as refugees. In classic studies of global care chains, the domestic live-in worker is the central individual, while in Nordic context the public employed care worker is becoming the dominant figure.

SHORT BIOGRAPHY:

Professor Lise Widding Isaksen works in the Department of Sociology at the University of Bergen, Norway. Among her research interests are gender issues, globalization, migration, transnational families, care work and welfare/social politics. She has written extensively on gender, migration and power in welfare states, with special emphasis on the social organization of care paid and unpaid care work.

Selected recent publications:

- 1) Lise Widding Isaksen (ed): *Global Care Work. Gender and Migration in Nordic Societies*. Nordic Academic Press, Lund, Sweden.
- 2) Lise Widding Isaksen (2012) "Transnational Spaces of Care: Migrant Nurses in Norway." In *Social Politics, International Studies in Gender, State and Society*, vol. 19, number 1, spring 2012, p.58-78, Oxford University Press, Oxford.
- 3) 'Strangers in Paradise? Italian Mothers in Norway' (2016) in Majella Kilkey and Ewa Palenga-Mollenbeck (eds) *Family Life in an Age of Migration and Mobility. Global perspectives through the Life Course*. Palgrave Macmillan.

SP12: *The Transformations of Capitalism in Eastern Europe* with Jan Drahokoupil and Svetlana Stephenson

Session Chairs:

Elena Danilova, Institute of Sociology RAS

Jan Drahokoupil, European Trade Union Institute, Belgium

The Sociology of Economic Dependence: Are East European Countries Stuck in the Dependent Capitalism Model?

It is somewhat ironic that the concept of dependence, traditionally associated with the Marxist tradition, has come to dominate the theoretical frameworks that inform economic sociology and political economy of the region that was once labelled as post-communist. This presentation first explores the meaning of political and economic dependence in the light of empirical evidence from the region. It then proceeds by investigating the prospect of the dependent market economies by looking at the dynamism of wage convergence and considering the impact of new technology on the nature of region's integration into global/European value chains.

SHORT BIOGRAPHY:

Jan Drahokoupil is a Senior Researcher at the European Trade Union Institute (ETUI) in Brussels. He published a number of books and journal articles on European and transition economies, welfare state, and multinational corporations. Jan coordinates research on digitalization at the ETUI. Recently, he edited two special issues of *Transfer: European Review of Labour and Research* on digitalization and the future of work. His book publications include *Globalization and the state in Central and Eastern Europe* (Routledge, 2009), *Transition economies: Political economy in Russia, Eastern Europe, and Central Asia* (with Martin Myant, Wiley-Blackwell, 2011), *The outsourcing challenge: Organizing workers across fragmented production networks* (edited, ETUI, 2015), *Flexible workforces and low profit margins: Electronics assembly between Europe and China* (edited, ETUI, 2016), and *Chinese investment in Europe* (edited, ETUI, 2017).

Svetlana Stephenson, London Metropolitan University, United Kingdom

Criminal Entrepreneurs and Capitalist Transformation in Russia

The collapse of the state socialist system and the rise of new capitalist forms in Russia were accompanied by wide-spread illegality and organized criminality. This led to a period of social chaos and lawlessness, which enabled criminal networks to convert their capacity for violence into economic profit. They established their own systems of private protection, the so-called "roofs", kryshi, using them for primitive accumulation, and competed with the weakened state as agents of violent regulation. While both the strengthening of the state and organized crime actors' own ambitions led to the latter's increasing integration into mainstream economic and political structures, a complex web of interdependencies emerged in which actors from criminal networks and political authorities collaborate using each other's resources.

This fusion and assimilation of members of the governing bureaucracy and members of an aspiring bourgeoisie coming from criminal backgrounds was as much the result of consensus and cooperation as it was of competition and confrontation. Using interview data with members of organized crime groups and representatives of law enforcement agencies, and analysis of secondary data, I argue that instead of a pattern of elimination of Russian organized crime by the state, we can see a mutually reinforcing ensemble that reproduces the existing social and economic order.

SHORT BIOGRAPHY:

Dr Svetlana Stephenson is a Reader in Sociology at London Metropolitan University. Her research has involved

studying informal and criminal social networks in Russia, as well as perceptions of social justice and human rights in a comparative context. She is the author of *Gangs of Russia, From the Streets to the Corridors of Power* (Cornell UP, 2015), *Crossing the Line. Vagrancy, Homelessness and Social Displacement in Russia* (Ashgate, 2006) and the co-editor of *Youth and Social Change in Eastern Europe and the Former Soviet Union* (Routledge, 2012). Her research was published in *Current Sociology*, *Radical Philosophy*, *Journal of Youth Studies*, *The Sociological Review*, *Europe-Asia Studies*, *International Journal of Comparative Sociology*, *Slavic Review*, *Social Justice Research and Work*, *Employment and Society*, among others. Before coming to the UK, she had worked at the Levada Centre in Moscow.

SP13: *Public Sociology and Public Intellectuals in Times of Europe's Crisis* with Markus Schulz and Maria Kousis

Session Chair(s):

Eleni Nina Pazarzi, University of Piraeus

Markus Schulz, New School for Social Research, United States of America

Crisis, Contention, and the Sociology of Possibilities

How could or should sociology respond to the crisis of the present? What are the competing options, resources, and obstacles? What can the sociology of imagination and possibilities contribute to these debates? This paper starts by discussing the social construction of the “Greek Crisis” in the context of a broader global crisis and a shifting zeitgeist. It contrasts the spectacles of corporate media and the technocratic narratives of political and economic elites with challenges to austerity and emerging alternative visions. On a theoretical level, it argues for the need to connect economic approaches to crises with studies of contentious politics and futures research. Studying stories of crises is studying futures in the making. This entails the forging of decision points and narrative devices that broaden or narrow the choices considered to be within “reason”. The widely diagnosed decline of utopian visions had left a void. Into it seep resentments of disenchantment to an extent that it threatens institutional stability, yet without altering more fundamental power differentials. Deconstructing the enclosures of expectation can help to democratize the imagination of future scenarios. In this sense, a sociology of possibilities offers practical relevance for the democratization of European futures.

SHORT BIOGRAPHY:

Markus S. Schulz is Vice-President of the International Sociological Association, President of the ISA Forum of Sociology in Vienna 2016, and founding curator of the online WebForum on The Futures We Want. Professor Schulz's research focuses on globalization, media, movements, and democratic imagination. He is author of the six-volume book series on Internet and Politics in Latin America (Frankfurt: Vervuert, 2003) and editor of the *Current Sociology* special issues on Values and Culture (2011) and *Future Moves* (2015). Among his many journal articles are “Collective Action across Borders” (*Sociological Perspectives*) and “Debating Futures” (*International Sociology*). Schulz won for his work international distinction, including the ISA's Bielefeld Prize for the Internationalization of Sociology, the Eastern Sociological Society's Candace Rogers Award, and the American Sociological Association's Elise Boulding Award. Schulz has taught at New York University, University of Illinois, Virginia Tech, and the Bauhaus University of Weimar, Germany. He is currently working at the New School for Social Research on a project about “Reclaiming Futures.” For further information visit Markus Schulz's personal website.

Maria Kousis, University of Crete, Greece

Solidarities Confronting Europe's Crises Through Alternative and Transnational Action Organizations

Solidarities confronting hard times in European spaces have been increasing since the recent economic and refugee crises. This presentation will offer main findings on solidarity initiatives and practices since 2007, which have been produced in LIVEWHAT and TransSOL, two European Commission funded research projects covering solidarity experiences in nine and eight countries respectively. More specifically the presentation will document major features of Alternative Action Organizations as well as Transnational Solidarity Organizations, using fresh data produced with a new method, Action Organization Analysis. Created for the needs of the specific research on solidarity initiatives, the method is based on protest event, protest case and political claims analysis and uses a hubs-website approach to build its randomly selected national samples.

These Action Organizations embody citizens' initiatives and networks of cooperation amongst civil society actors engaging in strategic alternative/solidarity actions in the public sphere, and aiming to provide alternative ways of enduring day-to-day difficulties and challenges under hard times, especially relating to urgent needs (food, health, shelter), the economy, environment, communications, alternative consumption/food sovereignty, self-organized spaces, culture, and others. These initiatives/organizations are not operated or exclusively supported by mainstream economic and political organizations (i.e. corporate, state, or EU related agencies).

The data show that different patterns of solidarity are evident across European spaces unveiling varying organizational types, beneficiaries and participants, solidarity orientations, aims, action types as well as supplementary activities to reach them.

SHORT BIOGRAPHY:

Maria Kousis (PhD University of Michigan 1984) is Professor of Sociology and Director of the Centre for Research and Studies in Humanities, Social Sciences and Pedagogics at the University of Crete. Her work focuses on political, economic and environmental contention, as well as social change and impacts of the recent crises. She was coordinator of the EC DGXII project 'Grassroots Environmental Action & Sustainable Development in the Southern European Union' and partner in EC projects including TEA, PAGANINI and MEDVOICES. Publications include 11 edited volumes/books/special issues and more than 60 articles/book chapters, including *Economic and Political Contention in Comparative Perspective* (co-edited with Charles Tilly; Paradigm, 2005). She is more recently involved as partner in the European Commission projects LIVEWHAT and TransSOL where she is leader of work packages on alternative forms of resilience and innovative paths to transnational solidarity, respectively. Furthermore, with Jochen Roose she has co-ordinated the GGCRISI Project on public sphere attributions of responsibility in Germany and Greece (2009-2013) funded by the Greek and German Ministries.

Mid-Day Specials

MD01: ESA Lecture Series (1) - The Future of Sociological Research

Session Chairs:

Airi-Alina Allaste, Tallinn University

with

Michel Wieviorka, EHESS / FMSH, France

Present and Future of Sociology. A European Perspective

This lecture examines some main characteristics of sociology (and other social sciences) today. They exist now in almost all countries all over the world but this doesn't lead necessarily to the decline of « methodological nationalism », following the expression coined by Ulrich Beck.

We should avoid any confusion between comparative approaches, and « global » or « cosmopolitan » ones.

The globalization of social sciences appear also when one considers the issue of language, and the quasi monopoly of English - a very complex question.

There is a contradiction between the reality in most Universities, and the discourses on pluri- or inter- or multi-disciplinarity, and one observes a strong tendency towards more and more specialization, and difficulties for many scholars to participate in rather general debates.

As a member of the scientific council of ERC, I discuss these issues taking into account the perspectives offered by this European institution. My conclusion : at the world level, we are facing now three main models for sociology, and not two : the International one, under anglo-saxon hegemony, the national one which resists to it, and the new European one, first of all with ERC.

SHORT BIOGRAPHY:

Michel Wieviorka, professor at the Ecole des Hautes Etudes en Sciences Sociales, is the President of the Board of the Foundation Maison des Sciences de l'Homme (FMSH). He was director of the Center for Sociological Analysis and Intervention (CADIS, EHESS-CNRS) between 1993 and 2009. From 2006 to 2010, he was President of the International Sociological Association (ISA) and has been a member of the ERC (European Research Council) Scientific Council since 2014. He was co-director with Georges Balandier of the journal Cahiers Internationaux de Sociologie from 1991 to 2011, and now heads the new SOCIO magazine (with Laetitia Atlani-Duault), which he created in 2013.

His research has focused on the notion of conflict, terrorism and violence, racism, anti-Semitism, social movements, democracy and the phenomena of cultural difference. After having edited the series "Voix et Regards" at Balland Publishing, he is now in charge of the series "Le monde comme il va" at Editions Robert Laffont, and with Julien Ténédos of the series "Interventions" at Editions de la MSH. His latest book is "The Jews, the Muslims and the Republic", at Editions Robert Laffont.

AIRI-ALINA ALLASTE is Professor of Sociology at Tallinn University and President of the Estonian Sociological Association. As a member of the current ESA Executive Committee, she is the director of the Pre-conference PhD Summer School Workshop in Athens from 27 to 28 August. Her research, publications and teaching focus on youth studies. She has been a national coordinator and working package leader for various international projects and been recently visiting professor at Lisbon University, Portugal; Griffith University, Australia and Åbo Akademi, Finland. She has been responsible organiser of several conferences including 10th Annual Conference of Estonian Social Sciences (Tallinn, Estonia March, 2017).

MD02: Assessing Sociology - Research and Impact Assessments and their Implications

Session Chair:

Sue Scott, University of York

with

John Holmwood, University of Nottingham, United Kingdom

Marta Soler-Gallart, University of Barcelona, Department of Sociology, Spain

Assessing Sociology: Research and Impact Assessments and their Implications

This Midday Session will explore the issues raised by the increase in assessment, audit and evaluation in relation to academic research. This process is probably most highly developed in the UK where it began in 1986, but has spread across Europe in various forms, including a range of attempts to measure the social and economic impacts of research. It can be argued that this process has raised the profile of research in Universities and beyond, but also that it has valorized particular forms of knowledge production at the expense of the further development of critical sociological thinking.

SHORT BIOGRAPHIES:

JOHN HOLMWOOD is Professor of Sociology at the University of Nottingham and Visiting Research Professor at the Institute for Philosophy at the Czech Academy of Sciences. He is a former President of the British Sociological Association and a current member of the ISA Executive and a Managing Editor of Discover Society. He is an active campaigner for public higher education. His talk will look at market-oriented policies designed to enhance the instrumental value of knowledge – ranging from research evaluation audits and policies for co-production of research – and their impact upon the social sciences and the place of sociology within them. It will argue that individualistic, behavioural science is promoted at the expense of critical, social (structural) science.

MARTA SOLER is Professor of Sociology at the University of Barcelona and director of CREA research center on theories and practices Overcoming Inequalities. She is a member of the ESA Council and of the Board of the Catalan Association of Sociology. She is currently the Coordinator of the EU 7th Framework Programme, IMPACT-EV. This project is evaluating the impact and outcomes of European SSH research (2014-2017), which describes the development of a system of indicators of scientific impact, political and social research in SSH. Her talk will discuss the findings from this project and their implications for social science research and researchers across Europe.

SUE SCOTT is an Honorary Professor at the University of York (UK) and a Visiting Professor at Helsinki University. She has been a Pro Vice Chancellor with responsibility for research and currently acts as a consultant on Research Assessment and Impact to a number of UK Universities. She is Chair of the Helsinki University Change Review. She is a Vice President of the ESA.

MD03: Meet the Editor: The European Journal of Social Theory at 20 Years

with

Gerard Delanty, Sussex University, United Kingdom

Meet the Editor: The European Journal of Social Theory at 20 Years

To mark the 20th anniversary of the European Journal of Social Theory, Sage Publications LTD, London, are sponsoring this Mid-Day Special event at which the Editor, Gerard Delanty, will offer his reflections on the journal over the past two decades as well as discussing the field of social theory and challenges for the future. The informal event, at which drinks will be available, will be also an opportunity to discuss with the EJST editor publishing in the journal.

SHORT BIOGRAPHY:

GERARD DELANTY. Professor of Sociology and Social & Political Thought, Sussex University, Brighton UK.

I work in the field of historical and political sociology and social theory. I am particularly interested in the intersection of history and sociology. I have recently been working on the European cultural heritage in the context of a Horizon2020 research project <http://culturalbase.eu/>. My current research interests include the Anthropocene debate, cosmopolitanism, and modernity in comparative perspective. My recent publications include *The Cosmopolitan Imagination* (Cambridge University Press, 2009), *Formations of European Modernity* (Palgrave 2013) and *The European Heritage: A Critical Interpretation* (forthcoming Routledge 2018). I have edited the European Journal of Social Theory since it began in 1998. I have started a blog site on Brexit related issues at www.gerarddelanty.wordpress.com

MD04: Academic Freedom Under Threat in Europe

Session Chair:

Laura Horn, Roskilde Universitet

with

Latife Akyuz, Goethe University Frankfurt am Main, Germany

Reyda Ergun, Kadir Has University, Philosophy and Sociology of Law, Faculty of Law

Csaba Szalo, Masaryk University

Academic Freedom Under Threat in Europe

The commitments to academic freedom and freedom of expression are cornerstones of an open, democratic society. The recent assaults on these principles in Higher Education in countries such as Turkey, Russia and Hungary once again show that academic freedom is seen as threat by increasingly authoritarian regimes.

In Turkey, the government has reacted with repressive measures against academics for expressing their political views in the 'Academics for Peace' campaign. Following the failed coup in July 2016, state disciplining and persecution of academics has increased, with their freedom of expression, opinion, association and travel curtailed in many cases. In Hungary, the autonomy of universities is under threat – most prominently following the government's bill of April 2017, which will render it difficult for the Central European University to continue operating in Hungary.

The struggle for academic freedom, it seems, is more crucial than ever in Europe. How could, and should, the academic community, including learned associations such as ESA, react to these developments? Which possibilities for solidarity, and which avenues for protest are there?

In this panel, speakers will offer presentations on the current state of affairs in Turkey and Hungary. Afterwards there will be an open plenary debate.

SHORT BIOGRAPHIES:

LAURA HORN is Associate Professor in the Department of Social Sciences and Business at Roskilde University,

Denmark. Her research interests are located within a critical political economy of European integration. She is chairing the ESA RN Council in the 2015-2017 term, and has been a member of RN06 Critical Political Economy since 2005.

REYDA ERGÜN UMUROGLU is Assistant Professor in the Department of Philosophy and Sociology of Law at Kadir Has University, Turkey. Her areas of research are political philosophy, philosophy of law, sociology of law, theory of human rights, and gender studies. She is an academic freedom activist and member of the working group on law under Academics for Peace.

LATIFE AKYÜZ received her PhD from Middle East Technical University (METU), Ankara in 2013. She has held positions as a visiting scholar at Indiana University (2010), Binghamton University (2011-12) and the Center for Ethnic and Migration Studies, Liege University (2014). Her research interests are border regions, ethnicity, and gender studies, with her most recent work focusing on migrant Alevi women living in Europe. She was one of the editors of the *Toplum ve Bilim* (Society and Science) Special Issue on Borders and Border Studies in Turkey. She held the position of Assistant Professor at Duzce University from March 2014 until her dismissal in 2016 due to her signing of the Academics for Peace petition. Now she is a Philipp Schwartz fellow in Goethe University, Frankfurt am Main.

CSABA SZALO is currently Chair at the Department of Sociology, Masaryk University, Brno, Czech Republic. He is involved in the Social Theory Research Network and in the Executive Committee of the ESA. In recent years he has been working on urban memory and European identity politics. He has an enduring interest in social theory and cultural sociology.

MD05: Author Meets Critics: Claus Offe's book "Europe Entrapped"

Session Chair:

Frank Welz, ESA President (Paris/Innsbruck)

Discussants:

Teresa Pullano (Basel), Sylvia Walby (Lancaster), Alison E. Woodward (Brussels)

with

Claus Offe, Hertie School of Governance, Berlin, Germany

Europe Entrapped

In the book "Europe Entrapped", Claus Offe brings into sharp focus the central political problem that lies at the heart of the EU and shackles its ability to deal with the most serious crisis of its short history.

Today Europe finds itself in a crisis that casts a dark shadow over an entire generation. The seriousness of the crisis stems from one core political contradiction at the heart of the European project: namely, that what urgently needs to be done is also extremely unpopular and therefore virtually impossible to do democratically. What must be done - and almost everyone agrees in principle on the measures that would be needed to deal with the financial crisis - cannot be sold to the voting public of the core member states, which so far have been less affected by the crisis than those on the periphery, nor can the conditions that core members try to impose be easily sold to voters in the deficit countries.

The European Union is therefore becoming increasingly disunited, with deepening divides between the German-dominated 'core' and the southern 'periphery', between the winners and the losers of the common currency, between the advocates of greater integration and the anti-Europeans, between the technocrats and the populists. Europe finds itself trapped by the deepening divisions that are opening up across the Continent, obstructing its ability to deal with a crisis that has already caused massive social suffering in the countries of the European periphery and is threatening to derail the very project of the European Union.

SHORT BIOGRAPHIES:

CLAUS OFFE is Professor of Political Sociology at the Hertie School of Governance in Berlin. He is author of numerous books, including *Contradictions of the Welfare State*, *Disorganized Capitalism*, *Modernity and the State*, and *Reflections on America: Tocqueville, Weber and Adorno in the United States*.

TERESA PULLANO is currently Assistant Professor in the Law Faculty and in the Institute of European Global Studies of the University of Basel. She is the author of *'La citoyenneté européenne: un espace quasi-étatique'* (Paris, Presses de Sciences Po, 2014).

SYLVIA WALBY, ESA President 1995-97, is Distinguished Professor of Sociology and UNESCO Chair in Gender Research, Director, Violence and Society UNESCO Centre, Lancaster University, UK. Her work contributes to theorising society. It mainstreams gender and other intersecting inequalities and uses complexity science to rethink core concepts of social systems, offering a comparative analysis of neoliberalism and social democracy in Europe and America (*Globalization and Inequalities*, Sage 2009). *Analysis of the cascading crisis* (Crisis, Polity 2015) addresses the changing role of the democratic state in regulating finance and the economy and offers a route towards an alternative future.

ALISON E. WOODWARD (Ph.D. UC Berkeley) is Research Professor Emerita at the Free University of Brussels (VUB) and Senior Associate of the Institute for European Studies at the VUB working on European Union policy on equality, gender, diversity and decision-making. Recently she published (2016) *'EU Civil Society and the crisis: Changing channels and organizational patterns in European transnational civil society'* in *'Shifting Paradigms after the Crisis'*, Palgrave. She has been ESA Vice-President and is presently a Board member of the ESA RN32 Political Sociology.

FRANK WELZ (Innsbruck) is President of the European Sociological Association, currently co-edits *'The Battlefield of European Identity'* with G. Tasheva (Routledge 2018) and is glad about the session for continuing the open debate on the conference theme.

MD06: Author Meets Critics: Jo Littler's book "Against Meritocracy: Culture, Power and Mythos of Mobility"

Session Chair:

Ruth MCDONALD, University of Manchester

Discussants: Ricca Edmondson (NUI Galway), Marianna Fotaki (Warwick Business School)

with

Jo Littler, City, University of London, UK, United Kingdom

Against Meritocracy: Culture, Power and Mythos of Mobility

Meritocracy today involves the idea that whatever your social position at birth, society ought to offer enough opportunity and mobility for 'talent' to combine with 'effort' in order to 'rise to the top'. This idea is one of the prevalent social and cultural tropes of our time, as palpable in the speeches of politicians as in popular culture. In this book Jo Littler argues that meritocracy is the key cultural means of legitimation for contemporary neoliberal culture -- and that whilst it promises opportunity, it in fact creates new forms of social division. In this session 2 speakers will engage in discussion about the book with Jo the author.

SHORT BIOGRAPHIES:

JO LITTLER is a Reader in the Centre for Culture and Creative Industries in the Department of Sociology at City, University of London, UK. She works on cultural politics and her research includes work on meritocracy, consumer culture, heritage and celebrity. She is the author of *Radical Consumption? Shopping for change in contemporary culture* (2008) and is co-editor of *The Politics of Heritage: the legacies of 'race'* (2005, with Roshi Naidoo) and *Cultural Studies and Anti-Consumerism* (2011, with Sam Binkley). She is part of the editorial collective of *Soundings: A Journal of Politics and Culture* and an editor of the *European Journal of Cultural Studies*. Her new book *Against Meritocracy: Culture, Power and Myths of Mobility* is being published by Routledge in August 2017.

RICCA EDMONDSON, NUI Galway, Ireland. Prof Ricca Edmondson taught philosophy at universities in Berlin, also working as a translator, before doing post-doctoral research on the sociology of organisations at the Max Planck Institute for Human Development there. She is a member of the School of Political Science and Sociology at National University of Ireland, Galway, Co-Chair of the Social Sciences Research Centre, and founder of the Galway Wisdom Project. She is a former member of the ESA Executive Committee and an editor of the ESA's journal, *The European Journal of Cultural and Political Sociology*. Since 1999 she has been a member of the Board of Research Network 1 (Ageing). Her research centres on four interconnected, interdisciplinary areas: the sociality of reasoning and rhetorical argumentation; understanding phenomena connected with 'wisdom', and developing new techniques for doing so; issues connected with the life course and life-course meaning; and interculturality, translation and qualitative methods in the social and political sciences.

MARIANNA FOTAKI is Professor of Business Ethics at Warwick Business School. She holds degrees in medicine, health economics, and a PhD in public policy from London School of Economics and Political Science. Before joining academia in 2003 she worked as a medical doctor in Greece, China, and the UK, as a volunteer and manager for humanitarian organizations Médecins du Monde and Médecins sans Frontiers in Iraq and Albania, and as the EU senior resident adviser to governments in transition (in Russia, Georgia and Armenia). Marianna is at present a Senior Editor for Organization Studies, and co-directs pro bono an online think tank Centre for Health and the Public Interest a charity that aims to disseminate research informing the public and policy makers (<http://chpi.org.uk>). Marianna is a Network Fellow at the Edmond J Safra Center for Ethics, Harvard University in 2014-2015.

RUTH MCDONALD is Professor of Health Science Research and Policy at the University of Manchester. Her research concerns health professionals and change in health sector organisations. She is a member of the ESA executive committee and former Chair of RN19 (Sociology of Professions Research Network).

MD07: ESA Lecture Series (2) - Sociology Today*Session Chair:*

Carmen LECCARDI, University of Milan-Bicocca

with

Frank Welz, ESA President, University of Innsbruck, Austria

Compass lost? Sociology in the Post-Welfare Society

The purpose of this session is to facilitate active exchange between speakers and the audience about the hopes and realities of sociology today. – Sociology's beginnings were auspiciously ambitious. The formation of a new social order in the 19th century was paralleled by a new mode of thought that

promised to provide a tool for navigating this new social world. During the golden age of the welfare state (1950-80), sociology became most attractive to critical students. It expanded at universities far and wide. My approaches. (1) "Kantian theories" (Habermas, Parsons) fit well with the future-orientation of the welfare state. (2) Backed up by the new neoliberal social order, other theories became dominant in the 1980s, such as "postmodernism" and "systems theory", both of which posited that traditionally modern perspectives, especially on the politics-society-public policy nexus, required serious reconsideration. (3) Focusing on the triumphant progress of a "new social positivism" as a third group of sociological views, my thesis will be that current conditions of knowledge production push sociology toward descriptive analyses which tend to reflect trends rather than analyse social transformation:

(a) the "eclipse of 'society'" in sociology has replaced categories such as collective institutions by nominalist labels like individualization, chance, choice, agency, and risk; (b) the "triumph of the fragmented 'individual'" in cultural analysis further fractured group categories; (c) the "triumph of ready-made methods", imposed via project- and funding-driven work; (d) finally, the increasing importance of "governing by numbers" further encouraging the "triumph" of the sociologist as an "academic 'self-entrepreneur'" (Foucault).

(4) Is there an alternative? What is to be done? Against the fragmentation of sociology into small vignettes, how can we strengthen the education of scholars as members of a collaborative association of peers and experts on societal transformation?

Margaret Abraham, ISA President (Hofstra University), USA

Sociology's Challenge - Unravelling a Post-Truth World

Growing inequality and resultant widespread frustration and anger have engendered deeply polarized societies that have heightened racism, xenophobia, ethnocentrism, religious fundamentalism and the politics of exclusion. Instead of targeting the real perpetrators of an unequal system, the resentment and frustration have metamorphosed into a frontal attack on multiculturalism, secularism, LGBTQA rights and a surge in a narrow inward looking nationalism. A frightening aspect of this surreal world is that the purveyors of fabricated claims and deliberate deceit are often able to convince their legion of supporters of their point of view, however extreme and false, often through effective use of the media and more particularly, social media. We live in a post-truth world. This presentation will consider how can sociologists respond to this dystopia? How does sociology face this profound challenge?

SHORT BIOGRAPHY

Professor Frank Welz (Innsbruck University) currently is serving as President of the European Sociological Association. He conceives of sociology as a public good. He has been the coordinator of ESA RN29 Social Theory and is publishing on social theory, sociology of law, and the history of sociology; currently is co-editing "The Battlefield of European Identity", with G. Tasheva (Routledge).

Margaret Abraham is Professor of Sociology at Hofstra University and the President of the International Sociological Association, (ISA 2014-2018). Her teaching and research interests include gender, globalization, social justice, immigration, and domestic violence. She has published in various journals and is the author of the award winning book "Speaking the Unspeakable: Marital Violence Among South Asian Immigrants in the United States" (Rutgers University Press 2000). Her co-edited book and volumes include, *Contours of Citizenship: Women, Diversity and the Practices of Citizenship* (Ashgate 2010); *Making a Difference: Linking Research and Action* (Current Sociology, Monograph Series, 2012), *Interrogating Gender, Violence, and the State in National and Transnational Contexts* (Current Sociology, 2016).

Carmen Leccardi is professor of Cultural Sociology at the University of Milan – Bicocca. She has been President of the European Sociological Association 2015-17.

MD08: Interdisciplinarity in Times of Budget Cuts and University Restructuring - Advancement or Demise of Sociology?

Session Chair:

Jolanta PEREK-BIALAS, Jagiellonian University

with

Kathrin Komp, Helsinki University, Finland

Creating Interdisciplinarity Through Budget Cuts: When Sociology Goes Economics

Recent budget cuts in academia pressure sociologists to tap new funding sources. Using neoliberal arguments, university administrations and policymakers suggest raising funding through commissioned research and product development. But how can such an adoption of economic perspectives in sociology can be achieved? And what are its advantages and disadvantages? This study answers these questions through expert interviews and participant observation. Findings identify university administrations, consultants and economists as the proponents of research commercialization, who focus on funding acquisitions and product improvement. The adversaries are sociologists, who find a commercialization antithetic to their research, have ethical concerns about aggravating social problems, and fear for their academic careers. Consequently, the discipline of sociology could erode.

Sue Scott, University of York, United Kingdom

Interdisciplinarity: Disciplinary and Institutional Challenges

Many recent university restructurings have created multidisciplinary departments/schools and multidisciplinary degree programmes. These structures are often intended to reduce administrative demands and also facilitate an interdisciplinary dialogue. The assumption is that new research ideas and collaborations will emerge if different disciplines are co-located or otherwise merged. This presentation discusses waves of change in UK Universities of the past 20 years or so and explores the intended and unintended consequences for sociology. The presentation will stress the need to differentiate between organisational structures of convenience and the intellectual questions and social issues which would benefit from a multi disciplinary or interdisciplinary response. The question 'what would we lose if there wasn't a discipline of sociology' will be posed.

SHORT BIOGRAPHIES:

KATHRIN KOMP is an assistant professor in sociology at Helsinki University, Finland. She specializes in research on population ageing, welfare policies, effects of the 2008 economic crisis, and research methods. Moreover, she currently holds a Marie Curie grant for a study on the long-term effects of unemployment spells on retirement. Recently, she conducted a study on the commercialization of sociological research. Komp was on the board of the ESA Research Network "Ageing in Europe" for eight years and now serves on the ESA executive committee.

SUE SCOTT has researched and published widely in the areas of gender; sexuality, risk; the body and childhood. She has held academic posts at a number of UK Universities including Professorships at Stirling and Durham. She was also Executive Dean of Humanities and Social Sciences at Keele University and Pro Vice Chancellor (Research) at Glasgow Caledonian University. She currently holds an Honorary Professorship at the University of York and is a Visiting Professor at the University of Helsinki and undertakes research consultancy and mentoring. She is a Vice President of the European Sociological Association and a Managing Editor of, the online social science magazine Discover Society discover.society.org.

JOLANTA PEREK-BIALAS is an assistant professor who works at the Institute of Sociology at the Jagiellonian University, Cracow, Poland, and the Warsaw School of Economics. She has been involved in international projects under the 5th, 6th and 7th FP of the EU and as well in those finances by the Norwegian Research Council of Science, the VW Foundation, the OECD/LEED Programme related to gerontology, sociology of ageing, population ageing and its impact on economy, active ageing, social inequalities, public policy analysis. Her publications in peer-reviewed journals and chapters in international books considered socio economic

consequences of population ageing in Poland and in selected Central and Eastern European countries, active ageing policy, employers' strategies towards older workers, reconciliation of work and care, social exclusion/inclusion of older people. She is a Vice-Chair of the RN 21 Quantitative Methods of ESA.

MD09: Meet the Editors: How to Write A Journal Article and Get It Published

Session Chair:

Lena Margareta Näre, University of Helsinki

with

Ricca Edmondson, National University of Ireland Galway, Ireland

Michalis Lianos, University of Normandy - Rouen FR, France

Eeva Luhtakallio, University of Tampere, Faculty of Social Sciences FI, Finland

Marta Soler Gallart, University of Barcelona, Department of Sociology ES, Spain

Meet the Editors: How to Write A Journal Article and Get It Published

While dissemination of research findings and critique is at the core of scientific practice, publication processes can be long and frustrating from the author's and journal editors' perspective. Authors want speedy publication, yet the quality of research depends on rigorous peer-review. The increasing pressure to 'publish or perish' forces authors to submit un-polished articles while journal editors are anxious for well-written, polished articles that fit the scope of their journal and contribute to its ongoing debates.

This session is designed to encourage ESA members to write journal articles, to share ideas on how to write a good article and how to get it published. The members of the panel can offer participants a range of long and varied experience in editing journals and in working with authors to help make their work clearer and more accessible.

We invite ESA members to attend the session in order to hear more about what journal editors are looking for in articles submitted to them and their advice on what the author can do to speed up the publication process. We invite ESA members also to share their thoughts and possible problems they may have experienced in getting published. We will offer constructive ideas how to improve journal publishing from the standpoints of authors, editors and readers. We invite ESA members to send their questions in advance to the chair of the session, though questions from the floor will also be welcome.

SHORT BIOGRAPHIES:

RICCA EDMONDSON taught philosophy at universities in Berlin, also working as a translator, before doing post-doctoral research on the sociology of organisations at the Max Planck Institute for Human Development. She has since worked at the School of Political Science and Sociology at the National University of Ireland, Galway and is founder of the Galway Wisdom Project. She is a former member of the ESA Executive Committee and an editor of the ESA's journal, *The European Journal of Cultural and Political Sociology*. Her research centres on the sociality of reasoning and rhetorical argumentation; understanding phenomena connected with 'wisdom'; issues connected with the life course and life-course meaning; and interculturality, translation and qualitative methods in the social and political sciences. She has been a member of Research Network 01 (Ageing) since 1999.

MARTA SOLER-GALLART, Harvard PhD, is Professor of Sociology and Director of CREA Research Centre at the University of Barcelona. She is Editor in Chief of "International Sociology", member of the ESA Executive Board and member of the EASSH Governing Board. She served at the ORCID Board of Directors. Recently she published in "Qualitative Inquiry", "Journal of Pragmatics" and "Nature".

MICHALIS LIANOS is Professor at the University of Rouen-Normandie and Editor-in-Chief of the European Sociological Association journal "European Societies" (www.tandfonline.com/toc/reus20/current). He was previously Lecturer at the University of London (Goldsmiths College) and Director of the "Centre for Empirically Informed Social Theory" (CEIST) at the University of Portsmouth.

EEVA LUHTAKALLIO is Associate Professor of Sociology (tenure track) at the University of Tampere, Finland. She is specialized in political sociology, visual and gender studies, ethnography, and social theory. Her recent research has focused on marginalization and political participation, as well as the questions of justifying and engaging in a polarizing civil society. Her recent publications include 'Ethnography of Politics and Political Communication: Studies in Sociology and Political Science' (with Nina Eliasoph, in *The Oxford Handbook of Political Communication*, edited by Kate Kenski & Kathleen Hall Jamieson, 2017) and 'Justification Analysis' (with Tuomas Ylä-Anttila, in *Sociological Research Online*, 2016). She is the author of *Practicing Democracy: Local Activism and Politics in France and Finland* (Palgrave Macmillan, 2012). She edits (with Ricca Edmondson) an ESA journal, the *European Journal of Cultural and Political Sociology*.

LENA NÄRE is Associate Professor of Sociology (tenure track) at the University of Helsinki, Finland. Her research focuses on migration, gender, work (especially care work) and ageing. Her recent publications include a co-edited volume entitled *Transnational Migration and Home in Older Age* (Routledge 2016). She is the Editor-in-Chief (with S. Bendixsen) of *Nordic Journal of Migration Research* and member of the ESA Executive Committee (2015-2017).

Md10: Meet the Funders: Sociology at its best - Everything you want to know about the ERC Grants

Session Chair:

Dagmar Danko, European Sociological Association

with

Lionel Léopold Thelen, European Research Council (ERC), Belgium

Sociology at its best - Everything you want to know about the ERC Grants

The ERC funding capacity increases each year and the budget devoted to social sciences has been bettered from 2015 onwards. With funding up to 2,5 million € for a 5 year project, the ERC has become – in less than 8 years – one of the major funding bodies worldwide and certainly the most generous for Social Sciences and Humanities.

"What do the ERC schemes have to offer to sociologists?" "How to get started with an application?" "How to increase your chances to get funding?" "What are the main hitches to avoid?" These are all relevant questions that will be raised during this workshop. Do not hesitate to bring yours!

This session is opened to all sociologists aiming to design and lead ground-breaking research projects to their good end. The presentations will be done by ERC Scientific Staff as well as by ERC Grantees. The presentation will be followed by a Q&A session. Of course, presenters will be available during the whole duration of the Conference to answer your queries. Flyers, reports and publications will be available to help you inasmuch as possible, not forgetting, last but not least, our website: <http://erc.europa.eu/>

SHORT BIOGRAPHIES:

After having graduated from Liege University (B) in Social Anthropology, Lionel Thelen has worked as research assistant in the same university for one year before being accepted as PhD Researcher in the European University Institute of Florence. He did his PhD in Sociology, studying the processes by which some individuals may anchor themselves into long-term Homelessness, processes he subsumed under the designation of "Self Exile". During his PhD thesis he made some visiting fellowships in University Paris V (F), in the University Saint-Louis (Brussels) as well in ISCTE (Lisbon - P). After the PhD Thesis Defence, in 2003 he had the opportunity to be hired by the University of Geneva as Assistant Professor in the Dept. of Sociology.

Since April 2009, he works for the European Research Council as Research Programme Officer, and has coordinated, in this function, various panels of evaluation, mostly in the SSH Domain. For 3 years now he has been in charge of the SH3 panel “The Social World, Diversity, Population” dealing with disciplines such as Sociology, Social Psychology, Demography, Education, Communication and, from next year onwards, Social Anthropology.

DAGMAR DANKO has acquired her PhD in Sociology at the University of Freiburg (Germany) in 2010. She has published a number of books, e.g. an introduction to the sociology of the arts (2012) and an introduction to the work of Howard S. Becker (2015). Since October 2016, she is Executive Coordinator of the ESA (Paris).

MD11: Meet Civil Society Actors: Migration in Greece

Session Chair:

Apostolos G. Papadopoulos, Harokopio University

with

Apostolos Veizis, *Medecins Sans Frontieres (MSF)*, Greece

Nikolaos Gkionakis, Babel Day Centre, Greece

Eleni Takou, SolidarityNow, Greece

Fotini Ratsiou, Volunteer, Greece

This event aims at facilitating the interaction between civil society actors and practitioners with the academia and researchers on the issues attached to migration towards Europe. Four experts engaged with migrants/ refugees are invited to present their views on how EU guidelines and policies on migration and asylum have been implemented by state agencies and the NGOs. They are also urged to testify their own experiences connected to their involvement with the migrants/ refugees during the recent period of 'Migration/ Refugee Crisis' and its aftermath. They are invited to offer complementary standpoints in view of their specific involvement with migrants/ refugees at different spatial scales (European, national, regional, local).

The interaction between civil society actors and practitioners, on the one hand, and academics and researchers, on the other, is expected to enrich the wider dialogue among them and empower those who have as their mission to respond to migration challenges. More generally, migration constitutes a domain where numerous socioeconomic, political and cultural issues are merged together, leading to social clashes or discontent. Very often civil society actors have intermediated migrant/ refugee participation, while state actions are limited and problematic. Finally, the presenters have been asked to reflect on the implementation of migration/ asylum policy measures and make policy recommendations.

SHORT BIOGRAPHIES:

APOSTOLOS VEIZIS is a Medical Doctor (General Practitioner). He is the Director of Medical Operational Support Unit (SOMA) of *Medecins Sans Frontieres (MSF)* -Greek Section. Prior to that he worked as Head of Mission and Medical Coordinator for *Medecins Sans Frontieres (MSF)* and *Medecins du Monde* in Afghanistan, Azerbaijan, Russia, Albania, Egypt, Georgia, Greece, Turkey. Participated on assessment, emergency assignments and evaluations in Kyrgyzstan, Morocco, Armenia, Lebanon, Syria, Ukraine, Turkmenistan, Zambia, Malawi, Uzbekistan, Serbia, FYROM, Cyprus and Tajikistan. He participated and had announcements in international and national medical congresses and contributed on publications of relevant articles.

NIKOLAOS GKIONAKIS graduated from the University of Padua (Italy) in Applied Psychology and then obtained his MSc degree specializing in Social Psychiatry-Child Psychiatry at the University of Ioannina (Greece). In 2007 he founded, together with other professionals, Babel Day Centre, a mental health unit for migrants in Athens (Greece). He is the scientific associate of the unit and he has developed clinical activity (especially with survivors of extreme violence and other extreme adversities), training activity (thus cooperating with international and national organisations), and supervision activity with professionals and volunteers assisting migrants and refugees.

ELENI TAKOU has studied communication, political science and political philosophy in Athens and Paris. She works as Senior Advocacy Officer at SolidarityNow (<http://www.solidaritynow.org>). During 2015, she has served as Chief of Staff of the Alternate Minister for Migration Policy. Prior to this, she has served as assistant coordinator of the Racist Violence Recording Network, a coalition of 35 CSOs, under the auspices of UNHCR Office in Greece and the Greek National Commission for Human Rights, and as Project and Communication Manager of the Hellenic League for Human Rights, the oldest NGO in Greece, where she focused her work on issues of migration, citizenship and anti-racism advocacy. She is co-writer of *Immigration in Greece. Eleven myths and more facts*, published by the Rosa Luxemburg Foundation (<http://rosalux.gr/publication/i-metanasteysi-stin-elleda>).

FOTINI RANTSIOU is a humanitarian worker in the international field since 1997, with the UN and EU. On a break from international work she moved independently to Lesbos where since August 2015 she has volunteered at the first response and in Moria/Kara Tepe. In 2015-2016 she was field adviser for Solidarity Now in Lesbos, later led a UNICEF assessment in the camps in the north of Greece and in 2017 she conducted an assessment of the urban refugee population in Athens and Thessaloniki for the Danish Refugee Council. She writes and tweets on the refugee situation in Greece, provides inputs to university researchers, think tanks, NGOs and media.

APOSTOLOS G. PAPADOPOULOS is Professor of Rural Sociology and Geography at the Department of Geography, Harokopio University (Athens, Greece). He has served as Director of Postgraduate Studies in his Department (2009-2011) and as an elected Vice-Rector of Economic Affairs and Development (2011-2015) at his University. His research is focused on the factors and mechanisms related to rural transformation, social change, social class and social mobility. He is also interested on the impact of migration on host societies, while recently he became interested on the asymmetries between social transformation and migration processes at various spatial scales. He has (co)edited/ written seven books, while he has over 100 publications, including refereed papers and book chapters. He is particularly interested in applied social research and recently he was appointed as member of the CIHEAM Advisory Board (2017-2020), focusing especially on research, education and rural development in the Mediterranean countries. He is Chair of the Hellenic Sociological Society (HSS) and Chair of the LOC for the 13th ESA Congress in Athens.

MD12: Author Meets Critics: Victor Roudometof's book "Glocalization: A Critical Introduction"

Session Chair:

Sokratis M. Koniordos, University of Crete

Discussants: Gili S. Drori, Giampietro Gobo

with

Victor Roudometof, University of Cyprus, Cyprus

Author Meets Critics: Victor Roudometof's book "Glocalization: A Critical Introduction"

The session will be concerned with the new and relatively under-theorized concept of glocalization. It has at its starting point Victor Roudometof's (London and New York: Routledge, 2016, 185 pp.) volume, which chronicles the term's origins and provides overviews of past and current research from anthropology, sociology, political science, cultural studies, and business studies. Unlike past theories, a central argument is that glocalization should be seen as analytically autonomous from globalization and proposes definitions of glocal as process (glocalization), condition (glocality) and worldview (glocalism). While glocalization and glocality should be recognized as important facets of 21st century social life, social scientists should reject both affirmative and/or negative glocalism. The limits of glocalization should be recognized and uncritical celebrations of glocality should be avoided.

SHORT BIOGRAPHIES:

VICTOR ROUDOMETOF is Associate Professor of Sociology at the Dept. of Social And Political Studies, University of Cyprus. He has studied history, economics, cultural studies, and sociology. He has held appointments at Princeton University, Washington and Lee University, Miami University and the American College of Thessaloniki. His publication record includes 100+ articles, book chapters, and other contributions. He has served as referee

and/or reviewer for major international publishers & scholarly journals. He has also served as external evaluator for stage agencies and research foundations in the Netherlands, Greece, Georgia, the USA & the Gulf states and in hiring, promotion and tenure review committees. He is Faculty Fellow with the Center for Cultural Sociology at Yale University & a member in the editorial boards of the European Journal of Social Theory, Nations and Nationalism, the Greek Review for Social Research, and Religions.

GILI S. DRORI studied Sociology, Anthropology and Political Science at Stanford University and Tel Aviv University. Currently she is Professor at the Dept. of Sociology and Anthropology, at the Hebrew University of Jerusalem. She has held appointments at Stanford University, University of Bergamo, Uppsala University, Technion, and the University of California at Berkeley. Among her more recent publications are: Gili S. Drori, Markus A. Höllerer, and Peter Walgenbach (2014), *Global Themes and Local Variations in Organization and Management: Perspectives on Glocalization*, Routledge; Krücken, Georg and Gili S. Drori (eds) (2009), *World Society: The Writings of John W. Meyer*, Oxford University Press; Drori, Gili S., Janne Tienari, and Arild Wæraas (eds.) (2015), "Building and Managing Higher Education Brands", special issue of *International Studies of Management & Organization*. Drori has been on the editorial board of *European Journal of Cultural and Political Sociology*, and the editor of *BaSha'ar – Academic Community for Israeli Society*.

GIAMPIETRO GOBO studied Sociology and Management off Technology at the Universities of Milan and Trento. Currently he is Professor of Methodology of Social Research at the Dept. of Social and Political Sciences, University of Milan. He has held past appointments at the University of Sienna and the University of California San Diego. Fields of interest and areas of specialization include: quantitative and qualitative methods, marketing research, epistemology, organization and management studies, computer supported cooperative work, and ergonomics. Gobo has published over fifty articles in the areas of qualitative and quantitative methods. His books include *Doing Ethnography* (Sage 2008) and *Qualitative Research Practice* (Sage 2004, co-edited with C. Seale, J.F. Gubrium and D. Silverman). He is currently engaged in projects in the area of workplace studies. He is associate editor of *International Journal of Qualitative Research in Work & Organizations*, and editorial board member in the *Qualitative Research*, *Qualitative Sociological Review* and *Forum: Qualitative Sozialforschung/Forum: Qualitative Social Research*.

SOKRATIS KONIORDOS (BA, Deree & Panteion; MA Kent; PHD London/LSE) is Professor of Sociology at the Dept. of Sociology, University of Crete. He has held appointments at Middlesex University, University of Quest-Nanterre (Paris 8), University of Cyprus, University of Milan-Bicocca, Open University, University of Thessaloniki, HOU, and the University of the Aegean. Main research areas include economic sociology, sociology of work, social structure, modernity, and social effects of the current crisis. He has published 17 volumes, and several research articles. Among his publications are, *The Handbook of European Sociology*, New York and London, Routledge, 2014 (with A. A. Kyrtis); *Conflict, Citizenship and Civil Society*, London: Routledge, 2010 (with P. Baert, G. Procacci and C. Ruzza); *Towards a Sociology of Artisans: Continuities and Discontinuities in Comparative Perspective*, Aldershot: Ashgate, 2001. After chairing the editorial board of *European Societies*, he is now the editor of the *Greek Sociological Review* and board member of the *Greek Review for Social Research*.

MD13: Author Meets Critics: Clyde W. Barrow's book "Towards a Critical Theory of the State"

Session Chair:

Monica Clua-Losada, University of Texas Rio Grande Valley

Discussants: Claus Offe, Laura Horn, Ian Bruff

with

Clyde Barrow, University of Texas Rio Grande Valley, United States of America

Author Meets Critics: Clyde W. Barrow's book "Towards a Critical Theory of the State"

This mid-day special will be based around the discussion of the recently published book "Toward a Critical Theory

of States” by Professor Clyde Barrow. The book is an intensive analysis of the 1970s debate between state theorists Ralph Miliband and Nicos Poulantzas, including its wider impact on Marxist theories of the state in subsequent decades. Clyde W. Barrow makes unique arguments and contributions to this continuing discussion in state theory and lays the foundation for more theoretically informed empirical and historical research on the state in the age of globalization. He argues that by merely moving past the Poulantzas-Miliband debate, as some have recommended, scholars have abandoned much that is valuable in understanding the state, particularly the need to comprehend the contemporary transformation of the state form and the state apparatuses as part of the new conditions of globalization and transnational capital accumulation. Building upon themes of state restructuring found in Poulantzas and Miliband, Barrow establishes the outlines of an approach that integrates the thought of both to propose a synthetic understanding of the new imperialism.

SHORT BIOGRAPHIES:

CLYDE W. BARROW is Professor and Chair of Political Science at the University of Texas, Rio Grande Valley. His books include *Critical Theories of the State: Marxist, Neo-Marxist, Post-Marxist and Class, Power and the State in Capitalist Society: Essays on Ralph Miliband* (coedited with Paul Wetherly and Peter Burnham).

CLAUS OFFE is Professor Emeritus of Political Sociology at the Hertie School of Governance. He has held chairs for Political Science and Political Sociology at the Universities of Bielefeld (1975-1989) and Bremen (1989-1995), as well as at the Humboldt-Universität in Berlin (1995-2005). He worked as fellow and visiting professor at, among others, the Institutes for Advanced Study at Stanford and Princeton, the Australian National University, Harvard University, the University of California, Berkeley and The New School in New York. He completed his PhD at the University of Frankfurt and his habilitation at the University of Konstanz.

LAURAHORN's research area is Global Political Economy, with particular attention to the regional manifestation of these structures and processes in the context of European integration. She is interested in the changing nature of capitalist restructuring and how these developments affect social power relations. Empirically, her work analyses the regulation of corporate governance and corporate accountability in the EU and beyond; the nature of the emerging European state formation; the question of which role organized labour can play in the (re)formulation of economic and social policies at the EU level, as well as a broader examination of left strategies and alternatives in the context of the challenges posed by the financial, economic, social and environmental crisis. Dr. Horn's work is situated within a historical materialist tradition, and engages with the writings of Marx, Gramsci and Poulantzas, amongst others.

IAN BRUFF is Lecturer in European Politics at the University of Manchester, UK. He has published widely on European political economy(ies), debates on comparing capitalisms, neoliberalism, and social theory, and is currently researching the political economy of neoliberalism in Europe. He is the Managing Editor for the new, cross-disciplinary *Transforming Capitalism* book series published by Rowman & Littlefield International, and he is on the Editorial Board for the journal *Art & the Public Sphere*. Also, he was the Chair of the Critical Political Economy Research Network of the European Sociological Association from 2009-13, and he now serves on CPERN's International Advisory Board.

MONICA CLUA-LOSADA is Associate Professor in Global Political Economy at the Department of Political Science at the University of Texas Rio Grande Valley. She is chair of the Critical Political Economy Research Network. She is also an executive board member of the Johns Hopkins University- Universitat Pompeu Fabra Public Policy Center in Barcelona. Her research focuses on the contestation, subversion and resistance of labour and other social movements to capitalist relations of domination. She has written and researched on the effects of the current financial crisis on the Spanish state, the British labour movement and social movements in Spain. Her recent work has been published in *Comparative European Politics*, *New Political Economy* and the *Global Labour Journal*. She has a forthcoming manuscript with Routledge, co-authored with David Bailey, Nikolai Huke and Olatz Ribera-Almadoz entitled *Beyond Defeat and Austerity: Disrupting (the Critical Political Economy) of Neoliberal Europe*.

RN01 | Session 01a Active Ageing & Wellbeing

Women in transition: profiles and wellbeing practices in the age of menopause

Giulia Mascagni, Andrea Giannini
Dipartimento di Scienze Politiche, Università di Pisa, Italy; Dipartimento di Medicina Clinica e Sperimentale, Università di Pisa, Italy
giuliamg.mascagni(at)gmail.com,
andrea.giannini(at)unipi.it

Midlife is a phase of profound personal and social change for women: a number of life events involving a change of role and/or a redefinition of identity take place around that time. The paper presents some reflections based on a work in progress research devoted to focuses on a nodal passage of life biological but not least social: the menopausal transition. Through the analysis of the literature and original data, it studies and clearly identifies profiles and practices of mature adult women, considering the intervening influences between spheres of life, social configurations and health (perceived and objective).

The field research was conducted in two phases, each with specific tools: a survey to key informants; and focus groups typologically organized with women in menopause and perimenopause. Three are the issues in particular better highlighted:

I) The experience of the bodily changes related to aging, along with the awareness of the loss of fertility and the related effects on self-image.

II) The personal experience of menopausal symptoms (light or pervasive) and the potential interference with personal and social activities.

III) The strategies implemented to deal with change.

The analysis of this case studies provided a new and clearer insight into the condition and perception of menopause in relation to health and quality of life; also, the multidisciplinary approach allowed to better define the framework of the main elements - tangible/intangible; individual/collective; environmental - which act as an incentive or as a barrier to redefine women's self-image, roles and daily life.

Timing, duration and order: The influence of housing histories on later life wellbeing

Bram Vanhoutte, Morten Wahrendorf, James Nazroo
University of Manchester, United Kingdom; University of Düsseldorf, Germany; University of Manchester, United Kingdom
bram.vanhoutte(at)manchester.ac.uk,

The long arm of childhood, social mobility and the risk exposure that accumulative (dis)advantage entails, are three powerful, interrelated life course mechanisms that are often tested using relatively crude empirical measures. This contribution wants to highlight the possibilities of life history data in grasping the importance of timing, order and duration of housing over the life course. Housing is an important proxy for life course socio-economic position, as it is the most basic form of wealth accumulation in the UK. This contribution makes use of the residential life history data, from birth up until the age of 50, collected in wave 3 of the English longitudinal study of ageing (ELSA), in a combination of sequence analysis, cluster analysis and regression techniques. A longer duration of renting and owning accommodation is related to respectively worse and better later life wellbeing. Moving more in childhood does not have implications for later life wellbeing, while frequent moving in young adulthood has positive effects on affective and eudemonic wellbeing. Moving more in midlife results in lower life satisfaction. Ten distinct housing careers emerge, illustrating the importance of accommodating heterogeneity in the population. Downward housing trajectories stand out as detrimental to later life wellbeing, while growing up abroad as a child is beneficial.

Spanish elderly are reflecting on their active ageing. How their views differ from the scientific literature and policy making?

Vicente Rodriguez, Gloria Fernandez-Mayoralas, Fermina Rojo-Pérez, María Eugenia Prieto-Flores
Spanish National Research Council, Spain; Spanish National Research Council, Spain; Spanish National Research Council, Spain; National University at Distance, Spain
vicente.rodriguez(at)cchs.csic.es,
gloria.fernandezmayoralas(at)csic.es,
fermina.rojo(at)cchs.csic.es, meprietof(at)geo.uned.es

Introduction: The Spanish population is becoming older and this offers alternatives for the development of an active living in different social contexts. There are multiple efforts to make active ageing an operative concept under professional and non-professional perspectives (research, social agents, organizations, older-adults individuals).

Objective: This paper aims at analysing how older-adults in Spain build their active ageing, by studying the dimensions, factors, and consequences that derive from their way of living. A comparison with other active ageing perspectives, especially those coming from the literature and the documents that define public policies, is also intended.

Data and method: Seven focus groups, composed by 50 individuals older than 50, all of them participants in the Longitudinal Aging Study in Spain, Pilot Survey, ELES-PS, as well as 10 in-depth interviews with senior social organizations officers were collected to

approach the lay active ageing perspective. Literature and policy papers review of active ageing has been also deployed to make a contrast with the lay approach. All the data have been analysed with Atlas.ti.

Results: Older people in Spain do not clearly assume what active ageing is for them, but their discourse allows to identify some referential aspects about the conditioning factors of their behaviour leading to an active ageing retirement, offering outstanding ideas about their personal, cultural, social activities, their leisure time in general, their involvement in some social participation interests and the benefits they get. Literature on active ageing and policy documents will allow comparisons between lay, scientific and policy perspectives.

Rethinking the concept of successful aging: a disability studies approach

Håkan Jönson, Tove Harnett, Annika Taghizadeh Larsson

Lund University, Sweden; Lund University, Sweden; Linköping University, Sweden
hakan.jonson(at)soch.lu.se, tove.harnett(at)soch.lu.se, annika.t.larsson(at)liu.se

The theoretical concept of successful aging has been closely related to individual responsibility for maintaining health, high physical and cognitive functions. Critics have argued that successful aging models reinforce the marginalization and increase the stigma associated with diseases and impairments in older ages. The aim of this presentation is to redirect attention from the – much criticized – normative and individualized character of successful aging, and rework it into a new model inspired by disability policies, and in particular the emphasis on equal rights that is present in the Scandinavian normalization principle. The new model – which we refer to as the Scandinavian Model of Successful Aging – is based on comparisons of possibilities as means to argue for the right to live like “others”. According to the proposed model, success is a matter of how society enables or disables individuals as specified into two criteria: a) being enabled to have an active engagement with life, like others in the third age, and B) being enabled to maintain a high level of function, like others in the third age. The potential of the model is discussed using interviews and participant observations from three projects involving persons who have aged with severe disabilities and help in the form of personal assistance. Interviewees described how the flexible help in the form of personal assistance enabled them to maintain an active engagement in life and a high level of function through activities that have been described as typical for the third age: exercise, travel, studies, research, hobbies, participation in voluntary work and political activities.

RN01 | Session 01b Care Policies

Care gap and the Care Mix in Europe: Exploring Modes of Long Term Care across European Countries

Platon Tinios, Thomas Georgiadis, Zafiris Valvis
University of Piraeus, Greece; Panteion University of Political and Social Sciences, Greece; University of Piraeus, Greece
ptinios(at)gmail.com, th.georgiadis(at)gmail.com, zvalvis(at)gmail.com

Ageing in Europe has increased the need for Long term care (LTC). LTC meets similar needs through strikingly different means in different contexts. This paper uses data obtained from the fifth wave (2013) of the Survey of Health Ageing and Retirement in Europe (SHARE) of people aged 50+ as a means to benchmark LTC in fifteen European countries from the North to the South. The focus is on two key indicators: The Care Gap, that is, the extent to which the need for care is not met by any kind of provision, and the Care Mix, that is, how the overall provision is split into formal (professional - public and private), and informal care (unpaid care by family, friends or neighbours). Basic findings for the 65+ population are supplemented by an analysis by large age groups and gender. The findings on heterogeneity by systemic features and by individual characteristics feed into an analysis that treats LTC as social investment. They can explain differences in the nature of social investment, the flows of potential costs and benefits and their distribution but also on the identity of those undertaking long term care social investment decisions.

Care in times of choice and competition – A synthesis of the concept(s) of care and their relevance for mainstream economics

Ricardo Rodrigues
European Centre for Social Welfare Policy and Research, Austria
rodrigues(at)euro.centre.org

The introduction of market-based mechanisms for the provision of care has been one of the defining characteristics of changes introduced in long-term care (LTC) systems. This transformation explicitly portrays users as consumers of care and implicitly assumes care to be a conventional commodity liable to be traded in marketplaces. The concept of user as consumer of care has triggered a broad debate, but a similar discussion on the concept of care as a commodity and its implications for the theories underpinning choice and competition have thus far lagged behind. This paper aims to bridge this gap by contributing to engage the diverse literature on care with the literature on choice and competition and critically synthesizing the implications that the concept of care has for market-based developments in LTC. Drawing on a range of mostly theoretical literature, the paper argues that the concept of care as a relationship, central to feminism literature, and

motivations for caring based on moral obligations have significant implications for choice and competition. They establish care as an experience good based on intangible caring relationships; whilst also pointing towards the potential for LTC to be morally contested commodity. The latter argument is of crucial importance in the context of choice, as it highlights the relevance of the concept of social embeddedness to understand users' decisions and questions the role of money in caring transactions that might be better described as gift exchanges akin to Akerlof's depiction of certain labour market transactions. The paper concludes by arguing the direct relevance of these findings for policy and research.

Can an expansion of informal care significantly reduce the need for institutional care for the elderly?

Mark Elchardus

Vrije Universiteit Brussel, Belgium
mark.elchardus(at)vub.ac.be

The paper is based on a pure probability sample of 2891 inhabitants, 45 to 75 years old, living in the Flemish (Dutch speaking) region of Belgium, drawn on the basis of the national population register (the net response rate was 53%). The survey dealt with various aspects of aging, dependency and care. The present paper focuses on two questions: (1) to what extent does the present level of informal care for dependent elderly person avoids or postpones long term institutional care, and (2) can a further increase of informal care be expected.

On the basis of the survey it is estimated that the 2.3 million people aged 45 to 75 living in the Flemish region, currently invest 123.000 full time equivalents in care, which postpones or avoids about 71.000 placements in institutional care (compared to the currently existing 75.000 beds currently available in the region). Clearly, informal care currently contributes very importantly to care for the dependent elderly people.

Former care givers were also asked if the institutional placement of the dependent person for which they cared, could have been postponed or avoided. On the basis of their answers it is estimated that, under ideal conditions, this would only be the case for 3000 to 6000 dependent persons. A further expansion of informal care can not be significantly counted on to slow the rate at which institutional care will have expanded in the next 15 years.

Characteristics and determinants of intergenerational transfers among families using mixed care for older people

Valentina Hlebec, Masa Filipovic Hrast

University of Ljubljana, Slovenia; University of Ljubljana, Slovenia

valentina.hlebec(at)fdv.uni-lj.si,
masa.filipovic(at)fdv.uni-lj.si

Provision of care to dependent old parents or parents

in law is an important part of intergenerational exchanges within families, especially in countries where long-term care system is based predominantly on family care. However, in mixed care networks, comprised from family carer(s) and formal carer(s), care tasks are shared between family members and formal carers. Apart from care shared by formal and informal carers, adult children and their parents may have financial and time exchanges. We will use the first Slovenian national survey of social home care users and their family members, collected in 2013 to observe characteristics and determinants of intergenerational transfers among families that use mixed care, i.e. a combination of formal and informal care for older people. We will observe the main determinants of intergenerational transfers within the dyads of users and their family carers, such as household type, age, distance between caregiver and care-receiver, and extent of care tasks.

RN01 | Session 01c Inequalities

Inequalities in the broken heart syndrome

Filip Oskar Teodor Wigselius

Stockholm University, Sweden

filip.wigselius(at)sociology.su.se

Excess mortality after widowhood differs for men and women. Previous studies also have shown that socioeconomic status (SES) is associated with factors, e.g. access to social- and other types of support, which have a bearing on the widowhood effect. I argue, that theory indicates an interaction between gender and SES. As both, the number of widows/widowers and the diversity in SES is increasing, it is necessary to examine these factors jointly.

First results using panel data of from the Swedish Panel Study of Living Conditions of the Oldest Old (SWEOLD), confirm the hypothesis that the relationship between SES and the widowhood effect differs between women and men. The widowhood effect was relatively larger among women with higher socioeconomic status among those with lower, while no differences were found among men. Analyses using Swedish total population register data will be ready in time for the ESA meeting.

What Equality? Life Course Diversity and Inequality in Later Life in Changing Sweden

Andreas Motel-Klingebiel, Susanne Kelfve

Linköping University, Sweden; Linköping University, Sweden

andreas.motel-klingebiel(at)liu.se,
susanne.kelfve(at)liu.se

This paper discusses shifts in inequality over time in Sweden, which serves as a case example of a quickly changing welfare society. Its 60+ population of today faced the golden age of capitalism, prosperity and welfare but also crises, new uncertainties, erosions and shifts in social norms and organisation of labour.

These changes add to life course inhomogeneity, generate asynchronies, and create winners and losers regarding life chances and inclusion. Transformations in life courses and social institutions exacerbate the cumulation of (dis)advantage and have crucial impacts on employment, retirement transitions and later life. Aspects like gender, cohort, education, ethnicity and others moderate these dynamics. Increasing disparities between societies give rise to migration and contribute in turn to differences within countries. This study deals with changing population compositions, patterns and later-life consequences of life courses in Sweden focusing on inter- and intra-cohort disparities. By taking an international comparative perspective, Swedish trends are contrasted with those in other European societies. Based on extensive Swedish registry information and European survey data from EU-SILC this study assesses changes in trajectories and distributions in a cohortsequential perspective. Results find significant shifts in life course patterns that are fortified by variations in population compositions with disadvantaged groups as forerunners in overall relative declines in later-life economic positions, and increasing intracohort inequalities corresponding with unexpected drawbacks for many as well as new possibilities for others

Paid work after retirement and marital quality: Are there differences between men and women?

Andreas Mergenthaler, Volker Cihlar
Federal Institute for Population Research, Germany;
Federal Institute for Population Research, Germany
andreas.mergenthaler(at)bib.bund.de,
volker.cihlar(at)bib.bund.de

Background: Paid work after retirement has increased in Germany during the last years. Several studies have addressed the prevalence of post-retirement work and its associating factors. However, the association between post-retirement work and marital quality as an indicator of retirement adjustment has not been studied in Germany so far. The study addressed the question (i) whether post-retirement work is associated with marital quality and (ii) whether this association is moderated by gender.

Data and method: The survey "Transitions and Old Age Potential" (TOP), a representative sample of 5,002 respondents aged 55 to 70 years was used. Two indicators of marital quality were analysed in hierarchical binary regressions: Subjectively rated change in partnership since retirement and partnership satisfaction. Post-retirement work was included as a binary indicator along with socio-demographic and transition-related variables, especially gender and the interaction between gender and employment status in retirement.

Results: The results show that paid work in retirement is not directly associated with marital quality, neither for men nor for women. However, the association between post-retirement work and the subjective change of the partnership quality after retirement was moderated by gender. Women in paid work after

retirement had a significantly higher probability of reporting no change or a worsening partnership quality compared to male respondents.

Discussion: The findings of the study add to the international debate by focusing on the setting of a conservative welfare state like Germany. It emphasizes the importance of a gender-related perspective. However, further longitudinal analyses are needed to address questions of causal inference.

Population ageing in Russia

Elena Nikolaevna Gorbaneva
NRU HSE, Russian Federation
helen563381994(at)gmail.com

The last decades of the demographic processes in both developed and developing countries are characterized by population aging. Shifts in the demographic structure determines the main directions of development of health and social protection based on determinants of healthy longevity among the main of which deals with the social status of the elderly, their health status, level of efficiency and mental state. Of particular practical significance at the present stage is a series of annual nationwide representative surveys on the basis of probabilistic stratified multistage territorial sample developed with the participation of leading experts in this field, which is an international research project National research University - Higher school of Economics and ZAO "Demoscope" with the participation of the population Center University of North Carolina at chapel hill (USA) and the Institute of sociology. Since 2010, the project received a new name "the Russian monitoring of economic situation and population health of the HSE" (RLMS-HSE). The results of these studies served as the basis for the work of the M. Kolosnitsyna, N. Khorikina and H. Dorzhieva "What Happens To Happiness When People Get Older? Socio-Economic Determinants Of Life Satisfaction In Later Life", which examines the satisfaction of the elderly life and, as a consequence, identifying key factors to healthy longevity.

RN01 | Session 02a The Oldest Old

Lifestyles of the Very Old – A Qualitative Analysis

Luise Geithner
University of Cologne, Germany
luise.geithner(at)uni-koeln.de

According to Bourdieu, lifestyles are class-specific patterns of taste and behavior. While Bourdieu analyzed lifestyles of middle-aged employed people, it is questionable if his assumptions about the structuring of the social space hold true also for those in old or very old age. Especially within the age group of the very old changes in health, mobility or social network gain importance. However, lifestyle research often treats age as a background variable only and rarely looks at expressive behavior specific to very old age. Hence, lifestyles of the very old are less differentiated and mainly associated with passivity.

Therefore, a qualitative study was performed to shed light on the specific range of expressive behavior of the very old. Eighteen semi-structured interviews were realized with Germans aged 80 and older living privately as well as institutionalized. The analysis follows the main research questions: How are lifestyles expressed in very old age and what function do they have? How are the lifestyles linked to living conditions as well as social origin and biography? Thereby, stability rooted in the habitus as well as change due to age are taken into consideration. Furthermore, taste with regard to music, reading, TV and art is analyzed. First results show a broad range of expressive behavior. In addition, also people in need of care or living in nursing homes show a strong interest to maintain or regain important parts of their lifestyles.

Spirituality of the Oldest Old (80+): Struggle between Traditional Religion and Post-Modernistic Spirituality

Anna Janhsen
University of Cologne, Germany
Anna.Janhsen(at)uni-koeln.de

To enable well-being of the oldest old (80+) despite a decline of physical and mental capacities and social losses, spirituality is considered as an important, independent component. Especially in modern and post-modernistic social approaches (eg New Age-movement, Esoteric or Body-Mind-Wellness) spirituality is often conceptualized in contrast to traditional and institutional religion. The European tradition theorizes spirituality in contrast rather within the context of religion.

These ambiguous and more and more merging understandings of spirituality within the local social sphere alongside different social developments regarding the status of spirituality and religion in society (secularization, individualization, liberalization as well as fundamentalism) are particular challenges in the lifelong engaging especially of the oldest old with questions regarding their spirituality and transmitted religious belief systems nowadays. Therefore, the impact of this social controversy regarding the understanding and function of spirituality on the subjective conceptualization of the oldest old is analyzed in qualitative interviews (n=21) with Germans 80+years from Christian, Islamic and Judaist cultural and religious backgrounds as well as non-religious backgrounds. In addition, the importance of religious socialization and social changes for the spiritual development, its relevance to find meaning in and of life and its impact on their well-being are discussed and linked back to different traditions of the understanding of spirituality.

Factors associated with decline in high morale in a five-year follow-up of very old people

Marina Näsman, Johan Niklasson, Yngve Gustafson, Birgitta Olofsson, Hugo Lövheim, Mikael Nygård, Fredrica Nyqvist
Åbo Akademi University, Finland; The Society of

Swedish Literature in Finland; Umeå University, Sweden; Umeå University, Sweden; Umeå University, Sweden; Åbo Akademi University, Finland; Åbo Akademi University, Finland manasman(at)abo.fi, johan.niklasson(at)home.se, yngve.gustafson(at)umu.se, birgitta.olofsson(at)umu.se, hugo.lovheim(at)umu.se, mikael.nygard(at)abo.fi, fredrica.nyqvist(at)abo.fi

Introduction: Morale in old age can be described as a future-oriented optimism and consists of an overall sense of well-being and a certain acceptance of changes in life associated with aging. Our research has previously shown that high morale in very old age is associated with increased survival and lower risk of depressive disorders. The aim of the present study is to identify variables associated with a decline in high morale over a five-year follow-up period in very old people.

Methods: The study is based on data from the Umeå85+/GERDA-study, which is a population based study conducted in Northern Sweden and Western Finland. The sample of the present study consists of 174 individuals who were 85 years or older and had high morale at baseline. Morale was measured with the Philadelphia Geriatric Center Morale Scale (PGCMS). Logistic regression was used for the multivariate analyses.

Results: Forty-seven (27%) individuals had a significant decline in morale over five years. In the univariate analyses, social isolation and poor self-rated health were significantly associated with a decline in morale five years later. Social isolation remained significant on a <0.05 level and poor self-rated health on a <0.1 level when controlling for age, gender, country and years of education.

Discussion: The majority of the sample had no significant decline in morale over the follow-up period. Identifying variables associated with decline in morale can, however, have important implications for the well-being of very old people.

Health and social factors associated with the rejection of active euthanasia in community-dwelling older subjects: evidences from an Italian case study

Stefano Poli, Valeria Pandolfini
Di.S.For., Università degli Studi di Genova, Italy;
Di.S.For., Università degli Studi di Genova, Italy
Stefano.poli(at)unige.it, Valeria.pandolfini(at)unige.it

Background: The major extension of late life expectancy in last decades has increased the significance of end-of-life issues, particularly among elderly people, considering both the role of medical practices in shaping and defining dying trajectories and the differences in national laws and in public attitudes about preservation of self-dignity and removal of pain in death. Avoiding a prolonged, painful and undignified death provides for many a rationale for euthanasia or physician assisted death, legalized in few countries and largely debated in most of the others. On the contrary, the fear of increased pressure

to end one's life prematurely and of potential abuses became often the main argument of opposition among vulnerable groups, like older people, especially when suffering disability, chronic diseases and lacking of autonomy.

Methods: Through a representative cross-sectional survey on 1.782 community dwelling over 65s residents in Genoa (Italy), we examined with bivariate and binary logistic regression analysis their attitudes towards active voluntary euthanasia (AVE), exploring associations with socio-demographic characteristics, health and socioeconomic conditions, ideological orientations and cultural practices.

Results: 39.9 per cent of our sample fully disagreed with AVE, 26.7 per cent expressed tolerance, 35.2 per cent agreed completely. Results showed significant associations of different attitudes toward AVE with cultural values and moral practices, as well with health and disability conditions, evidencing increasing full rejection toward AVE among over 75s old-old profiles (46.3%).

Conclusions: Our results suggest major differences among intergenerational units of older people, showing evidences of significant cultural change in attitudes toward end-of-life issues. If and to the extent that older age plays a role, it is rather still strongly associated with rejection than with acceptance of AVE.

RN01 | Session 02b Technology & Innovation I

Technostress: A New Threat to Wellbeing in Later Life

Galit Nimrod

Ben Gurion University of the Negev, Israel
gnimrod(at)bgu.ac.il

Numerous studies conducted during the past decade have demonstrated an overall positive association between Information and Communication Technology (ICT) use and Subjective Wellbeing (SWB) in later life. Without detracting from the value of previous research, it should be noted that most studies on ICT use and SWB in older adulthood focused on positive impacts, typically neglecting negative effects. By concentrating on technostress (stress created by ICT use), a destructive impact of ICT that is highly documented in research on younger users, this study aims at illuminating a potential risk factor associated with technology use in old age. The study was based on an online survey of 537 Internet users aged 60 years and over. Relying on constructs identified in previous studies, a new technostress scale was designed specifically for older adults. Additional measurements related to users' background characteristics, Internet use patterns and satisfaction with life. Analysis indicated that female gender, older age, less education and income and poorer perceived health correlated significantly with higher technostress levels. Furthermore, Internet use experience, frequency and sophistication were negatively associated with technostress, as was life satisfaction—a correlation that remained significant

even after controlling for background variables and Internet use patterns. These findings suggest that technostress is key factor in explaining third-level digital divides (i.e., disparities in benefits gained from technology use) and ought to be considered a threat to wellbeing in older adulthood. Future research should explore its antecedents and consequences and identify interventions useful in alleviating technostress and its effects on seniors.

Learning to use digital technologies in later life: affordances and constraints

Barbara Barbosa Neves, Ron Baecker

The University of Melbourne, Australia; University of Toronto, Canada

barbara(at)bbneves.com, ron(at)taglab.ca

Globally, older adults (65+) are still less likely to use the Internet than other age groups and are more likely to discontinue use with age. Research has shown that digital exclusion is an emerging form of social exclusion, as older adults are unable to access services and information that can increase social participation and well-being. Despite the growing number of projects to bridge digital divide(s), little attention has been paid to what older adults define as critical digital skills and to what they perceive as vital to ensure a safe and efficient use of digital technologies. This lack of evidence affects how we design and assess the impact of senior training programs, while reinforcing a perception of older adults as passive learners and neglecting their voices, needs, and aspirations. To help bridge this gap, we report on a longitudinal study of 17 older adults learning to use a tablet and a communication app in Canada. By drawing on mixed-methods data that included interviews, field observations, and usability evaluations, we explored their perspectives on training and adoption of digital technology. Findings reveal a rich picture of sociotechnical meanings, self-presentation efforts, and impression management by participants and researchers alike.

Mature Adults and the Information Society. An Analysis through PIAAC Data

Tatiana Iñiguez, Diana Valero

University of Zaragoza, Spain; University of Zaragoza, Spain

tatianai(at)unizar.es, dvalero(at)unizar.es

In the current information society, the skills acquired during formal education are quickly obsolete in the lifecourse of a person, hence the importance of Lifelong Learning. If we focus on Mature Adults (MA, people over 55, following the third age range provided by the Survey of Adult Skills - PIAAC -, OECD, 2013), this situation is even more pressing given the risk of exclusion that can be suffered by this population group, especially in the workplace. In the present contribution we analyze the competences of MAs, with special emphasis on their use of ICTs and digital skills, taking into account their sociopersonal variables. To do this, we used the microdata provided

by the PIAAC survey (OECD, 2013) performing a descriptive statistical study, first, to characterize the sample in comparison to others age groups. Secondly, a bivariate analysis was carried out using correlation and binary logistic regression, to analyze the relationship between sociopersonal characteristics, digital skills and other competences measured in the scale. The results show an increasing inclusion of MAs into Information Society, starting to break the generational digital divide. It is also shown that when the domain of informational competences is greater, it has a relevant effect on the other skills measured in the scale. We conclude that a greater democratization of the information society is necessary for a more inclusive society, defending a humanistic approach to lifelong learning and lifewide learning as a fundamental strategy to get it.

How Convenient is Everyday Life?: Older Practitioners and the Migration of Practices Online

Carolynne Lord

Lancaster University, United Kingdom
c.lord(at)lancaster.ac.uk

There have been concerted efforts in the public sphere to migrate much of our everyday life to the internet. In the pursuit of increasing standards of convenience and speeds of access to practices, such as those of shopping, banking and communication, much of everyday life, for younger cohorts of practitioners, is now enacted via their information technologies. But how does this affect those older cohorts (aged 65+) engaged in these practices? How do they experience the migration of these practices into the online sphere?

Following a practice-theoretical approach, this presentation will explore interview material collected with 10 older participants who were in the process of integrating apps, and the tablet computer through which they were accessed, into their daily lives. By taking a selection of the practices discussed (including photography and Scrabble) and exploring them in more detail, this presentation will demonstrate how the integration of the internet into everyday practices affects the conduct of their performance by older practitioners. By critically examining the notion of internet-dependence, in relation to everyday practices, this presentation seeks to provoke and contribute to discussions concerning ideas of internet-dependent convenience, and how these notions affect older practitioners who feel increasingly "left behind".

RN01 | Session 02c Voluntary Work and Nonemployment

The influence of intentional on actual volunteering among older people in Germany. Results from a two-wave-study

Frank Micheel

Federal Institute for Population Research, Germany
frank.micheel(at)bib.bund.de

Background: In the context of the active ageing

discourse in Germany, older people who intend to participate in volunteering are discussed as a serious societal potential. However, the link between intention and subsequent realisation of volunteering has been examined infrequently. Thus, the study investigates the influence of intentional volunteering on actual participation at a later stage.

Data and method: Data were taken from the two-wave survey "Transitions and Old Age Potential" with 2,501 respondents born from 1942 to 1958. We examine the relationship between intentional volunteering from the first wave (2013) and actual volunteer behaviour in the second wave (2016). The main effect is based on a 2*2 typology along the dimensions "actual volunteer work" and "intention to start/expand volunteering in the future". This effect is controlled for individual (e.g. Big Five) and socio-demographic variables (e.g. gender, education) as well as for past volunteer engagement.

Results: Intentional volunteering in the first wave has rather predictive power regarding actual volunteering in the second wave. Bivariate analyses reveal a strong association between the main effect and actual volunteering in the second wave (Cramer's $V=.6$). This relation stays robust in multivariate analyses controlling for individual and socio-demographic variables and for past volunteering experience.

Implications: The results suggest that the intention to start or to expand volunteer work is a reliable indicator for subsequent volunteering in older adulthood. It gives new and valuable information for the public and scientific discourses about harnessing (further) old age potentials in Germany.

Volunteering among immigrants in middle and later life

Claudia Vogel, Julia Simonson, Clemens Tesch-Römer

German Centre of Gerontology, Germany; German Centre of Gerontology, Germany; German Centre of Gerontology, Germany

claudia.vogel(at)dza.de, julia.simonson(at)dza.de, clemens.tesch-roemer(at)dza.de

Volunteering contributes to successful ageing and social participation, and it is expected to be beneficial for both the society and the volunteers themselves. This should hold true for immigrants and native citizens likewise. In respect to volunteering among immigrants, two opposed hypotheses are discussed: (a) Volunteering rates should be higher among immigrants than in the native population, due to the necessity to cope with challenges in the immigration process and with the integration process in the host country; (b) Volunteering rates among immigrants should be lower than in the native population, e.g. due to disadvantaged socio-economic status and deficits in the knowledge of the civil society structures.

We deal with two research questions: How do the volunteering rates of the immigrant and the native population differ in middle and late adulthood? How can differences in volunteering rates in immigrants and natives be explained? The analyses are based on the German Survey on Volunteering 2014, a

representative telephone survey of the population aged 14 and older ($n = 15,941$ respondents aged 50 and above; among them $n = 938$ immigrants aged 50 and above). The results show that among the population in middle and late life immigrants are clearly less likely to volunteer than natives in Germany. The differences can be partially attributed to socio-economic resources as well as to differences in the democracy index of the countries of origin, which we interpret as a socialization effect.

Barriers to Volunteering in Later Life

Dr Sarah Gibney, Ms Niamh Moran, Dr Mark Ward, Ms Sinead Shannon

Department of Health, Ireland; Department of Health, Ireland; Department of Health, Ireland; Department of Health, Ireland

sarah_gibney(at)health.gov.ie,

niamh_moran(at)health.gov.ie,

mark_ward(at)health.gov.ie,

sinead_shannon(at)health.gov.ie

Background: As the population experiences rapid ageing, concerns are growing surrounding a public expenditure which will be unable to support an increasing proportion of society which will be out of the labour force. However, an increasing number of older people contribute to society through unpaid voluntary roles. Volunteering also benefits the volunteer by providing essential constructive and productive roles as well as being associated with positive health and well-being outcomes. The purpose of this study is to explore barriers to volunteering among adults aged 55+ in Ireland to inform local actions to promote volunteering in Irish communities. **Method:** The current study analysed data collected as part of Healthy and Positive Ageing Initiative (HaPAI) survey ($n=10,500$). This was a random-sample, population representative survey of people aged 55 and older, living in 21 Local Authority areas, in Ireland between 2015 and 2016. A mixed effects logistic regression was conducted to analyse the association between voluntary engagement and a range of predictor variables. **Results:** Not liking your neighbourhood ($OR=2.76$), severe daily limitations ($OR=2.78$), material deprivation ($OR=1.91$) and being single ($OR=1.94$) or divorced ($OR=1.76$) all significantly predicted non-volunteering. Other predictors included being a homemaker, being aged 75 or above, moderate daily limitations and being widowed. **Conclusion:** The results indicate that demographic factors, social roles and resources paired with lifestyle factors have propensity to determine volunteer engagement.

RN01 | Session 03a Theoretical Concepts and Discussions

Anti-reductionist sociology as a basis for dementia studies

Edward James Tolhurst

Staffordshire University, United Kingdom

edtolhurst(at)gmail.com

Conceptualisations of the experience of dementia have been strongly influenced by the work of Tom Kitwood. While Kitwood's work valuably promoted the personhood of the person with dementia, it has been critiqued for offering a narrow perspective of experience. The requirement to expand this orientation is an enduring concern for dementia studies: drawing upon concepts from sociological theory, this paper seeks a richer theoretical contextualisation of the experience of dementia. This approach is aligned with an anti-reductionist sociology that rejects modes of theorising which reduce phenomena to a single explanatory basis. Anti-reductionist sociology must therefore account for the various domains that comprise the social fabric. Within the domain of psychobiography it is vital to acknowledge the intrinsic value of an individual person, which is not decentred by either neurodegeneration or social influences. While recognising this individuality, a cogent relational approach must also grasp the complex interplay between the person with dementia and others, such as family members, who feature in the domain of situated activity. Moreover, interaction can only be fully grasped by recognising the wider influence of social settings and contextual resources. This paper asserts that this is not a rarefied conceptual debate. Enhanced theoretical resources can help to advance a balanced and credible research agenda for dementia studies, which can reconcile the respective influences of biology, psychobiography, relationships and social contexts.

The Structured Independency of Old People: A novel theory of old age policy

Jutta Pulkki, Jari Pirhonen

University of Tampere, Finland; Gerontology

Research Center, GERIC; University of Tampere,

Finland; Gerontology Research Center, GERIC

jutta.pulkki(at)uta.fi, jari.pirhonen(at)uta.fi

In this paper contemporary old age policy is critically analysed. This is done by re-examining 'structured dependency' theory by Peter Townsend. By elaborating the Townsends' theory, a novel theory is composed. Theory formulation is based on the findings from the current theoretical and empirical literature, policy documents, and 'grey' literature such as the reports and newspaper articles.

The point of departure of 'structured dependency' theory is that certain kind of social policy, for example institutional long-term care generate dependent and passive old people. Today, active old age and freedom of choice are emphasised and independency of old people has been tried to maintain by for example replacing institutions with home care. This new old age policy has, however, as fundamental although different consequences as the former one, which we aim to identify.

We suggest that the new old age policy is based on neoliberal ideas and as such may result in situations where true need of old people is not recognised. This kind of policy is not responding to the dependency

evident at old age, and consequently makes independency not genuine but forced. Thus, it could be argued that we are heading to 'structured independency' where old people in need are left to cope alone, independently, but socially and physically isolated.

We conclude that the new old age policy may produce 'structured independency' where independency is rather forced than a natural or a dignified state. Instead of emphasising independency, freedom of choice and activity, old age policies should be based on true recognition of the nature of old age.

„Successful = Healthy = Good?“ – Gerontological Concepts of “Successful Aging” in Germany and their Normative Implications

Larissa Pfaller, Mark Schweda
Friedrich-Alexander University Erlangen-Nürnberg (FAU), Germany; University Medical Center Göttingen
larissa.pfaller(at)fau.de,
Mark.Schweda(at)medizin.uni-goettingen.de

Gerontological concepts of „successful aging“ not just constitute a leading academic paradigm in contemporary aging research. They also exert a critical influence on political programs in aging societies. Thus, they become a significant element of policies for the elderly and social images of aging. In particular, successful aging is frequently understood as “active” and therefore “healthy aging”, for example in the WHO’s “Global strategy and action plan on ageing and health” aimed at developing strategic international actions for the “Decade of Healthy Ageing” starting in 2020.

Against this backdrop, our contribution explores how concepts of “successful aging” are intertwined with notions of health and healthy living and analyzes the social and ethical implications of such images of age and aging. Our project „Successful = Healthy = Good Aging?“ focuses on contemporary discourses on “successful aging” in Germany. By means of qualitative social research (content- and metaphor-analysis of expert interviews, focus groups, and policy statements), we examine the concept of “successful aging” in recent German gerontology, social policy discourses, and the broader public. In doing so, we identify values and norms grounding contemporary gerontological discourses and examine how they are related to questions of health and illness. We discuss the normative premises and implications of gerontological and social understandings of “successful aging” and point out the need for further research and critical reflection.

RN01 | Session 03b Retirement Timing

The scarring effects of unemployment on the realized retirement age

Kathrin Komp
Helsinki University, Finland
kathrin.komp(at)helsinki.fi

Researchers have long established that

unemployment spells can influence the further career progression. They found that unemployment spells, for example, increase the probability of experiencing additional unemployment spells and slow down career advancement. Such effects of unemployment are sometimes labelled scarring effects. Previous studies document scarring effects on the short- and mid-term. This analysis takes a step beyond previous studies in that it explores scarring effects in a long-term perspective, investigating the scarring effects of unemployment on the realized retirement age. The research questions are: Over how long a period of time can unemployment spells influence the realized retirement age? And are there country- and gender-differences in this influence? The analysis is a time-lagged analysis of international longitudinal microdata from the life history interviews of the Survey of Health, Ageing and Retirement in Europe. Findings show that unemployment spells can indeed influence the realized retirement age, with unemployment spells directly preceding retirement being particularly influential. Moreover, within- and between-country differences in this influence exist. An important reason for differences in the influence of unemployment spells is the existence of previous periods of non-employment. Such periods of non-employment determine when individuals reach the minimum contribution period to pension schemes, meaning whether or not they have the option to retire early. Thus, periods of non-employment constitute a mediator that determines whether unemployment spells can have a scarring effect on the realized retirement age.

Which factors influence premium deferred retirement decision?

Sabrina Aouici, Julie Rochut
Cnav, France; Cnav, France
sabrina.aouici(at)cnav.fr, julie.rochut(at)cnav.fr

Reaching full rate age appears as a central parameter in the decision-making process of future retirees. Most people leave as soon as possible (as they reach a full pension). However, some retirees delay their retirement. This article attempts to understand the determinants that influence the premium decision, as a deviation from full rate standard. Based on data from the “Retirement Intentions” survey (2005), matched with administrative data from the French National Social Security Scheme (Cnav), we estimate the probability of using premium and the number of trimesters deferred. A qualitative approach based on semi directive interviews among retired baby-boomers is added. Our cross-disciplinary work enhances the complexity of the decision process (subjective or objective criteria). The professional status is a significant marker of the choice to retire with a premium: being a manager and having a high income increase the probability to defer retirement with premium. Moreover, those who anticipate economic difficulties also have a more important propensity to be concerned by the premium. Furthermore, home buyers are more likely to extend working life, probably

in order to face out their home loan. At the same time, many baby-boomers think that they should be involved in taking care of a member of their family during their retirement (either a child, a spouse or an elderly parent), which give incentives to use the premium to maximize their resources.

The effect of retaining measures on retirement timing —depending on companies' possibility to adjust work time arrangement

Tove Midtsundstad, Åsmund Hermansen
Fafo, Norway; Fafo, Norway
tim(at)fafo.no, ahe(at)fafo.no

Offering retaining measures, like phased retirement or additional leave to older workers has become a widespread strategy to promote longer working careers in Norway (Midtsundstad 2015, Hermansen & Midtsundstad 2015, Eurofound 2016). However, analysis of these measures shows that the possibility of phased retirement does not affect older workers timing of retirement in Norway (Hermansen 2015). Studies also show that companies' possibility to offer reduced working hours varies significantly (Midtsundstad & Bogen 2011, Midtsundstad 2014). The aim of this paper is to examine to what degree the effect of phased retirement are dependent on companies' perceived possibilities to adjust their working time arrangement.

The research questions are investigated using data from a surveys carried out among a representative sample of Norwegian companies in 2010 combined with individual register data of all employees in these companies over the period 2000-2012. We use an individual fixed-effects model (difference-in-difference approach) in combination with a linear probability model.

Changing fields of occupation, hysteresis and retirement

Simon Schmiederer
Federal Institute for Occupational Safety and Health,
Germany
schmiederer.simon(at)baua.bund.de

In the recent decades there have been profound economic changes and changes within work-ing conditions. Based on data of a qualitative study I would like to illustrate the interplay of employees with these changes in the past and its impact on early withdrawal from paid em-ployment.

In our qualitative study in which 31 older people who were either still working, respectively intending to work at the age of 63, or who left work before the age of 63 were interviewed. The study specifically focuses on several occupational groups in Germany: nurses, bank clerks, and metal workers. It aims to examine why some older people retire early while some others work longer.

In all occupational groups retirees mentioned major changes within their field of occupation in the last decade of their working live. Those changes posed challenges for these workers because it produced a

conflict between their standards and their idea of "good work" in their specific occupation on the one hand and what was expected of them during and after restructuring through new established norms, values and working routines on the other hand.

This can be interpreted using the Bourdieuan term of hysteresis, which describes the gap between habitus and changing field conditions. By doing so, the cultural and structural aspects of job dissatisfaction, as a factor for leaving paid employment earlier, can be illuminated as well as how structures and individual lives are linked through the life course.

RN01 | Session 03c Technology & Innovation II

The delegation of care to technological means

Bernhard Wieser
Alpen Adria University, Austria; Inter-University
Centre, for Technology, Work and Culture
b_wieser(at)yahoo.com

European policy agendas address aging societies as one of the „grand challenges“ of the future. The concern is often economic, but also questions of solidarity, inequality and exclusion come to mind. New solutions for safeguarding care for older people are much sought-after. In this paper, I will focus on e-health and related technologies of „assisted ambient living“. Such applications promise solutions for better medical care and the possibility to deliver assistance in familiar domestic environments. Living-at-home at old age rather than in a nursing home does not only suggest a higher quality of life, but also lower health care costs.

With an empirical study, I examine selected contexts of application of computer assisted health-monitoring technologies. Using scenario method, I analyse how stakeholders and health care specialists, frame the ways in which these technologies are expected to be beneficial and help to tackle challenges of future health care systems. Scenarios frame the criteria used for the assessment of technologies of "assisted ambient living". In such a way they foreground economic growth, cost-benefit optimisation, technological innovation as well as living quality, health benefit and incentive of use. Aspects of social justice, inequalities and unintended adverse effects are, however, less prominent or even neglected criteria in the assessment of the delegation of care to technological means.

The paper will be relevant for "Aging in Europe" and addresses how the medical care for older people changes through the integration into capitalist economy and innovation policies.

eHealth policies for multimorbidity care in Europe:

Italy; National Institute of Health and Science on Ageing (INRCA), Italy; National Institute of Health and Science on Ageing (INRCA), Italy; National Institute of Health and Science on Ageing (INRCA), Italy
francesco.barbabella(at)inu.se,
g.melchiorre(at)inrca.it,
s.quattrini(at)inrca.it,

r.papa(at)inrca.it, g.lamura(at)inrca.it

technologies, health outcomes and policy perspectives for ageing societies

Francesco Barbabella, Maria Gabriella Melchiorre, Sabrina Quattrini, Roberta Papa, Giovanni Lamura
National Institute of Health and Science on Ageing (INRCA), Italy; Linnaeus University, Sweden; National Institute of Health and Science on Ageing (INRCA),

Older people with multimorbidity are in need for integrated and patient-centered care which can meet adequately their complex health needs. In the healthcare sector, the role of information and communication technologies (ICTs) for addressing multiple chronic conditions has increased enormously in the last decades across Europe, sustained by favorable research and policy trends. However, the implementation and impact of eHealth policies for multimorbidity care have not been assessed yet. Our study aimed at surveying eHealth practices addressing needs of people with multimorbidity, analysing implementation aspects and developing policy recommendations for overcoming current barriers. The work was part of the ICARE4EU project, co-funded by the Public Health Programme of the European Union. 101 high-potential programmes of integrated care for people with multimorbidity were selected in 31 European countries, with 84 of them including at least one eHealth solution. Most common services concerned electronic health records (EHRs) and tools for digital communication between care providers. Case study analysis of a sub-sample of programmes suggested that eHealth solutions for people with multimorbidity can contribute to: widening access to healthcare services; enhancing care coordination and integration; enabling patients' self-management; and improving proactive and prevention strategies. Despite this potential, eHealth policies in Europe lacked a global and comprehensive vision for addressing the challenges and exploiting the potential at best. On this basis, a series of policy recommendations was developed for national and European policy makers.

Internet use among carers of people with dementia: a scoping review

Areti L. Efthymiou, Andreas Charalambous, Nicos Middleton, Evridiki Papastavrou

Department of Nursing, Faculty of Health Sciences, Cyprus University of Technology, Cyprus; Department of Nursing, Faculty of Health Sciences, Cyprus University of Technology, Cyprus; Department of Nursing, Faculty of Health Sciences, Cyprus University of Technology, Cyprus; Department of Nursing, Faculty of Health Sciences, Cyprus University of Technology, Cyprus
arefthymiou(at)yahoo.com,
andreas.charalambous(at)cut.ac.cy,
nicos.middleton(at)cut.ac.cy,
e.papastavrou(at)cut.ac.cy

New technologies and social innovations are becoming promising tools in health care sector and

provide a variety of services to support carers of people with chronic diseases. In Greece and Cyprus, the large percentage of the population over 60 years old are less literate in internet service use. The aim of the study is to discuss the profile and the factors influencing internet use among carers of people with dementia. MEDLINE, PUBMED, CINAHL and PsychINFO databases were searched. Key questions of the review were: 1) What information/services do carers of people with dementia search on the internet?, 2) What are the factors influencing carers internet use? 3) What are the main topics of research concerning ICT interventions and carers of people with dementia? In total 84 papers have been reviewed and four main categories of research papers were identified: the profile of internet users and factors influencing use, ICT interventional studies assessing effectiveness, usability and acceptability studies, and concept mapping papers on the importance of ICT tools use. The majority of research focuses on effectiveness and acceptability of ICT interventions. The factors influencing the use of ICT interventions and internet use are not frequently addressed by researchers. Age, relationship with patient, the socioeconomic characteristics, education, hours of care play a role concerning the type and frequency of use. Carers search for health related information, legal and financial issues and care management information. The present study reveals the lack of research on the eHealth literacy field and carers of people with dementia. Carers' training in eHealth literacy topics is an innovative field, which could assist the use of new technologies in Health sector.

The Impact of Selective Participation in eHealth Research on Inequality and Exclusion in Old Age

Arianna Poli, Marianne Abramsson, Andreas Motel-Klingebiel

Linköping Universitet, Sweden; Linköping Universitet, Sweden; Linköping Universitet, Sweden
arianna.poli(at)liu.se, marianne.abramsson(at)liu.se,
andreas.motel-klingebiel(at)liu.se

High expectations and large investments support research on innovative solutions for health delivered via information and communication technologies (ICTs). Several studies demonstrated promising results confirming the potentials of ICT-based tools in improving quality of life of older people with long-term conditions and their family caregivers. However, those tools are seldom implemented in clinical practice and patients' everyday life. Also, when they are available, they reach only a limited number of users. Part of the reason for this lacking inclusiveness can be attributed to how ICT-based tools are developed and tested. Particularly, little attention has been paid to the selective participation often occurring in the studies and its possible impact on the successive implementation phases, in terms of inequalities and social exclusion of those who were not represented. An analysis on social selectivity is conducted in four randomized controlled trial studies testing ICT-based tools for self-care for older people and family

caregivers. The analysis is based on multivariate quantitative modeling and aims at quantifying effects of selective participation on the results of the interventions. Preliminary results suggested some participation biases are possible in the research process between individuals involved in the studies and those who were excluded, particularly in relation to: level of education, digital skills, attitudes towards ICT-based tools for health, health status. Several challenges face research and implementation of eHealth, among which is the risk of exacerbating social exclusion and inequalities for some groups. In order to promote better outcomes of the studies and guarantee equal provision of services, it is essential that research considers the heterogeneity of individuals targeted.

RN01 | Session 04a Care

Dementia caregiving as a challenging task of ageing

Marta Fekete

Corvinus University of Budapest, Hungary;
Semmelweis University, Budapest, Hungary
fekmar(at)gmail.com

Parallel with population ageing, the number of those who will need care will increase. Non-institutionalised, voluntary caregiving, usually provided by family members, has gained a critical role in recent times. Informal caregivers can face financial hardship, emotional strain, and deleterious effects on their physical and mental health, but caregiving has also been shown to have positive aspects. Productive roles – such as caregiving, volunteering, employment – have advantageous effects, especially for elderly people, for older caregivers.

Prior to 2000, studies highlighted the negative aspects of caregiving including the compromising of caregivers' wellbeing. Despite this evidence of negative effects, positive outcomes do exist, and are worthy of notice and emphasise. Societal sustainability needs new values, like willingness to care, and to find happiness and satisfaction via such challenging role.

My research goal is discovering the aspects and determinants of caregivers' wellbeing, and finding the appropriate interventions for improving it. In the focus of my interest is dementia – an incurable chronic condition, affecting more than 50 million people worldwide, and based on provisions, the number will double in every 20 years. My previous work with the data of older caregivers of people living with dementia highlighted some factors have an important role as determinants of psychological wellbeing. My further plan is continuing this revealing activity using qualitative methods, which hopefully leads to new theories about ensuring better wellbeing status for caregivers and care recipients.

Caregiving Transitions and Life Satisfaction of Informal Caregivers

Regina Ilona Keller

APOLLON University of Health Economics, Germany
regina.i.keller(at)gmail.com

In the Western world, about two third of care recipients are in home care. This fact holds also for Germany: 70 percent of care recipients are cared for at home. Most of the caregivers are family members without any professional background in caregiving. To date, little is known about how caring for a close relative influences life satisfaction of caregivers in the long run. This study seeks to fill the gap by focusing on the process of transitions into and out of their caregiver role. Further, I examine how the caregivers' life satisfaction develops after these incisive life events.

The analyses are based on the data of the German Socio-Economic Panel, which provides annual information about caregiving situations in German households and life satisfaction since 1997. Using panel data allows to capture intraindividual changes by controlling time constant unobserved heterogeneity. The longitudinal research design also enables to identify effects of adjustment processes in terms of life satisfaction with respect to transitions into and out of caregiving situations.

As expected, life satisfaction decreases after transitioning into the caregiving status and—in contrast to the findings of the vast majority of cross-sectional studies—remains stable over the time of caregiving. When analyzing the period that marks the transition out of caregiving, the picture is rather heterogeneous. It seems that women recover more quickly than men from this strenuous event that is often associated with the death of the care recipient. After recovery, life satisfaction increases constantly for both genders.

Tensions and resilience of adult foster care work

Emilia Anna Leinonen

University of Jyväskylä, Finland
emilia.a.leinonen(at)jyu.fi

In Finland, the two main objectives of care policy for older people are deinstitutionalism and ageing-in-place: home itself has become the most significant place of older people's long-term care. This study examines the new housing and care service for older people called adult foster care. In adult foster care older people are not cared by their relatives or friends but by foster carers, who do not need to have any kind of formal education; motivation, a short training course and personal features are enough if one is caring for max. 4 persons in carer's own home. The government of Finland is putting a major emphasis on it as it is less expensive compared to the traditional institutional care. However, there is no scientific research on adult foster care.

The purpose of this study is to examine tensions and problems which foster carers face in their work, and to understand what helps them to sustain in their caring

role. Concept of resilience, which is understood as a psychological phenomenon referring to effective coping although faced with adversity (McCann et al. 2015), is used as a tool of analysis. The data consists of 10 thematic interviews which were analyzed by using thematic content analysis. The themes of the interviews focused on foster carer's everyday life, home and family, and the expectations, experiences and difficulties of the care work. The preliminary results suggest that in many cases foster carers are left alone with their problems.

Insecurities of taking care and being responsible: Adult children's stories about home safety for their elderly parents'

Jonny Bergman, Erika Wall, Linda Kvarnlöf, Jens Ljungdahl

Department of social science, Mid Sweden University, Sweden; Department of health science, Mid Sweden University, Sweden; Department of social science, Mid Sweden University, Sweden; Department of social science, Mid Sweden University, Sweden
jonny.bergman(at)miun.se, erika.wall(at)miun.se, linda.kvarnlof(at)miun.se, jens.ljungdahl(at)miun.se

This study focusing on adult children's perspectives on their own parents' wellbeing. We argue, that in caring and taking responsibility for elderly parent's wellbeing, adult children also address own insecurities. Based on interviews with, and observations of intergenerational interaction between, adult children and their parents (in total, 11 persons included), we analyze how adult children's understanding of their parent's wellbeing is embedded in various constructions of home safety – emotional and practical. The insecurities inherent in taking care of, and the responsabilization of care for, the elderly are manifested in how the adult children are caught up in dilemmas, and balance between promoting the social activity of their elderly parent on the one hand, and taking responsibility for protecting the parent from harm, on the other. In the case of home safety, children seek to lessen their own anxiety through control, which stands at odds with, and undermine, the elderly parent's activity and self-determination. The children's construction of safety for the parent is intertwined with dealing with own insecurities related to the responsibility for their elderly parent. Understanding the adult children's insecurity, dealing with dilemmas in relation to their parent's safety, is important to acknowledge complexities around activity and self-determination among the ageing.

RN01 | Session 04b Theoretical Concepts and Discussions

The intersection between ethnicity and old age: what sociologists of aging and ethnicity can contribute

Sandra Torres
Uppsala University, Sweden
sandra.torres(at)soc.uu.se

This presentation departs from social gerontology's theoretical deficit as far as understandings of ethnicity are concerned and builds upon an upcoming book that theorizes about the intersection between ethnicity/ race and aging/ old age. The book traces the social gerontological origins of scholarship on this intersection and argues that social gerontologists risk losing ground as the designated experts in this area as more and more ethnicity scholars discover aging and old age. This is especially the case since few sociologists of aging have contributed to the debate on ethnicity and old age over the past few decades. This may explain why social gerontologists' understandings of ethnicity have yet to embrace the shift from essentialism to constructivism that sociologists of ethnicity have proposed to be necessary if we are to understand ethnicity in global times such as ours. The book – upon which this presentation is based - builds on the systematic review of articles published in all gerontology and ethnicity journals between 1999 - 2016 (n= 291) which address the intersection in question. The presentation will provide insights into what characterizes the scholarship there is about this intersection and will argue (based on the debates that have received the most attention: on health, intergenerational relationships and caregiving as well as health and social care) that much could be gained if the social gerontological imagination on ethnicity were to be further developed.

The Othering of Old Age. Insights from Postcolonial Studies

Silke van Dyk
University of Jena, Germany
silke.vandyk(at)uni-jena.de

We witness a growing bifurcation of old age into a capable Third Age and a Fourth Age that is characterized by sickness, frailty and dependency. Against this backdrop, many gerontologists claim that the so-called young-old are praised and valued for their (ongoing) "sameness" in terms of activity-related midlife-norms, whereas the oldest old are increasingly excluded from humanity by radical "othering". Taking up this diagnosis, the paper elaborates on this growing polarization in later life: Based on empirical research on the re-negotiation of old age in Germany, the contribution argues that the juxtaposition of "sameness" and "otherness" obscures the true character of the polarization: Instead of sameness and otherness, we rather witness different processes of othering, with the young-old being valued as the other and the oldest old being disdained as the other. Despite the existence of profound critical analyses of the abjection associated with the Fourth Age as well as a considerable amount of literature on old age activation and the new role of the young-old, the othering of the Third Age has been completely neglected so far. The paper will indicate to what extent concepts from Postcolonial Studies may help us to understand this dual process of othering—glorification and abjection. Elaborating on the glorification the

paper argues that by affirmative othering the young-old are not just addressed as capable, but as non-competitive, social and caring and therefore as a new reproductive resource in times of changing gender relations. Are the young-old (of both sexes?) the “new” women?

The (un)making of citizens living with dementia: rethinking belongingness, solidarity and aging in a changing society by the concept of citizenship

Ann-Charlotte Nedlund, Annika Taghizadeh Larsson
Linköping university, Sweden; Linköping university, Sweden
ann-charlotte.nedlund(at)liu.se,
annika.t.larsson(at)liu.se

Citizenship is a central concept in the idea of a good society. The concept encompasses the cultural, social, political, health-related and technical aspects of ageing in a changing society. Citizenship encompasses the meaning and practice of belonging to a society and its various policy areas. An important part of claiming full citizenship is to be acknowledged as an independent individual with rights and also as an actor in the society. Citizenship becomes constructed through a dynamic process that involves various actors. Through this process older citizens, as targets of welfare-state policies, becomes socially categorized and positioned in an ambivalent way related to different attributes as e.g. age, gender, background, dementia. To study and problematize dementia and situations for people with a dementia diagnosis from a citizenship perspective has received increasing attention during the last decade. This paper critically discusses the “making” and categorisation of people living with dementia as citizen targets. The paper has a comparative approach and draws on empirical examples from interviews with actors working in Swedish welfare institutions and how they encounter citizens with dementia and furthermore how their practice relates to politics of redistribution, recognition and respect in that could end up excluding and/or including groups in society. The paper aims to further broaden the debate on how to enable citizenship and social inclusion for older people and people with dementia. It contributes to research on good ageing in a better society by critically analysing how perspectives on citizenship advance the thinking of ageing and further how to challenge ageism practices.

The relational 4th age

Bernhard Weicht
University of Innsbruck, Austria
bernhard.weicht(at)uibk.ac.at

Ageing societies have been a topic of public, political and academic discourses for years. Due to demographic and epidemiological developments, later stages in life have been significantly prolonged and older people who are active and independent are distinguished from those considered really old. Many authors have criticised the discursive split between the

so-called 3rd and 4th ages as creating new divisions, through which, first, the individual can confirm him/herself as active and independent, second, social policy can define a subject of care and, third, society can describe the other to the idealised citizen. Thus we know that a group is constructed in order to demarcate us from them, allowing, at the same time, a re-emphasis of active personhood.

However, by starting with a focus on the individual and his/her impairments, these critiques inevitably recreate and reproduce a passive victim of societal processes. The meaning and construction of very old age or the 4th age thus inscribe individuals with shortcomings and lacks. In this paper I therefore propose an alternative ontological starting point from which the 4th age can be investigated. Departing from (social) relations to other people and places I will explore the meaning of the construction of the 4th age not for individuals but for the very relationships. This approach, I will demonstrate, offers both theoretical and methodological tools and possibilities to challenge the 4th age as the horizon which, once crossed, cannot be accessed anymore (Higgs & Gilleard).

RN01 | Session 04c Care and Social Investment

The Concept of “Social Investment in Long-Term Care

Hans-Joachim Reinhard
University of Applied Sciences Fulda, Germany
hans-joachim.reinhard(at)sk.hs-fulda.de

The need for long-term care is a growing challenge for all European countries. The demographic changes entail several problems: in the countryside it is often difficult to organise and maintain adequate services for long-term care. Secondly, since trained professional staff is hard to find often untrained underpaid migrants with an uncertain legal status fill this gap. But the main issue for all countries is how to finance long-term-care. Long-term care needs an intensive manpower and there are only few possibilities to automatize care (eg. by robots) because care is a very personal and emotional matter. Many countries have shifted a good part of the organisation of care and of the implicit financial burden to the dependant or the dependant person’s family. In view of the change in family structures (e.g. increasing number of childless persons) this model will not work in future. The cost-intensity of long-term care results in many countries in the pauperization of persons in need for care given the overall decrease in old-age pensions. But financial constraints, which are mostly due to the EU-restrictions of the Stability and Growth Act refrain governments from investing in a better and decent care in human dignity.

This cross-country and comparative presentation shows how various European systems have approached and reacted on this social task. It will also reveal the EU social policy on long-term care, in particular the EU-Commission’s new idea of a “Social Investment in Long-Term Care” for an ageing society. This concept is currently under discussion and

considered as a feasible tool to mitigate some of the deficiencies in providing long-term care and to improve the situation of people in need for care.

Social Investment in Long-Term Care: Stakeholders' views

Alexandra Lopes, Virginija Poškutė, Bent Greve, Ismo IsmoLinnosmaa, Zosia Rutkowska
University of Porto, Portugal; ISM Vadybos Ir Ekonomikos Universitetas UAB; Roskilde Universitet (RUC); Terveystiete ja Hyvinvoinnin Laitos (THL); Instytut Pracy I Spraw Socjalnych (IPISS)
aslopes(at)letras.up.pt, virpos(at)ism.lt, bgr(at)ruc.dk, ismo.linnosmaa(at)thl.fi, zrutkowska(at)yahoo.com

Social investment has come to be seen as a new approach in contrast to Keynesian and Liberalism in the understanding of the development of welfare states. An abundant number of books and articles have been published in recent years to discuss the contours of the concept and its meanings for policy design and implementation. However, less emphasis has been put on whether the understanding of social investment has reached the stakeholders in a given a social policy field. This paper will try to discuss how stakeholders in the field of Long-Term Care perceive social investment and its applications to address LTC policies. The paper is based upon focus-group interviews done in different countries, representing different strands of welfare state development (Lithuania, Poland, Finland, Portugal and Denmark). The collection of data takes place during January and February 2017. The collection of data is done within the framework of the Horizon 2020 project SPRINT - Social Protection Innovative Investment in Long-Term Care. The paper will present the analysis from a comparative perspective presenting long-term care in the countries, how the stakeholders perceive and understand the concept of long-term care social investment.

Evaluating the design, participation, effectiveness and impact in support programmes for carers of elder people

Maria Silveria Agullo-Tomas, Vanessa Zorrilla-Muñoz, Alberto Veira-Ramos, Esteban Agullo-Tomas
Institute of Gender Studies (IEG) and Department of Social Analysis; Carlos III University of Madrid (UC3M). Getafe, Spain;; Institute of Gender Studies (IEG) and Department of Social Analysis; Carlos III University of Madrid (UC3M). Getafe, Spain;; Institute of Gender Studies (IEG) and Department of Social Analysis; Carlos III University of Madrid (UC3M). Getafe, Spain;; Psychology Faculty; Oviedo University. Oviedo, Spain
msat(at)polsoc.uc3m.es, vzorrill(at)ing.uc3m.es, aveira(at)polsoc.uc3m.es, estomas(at)uniovi.es

Purpose: The problems surrounding care for the elderly are a demonstrable fact in our society. The research called "Carers of the elderly: the situation regarding the Dependency Act and evaluation of programmes for caregivers" (MINECO, "Ministry of

Economy and Competitiveness", CSO2009-10290, National R&D Plan, 2009-2013, Spain) reflects the persistence of carer problems by exploring programmes for carers of elder people by qualitative and quantitative methods. This proposal emphasizes the quantitative analysis.

Methodology: CRPAC questionnaire develops items based on different surveys with special focus on EUROFAMCARE SPQ. The selected representative sample (439 programs) stems from Spain. Initially, a total of 57 items were examined to compose the dimensionality analysis for CRPAC. The questionnaire was answered by the program supervisors. The CRPAC scales assessed reliability and validity, including internal consistency, factor analysis, criterion-related validity, and average correlation between factors. Finally, the regression model tests the factors.

Results: AIC and BIC define the chosen factors. The decision was refined by factors referred to as "design," "participation," "effectiveness," and "impact of programmes". Cronbach's alpha coefficients range from 0.97 and 0.99 between these factors. The regression model considers the effectiveness as variable criterion (ANOVA with $p < 0.01$), and, design, participation, and impact of programmes as predictor variables. The model is statistically significant (adjusted $R^2 = 0.9264$, $F(3,334) = 1400.39$, $p < 0.01$). Conclusion: Evaluation of effectiveness could be considered for the application an improve caregiver programmes strategies by using the CRPAC questionnaire. Finally, this research underlines the need of review in quantitative gender perspective.

RN01 | Session 05a Portrayal of Old Age

Constructions of loneliness in Swedish and Danish daily-press

Axel Agren, Elisabet Cedersund, Christine Swane
Linköping University, Sweden; Linköping University, Sweden; Linköping University, Sweden
axel.agren(at)liu.se, elisabet.cedersund(at)liu.se, csw(at)egv.dk

Loneliness among older people are highly present topics in mass media internationally, and on national levels in Denmark and Sweden. These two countries are commonly perceived as welfare "models" with universal coverage enabled through high taxation. Despite this, loneliness among older people is often described as a widespread phenomenon in both countries. In two studies, we will examine how loneliness among older people is constructed in Sweden and Denmark, respectively. Particular focus will be on how loneliness is described, how each society should "tackle" loneliness and which actors that are designated responsibility for working with the issue. Conducting these type of studies have several motives: 1. Mass media has a significant impact on how loneliness and older people are constructed and perceived. Constructions which, in turn, has an impact on how older people understand and evaluate their own life situation. 2. There is, since several years

back, a demand for studies on how loneliness is constructed in different societal contexts. 3. Studies of this kind raises the question of differences in how loneliness, which commonly is understood as a universal and inevitable human experience, is constructed between two countries that, internationally, are perceived as similar, regarding organization of their welfare institutions. 4. These studies also highlights the concept of Aging Enterprise, central to critical gerontology, which can be used to understand how policies, programs, care provision and industries may contribute to socially produce dependency among older people.

On temporal regimes and (un)marked age in grey dancing: A problematization of age power

Clary Krekula

Karlstad University, Sweden

clary.krekula(at)kau.se

Comprehensive research has argued that analyses of ageing and older people's every day life conditions need to be based on age as a power relation. Despite this, age theories have only to a limited extent contributed to the problematization of age power, which has restricted empirical analyses of older people's conditions. This paper aims to illustrate and discuss different forms of age power, starting out from critical age studies which emphasise that theorization of age cannot be based on delimited age categories but needs to be based on empirical studies on the entire age span of the life course. The paper is based on analyses of qualitative interviews with 33 older persons whose main leisure activity is dancing, and with 11 organizers of dance events for older people as well as observations of 14 such events. Analyses of the temporal and choreographic organization illustrate that older people's dancing is marked, i.e. is presented as a deviating form of dancing while dancing for younger age groups is given a position as an unproblematized normality, and that younger age groups are presented as the age normality, i.e. as (un)marked age. Finally, the paper argues that temporality and choreography are examples of non-verbal practises which operate in the processes where age relations are created and maintained. The role which the concept pair marked/un marked age may have in analyses of age power and older people's social conditions is also discussed.

Portraying elderly people through video games. Gameplay and the procedural rhetoric of ageing

Cosima Rughinis, Elisabeta Toma

University of Bucharest, Romania; University of Bucharest, Romania

cosima.rughinis(at)gmail.com,

elisabetatoma26(at)gmail.com

In previous decades, games were mostly designed by teams of young men, for imagined young male players, mostly with male playable characters and a restricted repertoire of secondary characters and tropes for different genders and age groups. In recent

years we witness an ever higher diversity of game players, designers and characters (Williams et al, 2009). Correspondingly, there is increased scholarship on gender and video games and, to less extent, on ageing and old age as experienced through gameplay. We take this dialogue further by examining a variety of games designed for older and younger audiences, proposing a typology of elderly game characters in relation with their imagined players. We study games ranging from minute-length art games or casual mobile games to indie creations such as '80 Days', 'To the moon' and 'The way of life', and larger scale gameworlds such as Dragon Age. By virtue of interactivity and procedural rhetoric (Bogost 2006, 2008), games offer specific means to portray characters and their adventures. We thus propose and illustrate a typology of game-specific representations of ageing and the elderly. We also discuss a double standard of ageing (Sontag 1972) in game worlds, comparing older male and female characters. At the same time, while games designed within a feminist and gender-aware frame often feature women characters, games designed within an ageing-aware frame tend to focus on repairing their imagined players' cognitive abilities, rather than engaging them with a meaningful narrative involving older characters and/or experiences of ageing. We thus observe here a bifurcated trajectory in game design diversity.

RN01 | Session 05b Work

Entrepreneurship in older age – panacea for ageing workforce or the next step towards occupational insecurity?

Justyna Stypinska

Free University Berlin, Germany

justyna.stypinska(at)fu-berlin.de

Mature entrepreneurship* is gaining momentum. In both, numerical as well as in socio-political and economic terms. It is being presented as a panacea for the problems of aging workforce, seen as an inevitable direction for future labour market policies and proposed as an way of empowering of older workers or unemployed. On the other hand however, re-careering at older age brings about major risks and insecurities related to the financial outcomes, impact on societal and family relations, as well as possible strains on health. The aim of the paper is to look critically and comparatively at the international (EU, OECD, ILO) and national institutional setting (PL and DE) in which the mature entrepreneurship is embedded. The institutional factors conditioning the functioning of mature entrepreneurship include range from the functioning of labour market institutions, pension system reforms, policies of welfare states (including care regimes), governmental and non-governmental policies and projects targeting entrepreneurship, EU structural funds, as well as informal institutional factors, operating on more micro level, such as social networks. The goal of the paper is to present the dominant models and narratives of mature entrepreneurship as conveyed in international

and national policy papers. The paper is based on empirical work of an international project "Mature entrepreneurs in Poland and Germany" funded by German Scientific Foundation.

Employment of Older Workers - comparing Germany and the UK

David Valentine Wright

University of Brighton, United Kingdom

D.Wright2(at)brighton.ac.uk

The relatively low employment rate of older workers in the UK has been a long-standing issue for the UK Government. This paper compares the UK with Germany.

Like the UK, the policy of early retirement was introduced in Germany in response to recessions, notably the 1973 oil crisis, but reversed in 2000 after the Lisbon Summit.

At this time, German employment rates of older workers had dropped far below the UK's and this, together with Germany's coordinated labour market, made Germany the least likely country to improve.

However, since 2004 the employment rates for older Germans have risen faster. Some have suggested this as evidence of a new German model? An alternative explanation could be that the German labour market has changed. Previous research has identified that retirement decisions are affected by factors such as age, sex, health and type of work. For example, those engaged in heavy physical labour tend to retire earlier than office workers.

This paper models the effect of such factors on the age of retirement using Survival analysis of longitudinal panels (BHPS, Understanding Society and G-SOEP) from 1992 to 2015. The more rapid changes in Germany - notably the increase in the proportion in service sector jobs and proportion of older women in employment - partly explain the faster increase in the employment of older people. However, some national differences, remained even after controlling for individual factors with 2004 marking the year when the improvements in Germany began.

RN01 | Session 05c Ageing & the Welfare State

Ageing in Bulgaria: Tackling the Misery of Welfare Reforms

Tanya Chavdarova

Sofia University St.Kliment Ohridski, Bulgaria

tchavdarova(at)phls.uni-sofia.bg

In the early 1990s, the ex-socialist countries faced an urgent need to reform the systems by which they delivered social welfare to their citizens. Inherited systems were inefficient and financially unsustainable. Most of these countries, Bulgaria among them, tried to institute reforms based on a liberal paradigm of reduced entitlements and subsidies, means-testing, and privatization (Cook 2013). The aim of this paper is to discuss the evolution in the pension system, health care and long-term care in Bulgaria and the

demographic challenge of aging society they face. Although the focus is on the period 2008-2013, the social protection trends are explored in the context of the developments of the welfare system during the last 25 years. The first section of this paper offers an interpretation of the key factors that determine the state of welfare state in Bulgaria. The impact of economic pressures on welfare is linked to the domestic political instability and aging trends. In the next three sections, the evolution of pension system, health care and long-term care is discussed on the basis of statistical, economic and social surveys data, mostly in the EU comparative perspective.

Public Policy and Social Justice in Aging Society: Generational conflicts in European Countries.

Julia Zelikova

Russian Academy of National Economy and Public

Administration, Russian Federation

juliazelikova(at)hotmail.com

The project focuses on justice between age groups and generations and bases on data of 6th wave of World Value Survey. This dimension of justice has become one of the major issues of contemporary societies. There are moreover other cleavages that are usually categorized as "new" dimensions of inequality, for example, gender, ethnicity, race. And question is raised to what extent have the new intergenerational conflicts really crowded out traditional intragenerational ones?

Issues of justice play an important role in adjudicating conflicts and legitimizing their solutions along all these cleavages. In all modern societies, the elderly are the main recipients of public income transfer programs, while children, even when taking child allowances and the costs of schooling into account, are to a large part financed privately by their parents. Such unequal allocation of public resources among age groups may be considered "unfair" or ineffective if, for example, its outcome is that one group is consistently worse off than another.

There are three basic principles by which distributive outcomes are justified: need, merit or desert (usually based on work performance), and equality (usually based on citizenship status). Their salience varies between countries, between groups of persons, and between the parts of the welfare state, but together they seem to exhaust most of the conceptual and empirical space of distributive justice. For the specific topic of justice between age groups and generations, it is first of all necessary to analytically separate these three dimensions. The conflict between generations may be caused by different understanding of role of state in the public distribution. This is a key question of this project.

The political response after 20 years of transformation in the living arrangements of dependent seniors in France.

Loïc Trabut, Joëlle Gaymu

Institut National d'Etudes Démographiques, France;

Institut National d'Etudes Démographiques, France

loic.trabut(at)ined.fr, gaymu(at)ined.fr

Over the last few decades, the residential autonomy of the very old has increased. This growing autonomy among older age groups is seen everywhere in Europe and can be explained, in particular, by a greater desire for independence of the various generations, improvements in the economic situation of older adults and the development of public policies to promote sustainable autonomy. However, the contrasts between countries remain strong: residential isolation and institutionalization are more frequent in Northern Europe and multigenerational cohabitation is the prerogative of Southern Europe. These contrasts reflect differences in the degrees of family involvement and in the levels and modalities of public support.

Previous work has revealed large contrasts in the residential situations of older adults between the different territories of France. To what extent do these disparities persist in this context of increasing old-age autonomy? Do public policies take account of, or adjust to, these situations?

After examining changes in the residential situations of people aged 85 years and over at the département level, and the persistence or not of territorial disparities, we propose to describe social policies and to observe their possible correlations with the demographic situation in 2011.

We will begin by extracting demographic data from the censuses conducted between 1982 and 2011. Then, based on a number of public policy indicators and the health status of populations within the French territories, we will propose a typology based on an analysis of multiple correspondences and a hierarchical top-down classification.

Revisiting the Nordic long term care model: Persistent or new inequalities in the combination of formal and informal care resources?

Tine Rostgaard, Marta Szebehely

KORA, Denmark; Stockholm University

tiro(at)kora.dk, Marta.Szebehely(at)socarb.su.se

While both representing the Nordic welfare model with a universal, formal and de-familising approach to welfare, Denmark and Sweden were in the early 2000s at crossroads:

Denmark had for a number of years invested in public and free home care for older people with as many as 18% of those 65+ receiving such services, while Sweden had reduced home care, to covering only 9% of the population 65+ and at a somewhat high out-of-pocket cost. This positioned older people in Denmark and Sweden very differently: Analysis of Levels of Living Survey data from the early 2000s showed that in Sweden frail older people with shorter educations (and presumably lower incomes) were left with no one

to resort to but the family, whilst those with higher education purchased help from market providers. In Denmark, regardless of socioeconomic background, older people with need for care could rely on public services (Rostgaard and Szebehely, 2012).

With updated survey data, we now 10 years later revisit the two countries and see how recent cuts of home care in Denmark to levels similar to Sweden has affected the combination of formal and informal care resources for older people. Have older people in Denmark come to rely on the family instead and do with find similar inequalities in care resources as in Sweden? And are the inequalities in care resources still intact in Sweden? We also look into whether older people in general over time are in less need for care and address what are the implications of the trends over time in regards to the existence of a care gap within the Nordic model.

RN01 | Session 06a Ageism & Discrimination

Perceived age discrimination in the job search process in later life

Ricardo Twumasi, Cheryl Haslam

Robert Gordon University, United Kingdom;

Loughborough University, United Kingdom

A.R.Twumasi(at)rgu.ac.uk, C.O.Haslam(at)lboro.ac.uk

This article presents interview data from older job seekers (n=27) conducted during a time of legislative change in relation to retirement, pensions and age discrimination. These interviews were also collated into a representative case study video to further highlight, share, and educate people on the barriers to employment that older job seekers face, and the strategies they use to overcome them. Perceived age discrimination, change of identity, motivation, health and insufficient feedback were identified as significant barriers to finding employment. Social support, coping strategies for identity change and detailed feedback were reported as positive facilitators of the search for work. The findings suggest that older job seekers face significant barriers to securing employment, which require age specific support to overcome. Minimum standards of feedback provided to job applicants may increase transparency, and reduce the prevalence of discrimination in the job application process.

From an Ageing Society to a Society for All Ages: Perceived Age Discrimination across Age in Europe

Christopher Bratt

University of Kent, United Kingdom

christopher.bratt(at)gmail.com

Ageism is commonly seen as targeting older people. Age discrimination of younger people has received little attention. We investigate perceived age discrimination with data from the European Social Survey (Round 4, 2008), with advanced statistical methods.* We test the validity of the 3 age discrimination items in the ESS to assess perceived age discrimination across 29 countries and across

age, finding support to the age discrimination measure. We then find that younger respondents perceived substantially more age discrimination than older people across Europe, though no single pattern of age discrimination across age fits all countries. Following up on this finding, we raise the question why younger people seem to experience more age discrimination than older people.

* In addition to traditional multilevel structural equation modeling, we use the following statistical methods (possibly relevant for the RN01 & RN21 session on Advanced quantitative analysis in ageing research):

- approximate measurement invariance to test for measurement invariance across many groups (including the estimation of factor scores for latent variables in a model with approximate measurement invariance)
- local structural equation modeling to test for measurement invariance across age as a continuous variable
- moderated non-linear factor analysis to test for measurement invariance across age as a continuous variable and to develop individual-level factor scores with models that account for some level of measurement non-invariance.

Biographical continuity and disruption in nursing home settings – ageism in practice?

Tove Harnett, Håkan Jönson

Lund University, Sweden; Lund University, Sweden

tove.harnett(at)soch.lu.se, hakan.jonson(at)soch.lu.se

Personalization and biographical continuity are prominent goals in nursing home care, but little is known about how these goals are interpreted by actors in the immediate care context. The aim of this presentation is to critically examine how ambitions to personalize care through biographical continuity are discussed by residents, relatives, staff and managers in nursing homes.

Data consisted of individual and group interviews with 46 persons at four Swedish nursing homes. The analysis revealed that on the one hand, all actors embraced goals about biographical continuity. On the other hand, actors frequently referred to residents' frailty and disability as something that made them incomparable to their previous selves and something that justified biographical disruption.

Two competing ways of personalization was identified in the data: 1) "external life referencing" based on claims that previous habits should be transferred to the care context and 2) "internal care referencing" based on claims that aging and disability made residents different and incomparable to before. When using a disability perspective to interpret findings, it appears that arrangements that are described as logical in eldercare, may be regarded as a form of ageism. From a disability perspective, disability is an effect of the way societies support or restrict persons. Disability and frailty were the very reasons for admission to nursing homes, but the aging process was still regarded as the cause of "bodily limitations". This logic conceals the ways that eldercare

arrangements disables residents in nursing homes.

RN01 | Session 06b Intergenerational Relations and Policies

Redistribution in the welfare state: between income groups or between age-groups?

Márton Medgyesi, Róbert Gál

TARKI Social Research Institute, Hungary; Institute for Sociology, HAS; Hungarian Demographic Research Institute

medgyesi(at)tarki.hu, gal(at)demografia.hu

The welfare state has multiple roles in developed countries. One role is to redistribute income over the life-cycle, which aims at financing human capital investment and consumption during inactive phases of the lifecourse (childhood and old age) from contributions of those in working age. Another aim of the welfare state is moderating poverty and decreasing income inequality by transferring income from the relatively well-to-do to the poor. Previous research has focused mostly on the role of government redistribution in reducing poverty and inequality. Here our aim is to describe the redistributive role of welfare state programmes by income and by age in the same time and to assess the relative importance of these two factors. Our data (based on Household Budget Surveys) covers government cash transfers as well as in-kind transfers and both direct and indirect taxes in Hungary and selected countries representing different welfare regimes. First we describe concentration of transfers and taxes by income and by age then we decompose net taxes by age and income using the regression-based inequality decomposition method proposed by Fields (2003) and Cowell and Fiorio (2011). Our results show that overall redistribution between age-groups is more important than redistribution between income groups. These results suggest that analysing redistributive role of the welfare state should also include the study of redistribution by age. This is all the more important since current patterns of redistribution between age groups might prove unsustainable in ageing societies.

Does gender trump family ties? Intra-couple and inter-siblings sharing of caring responsibilities for elderly parents and in-laws

Matteo Luppi, Tiziana Nazio

Collegio Carlo Alberto, University of Turin, Italy;

Collegio Carlo Alberto, University of Turin, Italy

matteo.luppi(at)carloalberto.org,

tiziana.nazio(at)unito.it

This paper aims to understand more about the relationship between elderly care provision and family ties, in its distribution across family members. It contributes to the literature by comparing high intensity care provision in a range of European countries, by focusing on both providers' and recipients' characteristics. We use the data of the second, fourth and fifth wave of SHARE data, fielded

between 2006 and 2013 for seven selected EU countries, and probit multilevel models to explore the extent to which care responsibility towards elderly care extends across family's members. Results indicate that intense elderly care is still very much a gendered activity: daughters are more likely to provide it than sons, and mothers are more likely to receive it than fathers. We found that intense elderly care is a "children' issue", for which sister are more likely to share the responsibility compared to brothers. The three generations framework reveals how upward and downward caring responsibilities might be conflicting, but also how individuals more inclined to provide care to their parents are also more likely to provide it to younger generations.

Abstract: Intergenerational relationship and ageing

Ása Róin
University of the Faroe Islands, Faroe Islands
asar(at)setur.fo

Cross-national studies on intergenerational relationship have been found to be dependent on the social and cultural context in which they are embedded. Comparative studies have suggested that differences especially relate to family structure, economic conditions and state financed elder care. This study investigates dimensions of family relationships between older people and their adult children living in the Faroe Islands, a small archipelago in the North Atlantic Ocean and contributes to the existing literature on intergenerational relationship by adding empirical data from a remote area in Europe. Data derive from interviews with home-dwelling men and women aged 68 to 91.

The aim of the study was to explore how the roles of adult children were constructed and negotiated by older parents in the light of changes in family structures, demographic changes, and policies on elder care. Social constructionism formed the methodological point of departure and data were analysed using a discourse analytic approach. The results show that older parents do not rely on their adult children to support them in later life. On the one hand this is stated as a natural consequence of geographical distance; on the other hand, despite proximity, adult children were excused for their lacking support by referring to their busy schedules and independent lives. For those having adult children to support them on a daily basis, this was often constructed as an interdependent relationship which both parts would benefit from. In general, the interviewees expected the state to provide the necessary support and care if needed.

RN01 | Session 06c Family & Relationships

Siblinghood in the old age

Dana Sýkorová
Palacký University, Faculty of Arts, Czech Republic

dana.sykorova(at)upol.cz

The contribution is based on a sociological study on siblinghood in late adulthood (funded by the Czech Science Foundation, No. 17-07321S); its main objective is to understand siblinghood, i.e. to discover seniors' lived experience of siblinghood, ways of action in sibling relationships, key elements of the situation and their mutual interconnection – social worlds, arenas, in which siblings are rooted (see action-centred and situation-centred approaches) by means of the constructivist grounded theory. On the basis of an analysis of data from in-depth interviews, the author's contribution will outline (1) the core of elderly individuals' experience of siblinghood, meanings acquired by bonds among them; show (2) conditions, circumstances forming the context of contacts, relationships and exchange of support among siblings, (3) processes of negotiation sibling bonds. She will present sibling relationships as part of the network of relationships in the family of origin and siblings' procreation families from the perspective of the research. She will also view siblinghood in late age through the life course perspective, enabling to capture the influence of personal experience from the previous stages of life, events in the course of siblings' lives, interweaving of their family paths with the other life trajectories on negotiation of meanings of siblinghood.

The author compares the results of the qualitative data analysis with current competing theories/concepts of family relationships (the theory of kinship solidarity; the concept of kinship ambivalence).

Family relationships and food practices within french public retirement homes for autonomous elderly

Agathe Mathilde Zuddas
Université de Lille, France, Solal INRA, France
agathezuddas(at)gmail.com

Public policies establish solitude and undernutrition of elderly as major risks of ageing and public health concerns, elaborating nutrition plans and professional domestic help programs to solve them. Though, previous studies have shown the crucial role of families in domestic help and social interaction at old ages, in private housing as well as in nursing homes.

In France, 110000 elderlies live in public homes for autonomous people. They provide private apartments in a collective building offering various services. They are supposed to fight isolation and foster "autonomy", spreading "well eating" and "well ageing" messages, through daily activities and collective lunch particularly.

In this paper, we examine the effects of this specific institutional context on family relationships at old age, analyzing them through food practices, as they are part of the public concerns: how do relatives still play their part in their relatives'live? What happens for childless people? How is the experience of ageing impacted?

To answer these questions, we made a content

analysis of data collected through ethnographic observations and biographical interviews, in three nursing homes for independent elderly (two months in each institution), set into varied neighborhoods with regarding the urban environment and the public transportation. The analysis focuses particularly on the interviews with the residents.

It suggests that even in a context where help can be provided by the institution, families use food in different ways to maintain relationships between younger and older members. Besides, food practices reveal changes in familial roles, as new generations come in the game, and elderly modify their day-today routine. Furthermore, the institution organization use food as support to foster sociability of the inhabitants.

Characteristics of the interpersonal networks of old people in Hungary

Fruzsina Albert

Károli Gáspár University of the Reformed Church in Hungary, Hungary; Center for Social Sciences, Hungarian Academy of Sciences
albert.fruzsina(at)gmail.com

The presentation aims to describe the ego-centric interpersonal networks of the 60+ years old Hungarian adult population in detail, based on data gathered in the framework of the Hungarian National Research Fund study „Integrative and disintegrative processes in the Hungarian society” in 2015. The dimensions in focus are: partnership relations, core discussion networks (based on the GSS survey name generator question), friendship and weak ties (based on the position-generator by Lin and Dumin). The analysis describes the above mentioned dimensions by basic socio-demographic variables, creates a network-typology and present links of interpersonal network characteristics to life satisfaction. It tries to put the findings in international context and it also includes conclusions based on the findings with policy relevance.

RN01 | Session 07a Ageing & Migration I

Migrant narratives of Hungarian live-in care workers employed in Austria

Dóra Gábrriel, Attila Melegh, Gabriella Vadász, Dalma Hámos

Hungarian Demographic Research Institute, Hungary; University of Pécs, Hungary; Hungarian Demographic Research Institute, Hungary; Corvinus University of Budapest, Hungary; University of Pécs, Hungary; University of Pécs, Hungary
gabriel(at)demografia.hu, melegh(at)demografia.hu, vadasz.gabriella90(at)gmail.com, hdaly6(at)yahoo.com

As a result of population ageing across the continent, the demand for cheap labor of immigrant live-in caregivers has significantly increased in certain European countries. Employing a care worker from abroad means less costs and risks for the family in need than employing a native one. The lack of

favorable legalization policies can lead immigrant care workers to irregular status in many countries in Europe, unlike in Austria, where immigrant live-in care workers are mainly registered self-employed. For that reason Austria, as a special receiving country has been chosen for our study. Due to spatial conditions, and historical reasons, Hungary is an important sending country to the Austrian elderly care sector. Hungarian live-in care workers circulate from the country of origin to Austria once every second week, as they share shifts with another care worker. The study focuses on migrant narratives of Hungarian care workers who are involved in the Austrian live-in elderly care. The applied interview method combines the elements of narrative and semi-structured interview technique. The analysis of twenty life course interviews conducted with live-in care workers and their partners is based on the method of objective hermeneutics. The study presents different decision-making practices of the households, the motivations embedded in the family's socioeconomic situation, social-historical references, and new arrangements within the family through migrant narratives. The analysis of self-representations contributes to a more precise understanding of global care chains ruled by female workers.

Care biographies of elderly Poles from migrants' and stayers' families – are people, who give most care throughout their lifetime, best taken care of?

Anna Kordasiewicz, Agnieszka Radziwinowiczówna, Weronika Kloc-Nowak

Centre of Migration Research, University of Warsaw, Poland; Centre of Migration Research, University of Warsaw, Poland; Centre of Migration Research, University of Warsaw, Poland
anna.kordasiewicz(at)gmail.com, radziwinowicz(at)gmail.com, w.kloc-nowak(at)uw.edu.pl

While care scholars acknowledge that care is possible only within relationships (e.g. Browne 2010, Weicht 2015), this paper makes existing relationships a starting point and attempts to answer the question how caregiving and receiving have figured in the whole biographies of people requiring care in elderly life.

The paper proposes care biographies approach, which seeks to reconstruct patterns in which people engage in care processes throughout their lives. Taking as a vantage point the perspective of currently frail elderly, we include both the care they have received, as children, as parents for their children, and finally their elderly care arrangements, as well as the care they have provided: for their children, for their grandchildren and other family and non-family care receivers. Care biographies approach is inspired by the sociological concepts of trajectory and career (Hughes 1971, Goffman 1961, Becker 1963).

The paper discusses the case of Poland, where the biographical approach seems especially valid due to the predominant informal family care regime - the individuals in their biographies are the ones who have

to deal with care challenges both as givers and receivers. However, we provide empirical evidence that especially in the case of the elderly whose children are physically absent or who are childless, different actors are included in the networks of care, that go far beyond family.

The findings of this paper are based on a multi-sited transnational fieldwork. We collected interviews with 127 participants, among them 50 elderly people with children abroad, 32 migrants to the UK with parents back in Poland, with seniors with no migrants in the family, as well as with informal and institutional carers.

Ageing Finnish wellness tourists in Estonia

Veera Katariina Koskinen
University of Jyväskylä, Finland
veera.k.koskinen(at)jyu.fi

The increasing number of ageing tourists is especially visible in the segment of wellness tourism. The present culture of health self-management together with the idea of active ageing encourage people to pay attention to their bodily self-care especially in early old age. Consequently, many people are continuing an active lifestyle and enhance personal wellness to maintain good health and quality of life as they age. In this case study the focus is on ageing Finnish people who regularly visit spa destinations in Estonia. The study provides an insight into widening spectrum of self-care possibilities among ageing people.

Previous studies state that “transformation of the self” is one of the central benefits sought by wellness tourists. Prior research also highlights the importance of “therapeutic landscapes” in the process of achieving wellness. Hence, this study addresses questions such as: What meanings are attributed to spa tourism among ageing people? How does the Estonian spa environment shape the experience of wellness?

The study combines qualitative and quantitative methods. The data comprises focus group interviews (N=2), survey data (N=698), as well as field work (observation and individual interviews), which will be conducted in an Estonian spa destination. Preliminary observations indicate that for those who regularly visit spas in Estonia, spa travels are an important part of their personal wellness routine serving the purpose of both self-pampering and health improvement. Moreover, in spa environments people seem to find ways to develop wellness skills they feel are necessary for feeling and ageing well.

Negotiating the Identity Categories of Old(er) Age and Migrancy: A Social Constructionist Lens

Laura Machat-From
Linköping University, Sweden
laura.machat-from(at)liu.se

Given the concurrent trends of population ageing and the globalization of international migration, more and more people are ageing in countries other than the ones in which they were born. The resulting growing

number of older migrants has led to an increased interest in this population both in social gerontology and in migration and ethnic studies. One area of research in which this has become apparent is in the small but growing literature on identity among older migrants. What this literature thus far has not yet examined together are the two identity categories of old(er) age and migrancy (i.e. perceived difference from the native population resulting from migration). The present paper departs from a social constructionist understanding of identity as accomplished in the interplay between internal (self-)definitions and external definitions (by others). When (in what situations) and in relation to whom are identities pertaining to old(er) age and migrancy asserted or ascribed? How are the identity categories of old(er) age and migrancy negotiated? The presentation is based upon empirical material in the form of 24 interviews with individuals aged between 55 and 79 who were born in 12 different countries and have lived in Sweden between 18 and 61 years. The overall aim of the presentation is to shed light onto how the identity categories of old(er) age and migrancy are negotiated.

RN01 | Session 07b Sexuality & Intimacy

‘It’s a nice country but it’s not mine’: implications of ageing in place for older lesbian, gay and bisexual (LGB) adults in later life.

Paul Willis, Michele Raithby, Tracey Maegusuku-Hewett
University of Bristol, United Kingdom; Swansea University; Swansea University
paul.willis(at)bristol.ac.uk,
M.J.Raithby(at)swansea.ac.uk,
t.maegusuku-hewett(at)swansea.ac.uk

Internationally, ageing in place is one policy initiative targeted at meeting the rapidly increasing health and social care needs of an ageing population. In the UK, the ‘ageing in place’ agenda has been approached as a viable solution to finite resources because of its resonance with older adults’ wishes to remain living in familiar localities in which they have lived for significant periods of their lifetime. However there is little evidence to ascertain whether ageing in place is a suitable or beneficial way forward for older adults whose lives have not followed a normative life course in line with heterosexual expectations and heterosexual norms. Research on the social wellbeing of lesbian, gay and bisexual (LGB) adults indicates a differing but complicated relationship to community, neighbourhood and place in comparison to heterosexual older people. Here, we examine what an ageing in place agenda may mean for older LGB people from three angles: rural places as ‘home’; connections to LGB communities across localities; and, anticipating social care provision in the home. We present qualitative findings from a mixed-methods study into the long-term care needs of older LGB adults in Wales that included semi-structured interviews with 29 older LGB adults (50-76 years).

Thematic findings indicate a complex, and sometimes estranged, relationship to home, place and community. We contend that for health and social care policy to fully support the longevity of independent living a more nuanced understanding of home, rurality and community for sexually diverse groups of older people is required.

A place to transform: creating caring spaces by challenging normativity and identity

Silvia Radicioni, Bernhard Weicht
University of Turin, Italy; University of Innsbruck, Austria
silvia.ra18(at)gmail.com, bernhard.weicht(at)uibk.ac.at

In this presentation we discuss the transformative potential of the social (and partly residential) space of La Fundación 26 de Diciembre, in Madrid, Spain, which opened up to specifically support older LGBT people. Like all spaces, concrete caring places both shape and are shaped by understandings and constructions of normativity and identity. The traditional understanding of care for older people, imagining clearly demarcated dyadic roles, is firmly embedded in heterosexual logics of relationships within families, the own (family) home and institutional support. Social and residential places for older people thus both assume particular gender and sexual identities and contribute to a (re)production of the very normativity. But how can this interlinkage between the construction of caring spaces and the normativity of identities be understood and, possibly, challenged? Drawing on an in-depth case study we explore a space that allows visibility of different forms of living and caring practices of people with different genders, sexual preferences, origins, classes or political backgrounds. Through the daily life narratives of the people who work, volunteer or simply use the center we discuss the potential of challenging the restricted notions, assumptions and constructions through which particular places gain both social and political meaning. The paper highlights the transformative power of the active and collective making of caring spaces through which narratives of care, collective sexual and gender recognition and practices of caring relationships can replace both traditional/informal forms of living together and institutional spaces that provide professional care.

'I know how to deal with that disease': Challenges in Developing Inclusive Residential Care for Older Lesbian, Gay, Bisexual and Trans (LGBT) People

Paul Simpson, Almack Kathryn, Paul Willis, Trish Hafford-Letchfield
Edge Hill University, United Kingdom; University of Nottingham; University of Bristol; Middlesex University
simpsonp(at)edgehill.ac.uk,
k.almack(at)nottingham.ac.uk,
paul.willis(at)bristol.ac.uk, P.Hafford-Letchfield(at)mdx.ac.uk

Little is known about older LGBT experiences of healthcare services but when older LGBT people's

accounts have been documented, they indicate invisibilization and marginalization (Willis et al 2016). This paper reports on a feasibility study co-produced with older LGBT community advisers (CAs) who were trained to implement an audit tool that was designed to evaluate the inclusivity of older LGBT residents. We address the challenges and opportunities identified in interviews with eight CAs, six care home managers, two regional managers and a LGBT trainer associated with a voluntary organization before and after intervention in the home by CAs (N=33 interviews). In particular, we examine the diverse perspectives of study participants that identified structural/organizational and discursive barriers to inclusion animated by anti-LGBT prejudice - religious and secular. We also highlight opportunities arising from creation of safe space to explore pre-reflective LGBT-related phobias and CA role-modelling that lead to small but significant shifts in awareness and steps towards, more valuing, inclusive practice. We conclude with specific recommendations on advancing inclusion in care homes accommodating older people.

"Hope for the best, but prepare for the worst" – Same-sex Couples' Imagined Futures

Dora Tadic
University of Edinburgh, United Kingdom
s1564114(at)sms.ed.ac.uk

This research explores how older same-sex couples imagine their future, what challenges they imagine in their future, and how their imagination is framed by the normativity of heterosexuality. The research also addresses discrimination that surrounds sexual minorities, in particular older same-sex couples, who face homophobia and ageism in their daily lives. The theoretical concept of imagined futures is explored in the context of non-heterosexual ageing in Scotland, which was chosen because of its status as one of the best countries for LGBT equality, and against the backdrop of heteronormativity that is still prevalent in society, employment, and care settings. In order to explore these issues, the research takes a qualitative approach – it combines interviews with the couples' personal representation of their future. The interviews are semi-structured and allow the couples to focus on the areas of ageing they find most important for their life and relationship. In dialogue with existing literature on non-heterosexual ageing, some of the initial findings of this research suggest that there are indeed differences between the literature and the experiences that emerged from the data, such as an almost non-existent level of discrimination, and a large amount of social support. This research therefore contributes to a more comprehensive reading of literature on older age, with a better recognition and a more nuanced understanding of the intersection of gender, age and sexuality. The practice and policy implications of this research will address the challenges of discrimination against older people based on their age and stereotypes of sexuality.

RN01 | Session 07c Social and Political Participation

Gender, social participation and well-being in old age from a life course approach

Silvia Cervia, Rita Biancheri

Pisa University, Italy; Pisa University, Italy
silviacervia(at)tin.it, rita.biancheri(at)unipi.it

Social participation has been proposed as a determinant of the health of both women and men. More and more studies are examining the link between the social participation of the elderly and their quality of life and health, as the correlation is becoming increasingly relevant. Is the social participation of the elderly an effect or a cause of health? The answer remains unclear.

Epidemiological data show an apparent paradox between increased longevity in women and higher morbidity rates. Scientific research in this area has focused on what has been defined as feminine “resilience”, focusing on healthy lifestyles and habits (e.g. smoking behaviour), but without considering the effect of social participation on gender from a life course perspective.

By adopting the life course approach to study “health trajectories” in the ageing process, our research analysed the impact of social participation on health outcomes in old age. Specifically, we sought to redefine social participation to operationalise - in a gender-sensitive manner - those activities identified as socially oriented sharing of individual resources (including formal activities, such as participating in religious, hobby, volunteer, and political groups and informal activities, such as care-giving). By analysing the life story and medical history of a group of witnesses – women and men over the age of 75 – our research revealed a possible connection between the worst health outcomes (in terms of both disease and illness) and overburdening, resulting from a “double presence”, and the positive effect of the “re-establishment” of identities in care continuity.

Political Participation over the Life-Cycle. A Pseudo-Panel Approach

Amilcar Reis Moreira, Luis Manso, Mikkel Barslund
University of Lisbon, Portugal; University of Lisbon, Portugal; Centre for European Policy Studies
amilcar.moreira(at)ics.ulisboa.pt,
luis.manso(at)ics.ulisboa.pt,
mikkel.barslund(at)ceps.eu

After an initial period of interest (Crittenden, 1963; Nie et al, 1974; Curtis and Lambert, 1976; Beck and Jennings, 1979), the issue of how active citizenship evolves over the life-cycle has, for decades, been largely ignored by political scientists. However, given the increasing interest over the impact of ageing in developed economies, a body of evidence is slowly building in recent years - see Turner et al, 2001; Burr et al, 2002; Bukv et al, 2002; Campbell, 2002; Pattie et al, 2003; Goerres, 2007; Quintelier, 2007; Wass, 2007; Goerres, 2009; Bhatti et al, 2012; Bhatti and Hansen, 2012; Erkulwater, 2012; Nygard and Jakobson, 2011; Nygard and Jakobson, 2013; Grasso, 2014.

In order to adequately study how active citizenship varies over the life-cycle, we need be able to capture how individual’s behaviours vary over time and also to understand how historical and institutional contexts shape those behaviours. However, with some exceptions (see Tilley, 2004), longitudinal databases that allow us to follow individuals over extensive periods of time are scarce. Most importantly, as most of them are based on single-country surveys, they do not allow us to control for the effect of cross-national differences in individual behaviours. In order to overcome this limitation, and building on Deaton (1985), we will use data from the European Values Survey to build a pseudo-panel to assess whether political participation declines with retirement.

Mobility and Ageing – Preferences in the Use of Transportation Services and Goods by Age

Birgit Aigner-Walder, Albert Luger

Carinthia University of Applied Sciences, Austria;
Carinthia University of Applied Sciences, Austria
b.aigner-walder(at)cuas.at, a.luger(at)cuas.at

The changing age structure in industrialized countries like Austria, caused by the increasing life expectancy and low fertility rates, is affecting the consumption patterns of a (regional) economy. This can be explained by changing preferences and needs subject to the age of a household. Also studies in the field of mobility have shown that consumption patterns and expenditures for goods and services in the field of transportation are influenced by certain socio-economic variables as the age of the household. While there are comparable “young” regions in Austria like the capital Vienna (due to domestic and international immigration of young people to the metropolitan regions) there are also relatively “old” regions like Carinthia, a federal state marked by domestic out-migration of young people. The objective of this paper is to investigate to what extent mobility behaviour and expenditures of Austrian households for mobility (e.g. cars, bikes, public transportation etc.) are dependent on the age of the household, and subsequently which effects are to be expected for the demand of transportation goods and services due to the ageing of the population. The paper is based on a comprehensive literature review as well as a quantitative analysis of mobility expenditures from recent Household Budget Surveys.

RN01 | Session 08a Active Ageing Policies

Effective active ageing policies: High Performance Work Systems for elder employees

Eleanna Galanaki, Nikolaos Pahos
Athens University of Economics and Business, Greece; Athens University of Economics and Business, Greece
eleanag(at)aueb.gr, nikospahos(at)aueb.gr

The world is ageing rapidly (Loeppke et al., 2013). Population ageing is perhaps the most significant feature of global demography, given the fact that

never before in human history has our planet contained such a large share of old-age population. From an economic perspective, the emergence of graying populations is related to a decreasing number of younger employees. In contrast to the existing pressure for older employees to exit the workforce early, mature workers will be needed longer in the coming years (Taylor, 2007). In a competitive environment which changes constantly and requires creativity, innovation and adaptability, their work performance, their experience and their potential for further learning (Paloniemi, 2006) become valuable assets. The need for organizations to adapt Human Resource Management (HRM) practices for an ageing workforce and develop new ones is already urgent and will soon become critical (Patrickson & Ranzijn, 2004). Building upon the broad research question on the link of Human Resource Management with employee performance, this paper examines the relationship among High Performance Work Systems (HPWS), age and employee performance, using data from 1254 employees. Our aim is to explore which of the HPWS are most effective into sustaining the employment performance of older employees. Our results show that all HPWS have a significant effect on employee performance and that age moderates the relationship between High Performance Work Systems and employee performance. From all HPWS, training & development seem to be the most crucial for fostering a high performance of aging employees. Results will be discussed under the light of the challenges that they pose for the management of ageing human resources.

Active Ageing Policies and the Structure of Social Inequalities in Late Employment life

Dirk Hofäcker

University of Duisburg-Essen, Germany
dirk.hofaecker(at)uni-due.de

In recent decades, most European countries followed a strategy of early retirement to relieve their strained labour markets. Yet, against the background of demographic ageing, these measures increasingly were considered as socially and financially unsustainable. Many European governments revised their labour market and welfare policies accordingly to foster higher employment among senior workers. Legal retirement ages were raised and public pension benefits were cut to reduce the incentives for early retirement. Furthermore, employment-sustaining measures such as active labour market policies or lifelong learning were increasingly implemented - measures that were often referred to as 'active ageing' policies.

Most recent figures indeed suggest that these policies have been effective, as older workers' employment rates have risen substantially since the turn of the millennium. Yet, it remains an open question whether this aggregate increase has spread equally among all labour market strata or whether certain labour market groups are structurally excluded from this upward trend. We argue that - simultaneous to the increase in

late-career employment – active ageing policies have led to an increase in social inequalities among the older workforce. Particularly weak labour market groups – those with low education, in blue-collar occupations or working under hazardous conditions – have hardly been able to profit from employability measures while at the same time being confronted with an increasing pressure to prolong their working careers. To substantiate this allegation empirically, we provide a stylized sketch of major institutional trends based on most-recent macro data. Data from the European Labour Force Survey will then be used to reconstruct over-time shift in social inequalities in late career employment within European countries.

Activation and intergenerational solidarity as challenges for European social citizenship: suggestions from a comparative study

Barbara Barabaschi

Catholic University of Sacred Heart, Piacenza, Italy
barbara.barabaschi(at)unicatt.it

The paper is part of a wider research aiming to investigate welfare systems reforms, with a particular focus on active ageing policies in Italy, France, United Kingdom and Poland.

Each country case highlights principles inspiring national welfare reforms in the last decade (i.e., intergenerational solidarity, equity, activation) and how they have been translated into policies and measures focusing, in particular, on labour and training policies.

Paper hypothesis is that intergenerational solidarity may foster older people activation into the labour market. Activation, in fact, suppose a link between welfare and labour policies, since paid employment is a requirement for having access to welfare services and benefits.

The *contrat de génération*, "staffetta generazionale" and "solidarity contracts" are cited as a relevant example of how governments may favour employment for all generations at work. Furthermore, the impact of some reforms is presented and commented.

The role of institutional context is particularly underlined. If the welfare state wants to play an empowering action, it must ensure a context allowing actors to take responsibility for their activation. This means, to act first on training and employment opportunities, labour market and retirement regulation. The final part reflect, in a comparative way, on the role assumed by work in the in national policy frameworks and in defining the status of social citizen, in light of an interdisciplinary (main sociological) literature. Two approaches to social citizenship characterizing modern societies (the asset-based approach and the capabilities-based approach) are used to interpret results.

Co-creating welfare: Forming the active, old citizen

Aske Juul Lassen, Camilla Bundgaard Toft, Astrid Pernille Jespersen

University of Copenhagen, Denmark; University of Copenhagen, Denmark; University of Copenhagen, Denmark

ajlas(at)hum.ku.dk,

zdn482(at)hum.ku.dk, apj(at)hum.ku.dk

In recent years there has been an increased focus on co-creation in local governance in Western welfare states (Pestoff & Brandsen 2013). As part of this governmental turn, older people are urged to participate as volunteers in the design and execution of welfare services in Danish municipalities. This is caused by the potential resources amongst the healthy and active retirees, as well as the pressure on the welfare sector that the aging society constitutes in terms of increasing health- and care expenditure.

The study investigates how this type of co-creation is practiced in a small, sub-urban municipality in Denmark called Ishøj. Through interviews with municipal employees and active older citizens as well as participant observations amongst organizations and municipal initiatives, we have studied how retired older people are invoked to exercise active citizenship and engage in their local community.

The movement towards co-creation challenges and reshapes professionalism, responsibility and authority at a municipal level. While this is meant to leave an open space for innovative citizen initiatives it also forms a specific old age subjectivity; the engaged and resourceful. Our data shows how the constant flux of short-term welfare projects is dependent on and co-constitutive of this form of subjectivity.

The paper conclusively raises a discussion about the continuity and temporality of welfare initiatives and the restrictions of citizen involvement in co-creation initiatives.

RN01 | Session 08b Work & Transition to Retirement**Does the Task Specific Retirement Behaviour in Germany Support the Polarization Hypothesis? - Gender Differences Among Socially Insured German Workers**

Laura Romeu Gordo, Antje Mertens

DZA, German Center of Gerontology, Germany; DZA, German Center of Gerontology, Germany

Laura.Romeu-Gordo(at)dza.de, antje.mertens(at)hwr-berlin.de

Women and men tend to retire at different ages, primarily due to different legal regulations but also because of differences in socio-demographic and employment characteristics. While some factors are well determined, few studies actually look into the determinants of retirement at the micro level. Especially one factor has not been studied before - the performance of different tasks at the workplace.

We use two different data sets to study whether and

how the performance of different tasks influences the likelihood for retirement. We use task measures from the German Qualification and Career Survey (BIBB/IAB) to test whether they significantly have an effect on the hazard of leaving socially insured employment. For that purpose we use the Sample of Integrated Labour Market Biographies (SIAB).

Our analysis shows that tasks do indeed significantly influence the retirement behaviour, as do - besides socio-demographic characteristics and the sector of employment - firm characteristics and unemployment experience. Consistent with the technological change hypothesis higher percentages of routine manual tasks lead to a higher likelihood to leave employment while higher percentages of non-routine manual tasks decrease the likelihood to retire. With respect to analytical, interactive and routine cognitive tasks, women's retirement behaviour also supports the task change hypothesis: Routine cognitive tasks tend to have a positive, analytical and interactive tasks a negative influence on the timing of retirement. However, the retirement behaviour of men is being influenced less clearly by tasks. Finally, we do not find support of the polarization hypothesis as workers with low and medium educational levels do not significantly differ in their retirement behaviour.

Doing Retiring -The Social Practices of Transiting into Retirement and the Distribution of Transitional Risks

Anna Wanka

Goethe-University Frankfurt, Germany

Wanka(at)em.uni-frankfurt.de

With the ageing of the 'Baby Boomer' cohort, more and more adults are transiting from working life into retirement. This transition is shaped by different institutions and societal discourses and entails risks and chances that are coped with in diverse ways by different groups of persons. The presented research project focuses on the social practices of retiring, asking: How is retiring being done? Which societal institutions shape transitions into retirement? How are transitions into retirement articulated discursively? And how do these differ in regard to persons from different status groups? Methodologically the project tracks 15 older adults throughout their process of retiring from before to three years after retirement. It follows a longitudinal mixed-methods design with a qualitative focus, combining episodic interviews, daily diaries and non-participant observations. With this the research follows three aims: a) to describe doing retiring as a process in a holistic and comprehensive manner, considering the involved institutions and discourses from a praxeological perspective; b) to compare how older adults of different status groups do retiring and if these doings can be linked to the reproduction of social inequalities across the life-course; and c) to explore the practical potential of educational institutions at the transition from work to retirement. The presented paper focuses on the conceptual and methodological implications of a praxeological perspective for life-course research and

the distribution of transitional risks.

Transnational Habitus at the Time of Retirement

Minna Zechner
Seinäjäki University of Applied Sciences, Finland
minna.zechner(at)seamk.fi

International mobility requires the shifting of bodies across places, through life courses and stages, creating individual and collective experiences that become taken for granted. They are habitus, which is the durable deployment of an individual's body in the world, as well as a scheme of perception, thought and action that is present throughout life, including retirement. This study asks what kind of transnational habitus is visible in the narratives of interviewed older adults at the time of retirement. The answer is sought by analysing life stories of mobility from older adults who live or have lived abroad for several years. The multilocal transnational habitus of interviewees rests on their desire to maintain their mobility when retired. However, both their physical and mental international mobility is at risk when faced with an ailing body and mind, and policies allow and restrict the transferability of benefits and accessibility to services.

How does low-income employment effect the pension claims of cohorts differently? The German case

Wolfgang Keck, Laura Romeu Gordo
Deutsche Rentenversicherung, Germany; Deutsches Zentrum für Altersfragen (DZA), Germany
dr.wolfgang.keck(at)drv-bund.de, Laura.Romeu-Gordo(at)dza.de

The German Statutory pension system strongly links the benefit level with the contributions paid throughout the entire working life. Employees need to accumulate enough contributions in order to achieve an adequate pension in later life. Person working in the low-wage sector or employed on a part-time basis for a longer time risk to have an insufficient old age security. The presentation will examine the labour market developments in Germany in the last 15 years and its effects on old age pensions. On the one hand Germany experience a so called "job miracle" with a substantial increase in employment rates. On the other hand – at least for the period between 2000 und 2010 – a large part of the job growth took place in the low-income sector. Using data on contribution records from the statutory German pension fund, we will analyse a) if the share of persons with low pensions claims is higher in younger cohorts than in older ones and which social groups are most affected from the increasing low-income employment sector in Germany. With the longitudinal data source, we compare different birth cohorts at the same age by using sequence analysis in order to distinguish cluster(s) with periods of low income.

RN01 | Session 08c Ageing & Health

An examination of the factors associated with influenza vaccination uptake among older people

Dr. Sarah Gibney, Ms. Tara Moore, Dr. Mark Ward, Ms. Sinéad Shannon
Department of Health, Ireland; Department of Health, Ireland; Department of Health, Ireland; Department of Health, Ireland
sarah_gibney(at)health.gov.ie,
tara_moore(at)health.gov.ie,
mark_ward(at)health.gov.ie,
sinead_shannon(at)health.gov.ie

Background: The WHO has labelled 'Community Support and Health Services' as a core domain of an age-friendly environment which includes access to health and social care services which support healthy ageing. Influenza immunisation is an example of a primary preventative health intervention which is recommended for high-risk groups including older people. However, annual uptake in Ireland is frequently below the target of 75%. The aim of this study is to examine the prevalence of influenza vaccination among people aged 65 and over and the demographic, socio-economic, behavioural and environmental correlates and predictors of influenza vaccination uptake in Irish Local Authority Areas.

Methods: The Healthy and Positive Ageing Initiative (HaPAI) survey data was used (n = 10,540) which is a random-sample, population representative survey of people aged 55 and older, living in 21 local authority areas in Ireland (2015-2016). Stata 14 was used to carry out descriptive statistics and a mixed-effects logistic regression.

Results: Of the 6,548 eligible participants, 65% received the influenza vaccination (ranging from 46% - 79% across the 21 local authority areas). Uptake of the influenza vaccination was found to be significantly associated with age, gender, household composition, occupation and access to local health services. Regarding health-related variables, influenza vaccination uptake was significantly associated with poor self-rated health, not smoking, having a long-standing illness, multimorbidity, a full medical card, and private health insurance.

Discussion: The prevalence of influenza vaccination remains below the WHO target level in Ireland. Understanding the factors that influence influenza vaccine uptake among older people will inform future community public health plans to increase immunisation rates among older people.

Informal caregiving and health of migrants across Europe: What is the role of background and current country context?

Judith Kaschowitz
TU Dortmund University, Germany
judith.kaschowitz(at)tu-dortmund.de

In our analysis we examine the relationship between caregiving and health for foreign-born and native-born caregivers in Europe. We hypothesize that there are

differences in the relationship because these two groups vary with respect to resources like health, social support, income, norms and values, which can all mediate health effects of caregiving. We further assume that the relationship between caregiving and health is different for migrant caregivers across Europe. This is because the degree of formal care supply and the duty to provide informal care vary considerably in the different countries. We first examine the relationship between informal caregiving inside the household and self-perceived as well as mental health for foreign-born and native-born caregivers. Second we investigate whether this relationship varies across different countries. We thus shed light on the role of country of origin and current country context for health outcomes of caregiving. The analysis is based on data from the Survey of Health, Ageing and Retirement in Europe (waves 1, 2, 4 and 5) and the English Longitudinal Study of Ageing (waves 2 - 5). We apply cross-sectional as well as longitudinal models. We found no significant differences between foreign-born and native-born in the relationship between health and caregiving. All caregivers across Europe experienced a decline in their mental health, whereas native-born caregivers experienced also a decline in their self-perceived health. The country models showed that migrant caregivers in a few, mainly conservative welfare states, were in worse health compared to non-caregivers.

Social networks may decrease the risk of genes on dementia among older adults: A gender difference?

Jing Wu, Caroline Hasselgren, Björn Halleröd
University of Gothenburg, Sweden; University of Gothenburg, Sweden; University of Gothenburg, Sweden
jing.wu(at)gu.se, jing.wu(at)gu.se, jing.wu(at)gu.se

Objectives: Emerging evidence suggests that social networks may provide a protective mechanism against the development of dementia among older adults. In this paper the relationship between social networks and the onset of dementia is studied. Since there is a gender difference in both quantity and quality of social networks, special attention is given to the potential interaction effect between genetic factors, in this case the presence of APOE ε4 allele, and the strength of social networks on the onset of dementia among men and women, separately.

Methods: The analyses build on population based longitudinal data Gothenburg, Sweden - the H70 Birth Cohort Study. 564 individuals who were born in 1930 and had no dementia diagnosis before underwent the semi-structured neuropsychiatric examinations in 2000-01. The timing and rate of dementia onset was analysed using Cox proportional hazards regression model.

Results and Conclusions: Our results showed a significant association between APOE ε4 allele and the risk of developing dementia only in women. After we adjusted for marital status, education and socio-

economic status, among women, APOE ε4 carriers, a weak social network with children, neighbours and friends was associated with an increased risk of dementia onset, but this was not the case for men. The preliminary conclusions can be made that genetic factors (APOE ε4 allele) and social networks are interactively related to dementia risk and that social networks might decrease the risk of genes (APOE ε4 allele) on dementia for women, not for men.

RN01 | Session 09a Social Networks

The Strength of “grey ties”: a case study of self-managed community centres for elderly people in Tuscia district – Italy.

Tony Urbani
Università degli Studi della Tuscia, Italy
urbanit(at)unitus.it

The present work aims to overturn the common sense about elderly people as passive subject benefited by social welfare, showing an inedited vision of senior citizens, here shown as active people and leaders in local communities.

This qualitative-quantitative research is based on 393 cases divided in more than 20 social centres in Viterbo district (known as Tuscia Viterbese) in Italy and to what extent social capital (in specific environment) can be a flywheel for empowerment, trust, health and happiness for senior citizen. The mix of social capital and democratic environment in community centres that are self-managed by seniors and the fact that they can really decide activities and ruling class are crucial elements for well-being and happiness of seniors. This study shows that social capital could reduce daily hospitalization, medicines consumption while increasing perceived happiness.

The community centres for elderly people managed by ANCeSCAO NGO are not just a case of excellence (even with some critical issues as e.g. communication and conflicts), but they could be also a bridge for new welfare for seniors, an empowering and enabler social welfare, where bottom-up processes are balanced with top-down ones.

Elderly people involved in ANCeSCAO NGO in Tuscia district display availability to help the local communities, some of them are involved in voluntary activities or fundraiser for poor people and earthquake victims in Italy.

“Not just any club” – A regard to the 'hows', 'whens' and 'whys' of building collective wisdom in older adults' group activities

Jenni Spännäri
University of Helsinki, Finland
jenni.spannari(at)helsinki.fi

Research on wisdom has been of increased interest in sociology and developmental psychology. Also the ways to become wise are explored in many current theories in the individual level (eg. Glück & Bluck 2014). But could wisdom be shared property, and becoming wiser a joint effort?

This paper investigates the process of creating, cultivating and sharing wisdom in study groups of older adults belonging to an active, young-old segment of the older population. It shows, how wisdom is constructed both through participants' own experiences and through role models – and how it could be developed further into an utilizable, shared scheme for thought and action. This paper will also shed light on the diverse functions of study groups and group activities for and by older adults.

Does Size Matter?' Social Networks and Network Satisfaction in Age

Ronny König, Ariane Bertogg

University of Zurich, Switzerland; University of Zurich, Switzerland

koenig(at)soziologie.uzh.ch,

bertogg(at)soziologie.uzh.ch

Intimate relationships are important for any human being and constitute a valuable resource for support. However, despite longer life expectancy and thus an increasing extent of sharing contacts, previous research has paid more attention on social networks in young adulthood than in old age. With respect to lower birth rates and rising divorce rates increased retirement age and generally higher social and geographical mobility, intimate relationships are in danger of becoming more volatile. This applies especially to the second half of life, where children move out, health and mobility limitations increase, relatives pass away and the contact with former colleagues diminishes.

Against this backdrop, this study investigates the size of and satisfaction with social networks of persons aged 50+ in various European countries on the basis of the Survey of Health, Ageing and Retirement in Europe (SHARE). We focus on emotional ties, addressing the following questions: (1) How small or large are social networks of the elderly?, (2) Who belongs to the social network and how satisfied are they with their social networks?, (3) Are there gender- and/or country-specific differences? and (4) Does network size and constitution matter for network satisfaction? In all countries, women reported significantly larger networks and a greater network satisfaction than men. Furthermore, the larger the social network the greater the satisfaction of women and men. However, this link varies between countries and is dependent on a series of exogenous factors.

Everyday Activity Limitations and Social Networks of Older Adults: Longitudinal Evidence from the SHARE survey

Liili Abuladze, Luule Sakkeus, Adriana Santacroce
Estonian Institute for Population Studies, Tallinn University, Estonia; Estonian Institute for Population Studies, Tallinn University, Estonia; La Sapienza University of Rome, Italy

liili(at)tlu.ee, luule.sakkeus(at)tlu.ee,

adriana.santacroce(at)gmail.com

Studying the role of social networks in health

outcomes helps to understand how surrounding social environment, particularly interactions with other people, influence health. Cross-sectional analysis of the European older adults has shown that network size is slightly bigger for those with less severe limitations, but smallest for those with severe limitations compared to the non-limited population, indicating that there is a changing dynamic with regard to networks depending on the level of activity limitations. Some countries such as Switzerland, France and Belgium indicated having more diverse networks whereas Austria, Estonia, Hungary and Portugal had more family-based networks. (Abuladze & Sakkeus 2013). This paper aims to understand how the dynamics of social networks are related to disability outcomes among older Europeans. The main research question is the following: Which type of social networks lead to the onset of disability? We use the Survey of Health, Ageing and Retirement in Europe (SHARE) Waves 4, 5 and 6. The change in the Global Activity Limitation Index (GALI), identifying three levels of severity of activity limitations as our main health outcome variable. Social network characteristics will be used as main independent variables. First descriptive results indicate that Estonian older adults have remained the most disabled people among the participating countries - 29% of them are severely limited by Wave 6. Estonian and Italian older adults have lost the most network members since Wave 4. These are also the only countries where people have lost more members than added during this time. Swiss older adults see no change in the number of social networks; Austrian, Spanish and Slovenian older adults have added the most network members.

RN01 | Session 09b Ageing & Migration II

Immigrants' old-age pensions in Germany: employment patterns, migration-related features and socio-economic disparities

Janina Söhn

Sociological Research Institute (SOFI) at Göttingen University, Germany

jsoehn(at)uni-goettingen.de

By-now established countries of immigration like Germany host a substantial minority of immigrants among their retired population, many of them from other European countries. By and large, statutory pensions relate only to employment (and other pension-inducing activities) within the boundaries of the national welfare state – which immigrants have crossed at some point. In Germany, immigrants' average old-age pensions are well below the national average and the variance of immigrants' pensions is situated in the lower half of the distribution. My approach to the topic of migration and retirement aims at answering the following questions: Which patterns of employment careers as valued by the German retirement law do retired immigrants exhibit? And what do average old-age pensions associated with those patterns amount to? For which immigrant groups –

both in terms of the characteristics of employment trajectories and socio-economic features – are the pension entitlements caused by directly migration related factors like a higher age at migration and/or by post-migration factors like under-average wages or longer spells of non-employment? My statistical analysis uses the data base “completed insurance biographies” (Vollendete Versichertenleben [VVL]) for the retirement-entry cohort 2014. The VVL used here contains the original administrative data on the whole employment careers recorded by the German statutory pension scheme. Based on the monthly information on different activities and formal statuses (e.g. employment differentiated by three income-categories, unemployment, unpaid reproductive labor) of more than 90.000 immigrant, the employment patterns to be presented are the result of a sequence analysis combined with an hierarchical cluster analysis.

Alternating Migration Flows and their Age-Structure and Duration-of-Stay Effects on the Long-Term Sustainability of the German Statutory Pension Insurance

Jan Valentin Vogt
KU Eichstätt-Ingolstadt, Germany
valentin.vogt(at)ku.de

Besides fertility and mortality, migration is a key influence to demography. It changes both population size and age structure. Nonetheless, demographic parts of macroeconomic long-term pension simulations for Germany have not fully taken into account that the age structure resulting from alternating migration flows has a reasonably different shape than the one resulting from constant migration scenarios – especially, when labour market participation heterogeneity across the duration of stay is taken into account.

This contribution makes use of regularities in the relation between the size of a migration flow and its relative age structure. These regularities allow a parametrisation of the age profiles with a few intuitive parameters. With this parametrisation, alternating migration scenarios reaching until 2060 are created together with their constant counterparts, which share the same average size.

The simulation model applied here consists of a cohort-component population projection, a Solow-Swan growth model, a projection of the labour market participation via entry and exit rates considering heterogeneity across age, gender and duration of stay of immigrants, and a detailed calculation of the pension insurance's budget via average lifetime earnings profiles for each cohort. The main target variables for an assessment of the pension insurance's sustainability are the contribution rate and the insurance level under a balanced budget constraint.

The simulations show a reasonable effect of the different age structure on both target variables in the alternating scenarios. This might lead to an underestimation of the effects of immigration on the

sustainability of the German statutory pension insurance.

Does migration have long-term consequences for cognitive functioning?

Stefan Gruber, Gregor Sand
Max Planck Institute for Social Law and Social Policy, Germany; Max Planck Institute for Social Law and Social Policy, Germany
gruber(at)mea.mpisoc.mpg.de,
sand(at)mea.mpisoc.mpg.de

A large amount of studies have investigated the “Healthy Immigrant Effect” (HME) and found that people who migrate are healthier than their native counterparts. This health advantage tends to wane with length of residence. The HME was detected for a range of health outcomes like physical health, disability, mortality risk, and health behaviour. An understudied outcome in this context is cognitive functioning. On the one hand, the adaptation to a new environment including language, habits, working conditions, etc. might have a positive effect on the cognitive functioning of migrants. On the other hand, stress associated with difficult emigration and acculturation experiences could undermine cognitive abilities. The so far existing literature focuses on Latin American immigrants to the United States. Although few studies suggest that the HME extends to indicators of cognitive functioning, the majority of them do not find apparent differences between immigrants and natives. However, the classical comparison with the native reference group does not necessarily provide sufficient information

on the consequences of migration itself. In this study I extend the existing literature in two respects: First, I compare migrants not to natives in the destination countries but to stayers in the respective country of origin. Second, I study the European migration context using data from the “Survey of Health, Ageing and Retirement in Europe” (SHARE). Focusing on people aged 50+, the migrant sample in SHARE has migrated several years ago (on average 30 years), which allows for observing the long-term consequences of migration.

Structural disadvantage and subjective wellbeing: Protection by religion among young-old Turkish and Moroccan immigrants in the Netherlands

Silvia Simone Klokgieters, Theo van Tilburg, Dorly Deeg, Martijn Huisman
Vrije Universiteit Amsterdam, Netherlands; Vrije Universiteit Amsterdam, Netherlands; Vrije Universiteit Amsterdam, Netherlands; VU University Medical Centre Amsterdam; Vrije Universiteit Amsterdam, Netherlands; VU University Medical Centre Amsterdam
s.s.klokgieters(at)vu.nl, theo.van.tilburg(at)vu.nl,
djh.deeg(at)vumc.nl, m.huisman(at)vu.nl

High levels of structural disadvantage are known to have a negative impact on the wellbeing of older labor immigrants and their wives. The question is how these

populations may be protected against the negative effect of structural disadvantage. The stress coping literature suggests that intrinsic and extrinsic religiosity may help immigrants to maintain high levels of wellbeing. This may be especially so in contexts where persons have relatively little control over the disadvantage with which they are confronted. Furthermore, populations in which religion is the norm rather than the exception, are likely to call upon its protection whenever their wellbeing is jeopardized. The current study investigates protection by religion against structural disadvantage among Turkish and Moroccan immigrants living in the Netherlands. Data were collected from 255 Turkish and 199 Moroccan immigrants in the context of the Longitudinal Aging Study Amsterdam. Cluster analyses with variables denoting social, physical and economic disadvantage revealed three severity levels of structural disadvantage, namely severely, - moderately, - and not disadvantaged. Linear regression analysis showed that being severely and moderately disadvantaged was negatively associated with level of wellbeing. Furthermore, religious coping, but not religious attendance and membership of religious organizations, was positively associated with respondents' level of wellbeing. Religious coping buffered the relationship between moderate and severe disadvantage and well-being. Membership of religious organizations impacted the relationship between structural disadvantage and wellbeing, however not as a buffer but as an accelerator of the negative impact of structural disadvantage on wellbeing. This study concludes that protection by religion among young-old immigrants differs by intrinsic and extrinsic religion.

RN01 | Session 10a Elder Care

Should I stay or should I go? Nurses' motivations for working in elderly care services

Heidi Gautun, Christopher Bratt
Oslo and Akershus University College of Applied Sciences, Norway; University of Kent
Heidi.gautun(at)nova.hioa.no,
Christopher.bratt(at)gmail.com

Aim: Most modern countries encounter increased demands for skilled staff in health- and social services, resulting in stronger competition between health sectors for skilled employees. Several studies have documented that elderly care has difficulties recruiting skilled employees, but whether employees plan to stay in their jobs has received little attention. We investigate to what extent nurses in the Norwegian elderly care consider changing workplace and working outside elderly care. And what reasons do those wanting to quit report?

Data: A nationwide survey conducted among 4,945 nurses working in nursing homes and home- care services in Norway in 2016.

Results: About 90 percent of the nurses indicated that the most important motivation for starting to work in elderly care was a desire to contribute to the patients'

wellbeing, and that they perceived working with older and chronically ill patients as meaningful. Still, 50 percent considered quitting work in these services. The main reason indicated was that their department had too few employees trained for working in health services, resulting in a stressful work environment with too little time to give patients adequate service.

Conclusion: In addition to improving the recruitment of employees, it is crucial to develop methods that motivate skilled employees to remain as workers in the elderly care.

Care poverty among older people in Finland: A Nordic country facing the risk of unmet care needs

Jiby Mathew Puthenparambil, Teppo Kröger
University of Jyväskylä, Finland; University of Jyväskylä, Finland
jibymathewmsw(at)gmail.com, teppo.kroger(at)jyu.fi

Nordic care systems have recently been under major transformations, as publicly funded services have become targeted more strictly, leaving many older people without support. Simultaneously, for-profit provisions have emerged and grown rapidly. Consequently, new inequalities have emerged: private care service use has increased among well-off older people and family care in low-income groups.

Due to gaps left by shrinking public care services, some older people might not receive the support they need. Having unmet care needs is here examined through the new concept of care poverty, that is, care needs that are not covered adequately. The extent of care poverty and its predictors among the 75+ population are analysed with questionnaire data from Finland, gathered in 2010 (N=1464) and 2015 (N=1474). The results show that there is a specific group of older people in Finland who have a clear risk of ending in care poverty, despite the continuing universalist orientation of the public care system. The analysis shows how the recent transformation of the care service system has contributed to the emergence of care poverty among older people in a Nordic context. The results are compared to international findings concerning the level of unmet care needs in other welfare states.

"If we are nice to each other we'll make it" - a follow-up study on elderly care recipients' experiences of informal care in a Finnish context

Sarah Åkerman, Fredrica Nyqvist, Mikael Nygård
Åbo Akademi University, Finland; Åbo Akademi University, Finland; Åbo Akademi University, Finland
sarah.akerman(at)abo.fi, fredrica.nyqvist(at)abo.fi, mikael.nygard(at)abo.fi

Finland is characterized as a Nordic welfare state with mainly publicly financed and publicly provided social and health care services available to all according to need rather than ability to pay. Eldercare has generally been carried out within public homecare or institutional care. However, due to demographic, economic and political changes, active ageing and

ageing in place are increasingly highlighted as well as marketization, increased privatization and refamilisation of eldercare. Refamilisation refers to the shift of care responsibilities back to families, in other words more informal care. Previous research on informal care tends to focus on the caregivers, leaving the care recipients' experiences understudied. This study contributes to the research in this field by presenting results from a follow-up interview study among Finnish informal care recipients aged 71-80. The aim of the study is to investigate elderly care recipients' experiences of informal care overtime. The follow-up interviews were conducted in 2017, nearly two years after the initial interviews, using a qualitative semi-structured procedure followed by qualitative content analyses of the responses. The results from the baseline study showed that the care recipients appreciate informal care but worry about the future. In this follow-up study we expect to find increasing health problems and changes in the everyday lives of the care recipients. Our study provides in-depth knowledge on care recipients' experiences of informal care and thus provide unique evidence on the virtues and possible shortcomings this care form may entail in a larger societal context.

RN01 | Session 10b Health & Disability

Comparing cumulative (dis)advantage in health for different contexts: Later life developments in England and Germany.

Martin Wetzel, Bram Vanhoutte
University of Cologne, Germany; University of Manchester, United Kingdom
wetzel(at)wiso.uni-koeln.de,
bram.vanhoutte(at)manchester.ac.uk

Background: Health disparities between different social groups, as well as health developments over the life course are a long-standing topic of interest in the social sciences. In this study, we examine cumulative (dis)advantages in health from a comparative perspective between England and in Germany to understand better the impact of welfare states on health development and health inequalities. Therefore, we disentangle ageing from cohort effects and compare health developments for different educational classes in later life.

Data: We used data of the English Longitudinal Ageing Study (ELSA, bi-annual between 2002 and 2014, 14,139 individuals) and the German subsample of Survey of Health, Ageing and Retirement in Europe (SHARE, 2004, 2006, 2010, 2012, 8400 individuals) to compare developments of functional health (sum of ADL and IADL) over the age range of 50 to 90 years. We applied multi-level modelling to plot ageing-vector graphs.

Results: The findings show that people in Germany have less limitations at the age of 50 than in England. At this age, we find stratified functional health by education in England only. While the differences between the higher and lower educated stayed stable in England, in Germany education-stratified health

differences increased over age.

Discussion: Welfare states affect health inequalities in later life differently - but also in the years before. While health differences seem to increase in England already in earlier ages and then remain rather stable, health limitations increase and accumulate in Germany stronger in later life. We discuss these findings under the light of contextual differences.

Transitions between disability and old age - now and in the near future

Lea Graff, Tine Rostgaard
KORA, Denmark; KORA, Denmark
legr(at)kora.dk, tiro(at)kora.dk

As our societies witness increased longevity and ageing societies, we also see that more people with disabilities live well into old age. However, there are different societal, systemic and individual assumptions about needs, rights and obligations associated with frail older people and people with disabilities.

The paper presents quantitative results from a Danish study, investigating what challenges ageing of society pose for the individual as well as for the welfare state in regards to meeting the needs of those who either age into disability or age with disability.

Using panel data from the Danish Level of Living surveys (Ældredatabasen) from 1997-2012, we investigate how ADL related needs for care have changed over time for the 52+ year olds. In line with theories of compression of morbidity we find an increase in functional ability for the individual, but with ageing societies, overall societal need for care is increasing. We make projections of how needs will change in the near future and how this will also affect the take-up of care services. Finally, we show how the very different systemic approaches to assessing needs and rewarding services for persons who are under or above 65, but otherwise have identical and socio-economic backgrounds, result in a very different service take-up that seems to favour those 65+.

Diverging Ideas of Health? Explanatory Factors for Self-Rated Health Across Gender & Age-Groups in Europe

Patrick Lazarevic, Martina Brandt
TU Dortmund University, Germany; TU Dortmund University, Germany
Patrick.Lazarevic(at)TU-Dortmund.de,
Martina.Brandt(at)TU-Dortmund.de

Self-rated health is the most important and widely used single indicator for health in survey research. Despite its widespread use, self-ratings of health remain a black box for researchers since hardly any studies systematically analyze what factors influence their rating, especially from a comparative perspective. In our paper, we want to gain a better understanding of health ratings firstly by identifying relevant determinants for the assessment and secondly by quantifying their contribution to R² across gender and age-groups in 15 different European countries.

Using data from almost 57,000 respondents of the fifth wave of the Survey of Health, Ageing and Retirement in Europe (SHARE), we explain self-ratings of health via linear regression models. Our model comprises a wide array of health-related variables which are grouped into five categories: BMI, performance tests, diagnoses of illnesses and pain, restrictions in daily life and mobility, and depression. We focus on the share of explained variance by variable group and compare these shares between males and females, three age-groups (50-64, 65-79, and 80-90), and across 15 countries.

Results indicate that our model explains self-ratings of health rather well ($R^2 = 0.46$) with illnesses and pain contributing the most to the appraisal (41%). Restrictions are the second most relevant factor (29%) followed by performance tests (16%). Depression (12%) and especially BMI (3%) are less relevant for health ratings. This ranking is consistent for both genders across almost all countries with only little variance overall. A comparison of age-groups across countries, however, indicates that the contribution of illnesses and BMI to health-ratings decreases over the life-course while the contribution of restrictions and performance tests to R^2 increases.

Coping with hearing and vision impairment in old age.

Gro Gade Haanes, Elisabeth Hall
University of Faroe Islands, Faroe Islands; University of Faroe Islands, Faroe Islands
groh(at)setur.fo, eh(at)ph.au.dk

Hearing and vision impairments are natural parts of ageing and therefore affect the lives of many elderly. Estimates are that 40-50% of the septogenarians and more than 90% of the octogenarians are affected by presbyacusi. The global burden of presbyopia tops one billion people worldwide. These impairments are also risk factors for functional decline, social exclusion, withdrawal, depression and accidents. The aim of this study was therefore to explore how elderly themselves experience or cope with (impaired) hearing and vision in everyday life. Data derive from in depth interview of 10 elderly home care patients with a mean age of 89 years old, about their hearing and vision in daily life. The findings show that this group of elderly have serious health challenges in general that are so challenging that they cannot attend to or prioritize their hearing and vision impairments. Their hearing and vision impairments have come gradually over many years and often without their having noticed it. They have changed their daily routines and practices in accordance with their impairments and for the most part they accept the impairments. They think this is a part of ageing and are not informed that it may be possible to optimize both hearing and vision. When asked whether they would accept help to improve their hearing and vision, they confirmed that it would be helpful. The conclusion is that the elderly need help and guidance to improve their hearing and vision impairments.

RN01 | Session 11a Inequality and Marginalisation

Social participations and life satisfaction: specific issues and inequalities

Marie Baeriswyl
Université de Genève, Switzerland
marie.baeriswyl(at)unige.ch

This presentation explores the links between social participations and life satisfaction after retirement age. Today, many researchers emphasize the positive association between activities and health in the broad sense. These results contribute to the discourses promoting “active ageing”. This concept can be seen as the dominant contemporary representation of “ageing well” and puts great importance on the social participation of the elderly. Here we want to examine this question in the light of the diversity of the investments and the population’s heterogeneity. To this end, we adopt a large and multidimensional perspective on social participation. We will study simultaneously various activities: socially strongly valued forms of formal participation in the public space (volunteering, associative activities) but also more informal manifestations (“social leisure”), participation to religious sphere or modes of investment in the private sphere. More precisely, we will explore the links between these different aspects of the participation and a measure of life satisfaction. Beyond that, these results will be considered in the light of a broader system of resources and inequalities. These analyses – showing the relative importance and the issues attached to various forms of practices at retirement time – contribute to a critical perspective on “active ageing”. Empirically, we will use data from the survey “Vivre-Leben-Vivere: Old Age Democratization? Progresses and Inequalities in Switzerland”. This survey on the living and health conditions of people 65 and older was carried out in 2011/2012 in five Swiss regions.

Ageing and the city: urban resilience and sociospatial marginalisation of older people in East London

Theodora Frances Bowering
Centre for Urban Conflicts Research, Department of Architecture, University of Cambridge, United Kingdom
tfb24(at)cam.ac.uk

Ageing is a heterogeneous process, key aspects of which are played out in the civic spaces of cities. In their everyday routines older people inhabit, traverse, observe, avoid and contest civic sites – streets, transport infrastructures, markets, community centres – assembling their own personal territories and networks. Readings of these assemblages offer insights into the existing spatial, temporal and social accessibility of civic spaces for older people. This research argues that age should be engaged in its urban and spatial dimensions and that older people need to be included in discussions of marginalisation

in cities. A questioning of age as a factor of marginality in urban studies opens up debates on spaces and practices of exclusion, isolation, loneliness and fear, as well as mobility and visibility, that link with ageing studies. While ageing studies address the complexities of ageing and point to the importance of urban environments, this research is yet to be properly connected to and critiqued within urban and architectural disciplines. These disciplines offer a unique contribution and challenge to ageing and urban debates through concrete empirical analyses of space that act to ground the abstract in descriptions of everyday physical places. Along with empirical ethnography and spatial mappings of the London Borough of Newham, this research reveals how ordinary urban spaces are transformed through their quotidian occupation into civic places. They then demonstrate how fundamental these places are to older people, especially when vulnerable, and how they impact their ability to resist their marginalisation and be a part of the city.

Loneliness among older people in Europe: a comparative approach

Fredrica Nyqvist, Mikael Nygård

Åbo Akademi University, Faculty of Education and Welfare Studies, Social Policy, Finland; Åbo Akademi University, Faculty of Education and Welfare Studies, Social Policy, Finland

fredrica.nyqvist(at)abo.fi, mikael.nygard(at)abo.fi

Previous research suggests a link between cultural factors on a society level and loneliness indicating that older individuals in more individualistic societies generally report lower levels of loneliness. It is also, however, plausible that the link between cultural differences and loneliness is to some extent mediated by differences in welfare-institutional characteristics, such as the generosity and coverage of pension rights, the level of income inequality or the general standard of living. Based on previous research linking welfare-institutional characteristics (such as the degree of universalism) to various health and well-being outcomes, we can perhaps assume that welfare-institutional factors alongside society-level cultural factors (such as the degree of familialism) may also be associated with subjective experiences of loneliness on an individual level. Previous research on such cross-level associations however still remains scant. Therefore we explore loneliness among older Europeans from different welfare regimes by testing the association between loneliness in older people (60+) and various socio-demographic, social and health-related indicators on the one hand, while simultaneously controlling for various welfare-institutional and cultural characteristics on a context level on the other. We employ regression models to estimate these associations on the basis of the latest European Social Survey (ESS) Data from 2014. We argue that the associations between loneliness in older people and individual variables are embedded in larger cultural and welfare-institutional contexts. An investigation of these complex interactions and

connections is therefore warranted for a deeper understanding of the prevalence of older people's loneliness in a comparative setting

Socio-economic and health determinants of elder abuse

Isabel Correia Dias, Alexandra Lopes, Rute Lemos, Sílvia Fraga, Diogo Costa

faculty of arts and humanities of university of Porto, Portugal; faculty of arts and humanities of university of Porto, Portugal; faculty of arts and humanities of university of Porto, Portugal; institute of public health university of Porto; institute of public health university of Porto

mdias(at)letras.up.pt, aslopes(at)letras.up.pt, lemos.rute(at)gmail.com, silfraga(at)med.up.pt, diogo.costa(at)ispup.up.pt

The starting point of the project underlying this communication is the need to fill in the gap on elder abuse studies, focusing on the effects of the socio-economic crisis. The broad research hypothesis is the recent economic recession increases the risk for those that are already at structural risk and it brings additional strain translating into increased prevalence. The research project will start from the EPIPorto database. EPIPorto is a cohort of 2485 adult residents in Porto, Portugal. It will focus on the elderly participants from the initial cohort with the specific purpose of: reassessing their socio-economic conditions and testing if the decline or deterioration of those has had any impact on to the occurrence of aggressive and abusive behavior; analyzing general health indicators, their effects as determinants of vulnerability towards abuse; characterizing the neighborhoods where individuals live, according to their socio-economic status, in order to identify risk factors associated with these areas.

This communication intends to show the first results of the project and discuss if this is a cluster effect of accumulation of socio-economic disadvantages and health conditions that together increase the vulnerability of older people and the risk of abuse.

RN01 & RN13 | Session 09a JOINT SESSION: How do Increasing Childlessness and Limited Family Support Affect Older Adults?

Support networks of childless older people in Europe

Christian Deindl

University of Cologne, Germany

deindl(at)wiso.uni-koeln.de

Research on the social networks of childless (older) people up to now produced quite ambivalent results – especially in comparison to parents and in older age. There are studies claiming that there is no real difference between childless people and parents in terms of wellbeing. Others found that social networks of parents and childless are similar and that the childless elderly receive as much support from their social network as parents do. Some, however, do find

differences and claim – almost – the exact opposites: childless people feel worse, they have smaller networks, receive less support, etc. With the social network module of the Survey of Health, Ageing and Retirement in Europe (SHARE) it is now possible to analyze social networks in a comparative study using reliable measures of social networks. We will use this data to analyze if and to what extent childless older people differ in their social networks from parents. Important network measures are the size of the social network, as well as its quality in terms of contact and closeness with its members and the satisfaction with one's social network. The analyses show that childless older people have somewhat smaller networks than parents, are also less satisfied with their social networks, are not as close with their members and have less contact with them. We thus find substantial differences between parents and childless older people concerning their social networks apart from the lack of children.

Students' attitudes about ageing and intentions to work with older adults after graduation

Stella Bettencourt da Camara

ISCSP-ULISBOA - School of Social and Political Sciences – University of Lisbon CAPP - Center for Administration and Public Policies, University of Lisbon, Lisbon, Portugal
scamara(at)iscsp.ulisboa.pt

The increase of older population has two important implications for health care and social work students: (1) an increase demand for social workers and health care professionals; (2) the need for social workers and health care professionals to be prepared for working with old people and for dealing with the changes that this ageing will bring to all settings and fields of practice. Now, the attitudes of social workers, doctors, nurses and physiotherapists toward old people can have a significant impact on the quality the services they render. Research conducted in several countries has shown that health care and social work students, exhibit negative or neutral attitudes towards the elderly and are reluctant to work with them after graduation because they consider not to be a priority area and belittling in terms of status and unattractive as occupation. Is this also true of the Portuguese case? In the present study the Kogan Attitudes toward Old People Scale (1961) was applied to 620 social work, medical, nursing and physiotherapy Portuguese university students.

The aim is (1) - Present some of the results thus obtained, namely with regard to the relationship between the students' intentions to work with older adults after graduation and (a) age; (b) gender; (c) attitudes towards old people; (d) had lived with grandparents; (e) contact with older adults and (2) characteristics of two typologies: i) students who would prefer not to work with older persons and; ii) students who would like to work professionally with them after graduation resulted from using the Latent Class Model and the BIC (Bayes' Information Criterion).

The different faces of childlessness in later life

Martin Kohli, Marco Albertini

European University Institute, Italy; Università di Bologna, Italy
martin.kohli(at)eui.eu, marco.albertini2(at)unibo.it

Childlessness in later life is the subject of widely held misconceptions. One of the most misleading ones is that childless elderly people are all of one kind. Contrary to this assumption, we show that parental status is a continuum, ranging from full childlessness across several intermediary conditions to full current natural parenthood.

In a study of the elderly population across 11 European countries based on the Survey of Health, Ageing and Retirement in Europe (SHARE), we show that "social parents" (i.e., people who have no natural children but who have adopted, foster, or stepchildren) are more similar to natural parents than to non-parents. Family recomposition thus does not seem to inhibit intergenerational exchanges as long as social parents have sufficient contact with their social children. In contrast, parents who have lost contact with their children – natural or otherwise – or have survived them have a heightened demand for formal care in later life.

In a second study based on the US Health and Retirement Study (HRS), we analyze how childlessness affects the likelihood that disabled elderly people receive informal care, and nondisabled ones anticipate future informal care. In general, the results do not hold up the claim that in the US non-parents face significant support deficits in old age. Compared to natural parents, step-parents get less help from their children but more support from their partners. The analysis of support expectations reveals that parents as well as childless people tend to overestimate the availability of informal care in case of need.

RN01 & RN16 | Session 10a JOINT SESSION: European Health Policy and Ageing Societies: Challenges and Opportunities

Family Strategies for Care Giving for Older People with Intellectual Disability (ID), within 'post-institutional' Ireland

Damien Brennan, Rebecca Murphy, Philip McCallion, Mary McCarron
Trinity College, University of Dublin, Ireland; Trinity College, University of Dublin, Ireland; University of Albany, New York, USA.; Trinity College, University of Dublin, Ireland
dbrennan(at)tcd.ie, MURPHR30(at)tcd.ie, pmccallion(at)albany.edu, mccarrm(at)tcd.ie

Background

Over the past number of decades there has been a significant increase in the life expectancy of people with an ID. Within contemporary 'post-institutional' Irish society, families are now the primary providers of caregiving support for people with an ID. However, as

people with an ID age so too do their families, making family caregiving more difficult and complex. This paper examines the caregiving capacity of parent and sibling carers for their ageing family member with an ID.

Methods

Situated within the larger parent study population of IDS TILDA (Intellectual Disability Supplement to The Irish Longitudinal Database on Ageing), a qualitative study, comprising of focus groups and semi-structured interviews was conducted with a purposive sample of parent and sibling carers (n=17) of older people with an ID.

Results

Irish family caregiving capacity was compromised by contemporary carer support systems.

The majority of families articulated that they represented the last remnant of family caregiving capacity existing within the family.

Few families have definitively formulated future care plans, and where plans do exist these are predominantly aspirational in nature.

Families anticipated future crisis management and foresaw a strong possibility of their family member with an ID requiring residential care provision (out-of-family home) at some point in the future.

This raises the possibility and risk of a re-emergence of institutional / poorly planned care provision for older people with an ID.

Development of Living Labs in health and autonomy in France

Valentin Berthou

Université de Technologie de Troyes, France
valentin.berthou(at)utt.fr

Since 10 years, the number of Living Labs is increasing in Europe. A Living Lab is characterized by a wide network of stakeholders, shared governance, private-public- people partnerships (PPPP) and user-centered (or user-driven) methodology. The goals of these structures are to produce open innovation for users and to solve the European Paradox (linking deep research and commercial activities).

There are several types of Living Labs, for an example in Smart Cities, for green IT or for health & autonomy. These last organization aims to develop technological solutions / products to gap the loss of autonomy and to promote a "well ageing" society for elderly people. Indeed, the ageing of population is becoming a priority for public health policy. But we observe that Living Labs in health and autonomy come from a bottom-up dynamic. The specific place of user in the center of the methodology reveals an empowerment process and the will to build a health democracy.

The objective of this communication is to mapping Living Labs and their uses and to ask what is exactly a Living Labs and what is his weight in the traditional health system. We base on our fieldwork in different French Living Labs (actor's shadowing, interviews, participating observation...) to conduct our reflection.

Does Socio-Economic Status Influence Grip Strength in Older Europeans? Analysing the Links between Education and Objective Health

Judith Kronschnabl

Max-Planck-Institute for Social Law and Social Policy, Germany

kronschnabl(at)mea.mpsoc.mpg.de

Using data from the Survey of Health, Aging and Retirement in Europe (SHARE), this study examines the links between objective health, measured by maximal isometric hand grip strength, and socio-economic position. This paper investigates the relation between education and health via both (1) direct and (2) indirect pathways through other socio-economic aspects like occupational status or income as well as (3) through behavioural risk factors such as smoking, heavy drinking, physical inactivity and obesity. Maximal isometric hand grip strength has proven to be a reliable predictor of functional disability, morbidity and mortality (Rantanen et al. 1999, Griffith et al. 1989, Sasaki et al. 2007). Therefore, repeated grip strength measures are used in this paper to examine whether differences in objective health can be related to socio-economic position. Preliminary results confirm the positive association between education and objective health. However the educational effect grows significantly smaller when adding other socio-economic factors. Thus, a large part of the effect is mediated through occupational status and income. In accordance with the literature, higher occupational status is related with better health on every level of the social gradient. Additionally, it can be shown that individual health behaviour also plays a dominant role. Although smoking is not significantly associated with grip strength, health inequalities due to educational differences can partly be explained by health risking behaviour like drinking, physical inactivity and obesity, all of which are negatively associated with objective health.

Effects of Norwegian companies' initiatives to postpone retirement

Tove I Midtsundstad, Roy A. Nielsen

Fafo - Institute for Labour and Social Research, Norway; Fafo - Institute for Labour and Social Research, Norway

tim(at)fafo.no, ron(at)fafo.no

Partly in order to offset the reduced labour supply following ageing populations, policy objectives in most OECD countries are shifting towards providing good incentives and supports to work for those who can (downplaying income provision for those who cannot work and their families). In addition, public activation strategies are supplemented by companies which introduce strategies for managing less healthy workers and an ageing workforce. Since introducing the "Inclusive Working life" agreement in 2001, a growing number of Norwegian employers have introduced workplace measures and arrangements in an attempt to facilitate prolonged employment for

elderly employees and employees with ill health. The relationship between such measures and sickness absence appears minor (Midtsundstad & Nielsen 2014). However, interventions reduce disability enrollment (Midtsundstad & Nielsen 2016). In addition, individual measures (e.g. extra days off and extra pay) offered to older workers from age 62, delay retirement (Hermansen 2014, Hermansen & Midtsundstad 2016). Midtsundstad et al. (2012), however, found that offering retention measures to older employees do not impact early retirement patterns. There is a need for more knowledge on the effects of retention measures provided by employers. In this paper we will utilize two linked data sources: a company survey on employer strategies to postpone retirement with a panel of employee register data on labour force participation, income sources and more. By means of this dataset we can study if and how changes in employer strategies translate into changes in disability and retirement rates. In this paper we study the effect of four particular strategies on retirement behavior; less physical/psychological demanding work, more flexible work, supplementary education, and reduced work hours.

marja.aartzen(at)nova.hioa.no,
marijke.veenstra(at)nova.hioa.no,
thomas.hansen(at)nova.hioa.no

Good health is one of the key qualities of life, but opportunities to be and remain healthy are unequally distributed across socio-economic groups. The role of the social network as potential mechanism in the pathway from the socio-economic position (SEP) to health has derived little attention. This study examines whether structural and/or functional characteristics of the social network mediates the effect of socio-economic position (SEP) on physical health. Data comprise 4,534 men and 4,690 women aged between 40 and 81 participating in the Life course, Aging and Generation study (NorLAG). We apply multiple mediation models (Preacher and Hayes, 2008) to evaluate the relative importance of each network characteristic. Our results indicate clear socio-economical patterns in the social network. The network of men and women with higher SEP better protects against loneliness, which is related to better physical health. The effects of the network on health are similar in younger and older people, but the explained variance of health in older people is only

half of that of middle-aged people, indicating that other factors than SEP become more important for health at older age. Based on estimates with the multiple mediation model we concluded that the function of the network is more important for physical health than its structure. Multiple mediation analyses appeared to be a helpful analytical strategy to test the tenability of multiple mediators simultaneously.

Assessing the quality of SHARE survey data. The impact of aging on measurement error

Daniele Zaccaria, Emanuela Sala
Golgi Cenci Foundation, Italy; University of Milan
Bicocca, Italy
daniele.zaccaria(at)unimib.it,
emanuela.sala(at)unimib.it

In an aging society, the availability of good quality survey data is key. In particular, longitudinal surveys of older people are very powerful research resources to study social inequalities and monitor older people's health conditions. It is not surprising that a number of longitudinal surveys of older people has been conducted in recent decades, both in the U.S. and in Europe.

The relevance of these surveys is undisputed. However, there are very few studies that systematically assessed data quality in longitudinal surveys of older people (Kalwij, 2010; Gaertner et al., 2015).

This paper aims to evaluate the quality of the survey data in the Survey for Health and Retirement in Europe (SHARE). We draw on Lynn and Lugtig (2016)' theoretical framework to assess the effect of aging, and in particular, of changes in respondent cognitive functions, on a number of indicators of measurement error, including item non response and answers to open ended questions. Controlling for age and educational level, we expect to find a positive relationship between a deterioration in cognitive functioning and the occurrence of measurement error. We use Wave 1, 2, 4 and 5 of SHARE data. We intend to employ a set of multilevel models and, in particular, to use growth curve models (GCM) which are appropriate statistical techniques to model change in a dynamic framework. We consider as independent variables a set of indicators of cognitive function, i.e., ability in verbal fluency and numeracy skills.

A life-course approach to the study of paid work, informal care provision, volunteering and civic participation in mid to later life in Britain

Lawrence Benjamin Sacco, Laurie Corna, Debora Price, Karen Glaser
King's College London, United Kingdom; King's
College London, United Kingdom; University of
Manchester, United Kingdom; King's College London,
United Kingdom
lawrence.sacco(at)kcl.ac.uk, laurie.corna(at)kcl.ac.uk,
debora.price(at)manchester.ac.uk,
karen.glaser(at)kcl.ac.uk

In light of population ageing, policies aimed at

extending working lives are being implemented in numerous countries around the world. In the UK, the state pension age has been delayed and pathways to early retirement have been restricted. However, given older adults' substantial contributions to unpaid activities, such as informal care and volunteering, longer working lives may have repercussions for engagement in these activities. Previous research on the relationship between paid and unpaid activities has predominantly focused on single activities and taken a short-term perspective.

We examine mid to later life pathways of engagement in paid work, informal care provision, volunteering and civic participation. Engagement pathways are modelled through two-stage latent class analysis, using longitudinal data from the British Household Panel Survey and Understanding Society (1991-2015). In addition, drawing on the life course perspective, we assess how engagement pathways are related to gender, socioeconomic position, health and labour market and family life-course experiences, in order to understand how dimensions of cumulative (dis)advantage shape inequalities in engagement in later life.

Results suggest that a life-course perspective is needed when studying engagement in unpaid activities at a later age, as earlier levels of involvement determine engagement in later life. Furthermore, findings highlight the importance of inequalities in engagement as health and socioeconomic position are related to mid to later life engagement. Pathways of higher engagement in paid and unpaid activities characterise the experience of a small proportion of our sample who enjoy better health and hold higher socioeconomic position. Implications for the promotion of active ageing and current trends of increasing labour market participation at older ages are discussed.

Prevalence of loneliness, activities engagement and life satisfaction in later life: A snapshot from the Survey of Health, Ageing and Retirement in Europe (SHARE)

Sunwoo Lee, Jana Pelclová
Palacký University Olomouc, Czech Republic; Palacký University Olomouc, Czech Republic
sunwoo.lee(at)upol.cz, jana.pelclova(at)upol.cz

This current study examines the relationships between loneliness, social and cognitive activities engagement, and life satisfaction among respondents to the Survey of Health, Ageing, and Retirement in Europe (SHARE) wave 5. A total sample of 16,448 male and 19,952 female aged 65 to 103 years from 15 European countries was analyzed. We used a multiple questionnaire items to measure activities engagement, loneliness, and life satisfaction among the respondents. A series of multiple regressions and a technique of structural equation modeling (SEM) were employed to examine the hypothesized relationships among study variables. Results indicated that across different indicators of activities engagement, there were significant path coefficients

toward the measure of loneliness; for those who more frequently participated in educational or training courses and sport or social clubs in the past year, they were less likely to experience loneliness. The measures of activities engagement and loneliness were significantly associated with life satisfaction, but different ways. Activities engagement positively affected life satisfaction ($p < .01$), while loneliness negatively influenced life satisfaction among the elderly ($p < .001$). We also found activities engagement was a significant mediating factor in the association between loneliness and life satisfaction. Study findings reinforced the important role of remaining activities in seniors' quality of life. This suggests that we should promote sustainable community programmes to help the elderly more engage in social activities and better cope with loneliness.

RN02 - Sociology of the Arts

RN02 | Session 01a Gendered Inequalities and Careers in the Arts

Beyond artistic vocation : A gender admission process of men and women candidates to an artistic career

Mathilde Provansal
 Université Paris 1 Panthéon Sorbonne, France
 mathilde.provansal(at)gmail.com

Women visual artists tend to disappear from the top of artistic rankings and continue to have a dominated position in the contemporary visual art world. Yet about half of the French visual artists are women, and french art schools have been predominantly feminine for the past thirty years. In this presentation, I analyze the ways gender differences emerge in professional trajectories through the analysis of one particular moment that precedes the entrance into an artistic career, the admission to art school. I observed the admission interviews of 87 candidates and the jury deliberations. Some professors and 50 former students of the school were interviewed too. Observing the oral admission exam to the École des Arts Plastiques reveals the criteria used by jury members to decide between those who can attempt an artistic career and outsiders. I show that women face gendered representations. This may affect early on their experience in art school and their future artistic career.

The arts, a men's world. Gender inequalities in artists' labour markets

Jessy Siongers, Astrid Van Steen
 Ghent University, Belgium; Ghent University, Belgium
 jessy.siongers(at)ugent.be,
 astridvansteen(at)gmail.com

The artistic labour market is characterized by a-typical employment conditions, often demanding extreme flexibility and resulting in uncertain and precarious career prospects. Over the past years there has been an increase in studies on this precarious position of creative workers. These studies invariably point at elements such as under-payment, unemployment, multiple job holding, difficulties with copyrights, contract negotiations and many more. Also, they all point out that this precarious situation affects female artists more than their male counterparts.

Most of these studies focus on one specific discipline, in this paper we will use a comparative approach. To this end, we rely on data gathered in 2014 by means

of an online survey among 2706 professional artists in Flanders. Artists active in different arts disciplines (audio-visual arts, visual arts, music, literature and performing arts) participated in this study. In our paper, we first describe the gender differences in employment conditions (artistic vs. non-artistic activities, unemployment, income, job satisfaction) in the studied arts disciplines and examine which disciplines are more female-friendly than others. Secondly, we examine which features cause these gender differences and which aspects have an influence on female artistic careers. By means of multivariate statistical analysis we look at supporting as well as inhibiting factors (working conditions, domestic conditions, education and training, ...) of female artistic careers.

Female Filmmakers' Challenges in Creative Work. Cases of Hungarian Female Filmmakers from Romania

Emese Biró, Andrea Virginás
 Károli Gáspár University of the Reformed Church in Hungary, Hungary; Sapientia Hungarian University of Transylvania, Romania
 biroemese(at)yahoo.com, avirginas(at)gmail.com

Female filmmakers are still underrepresented in East European film production, and the factors influencing their entrance to the film production field, as well as their success or failure to remain active in the field needs to be examined. This is an important aim of our research titled Hungarian Female Filmmakers in Eastern European Film Production. In this study, qualitative interviews were conducted with female filmmakers working as directors, script-writers, producers, editors or actresses. Besides this small-sample in-depth interviewing, we also selected a sample of relevant press interviews made with our interviewees and we conducted a thematic analysis of these articles, in order to compare the result with our previous findings. Besides the entrance and 'survival' strategies in the film production, another important focus of our study was on creative female filmmaking practices. Do they see their creative work as a teamwork-based activity or an individual struggle? How do they perceive their own role in the creative process, decision-making, fundraising, promotion and other aspects? How does their gender and minority background (female Hungarian filmmakers from Romania) influence the above mentioned aspects? What is the role of international cooperation in their filmmaking possibilities and practices? We also examined how they use their own related personal experiences in their films, especially the fact that some of them are also characterized by geographic mobility. Finally, we used the 2016 research report of the EWA (European Women's Audiovisual Network) referring to female directorial participation in six national film industries in Europe as a background to contextualize our own results.

RN02 | Session 01b Solidarities in the Arts**The Art of Organic Solidarity: The Fall of 'Solidarity Forever' and the Rise of Collaborative Organising and Participatory Art?**

Marek Korczynski, Joyce Jiang
 University of Nottingham, United Kingdom; York
 University, United Kingdom
 Marek.Korczynski(at)Nottingham.ac.uk,
 joyce.jiang(at)york.ac.uk

This paper examines the relationship between art and labour organising. Historically, there has been only a limited use of art linked to labour organising. We argue that a key reason for this has been the disjuncture between uniform mechanical solidarity and art works, which tend to be cultural expressions open to multiple readings. If the future of labour organising should lie with a new form of organic collaborative solidarity, does this open up a new space for the role of art in labour organising? We address this first conceptually by articulating an ideal type of the art of organic solidarity – an array of participatory art practices that are symbiotic with organising for collaborative organic solidarity. Then we consider the utility of this ideal type in the analysis of an extreme case - Justice For Domestic Workers, a self-help group of migrant domestic workers in London which prioritises organic solidarity. We draw on extensive ethnographic research of this case. In this case, art was constructed as a safe space for participation, in which both individual and collective identities of workers were articulated, and in which a form of cognitive questioning took place. We show that the use of art in this case appears successful and sustainable. We argue that the successful use of art in this case stemmed from the symbiosis between the flat participative (related to organic solidarity) modes of both organising and art use. We conclude that there is likely to be more opportunity for art in labour organising in an era where organic solidarity is emphasised than existed in the era when the mechanical 'Solidarity Forever' was the song to be sung.

Experiences of Solidarity: Narrations of three Art Initiatives from Ankara

Emek Can Ecevit, Hale BabadoğanKaya
 Brunel University, Brunel Business School; Middle
 East Technical University, Sociology Department
 ecevitemek(at)gmail.com, hbabadogan(at)gmail.com

Art initiatives could be seen as the smallest organisational agents that have the power to forge a change within the art-world together with the subjective presence of the artists. Specifically by their accepted organisational model that is mostly spontaneous in time, small-group in size, independent and non-hierarchical in decision making procedures, open-ended, non-deterministic and practical in objectives, and interdisciplinary in participation that eventuates in most needed solidarity formations. Art initiatives have the capacity to make critiques of

the artistic field from within; that is, they raise their voice to the already excepted rules, regulations and laws and implementations on the art-field. As associations thus they force others on the field to question the artistic practice, production and dissemination of works of art within the art-world. Utilizing various disciplines, their criticisms not only influence the artistic field but also carry over the concepts and issues that the social opposition put forward.

Although they are flexible, nomadic, free floating, seeking collective action and co-existence and new organisational forms within the highly nested and oppressed environment of neo-liberal politics, artist initiatives and artist-run spaces still needs a sustainable ground at least on practical levels.

Taken into consideration of the basic characteristics of artist initiatives and artist-run spaces this paper examines in theory and practice the current position and their future expectations in terms of their political stand, organizational forms, experiences and narrations of two art initiatives, Avareler and Ankara-Art Initiative and an artist-run space, Torun from Ankara that has been lasted more than five years and still active in Ankara, Turkey.

Art, solidarity and civil rights. Theatre as community response.

Ilaria Riccioni
 Free University of Bozen, Italy
 ilaria.riccioni(at)unibz.it

What can be the contributions of the sociology of the arts at the present critical juncture for a democratic Europe, in a time of great uncertainty, loss of rights for many populations and a widespread experience of destructuring institutions. If institutions are meant to be the structure from which the leading values of countries can be represented, what does implies their actual fading away? According to Jean Duvignaud the social function of artistic creation is that "elle vise à créer de la socialité"(Duvignaud 1965:54). Duvignaud defines three types of esthetic attitude: the first implies the relation between aesthetic experience and social space, in which is considered the dialogue between the different signs proposed by artists and the audience. Theatre is the artistical form which assumes this form of community holder: «Cette fraternité devenue irréalisable, prend la forme d'une attitude créatrice efficace, mais en tant que nostalgie d'un communion perdue, en tant que rêve interdit sans cesse avivé par un désir irrépressible de fusion affective» (Duvignaud 1965: 83). The consequent frustration after the division of labour, the social stratification, the extremely specialized jobs of contemporaneity, the need of sharing spaces and experience has changed social needs. In the theatre there is a reflexing communication which merges communication and participation into one single action, reaching for a clear social role: which is to bring to life the existant underlying relations of social movements and social change. This paper will inquire how and if the work of contemporary theatre in Italy

assumes this role of reflexing communication bringing into life deep relation between social issues.

Hear it from themselves: the impact of arts on equality

Pia Maria Houni
Finnish Institute of Occupational Health, Finland
pia.houni(at)tth.fi

How do arts-based initiatives influence artists and artistic professions? This question stems from the ArtsEqual–research project (2015-2020) in Finland. Currently Finnish culture is described more capitalistic than ever before in its history. This means implementing “hard values” in many sectors of Society. At the same time there is a widespread conversation and political will to support arts-based opportunities for people of all ages. The key issue here is what does equality really mean when looked at through these kinds of projects. How does art develop solidarity in every day life inside a fast paced Society? Artists are at the center of these questions, they are the people who make things happen with their professional skills. What kind of opportunities have they described to happen in the field? How do they understand the impacts of arts in different frames? To answer these questions, I have based my presentation on semi-structured research interviews of artists, who work in participatory, applied or community art fields. The total amount of interviews is 39. The interview themes include artists’ working habits and practices, their outlooks and impressions on the debate of autonomous and applied art, and their experiences of multi-professional collaboration in arts initiatives (especially in the public sector). What about artists themselves - in what way do they experience the meaning of art in their hybrid identities. How does aesthetical thinking connect with political missions.

RN02 | Session 01c Artistic Production, Creativity, Skills and Practice

Creating in the studio. Artists’ studios and the flow of creativity

Adina Manta
University of Bucharest, Romania
adina.manta(at)sas.unibuc.ro

As a contribution to a deeper understanding of the art worlds, this paper aims to give a comprehensive account of the flows between the materiality of contemporary visual artists’ studios and creativity in the process of art production. Following on Latour, Deleuze and Guattari theoretical frameworks, I consider the relationship between visual artists and their studios in order to give a new spin to the much neglected concept of creativity in the sociology of art. As contemporary visual artists’ work practices involve sites and modes of production, the materiality of the space becomes an actor in the creation process. Due to this, I conceptualize creativity as a social product,

an assemblage in which various human and non-human actors are involved. Drawing on interviews with artists and observations of artistic spaces, I examine how in these spaces the artist initiates creatively the experiencing of the space not only as an object, but also as a thing that is part of the artistic creation process. The space, through its materiality, becomes part of the artistic creation and a link in the creativity process. Not only a work place or physical container for creation and contemplation, the studio reveals the complex relationship between materials and forces in the process of art making.

The Craft of Performing Artists: Skill, Identity and the Learning Curve

Chiara Bassetti, Dafne Muntanyola-Saura
University of Trento, Italy; Universitat Autònoma de Barcelona, Spain
chiara.bassetti(at)unitn.it,
dafne.muntanyola(at)uab.cat

What are the skills a professional performing artist needs? How are these developed? How do the performers subjectively describe and interpret their learning process and creative practices? Artists are immersed in specific intersubjective aesthetics, conceptions of artistic work, and common sense alike. The contemporary art market is impregnated by an individualism that revolves around the glorification of feeling and emotion. Singularity (Simmel, 1908, Heinich, 2014) and distinction (Bourdieu, 1979) are crucial, and the body –with what is perceived as its intrinsic individuality– is taken as a tool for thinking as well as the place for creativity. Still, Feyerabend (1987) regards the myth of creativity as a recent historical construction. Williams (1985) shows how in the wake of 19th century division of labor the adjective “expert” evolved into the noun “expertise”. The Romantic artist becomes an expert when capable of producing and communicating a certain form of cognition and action that does not belong to everyday life. This professional way of seeing (Goodwin, 1994), moving (Dreyfus, 1998) and doing (Sennett, 2012) lies at the root of expert creative practices. How do performers make sense of their creative process and its cultivation? In our contribution, we provide a comparative discourse analysis of two collectives of performing artists –namely musicians and dancers– based on around 100 semi-structured biographical interviews conducted in Italy and the UK. We identify the cultural topoi that define artists’ narratives, and look at commonalities and contradictions. Finally, we propose a learning curve model that shows how identity and expertise co-evolve along social patterns of skill acquisition and legitimization.

A sociology of causal attribution in music performance: a case study

Pedro Santos Boia
CIPEM/INET-md - Centro de Investigação em Psicologia da Música e Educação Musical, Porto Polytechnic, Portugal; Instituto de Sociologia, Porto University, Portugal

psantosboia(at)gmail.com

This paper develops a sociological and cultural approach to causal attribution in learning, practicing and performing on a music instrument, proposing a new approach to a yet under-researched topic in music performance and education.

Attribution theory refers to the causes people invoke to explain the success or failure of their actions, and has been typically approached by psychology and social psychology (Heider, 1958; Weiner, 1974).

What students, teachers and performing musicians think to be the reasons of why something is 'difficult' to play may be influential upon their attitude and motivation to learn, practice and perform. For historical reasons, the viola has gained in the past the reputation of being a particularly problematic instrument to play. As will be shown, this created a tendency to attribute causes of technical and musical difficulties to the viola itself because of its supposedly inherent 'limitations'. That fact may have a negative impact upon the efficacy of practicing and creativity in problem-solving, and the player's ability to overcome difficulties in instrumental technique and musical performance. This study draws on empirical analysis of real-time data (video recorded lessons), audio and video interviews with players, documentary analysis, and ethnographic evidence. It considers music history, internalization processes and habitus (Bourdieu, 1977; Wacquant, 2004), representations and discourses (Durkheim, 1898; Moscovici, 1981), as well as the players' actual practices (Zembylas, 2014).

This sociocultural approach to the psycho-social process of attribution wishes to contribute to open the black-box of the tacit dimensions of artistic practices and work, unveiling constraints upon performance, learning and teaching that musicians themselves may not be aware of.

Before stardom. Informal collectives as vehicles of biographical mobility

Piotr Szenajch

Polish Academy of Sciences, Poland

piotrszenajch(at)gmail.com

This paper aims to reflect on a stage found in the life histories of renowned visual and performance artists with whom I conducted a series of autobiographical narrative interviews. Before establishing relations with an institutionalized and professionalized art world, my interviewees participated in at least one vibrant collective based on shared beliefs, strong bonds and regular meetings, competing for mutually acknowledged stakes and taking positions within structures resembling a field.

Among the vivid cases I would like to describe there was a radical neo-avant-garde art subculture with punk sensibilities established during Polish martial law in early 1980s; a vigorous nation-wide performance art circuit working without institutional support in early 1990s; but also, an amateur theatrical scene in a peripheral post-communist town or even a provincial cycling club.

In these collectives one can find aspects of strategic action fields (N. Fligstein & D. McAdam), thought collectives (L. Fleck), counterpublics producing their own counterdiscourses (N. Fraser) or a self-organized dark matter (G. Sholette). As their participants, my interviewees underwent intensive secondary socialization, learned social skills (Fligstein & McAdam) and built their subcultural capital (S. Thornton) but also explored new forms of being together. This contributed to their cultural mobility (P. DiMaggio), built new layers of their habitus (P. Bourdieu) or enriched their heritage of dispositions (B. Lahire). Thus, such informal collectives could become „vehicles of multidimensional biographical mobility” – what displaces individuals across class structure, discursive formations and positions within social fields – and enabled them to become the most prominent figures of the local art world.

RN02 | Session 02a Site-Specific Art & Public Space (Panel)

Urban Experiments in Times of Crisis: The Case of Svolou's Neighbourhood Initiative in Thessaloniki/Greece

George Chatzinakos

Manchester Metropolitan University, United Kingdom

g.chatzinakos(at)gmail.com

This participatory action research, critically engages with issues of community-building and place-making. It describes the development of an urban experiment that takes place in inner Thessaloniki. It is organised by a bottom-up neighbourhood initiative, which was founded in 2013, by a group of locals. Influenced by respective cultural practices that take place in Barcelona, our main action is a collective dinner. The first challenge that emerged in our discussions was whether it was possible to transfer in a sustainable way a cultural activity from another city of the European south to Thessaloniki. Apparently, this pilot urban experiment created a more fertile ground for carrying out various activities in the neighbourhood. Gradually, this enabled us to establish a new neighbourhood identity, by combining various local and socio-cultural attributes. Nowadays, our focus is to find ways that can add to individual responsibility, collective sensitivity and 'sociological imagination' towards the commons. Arguably, the denaturation of respective neighbourhood initiatives can create a spreading domino effect, dragging the history of this city in a new era of participation and solidarity; challenging the social conventions; strengthening social ties; creating a new relationship with public space. In Greece, due to the lack of a permanent institutional framework, people can't (re-)produce in a sustainable fashion applicable actions that will respond to their individual needs and provide solutions to the collective problems of their place of residence. To this end, to what extent neighbourhood initiatives can present an alternative way of cities' management and citizens' participation in the midst of a more-than-financial crisis?

Artistic re-appropriation of public space in Turkish scenes: the case of site-specific experiences in Istanbul

Zeynep Baykal, Seval Unlu Gok
Beykent University, Turkey; Beykent University,
Turkey
zbaykal83(at)gmail.com, sevalunlu(at)hotmail.fr

Nowadays, it seems much more appropriate to define politics beyond its representative liberal democratic meaning, as the right to have a say and have a right to behave for a collective life. In line with this, art itself begins to become a new way of refusing and challenging the traditional ways of doing politics. Thus, the collective spirit emerging out of the long lasting relationship of art and politics is combined and interacted with the unintended, unexpected features of new paths of doing politics. In this process, public space have a crucial role in such new cognitive maps of existence. Public space turned into a concrete presentation which is occupied, appropriated by those who had no right to be a part of it before. Related to that, site- specific theatrical performances with their usage of the space, bodily existence and expression within that space, contingency directly or indirectly to that transformation and have a potential to trigger a kind of collective impact on audiences. From that perspective site-specific performances can be considered more as a cipher of art and politics relation than as an artistic gender. It is possible to understand the impact of space on body expressions and bodily existence of performance by looking at the recent site-specific productions on Turkish art scene. This presentation aims to examine the political and emancipative aspects of selected site- specific performances in Turkey, in İstanbul from 1990's to now on. This analysis will include a media research about the performances, in-depth interviews made by the authors, and personal experiences of the authors as a spectator of the performances.

Artistic Interventions: Affirmative Over-Identification as Tactics of Critique

Mirjam Pot
University of Vienna, Austria
mirjam.pot(at)univie.ac.at

Since 2010 the Austrian activist group "Die Freunde des Wohlstands" (Friends of Wealth, FoW) carries out artistic interventions in public space. During these interventions they pledge – among others – for lower property taxes and compulsory labor for the unemployed. Only at second glance it becomes clear that the group works with the technique of affirmative over-identification (AOI). By taking over dominant discourses put forward by the economic and political elites and exaggerating them slightly, they challenge and criticize the ideological basis of these discourses.

The paper is structured as follows: Based on the literature on AIO I identify four functions of AIO, namely 1) the creation of distance between the discourse at stake and the audience by means of a

complete collapse of distance, 2) semiotic sabotage of the language and signs used in that discourses, 3) emphasis on the responsibility of the audience regarding the interpretation of the intervention due to its ambivalence, and 4) the possibility to break up and reconstruct discourses. Subsequently, I analyze the artistic interventions of FoW in terms of content, implementation and use of AIO and possible affects. In particular, FoW aim at directing attention on neoliberal, classist and elitist discourses by spontaneously confronting its audience with condensed content of that sort in order to trigger critical reactions. Finally, drawing on Rancière's notion of the political, I consider artistic over-identification a form of critical political art, as it challenges the "distribution of the sensible" (Rancière 2006).

Participatory theatre, urban exclusions, and youth (re)claiming the city

Valerie Monique Stam
Carleton University, Canada; University of
Amsterdam, Netherlands
valerie.stam(at)carleton.ca

Drawing on a participatory theatre project with youth in what is known as Afrikanerbuurt, a neighbourhood in Rotterdam, this research highlights the processes that work to other and exclude Black and Muslim youth from full belonging, and spotlights the ways in which youth are fighting back to (re)claim space in Dutch society. In the context of the migration crisis in Europe, first- and second-generation racialized and Muslim youth navigate varying barriers to belonging and citizenship: while they hold de facto legal citizenship, their de jure citizenship (social membership) is questioned (Arendt 1951; Somers 2008). Discourses of tolerance and danger, the archetype of "good" citizens, and everyday racism work to other certain bodies (Ahmed 2004; Brown 2008; Essed 1991; Thobani 2007; Wekker 2016). At the same time, cities are becoming important sites of belonging and hyper-diversity (Holston & Appadurai 1999; Tasan Kok et al 2014). In this presentation, I will look at how Black and Muslim youth "talk back" to these processes of othering through theatre. In co-creating and co-producing a theatre production, youth participated in, and facilitated, public conversations on (re)making and (re)claiming urban sites and modes of belonging. This presentation will examine the ways in which participatory theatre allows and disallows for expressions of belonging, subjectivities, citizenship, and resistance. It will also analyze performative ethnography's potential to transform public city space.

Crip art in public space

Laura Moya
University of Zaragoza, Spain
lmoja(at)unizar.es

The cultural ecologies of the last three decades, motivated for a posthistoric turn of the arts, have ousted the estetic aspect and have caused an opening to multiple creative channels. This diversity of

means, include facilities, videos, performances, happenings, flashmobs...., that ignored the museum, temple of power masked for the beauty, and also public spaces in which only keep in mind the public as observer. These practices have occupied the streets and the public spaces in the cities, questioning the treat between author/work and author/spectator. And, the social movements, tired of the inefficiency of the public politics, have found in this art their creative way of protest and transformation.

So, the crip movement, with the appropriation of the "crip" term, has questioned the compulsory organic and functional body, also has found in this art the tool for such deconstruction. Dragging their bodies to the steps of the Washington's Capitol, making flashmobs of crip dance in public spaces, are some artistic examples of this movement in an international level. Inside Europe, in Spain, the "Marchas de la diversidad funcional" or the flashmobs of "Trayectos" festival, have showed these processes. These are so examples about art in streets and public spaces of the cities and which put in first place the bodies dissolving their normality and showing the diversity.

RN02 | Session 02b Institutionalization and Innovation in Cultural Industries

The dynamics of dance: a cross-national comparison of the institutionalization of electronic/dance music in the US and UK

Alex van Venrooij, Rens Wilderom
University of Amsterdam, Netherlands, The; University of Amsterdam, Netherlands, The
a.t.vanvenrooij(at)uva.nl, B.R.Wilderom(at)uva.nl

The historical development of electronic/dance music raises an interesting empirical puzzle: while "house" and "techno" music originally emerged in the early to mid-1980s in local music scenes of Chicago, Detroit and New York, the institutionalization and commercialization of this genre occurred predominantly in the UK and other European countries. In this paper we aim to account for the difference between the "successful" trajectory of dance music scenes in the UK compared to the scene development in US. Which factors enabled or constrained the development of the scene-based genre into an industry-genre in the UK, and why did it fail to make this transition in the US? We draw upon theoretical frameworks from social movement analysis and organizational studies to show how the interaction between established field structures and processes of social movement/scene development can account for cross-national variations in the trajectory of dance. We especially focus on cross-national difference in two exogenous field structures that helped and/or blocked the trajectory of dance music: the opportunities provided by the media field and recording industry field. The analysis shows that, paradoxically, the commercial market structure that inhibited the successful commercialization of dance in the US provided chances for the success of dance in the UK due to its specific constellation of the media field.

A cinema made in Europe? On the creation, production and marketing of contemporary Greek cinema.

Maria Papadopoulou, Eirini Sifaki, Anastasia Stamou
Hellenic Open University, Greece; Hellenic Open University, Greece; Hellenic Open University, Greece
mary_papas7(at)yahoo.gr, eirini_sifaki(at)yahoo.gr, natasastamou(at)yahoo.gr

Recent film production has been greatly influenced by the European Union's legislation, funding and programs such as Creative Europe. This presentation examines the strategies used to create, produce, distribute and promote a number of recent Greek films that have become widely associated with the label «New Greek Wave» or «Weird Cinema». We will first explore the context and the agents in the specific art market that have enabled the emergence of a particular trend in Greek cinema, discussing the advent of a new generation of filmmakers and producers nurtured by European cultural projects and mobility and their ability to make aesthetic virtue out of economic necessity. Special insight will be given to the training, development and funding activities available to European directors and producers to develop and promote their works at an international level (training initiatives, talent campuses, script and project development labs, professional networks, databases, on line platforms, etc). The role played by festival markets, co-production schemes but also world sales agents in the further promotion and commercial exploitation of these films will be also discussed. Our analysis results from the extensive study of scientific literature, national and international film reviews, European institutions and gatekeepers' public discourse and advertising material. Arguably, all these European initiatives and emerging "art worlds" have a great impact not only on the global exposure of contemporary Greek Cinema but also on the artistic practices and identity of the creative process. This research project was funded by the European Parliament (MEP G. Grammatikakis).

Clients and Film Production Networks

Arek Dakessian
The University of Edinburgh, United Kingdom
arek.dakessian(at)gmail.com

Filmmakers and production networks have often found themselves at the heart of academic debates around flexible work due to the project-based organisation of the film industries. Indeed, as a means of reducing uncertainty over securing future work, filmmakers are flexibly specialized (Christopherson and Storper), form semi-permanent workgroups (Blair), and collaborate repeatedly with colleagues from successful projects. Filmmaking careers are "crafted" over time (Jones) in social network markets (Potts et al) characterised by significant overlap between different 'types' of work such as television, film and advertising. Little attention has been given to the sheer number and variety of clients filmmakers and production networks are commissioned by, however. Based on an ethnography

of networks of film production in Beirut, I investigate how filmmakers 'manage' this variety of clients. By drawing upon social network analytic techniques of block modelling and the concept of structural equivalence, I demonstrate how different clients influence the structure of the production network in different phases of the production process (cf Santagata). Further, I argue that client management is a considerable part of production work that filmmakers and production networks take under serious consideration during the production process and between projects. As successful as certain projects might be, the decision-making process on future work is also shaped by the filmmakers' and production networks' evaluation of the 'fit' between them and the client.

RN02 | Session 02c The Power of (D)evaluation in the Arts

Contextualising evaluations in the arts

Tasos Zembylas

University of Music and Performing Arts Vienna,
Austria

zembylas(at)mdw.ac.at

Art worlds encompass a variety of evaluative practices, since artworks are valued in different contexts and for different purposes. Appreciation or devaluation result from social negotiations that take place in institutional settings. It is therefore essential that the analysis of evaluation processes explicitly focuses on the structuring role of such practical contexts (see Lamont 2012).

In my presentation I will highlight three typical evaluative situations:

- art criticism, that is to say aesthetic evaluation in public media
- the art market, that is to say (mainly) monetary evaluation within business organisations
- public funding, that is to say aesthetic, monetary and political evaluation in public funding agencies or councils.

These different contexts, purposes and institutional settings form cognitive and practical trajectories that pre-structure evaluating acts (see Thévenot 2007; Heinich 2014). Such structural bonds (e.g. to organisational interests, to cultural political objectives, to business strategy) do not necessarily have to be restrictive; yet they represent guides that cannot easily be ignored. Thus professionals (art critics, art dealers and managers, art administrators etc.) are aware that their own evaluative decisions will be subject to evaluation by their peers and non-peers, who as a rule expect from them to conform to some major evaluative standards shared in their practice community (see Wenger 1998).

do we measure what we treasure?

Andries van den Broek

Netherlands Institute for Social Research SCP,
Netherlands, The

a.van.den.broek(at)scp.nl

Keeping in mind the expression "what is measured is treasured", it is of great importance to reflect on what counts as key indicators of artistic life. To make it concrete: does it include the opera house and prestigious museums only, or also the punk rock scene and the amateur arts?

It seems that, more often than not, what is being measured about artistic life has grown organically, based on (implicitly elitist?) assumptions and on data easily obtainable.

On behalf of the Dutch Ministry of Culture, my project takes a few steps back and in a way asks the question: what is so treasured that it deserves to be measured? The paper will be a kind of mid-term review, and I will very much welcome comments from colleagues

The paper will touch upon how key indicators were identified elsewhere (i.e. in other fields in the Netherlands and with respect to the arts in other cultures), will talk about how I spoke to key figures in the Dutch arts world and will give an update of the key indicators identified and the main issues that arose in doing so.

The impact of film criticism and cultural evaluation on the formation and the emergence of a "Weird Wave" in Greek Cinema

Anastasia Stamou, Eirini Sifaki, Maria Papadopoulou
Hellenic Open University, Greece; Hellenic Open
University, Greece; Hellenic Open University, Greece
natasastamou(at)yahoo.gr, eirini_sifaki(at)yahoo.gr,
mary_papas7(at)yahoo.gr

"Is it just coincidence that the world's most messed-up country is making the world's most messed-up cinema?" The question was raised by film critic Steve Rose at Guardian (2011) concerning contemporary Greek cinema, which has gained great reputation in recent years, including numerous distinctions at festivals, media coverage and an Oscar nomination. First revealed in 2009, Yorgos Lanthimos, with his movie "Dogtooth", symbolizes the coming of a new generation of filmmakers whose creativity and surrealist tendencies have been stimulated and exacerbated by the social and economic crisis. This presentation examines the way journalists and film critics both in Greece and abroad described, evaluated and labeled the emerged "Greek New Wave". In line with cultural evaluation theory, we conducted a content analysis of film reviews in order to explore the criteria that professionals deploy to assess these films. By coding the collected texts using high art and popular aesthetic evaluation criteria and pointing out the forms of language (words and phrasings) used within media discourse, we detected critic's perspectives towards this new phenomenon in order to define their contribution to its formation. We focused on the so-called "weird" aesthetics (a label used by critics to describe a mixture of recurrent elements in both form and content) and the way they were disseminated to the public. Finally, this presentation aims to provide a better understanding of

the role that professional media critics play in the evaluation and subsequent legitimization of cultural products and genres. This research project was funded by the European Parliament (MEP G. Grammatikakis).

The Art Scene of Cluj-Napoca and Art Criticism

Roxana Modreanu

Universitatea de Artă și Design Cluj-Napoca, Romania
roxanamodreanu(at)gmail.com

In the context of a nearly non-existing art criticism movement in the city of Cluj-Napoca, Romania, an anonymously project made by the author took place in the spring of 2016. This paper, based on this empirical action, aims to present the development of this initiative and its consequences. The premises of the project revolved around making art criticism visible and facilitating the dialog between art-galleries and their audience. Therefore, the author wrote anonymous fanzines discussing every single gallery's activity for the city of Cluj-Napoca, in an exercise of going back to the beginning of art criticism from the XVIII century, with its anonymous chronicles. The fanzines were left at the opening to the corresponding gallery, and both the reactions of the audience and of the gallery officials were monitored by the author. The end of the project was marked by a public discussion, accessible to the audience, where all the gallery officials were invited for the disclosure of the author's identity and a discussion about the state of art criticism and the relation between art-galleries and their audience. The discussion successfully revealed the local art scene's elitism. In the same time we consider that the project was a success, given the disponibility of some of the galleries to discuss the art criticism and the role of the audience topics, proving that there is interest for art criticism in Cluj-Napoca's art scene.

RN02 | Session 03a Heritage, Memories, Visual Cultures and Cultural Representations (Panel: Lusophone Sociology of the Arts, Part 1/3)

Madureira - Copacabana, Yemanjá: paths of The Queen of the sea

Ana Paula Alves Ribeiro, Maria Alice Rezende Gonçalves

Universidade do Estado do Rio de Janeiro, Brazil;
Universidade do Estado do Rio de Janeiro, Brazil
anapalvesribeiro(at)gmail.com,
marialicerezende(at)gmail.com

In this paper we intend to conduct an ethnography of Yemanjá Party of 'Mercadão de Madureira', focusing on photographic records and emphasizing their belonging to african-Brazilian culture. It is a party in process, changing, dialoguing with contemporary society without losing its characteristics which makes it be recognized as a sacred feast and African origin. The patrimonialization process of immaterial culture, cultural policies and visibility of african-Brazilian culture and its commercialization in Brazil makes this

carioca party one of those builders phenomena of african-brazilian ethnicity.

[Em português]

Neste trabalho pretendemos realizar uma etnografia da Festa de Iemanjá do Mercadão de Madureira, privilegiando os registros fotográficos e enfatizando seu pertencimento a cultura afro-brasileira. Trata-se de uma festa em construção, em constante mudança, dialogando com a sociedade contemporânea sem perder suas características que a faz ser reconhecida como uma festa sagrada e de matriz africana. O processo de patrimonialização da cultura imaterial, as políticas culturais e a visibilidade da cultura afro-brasileira e sua mercantilização no Brasil torna essa festa carioca um daqueles fenômenos construtores da etnicidade afro-brasileira.

Brazilian contemporary art: word and visuality

Fernando Souza Gerheim

UFRJ, Brazil

fernando.gerheim(at)gmail.com

This research investigates the relation between word and image in the work of some contemporary Brazilian artists, aiming to read their works from the point of view of a certain rupture in the way by which the visuality and the semantics are organized and related. This rupture establishes a new paradigm, in which the relation of identity between word and image in the concretist movement is replaced by the displacement and the difference that each can produce in the other. The idea of "semantic participation" by Hélio Oiticica, presented in the text *General Scheme for the New Objectivity* (1967), can be seen as a milestone in this rupture, in which the identity between word and image gives rise to a relationship in which one does not seek to suppress difference or to integrate it. Instead, Oiticica seeks to incorporate the contexts to the circumscription of art, producing displacements in the divisions that demarcate doing, saying and thinking. This new relationship between word and image will be investigated in works by artists such as José Agripino de Paula, Nuno Ramos, Artur Barrio, Leonilson, Fernanda Gomes and Ricardo Basbaum. The visual-semantic relation is undertaken by these artists in different ways, having in common the fact that all deny the presupposition of a place where image and word are equivalent, affirming in exchange the displacement that each can produce in the other and its singular emergence. Particular works can, paradoxically, illuminate the panoramic view of the visual-semantic relationship in contemporary Brazilian art.

New urban narratives at the public space: art, territoriality and community development in the Flâneur project

Pedro Costa, Ricardo Lopes

Instituto Universitário de Lisboa (ISCTE-IUL) /

DINAMIA'CET-IUL, Portugal; Instituto Universitário de

Lisboa (ISCTE-IUL) / DINAMIA'CET-IUL, Portugal

pedro.costa(at)iscte.pt,

ricardovenanciolopes(at)gmail.com

Analyzing a project developed throughout several European cities (“Flâneur – New urban narratives”) which endeavored new approaches to the relation between art, public sphere and local communities through the way creative processes and exhibition devices on public space are displayed, this paper aims to analyze the relation between the artworks produced, the creative processes and the territories and art worlds where they are developed. Their territorial embeddedness, the contribute they bring to community development, and the way they build their relation with photography art worlds are particularly explored, drawing upon empirical work based on direct observation and interviews to the 24 international photographers as well to some of the curators and producers involved in the network of festivals and cultural institutions that were gathered around this project.

“Flâneur” is a network project involving 20 organizations from 11 different countries. Artists are encouraged to create new interpretations of urban territories, taking the concept of flâneur as their starting point and considering the physical context of the city as a social construct in a state of constant flux and change. During its two year span, Flâneur project is being developed and presented in 16 cities, mixing internal and external perspectives. The results are displayed in public space, contributing to a process of deconstruction and “democratization” of the access to art, sharing it with an heterogeneous audience. Replicating the city, open and accessible 24 hours a day, the exhibition displays are configured as modular backlit structures, which are adapted to each specific site.

RN02 | Session 03b Sociological Perspectives on Cultural Policy

Access to Art in Europe: A Comparative Study

Tal Feder

University of Haifa, Israel

talfeder(at)gmail.com

One of the main stated goals of agencies funding the arts is improving the access to art. The notion of access is built on the premise that cultural consumption would be more widespread if it were not for barriers that prevent it. Increasing access actually means devising arts policy that will aid in removing the barriers that prevent potential art consumers from realizing their desires or preferences. However, the discourse about access to art is somewhat vague and incoherent since access has different levels and dimensions which require different policy responses.

In this paper I suggest, based on previous literature, a theoretical framework that identifies different dimensions and levels of the notion of access to art. I distinguish between the levels of: rights, opportunity, consumption, reception and active participation in relation to arts attendance and creation.

I identify how these different dimensions of access are linked to different socio-economic characteristics by

analyzing data from two Eurobarometer surveys conducted in 2007 and 2013 that contain a module on cultural access. Using data from 27 European countries I study how different social characteristics are related to the different dimensions of access suggested by the theory. I show how the social patterns underlying the prevalence of barriers to access to art differ between countries and between the years 2007 and 2013. The results of the empirical analyses have implications for planning of arts policy that aims to increase access to art.

The Role and Status of Artist Organization in Nordic Cultural Policy – a comparative outline

Maria Hirvi-Ijäs

Cupore, Center for Cultural Policy Research, Finland

maria.hirvi-ijas(at)cupore.fi

The role of artist organizations within the field cultural policy has in the Nordic countries been regarded as fundamental and relevant from a cultural democratic point of view. They have also been given a status as agents embodying a specific qualitative expertise not found elsewhere. In recent overview studies and reports it is possible to discern some shifts and new demands of specificity, where the traditional roles are questioned. How can these shifts and demands be made visible and possibly concretized?

In my presentation I will talk about a short comparative study between The Artist Association of Finland and the National Organization of Artist in Sweden. The organizations represent each about 3000 artists in the field of visual art, and in Sweden including design.

In the comparison I look at the organizations from five aspects:

1. History, aim and organizational structure
2. Definitions of artists, identification and profile
3. Definitions of profession and job market
4. Cultural political goals and strategies
5. Experienced impact on cultural policy

This study is a part of my larger ongoing research on discursive, ideological and strategical differences in the cultural policies of the Nordic countries.

Visual artists' self-representation in subsidy requests. A case study of Flanders, 1965 – 1999.

Julia Peters

Ghent University, Belgium

j.peters(at)ugent.be

Since the romantic bohemian movement, (visual) artists have found themselves in a precarious economic position. Many artist careers are contingent upon government funding. Then, how do artists (re-)present themselves to the state as worthy of this indispensable support? I present a first sociological exploration of this question through a case study of 17 visual artists' grant application processes, i.e. the letter exchange between the artists and government commissions, taken from an archive containing all grant applications in Flanders from 1965 to 1999. I find several ways in which artists claim their subsidy-worthiness, among which "the suffering artist", "the integrated professional" and "the socially engaged artist", touching upon questions about the contextuality of what an artist is considered to be, about the isomorphism between individual artists and cultural policy, and about the neo-liberalization of cultural policy.

Unmaking culture through austerity: Effects of material deprivation on visual artists

Alexandros Baltzis, Nikolaos Tsigilis

Aristotle University of Thessaloniki, Greece; Aristotle

University of Thessaloniki, Greece

baltzis(at)jour.auth.gr, ntsigilis(at)jour.auth.gr

The paper presents some results of an original survey in a sample of 591 visual artists in Greece, focusing on their living and working conditions. This sample represents 10% of the total members of the Chamber of Fine Arts of Greece (margin of error $\pm 3.82\%$, 95% confidence interval). The questionnaire includes over 250 variables embracing a wide range of issues, including standard indicators of material deprivation, as well as questions comparing the situation before and after the introduction of the austerity programmes. The research was carried out by the School of Journalism & Mass Communications (Aristotle University of Thessaloniki), in collaboration with the State Museum of Contemporary Art and supported by the Chamber of Fine Arts of Greece. This survey is the first of its kind carried out in the country. The survey is part of a wider attempt to study cultural work in Greece and it is based on previous exploratory study with focus groups about the working conditions of visual artists and film makers.

An overall index of economic strain was calculated enhancing the material deprivation indicator with the enforced inability to afford an atelier (Cronbach's Alpha = .893). Analysis of variance showed that respondents answer consistently about their income. The overall index of economic strain was used to compare variables about the living and working conditions of visual artists before and after the introduction of the austerity policies. The findings illustrate an extended deprivation of the material

conditions required to work as a visual artist in Greece.

RN02 | Session 03c Subjectivities and Subjectivation in the Arts

Figures of subjectivities: the creative subject and art as critique and self-formation

Dan Eugen Ratiu

Babes-Bolyai University, Romania

daneugen.ratiu(at)gmail.com

This paper responds to the general conference theme by discussing a key figure of subjectivity, the creative subject, and the functions of art in the present context. I will examine its constitution and contemporary avatars, starting from the "aesthetics of the self" outlined by Baudelaire in "The Painter of Modern Life" (1863) up to the "aesthetics of existence" developed by Foucault in his latest work. This passes by the analysis of modernity as an "attitude" and makes of self-invention one of the characteristics of this attitude and one's relationship with oneself ("What is Enlightenment?" 1984). As Foucault maintains, modernity does not "liberate man in his own being", but rather compels him to face the task of inventing himself as a kind of transgression of the historical limits and situation. Moreover, following Baudelaire, this complex and difficult "elaboration of the self" did not take place in society itself, or in the body politic, but can only be produced in another, different place, which is art (Foucault, 1984). The questions are whether this critical "aesthetics of the self" is what must once again characterize our relationship with our own present and ourselves, and whether this active form of aesthetic self-formation can circumvent other forms of "subjectivation". I will also draw on the notions of "critique" and "critical attitude" supported by Foucault ("What is Critique?", 1978, and other works) to suggest that artists can contribute to redevelop a particular sense of self-realization and self-fulfillment by their critical demands for creativity and authenticity.

Art education in France : shaping subjectivities against capitalism

Nathalie Montoya

université paris diderot, France

nathalie.montoya(at)gmail.com

In France, art education (« éducation artistique et culturelle ») has been built as a tool to pursue cultural democratization. Getting more students engaged in the arts appear, at least in the public discourse, to be the main goal of developing art education schools. However, a critical observation of art projects in schools show that art education class pursues a deeper and an implicit goal: most of the artists who work in schools want to change the students, to open and expand their ways of seeing what they can do with their lives. They usually want to share a critical way of seeing capitalism and some aspects of our modern trend. This paper will try to analyze the values associated with art education (Dewey, 1934) and the

way these projects try to shape the subjectivities against capitalism.

But at the same time, the observation of art education shows us that artistic intervention could lead to a paradoxical result, as artists tends to display in a classroom a way of working, creating and undertaking their own lives, it is that which fits perfectly into the new spirit of capitalism (Boltanski, Chiapello, 1999)

This paper will present some of the results of a study grounded in field research undertaken in middle schools in the suburbs of Paris (Seine Saint-Denis) between 2010 and 2014 (this paper will be based on the observation of approximately 15 art education projects).

Rancière revisited: Reconceptualising emancipation in arts.

Ina Sattlegger

University of Vienna, Austria

ina.sattlegger(at)yahoo.de

“Politics is first and foremost an intervention upon the visible and the sayable.” (Rancière: 2001)

Rancières work on aesthetics is very much established within the sociology of arts. However, for this conference I would like to focus specifically on the political inquiries of the French philosopher concerning the possibility of new collective subejectivities.

What I propose is a theoretical investigation into the value of his concepts of police and politics, equality and disagreement that subsequently tries to explore the emancipative potential of (performing) arts. I consider this fruitful precisely because his thought enables us to put the very notion of ‘subjectivity’ in the centre of exploration.

Questions are the following: (How) can we utilize Rancières notion of the political as a-priori emancipatory to ask whether art can contribute to a ‘stage-building’ for the un-doing of old and doing of new European subjectivities and forms of agency?

More specifically: Can we perceive specific artistic interventions that engage critically with the notion of European subjectivities, such as ‘Eating Refugees’ staged by the Berlin-based ‘Center for Political Beauty’ (‘Zentrum für Politische Schönheit’) and others as aiding in rendering acts of speech audible that were perceived as mere white noise before?

Can we think of those practise(s) as ‘interventions upon the visible and sayable’ and thus, as politics – or not?

Art as a Reflexive Medium of Change: Desire, Aesthetic Resonance and the Material Language of Objects

Anil K. Jain

Zeppelin Universität Friedrichshafen & Universität der

Künste Berlin, Germany

anil.jain(at)zu.de

The »material turn« in the social and cultural sciences has led to a new interest in both the material conditions of cultural production and the role of objects/non-human »actants« (see e.g. Latour 1996) in social interaction. Also in art theory object-centred approaches like, for example, Graham Harman’s (2002) object-oriented ontology have gained popularity. However, neither the related objectivation of subjects nor the subjectivation of objects provide satisfying explanations why objects really do »matter«. That is why in this paper a different perspective is taken that points to the important role of »aesthetics« and »materiality« without eliminating the subject-object difference.

The »aesthetics« of material objects »speaks« to our senses – and to our desire. It addresses the cognitive as well as the latent emotional layers of the subject. In this way, the (art) objectworks as a medium, and its message is a message about our desire. If we listen to this message we »reflexively« may start to take a different position also to ourselves and our social environment. Additionally, the aesthetics of objects can »trigger« and amplify existing (in)formation(s) via »resonance«. Both aspects may provide impulses for change.

In the final section of the paper results of empirical research (from a research cooperation of the Zeppelin University Friedrichshafen and the University of Arts Berlin) will be presented that show how art can work in practice as a reflexive, aesthetic medium of change in organisational contexts and the public space. Especially, I will focus here on what I call the »instrumental paradox«, i.e. the actual uselessness of a mere »instrumentalisation« of art – as well as any kind of object »fetishism«.

RN02 | Session 04a Artistic Creation, Inter-Knowledge and Transglobalization (Panel: Lusophone Sociology of the Arts, Part 2/3)

Mail and poetry: highlights on creation, interaction and dissemination of art

Ligia Dabul

Universidade Federal Fluminense . UFF, Brazil

ligia.dabul(at)gmail.com

The idea of this paper is to reflect upon some aspects of artistic creation that exist within letters written by poets. Our point is to know in what manner we can establish a relationship between creative processes in art and artists’ social interaction, specially the one within mail exchange. Paying attention to social interaction as means to understand creative processes allows us to bring in to analysis the collective and the communicative aspect of those processes, therefore, also allows us to describe some dimensions of the distinction that is attributed to them. When we deal with those interactions in a so extensive social practise – sending and receiving letters –, based on a material and an ordinary way of

communication – the writing –, we also see and explore ways of creation that are neither exceptional nor exclusive of poets. Those procedures take us to explore how relevant is social interaction to artistic invention, and how much artists create beyond what they fix in their consecrated objects and what they do so by means of common social practises which, maybe for being so, we do not usually consider them so easily as triggers for creating art.

Art institutions and the public sphere: a case study on the Museu de Arte do Rio

Sabrina Parracho Sant Anna
UFRRJ, Brazil
saparracho(at)gmail.com

Given the growing diagnoses of musealization processes, of the spreading of cultural centers and of the new status assigned to curators, this research investigates the emergence of exhibitory institutions as instruments for intervention in the urban space, in times of social change. I shall here analyze the foundation of the Museu de Arte do Rio, in March 2013. The research aims to discuss the possibility of building an art institution, taking on account the formation of social networks and the negotiations in the public sphere for the emergence of a shared project. To think about these issues, I have been investigating how it is possible to solve controversies and to build consensus around the concepts of modern, contemporary, and a global city. Built through a decade of disputes, the Museu de Arte do Rio seems to be revealing both of the place destined for museums in contemporary times, and of the negotiations between organized groups and institutions in Rio. Conceived in times of optimism and prosperity in expectation for mega events such as the Olympic Games, in 2016, the museum was built as a new icon for the city. Nevertheless, just when it was founded in March, 2013, the museum was, however, the target of demonstrations that anticipated the massive protests that spread in the country since mid-2013. This paper seeks to understand how the institution has been the target of new disputes in the city and has been incorporating new categories to face the demands for change.

Grandpa and the Holy Inquiry: questions in theatre and theatre in question

Andrea Copeliovitch
Universidade Federal Fluminense, Brazil
copeliovitch(at)hotmail.com

This proposal includes a theatrical presentation followed by a discussion

The scene is about my grandfather who came to Brazil in 1930 as a Jewish immigrant and whose family was killed in Poland and it is also about Branca Dias, a character of *The Holy Inquiry* (*O Santo Inquérito*), a Brazilian play written by Dias Gomes in 1966, about a “new Christian” who was condemned by the Inquisition in Brazil in the XVIIIth century.

The discussion is about how to talk about such

sensitive issues in a way to accomplish what Bertold Brecht proposed, that is to entertain the spectators and to make them develop a political – sociological reflection on the issues presented. This Scene has been directed by Eugenio Barba, in a artistic residence, using the principles of his Theatre Anthropology such as opposition, omission and dilated body. We believe those techniques help the actor and the director to get to a *Verfremdungseffekt*, an effect of strangeness.

Times and spaces of contemporary art circuits in Porto Alegre

Cornelia Eckert, Ana Luiza Carvalho da Rocha
Universidade Federal do Rio Grande do Sul, Brazil;
Universidade Federal do Rio Grande do Sul, Feevale, Brazil
chicaeckert(at)gmail.com, miriabilis(at)gmail.com

The Mercosul Bienal takes place in Porto Alegre (RS, Brazil) and had its 10th edition in 2015. An event organized by a curatorship, the Bienal Foundation is an administrative institution that ensures continuity in order to comply with the objective of international circulation of contemporary art and of exchanges between its actors and a wide audience in this urban context. Often the Bienal faces difficulties of budgets, conflicts of conception and confrontation with political managers. This paper deals with the conception of actors (especially the curators) on the artistic and aesthetic policy of these Bienals in Porto Alegre, which brings together foreign and Brazilian artists, among them from Porto Alegre. We conceive Bienals as a time-place for the collective expression of contemporary art and of challenges and ruptures of artistic creation. Targeting the large population of metropolises, the Bienal propose different situations of interaction between visitors and the works of art and debates of authors and producers, in different public spaces of the city, appropriate for the exhibition. Interpreting the actors' narratives and published material about their curatorial actions is the motto for us to arrange, in the form of ethnographic collections. These arrangement of images also explain the contradictions of cultural policy, whether referring to the continuity of the Mercosul Bienal project, which has crossed different ideological positions of municipal and state management, or refers to the support or neglect of these managements in the process of circulation of contemporary artistic production in this context .

RN02 | Session 04b Art Markets - What Else?

The art market upside down: valuation practices and the function of auctions in the emerging Chinese market

Svetlana Kharchenkova
Leiden University, University of Amsterdam,
Netherlands, The
s.s.kharchenkova(at)hum.leidenuniv.nl

For new markets to function, institutions and judgment

devices to resolve value uncertainty need to be created. This paper analyzes valuation in an emerging cultural market: China's contemporary art market. Based on extensive fieldwork in Beijing, it explores why new art and unestablished artists appear at auction in China. It argues that auctions act as a judgment device because the Chinese art market is new and lacks trusted valorizing structures and experienced buyers. This paper shows how value is constructed and judged in an emerging market and contributes to sociology of art, market sociology and sociology of valuation. It highlights that in new markets value uncertainty may be resolved differently than in established markets. Market differences across countries may stem from a stage of market development. In new markets market actors can become judgement devices, and the role of judgment devices may be temporary and contingent on the institutional environment.

Contemporary Art Market Scene in Turkey of the 21st Century: Contemporary Istanbul Art Fair Example

Hülya Biçer Olgun
Hacettepe University, Turkey
hlybcr(at)gmail.com

In this study, 21st Century Turkey contemporary art market is examined through Contemporary Istanbul Art Fair. The aim of this study is to examine the reproduction of power in the arts through the actors who regulate and support one of the most important activities of the contemporary art market in Turkey and to reveal the relationship between these actors. In this study, the effects of the actors who regulating and supporting the Contemporary Istanbul Fair on the reproduction of the arts field through economic and social capital are discussed with Bourdieu's perspective. In addition, the network of relationships between actors or objects (art objects) is explored, taking advantage of Bruno Latour's approach.

The center of the contemporary art market in Turkey is the Istanbul art market. The various actors that make up Contemporary Istanbul are among the important determinants of the art field with their economic, social, cultural and symbolic capital. Thus, these actors draw the picture of the contemporary art scene in Turkey.

In this study, it is revealed who is the actors (persons or institutions) who organize Contemporary Istanbul, who support this activity, and the network of relations between these actors is revealed. Thus, the process of regenerating the powers of the arts that are encountered as determinants of the Turkish art market scene is being revealed. This analysis is based on Pierre Bourdieu's field theory (art field and capitals) and Bruno Latour's Actor-Network Theory. The data of this qualitative study were collected based on content analysis and observation.

The Art Gift

Victoria D. Alexander
Goldsmiths, University of London, United Kingdom

v.alexander(at)gold.ac.uk

Marcel Mauss's conception of "the gift" is useful in understanding certain kinds of exchanges. The Maussian gift is embedded in a series of obligations for both giver and receiver, it comes "with strings attached" and is both interested and disinterested. The Maussian gift stands in contrast to commercial exchanges, which are clearly interested and also is distinguished from our contemporary understanding of gifts as utterly disinterested, "pure", and diametrically opposed to commercial exchange. This paper is concerned with his idea of the Maussian gift and how a Maussian perspective can help us understand the "art gift". Focusing on the visual arts, I consider how artists, patrons, and owners become permanently connected to physical works of art, for instance, through a work's provenance, and how patently commercial aspects of the visual arts world are cloaked in scholarly disinterest (Velthuis, 2007). I also examine how patronage and philanthropy in the art world, are always more or less self-interested and competitive but also characterized by disinterest and even the urge to do good. An intertwining of obligation, and interest/disinterest epitomize the art gift.

RN02 | Session 04c Embodied Perceptions, Knowing and Subjectivities

The "Artistic Body". Embodied subjectivities of the theatre acting experience

Stribor Kuric Kardelis
Universidad Complutense de Madrid, Spain
striborkuric(at)ucm.es

The proposed presentation will discuss a part of my PhD where the central figure of analysis are emerging models of theatre production that have been intensifying in recent years with the decline of funding and procurement by the public sector in Spain. I call them models of "dramatic craftsmanship".

To analyse these new figures, the project is formed by two complementary axes: The first one is based on the political and economic dimensions of the productive sector in which these models are embedded. The second axe are the social and psychological dimensions of the creative worker in the sector focusing on theatre actors and actresses. The main methodological tools I am using are in-depth interviews with theatre workers and ethnographic analysis in two theatre companies in Madrid.

In this presentation, I will focus in the second phase of the research where I will expose the process of labour subjectivity building in theatre actors and actresses in relation with their bodies. I will be taking a leap from the Cartesian separation of body and soul and adopting a processual and multiple perspective where physiological, psychological and social features are inscribed simultaneously on the body. The goal is to combine different approaches to the body-work relation like: the "organizational body", the "aesthetic body", "emotional labour", "body capital" or "sex work";

to grasp how the “artistic body” is developed in theatre. In conclusion, crafting the concept of the “artistic body” will allow me to analyse embodied structural and psychological components of the workers’ subjectivity.

Aikido and the remaking of everyday experience

Ryan Jepson

University of Vienna, Austria

ryan.jepson(at)univie.ac.at

In the English language Aikido is commonly known as a “Martial Art”, a translation of “Budo” which refers to the code of ethics, sets of practices including multiple artistic practices of the “way of the samurai” in feudal Japan in existence until the late 19th Century. This presentation, however, will reflect on the developments of Aikido of the past decades and its evolution (as practiced by one organisation in particular) to a way of modern living both as a philosophy, but most importantly, through embodied learning and training of mind and body in a group environment.

With an emphasis on remedying the inherent dualism underpinning resolving conflict through fighting, Aikido can be understood as a practice of “non-fighting” which must be studied seriously through through “bodily techniques” to invoke the notion used by M. Mauss. Following this concept, experiences of long-term Aikido practitioners can help to extend the notion of “mindfulness” with implications for researching and understanding a broad array of social interactions and situations.

The teachings, practices, methods and settings of learners reveal pathways to everyday life in the contemporary era and may have significant implications for improving and researching mental, physical, social and societal wellbeing.

Crafted Identities: embracing shared perspectives through phenomenological interpretation of ceramic practice.

Catherine Louise Roche

University of Westminster, United Kingdom

w1610248(at)my.westminster.ac.uk

Responding to the future ‘(un)-making’ of European identity for UK citizens and the resulting sense of loss incurred by many, this paper will explore current phenomenological perspectives of visual art that expose the integral nature of shared identities found within embodied experiences of art viewing, and the relevance this has for audiences. Merleau-Ponty’s theories of embodiment will underpin the argument, with particular attention given to recent thinking that assimilates his ideas within a contemporary context, acknowledging the diverse perspectives that form the basis of embodied perception of artworks, and the reciprocal, modifying nature of these encounters upon audiences.

Employing these phenomenological positions alongside theories of sensory perception, materiality and remediation, this paper will examine work by

ceramicist Ingrid Murphy, whose practice navigates the interface between traditional and new technologies. Juxtaposing augmented reality with the physicality of hand-made objects, Murphy disrupts tactile and cognitive perceptions of body and self, transforming functional ceramic objects into nuclei for embodied perception, whilst opening up wider discourses of difference and continuity. By applying this theoretical framework to Murphy’s practice, craft, particularly ceramic artworks, is exposed as a potent means to connect with notions of shared identity and communal consciousness, through sensory perception of material qualities and embedded cultural codes; a consideration of tacit knowledge performed via skill and processes of making will also inform the argument. Ultimately, phenomenological methods of approaching humanity through crafted artworks can be seen to offer valuable alternative narratives in a global climate where difference and plurality are increasingly under threat.

An Embodied Image of the Philippine Heart Center Hospital as a Therapeutic Site

Karen So

De La Salle University, Philippines

karenfrando.so(at)gmail.com

Framed in Pallasmaa’s idea of embodied image, the paper revisits the idea of the Edifice Complex by Lico and embarks on a multi-sensory study of the inside, outside and inside out of architecture, with focus on the Philippine Heart Center Hospital (PHC). Furthermore, the paper explores Honrado Fernandez’s concept of holistic architecture towards contributing to local aesthetic concepts on space anchored on the experience of illness and health.

The narrative of an embodied image of architecture will be explored through weaving stories that revolve around the body and the senses’ perceptions on space and its connection to experiences of illness and health. Three major stories include the following: a historiography of hospitals using Mojares’s loob at labas in reference to the colonial body, the design philosophy of Architect Jorge Ramos framed in borrowed ideas from urban design using Moughtin and Signoretta’s landscape of a therapeutic environment and an aesthetic scanning of the site by borrowing Manahan’s categories on “good architecture” to frame the stories of former patients and family caregivers who engaged with Jorge Ramos’s symbolic design layout juxtaposed to my own personal accounts in taking care of both my parents in the hospital.

Using socio-historical, technical and personal stories, the study aims to draw a narrative of an embodied image of the PHC that would expand new directions in contextualizing and understanding the aesthetic relationship of architecture and well-being in a local interdisciplinary art studies lens.

RN02 | Session 05a Practices of Musical Resistance and Urban Cultural Scenes in Late Modernity (Panel: Lusophone Sociology of the Arts, Part 3/3)

DIWO! Networks and forms of collaboration in alternative music scene of Lisbon metropolitan area

Ana Sofia Oliveira
ISCTE - University Institute of Lisbon, DINAMIA'CET -
University Institute of Lisbon, VAT number:
501510184, Portugal
ana.s.s.oliveira(at)gmail.com

Within a relational approach to music, in this communication, we propose an analysis of the importance of networks and mechanisms of collaboration in the musical production of Lisbon alternative scene. Based on concrete case studies, we will try to understand how the musical careers can be framed in networks or scenes, composed by different actors, exploring the relations established between the musicians and between them and the most diverse agents related to the musical field. Adopting a do-it-yourself (DIY) approach to the analysis of the construction and management of these careers, in this communication we aim to uncover the relevance of different forms of collaboration among agents, looking at musical production as a collective creation - do-it-with-others. If in punk the DIY implied to belong to a network and to be connected with different elements, also the indie musical trajectories emerge from a creative community. They are developed under the sign of an economy of reciprocity and trust, in a constant limbo between independence and interdependence, competitiveness and reciprocity, in which social capital acquires extreme relevance. It is precisely the role of this creative community to create the musical careers that we intend to analyze regarding Lisbon metropolitan area, exploring the ways and channels of communication used to promote these careers (cultural agendas, media coverage...). What conclusions does this analysis allow us to withdraw? Is there a certain institutionalization of these dynamics, of these practices? Are we facing new ways of being alternative?

National Identity and Brazilian Modernity: the Case of the Recording Industry

Pedro Martins de Menezes
University of Porto, Portugal
pedromenezes89(at)gmail.com

This work intends to understand the role that foreign record labels settled in Brazil played in the construction of a national identity and in the modernization project of the country during the 1964-1979 period. Throughout those years, dictatorship and the cultural industry established a conflicting partnership whose purpose was forging a national identity and modernizing the country by the massification of society. This massifying project

brought together the dictatorship and the cultural industry because they were both aware that, under that banner, they would materialize their interests: on one side, the populist, and integrative discourse of a government mainly interested in national security formed the compact public for the cultural industry. Inversely, by exposing the entire population to the same content, the cultural industry integrated the people, giving back to the dictatorship the unified nation it longed for. And so, tensely united by the idea of massification, dictatorship and cultural industry believed they could find a national identity and modernize Brazil. However, this was an unstable arrangement, for, if on the one hand the State invested technical and institutionally in establishing a cultural industry, on the other hand, the product generated by this industry was controlled by the dictatorial censorship. Incited by the paradoxical alliance established by dictatorship and cultural industry, many foreign record labels came to Brazil. Given that these companies were the frontline artificers of the project of finding a national identity and modernizing Brazil through massification, I ask: what was the role played by foreign record labels in Brazil in forming the national identity and in the modernization project of the country? And what national identity and modernity emerged from such initiative?

Todas as Artes, Todos os Nomes: paths and interventions in the cultural resistance/renovation of Lisbon and Rio de Janeiro

Paula Guerra, Lígia Dabul
Faculty of Arts and Humanities, Institute of Sociology,
University of Porto, Griffith Centre for Social and
Cultural Research, Portugal; Federal Fluminense
University, Department of Sociology, Brazil
pguerra(at)letras.up.pt, ligia.dabul(at)gmail.com

This paper seeks to propose a meeting of the social and human sciences and the arts, understanding art as a daily life experience that is aesthetical, political and made of resistance to hegemony, where different lifeworlds and affective cartographies are expressed. Considering the relationship between the impasses and contemporary questions, we assume the diversity of concepts – citizenship, violence, human rights, urban intervention, resistance, memory – in their capacity to produce difference and singularity. This disciplinary matrix takes us to the multipolar nature of violence in its symbolic dimension, something which goes beyond criminalization, punishment, mediatization or normative visibility. Approaching Barthes (2009) and Derrida (1986), we take the stance that the critical analysis of a text – in its wider sense which can encompass actions, speeches or life stories – never makes any sense objective, but is faced with a plurality of different senses. We focus specifically here on rap, progressive kuduro and ostentation funk. Crossing borders, disciplines and oceans, we attempt to show that artistic creation is severely truncated in its reduction to the work of art by sociology. What we propose here is that artistic

creation is not only a social fact and factor; it is still, at least, a social knowledge, a social representation, a social interpretation, a social valorization and a social imagination.

RN02 | Session 05b Matchings and Intermediations in Arts Production and Distribution

Finding Legitimacy: Matching in the Publishing Market

Henrik Fürst
Uppsala University, Sweden
henrik.furst(at)soc.uu.se

In the publishing market, writers and publishing houses are potentially matched with each other through a manuscript. The results of these matches are published books. This presentation draws on 73 interviews with writers and publishers in Sweden and explores how and what reasons are given for a match. From the writers' side, publishing houses are categorized and the selection of publishing houses is justified by strategies referring to different orders of worth. From the publishers' side, manuscripts are categorized and selections are also justified by strategies referring to different orders of worth. The justification strategies used are often combined, and the strategies deployed depend on knowledge about the other side of the market and the publishing field. Strategies may be dynamic – referring to an alignment of writers, manuscripts, and publishing houses – but may also be more static in the form of conventions. The results illuminate a process where two sides of an artistic labor market are matched with each other.

Mapping Professional Self-concepts of Gallery Owners

Michael Gautier
University of Bern, Switzerland
gaumic(at)gmx.net

Gallery owners occupy a crucial position in the art world. The discovery and valuation of new artistic positions without the involvement of commercial galleries are hardly conceivable, as they very often initiate the processes of reception and commodification of art. Three major challenges determine the professional practice of the art dealer advocating contemporary art: 1. the enduring commitment to innovation; 2. the highly uncertain symbolic and economic profits; 3. the simultaneousness of value- and goal-rational logics of social practices—i.e. a) disinterested aesthetic receptiveness (passion) certifies his/her credibility as an ally of the artist and as a trustworthy mediator for the collector, b) interestedness is necessary in order to successfully market and place art and to sustain his/her business/enterprise.

Despite the importance of the phenomenon of galleries, little is known about the dispositions and interpretative patterns that structure their owners' professional practice and enable them to commit to

their delicate task. A systematic reconstruction of such professionally relevant concepts was conducted by means of contrasting case studies based on a qualitative analysis of transcribed interview records and of the biographical data of European and American gallery owners. The sample covers as wide a range as possible of age, gender, generation, origins, trajectory, gallery size and program. The presentation aims at outlining a typology of dispositions and interpretative patterns of gallery owners active in the global art market: a) the operator (strategic agent, rational organiser, program as an associative relationship); b) the partner (gatekeeper, elective affinities with artists, program as a communal relationship); c) the curator (project-oriented, co-author of exhibitions, intellectual affinities with artists); d) the adviser (artists as clients).

We should not forget technicians : towards a study of technical intermediaries in art worlds

Andy Battentier
University of Milan, Italy; University of Amsterdam, The Netherlands
andy.battentier(at)unimi.it

In the analysis of artistic production processes, technical craft workers, such as sound engineers, stagehands, copy editors, film editors, light technicians, are rather ignored by sociological studies, most works focusing either on artists or on audiences. This might be explained by what Bourdieu (Bourdieu, 1977) calls the « charismatic ideology of the creator » : gazes, even the sociological one, tend to concentrate on who is designed « creator », leaving all the things « creating the creator » in the shadow. Even Howard Becker (1984) was considering technicians as « support personnel », included in art worlds as a « residual category, designed to hold whatever the other categories do not make an easy place for » (1984 : 2). The recent stream of studies around « cultural intermediaries » (Negus, 2002 ; Wright, 2005 ; Hesmondalgh, 2006 ; Maguire & Matthews, 2010 ; Lizé, 2016) could have opened the door to the study of technicians. But the concept is never used in a way that could describe their activities, both in theoretical texts and in empirical studies.

However, isolated studies of technicians in art worlds (Kealy, 1979 ; Le Guern, 2004 ; Kuipers, 2015 ; Rudent, 2008 ; Hennion, 1987) show that focusing on technicians is a chance to deepen the knowledge of social dynamics of cultural production, due to their critical position in the production nexus. We will show it by first defining the activity of technicians in art worlds. We will then propose the concept of « technical intermediaries » that will make a room for technicians in the sociological literature about art worlds. We will finally give examples of results that studying technicians in arts worlds can lead to.

Digital Brokers of Attention: the Case of Visual Arts

Nathalie Casemajor, Jonathan Roberge, Guy Bellavance
INRS, Canada; INRS, Canada; INRS, Canada
nathalie.casemajor(at)ucs.inrs.ca,
jonathan.roberge(at)ucs.inrs.ca,
guy.bellavance(at)ucs.inrs.ca

Over the past two decades, new spaces for the construction of visibility and reputation, animated by a new breed of cultural intermediaries, have greatly modified the conditions whereby cultural goods are accorded value (Valtysson, 2010). The visual arts world, which may at first have appeared relatively sheltered from these shifts, has also undergone several changes that may foreshadow a significant transition (Poole and Le-Phat Ho, 2011; Bellavance and Sirois, 2015). This is particularly the case for the contemporary visual arts scene, where the creation of economic and symbolic value is based on highly speculative processes. Is online visibility a determining dynamic of recognition and legitimation, or does it only serve to reinforce mechanisms that are already being played out in the traditional spheres of visibility and value-creation? This is the subject of the current paper, which proposes a case study concerning the collection, analysis and visualization of data from the website Artfacts (e.g. its peer-group algorithm), in comparison with a similar site, Artnet (including data such as its trending artist list, for example). These case studies are conducted according to the following two-step methodology: 1) a content analysis of the interfaces (statistical reports, visualizations of artists' value) and 2) a discourse analysis of texts explaining the sites' ranking principle and the measurement indicators used. These analyses will be complemented by three semi-structured exploratory interviews with stakeholders in the contemporary art world (museum directors, gallery-owners, curators) to assess the perceptions of these visibility-building tools among traditional mediators in the cultural field.

RN02 | Session 05c Current Developments at Museums

Support or substitution? Museums and art education in double-peripheries

Dominik Porczyński
University of Rzeszów, Poland
dporczynski(at)gmail.com

The paper's main objective is to depict growing participation of museums in the fields of art education and regional identity construction. The presentation concentrates on Poland's Podkarpackie Province (or Subcarpathian Voivodeship) identified here as double-peripheries due to its far-from-centre location in semi-peripheral country.

Basing on Pierre Bourdieu's concepts, well organised system of education may improve lacks in cultural capital inherited from parents by lower or middle class

students. In discussed instance aesthetic competence may be developed in schools. In case of South-Eastern Poland, however, art education seems to be ceded on museums.

Research on educational practices in West European museums show teachers using museum lessons and exhibitions mostly as elements supporting curricula. Interviews carried out with curators and educators in Poland on the one hand confirm these outcomes, yet – on the other hand – deliver some different cases. Thus, from the perspective of interlocutors pupils often lack basic knowledge which curricula conducted until 1999 (before education system reform) provided. In result museum education seems to substitute school in fields related to classic culture, arts and regional history.

The paper bases on research carried out in 52 museums of Subcarpathian Voivodeship in years 2015-2016. Data includes quantitative interviews conducted with museum employees and visitors as well as in-depth interviews performed with curators and educators.

The former collections of French popular art: towards a museographical revival

Sophie Marino
Ecole nationale supérieure des Beaux arts de Paris,
France
sophie.marino(at)beauxartsparis.fr

The National Museum of Folk Art and Traditions (Musée national des arts et traditions populaires) was created by George Henri Rivière in 1934 in the museum of the human being (Musée de l'Homme) and opened its doors in 1972 in a spectacular setting. Rivière was considered as the creator of the modern museology. His museum, dedicated to French ethnology, proposed an innovative museography, between esthetics and scientific rigor.

In 2002, after two decades of institutional crisis, the museum was renamed the Museum of Europe and Mediterranean Civilisations (MuCEM); it closed its doors in 2005 and reopened in Marseille in 2013 as the Museum of Mediterranean Civilisations with a new scope and a new mandate.

The collections of Rivière are thus very different from the new project and put into storage at the Mucem.

Nevertheless, several exhibitions organized by institutions of contemporary art, the Palais de Tokyo (2008, 2015 and 2017), and the Centre Pompidou Metz (2016) decided to show these collections, sometimes in their original museography which then becomes unit of exhibition and even object of exhibition.

What is the significance of this this new curiosity for this part of the French museums history? Several hypotheses appear: the approach of contemporary art on popular art and the question of popular culture in France, an esthetic point of view on the museography of ethnography. The presentation will focus on the four exhibitions cited above. We shall question this change of institutional space thanks to a qualitative investigation supported by document retrievals.

Risk, Reputation, and Damage: Studying Art Theft in the European Union

Naomi Oosterman

City University of London, The United Kingdom

naomi.oosterman(at)city.ac.uk

Art crime has become an increasingly studied topic within the field of cultural sociology. Art theft is a form of crime that is almost per definition transnational and this it can pose severe consequences to (trans-) national art worlds. The impact of art theft on local art worlds, and the policy implemented thereafter, is considered severely ambiguous due to the fluidity of the cultural value of art.

This research is twofold. On the one hand this study investigates the criminal dynamics of art theft in the European Union, analysing 4,000 cases from the Interpol Works of Art database. On the other hand this research studies the different threats and risks to museum collections, using qualitative data from several metropolises in the Netherlands, Italy and the United Kingdom.

This study found that oftentimes arts and cultural property crimes made it to the governmental agenda, but just as often has it resulted in intangible (in)operational efforts, both in arts policy and securitisation. Central to this research is the argument that the implications of art thefts on local art world are empirically difficult to shape due to the fluidity of cultural value and certain impunity in (inter-) national policy. The research finds that, even though museums fear for the classic threats to their collections (theft, vandalism), a far greater fear is present in the risk of reputational and institutional damage. Furthermore, a discrepancy is evident in the objects that are often highly securitised and the objects targeted.

From Liverpool with Memory. House of Memories' national partnerships on dementia care – a critical analysis

Rafaela Neiva Ganga, Kerry Wilson, Gayle Whelan
Institute of Cultural Capital, United Kingdom; Institute of Cultural Capital, United Kingdom; Institute of Cultural Capital, United Kingdom
r.neivaganga(at)ljmu.ac.uk, K.M.Wilson(at)ljmu.ac.uk, G.Whelan(at)ljmu.ac.uk

Dementia and Alzheimer disease are currently the leading cause of death in England. Dementia refers to a variety of diseases that are characterized by a progressive cognitive and overall decline. There is no cure for dementia, but culture and art-led programmes have been recurrent in literature as particularly beneficial strategies to improving the lives of people with dementia and their caregivers (Camic, Baker, & Tischler, 2015; Rosenberg, 2009)

House of Memories (HoM) is a museums-led dementia awareness-training programme focus on the remanence potential of museum collections. Created by National Museums Liverpool (NML) in 2012, with funding from the Department of Health (UK), it provides dementia carers resources to support people

to live well with the condition. HoM has been directly referenced within leading policy documents, including the UK Prime Minister's Challenge on Dementia (Department of Health, 2012), and the recent review of care standards for people living with dementia (Care Quality Commission, 2014), with HoM cited as a creative intervention that focuses positively upon the individual's quality of life. Unsurprisingly, HoM has been attracting national and international museum partners' whiling to replicate the programme.

Since 2012, Crossing Boundaries: The value of museums in dementia care has been collecting data on HoM national expansion (e.g. to North, Midlands and Southeast) through a multi-method strategy design to understand three distinct but complementary outcomes: professional learning and development; wellbeing and culture of care; and social value and return on investment. This paper focus on the critical analysis of the programme's impact on a culture-led interventions in dementia on partner museums, particularly on the national transferability, adaptability and impact of the existing model.

RN02 | Session 06a Spaces of Possibility Between Utopian Arts and Challenges of Urban Futures

City as Space of Possibility – Alternative and Artistic Initiatives Towards Urban Sustainability

Volker Kirchberg, Sacha Jérôme Kagan
Leuphana University Lüneburg, Germany; Leuphana University Lüneburg, Germany
kirchberg(at)uni.leuphana.de, kagan(at)uni.leuphana.de

The multi-year and multi-faceted research project "City as Space of Possibility" (a project with many inter- and transdisciplinary participants that the first author is coordinating and where the second author is Principal Investigator) looks at agents of civil society that desire and realize changes towards sustainable urban development. Our project has the explicit aim to identify, reflect upon and strengthen these agents of civil society who build urban cultures of sustainability by creating and promoting creative, artistic and alternative experiments in an urban environment, contributing to potential innovations (related to cultural dimensions of urban sustainability). Specifically, we analyze urban spaces of possibility with respect to how they offer positive conditions, potentials and mechanisms for these change entrepreneurs (whether they are individuals, informal groups, initiatives, and social movements) and how they are supported (or hindered) by established institutions. The empirical study focuses on the city and selected urban areas of the German capital of Lower Saxony, Hanover. The exemplified spaces of possibility in Hanover are hubs for people realizing creative-artistic and innovative-alternative experiments towards an sustainable urban environment, also following a value set of critique and curiosity, openness and tolerance, diversity and justice, empathy and liberty. However, we also look into the challenges and potential weaknesses of these

spaces of possibility – and we extensively share our findings with the actors in Hanover.

speculating on urban futures: framing art conceptually, and orienting it strategically, beyond the aesthetic-political paradigm of the contemporary city

Andrea Pavoni
ISCTE, Portugal
andrea.pavoni(at)iscte.pt

In the 70s Henri Lefebvre claimed that the future of art would not be artistic, but urban. Today the prophecy has been fulfilled, yet in a rather more dystopian sense than the one he implied. After an enthusiastic escape from the prisonhouse of the Gallery, artists took the street undergoing (rather uncritically) their own social and experiential turn, often with dire consequences. On the one hand, their insistence on the social and political value of art ultimately defused its potential, often reducing it to an ameliorative and legitimising appendage to processes of neoliberal urbanisation. On the other, the site-specific craze for constructing transgressive and eventful experiences in the urban space soon became incorporated into what Doreen Jacob terms eventification, i.e. the use of urban events as an aesthetic strategy of gentrification. If we are to address the question of how might art contribute to long-term socio-political change, it is paramount to rethink its aesthetic strategies, against the aesthetic paradigm of the neoliberal city. A task, I argue, which rests on emancipating art from what today seems its one and only horizon: namely, phenomenological experience. An art of speculation, therefore, is not the financial/economical process traumatically reshaping contemporary urban space, but a philosophical strategy for art to address its (urban) conditions of possibility, and thus to challenge the urban both as an aesthetic paradigm and a structural process. Employing relevant examples from Italy, UK and Brazil, this paper will speculate in this direction, also arguing that embarking on this path will necessarily require, for the sociology of the arts, to rethink and update its presuppositions about the social, the arts, and the urban itself.

Perspectives on Refugees Theatre in Germany

Ruba Saliba Totah
JGU University, Mainz, Germany
totah(at)uni-mainz.de

Since the beginning of the Syrian Refugee crisis, around 300,000 Syrian refugees ended in Germany. Policies of integration were put in practice, whereas, standpoints against refugees have been adopted by the right-wing political parties. Amidst this ambivalence, theatre takes role in the institutional German refugee service programs, especially that it is a tool for healing, storytelling, and human values reiteration in times of hardships. In addition, emphasized while notable number of Syrian artists and theatre makers, fleeing dictatorship, were among the thousands of refugees in Germany. Hierarchies

imposed on refugees' theatre making are addressed as multipliers of the political motivation to theatre production.

This paper, based on a current empirical PhD project, analyzes a key performance and a key host institution of Syrian refugees' performances of theatre in Germany in the past 2 years: 'Goethe Institute Damascus in the Exile' institutional experience as a promoter of refugee performance. In addition, 'letter of the tigers to the humankind' as performed by the Syrian Actor May Skaf in collaboration with Gorki theatre and Center for Political Beauty, in Berlin. The paper deconstructs the assumptions and knowledge systems that reiterate theatre's political motivation. It realizes subjectivities of institutions supporting theatre, and subjectivities implied by performances, and studies the extent to which collaborations between promoters of theatre and performers are aiming to eliminate social challenges in Germany, and demonstrates the power of art in creating a social experience space, in which belonging, identities, gender, culture and nationality are negotiated.

Utopia and Art: Pedagogical, Liberational and Critical Meaning of Art

Polina Golovatina-Mora, Hernando Blandon Gomez
Universidad Pontificia Bolivariana, Colombia;
Universidad Pontificia Bolivariana, Colombia
polina.golovatina(at)upb.edu.co,
hernando.blandon(at)upb.edu.co

This paper elaborates the concept of utopia as a reflective vision of the contemporary social structures and relations with a clear transformative purpose, as an emancipating alternative of a dream to the hierarchical and oppressive realism (for example, Srnicek & Williams, 2015). Art in its multiple expressions and forms, as it has been emphasized by different philosophers and sociologists of the art, or scholars working with critical theory and critical pedagogy, has a powerful transformative and critical potential. Various authors, among which are, for instance, Jenkins (2009) and Fals-Borda (Fals-Borda & Rahman, 1991), speak of the art as of the form of communication that consolidates the community (a society) while diversifying it. Such understanding of the art helps to reflectively revise the notion of the solidarity and its meaning for the society, community and an individual as such. Artistic expression and reflection of the everyday life can strengthen the potential of the everyday life (de Certeau, 1984), which together with its practices that form and maintain provide an excellent system of the checks and balances for any social practice, belief, value and overall, any ideology. As well as, quotidian artistic practices can be a powerful tool of reflexivity. The paper will revise theoretical aspects of the proposal, provide an analytical revision of the advances of the artistic project of one of the authors that elaborates a proposal for the social transformation of the postconflict society (Colombia) and, finally, present an analysis of the pedagogical practices that author have been employing in their classes using both art as a

utopian project and utopia as an artistic project.

RN02 | Session 06b Visual Art Audiences

The Artist's Collector: How Contemporary Artists Conceptualize and Evaluate Arts Audiences

Ann Mullen

University of Toronto, Canada

mullen(at)utsc.utoronto.ca

Studies of arts consumption typically investigate the characteristics of those who consume art, and how audiences receive, or make sense, of art. Missing in this research has been a consideration of artists' conceptualizations of their audiences. In this paper, I draw on in-depth interviews with 28 contemporary artists in San Francisco, California, to report on artists' views on: to what degree their audiences understand or appreciate their work? What, if any, background is required for appropriately receiving their work? What kinds of people make ideal collectors? How do they react when their work is purchased as an investment or for strictly decorative purposes (i.e. because it matches the sofa)? Findings reveal how artists value their own work, especially its decorative versus conceptual value, where artists locate meaning in their work, and how they navigate a common set of tensions and contradictions in displaying and selling their work. Most artists insist that their art does not contain just one meaning, welcome multiple subjective interpretations, and resist the idea that art can be decoded to uncover any essential meaning. On the other hand, artists simultaneously distinguish between those who "got" their work and those who fail to understand it. When collectors show a lack of understanding of the work, artists maintain the hope that visitors to the collectors' homes might better understand the work, suggesting the work does carry an inherent meaning. Finally, artists distinguish between understanding, appreciating and engaging with the work. For many, the ultimate desire is for viewers not to understand but to simply engage deeply with their work.

Visitors and Participants, Londoners and Parisians: Borders outside and inside a collective contemporary art piece

Christophe Prieur

Telecom ParisTech, France

cprieur(at)enst.fr

This communication is built on a research conducted as participant observation, among a collective of one hundred performers (called *participants*) in a piece presented in autumn 2016 in a famous French museum. In this piece, the visitor sees, without any mediation element, a swarm of individuals evolving inside a large hall. The visitors may wander around the hall, even among the swarm, but its cohesion prevents them from feeling a part of it.

Now from time to time, a participant comes to a visitor, tells an intimate story, starts a conversation, then suddenly stops and comes back into the group. This interaction is a glimpse at the singularity of the

individuals from which the collective is made. They don't look all alike any more. The ephemeral connection has casted, from the inside, a Simmelian bridge above the invisible but obvious border which keeps the visitor out.

Inside the swarm, the situation happens to be the same: the strong cohesion seen from outside is actually made of many separations between smaller groups, for instance the Londoners who did the piece several years ago and seem so tightly connected, especially from the point of view of the Parisians, who barely knew each other when the piece started. All along the ten weeks of the exhibition, these groups merge and reconfigure, the inside borders move, thanks to the inner rules of the piece, but also mainly to the sociability built outside the time and place of the piece among the participants.

The Modern Students at the Art Museum (Based on the results of the sociological studies at the State Russian Museum, St. Petersburg)

Ekaterina Potyukova

The State Russian Museum, Russian Federation

ekaterinkap(at)gmail.com

The report focuses on the relation of the modern students to the art museum in the context of the results the sociological studies. The surveys of the museum audiences and the students of St.Petersburg high schools have been carried out by The Department of Applied Sociology and the Youth Services of the Russian museum.

The art museum visitors are primarily composed of people having higher and incomplete higher education, i.e. the current or former students. Thus the students' interest to the museum reflects its potential for further development.

According to the regular sociological surveys, during the last decade up to 1/4 of all Russian museum visitors are students. At the same time, only 15-17% of all St. Petersburg's students visit the art museums more or less regularly. The Fine Art permanently takes the last position in the list of preferences of different types of arts.

The special educational programs for students have been developed and constantly being improved at the art museums (guided tours, lectures, classes, etc.). Such programs are carried out with young people who come to the museum on their own and therefore already interested in the Fine Art.

In order to attract unprepared and uninterested students to the Russian museum the employees of The Department of Applied Sociology and the Youth Services have developed non-educational method of facilitated-discussion of the art works, in order to arouse students' interest to the Fine Art.

The students' comments, describing their impressions, have been analyzed by a content analysis. Yesterday's schoolchildren feel themselves equal participants of the discussions about art, thus overcoming the barrier of estrangement between the museum "sanctuary" and the incompetent visitor.

Visual analysis and sociological study of fine art museum audiences

Mathias Blanc
CNRS, France
mathias.blanc(at)univ-lille3.fr

From March to June 2017, the Musée du Louvre organizes in the Louvre-Lens an exhibition devoted to the works of 17th century brothers Le Nain.

This paper focuses on how the different audiences of this exhibition look at Le Nain's paintings and how visual meanings unfold in this social situation. In order to make visible the concrete visual interaction of the audiences with the pictures, we use our digital dispositif Ikonikat which allows the visitor to annotate pictures by drawing lines or curves, i.e. to sketch, on a digital reproduction of the paintings which is displayed on tablets. Drawing lines is used to tag and explain what the picture means to the visitor. Therefore, visitors have the possibility to show what is relevant for them in these pieces of visual art.

This communication will present results of this study, focusing on the question of how we integrate a visual analysis to a sociological study of museum audiences.

RN02 | Session 06c Reconsidering Arts Management (Panel: Arts Management Studies, part 1/2)

The Dust of Everyday Life

Constance DeVereaux
Colorado State University, United States of America
cdevux(at)gmail.com

Romantic, idealized notions about the arts persist. As a set of phenomena they escape our ability to define or adequately describe. Taken together, "the arts"—in which are often included all painting, all sculpture, all music, all dance, all theater—barely satisfy the requirements for family resemblance that permit treating them as of the same kind. These two conditions: idealization of the arts, and definitional challenges, lend to hyperbolic claims about the influences and benefits of the arts in social and policy domains. Pablo Picasso's claim that "Art washes away from the soul the dust of everyday life," is not so different from assertions that the arts make humans better citizens, as has been claimed by many government agencies and foundations interested in establishing the benefits of the arts. Establishing the truth of either statement requires some configuration of criteria, and agreement upon just what is meant by "soul," "dust," "citizen," and "everyday life."

Reliable studies about the effects of the arts are hard to come by. We know little enough about physiological effects of single instances of art exposure, much less about direct effects of "the arts" on social or civic behavior. This paper compares scientific studies on physiological and cognitive effects of art versus those claiming effects of the arts on human behavior in the social and political realm in order to show the deficiencies in claims about arts benefits. The aim is

not to undermine the value of the arts, but to indicate ways to more responsibly represent their value to contribute to more effective policy action. Reference to Habermas' structural transformation of the public sphere is key to this paper's premises.

The Philosophy of Arts Management

Njordur Sigurjonsson
Bifrost University, Iceland
njordur(at)bifrost.is

In this study, I approach arts management from a different standpoint than most of the mainstream research and theory, which often is too focused on financial management, organization, marketing and other generic business management topics. The prevailing literature is also too occupied with lists of rules and recipes for success, none of which is very helpful or interesting. What I want to do here is to approach it differently and ask what "the philosophy of arts management" could be if it were a field of study, a seminar or a book, even something as casual as a Wikipedia entry. What would be the main theories? Whose ideas should we look towards. Could we talk about Arts Management Epistemology? Arts Management Aesthetics? Or even Metaphysics? And yes, answers will be suggested.

How arts management education react to today's society challenge

Hua Fang
Shanghai Conservatory of Music, China, People's Republic of
hifanghua(at)163.com

This article from four aspects to explain what discussion happened in arts management education. First, how arts management as a discipline connect to today's society; second, what kind of curriculum design can reaction to this change; Third, what kind of requirement for teacher can support these arts management education; at last, what problem we can find from the standard of student enrollment.

at the first part, with some literature review about arts management definition I want to explain how we understand the discipline of arts management, and how it can connect to the circumstance that we have to face now. second part of this article I want to through some curriculum design cases to describe what different background let us have different understanding about arts management. The third part focus some discussion about some requirement for teacher of arts management. what kind of teachers are capable of teaching work and not just bring skill training which can not push students to think the circumstance of arts management. The last part from literatures and cases study I want to analyze the standard of student enrollment and how it affect arts management education.

Through these four parts analyze I want discussion how arts management as a discipline in university it can connect to today's society, and related to the

inside and outside of the art world.

Culture a public good? Critique, Reflection, and Recommendations

Antonio C. Cuyler

Florida State University, United States of America
acuyler(at)fsu.edu

Americans for the Arts (2016) has argued that culture accomplishes specific instrumental ends such as better citizens, engaged communities, educational gains for children and adults, and inspiring human excellence. Beyond these extrinsic benefits of culture, scholars have also identified the intrinsic impacts of culture as aesthetic enrichment, captivation, emotional resonance, intellectual stimulation, social bridging and bonding, and spiritual awakening (Brown & Novak-Leonard, 2013). However, in addition to questioning if culture indeed bears these benefits, rarely have scholars questioned the implicit bias in the assumption that Mozart is more valuable than 2 Live Crew or that Damien Hurst is more beneficial than Chris Ofili. Moreover, few, if any scholars have questioned the implications for cultural engagement when the “culture” used as the intervention to produce these benefits is not culturally relevant (Gilmore, 2012; National Endowment for the Arts, 2010a, 2010b, 2012, 2015a, 2015b; and Novak-Leonard & Brown, 2011). Therefore, this paper aims to offer critique and reflection on the question is culture truly a public good? In addition, this paper assesses the utility of culture engagement studies. Finally, this paper will use Keller’s (1989) framework for socially responsible arts administration to make recommendations for how the cultural sector can better deliver the benefits it purports to all individuals in society.

RN02 | Session 07a Social and Cognitive Effects of the Arts: Communication, Socialization and Empowerment

How Cultural Consumption and Communication Maintain Social Relationships: A Communication Perspective

Kyung-eun Kwon, Eun-mee Kim

Seoul National University, Korea, Republic of (South Korea); Seoul National University, Korea, Republic of (South Korea)

happina(at)gmail.com, eunmee(at)snu.ac.kr

Early studies conducted by Bourdieu in 1986 as well as DiMaggio in 1987 reflected on the way in which personal ties were related with content of consumption. Their argument on connection between cultural consumption and social networks has been empirically supported by new researches showing that popular culture consumption has a positive impact on weak-tie network density, while highbrow culture consumption selectively increases strong-tie by Lizardo in 2006, 2011 and 2013.

Although I agree that cultural consumption could serve as social resources in terms of contents, I argue that the ends of cultural consumption should be treated ‘for

its sake’ and suggest the concept of ‘modes of consumption’ consisting of rapid adaptation, repeated exposure, and information seeking. Adding to it, I point out that communicative abilities and actions could be the significant factors in social relationships, so I propose a synthesized model consisting of three variables, modes of cultural consumption, social networks, and communication.

An online questionnaire survey administered to 1019 Korean participants revealed that the outspokenness of tastes, writing online reviews of movie or music, was the most significant factor in determining online cultural network which is the existence of a buddy formed online to exchange cultural information. The result also showed the moderating effect of communicative competence was statistically significant. When communicative competence is high, the positive relationship between information seeking and online cultural network gets stronger. These findings exemplify the potentials of modes of consumption as well as expression of tastes for improving network research and provide a starting point for future analyses.

*** This research was funded in part by the Institute of Communication Research, Seoul National University.

A Typology of Participation: Opportunities and Challenges for Participation in European Cultural Centers

Birgit Eriksson, Carsten Stage, Camilla Møhring Reestorff

Aarhus University, Denmark; Aarhus University, Denmark; Aarhus University, Denmark
aekbe(at)cc.au.dk,
norcs(at)cc.au.dk, norcmr(at)cc.au.dk

Across Europe cultural institutions are increasingly met with the demand of creating citizen participation as a way of contributing to the solution of various social challenges (political disinterest, exclusion of minorities, increasing inequality, lacking social cohesion). This call for participation is, however, not always unproblematic. The concept of ‘participation’ is often used in broad and imprecise ways (Arnstein 1969, Carpentier 2011, Cohen and Uphoff 2011/1980, Cornwall 2008, Kelty 2017), and very little is known about how cultural institutions conceptualize, design and evaluate participatory processes. This paper will address questions of civic participation through a participatory research project – or an ‘experiment in participation’ (Lezaun et al., 2016) – where 20 employees from cultural centers across Europe conducted a ten days fieldwork in 20 other European centers in order to collect empirical material about their participatory visions and practices. In the paper we investigate the concept of citizen participation on two vectors: as a method (with networking ‘citizen scientists’) and as an object (at the 40 involved centers). By combining these two approaches to participation we will study and present the types of participation deployed across the centers, and the multivalent effects of taking part in the project as

expressed by the participants. Based on this we will develop a typology of participation and discuss the various types' opportunities and challenges in a radically changing Europe. Finally, we will reflect on this particular form of research methodology and its potentials for generating new solidarities and inclusive cultural institutions in and between European countries.

Through the paths of an artistic education in the Generation Orchestra - sociological contours on the life trajectories of social actors until the emergence of new dispositions and individual variations.

Rute Teixeira

Faculty of Arts, University of Porto, Portugal
ruteateixeira(at)gmail.com

In the pretension of the Generation Orchestra as a project of social mobility of qualification of the fabric and cultural practice, of integrated development and of population involvement, the contribution of theorists of the sociology of culture, education, dispositions and individual variations is imperative.

The relevance of the Generation Orchestra as a project of the music community, in which there is the possibility of the actors, when involved and committed to the collaboration of musical practices, achieve personal and social transformations that will have a great impact on their lives.

It will be our interest in this research to demonstrate the relevance of this problem, which we propose the comparative investigation of three school groups in Lisbon, solid and functional examples of the project; Trying to analyze the processes of (re) re-socialization and (re) structuring of the life paths of the actors, in different social dynamics, after the end of his musical career in the Orchestra.

It is intended that this project is the result of a collective experience, where subjects have in themselves, through their systems of dispositions and the multiple contexts where they are inserted, what Lahire (1998) calls "singular folds of the social."

In this stage of systematization, we will follow the methodology that the author proposes in his studies: the construction of sociological portraits.

At the present moment, we have already conducted 10 interviews with young people who have already left the Orquestra Geração and their life course has continued to be linked to musical practice.

This preliminary result, proves to be quite interesting, in that, it will allow us to identify the great sociological regularities present in the tracks traced by these agents.

Impact of the arts in social work and societal change

eltje bos

University of applied sciences Amsterdam,
Netherlands, The
e.bos(at)hva.nl

Impact of the arts in social work and societal change:

This contribution explores through sociological, psychological and neurobiological approaches how and in what context participation in the arts contributes to positive feelings which result in enhanced individual and group skills and individual and group empowerment. This empowerment in turn tends to positively benefit society and the creation of public value. The impact of the arts is explored through positive psychology(Frederickson 1998), the strong effect of participation in the arts on the non cognitive part of the human brain (Koelsch a.o. 2010,Scherder 2015), and the possibility to influence moods and behaviour, and the added value of participating in group activities (Collins 2004, Frederickson 2008).

For several reasons this is an urgent matter. The cultural and social dynamics in western welfare states, such as the Netherlands, demand changes on many levels. The roles of citizens are changing as a consequence of the aging population, the financial and economic crisis, huge cutbacks in governmental spending, and governmental decentralization processes. Moreover, the current arrival of large numbers of refugees, and the subsequent tensions between groups of people, combined with the rise of a network society, cry for creative solutions to create public value, for all citizens.

RN02 | Session 07b Arts Consumption

Out of place in an institutional art space?

José Soares Neves, Valerie Visanich
University Institute of Lisbon; University of Malta,
Malta

Jose_Soares_Neves(at)iscte.pt,
valerie.visanich(at)um.edu.mt

In recent years, cultural participation in art institutions has come to take centre stage in debates on audience development. This is especially the case in countries that register low in the cultural participation rates – countries like Malta and Portugal. These two southern European countries share certain common peculiarities that may contribute towards this low rate of participation in formal arts, yet score highly in participation in folk arts. A study that makes sense of these cultural conditions, in a comparative approach of the two countries, remain absent in the social sciences. This paper is concerned with understanding these commonalities influencing cultural participation, buttressed by theoretical frame on cultural consumption and taste. It is the aim here to present a contextual framework, through a comparative approach of both countries, for an epistemological understanding of cultural engagement in both art forms. This paper brings together the study on cultural consumption of folk arts and arts in institutions under a single conceptual framework.

Art and cultural consumption in Russian Deaf community

Nikita Bolshakov

Higher School of Economics, Russian Federation
bolschakow(at)gmail.com

One of the key statements of the Convention on the rights of persons with disabilities emphasizes the major role of art and culture institutions in the available-for-all human development tools. Accumulating of cultural capital, as it is understood in the conception of Pierre Bourdieu, is one of the most effective ways to reach equality and, individually, get inclusion in the society. At the same time consideration of people with disabilities as a homogeneous group might be a big mistake in an art and culture perspective. The existence of Deaf culture, which may be the single cultural landmark for many deaf and hard of hearing people, requires a deeper investigation of practices related to art and leisure of the Deaf. In this context understanding of how specific deaf practices are related to the common practices and how the accumulation of cultural capital in deaf societies influences inclusive or exclusive processes are a matter of high importance.

We have tried to answer this question by conducting a quantitative survey of Moscow deaf people. As a result, three sustainable patterns of their cultural consumption, including three components: art practices, preferences and motives were built upon the data. The key models identified in this study are patterns of "cultural inclusion", "cultural isolation" and "passive cultural consumption". The study shows that the degree of hearing loss is not a major dominant, defining a person's choice of cultural consumption. In families with a high level of accumulated cultural capital, hearing impaired children will more likely focus on cultural inclusion and integration into the wider cultural context.

Paradox of conservatives: innovativeness and attendance of unconventional opera and ballet

Iuliia Papushina, Olga Maksimenkova, Alexey Neznanov

National Research University Higher School of Economics, Russian Federation; National Research University Higher School of Economics, Russian Federation; National Research University Higher School of Economics, Russian Federation
yupapushina(at)hse.ru, omaksimenkova(at)hse.ru, aneznanov(at)hse.ru

To shape tastes of audience staging unconventional performances is one of the most important task for any theatre. What determines audience's response to unconventional performances? The paper tries to apply Rogers's theory diffusion of innovations (Rogers, 2003) for participation in arts. The research question is whether innovativeness measured by Likert like scale based on Rogers's approach converts into higher attendance of unconventional operas or ballets. The data comes from the on-line survey of 867 Perm Opera and Ballet Theatre's news subscribers conducted in March 2015. For implement the deep data analysis with big features space (more than 20 nominal and ordinal attributes) we used methods of Formal Concept Analysis (FCA) (Poelmans, Ignatov, Dedene, 2013). Such methods allow us to generate

insights. The findings reveal that conservatives attend unconventional performances oftener. These results are preserved when age and gender variables are under control. Authors propose a possible explanation of the identified paradox. The results put under the question implication of Rogers's approach for prediction of performing arts participation.

Comparative Study on the Process of Development and Evolution of Japanese Pop Culture Events

Keiko Kawamata, Kenichiro Kuroiwa, Toshihiko Miura, Norio Tajima

Asia University, Japan; Aoyama Gakuin University, Japan; Chuo University, Japan; Takushoku University, Japan

kwm2013(at)asia-u.ac.jp,

kuroiwa(at)gsim.aoyama.ac.jp, tmiura(at)tamacc.chuo-u.ac.jp, tajimanorio(at)nifty.com

Over the past few years, the Japanese content industry has attracted considerable attention as Japan's next leading industry. The expectation has been fueled since 2012, when the Ministry in charge of the "Cool Japan" Strategy was established, followed by the foundation of the Cool Japan Fund in November 2013.

While the Cool Japan strategy has been unprecedentedly promoted, it is interesting to note that the two well-known overseas events such as Japan Expo in Paris and Anime Expo in Los Angeles have started as a fans (geeks) small gathering with no administrative support nor company involvement. Nonetheless, it has grown to the very popular cultural event attracting approximately 250,000 visitors per year.

The purpose of this research is to explore the process of evolution and expansion of the Japanese pop culture events with a focus on consumers' participating behavior in terms of knowledge about and involvement in the Japanese contents (anime/manga) and the event itself. It also aims to build a conceptual model of consumer-generated cultural event. The following cases are to be analyzed: Japan Expo (Paris), Anime Expo (Los Angeles), Leipziger Buchmesse (Leipzig), Japan Expo in Thailand (Bangkok), and World Cosplay Summit (Nagoya, Japan).

The theoretical framework of this research is not specific as the research is exploratory in nature. However, the existing literatures on diffusion theory, consumer culture theory and the consumer-generated market behavior are reviewed. The methodology employed is analysis of documents and interview with the responsible persons of respective events.

RN02 | Session 07c Internationalisation and Arts Management (Panel: Arts Management Studies, part 2/2)

Transcultural Arts Management – Curating Diversity at International Arts Festivals

Lisa Gaupp

Leuphana University of Lueneburg, Germany
gaupp(at)leuphana.de

The planned paper takes a look at how different notions of diversity are curated at renowned trans-/international arts festivals while analyzing the respective meanings of diversity. The focus will be set on curatorial strategies as discursive social practices, which (de)construct identities, symbols and relations. The curatorial therefore is understood as a complex field in arts management of different intermingling practices, persons and institutions where dominant ideologies, terminologies, habits etc. are (re-)produced.

The presented case studies serve as a basis to ask how, in general, trans-/international arts festivals are curated/managed in regard to which concepts of culture and which institutional or social assumptions are applied and by that reinforced. Likewise, the epistemological foundations of these concepts will be shown in order to demonstrate how a 'transcultural' perspective can reveal an alternative view in curatorial practices. The analysis leads to the conclusion that arts management should and need to adapt to the realities of today's post-migrant social processes. Thus, the possibilities of a transcultural arts management rather than of an international arts management will be sketched.

Internationalisation as the (Invisible) Curated Object

Georgiana Bu

Babe-Bolyai University Cluj, Romania
georgianabut(at)gmail.com

Identified as 'jet-set flâneur' by Ralph Rugoff and 'cultural broker' by Mari Carmen Ramirez, to name just two recent analogies, the curator of contemporary art is international and nomadic. An idea provider that selects and displays 'international art' through an often replicable system of mediation and framing, not only does the curator convey, but also construct meaning; and she does this for an international audience. Here internationalism is both the ground upon which today's curatorial practice is formed, and one of the formative forces art and curating hold.

'Exhibitions often telegraph their most cogent messages between the lines', Pamela M. Lee wittingly observed in her essay 'The invisible Hand of Curation'. Many times, I argue, internationalisation rests within the realm of the concealed, but can be found – naturalized as it is – within the different parts of the exhibition apparatus. With a close reading of Pascal Gielen's conceptualization of the 'Flat Wet World' and Dorothee Richter's analysis of the relationship

between display (the disclosed) and backstage (the concealed) as a theoretical reference point, this paper addresses ways in which the issue of internationalisation can pressure the decision making process in curating contemporary art practice and how this is articulated in the space of the exhibition, by examining certain models of exhibition making that have the international aspect embedded either in their framework and/or in their backstage narrative.

Researching the sociocultural implications of intercultural approaches within Berlin's highbrow music sector

Kristina Juliane Kolbe

London School of Economics and Political Science,
United Kingdom
k.j.kolbe(at)lse.ac.uk

This paper draws on my current PhD research which explores the sociocultural implications of contemporary forms of cultural production in European urban centres to examine whether it is associated with forms of socio-cultural diversity, or the reproduction of cosmopolitan elite formations. Based on comprehensive ethnographic data including qualitative interviewing, participant observation and musicological analysis, I specifically look at the so-called intercultural project 'Selam Opera' taking place in Berlin's highbrow music sector, which aims to grasp the multicultural and socially diverse image of its urban surroundings. This paper analyses the consequences of an intercultural perspective for the aesthetical and organisational nature of contemporary cultural production. Reflecting both postcolonial discourses of representation and current debates around the concept of 'emerging cultural capital', I assess the implications of an intercultural approach on forms of urban identity construction, patterns of cultural representation and social distinctions. In this context, I critically investigate Selam Opera's objectives and strategies to include often marginalised non-Western voices and aesthetic principles into the European classical music realm. Closely dissecting the musical and institutional workings of Selam Opera, I particularly explore to what extent an intersectional account between ethno-cultural and social forms of inequality is reflected. My analysis shows that the Selam Opera project indeed questions hierarchical structures of (multi)cultural representations, thus renegotiating ideas of cultural identity and power. However, I also demonstrate that challenges of social inequality continue to play out in the project's daily practices, which implicitly even reconstitute sociocultural 'middle-class values' within a cosmopolitan setting. I hence maintain that the project's intercultural approach fails to substantially redefine the very basis of systemic sociocultural inequality within a highly regulated and hierarchised cultural system.

RN02 | Session 08a Social and Cognitive Effects of the Arts: Personal and Collective Identities

Cinematic Identification and Uses of the Past

Maria Brock
Södertörn University, Sweden
maria.brock(at)sh.se

This presentation will showcase some initial results from a project investigating the role of cinematic images in personal memory in Russia and East Germany. So far, both contexts have been subject to analyses that frequently posit a kind of pathological relationship to their pre-transition past, with little work that examines the impact of representations of the past on subjectivities.

The study analyses the impact of cinema on subjective representations of history, using the example of Russian and German films that speak of the (recent) socialist past. It examines whether cinematic images help activate particular modes of identification with historical images of the nation via fantasmatic processes, and asks whether films are better equipped to provide an answer to questions about the nature of the past.

The aim is to identify particularities as well as commonalities of the 'afterlives' of socialism in Russia and the former GDR, looking at how these feed into ideas of the present as well as visions of the future. This paper will combine theoretical discussions with examples from my empirical research as well as scenes and stills from films. The aim will be to explore the relationship between history, its cinematic representation and psychic processes of identification in the post-socialist world.

Creating belonging within belonging : musical practice, emotions, aesthetic experience and the construction of (alternative) identities

Marion Sarrouy
Rennes 2, France
marion.sarrouy(at)gmail.com

In this communication we will look at the contemporary form of a traditional musical practice as it deals with issues of community identity in interaction with changing social norms within the post-conflict context of Northern Irish society. Working with pipe bands, music groups of scottish origin composed of pipes and drums, our work focuses mainly on the protestant community and within it the role played by culture in processes of belonging.

Offering on the one hand a collective space through a shared community of interest and activity, the musical practice provides a support for a positively invested identification to the self and the collective allowing new models distinct from the heritage of the conflict to emerge. On the other hand, the collective scene hence created provides a space where scenari of conflict and reconciliation can be enacted without much harm and with 'depassionated passions'. The musical field, however, continues to interact with

global social change and the dominant norms of the conflict/post-conflict society. How does it interact with hegemonic discourses ? To what extent does it offer an alternative space and/or voice or concurs with dominant norms and values ?

Both a space and a voice, the role of music in identity formation needs to be understood as encompassing social interactions as well as involving the body and the sensory. Observing differing trajectories we will look at the formation of taste and aesthetic experience as they become associated with character types organised around ideas of cultural legitimacy, questioning how these may reproduce the social stratification of the wider social context.

Searching a political voice through artistic practice in the community

Rui Telmo Gomes
Instituto Universitário de Lisboa (ISCTE-IUL), Centro de Investigação e Estudos de Sociologia (CIES), Portugal
rui_telmo_gomes(at)iscte.pt

Over the last few decades, important social intervention programs have been developed based on local artistic projects, led by youth cultural associations. Such projects usually reinforce community participation in social contexts of poverty and social exclusion. At the same time, they have been one of the areas of multicultural affirmation in Portuguese society through different artistic languages.

This paper presents different case studies of community art projects in an ongoing ethnographic research around Lisbon and reflects on the importance of artistic rituals as a transformative experience and a mobilizing factor in processes of identity construction and political participation of marginalized populations.

Two main analytical hypotheses are discussed: professional careers combining artistic practice, cultural mediation and political activism; political protagonism of youth cultural associations at local level, combining strategies of cooperation with other agents and institutions, notwithstanding possible weaknesses and limits of their action.

Singing Together: Choruses and Alfred Schutz's theory of musical communication

Naomi Miyamoto
Ritsumeikan University, Kyoto, Japan
nmiya(at)sd5.so-net.ne.jp

Alfred Schutz examines musical activities as non-language communication in his essay, "Making Music Together," by placing an emphasis on 'tuning-in' relationships when people make music. While Schutz mainly focuses on music created by instrumentalists, I will rethink his theory in terms of chorus, i.e. vocal music activity. It is true that Schutz considers all kinds of music including vocal music, but this presentation will analyze more closely the particular function of singing in a chorus.

As an example of a vocal music activity, I will examine the Japanese popular folksong 'Furusato' ('My Old Country Home'), which was frequently performed by choruses directly after the Great East Japan Earthquake in 2011. It was a symbol of Japanese unity at various charity events, used to overcome the disaster and to realize a national bond. This song is generally regarded as important because of its lyrics, which depict an old Japanese landscape, but it is also significant that the song was sung in unison; people sing together the same melody at the same time. As such, they can share the communal memory and feeling the song invokes through the collective act of singing. The function of this song is different from the chorus of Beethoven's Symphony No. 9, which was viewed as a symbol of unification for Europe. In fact, the 'We-feelings' that are formed by both types of choruses are dissimilar. Through my discussion it is clarified that vocal music communication varies according to the types or forms of choruses.

RN02 | Session 08b Macro-Sociological Perspectives on the Arts

Island Insularity: The Arts in a Small Island State

Valerie Visanich
University of Malta, Malta
valerie.visanich(at)um.edu.mt

The maxim small is beautiful is often applied to small-island states. It is also a fact that small islands are often faced with vulnerabilities and challenges for their remoteness and insularities. This paper examines such peculiarities of small states focusing on art practices from a sociological approach. Can sociological investigation ignore the contextual factors, the limitations and challenges of a small geographical territory and its influence on art production and practices? This was one of the main questions tackled by the BJCEM (Biennale of Young Artists from Europe and the Mediterranean) transnational cultural project, involving an ethnographic study with artists in various small states. This full cultural immersion in Euro-Mediterranean small states aimed at mapping the differences and similarities in constraints and challenges of artistic practices. It explored the geopolitical peculiarities complexity of territories such as of San Marino, Montenegro, Kosovo and Malta. As the cultural representative of Malta in this project, I will present insights and research outcome.

This paper specifically focuses on one location that was part of the project location, the small state of Malta. Reference to this location is made not to suggest identical challenges faced in small-states within the Euro-Mediterranean region. In effect, I contend that the distinctive socio-economic and cultural conditions of these locations contribute to different peculiarities.

There are various aspects worthy of analysis, however I will specifically focus on the notion of insularity outlined by referring to three features – artists' need to train and work abroad, the status overlap of the artist, and the patterns of cultural consumption.

Strategic Positions of Artists as Political Actor towards Minjung Art as Symbolic Order in South Korea

Pil Joo Jung
Seoul National University, Korea, Republic of (South Korea)
piljooj(at)gmail.com

Minjung art in South Korea is understood as a resistance art movement which questioned the social role of art in the oppressive political circumstance under military regime in the 1980s. In South Korean art history, it is widely believed that Minjung art 'naturally waned' by the democratization in the 1990s, not by the artistic choice. However, this belief is failing to perceive Minjung artists' artistic choice as the political action which could make the space of possibilities for unexpected (or willingly rejected) social identity outside the symbolic order of Minjung art. This article therefore aims to understand the irony of 'the Decline of Minjung art' without Minjung artists, focusing on Minjung artists' utterances which deny their imposed identity which had been circumscribed as the 'Minjung artist' in Minjung art as the symbolic order in the era of democratization.

Minjung artists as political actor can be examined through the framework of power struggle on certain symbolic power, which grants artists social and political means of accessibility to resources such as economic, social and even personal (self-expression or representation) ones.

From depths interviews with artists who are considered as Minjung artists, this article argues that individual artists' denial of their identity, which has often been dismissed non-academic, irrational and whimsical judgement of artists, can be rather a kind of strategic actions for the individuals to look for or sustain unexpected identity outside the symbolic order of Minjung art, on which their art practices rely, in the macro-social change.

Controversies over the Japanese tradition and formation of the art field in 1950's Japan

Naoki Iso
Keio University, Japan
iso.naoki(at)gmail.com

In this presentation, I examine the development of the art field in 1950's Japan, focusing on the autonomy of the field in relation the state or the government. Japan introduced the modern idea of art from Europe in 1870's and the government played the major role to institutionalize the education and professions of art. Until the mid-twentieth century, the art field did not have autonomy from the national government.

The relative autonomy of the art field became a reality in 1950's as a result of artists' new movements. In the period, so-called "the controversies over the Japanese tradition" took place in various sub-fields of art. Here I take examples from the visual art field and the architecture field, relating the controversies. They were about redefinition of the Japanese cultural

identity and repositioning the European culture in the post-war period, accordingly remaking the art field more and more autonomous from the government.

Transformation of the image of society in the Czech and Slovak popular music (1980-2016)

Marcel Mečiar

Beykent University, Turkey

marcel.meciar(at)gmail.com

The transformation is conceptualized in this study as a change in the reflection of society in the Czechoslovak and later Czech and Slovak popular music through the analysis of lyrics of the biggest hits of the selected decades under study. The author argues that the thematic differences in popular music between the periods not only reflect the shift from the centrally planned economy and socialism (the state-controlled and censored music production) to the market oriented economy and democracy (profit-oriented production of private music labels) but they also depict the transformation from organized modernity to a postmodern (late-modern) society. While the production of popular music in the 1980s took place behind the heavy veil of the Iron Curtain and the Communist regime sought to present the image of carefree and safe life under the process of so-called normalization which started the next year after the defeat of Prague Spring of 1968, the period after the "revolutionary" year of 1989 left the countries of Central and Eastern Europe fully exposed to the influence of the capitalist system and uncontrolled Westernization. Within this shift, besides certain thematic modifications within the discourse(s) of popular lyrics represented by wider openness about crucial social issues, the changes in popularity of previously dominant musical styles (the 1980s pop, disco) paved a way if not to a dominance then at least to a greater share of previously alternative and minor (rock, metal, punk) or absent (techno & house music in 1990s, a commercialized hip hop by the 2000s) musical styles. Sociological conclusions that will be intertwined with this year's main question asked at the ESA Conference "Quo vadis, Europa?" will be drawn, too.

RN02 | Session 08c Cultural Spaces and Urbanity

Art and culture in malleable space. Comparative case study of the construction projects of the Helsinki Central Library and Amos Rex Art Museum.

Aino Iiris Elena Alatalo

University of Tampere, Finland

alatalo.aino.i(at)student.uta.fi

Flexibility, modifiability and openness of space have been some of the growing trends in the field of architecture. This holds true for working spaces, housing and factories alike. Drawing on the conceptual tools of Science and Technology Studies and particularly Actor-Network Theory my paper focuses on this phenomenon in the specific field of

cultural buildings: the Helsinki Central Library and Amos Rex Art Museum. Through these case studies of Helsinki-based cultural construction projects my PhD study looks into the interconnections of art, architectural space and urban planning. Preliminary results of an on-going analysis signal that the adaptability of space to different purposes has become a key element also in the field of arts and culture. Rather than stabilizing action by providing a steady spatial frame of reference and material surroundings for the artworks and the public, the principle in the projects is to mould the space anew according to the needs of a particular activity. This is achieved by building a temporary space within an existing space. The ideal of malleability appears to be connected i.a. to the accelerating technological change. Not knowing what could be considered as art and what kind of action the art objects are going to create in the next fifty years, cultural organizations are preparing for the unknown forms that art and culture will take in the future. The buildings materialize a vision of future that is simultaneously produced in the projects and yet unknown to us. Against this background the paper looks into what kind of implications this development has for the relations of art, architecture and the public.

Contradicting concepts of culture in contemporary Helsinki. Narrating the case of Guggenheim Helsinki.

Fotios Skouras

University of Jyväskylä, Finland

fskouras(at)gmail.com

Aim of the proposed research is to highlight the contradicting notions of contemporary cultural field in Helsinki by examining differing policies, practices and techniques which coexist and compete in today's public urban space. It has as main area of study the case of Helsinki Guggenheim plan which has left its mark in the cultural and political scene of Helsinki within the years 2011-2016. The production of common urban space is becoming increasingly important in the contemporary world contested from the requests of continuous economic growth and the needs of societal coexistence. The first constitutes a process of constant urban growth based on reconstruction of cities, the marketization of public spaces and different social, political effects associated with this dynamic. The second forms an objective of transforming the day to day life by ascribing new uses to the urban common spaces and by redefining the collective (inter)action. At the background of this study is the hypothesis that depending their starting point and scope, the cultural agents produce different types of urban intervention and imagination, different interpretations regarding the material and symbolic use of cultural resources and different forms of citizens' involvement. Under this perspective the research's examination is to explore how these evolutions can be understood under the frame of cultural policy and to indicate the citizens' perception about the urban cultural space. The study is linked

with a broad research stream regarding the Urban Commons and particularly with the work of Henry Lefebvre and the social production of meanings of space.

Architecture Exhibitions in the global museum field: A Case study of 'Everyday architecture re-made in Taiwan' exhibition in the 2016 Venice Architecture Biennial 'Reporting from the front'

Chia-ling Lai

National Taiwan Normal University, Taiwan
muse.chialinglai(at)gmail.com

Since the World expo, architectures have been constituted as significant parts of the exhibition. However, on the one hand, architecture exhibitions in the museum receive relatively less attention in the museum field; On the other, the new iconic architectures turn into the main attraction of new museum buildings. When the lack of authenticity of the reproduced model exhibits reduce the attraction of architecture exhibitions, the spatial concepts and miniature aesthetic design render the architecture a new exhibition trend.

This research focuses on the Venice architecture exhibition as a 'laboratory' for spatial aesthetic practices and Taiwan pavilion as a case study, to explore the curatorial strategies of linking spatial concepts and local spatial practices to compete in the global exhibition field. Drawing upon Bourdieu's field theory, Latour's Actor-Network-Theory and Urry's global mobility and complexity, this research develops the concept of global mobile museum field applying upon architecture exhibitions. Based on the archive research, interviews on curators, fieldwork and visitor studies, this research interrogates how the everyday architecture and alternative spatial practice displayed in the spectacular competitive exhibition field based on the multiple discourses of everydayness in the 'Everyday architecture re-made in Taiwan 2016' exhibition in the alternative 2016 Venice architecture thematised as 'reporting from the front'.

Redeveloping urban spaces through culture and tourism: a case study about Rio and Barcelona

Bruno Gontyjo do Couto

University of Brasilia, Brazil
brunogcoto(at)gmail.com

The present paper adopts as object of analysis what Yúdice designated as "artistic and cultural policies of urban revitalization". These are basically policies of renovation and regeneration of abandoned urban spaces which have as their "central feature" the adoption of the sectors of art, culture and tourism as a vector of development and restructuring of the site. Basically, they invest in the renovation and modernization of the cultural infrastructure of these sites in order to install a business and services complex with emphasis on the areas of art, culture and tourism. During this process, a great number of spatial, architectural and symbolic resources are mobilized to create the "new space" as a special

ambience, distinctive and spectacular, dedicated to enjoyment and contemplation practices. This kind of initiative has been developed in several cities around the world at least since the late 80's. In this research, we chose to focus on the city of Rio de Janeiro, comparing it to the previous case of Barcelona. More specifically, we have been analyzing the current context of restructuring of the entire port area located in downtown, a process coordinated by the local government through the project "Porto Maravilha" which aims to "requalify" an urban area of 5 million m². From our point of view, the combination of a) actions of expansion and modernization of artistic and cultural facilities, b) restoration of historical buildings and "local material heritage", c) strategies to promote the installation of restaurants, hotels and shops, suggests that the project - following the example of "Port Olímpic" in Barcelona - seeks to reconfigure the zone port into the new great artistic and cultural center of Rio.

RN02 | Session 09a Developments in Particular Domains of the Arts

The Rise of Fantasy: Changes in the French Production Field of Speculative Fiction

Elodie Hommel

ENS de Lyon, France; Centre Max Weber, France
elodie.hommel(at)ens-lyon.fr

Since the term "science fiction" first appeared to describe a group of fictional productions, authors, publishers, readers, and academics have discussed its definition and its limits. For some, science fiction is a rational extrapolation of contemporary knowledge, and must be focused on sciences and technologies, while for others, it represents first and foremost a way to think about humanity or society. These definition conflicts also operate within the French production field of science fiction, which has been disrupted for the last fifteen years by the growth of fantasy, a related genre, which some include in and others exclude from science fiction. In this context the publishing category of "littératures de l'imaginaire" emerged (which can be translated either as "imaginary/non-realistic literature" or as "speculative fiction"), assembling science fiction, fantasy, and some fantastic stories. This term allows to refer to one group of publications without pinning down the definition of science fiction. How does the growth of fantasy modify the French production field and how does it help highlight the recent changes in the publishing offer?

This paper, based on a study of the products currently available on the French market, will give an overview of the history of science fiction and fantasy publishing in France, and then describe the recent changes in the French production field: institutional recognition, marketing strategies, along with the growth of fantasy. It will finally consider how to visualize the publishing offer, highlighting the criteria polarizing the field among different publishing positions (commercial, legitimistic, innovative).

Dracula Goes To Hollywood: Vampire Aesthetics in Francis Ford Coppola's Dracula (1992) and Its Cultural Function

Stefan Sebastian Maftai
Babes-Bolyai University, Romania
stmaftei(at)yahoo.com

The paper analyzes Coppola's Hollywood version of Dracula (1992) as an example of aesthetic 'reverse colonization' (Stephen D. Arata) according to the late Victorian cultural narratives concerning the Other. Although the movie does try to historicize the Gothic aesthetic beyond the original novel's narrative (with the introduction of the historical Prince Vlad), the main narrative is fixated on the strategy of 'reverse colonization' that portrays the Other (the monster, the prince, the dandy) as colonizing the 'civilized' world. Coppola's tactic of creating a Dracula with a triple personality (Prince, Dandy, Monster) is an elegant and freshening aesthetic solution, yet culturally long-established: the historicized prince-dandy-monster aesthetics brings out a 'reverse colonization' very close to that of Stoker's original novel. This strategy is consistent with Hollywood's tendency of supporting and conveying well-established cultural values (Douglas Kellner). In comparison to other filmic portrayals of Dracula, Coppola's take appears culturally modern. Analyzing Coppola's aesthetics will require a two-step approach: a. First, to explain the aesthetics of reverse cultural 'colonization' by focusing on the triple-faced Dracula. Elements of aesthetic 'reverse colonization' are to be found in Dracula the Prince, the Monster, the Dandy. b. Second, to see if 'reverse colonization' is an attitude particular only to this filmic version of Dracula or if it is part of a wider approach in Coppola's films. Coppola's filmography will reveal that the occurrence of 'reverse colonization' is part of Coppola's constant attitude of criticizing the civilized self.

The European Dance: The Emergence and Transformation of a Contemporary Dance Art World (1989-)

Gurur Ertem
Independent Researcher, Turkey
gururertertem(at)gmail.com

This paper is an empirical investigation of the development of a contemporary dance art world as a distinct field of cultural production at a transnational level. Deploying a mixed-methods qualitative approach, I argue that this particular art world came to being organized around the recasting of dance as a field of knowledge production. I contend that the aesthetic transformations within the artistic realm became successful due to the confluence of wider political and organizational factors. The transnational networking movement that began in the independent performing arts field in the late 1970s and 1980s were given an additional boost by the "cultural turn" of the European integration process since the end of the Cold War. I analyze the impact of EU programs on

dance networks for the dissemination of the aesthetics and production models of dance throughout Europe. In other words, I investigate the process through which contemporary dance made in Europe became European contemporary dance.

Convergences and diversifications: the roots and development of theater in Turkey

Zeynep Baykal
Beykent University, Turkey/ Middle East Technical University, Turkey
zbaykal83(at)gmail.com

Although the roots of theater as a branch of performance has historical roots in Anatolian lands, the modernization and institutionalization process of theater in Turkey has a relatively short history. From the Tanzimat (reformation) period of the Ottoman Empire, westernized theaters have begun to perform in newly constructed stages. Later on, the establishment of the Turkish Republic led to the formation of Turkish State Theater. Besides that, after the 1940's small private theater companies were founded in the capital city Ankara as well as in Istanbul. The creative play-writing process of this generation was also influenced by these previously mentioned developments. The tenets of the state ideology encouraged the play-writers to write their plays in a Western style. In the present, performances are realized in various private theater companies, State Theater, and municipality theaters. The aim of this work is to make a detailed socio-historical analysis of this process by means of archival materials and visual data (theater play posters, programs), secondary literature about the members of selected theater companies in Turkey.

RN02 | Session 09b Cultural Heritage and Memory

"BZ '18-'45". An expression to promote humanitarianism, tolerance and respect for diversity."

Emanuele Stochino
Università degli Studi di Padova, Italy
socialarte(at)tim.it

The permanent exhibition "BZ '18-'45. A Monument to a City Two Dictatorships" (Fascist and Nazi) refers to the Victory Monument designed by Marcello Piacentini and erected in Bolzano in 1928. This imposing monument, was built to celebrate Italian victory during the First World War and to mark the annexation of territory south of the Brenner. The monument was the first step taken during the fascist era to implement forced Italianisation policies on the local population. At the end of the Second World War, the monument met systematic opposition from all language groups within the area (Italian, German and Ladin). After years of diatribe, a commission was established to design a museum covering the period between 1918 and 1945. The exhibition, which opened in 2014, was created both to explain works of art and contextualize them

historically and also to underline the socio-historical value of the building itself. The monument was singled out for special mention by the European Museum of the Year 2016 Award due to the project's socio-historical contribution, that is, its redimensioning of ideologies by means of comparison with an artwork which is fascist by design yet also an expression of ideology, which promotes humanitarianism, tolerance and respect for diversity. If, as Schlesinger Jr. claimed, "Ideology is anti-historical. It exists according to models which substitute reality with its ideological models", the democratic comparison, in question, has ensured that art and history are vehicles of knowledge and integration.

Archives, as repositories of cultural memory and identity, and public use: issues of availability and accessibility.

Olga Kolokytha, Krisztina Rozgonyi, Izabela Korbiel, Katharine Sarikakis
University of Vienna, Austria; University of Vienna, Austria; University of Vienna, Austria; University of Vienna, Austria
okolokitha(at)gmail.com,
krisztina.rozgonyi(at)univie.ac.at,
izabela.korbiel(at)univie.ac.at,
katharine.sarikakis(at)univie.ac.at

The role of art and its association with European identities does not stop with the creation/ making of process, but goes further in the preservation and accessibility of it for citizens and future generations. Archives are the repositories of artistic creation, cultural heritage and cultural memory and identity on a national and European level, therefore availability and accessibility of their material for the citizens is, or should be, of paramount importance.

This paper focuses on art audiovisual archives in four European countries, namely Austria, Greece, Hungary and Poland, investigating the impact of digitisation of European archives on accessibility and availability for European citizens, as a form of governance of the history and memory of nations, making particular reference to measures and instruments to facilitate access of archival material. Our research questions the implications of the crisis upon the curation of archives and its impact on decision-making for their governance.

The paper's evaluation draws upon the analysis of a. pre-existing national conditions shaped by the application of the EU framework, b. its gaps from a public use perspective, c. restrictions/facilitation for knowledge about, availability and accessibility of cultural heritage, and d. the possibilities and practices for spaces for innovative actions.

Social engagement for heritage management and protection: public discourse on preserving modern architectural heritage in Greece

Maria Leni
Hellenic Ministry of Culture and Sports, Greece
marialeni(at)outlook.com

Cultural heritage is protected and preserved by specific legislation. However, some cases of architectural heritage management and maintenance have implicated social actors' involvement in the protection process.

According to the Greek Law "For the Protection of Antiquities", the architectural works dating after the establishment of the Modern Greek state (1830) are protected when classified as monuments. Some 19th and 20th century buildings were listed as such and saved from demolition thanks to the vigorous intervention of different social groups.

Most of the social engagement and public discourse on architectural management policies share the same characteristics: the buildings have an important history and often special symbolic meaning, their management engaged the scientific society that published their anxiety on their preservation, there were political and scientific conflicts and, above all, many social groups were pressing on the subject, using all possible means of publication and communication of their positions.

As case studies, we are going to focus on different types of social involvement for the protection of some 19th and early 20th century buildings in Athens: Prime Minister D. Rallis's house is one of the few remaining buildings of the early neoclassical period; the risk of its imminent demolition for the purposes of a new building construction mobilized cultural and social actors in order to save it. Accordingly, the protection of the neoclassical apartment buildings near the Acropolis Museum engaged not only the national, but also the international social community. Similarly, the determination to maintain the refugee apartment buildings on Alexandras Ave. led some social groups to the Council of State.

The Ghost of Past. Case Study of the Artistic Activity in „Ursus” - the Old Industrial Factory

Karolina Ewa Izdebska
University of Szczecin, Poland
karolina.izdebska(at)univ.szczecin.pl

In 1989, in Poland began the radical transformation of socio-political system. Industrial workers, who performed the leading role in the previous system, survived this time particularly hard. The socialist system in the face of the global free market turned out to be unwieldy. In 2003 bankruptcy of the "Ursus" factory was declared.

Polish artist – Jaśmina Wójcik - together with residents of Ursus and former employees decided to save the memory about the place. The collected stories creates a specific and fairly consistent picture of the place woven with personal experiences, impressions, memories. It reveals a number of aspects of the relationship with a particular place (factory). This place has several dimensions: other people, the social atmosphere and material environment in the form of old buildings, machinery, tractors.

In the case study the author tries to answer the question of what role the art can play in creating

identity of the place referring to the heritage which is cumulative in a particular space. The artistic activity in Ursus gave two kinds of research material. On the one hand it has become the subject of a sociological description in the layer of both the payload and the visual. On the other hand it is rich source of existing data. Such two-pronged approach allowed more fully capture the multidimensional nature and complexity of the described art project and the events that this project commemorates and comments.

RN02 | Session 10a The Arts in the Context of Neoliberalism

Left-wing Populism and the Arts: Crisis, Resistance and Critique

Panos Kompatsiaris
Higher School of Economics, Moscow, Russian Federation
panoskompa(at)gmail.com

In philosophical aesthetics as well as in the wider popular imagination, art refers to a reflective and contemplative activity and is routinely different than popular culture as the brute and philistine cultural expressions of the masses. While art is expected to have a broadly-conceived educational mission, it has to simultaneously denounce such popular culture forms that involve propaganda, didacticism and immediacy in order to legitimize itself socially. The apparatus of 'populism' can be seen as an antagonistic pole to the fundamental principles of art's constitution as a separate field of practice. Populism is a largely demonized and hideous articulation of popular culture, standing not only against art but against 'enlightened' practice in general (Laclau, 2005). Populism is banal, repetitive and stagnating, and, according to its opponents, it vulgarizes rational political debate and the prospect of achieving a responsible civic consciousness.

This paper explores the social and political implications of the merging of art with left-wing populism in the context of present day Europe. It looks at cases that employ a direct language and an aggressive anti-neoliberal rhetoric grounded on widespread populist binaries, such as the 'elites' and the 'people'. I argue that populist artistic forms challenge the split between art and popular culture and can act oppositionally both against right-wing populism and prevalent forms of neoliberal governance.

A plaster for the wounds of neoliberalism?

Mirja Liikkanen
Statistics Finland, Finland
mirja.liikkanen(at)stat.fi

Call for papers for this RN says "Art's position within society and politics has always been complex and ambi-valent. Artists may raise a critical voice or offer ideological legitimation for a dominant, hegemonic image of society." I'd like to seize on the latter, especially on behalf of art sociology. Are we a critical

voice in the society?

This question is especially crucial in present societal situation where neoliberal political order has altered heavily the societal order and has created a new class order. Recent research has shown how work and the middle class identity and position, and capabilities connected to it, are prioritized and regarded as proof of proper citizenship in the society. Those who do not reach this position are pushed into margins and poverty, and are more and more often controlled and punished by social politics.

Cultural policy speaks a lot about inclusion and participation, and has programs and projects among those in the margins, often with research on their efficiency. My question is, if cultural policy and research connected to it acts as a critical voice or does it instead offer only a plaster for the consequences of the more general societal politics.

I will discuss the issue by inquiring the new class order in relation to changing of concepts like audience, experience/creative economy, participation or social space. What kinds of (new) societal connections can be found? How is art connected with - celebrating the middle class identity or empowering those in the margins?

Perverse Use of Street Art by Local Authorities

Voica Puscasu
Babes-Bolyai University - Cluj-Napoca, Romania
voicapuscasu(at)gmail.com

All around the world Street Art stands in a legal grey zone between being treated as vandalism or as a welcome addition to the urban landscape. The reinforcement of punishments for such acts is highly dependent on the local authorities and thus varies greatly, but things have the potential of get even more confusing when the said authorities choose to protect one work while taking down another, occasionally by the same author. As the laws are murky at best, there is little wonder that Street Art pieces eventually come to be distasteful political pawns. In this case study we shall see how a mayor in North-Western Romania used art as a defense for a very controversial and offensive wall that he had previously build, in order to protect it from being taken down. The wall was put up as the mayor's initiative to visually separate the slums in which Roma minority resides, from the rest of the town. While technically not creating a ghetto, the construction raised red flags for various anti-discrimination agencies, which begun taking legal action against the mayor as well as an all-out media war. The mayor's response was inviting young students form an art university to paint the wall so that it would fall under the protection of copyright laws and thus safe from destruction. However, the university's involvement in such matters caused further outrage, a media scandal, and public debates. This entire situation brings to light numerous issues pertaining to Romanian society, but the relevance of this discussion stems from the fact that due to the current global state of things, a similar scenario could easily be found elsewhere.

Rewriting of Urban Space: Istanbul's Street Art and Graffiti Scene

Hande Aral, Ozan Günel
Beykent University, Turkey; Beykent University,
Turkey
aral.hande(at)gmail.com, ozzygunel(at)gmail.com

Lefebvre said every society is a production of its own space. Unlike feudal ages, cities theoretically should be stripped from class differentiations but with neo-capitalism rising all over the world, modern cities evolve to separate classes from each other much like feudal cities. Subculture born to rebel this design and one of the most important part of subculture is to reflect and rebel against this design in a cultural and artistic sense. Usually subculture produce by people who can not reach that cities possibilities. Graffiti rise within African-American community during popularization of hip-hop. But Istanbul on the other hand create different kind story. In Istanbul subculture and all its artistic expressions like graffiti and street art also belong to middle class. While street art and graffiti started to fuse with system in general street art and graffiti in Istanbul hold their position as both urban and political struggle field. After Gezi protest this field of resistance acknowledged more and more both from artist and from urban residence. Not every art emphasize heavily on political issues but with rising of far right conservatism, urban transformations, rising of violence culture and separation of space between rich and poor classes, existence of non-systematic production became ideological itself. Ranciere said political activity is to remove body from its designated space or changing o space's fate. So this research tries to elaborate how Istanbul's street art and graffiti became cities first line of defense against neo-capitalism and conservatism and how art is changing city's resistance dynamics.

RN02 | Session 10b Arts as Theories, Arts as Research and the Sociology of the Arts

Punishment in the Frame: Rethinking the History and Sociology of Art

Eamonn Carrabine
Essex, United Kingdom
eamonn(at)essex.ac.uk

The paper will draw on my ongoing research on the iconography of punishment, which is a study of the dominant ways in which penal landscapes have been represented since the 1500s. Images and texts are embedded in the social worlds that produced them, and while they should not be read as unproblematic sources of historical information they do tell us much about the tensions animating an era. The overall argument is that cultural processes should always be seen as part of a whole, so that the practice of textual or visual analysis must always be linked to a material analysis of the institutions and social structures surrounding the work. It seeks to develop an approach to images that avoids both the essentialism of art

history and the reductionism of sociology by offering a rethinking of the relationships between the two. It begins by setting out the current state of the sociology of art, before discussing 'new' art histories that are inspired by social analysis and then it concentrates on how images of punishment have featured in Western art. This substantive material provides a rich resource to understand the force of representation and offers an opportunity to develop an aesthetic sociology that avoids some of the problems identified in the paper.

Music as a way of ordering (social) noises

Łukasz Strzelczyk
University of Warsaw, Poland
luk.strzel(at)gmail.com

In the world dominated by images, sound is treated as a more emancipatory and autonomous way of communication, a gesture of the new iconoclasm. But if we are conscious of the experience of music's interception in its exploitation to monetarize the emotions and to increase its sales (not to mention the situation when music was used during tortures to break down prisoners) in the late-capitalism reality, can we still state that music is legitimate?

Due to this, maybe it is better not to separate music from society, but to examine the tension between them. Maybe it is better not to analyze the discourse about music, but the music's discourse, entangled in economy and – what is more important – politics. Sound, in spite of being self-referential, or maybe because of it, is political. It defines and decides who and under what rules will be heard, whose voice is important and who has control over it and who is fighting that power. Music is a system of codes and ordering structures. So isn't the subversive potential channeled in that noise? What can this noise, or music in general, say about our modern world?

Jacques Attali claimed that with the help of music one can theorize about the condition of society, possible changes and their direction. Music as a social theory. Theory which switches the direction of conclusions about society by focusing on the examination of the theory itself which can be fined in the practice. The most important thing it discovers is the way sound exposes the society and at the same time exposes itself.

hat does the Crisis signify for the Greek Art?

Phillipos Goutzos, Fani Giannousi
Aristotle University of Thessaloniki, Greece; Aristotle
University of Thessaloniki, Greece
filalogos(at)gmail.com, fgiannou(at)polsci.auth.gr

After the 2008 global economic crisis, Greece has been experiencing a tumultuous economic and political situation with massive riots, multiple political crisis and elections that shattered political, economical and social stability. Amidst this upheaval, the refugee crisis has further destabilized an already dazed and confused society. Art and culture have been affected, nevertheless, it has been posited that the crisis has probably further enhanced production, international

visibility and mobility in the Greek artistic field. An increasing number of foreign artists is relocating in Athens, there is a plethora of performances and exhibitions, with special emphasis on the refugee crisis, receiving attention in Greek and international press.

This interest appears to eco predominantly a certain leitmotif; artistic creation is encouraged or has emerged directly as a response to the economic and humanitarian crisis. This may stem from the system of values that runs across the art world: the correlation of socio-political situation and art. This rhetoric suggests that art and subversive politics, creativity and social turmoil are closely interrelated. But to this argument there is a retort. It is pointed out that this approach is either part of a bio-political program of control, or the fashionable response of a cosmopolitan elite, institutions and high profile artists to the problems of global capitalism. Instead, a precise examination of the specific variations or manifestations of this phenomenon in local artistic fields is required. This presentation attempts to investigate the transformations of “the contemporary art in crisis” in Greek socio-cultural context.

RN02 | Session 10c Professional Developments and Reputations of Artists

From facilitative artists to artist-facilitators: hybridization tendencies in community art

Sari Karttunen
Cupore, Finland
sari.karttunen(at)cupore.fi

My paper looks at the connections between the facilitative role of artist and the practice of professional facilitation as a side job in the case of community artists. The words ‘facilitation’ and ‘facilitator’ are frequent in their speech today. They may understand ‘facilitate’ in the vocabulary meaning ‘to make something possible or easier’, or they may refer to a distinctive area of expertise that supports group processes by means of specific methods. The bridge between community art and facilitation is especially intriguing, as the art form deals essentially with social relations and processes, and makes use of participatory methods to engage people. In the presentation I will compare the methods, skills and resources that community artists use in what they define to be art projects against the tools and competences they exploit when facilitating group processes in private companies, city departments and so on. The focus is also on descriptions of professional role and identity. Theoretically the paper draws upon the concept of ‘hybrid artist’ (Abbing, Gielen), which refers to crossovers between art and other industries, mixed identities and fused skills. Empirically it bases on interviews with Finnish community artists. The main conclusion is that borders between art practice and facilitation are blurring in terms of working methods and skills, but professional roles and identities remain more compartmentalized.

Commitment and Professionalisation. Controversial Postures in the Theatre of the Oppressed.

Clément Poutot
Université de Caen Normandie, France
clement.poutot(at)unicaen.fr

During the 7th edition of the Muktheadhara Festival (India, 2016), several practitioners of the Theatre of the Oppressed from different countries created a play to tackle an issue specific to this artistic and activist practice : the professionalisation of the activity. This process of professionalization began in Europe in the early 1980s, and remains a point of conflict among practitioners around the world. In this paper, I shall question the tension between activist commitment and professional enrolment via the prism of “salarisation” (understood as the process of engaging in remunerated activity). First, on the basis of a comparison of the practices of Indian, French and Greek groups, I will show how this salarisation fundamentally alters the relationship practitioners (artists) have with the participants (audience); especially when they initiate long-term processes with specific audiences. Indeed, the context of salaried activity induces a different relationship of reciprocity between practitioners and participants. This difference is strongly related to the sponsors’ role – and to the coherence required by the sponsoring institution – which tends to make the practice of this theatre consistent with, adapted to, and therefore admissible and usable by a particular institution. Secondly, I will analyze the tactics put in place by the practitioners, to ensure that this artistic practice remains a form of activism, despite professionalisation. In that regard, I offer to present four different tactics observed on my research fields, to contribute to the Research Network dedicated to Sociology of the Arts (RN02_e : Professional development).

Museum artists in today’s Russia

Marina Maguidovitch
Saint Petersburg State University, Russian Federation
socioart(at)hotmail.com

As was shown by an expert survey amongst heads of regional departments of the Ministry of Culture of the Russian Federation conducted by the author in May 2016, one of the most acute socio-economical problems in Russia is the lack of professionals in the cultural and art industries, and the aging of creative personnel in the regions. The paper will be focusing on the social aspects of professionalisation of the artists working on (putting in place organising) museum exhibitions ; the ways of creating conditions for the development of their career and a professional culture in today’s Russia. We demonstrate that the main problems reside in risks and uncertainties linked to the status of those workers, and in the fact that their concerns are ignored. The conclusion we are drawing leads to the necessity of legitimizing the activity of museum artists, according to the specificity of their

work today.

Symbolic Networks: How museum exhibitions signal artists for historical commemoration

Laura E.A. Braden, Thomas Teekens
Erasmus School of History, Culture, and Communication, Netherlands, The; Erasmus School of History, Culture, and Communication, Netherlands, The
Braden(at)eshcc.eur.nl, Teekens(at)eshcc.eur.nl

Modern history is presented relationally, with each generation connected to create a flow to the historical narrative. Focusing on relational importance for historic reputation, this research examines how contextualization of artists within art historical networks affects commemoration. Examining a population of 236 artists who first exhibited between 1946 and 1955 in three of the Netherlands' largest museums (Boijmans, Stedelijk, and van Abbemuseum), we examine connections curators create for these artists through exhibition, and analyse how such connections affect commercial and historical commemoration. Using network analysis, we examine exhibition connections established for artists with prior (1930-1945), concurrent (1946-1955), and subsequent artist cohorts (1956-1989)—altogether examining connections across 540 exhibitions and analysing a network of 6885 individual artists. Through museum exhibitions, a “symbolic network” is created: curators establish a network of connections between artists, serving to locate artists in a historical narrative. Our findings indicate these symbolic networks matter for long-term reputation, but with different networks serving different types of commemoration. Artists who exhibit with their own or previous cohorts are significantly more likely to achieve commercial success (as measured through auction prices), while those well-contextualized with previous, own, and subsequent cohorts are significantly more likely to achieve historical commemoration (measured through books about the artist). Overall, the research provides insight on how museum exhibition serves to contextualize artists within art history, and how symbolic networks develop long-term reputation and recognition.

RN02 | Session 11a Everyday Life and the Arts: Practices, Interventions and Cultural Transmission

From Impacts to Action and Embodied Experiences: Remodelling Research Practices of Cultural Interventions

Marjukka Colliander
University of Tampere, Finland
marjukka.colliander(at)uta.fi

This paper contributes to research on art-based interventions and prevailing cultural discourses. Cultural participation is considered as a Human right in Europe. It is also widely discussed that participatory art-based interventions impact well-being, although the extent to which these interventions affect to well-

being is largely unknown. Despite the lack of clarity and evidence these discourses have infiltrated almost every institution, policies and action plans one could imagine concerning culture and arts. Properly evaluated intervention studies are needed. I argue that the research interests have long been based on the issues that are not measurable and therefore I will outline possible new area of interest to art and cultural studies. Rather than measuring the not measurable actions the gaze should be directed to the cultural action itself.

My current Research Project – Arts in Care and Prison. An Ethnographic Study on Cultural Project Implementations in Institutional Environments – engages with the issues of participation, accessibility, inclusion, exclusion. I examine cultural project implementations and action in the light of the cultural policy. Aim of the study is to shed light to the grass roots level and answer to the need to understand interventions and effects more widely and not only from the perspective of cultural well-being. This study provides information of what happens when two functionally different institutions –culture and care and different objectives meet.

In this presentation I will present results based on the ethnographic data collected from different institutions and projects. My interests are on the daily practices and discourses and on the action itself.

#sharedmemories: city exhibition markets and photography raised by culture festivals

Ravena Sena Maia, Paulo Nunes
Federal University of Bahia, Brazil; University of Coimbra, Portugal
ravenasena(at)gmail.com, paulonunes(at)unifei.edu.br

In times of virtual sociability requiring not only living an experience, but also sharing it on social media, digital photography becomes an important builder of a shared memory, which demands different ways to connect with space. The role of memory device that the photography already plays in tourism extends to new culture markets, transforming the snapshot in an urgent, compulsive, ephemeral and especially, mediatic act. As a result, cities have been remodeling their sightseeings, art gallery exhibitions, museums and cultural places with new architecture and scenarios looking forward for shots that bring hashtags, likes and consequently access to an exhibition market. A new speech is inserted on shared memory notion: personal pictures become commodities for festivals and other cultural events to promote these places leading to a strong interference in city structures by imagistic. From the interaction between public and place (by photo and video), simulated physical spaces are created to produce an interaction focused on two different perspectives: the public's - that sees those shots as a way to legitimize its presence and experiences during the festival - and the business perspective, that seeks shared memory as an opportunity to build the event's reputation by framing the brand name, the location (check-in data) and audience profile as a whole by using a built in

social media environment. At internet, those pictures work based on the commodity fetishism logic, that is, share on the public domain an image of the festival which wants to be published, consumed and experienced.

**Cultural transmission reconsidered:
Contemporary readings and uses**

Ana Gonçalves
Universidade de Lisboa, Instituto de Ciências Sociais,
Av. Professor Aníbal de Bettencourt, 9, 1600-189
Lisboa, Portugal; Instituto Universitário de Lisboa
(ISCTE-IUL), Centro em Rede de Investigação em
Antropologia, Lisboa, Portugal
goncalves-ana(at)campus.ul.pt

This paper revisits a topic of fundamental importance for social sciences and their approaches both to culture and the arts: the cultural transmission. This is a particularly catchy issue because it is at the core of concerns about the production, reproduction, and change of social groups and contexts, but it also can contribute to the enlightenment of the social circumstances of cultural or artistic creation and reception, as well as the personal motivations of those engaged in them.

Despite being the outcome of a continuous scientific endeavour, the focus on processes affecting the transmission and appropriation of cultural narratives, tastes, skills, practices, experiences has increased in popularity in recent years as a renewed interest in heritage emerges in the academy.

Overall, it is proposed that the present paper tries go beyond a brief presentation and discussion of the main aspects of the ongoing debate, in the light of the theorists and works that are particularly influential nowadays. Moreover, it is intended to critically explore the actual use, its potential, challenges and limitations for the empirical study of culture and the arts, especially bearing in mind the musical realm.

**Choral singing as social practice: a study on
institutions and amateur singers in Portugal**

Maria João Lima
ISCTE - University Institute of Lisbon (ISCTE-IUL),
Portugal
mjsap(at)iscte.pt

The practice of choral singing has a significant expression in Portugal revealed by hundreds of groups identified and characterized by this research. These groups mobilize around choral singing practice thousands of individuals, from singers to composers, conductors, ethnographers, among others. In recent years, new media technologies also contribute to increase the dynamism of this practice. Following an epistemological, theoretical and methodological proposal that focus the 'modes of relating to culture', this paper explores the social relations that are established between the individuals (the singers) and the institutions (the choirs). Articulating quantitative and qualitative methodologies from an extensive survey on amateur choirs and from a fieldwork

research including individual interviews to amateur singers, this paper explores the institutional context of the amateur choral practice in Portugal, presents the typologies of choral groups through the multivariate analysis of the data and explores the motivations, constraints and impacts of choral practice in the everyday life.

RN02 | Session 11b Iconecologies: Sociology & Images

Windows of Soul: Reflections on the Sociological Look

Maria Alice Costa
Universidade Federal Fluminense, Brazil
alicecosta.rj(at)uol.com.br

The article aims to analyze the relationship between sociology and photography in the process of translating other looks and knowledge. Based on the reflection of the concepts "sociology of absences and emergencies" and "ecology of knowledge", worked by the Portuguese sociologist Boaventura de Sousa Santos, we intend to study the photographic image as a possible methodology for the process of translation of knowledge in its Artistic, linguistic, cultural and sociological dimensions. Based on philosophical and theoretical reflections on visual sociology and, through an interdisciplinary approach to transdisciplinary studies, this article works with the photographic result of political and human rights issues by students of the Postgraduate in Sociology and Law (Master's and PhD) from the Fluminense Federal University, Rio de Janeiro, Brazil.

**Cause we are living in a material world: on iconic
turn in cultural sociology**

Jitka Sklenarova
Universität Hohenheim, Germany
jit.sklenarova(at)gmail.com

The strong programme in cultural sociology has recently taken up topics of visibility and materiality and made an effort to include them into one theory. The iconic theory suggested in *Iconic Power* (2012) pursues two main goals. It aims at overcoming the duality of materialism and idealism, two approaches that have in the sociological theory until now been fully incompatible. The proposed concept of icon combines an aesthetic surface and a meaningful depth of a cultural object, which are mutually constituted and intertwined. Bringing the elusive experience, the feeling of material objects and their deep cultural meanings together seems to be the right way to go for cultural sociology that has dealt with collective emotions and representations since its birth. The iconic theory also makes possible the emancipation and liberation of images from the textual and discursive dominance typical of the sociological thinking in the 20th century. The source of inspiration for the new theory was the so called iconic turn in the art theory. However, there seem to be some fundamental disagreements between these two

approaches. My thesis presents the newborn iconic theory and reflects its benefits and pitfalls. Furthermore, drawing on the background of developments within the scholarly approach to images and on the currently used sociological methods of image analysis I offer possible answers to the questions and puzzles raised by the theory of iconic power.

A Network of Appropriations: Artistic Practices as Resistance against ICONOMANIA

José Bento Ferreira
USP, Brazil
jbmferreira(at)usp.br

Images are crucial to social interactions in ancient and modern societies, material and mental images play decisive roles in tribes, cities and in the context of globalization. According to Belting, iconoclasm itself would be a strategy within the image wars aiming to take control over the realm of images in order to impose one true image, or the image of truth. In spite of the generality of the social role of images, Belting names after Gunther Anders "iconomania" a form of idolatric consumption of images, more specific to the age of mass communication, sign value and social media. An "ethnographic turn" (Foster) of contemporary art resets the question of politicization of art in connection with "relational" (Bourriaud) and "global" (Belting) art. Certain artworks which could fit in such categories result from critical stands toward iconomania. Such artworks require other criteria than those of classical and modern art in order to be properly understood and evaluated. An anthropology of images provides knowledge concerning the many uses of images for human interactions and a theory of the avant-garde displays the set of artistic practices, or procedures, which turn to be useful for the appreciation of contemporary art. Such procedures may be generalized under the concept of "appropriation."

RN02 & RN23 | Session 09a JOINT SESSION: Artful Sexualities and Sexualities of Art

From text to stage: (self-)representations of sexuality by French and Greek sex workers/authors/performers

Yagos Koliopanos
Université Paris Ouest Nanterre La Défense, France
koliopanos.yagos(at)gmail.com

In this communication, I will focus on a sample of my PhD corpus - which consists of around 40 books written by French and Greek sex workers from the 1970s until today - and present a few results from my fieldwork (observation, interviews, content analysis). The interpretive framework is that of sex workers/authors/performers whose autobiographical texts have been adapted on stage (theater/performance) by (or in collaboration with) the authors themselves*. My main objectives are to shed light on the production, mediation and reception of

these (self-)representations and examine how they help emerge sexual stories (Plummer 1995) that underpin subjectivities and reinforce solidarities. Further, I wish to show how these artistic processes, while promoting agency, are at the same time liable to consolidate or transgress sexual and gender norms. More specifically, the autobiographical discourses of Oussakova and Koumarianou, as well as their theatrical adaptations, contribute to a process of fictionalization that complies to normative representations of prostitution more often than not penned by male/cisgender/heterosexual men: the former deploys the topos of the lascivious and hypersexed courtesan whereas the latter reproduces that of the unhappy and repented prostitute while at the same time discussing sexual issues from a transgender perspective. On the contrary, those of Roland and Chargois, while sharing an institutional context, question stereotypes on sex work, and, more generally, defy sexual and gendered norms.

* With the exception of Gabriella Oussakova, who did not in any way contribute to the stage adaptations of her memoirs (1981), the other authors/performers whose work I will discuss are Greek Eva Koumarianou and French Alice Roland and Marianne Chargois.

Turkish Sex Influx: Between European and National Modes of Sex Films Environment

Özgür Yaren
Ankara University, Turkey
yarenozgur(at)gmail.com

This paper aims to map out the boom in trash erotic productions in Turkish cinema during the 1970s. Following the brightest years of commercial cinema, this decadent period was the result of many dramatic social, economic, political and cultural shifts at both local and global levels. Scholars tend to argue about the adaptive capacity of Turkish cinema and how it followed European –particularly Italian– cases in order to resort to sex films as a survival strategy.

This paper will argue that, while the Turkish film industry followed European producers in resorting to sex films (by importing or adapting European films), it also created a unique mode of sex films, including production and screening methods, and differed from all other sex film environments. This demonstrates the dual nature of Turkish cinema, both as an appendix of European film culture in the margins of Europe and an autonomous model of national cinema. It will be asserted that historically specific social and political conditions such as rural–urban migration in the context of late industrialization and particularly cultural and class based divisions enabled this autonomy.

To reference it with the popular denomination of the period, the 'Sex Influx' (seks furyası) of the late 1970s created an entire environment, from production to exhibition, that was designed to circumvent strict censorship, negotiate with the authorities, and survive a grim decade of crisis that began and ended with military coups. It is important to put forward unique aspects and resistance strategies of this environment.

The Directors Twist; to make unethical art appear ethical

Målfrid Irene Hagen
Østfold University College, Norway
malfrid.i.hagen(at)hiof.no

In this paper I present and discuss a controversial art exhibition arranged at the Munch Museum in Oslo in 2015, and analyse the accompanying media debate. The exhibition was controversial due to its explicit sexualized content, and described by visitors as both unethical and speculative. Many of the exhibited paintings, photos and video-installations were depicting sexualized violence, and as claimed by many visitors, art critics and art historians; the exhibition was flirting with, or promoting, pedophilia and sexual abuse of children. In particular I discuss the statements of the museum's director and responsible curator, who in order to defend and legitimize the exhibition, claimed that it was not unethical, because the aim of the artist was to make it appear as social criticism, although the artist himself expressed that he find the images fascinating and interesting. This makes the arguments of the director and curator appear as reconstructions of reality, camouflaging the unethical and speculative as social criticism, to defend the reputation of the museum as well as their personal reputation.

BDSM as a playful and artful way to experience several realities and complexity, at the "Xplore Berlin" festival of arts, sex and bodywork

Sacha Jérôme Kagan, Regine Herbrik
Institute of Sociology and Cultural Organization (SKO) Leuphana University Lüneburg, Germany;
Institute of Sociology and Cultural Organization (SKO) Leuphana University Lüneburg, Germany
kagan(at)uni.leuphana.de,
regine.herbrik(at)leuphana.de

In the practice of BDSM as a playful fiction, occurs both a realisation of the imaginary and an unrealisation of the real:

- an experience and sensual realisation of otherwise less visible, abstracted notions such as power and power constellations;
- an unrealisation of real social relations through fictionalization, excretion or/and artful evocation, allowing a simultaneously intensified and distanced experience, opening up new interpretations and negotiations.

BDSM play maintains ambivalences and revels in ambiguities, mediating between several realities without flattening them. In this, it fosters a sensibility to qualitative complexity (Morin) through aesthetic experience (Dewey). BDSM practice, rich of an artful playfulness, constitutes a potential playing field for artists, allowing them to explore, research and experiment with constructions, boundaries and the (de/re)formations of diverse social phenomena (related to identity, gender, sexuality, communities, religion, politics, nature, etc.).

In this paper, we focus on the encounter of BDSM practice and artistic practice, in the case of "Xplore Berlin", an annual three-days festival organized by a group of artists, sex-workers and bodywork-practitioners around the choreographer Felix Ruckert, and mixing BDSM, various sexual practices, performance art and dance, rituals, various forms of 'bodywork', and academic lectures. Our empirical ground includes mainly participant observation and a few in-depth interviews, complemented by some insights from participatory transdisciplinary research that was integrated in the Xplore festival program. The empirical work was carried over three editions of the festival (2015 to 2017).

RN03 | Session 04a General Session I

Vulnerability of Voice: Narrative Construction of the Experience of Adversity in Latvia

Baiba Bela
University of Latvia, Latvia
baiba.bela(at)lu.lv

The risk of poverty or social exclusion is considered as an important problem in all European countries, although there are considerable variations between European Union Member States. Latvia is among the five countries with highest share of persons under the risk of poverty or social exclusion - 32.7%, while the EU average is 24.4% (Eurostat, 2015). What it means for people who experiences difficulties has not been widely explored yet. The biographical perspective is used in order to elucidate the lived experience of vulnerable narrators. The paper offers insights into the narrative construction of the experience of adversity, in particular resistance to stigmatization through silencing of negative aspects and stressing of positive, such as resourceful coping strategies. The study contribute to a deeper understanding of the complex nature of poverty consequences on life course and subjective well-being. Moreover, it advocates the necessity to develop less stigmatizing language that is more sensitive to the subjectivity of voice, respects the dignity of research participants and promotes solidarity.

The Underclass in the World of Austerity

Franz Erhard, Sammet Kornelia
Leipzig University, Germany; Leipzig University, Germany
fr.erhard(at)uni-leipzig.de, sammet(at)uni-leipzig.de

Solidarity between social groups is crumbling. As the middle classes get more and more under pressure from the new austerity capitalism, they cancel established social contracts. Therefore, participation in the job market, the welfare system and society in general gets harder for the underclasses as well, as the middle classes struggle not to experience a decline in their own social position. Most research conducted on precarity does not reflect this reverse of the medal. Here we often find only the diagnosis that people experience cutbacks and austerities regarding

the working conditions and the living standards they are used to. Structural reforms of the European welfare systems have made their contributions to this development. Yet, these descriptions do not seem to fit the living conditions and changes the underclass have to experience.

During our presentation, we want to focus on those who never experienced regular work, who grew up in a milieu of poverty and sacrifice and who therefore have never had the experience of taking part in the world of employment (and all the integrational effects that come with it). Their lives, in fact, started at the bottom and never got under the impetus of aspiration. Based on biographical interviews, we show how they conceptualize their own role and position in society. Which concepts of the world do they follow? How do they cope in a society that expels them from its accepted means of achievement and appreciation? Which new conflicts arise from this structural position of expulsion?

Academic Labor Market in Belarus: Biographical Perspective

Svetlana Poleschuk

European University Institute, Italy

svetlana.poleschuk(at)eui.eu

My current PhD project entitled “Academic careers in a quickly changing world: biographies of academics who stayed or left Belarus in the year 1991” examines the academic careers of Belarusian scholars and focuses on the experience of a single cohort of scholars who started their higher education in 1991. The research project aims at understanding how the historical event of gaining independence by Belarus in 1991 affected academic careers. The study takes a longitudinal approach and observes the changes that academic careers in the country have witnessed over the last 25 years. The cohort is divided into 3 subgroups: those who graduated from a Belarusian university and then continued their academic careers outside Belarus; those who pursued academic careers in Belarus after graduation; those who returned to Belarus after their studies and employment in the West. The sample comprises 60 interviews in total. The project aims to explore three structurally different patterns of academic careers within the life course to see how individuals interpret and respond to change throughout their lives and how they construct different types of biographies, accounting for the opportunities and constraints of society and history. I would like to take part in the RN03 to present my PhD project, specifically the results of the first round of the fieldwork which include the analysis of some interviews, an overview of the special characteristics of the Belarusian labor market as well as the sector of higher education and research.

RN03 - Biographical Perspectives on European Societies

RN03 | Session 05a General Session II - Identity and Biography

Biographical methods and complex realities of modern societies

Lyudmila A. Nurse
Oxford XXI, United Kingdom
lyudmilanurse(at)oxford-xxi.org

Cultural diversity is generally viewed as a welcome feature of modern society; people happily relate to other cultures in their everyday lives. Communities are less certain when new cultures move into their neighbourhood if they lack strong historic and cultural memories. This is particularly relevant at times of economic and political uncertainty which could easily prompt stereotypical images, if 'other' represents a high proportion in a locality. The paper analyses recent research that challenges practices of migrant and cultural minorities integration in modern European societies by tackling the relationship between increasing cultural diversity of communities and awareness on the part of local populations regarding their human security and sense of well-being (Lianos 2013; Adida, Laitin and Valfort 2016). It aims to systematically identify factors, perceptions that can aggravate or ease such sense of insecurity of individuals from various perspectives: generational, culturally diverse and relatively culturally homogeneous communities, in public space and media. The paper demonstrates how biographical methods can "unpick" such complex realities of everyday life.

The sociological meanings of biographical crises

Ana Caetano
ISCTE-Instituto Universitário de Lisboa, CIES-IUL,
Portugal
ana.caetano(at)iscte.pt

Although social life is largely based on processes of standardisation of action (which make practices more or less predictable) it is not always a result of order and harmony. Situations of disorder, unpredictability and disruption are also part of the existence in society and contribute equally to the configuration of biographical pathways. This is especially relevant taking into account the multiple structural crises that European societies have been facing and that produce effects at the individual level. The main goal

of this paper is to discuss theoretical-operative parameters to study biographical crises, i.e., stages of life marked by the disruption of habitual frameworks of action and thought, which have a substantial impact in the lives of individuals. The sociological literature on this topic encompasses the different forms that crises can assume and evidences some conceptual dispersion. The range of notions used to designate crisis situations is quite wide: rupture, disruption, discontinuity, transition, turning point, critical moment, contingency, bifurcation, accident, inflection, trauma, adversity, epiphany, etc. However, the richness of this conceptual lexicon produces some uncertainty as to the meaning of each notion. In this presentation the main contributions from sociology to the study of this topic are mapped, namely by identifying what fits the concept of crisis in the literature. Based on this discussion an analytical model for the empirical study of biographical crises is presented. The model is composed by six different dimensions of analysis: temporal, sequential, contextual, material, subjective and causal.

(Un)made identity. Upper Silesians in Germany in their search for identity and belonging.

Justyna Kijonka
University of Silesia in Katowice, Poland
justyna.kijonka(at)us.edu.pl

The paper discusses the problems of identity and rootedness in the context of the biography of the migrants who came to the Federal Republic of Germany from Upper Silesia in Poland as "(Spät-)Aussiedler" – "ethnic Germans" between 1970 and 2000. The presentation is based on research that I carried out on this category of migrants between October 2014 and July 2015. The people who were interviewed have spent most of their lives in Germany or were even born there. It also discusses findings from my previous research on the Upper Silesian identity, which was conducted in Poland.

There were multiple reasons for migrating and even today the identity of Upper Silesians in Germany is complex and ranges from having a Polish identity (or as being "from Poland") through a Silesian identity to a German or even "European" identity. Since Poland became a member of the European Union, many "(Spät-)Aussiedler" are owning up to their Polish roots or just declaring that they are "from Poland" or that they were born there. The identity of the second generation, who are often deprived of a Polish/Upper Silesian identity by their parents, which is often sought after when they become adults, is also interesting from a sociological perspective.

The purpose of my research is to examine who Upper Silesians in Germany are now and how do they construct and build their identity. I am also trying to answer the question of what determines the imagined community of Upper Silesians in Poland and in Germany. Hence, the long-term perspective plays an important role in my research.

Young Adult Migrants in further education

Milena Prekodravac

Soziologisches Forschungsinstitut Goettingen,
Germany

milena.prekodravac(at)sofi.uni-goettingen.de

A lacking 'culture of recognition' in institutional practices concerning foreign credentials on the one hand, and discourses of 'increasing shortage of skilled labour' on the other, seemingly leave qualified immigrants with little or no individual choices on how to gain a foothold in Germany. And despite the European education area, actual voices of those who navigate in education and across states are often neglected.

My qualitative study focuses on immigrants from both EU and non-EU-countries who came to Germany in recent years, comparing narratives of those who study at a German university with those who participate in programs for foreign academics outside the university. They find themselves in a similar situation before they opted for these alternatives: Bringing academic credentials across borders, they chose different educational paths in the country of immigration.

After a brief summary of the research design and methodological steps in this study, I will present examples which show how individuals link their current experiences after migration to the previous educational biography. This linkage has to be negotiated, re-adjusted, or modified by the individuals in and with the institutions.

The question raised will be: How do they experience this linkage of (re-)education in a similar and yet so different context?

The paper aims at reconstructing social and symbolic boundaries by taking a look at past experiences, current motivations and future self-assessments of people who consciously decided to attend a German speaking educational program.

RN03 | Session 06a Places and Changes – Glocalisation in Europe from a Biographical Perspective**From Cosmopolitan Solidarity Practices to Glocal Identity Conflicts. The Case of International Volunteers for Development in Tanzania and Madagascar**

Augusto Gamuzza

University of Catania, Italy

a.gamuzza(at)unict.it

The present evolution of geopolitical situation of western societies seems to indicate that the space for solidarity discourse into global public agenda is narrowing, underlining the inescapable necessity to be emphatic only with who is similar to us: the difference between who is inside and who is outside is becoming a real socio-political descriptor of our societies. This consideration is challenged by an opposite weltanschauung that recognizes and emphasizes with the otherness beyond the nation-state and its administrative boundaries and social rules, unveiling

the relevance of a cosmopolitan solidarity to global issues and social change [Beck 2013]. When this form of solidarity is translated into biographies and historic/personal trajectories, it implies a 'conflicting' outcome upon the subject identity and social collocation into "private homeland – ojczyzna prywatna" [Ossowski 1984: 37-40] - with regards to local communities. In order to empirically surround these issues, the aim of this work is to present the main theoretical and empirical results of a fieldwork, started in 2015, oriented to understand, from an insider perspective, the cosmopolitan solidarity practices and the related identity conflicts of subjects involved in NGO international volunteering. The exploratory case presents an extensive study upon the NGO CO.P.E. Cooperazione Paesi emergenti. The paper compares results from two work packages, covering a period of activity from 2004 to 2017, designed for the integrate analysis of international NGO volunteers for development in Tanzania and Madagascar: 1) a biographical research stream dealing with the in depth analysis of the tranches de vie of Managers and coordinator of NGO projects; 2) a semi-structured interview campaign administered to volunteers and international civil service units in Tanzania and Madagascar.

Biography, place and local civil society

Robin Mann, David Dallimore

Bangor University, United Kingdom; Bangor University, United Kingdom

r.mann(at)bangor.ac.uk, d.j.dallimore(at)bangor.ac.uk

Biography is a mirror of the relationship between place and change. Economic transformations, population movements as well as social and cultural changes are embedded in the biographical narratives of people whose lives they have altered. As part of WISERD Civil Society research programme, we have gathered 20 biographical narrative interviews with people who live in two contrasting but geographically close localities in North Wales, UK. One site is a large, former industrial village, where recent generations have had to come to terms with post-industrial transformations and the decline of key local institutions. The other is a more rural village which appears to enjoy higher levels of participation in traditional as well as more contemporary lifestyle activities, including international 'twinning' arrangements. Biographical narratives in the first setting convey a strong sense of nostalgia, in which the struggles of the present are lived through the memory of the proud past. The second locality narratives carry less weight of the past, and have more energy and optimism. In our research project we argue that, beside class differences, which are to some extent represented by differential access to material resources and networks, a more profound difference lies in how communities perceive and actively build their 'place narrative'; how they manage their identities in order to attract new opportunities and new people or guard their memory, by sequestering and affirming the old sentiments.

European childhood publics: making biographical research with younger children possible

Sevasti-Melissa Nolas, Christos Varvantakis, Vinnarasan Aruldoss
University of Sussex, United Kingdom; University of Sussex, United Kingdom; University of Sussex, United Kingdom
s.nolas(at)sussex.ac.uk,
c.varvantakis(at)sussex.ac.uk,
v.aruldoss(at)sussex.ac.uk

Younger children's biographies remain an under-theorised area of research. We argue that there is a curious paucity of research on younger children that explicitly engages with biographical theory's focus on temporality and its more explicit political imperative on linking personal lives with public issues. The established paradigm of life history research and the emerging genre of children's biographies of famous 'change makers' favour adult informants/figures who may recollect their childhoods but do not serve to bring contemporary children's experiences out of the private sphere into public life. As such, children remain a subaltern group within biographical research much as they are anyway in many European societies where public and scientific discourses continue to position children in ways that emphasize their vulnerabilities at the expense of their capacities for agency and participation. The paper problematizes why this may be so when it is known that key dimensions of biography such as identity, memory, narrative and reflective capacity are formed from birth to age 6. In order to bring children into biographical research, and therefore into public life, we report on findings from the ERC funded Connectors Study, a three-city comparative ethnography which explores the relationship between childhood and public drawing on biographical theories. Using case histories from a sub-sample of children living in two European cities (Athens and London), the paper presents a methodological exploration of biographical research with younger children. The analysis focuses on two key political events with resonance in each country (the refugee crisis and Brexit) and explores how these were engaged with biographically by the children.

„I was born in four different countries” A case study of the biographical narration in the frame of the family.

Wojciech Polec
Warsaw University of Life Sciences SGGW, Poland
wpolec(at)wp.pl

In my presentation, I want to focus on the process of creation of the autobiography for descendant generations in the family and not for a broader public or in the frames of the scientific project. I analyze the changing social roles during the life cycle of the person, who has the experience of migration, but also the changes in the political, economic and social system. I focus on the hierarchy of values, experiences and meaning the grandfather want to pass to his grandchildren in the future.

The title of my work is a citation from the biographical narration of my father-in-law, which he prepared with my help for his grandchildren. It is connected with the fact, that he is born in Lida region on the territory which till the II World War was a part of Poland, after war it was a part of USSR, and now is a part of Belarus. In the time of his birth that territory was under German occupation. The ambiguity of the time and place has affected his whole life. He was soviet citizen, but in the age of 17, he moved from USSR to Poland and was settled on the territory which before the war was a part of Germany.

I will try to show how the biographical narration is construct when its goal is to create the message for the future generations.

RN03 | Session 07a Biographical Perspectives on “Otherness”: Methods of Research and Analysis”

Different Data – Different Stories?

Meltem Karadag, Alexandra Konig
Gaziantep University, Turkey; Wuppertal University, Germany
meltemkaradag(at)gmail.com,
akoenig(at)uni-wuppertal.de

Narrative interviews are a well-established way of generating textual biographical data. They allow us to examine how the self is shaped in socio-biographical processes. Using formats of textual data other than interviews is also well-known in biographical research. We are interested in the stories different textual and visual data tell us and how these data can be combined. In our presentation we will discuss processes of selfpositioning and self-presenting by using different types of data. Our argumentation is based on a Turkish-German cooperation project which focuses on work migration from Turkey to Germany during the 1960s and 1970s. Our presentation focuses on two cases: two married couples leaving their children with the grandparents in Turkey. Regarding both exemplary cases, we have different kind of material: (a) artifacts from the 1970s made in Germany, especially photos presenting family life, (b) artifacts from the 1970s made by the grandparents, especially tape recordings presenting the life of the child in Turkey, and (c) biographical interviews with a family member, approximately 20 years after migration. All material is part of the collection of Domid, an archive which collects and conserves artifacts from migrants in Germany to document migration history. Using this material, we will analyze how otherness, cultural/national belongings and cosmopolitanism are addressed in different data types. And in terms of methodology we will reflect (1) the relevance of a cross-cultural team in the research process, and the (2) possibilities and limitations of combining different kinds of data.

Walking Biographies: modulating borders, risk and otherness

Maggie O'Neill

York University, United Kingdom

maggieoneill5(at)hotmail.co.uk

As a methodology for conducting biographical research walking has much to recommend it, especially when combined with visual and participatory forms of doing research. Walking methods can help articulate the material, phenomenological, lived, embodied and imagined yet transitory sense of lived lives as well as giving priority to walking and thinking as 'body and image-space' (Wiegel 1996) as a means for 'modulating alienation' as well as 'that crucial element of engagement of the body and the mind with the world, of knowing the world through the body and the body through the world'.

This paper shares the findings from a Lev erhulme Trust fellowship that sought, over the course of one year, to consolidate and develop advances in biographical methods using walking and performative methods for doing social research with marginalised groups in times of risk, austerity and uncertainty. Specifically the research fellowship sought to: interrogate walking as a method for conducting research on borders, risk and belonging; conduct walking research with participants to access lived experience and reflections on border places and spaces; advance innovations in biographical methods; as well as reflect on the impact of the collaborative research findings and outputs for various publics.

The presentation shares a series of walks with Europe's 'others' and suggests that through the walks we are able to get in touch with 'storied lives' in sensory and corporeal ways that fosters 'understanding' and critical reflection. This necessarily involves reflection on ways of knowing and understanding in biographical research and the potential for walking as method as part of the 'craft' of the biographical researcher.

Dogma of Memory

Jane Louise Arnfield

Northumbria, United Kingdom

jane.arnfield(at)northumbria.ac.uk

This paper will demonstrate how witness testimony as presented in performance can contribute to furthering knowledge of individuals in a group context as audience/spectators of performance of witness testimony. The first part of this paper will explore and explain how creative expressions or representations of these witness testimony experiences can contribute to resilience and recovery in individuals and groups. Evidence in the form of audience feedback from the performances of The Tin Ring and data analysed will provide examples of how first hand witness testimony, taken from The Tin Ring and delivered to an audience between 2011 and 2016 contribute and impact on the individual (as a spectator) and their personal and universal understanding of the Holocaust. I will focus

on the almost one hundred performances in thirteen countries of The Tin Ring (2012). To demonstrate how creative representations of these first hand witness accounts and experiences can contribute in a different ways to both our understanding, and the actual sense of recovery of, an individual whose testimony is utilised in performance. Focusing on the spectators/audience who experience these first-hand accounts through the medium of performance and the creative arts. The focus will be on the therapeutic nature/effects produced through memory arousal and activation for both the testimonial holder and the spectators. The paper will activate an enquiry into how creative performances can be utilised as a mechanism to enable the original source material to reach a wider audience.

Migration-Education and 'Othering'. Biographical perspectives on 'Otherness' in East and West German schools

Asiye Kaya

Hochschule Magdeburg-Stendal, Germany

asiye.kaya(at)hs-magdeburg.de

Migration related difference, especially in the field of education, is considered a particularly problematic and overwhelming issue for Germany, a society which considers itself homogenous, so the recent studies. Similar to other societies, particular knowledge of national self has been (re)produced formally and informally in the context of education. In this, the perspectives and experiences of subjects, those considered problematic and 'othered' have been neglected in studies on education, didactical school materials, and migration.

Based on biographical interviews conducted with adults, once students of schools of East and West Germany, during our current joint research-project on migration and diversity in East/ West German school books and school book socialization, my paper deals with the following questions: What exactly do migration related students learn about themselves as children of Immigrants (or of non white, non German People) and about their classmates in their school books, and interactions and communications with educators and other students? How does this knowledge gained in schools in both East and West German contexts impact their biographical self-concept and societal positioning? What differences are there between East- and West German experiences? The preliminary findings show that the existing diversity gap in educational settings in both Germanies provoke a gap between migration related, non white and non-German subjects and the perception of (united) Germanness. Based on my biographical research findings with focus on 'otherness' I will discuss methods of research and analysis applied in our joint research project.

RN03 | Session 08a Different Voices and Memories in (Un)making Europe**From communicative to cultural memory – the meaning of individual memories in (un)making Europe**

Kaja Kazmierska
University of Lodz, Poland
kajakaz(at)uni.lodz.pl

In the second decade of the 21st century we may observe the process of significant generational shift when the second world war generation starts to decrease rapidly and the communicative memory is gradually replaced by cultural memory (after Jan Assmann). In the presentation I would like to reflect on the meaning and power of biographical account which is both a testimony of the past and an individual, unique experience of one's life. I will also refer to the characteristics of the contemporary generations having different memory and history sensitivity based more on emotions than on knowledge of historical facts. In this dimension I would also like to discuss the reference of Paul Ricoeur's concept of exchange of narratives as the chance to build common field of discourse for European memory and identity.

Russian letter from the front as an ego document and witness of time

Elena Rozhdestvenskaya
HSE, Russian Federation
rigasvaverite(at)gmail.com

In the focus of the report - a collection of letters from several wars (from the First World War to the Afghan and Chechen campaigns) in Russian context. Letter from the front is analyzed as a personal document; with appropriate historical procedure can also be a social, discursive and historical document, which tells about the attitude to a social event, to the context of the front and the circumstances of everyday life in war. It is also necessary to take into account the biographical perspective of the soldier or officer, immersed in the events of the war, and everyday life at the front, in informal communication with his combatants, and correspondence with those who are in the rear. Modern military sociology turned to face the "little man" at war with his experiences. The ethos of military labor, reconstructed on the basis of the letter collection, formed at the intersection of three parameters: the everyday at the front, a mega event of the national war, as well as the sense of homeland. Thus, the discursive polarization of the front and the motherland is the framework conditions that give meaning to the military work, require its intensity, and legitimize the sacrifices. Letters shows, that the symbolic meaning of the war as an event of national significance is changed. War appears in last letters in its undisguised form - as the solution of destruction, and subjective –as survival.

Getting Mixed-up in Counter-Positionings

Noga Gilad
University of Haifa, Israel
giladnoga(at)Gmail.com

In biographic constructivist eyes, giving voice names a handful of practices establishing the platform required for the recognition of the unjustly unrecognized. 'Giving Voice' aims at reshaping the social spaces in order that newly and now partly recognized groups begin to participate in the ever-changing public sphere. As more and more subjectivities evolve, contemporary configuration of solidarities demands new revisions.

Surprisingly, however, doing this (i.e., opening new spaces and explicating implicit social structures) simultaneously overlooks and in fact provokes alternative discourses of agents to oppose these practices. They may feel that the space allocated to these new groups has deprived them of their formerly unquestioned positions. These are now perceived by the public negatively as their privileges.

Often they do not accept it, but respond and resist. Unlike the 'realist' explicit confrontations we used to have in former periods, trying to show who is right and who is wrong, the new trend of opposition is to appropriate discourses of giving voice, and to position oneself "inside out" and "upside down" vis-a-vis the hegemonic discourses (Leon, 2016). The process we discuss now is, then, the reforming and reconstituting of the social hegemonic discourses themselves (Gramsci, 2004), looked at in a new and wider configuration. So now we are also asking: What happens to these new agents when they try to claim voice not as a means of liberation but rather as a means of opposition, in order to silence their rivals' voices.

Reconstructions of biographic interviews of Israeli Settlers show such counter-positionings, and how narrators mix themselves up in it. These more personal versions supposedly result in great victories but in fact construct disconnection and isolation.

Un/making nation on example of Poles from Ukraine

Kamila Zacharuk
Polish Academy of Sciences, Poland
zacharuk.kamila(at)gmail.com

In my paper, I would like to present, basing on my research, how family memories and national narrative may be incompatible. Poles in Ukraine are highly diversified, what I would try to describe in Norbert Elias' terms as a historical figuration due to the relation of power.

In the light of data from the Census in 2001, nowadays Poles from Ukraine are the most integrated minority in whole country. They define their own identity as a memory about roots and strong bonds with local community. From the other hand, historically, they are strongly divided and as a result of developing Polish historical politics, it makes new diversity.

Presenting a different type of regional identities, I will try to show it accordingly to the Polish and Ukrainian historical processes. Depends on methodological approach, we can interpret that data in many different ways, using for that purpose terms like nationalism, nation, historical or nonhistorical group. Enough to say that term "Poles from Ukraine" sounds like a one group, which they have never been. Moreover, groups of Poles who came to Ukraine since XVI to XX century, came from different social groups. While analyzing the historical process, it makes few societies with different, often contradictory goals. In my speech, I want to draw attention to several orders of data analysis. Two of them refer to relation between minority groups with Poland and Ukraine, third and most important is about impact of both of them on the formation of individual and collective identity.

RN03 | Session 09a Biographical Constructions of New Inequalities in Europe: Precariat, Capitalism and Solidarity I

Autotelic values of personal development vs neo-liberal "virtues" in individual biographical experiences

Katarzyna Waniek, Agnieszka Golczynska-Grondas
University of Lodz, Poland; University of Lodz, Poland
k.m.waniek(at)gmail.com, agrondas(at)uni.lodz.pl

Nowadays sociological discourses either "serve" or criticize neoliberal ideology. Consequently, they often produce mutually exclusive understandings and explanations of social processes and phenomena. Our main assumption is derived from the notion by Marek Czyżewski, pointing that "Real agency, creativity and responsibility for oneself is different than a sense of agency, creativity and responsibility or than rhetoric promoting agency, creativity and responsibility" (Czyżewski 2013). Autobiographical narrative interviews unveil that these only allegedly subtle disparities may be connected with various biographical attitudes and process structures. We will reflect on the issue of the interplay of culturally established values and biographical structures of individual experiences in differentiated macrostructural conditionings following the example of seemingly identical set of values, previously present in communist social order within the framework of so-called alternative society, nowadays addressed as neoliberal "virtues". On the one hand we will refer to narrations of Polish social innovators, active before systemic transformation of 1989. During communist regime creativity, reliability, self-agency, flexibility were perceived as the desired attributes of personal development (understood in terms of humanistic psychology) of the individuals who - implementing biographical action schemes - introduced innovative patterns in professional work. On the other hand, we will present some life histories of the 1980's generation in which biographical experiences guided by neo-liberal "virtues" transform into its opposite and show their fragility and "night side". Consequently,

narrators overwhelmed by expectations created by neo-liberal reality, enter trajectories of suffering, seem to become vulnerable, dependent, and self-alienated. Thus order change into disorder, rationality into irrationality, agency into apathy, independence into dependence.

Biographical experiences of work in transformation and crisis: life strategies and work trajectories in Croatia

Augustin Derado
Institute of social sciences Ivo Pilar, Croatia
augustin.derado(at)gmail.com

This paper aims to analyze the the connections of work trajectories and life strategies in the times of social transformation and crisis in Croatia. Our starting assumption is that transformations of the economic and social systems in former socialist states, as well as the multiple and sometimes contradictory demands from the new economic and social realities have greatly impacted many individual biographies, especially in the sphere of work.

The research sampling procedure used the results of an nationally representative survey (2014.) which has reconstructed the field of social classes according to the economic, social and cultural capital (Bourdieu, 1996) in Croatia. From the reconstructed field of social classes 30 interviewees have been selected following the principle of "maximum variation sample" (Creswell, 2014). Elaborate stories on the work trajectories of the respondents have been collected, along with the experiences of coping with the social transformations and economic crisis. This paper is simultaneously aimed at understanding the subjectivist bases of objectivist categories and on a careful reflection on the macro-causes of noted and interpreted micro-experiences (Burawoy, 2000). Both the concept of life-strategies and the biographical approach to individual experiences and trajectories provide opportunities to elude the analytical difficulties arising from the structure-agency divide and to locate the personal experiences within the wider social context (Hubbard, 2000). Finally, we analyze how the changing social structures provided opportunities and constraints to individuals, and how the use of economic, social and cultural capital enabled or hindered individual agency in work trajectories and life strategies in Croatia.

Coping with precarity: the case of young precarious workers in Poland and Germany

Adam Mrozowicki, Vera Trappmann, Jule-Marie Lorenzen
University of Wroclaw; Leeds University Business School; Freie Universität Berlin
mrozowicki(at)gmail.com,
V.Trappmann(at)leeds.ac.uk,
julelorenzen(at)posteo.de

In the context of the debates on the social agency of the disadvantaged social classes and categories of workers, this paper aims at exploring the biographical conditions, properties and consequences of coping

practices developed by young precarious workers in Poland and Germany. Despite political-economic differences, Poland representing the embedded neoliberal economy and Germany the coordinated market economy type, in both countries young people tend to be systemically disadvantaged in terms of greater risk of poverty, temporary employment and unemployment than general population. Simultaneously, regardless the objective changes in life and labour market conditions, young people in both countries tend to be satisfied with their lives and surprisingly optimistic about their future and rarely engage in conventional protests and collective actions. Exploring this potential paradox, this paper will be based on a tentative analysis of biographical narrative interviews with young people collected within the framework of the DFG-NCN funded PREWORK project in 2016-2017. Thus far, 35 interviews in Poland and 18 interviews in Germany (East and West) were collected with young people (aged 18-30) in low-paid temporary jobs, low-paid open-ended contracts, traineeships and unemployed, differing from each other in terms of educational resources, sector and types of jobs performed. In the paper, the first results of comparative analysis will be presented with respect to: (a) the conditions and types of coping strategies adopted by informants; (b) the socio-political consequences of coping strategies in terms of mobilization (new and old solidarities) and, more often, demobilization (isolation) of young people in the public sphere.

“One way or another, I have to make a living, don’t I, Miss?” - Former inmates’ routes to becoming economically active

Andrada Istrate

University of Bucharest, Romania

andrada.istrate(at)gmail.com

Drawing on 16 months of research on the topic of prisoners’ reentry in Romania, this presentation seeks to unveil former prisoners’ strategies towards finding and securing employment. Formal employment is only one point on a continuum of post-release economic practices. Examining the work experiences of 20 former prisoners throughout their first year after release, I argue that former prisoners have restricted access towards pursuing so-called legitimate goals (such as finding a job and living their version of a “good life”) and forced to simultaneously engage in multiple routes to becoming economically active. These routes include working without contracts, informal transactions, hustling, or “making-do”, the refusal or impossibility to find work, the mobilization of existent human and financial resources, entrepreneurship, and emigration. This main argument of this presentation is that recent shifts in employment practices produce and sustain job instability, occupational changing and short-term planning that have come to define the entire prison population. The failure to acknowledge the deep transformations that work and employment have endured over the past decades in Romania can lead to misunderstanding the

former inmate population by attributing faults that lie more in the structural arrangements of a society rather than in people’s individual characteristics. Ultimately, grasping work in its proper context can shed light on the future of reentry.

RN03 | Session 10a Biographical Constructions of New Inequalities in Europe: Precariat, Capitalism and Solidarity II

The conduct of life of the German middle class

Stefan Holubek

University of Bremen, Germany

sholubek(at)uni-bremen.de

The middle classes have been at the centre of many European societies since the second half of the 20th century, and are still key political players. However, vivid debates about disturbances of the middle-class life in spheres, such as work and labour market, parenthood and civil society engagement occurred in the past decades. Those debates have led to diverging conclusions and mostly lack a comprehensive, empirically grounded understanding of the interrelations of disturbances in different spheres of life in a biographical perspective.

In our research project, we follow up the concept of ‘everyday conduct of life’ and complement it with a biographical perspective in order to gain an elaborated picture of the middle-class life (“Lebensführung”, in the sense of Max Weber): How are members of the German middle class able to harmonize the impositions of daily activities? Are they able to shape their own biography, following self-formulated, long-term life goals and to which extent do they experience themselves as being subjected to external forces? We assume that the specific mode of ‘doing life’ of the German middle class has been and largely still is characterized by a continuous investment of economic and cultural capital to pursue the reproduction and, if possible, improvement of one’s social status.

Empirically, we approach these questions qualitatively, mainly relying on narrative biographical interviews with members of the German middle-class. The paper will present the theoretical framework of our study and some preliminary findings of our empirical research.

Professional success: changing self- reflection of professionals

Victoria Semenova

Institute of Sociology RAN, Moscow, Russian Federation

victoria-sem(at)yandex.ru

The discourse of professionalism, of becoming and being a ‘professional worker’ in different new and existing occupational groups now is now under rethinking and discussion as a consequence of great change on the labor market in times of ‘liquid modernity’ (Bauman, 2008). On one hand, organizational professionalism is seen as a developing field of professional and occupational

training and certification of the workers/employees, which could be labelled as growing control and 'credentialism' (Evetts, 2012). On the other hand, professional work as individual experience brought to light new meanings to the needs and demands towards professional position which came as an individualized response to institutional change on the labor market.

Focusing on issues of professional practice for a long time had an important role in biographical research as a problem of the relationships between the structures and individual experience which was called by Schutze as 'paradoxes of professional work' (Schutze, 2000) and was developed through subjective interpretations of professionals in the cause of case analyses in the different fields.

Based on case studies of professional's narratives as well as their professional strategies in parents/children perspective, the paper focuses on the consequences for the development of careers of two generations of professionals in Russia. Grounded on the empirical results of the study I will discuss their understandings of long-life or short-change career as well as subjective meanings of professional success, professional training and credentials, the choice between the extension of competence and vertical mobility.

Corporate (In)Equality - Biographical Experiences of Female Expats from Post-Soviet Countries in Poland

Anna Dolinska
University of Warsaw, Poland
anna.dolinska(at)wp.pl

The structures of multinational corporations, cosmopolitan work environments, and the expat culture are a relatively new phenomenon in Central and Eastern Europe. In the case of Poland, 'professional mobility' will be more likely understood as going West and seizing the opportunity to work in other EU countries, or participating in student exchange programmes, and to a much lesser extent will be associated with the increased inflow of foreigners from the ex-Soviet republics to Poland.

Yet, females from the post-Soviet countries especially from Ukraine, but also from Belarus and Russia, constitute the largest immigrant groups in Poland. Most of them migrate for economic reasons and seek better work opportunities, or to pursue tertiary education. However, for many years in the collective consciousness of the Polish people these immigrants have been stereotypically perceived as physical workers who take up non-prestigious jobs requiring little or no qualifications.

The primary focus of my research is on the bottom-up experiences and professional biographies of entrepreneurial, white-collar female migrants from post-Soviet countries, who found employment in non-migrant jobs, especially in the corporate sector. On the basis of the conducted interviews I wish to explore the experiences of the female migrants – to what extent they experience the open and cosmopolitan

Europe, and what are the possible inhibitors of 'careers beyond borders' (such as gender regimes or nationality) from the perspective of the peripheries of the European Union.

RN04 - Sociology of Children and Childhood

RN04 | Session 01a Children's Identities I

Childhood and Fashion: Investigating the Embodied Performance of Gender through Fashion

Galatia Kallitsi

University of Cyprus, Cyprus
kallitsi.galatia(at)ucy.ac.cy

This paper aims to provide a sociological insight on the ways tween children (8-13 years old) negotiate fashion to construct their social, gendered and sexual subjectivities. More specifically, the paper explores how children's fashion choices reveal embodied gendered subjectivities and the complex ways in which they negotiate a sexualized cultural domain. My overall goal is to combine feminist perspectives on beauty and sexualization with empirical data from children's lives.

This paper is based on an ethnographic approach. Twenty boys and girls between 8-13 years old in Cyprus were interviewed in their home space. Tasks such as wardrobe audits and items such as fashion magazines, school pictures, and dolls dressed by the "Dollz Mania" online dress-up game were used as a starting point for discussing the desirable "beauty" ideal in semi-structured interviews. Data were also gathered through observations in the school setting and children's social activities.

Results indicate that children are well aware of the symbolic value of clothing and its importance in expressing both individual uniqueness and participation in collective trends. The paper argues that children face social and cultural pressures to express a socially acceptable gendered and sexual body through fashion that is closely connected with the performance of certain types of masculinities and femininities ("sporty", "trendy", "sexy", "cool"). Often preteen children, both boys and girls, show a strong desire in possessing fashion items that help them build an adult appearance and an idealized gendered self.

Challenging normative assumptions about vulnerable children and youth through a myriad of small stories

Manon Alice Lavaud

Roskilde University, Denmark
manon(at)ruc.dk

This paper shows how an analytical focus on "small stories" can challenge normative assumptions about children and youth in vulnerable life situations.

The paper is based on a study about social work with children and youth living in foster families and residential institutions in Denmark. Based on repeated interviews and observations with thirteen children and youth and several professionals around each, the study explored how notions of normality, difference and deviance came into play in the stories they told about themselves, their strengths and challenges, and the stories told by the professionals. The concept of small stories was used to draw attention to the many different stories told by the children, youth and the professionals. After a brief presentation of the study and the concept of "small stories", I present some examples from the analysis of the empirical material, which had an explicit focus on the myriad of small stories gathered across the range of actors through interviews and observations.

I argue that even though the stories told by the children may seem weak or incoherent compared to the stories of the professionals, giving longer accounts underpinned by psychological theories and professional knowledge, we should not dismiss these stories. Moreover, the study highlights the fragmented and situational character of the stories told, and hereby attempts to challenge normative assumptions about childhood, normality and deviance that infuse the perspectives of the professionals as well as the stories the children and youth tell about themselves.

Civilising Projects and Children's Perceptions of Social Categories

Laura Gilliam, Eva Gulløv

Aarhus University, Denmark; Aarhus University, Denmark
lagi(at)edu.au.dk, evag(at)edu.au.dk

Based on ethnographic fieldwork in Danish child institutions and schools, this paper employs Norbert Elias' concept of civilising to analyse the aims and practices of institutional upbringing. As we argue in our new book, *Children of the Welfare State*, looking at "civilising projects" and the way children navigate and react towards them, afford a window to investigate cultural ideals and citizen formation as well as their social consequences. In this paper, we will focus on how institutional upbringing influences children's identities, their identification with others and their understanding of different social categories. In the process of acquiring a consciousness of the proper relation between self and others, children seem to learn the association between specific conduct on the one hand and social status and degradation on the other hand. Thus, through their everyday interactions and navigation of the institutional demands, children do not merely learn how to behave, but gain a consciousness of class, ethnicity, gender and distinction and a sense of their own social worth, identity and group membership. Focusing on our material about migrant children in kindergartens and schools, we show how children experience that ethnic

minority children and especially boys, tend to belong to an ‘uncivilised’ category. Reacting to marginalisation with opposition, troublemaking and an inversion of civilised norms, these children demonstrate a “paradox of civilising”, i.e. that the civilising projects despite intentions of inclusion and moral upbringing, sometimes come to exclude already marginalised groups by way of monopolizing civilised standards.

The Formation of Health and Gender - an Ethnographic Study of Health Identity Formation among Children

Mathilde Cecchini

University of Aarhus, Denmark

mcecchini(at)ps.au.dk

Recent studies suggest that health plays a role in identity formation among children; children identify as “healthy” or “unhealthy”. However, we still need a more elaborate and nuanced understanding of children’s health identities. By adopting an intersectionality approach this paper aims to examine the meaning of health in identification processes among children by investigating how health intersects with other principles of differentiation such as gender, ethnicity, social class and peer group in these processes. The paper is based on an ethnographic study of identity and hierarchy formation among 12-14 year old school children in two Danish Public Schools. The study shows that how a child’s health is interpreted and evaluated by the child itself and its peers is to a wide extent depended on the child’s gender. The health of girls is mainly understood and assessed in terms of physical appearance and eating habits, while the health of boys is interpreted and judged in relation to physical activity. The health identities of children thus seem to be gendered. The paper concludes by arguing that this has implications for how we should conceptualize and study the health of children, but also for practitioners working in the field of health promotion aimed at children and young people.

RN04 | Session 01b Children as Refugees and Migrants I

Constructing the child as refugee: visual and textual representations of refugee children in digital media

Eleni Theodorou

European University Cyprus, Cyprus

E.Theodorou(at)euc.ac.cy

Over the past few years, Europe has seen a significant rise in immigration as a result of protracted and violent conflicts in various places around the world. One of conflicts that has featured prominently in European media is the Syrian conflict. Images of men, women, and children refugees from Syria reaching European shores in small, overcrowded and fragile boats drifting in tumultuous Mediterranean waters have been traveling around the world through, inter

alia, digital media. The power of the media to produce, reproduce and represent ideas and ideologies about refugees and asylum seekers, often construing dehumanizing and stigmatizing representations of (mostly adult) refugees, has been documented in the literature (for example see Banks, 2012; Eses, Medianu, & Lawson, 2013, Bleiker, Campbell, Hutchison & Nicholson, 2013). This paper seeks to turn the gaze unto the refugee child in particular with the aim of unraveling meanings and conceptualizations of the child as refugee by critically examining representations of refugee children in image and text appearing in Greek-Cypriot digital news media over the period May 2015-May 2016, a period which, according to UNHCR records, marked a tremendous spike in refugee flows through the Mediterranean sea. Through engaging in qualitative visual, content, and thematic analysis of approximately 350 news articles appearing in ten different Greek-Cypriot digital news media (digital newspapers and news sites), visual and textual representations of refugee children were critically interrogated as to the ideas and conceptualizations of childhood vis-à-vis dominant ideological constructions of childhood innocence (Duschinsky, 2013) and of the raced, gendered and classed child-subject.

Contested Childhoods: Independent Juvenile Migrants’ Social Navigation Strategies through Worlds in Crisis.

Sofia Vlachou

Panteion, Greece

SVlachou(at)gmx.de

My presentation discusses chronological Age as an additional field of Biopolitics exercise in the European migratory context. Based on research with independently migrating teenagers and young adults in Greece, it highlights some of those juveniles’ generational strategies to localize and create passages through the real, symbolic and material constraints imposed on them by spatial seclusion, economic and civic deprivation and exposure to racism during their efforts to reach an imagined ‘genuine Europe’. While examining the subjects’ sociopolitical situatedness with relation to further intersecting aspects such as ethnicity, nationality, sex and gender the presentation moreover traces eventual racialization, gendering and generationing rationalities that underlie public discourses around migrant Bogusness. It is finally argued that due to the existence of an additional, generational ‘bio- filter’ in matters of migration governance, in the case of young migrants, the natural process of reaching chronological adulthood constitutes after all an instance to be feared of instead of being celebrated, once that it forms another threshold of exclusion from settlement options.

The Experiences of Unaccompanied Minors before and during their migration to Greece

Ourania - Eleni Zachariadou
University College London, Greece
zachariadou.rania(at)gmail.com

This research attempts to explore the experiences of unaccompanied minors, before and during their migration to Europe. It aims to assist the better understanding of these children, hoping that this could help not only the improvement of services offered to them, but also influence people who are negative regarding children's migration. This is a case study which took place in a shelter (directed by an NGO) in Greece. Before the beginning of the research an ethical application has been examined by the ethical committee of University College of London and a pilot research has been completed. The methods which are used are qualitative methods, such as group activities (the creation of drawings and posters) and group interviews. The participants were boys between 12 and 18 years old. Regarding the findings, minors seem to migrate in order to be safe from the terrorists and the war and to get a better life. Moreover, all participants have had painful experiences from the migration trip which was scary and dangerous for them. Greece is just a station for them, before their final destination. The decision for these minors' migration, in most cases, had been made by their family or/and by their family and them personally. However, there were cases when children made this decision alone and/or against the will of their family. Participants present positive and negative aspects of their life before their migration with the main conclusions being that these children have survived several hazards, in order to start a better life.

Present- absent? Migrant and refugee children in Polish schools in the narratives of teachers

Urszula Markowska-Manista, Dominika Zakrzewska-Oleńska
Maria Grzegorzewska University, Poland; Maria Grzegorzewska University, Poland
umarkowska(at)aps.edu.pl,
dzakrzewska(at)aps.edu.pl

Polish school is a place where migrant or refugee students are still relatively rare. Despite the fact that the problem of cultural diversity connected with the concept of intercultural opening of the school has been addressed for several years, school praxis still seems to be oriented towards the needs of a homogeneous environment, with an average, undistinguished student, and most importantly, one who does not stand out against the majority of school class. Research (observations and interviews) conducted in school environment allow to discern children's diversity with a clear division into those who are better and worse. The observations and research also reveal that children's cultural context is ignored. The aim of the presentation is to outline how migrant and refugee students in Polish schools are perceived through the prism of teachers' narratives.

In the presentation we will refer to research results from 2015-2017 when interviews were conducted among 80 teachers from primary and lower secondary schools.

The presentation is an attempt at a critical look at the place of migrant and refugee students in Polish schools as well as how they are perceived by teachers.

RN04 | Session 02a Children's Identities II

Constructing children's national identities through waved and unwaved flags

Nehir Gündoğdu
Independent researcher, Turkey
nehir0495(at)hotmail.com

Children encounter with waved and unwaved flags in schools that remind them of national identities every day. While Billig's (1995) banal nationalism concept helps to understand institutions' usage of national discourses to build their imagined communities (Anderson, 2006), Thompson's (2001) local nationalism perspective points out individual's engagement with these discourses in the construction of national identities. By engaging both ideas, this paper aims to discuss what national identity reminders are around children specifically in preschool context and how children understand and perform these reminders. I will try to argue these questions based on my field study in Ankara capital of Turkey. The study has been conducted in two state preschool classrooms between September 2013 and March 2014 by participant of 49 children aged between 5 and 6, two preschool teachers, two assistants of teacher and four managers. Observation suggests that the children construct their national identities through the discourses offered by preschool curriculum and teachers. On the other hand, the findings show that the children did not absorb and take on board all the messages they receive about national identity. This reminds us that children also create their own meanings. In addition to this, although some children interpreted national symbols and rituals in a way that differed based on preschool curriculum and staff expectations, they did not also question or search for other ways of beings. This may mean that children did not know what exists beyond the boundaries that are given to them.

Migrant children's identity construction: education as socialisation venue in complex migratory contexts

Chiara Massaroni
Universität Innsbruck, Austria
Chiara.Massaroni(at)student.uibk.ac.at

While it is without doubt that education has a paramount role in ensuring socio-cultural integration and influencing migrant children's identity, research has been largely influenced by two limiting assumptions. First, it often focuses on curricular approaches, overlooking the role of educational

settings as socialisation venues. Secondly, it is embedded in a dichotomous interpretation of migrations (push-pull, illegal-legal, North- South) and is influenced by the “permanent settlement migration paradigm” (Agunias, 2006). Migration, however, is a complex phenomenon and migrants continuously forge multiple forms of belonging across nations or communities, constructing diverse personal plans and life narratives. Morocco is an example of such complexity, being a crossroad of continental migrations, a temporary and long-term transit hub and a destination county, where migrants constantly renegotiate various interpretations of belonging.

This paper looks at educational settings (formal and non-formal) as socialisation sites for young migrant children between 6 and 12 in Morocco. I will interpret the Moroccan migratory scenario and educational offers through the combined lenses of psychosocial identity theory and multi-dimensional perspective on migrations. I will argue that, for educational spaces to foster a positive sense of self for migrant children, it is necessary to understand the complex dynamics correlated to modern migrations and the influence that elements such as hopes, expectations, local and transnational networks can have in shaping the child's identity.

Migration, identity and childhood: Exploring young migrants' ethnonational identifications and belonging

Eugenia Katartzi

University of Leeds, United Kingdom
e.katartzi(at)leeds.ac.uk

In the era of unprecedented migration waves an ever-increasing number of children and young people experience, mobility and dislocation as crucial part of their lives (United Nations, 2016). More than ever children and young people move between and across states leading transnational and translocal lives, thereby disrupting the idealized notion of childhood as unfolding in fixed and bounded spaces (Ní Laoire et al., 2010). The presentation seeks to shed light on the intricate relationship between migration, 'identity' and belonging by focusing on young migrants, a group placed on the periphery of scholarship and public debate. Based upon a qualitative study of youth identities in the context of Greek society, the key objective is to examine ethno-national identifications, formed through the dialectic of self-definition and categorization. The narrative analysis of young migrants' in-depth interviews unpacks how their sense of belonging and emotional attachments to their countries of origin and settlement are mediated by processes of racialization and othering. Young migrants' narratives point to an understanding of identifications and belonging -what comes to be seen as 'identity'- as deeply socio-politically bounded processes in the frame of which boundaries are being drawn and bonds are forged and inter-subjectively negotiated on the basis of alleged similarities and differences between the 'self' and 'others', 'us' and 'them'.

Language as a Means for Ethnic Identity Fencing or Bridging? Multilingual children's perspectives on the relation between ethnic identification and language

Graziela Dekeyser, Paul Puschmann, Gray Swicegood

Ku Leuven, Belgium; Ku Leuven, Belgium; Radboud University Nijmegen; Ku Leuven, Belgium
graziela.dekeyser(at)soc.kuleuven.be,
paul.puschmann(at)soc.kuleuven.be,
gray.swicegood(at)soc.kuleuven.be

Antwerp (in the Dutch-speaking part of Belgium) is turning into a minority-majority city, characterized by superdiversity in terms of ethnicity, culture and language. Against this new reality, we investigate how 10-12 year old multilingual children perceive the relationship between language use and proficiency on the one hand and ethnic identification on the other. These children are part of many social groups (e.g. social class, sex, age, leisure activity groups) besides the own ethnocultural minority group and thus have multiple identities. Questions arise then to which degree 1) children view their language use as implicated in their ethnic identity and 2) whether language functions as a way to draw ethnic boundaries or, conversely, as a means to bridge the distance between ethnic groups.

We use data from the multi-method Multilingualism in Antwerp study (Dekeyser, 2016). Focus groups were organized with children to discuss several language dimensions (e.g. language use, management and ideologies) in their everyday lives. By means of vignettes and yes/no statements, children were asked to voice how they link language practices and proficiency to feelings of belonging, ethnic identity and processes of social exclusion and inclusion. The focus groups were stratified according to sex, ethnicity, migration generation, and children's perception of their schools' policy toward the use of the home language, for 5th and 6th year pupils across 19 primary schools in Antwerp. This makes it possible to investigate intra- (e.g. across schools and/or sex) and interethnic differences. Cross-case analyses will be performed with NVIVO.

RN04 | Session 02b Children as Refugees and Migrants II

Children, transnational migration and school. The relevance of transnational mobility in the debate between children's agency and structural constraints.

Sara Amadasi

Università di Modena e Reggio Emilia, Italy
samadasi(at)yahoo.it

In the last decade a significant number of children with a migrant background has been included in the Italian schools. The inclusion of these students brought major changes inside the school.

This work aims to focus on one of these changes,

represented by the management of periods of absence of those children who live experiences of temporal return to their – or their parents' – countries of origin during the school year.

These trips represent processes able to express a high degree of social complexity, involving a number of diverse and heterogeneous issues that may be of great interest to social sciences. On one side these international journeys introduce a break in the school system that reveals social changes that the school, as an institution, is forced to deal with; on the other hand, this mobility which sees children as protagonists, promote reflections on their active role in social processes, recognizing them as deeply involved in the global dynamics and requiring a change in the more traditional understanding that wants them projected only to a future participation in the world.

Based on video recordings of workshops with children and interviews conducted with teachers realized in a research year in two primary schools and one first grade secondary school, this work aims to analyze children's narratives as well as teacher's narratives.

The purpose of this paper is to reflect on the different meanings' constructions that international mobility takes on in these narratives and what is the space of agency for children inside them.

Navigating difference and belonging: Narratives of migrant Irish Childhoods

Susan McDonnell
IT Sligo, Ireland
mcdonnell.susan(at)itsligo.ie

Based on recent research with children from migrant and non-migrant backgrounds, this paper brings focus to younger children's intersubjective identity processes in contemporary Ireland, as situated in domestic and educational settings but also overlapped by broader texts of global media and consumption, spatial regulation, cultural and religious symbolism, mobilities, and normative whiteness. Unsettling assumptions of homogeneous Irish childhoods and of children's passivity in relation to their social worlds, this work explores children's negotiations of belonging to national communities. The paper illuminates processes of production and contestation of normative and raced Irish childhoods through texts and practices that were spatial, institutional and mediated but were also reproduced by children themselves. These exclusionary currents were corroborated by conceptualisations of migration and asylum, embedded in narratives of nation, that categorised some children as 'out of place'. Children's contestations of such binary discourses occurred in two key ways. Firstly, the paper considers the productive potential of children's, especially minoritised children's, marginal positioning as a site for questioning or transgressing definitional boundaries. Secondly, the significance of playful speech as deconstructive identity practice is explored. While problematizing assumptions of migrant children's passivity in raced settings, the paper also acknowledges the necessity for broader commitments

by adults in order to operationalize children's agency in this regard. As such, the paper suggests that interrupting exclusionary raced identities in Irish primary schools requires engagement with children's world-making practices and the multiple resources that inform their lives.

Seeking Neverland: Refugee Children in Europe

Tuba Bircan
University of Leuven, Belgium
tuba.bircan(at)kuleuven.be

The impact of the Syrian civil war has started with the region and expanded to the entire globe. Since World War II, one of the largest forced migrations has been experienced as a mass influx of Syrians. According to the UNHCR, as of January 2017, an additional 8.7 million Syrians are internally displaced, with numbers increasing due to the incessant crisis. The neighbouring countries have hosted more than 4.8 million registered refugees and around a million Syrians seek asylum in Europe.

Research on refugee and asylum-seeking children has been focusing on the aspects of mental health and psychological interventions. Moreover some studies investigate the multiple drivers that push children to start new lives, and the problems that they face as a result of this new beginning. This study will contribute to the body of knowledge by examining the spatial distribution of the children refugees, in particular from Syria, Afghanistan and Iraq, among European countries. Hence, it will investigate if there exists a pattern for selection of destination countries

The objective is to answer the following questions: Which countries are more preferred destinations for unaccompanied minors and refugee children with families? What could explain the geographical preferences? What happens to other child refugees such as Afghan and Iraqi minors? Are the host countries prepared and committed for the challenge? Consequently, with the use of the Eurostat and UNHCR asylum applications and evaluations data for 2008 and 2016 for EU28 countries and Middle Eastern countries such as Turkey, Jordan and Lebanon, the characteristics of the refugee children by nationality, age, and sex will be discussed and the trends over the years will be explored.

Unaccompanied minor refugees in the state of Brandenburg, Germany

Madeleine Sauer, Ingmar Zalewski
FH Potsdam, Germany; FH Potsdam, Germany
sauer(at)fh-potsdam.de, zalewski(at)fh-potsdam.de

Today, about 1500 unaccompanied minor refugees live in the state of Brandenburg, Germany, faced with a culture of welcome on one hand and rising Xenophobia on the other. In our research we evaluate the situation of those minors. Building on the empirical dataset of an explorative pre-study (Thomas & Ackermann 2017 forthcoming) challenges and problems of the minors' situation are being investigated.

From the subject's perspective, we take a closer look at the minors conduct of everyday life leading us to an understanding of the minors as active members of German society acting in – more or less regressive – social structural settings. The minors actively participate in our research as we form a peer-research-group. Therefore, we hope to access this vulnerable group from an inner perspective and not only from our privileged position as academics.

From an institutional perspective, we focus on the problems the young people have to deal with (uncertainty concerning the residence title, frustration, traumata, social hostility and racism in the neighbourhood etc.) and evaluate the existing problem solving strategies the institutions (are able to) offer.

From a structural perspective, we look upon the social environment the minors live in and ask what it needs to successfully integrate them into German society. Furthermore, we want to know which challenges society has to face and which changes are necessary towards a transformative society.

First results of the research will be presented.

RN04 | Session 03a Child Protection, Risk and Resilience/Children's Use of New Media

Early childhood and digital media – Social Change, Subjectivities and Perspectives

Jutta Wiesemann, Clemens Willi Eisenmann, Inka Fürtig, Jochen Lange, Philippa Hare, Astrid Vogelpohl, Bina Elisabeth Mohn

University Siegen, Germany; University Siegen, Germany; University Konstanz, Germany; University Siegen, Germany; University Siegen, Germany; University Siegen, Germany; University Siegen, Germany; University Siegen, Germany; University Siegen, Germany
wiesemann(at)erz-wiss.uni-siegen.de,
clemens.eisenmann(at)uni-siegen.de,
inka.fuertig(at)uni-siegen.de, jochen.lange(at)uni-siegen.de, piphare(at)gmx.de, vogelpohl(at)posteo.de, Bina.Mohn(at)uni-siegen.de

When addressing the diverse challenges which children and families in Europe face nowadays, new media are playing an ever-increasing role in how everyday life and new affordances of work and leisure are structured and organized. Our paper focuses on the earliest phase in life, in which the relevance of these new media infrastructures already becomes apparent: early childhood (0-6 years). The research draws on camera ethnographic and written ethnographic observations as well as audio-visual recordings stemming from participant observations in 15 families across Germany, which range from single mother academics to refugees. In our ongoing research project at the collaborative research center "media of cooperation" in Siegen, we investigate the concrete processes of acquisition and the cooperative making of smartphone usage in everyday family situations. Pervasive and always-on smartphone presence fundamentally impacts forms of communication, learning, and socialization processes in early childhood. We observe social change in the

making, which may fundamentally affect the meaning – and our understanding of – subjectivity in the nascent generation. For instance: How is the concept of "being present" transformed, when family members are continuously participating (only) via Skype? With our qualitative media- ethnographic approach, we will address these issues empirically and present observations and video recordings of everyday media use in early childhood, representing the mutual fabrication of typical media practices in contemporary Europe.

Empathic moments in risk assessment with abused children

Clara Iversen

Uppsala University, Sweden

clara.iversen(at)soc.uu.se

A challenge for child protection workers in interactions with abused children is to establish rapport without compromising the impartiality of the information children provide. In literature and policy documents, child protection workers are often recommended to respond to children in a way that is empathic but neutral. However, the actual strategies for accomplishing this stance are seldom discussed. Research shows that in practice, institutional representatives tend to down-prioritize empathy and focus on the institutional task, such as advice-giving or asking for information. There is, accordingly, a lack of studies of how child protection workers actually can display empathy in interactions with abused children. The current paper uses conversation analysis to explore real-life risk assessment interviews with abused children in health and social care. By focusing on how initiating actions set up constraints for responses, the analysis highlights the joint meaning-making between children and child protection workers. The paper shows how children make an empathic response relevant and different ways in which child protection workers display empathy, such as by formulating children's assessment, by upgrading their assessments, and by offering reaction tokens. It also shows the interactional consequences of different approaches and discusses these in relation to different institutional agendas.

The right to security of online childhood

Deborah De Felice

University of Catania, Italy

defelice(at)unict.it

The complex relationship between children online and digital technologies is the starting point of this reflection of a growing process of multidisciplinary theoretical attention on building children's biographies. On the one hand, the concepts of "risk and childhood safety" have become increasingly central in institutional discourses. The content of this attention seems however to assume more the form of adults' fears, dealing with an endless struggle for a utopian safety for their children, than the reality of what really can be a "risk" for children online. On the other hand,

the current change of the representations of childhood are increasingly oriented to a vision of the child as the subject of its own history and therefore more active and participatory. This makes it difficult to manage the distinction between adults and children and is problematic for the use of traditional parenting styles. Starting from a reflection on the main theoretical perspectives that have been compared on the issues of social change, this paper aims to clarify and problematize some of the paradoxes that accompany what has been said related to children's safety in the so-called second modernity, compared to the United Nations Convention on the Rights of the Child and the powerful entry of technology digital science in familial contexts.

Empirical Assessment of different theoretical models of resilience

Otto Bodi-Fernandez
University of Graz, Austria
otto.bodi(at)uni-graz.at

Within the scientific and socio-political discussion about the effects of inequality and, in particular, poverty, the concept of resilience has increasingly been referred to. Resilience is commonly understood as the psychological resistance of children to biological, psychological and psychosocial development risks (Wustmann, 2004). Despite the "omnipresence" of the resilience concept (see Friedrich, 2012), empirical studies on resilience differ in the concept of what is understood as resilience, how resilience is operationalized, and with which methodological instruments surveys are carried out. The present study deals with the question of the empirical assessment of the facetious phenomenon of resilience. In recent research, various strategies have been pursued which are as diverse as the theoretical concepts and definitions of the term. Based on the data of a children's study on living conditions and well-being, conducted in 2013, the paper shows which implications result from diverse resilience concepts for empirical material. In the study, which is located in the 'new' approaches of social childhood research, 1,749 children and adolescents between the ages of 10 and 15 were interviewed on their living conditions and their current well-being. Children experiencing poverty were of particular interest. Based on the data of this study, the paper shows which theoretical resilience models are empirically observable in different areas. It is also shown that in the case of possible demonstrable resilience effects, additive, mediating, and moderating effects should be differentiated, whereby moderating effects come closest to the current notion of the concept of resilience.

RN04 | Session 03b Children and Intergenerational Relations

Facilitation of children's narratives of cultural differences in classroom interactions

Claudio Baraldi
University of Modena and Reggio Emilia, Italy

claudio.baraldi(at)unimore.it

This presentation concerns the analysis of narratives of cultural difference as co-constructed in facilitator-children interactions, during a project in multicultural classrooms. The presentation provides an empirical analysis of intergenerational relations as displayed in classroom interactions. The theoretical presuppositions are that (1) intergenerational relations are visible as embodied in adult-children communication, specifically in adult-children interactions, and (2) depend on the form that these interactions take. In classroom interactions, intergenerational relations are based on a hierarchical form of interaction between teacher and pupils, concerning difference of epistemic authority, i.e. rights and responsibilities of access to and production of knowledge. However, methodologies of facilitation may be introduced in the classroom to promote more equal intergenerational relations, by enhancing children's epistemic authority. This presentation analyses video-recorded data about facilitator-children interactions in multicultural classrooms, showing the ways in which facilitation may promote children's epistemic authority in narrating cultural differences. It shows that the children's ways of narrating cultural differences depend on the form that facilitation takes in the interaction. Facilitation may (or may not) promote the inclusion of cultural differences into narratives of personal experiences and knowledge, based on the recognition of children's epistemic authority. By promoting personal experiences and knowledge, facilitation can avoid cultural essentialism. Facilitation can deal with cultural differences as opportunities to enhance children's epistemic authority, rather than as knowledge that must be learnt by children. Therefore, children can decide to ignore, underscore, or reject cultural differences, on the basis of their own experience and knowledge.

Gender and Children's Housework Time in China: How Does Family Structure Matter?

Yang Hu
Lancaster University, UK
yang.hu(at)lancaster.ac.uk

Differentiated gender roles and the 'stalled' gender revolution in adulthood are rooted in one's gender-role socialisation in childhood. While most previous research on children's gender-role socialisation focused on two-parent families, little is known about the ways in which gender-role socialisation may operate similarly or differently in distinct family structures. Analysing data from the 2010 and 2014 China Family Panel Studies, I focus on the gendered pattern of time spent by boys and girls on housework and how this pattern varies by family structure. On balance, the results support the 'intergenerational substitution' theory that children are viewed as natural substitutes for their parents' absence from domesticity along the gendered mother-daughter and father-son lines. Compared with children from two-parent families, sons and particularly daughters spend more

time on housework with the absence of the father and the mother from home respectively. The presence of female siblings 'alleviates' the need for 'intergenerational substitution' from girls and particularly boys. The pattern is further complicated by the multigenerational family structure. Whereas the presence of grandfather(s) at home increases the housework burden for girls and to a lesser degree for boys, the presence of grandmother(s) at home contributes to reducing the housework burden for both boys and girls. The results show the complex ways in which gender and intra-/inter-generational relations intersect in shaping children's gender-role socialisation, which are key to a thorough understanding and early intervention of the (re)production of gender inequalities in the domestic sphere.

Responsive democracy, participation and children

Johanna Kiili

University of Jyväskylä, Finland

johanna.j.kiili(at)jyu.fi

The presentation discusses whether the representational democracy can truly represent children. Representational and collective participation structures for children are being recommended in pan-European policy as means to include children in democratic processes; however there is a lack of sufficient knowledge on how such structures can include all children. As children lack political rights, the concept of responsive democracy is used in the presentation. Responsive democracy and participation may at best be seen as a complex interplay of relations between actors, resources and overlapping social spaces that vary with time, rather than relatively static field. The presentation asks how the greatest possible difference and inclusion can be comprised in the processes and structures of participation. To understand whether and by what means participation structures might achieve this, critical analysis of children and adults relationships to relevant resources and institutional positions in the participation processes is necessary. This aim is reflected by presenting a preliminary design of a new evolving research project, aiming to develop open public arena for participation in two neighborhoods in the city of Jyväskylä, Finland. This arena will be developed together with children, researchers, city officials (education, social and health services, leisure services, libraries etc.), politicians and resident associations. The main aim of the arena is to provide a public place for intra- and intergenerational dialogue, discussion and debate and to open up opportunities especially for children to 'answer back': to plan and reflect the aims, methods and results.

RN04 | Session 04a Children, Poverty and Austerity I

Childhood, inequality and the politics of child protection

Ian Kelvin Hyslop

University of Auckland, New Zealand

i.hyslop(at)auckland.ac.nz

In late capitalist societies the contemporary practice of child protection and the associated discourse of individualized children's rights are entangled with understandings drawn from trauma studies and the science of brain development. Practice design is also driven by political concern about the social and economic costs attributed to failing citizens. The overriding focus is on the inter-generational transmission of social disadvantage. Removal and re-socialization of the children of the poor is connected with reproduction of the idealized liberal subject. In anglophone countries practice developments which are promoted as child-centered and safety-focused are essentially eugenic in their effect. Narratives of care, morality and children's rights serve to disguise and/or justify discriminatory policy programmes which have racist and classist outcomes. Rising levels of state care and the permanent out-of-family placement of looked-after children impacts disproportionately on families disadvantaged by the renaissance of liberal fundamentalism in political and economic life. This pattern of development has significant implications in the European context of political and economic austerity. This paper sets out to move beyond broad sociopolitical deconstruction. Exploration of the historical and contemporary role of science and the liberal political tradition in social work and child protection helps to clear the way for alternative future trajectories to be considered. A range of theorists have grappled with the apparent reality that despite the contradictions of capitalism being self-evident, it does not appear that a sustainable socialist alternative will simply appear. It is argued that the political left must reconsider the role of child protection practice as part of a wider re-imagining of progressive social change in the here and now.

Reforms in Children's Services as an Austerity Measure: Political Discourse in the United Kingdom and Finland since the 2008 Financial Crisis

Tuukka Taneli Niemi

University of Helsinki, Finland

tuukka.niemi(at)helsinki.fi

Children's services and financial support for families as a target of austerity is problematic with regard to its potential social implications. They can exacerbate child poverty levels and social inequalities among children as well as family household debt-to-income and social exclusion in particular among lone parents. Two European states where such austerity measures have been notable since the 2008 financial crisis are the United Kingdom (UK) and Finland. In the UK, these include the abolition of the child tax credit for families with over two children, the reduction of the welfare cap and the abolition of child poverty targets. In Finland, cuts are being directed towards day care services, with the hours provided for day care being reduced for unemployed parents and day care groups

being increased. It is unclear how and to what extent the social risks associated with these reforms have been taken into account and represented in the decisions to specifically target children's services as a measure of austerity. This research gap is addressed by the article through a discourse analysis of the relevant media presentation and policy papers in the two countries. Findings show that there are clear similarities between the government rhetoric in the two countries, with a notable lack of acknowledgement of the risks. Nor have either of the governments' policy decisions to target family support been presented as evidence-based, with a lack of recognition of the long-term value of early childhood investment. Aside from lowering the municipal bill, the sole reason provided for the cuts has been to encourage getting people off benefits and into work.

The Palestinian 'Children of the Junctions': The Tip of the 'Occupation Economy' Iceberg

Yoad Eliaz

The Max Stern Yezreel Valley College, Israel
yoadeliaz(at)gmail.com

Israel governs two political entities – the State of Israel and the Palestinian Authority. The duality of two separate judicial systems and two separate economies allows for the revocation of rights, political repression and financial exploitation. The “children of the junction” are impoverished Palestinians, aged 5-16, who slip through military barriers to go begging and peddling at traffic-junctions in Israel. Research into these children's lives focuses on the two interrelated economies: the wealthy Israeli economy and the poor Palestinian economy, which is referred to as “Occupation Economy” in the research literature. The central argument is that the children of the junction are the “tip of the iceberg” of the occupation economy because of the combination of three conditions: A. Poverty, which transcends shame and compels the Palestinians to display austerity in the public sphere; B. Innocence and vulnerability which adults attributes to children, in general, and which transcends the Israelis' contempt and denial towards existence of the Palestinians, their poverty and the occupation; C. Relative leniency shown by soldiers and police towards children at the border crossings and within Israel. This paper is based on the findings of the 3-year collaborative research, conducted by both Jewish and Palestinian-Israeli researchers. Data collected through conversations with the children; official documents, media reports, documentaries; and unedited footage from the film “Pennies”, showing interviews with parents. This Research may shed light on children's responses to poverty and middle class adults' attitudes towards to the poor.

1 € meals for children in poverty situations: a magic measure?

Griet Roets, Bruno Vanobbergen

Ghent University, Belgium; Ghent University, Belgium

Griet.Roets(at)UGent.be,

Bruno.Vanobbergen(at)UGent.be

In this paper presentation, we explore the underlying principles and potential implications of a recent policy measure that is considered as a particular anti-poverty strategy for children in poverty in Flanders (the Dutch speaking part of Belgium). Following on the Flemish Child Poverty Action Program (2012) in which the importance of healthy and affordable food for children in poverty is emphasised, the Flemish Minister of the Interior, Integration, Housing Policy, Equal Opportunities, and Poverty Reduction launched a 1 € meal policy measure in 2016. The provision of 1 € meals is limited to children between 0-12 years and is coupled with the condition that the 1 € meal initiatives serve as entry points to offer integral family support in local networks of welfare actors. In that sense, the Minister claimed in the media as follows: “we offer 1 € meals to children in poverty situations on the condition that their parents accept parenting support. Every healthy meal we offer to a child means saving a child for our nation state”. In an attempt to explore whether 1 € meals are experienced as meaningful and supportive by children and their parents in poverty situations, we discuss findings acquired from a qualitative research project in which the perspectives of children and parents in poverty situations who make use of these initiatives and the 1 € meal providers are explored.

RN04 | Session 04b New Methodologies and Ethics of Research with Children I

Research with children: participative methodologies and ethical dilemmas

Ana Nunes de Almeida, Ana Delicado

Instituto de Ciências Sociais/Universidade de Lisboa,

Portugal; Instituto de Ciências Sociais/Universidade

de Lisboa, Portugal

ana(at)ics.ul.pt, ana(at)ics.ul.pt

The “participative turn” in social sciences is particularly important in research with children. Inspired by CRC principles, it was reinforced by the theoretical claim to consider children as “competent beings” in the present, which meant the methodological necessity of giving them “a voice” in science. This voice is expressed in a wide variety of forms and languages, from verbal narratives to visual products and images. New methodologies are put forward to capture their views and representations in more interactive and dynamic ways, involving them in all different stages of research, so that their voices are brought to stakeholders of various domains.

However, with participative methodologies new ethical problems and dilemmas arose. Keeping anonymity and privacy, the obtainment of informed consent and the free option of non-participation, the adequacy of proposed activities to children's competences, the relationship with gatekeepers or mediators and the selection of the (private/public) places to interact with the child/children, all these issues imply sensitive choices. Surprisingly, ethical dilemmas are framed almost exclusively by adult-centred prescriptions:

children voices are left behind when it comes to implement ethical protocols in the field.

Our reflection aims at addressing and discussing these ethical issues, departing from two research projects we were involved in: Children and the Internet (2008-2013, ICS/Universidade de Lisboa/Fundação C. Gulbenkian), and CUIDAR – Cultures of Disaster and Resilience among children and young people (2015-2018, a European Union's Horizon 2020 research and innovation programme under grant agreement No 653753; coordinated by Lancaster University, the consortium includes the ICS/University of Lisbon, the Open University of Catalonia, the University of Thessaloniki, Save the Children UK and Save the Children Italy).

Towards an Ethics of Knowledge Production in Childhood Studies

Spyros Spyrou

European University Cyprus, Cyprus
s.spyrou(at)euc.ac.cy

Much discussion on ethics in Childhood Studies so far has revolved around the development of ethical protocols and guidelines or how to address power differences between adult researchers and children in research. Though this is both important and necessary, I suggest that the field needs to expand its scope of ethical concerns to wider questions of knowledge production. Turning to knowledge production as an ethical concern, brings in sharp focus the need to reflect, as researchers, on the knowledge we opt to bring forth. Moreover, it highlights that knowledge production is a political act with potential, material consequences on children's lives. Hence, the need to attend to the ethics and politics of representation in childhood research with care and a sense of responsibility. In this paper, I argue for the need to reflect on the kinds of knowledge we, as researchers, produce, the realities of children's lives we end up disclosing, and the effects of our choices on real children's lives: what knowledge, for whom, when, and why? I make a case, in particular, for attending to the irreducible, apophatic child—the child who is not exhausted by our representations—with a critically open and reflexive attitude and, above all, humility towards the very act of producing knowledge. Attending to the mess of the childhood phenomenon by defying clarity, singularity and consistency and embracing ambiguity, multiplicity and contradiction is, I suggest, a first productive step towards developing a more critical and ethical Childhood Studies.

Empowering or exploiting - reflecting on research with children

Beata Sokolowska

Trinity College Dublin, Ireland
sokolowb(at)tcd.ie

Children's voices need to be heard. Researchers with genuine interest in exploring what children have to say, face a challenging task of achieving it without

breaking the ethical codes of conduct. How can we ensure that the issue of children's rights is addressed in our research? Is everything that is legal is ethical? And what about child's competency to consent to research? Lastly, how do we know that what we have done is enough to ensure ethical conduct compliance while at the same time empowering children rather than exploiting them?

This paper focuses on tangible ethical aspects that emerged during the preparation of the longitudinal qualitative research with Polish immigrant teenage children in Ireland; namely how to ensure non-confrontational, non-invasive methods particularly within a qualitative approach, confidentiality, trust, power disparities and finally, the potential effect on children after the researcher has left the field of study. This paper offers concrete encounters rather than abstract ideas, addressing the above-mentioned challenges, exploring the insider/outsider dichotomy and the notion of reflexivity through the prism of ethical quandary of research with children.

Should there be a longitudinal study on children and young people well-being in the European Union?

Gary Pollock, Haridhan Goswami, Jessica Ozan
Manchester Metropolitan University, United Kingdom;
Manchester Metropolitan University, United Kingdom;
Manchester Metropolitan University, United Kingdom
g.pollock(at)mmu.ac.uk, h.Goswami(at)mmu.ac.uk,
j.ozan(at)mmu.ac.uk

There has been a growing interest among academics, policy makers and practitioners in the subjective well-being of children and young people (CYP). The recognition of CYP's rights to having a good childhood and good future life chances, coupled with the injunction from the New Sociology of Childhood to consult with CYP as active agents have also resulted in an increasing interest in the use of well-being as a key concept in policy programmes in many countries. In recent years, child well-being has become a priority for the European political agenda. However, the main challenge for the European Union (EU) is to develop the best policies and approaches to effectively improve the well-being of children and young people using the most robust and suitable sources of data. It is only through the collection of longitudinal data that it is possible to systematically measure the changes in child well-being within and across its member states over time..

In this paper, we discuss the policy relevance of child well-being in the context of the EU strategy for CYP. We also detail the challenges associated with conducting a common longitudinal study on CYP's well-being across all EU member states. We discuss these challenges under three broad categories: (a) challenges for the study because of its longitudinal nature, (b) challenges for its cross-European nature, and (c) challenges for the study because of its involvement with children and young people.

RN04 | Session 05a Children, Poverty and Austerity II**Childhood poverty and European inspired actions: from the production of crisis to a palliative prescription**

Gabriela de Pina Trevisan, Manuel Jacinto Sarmento
University of Minho/Institute of Education. Portugal;
University of Minho/Institute of Education. Portugal
gabriela.trevisan(at)gmail.com,
sarmiento(at)ie.uminho.pt

Childhood poverty has hit different dimensions in the South of Europe, from the start of its financial and economic crisis of 2007/08, which caused a regression in decades of childhood inclusion policies. A significant reduction of social transfers was observed, namely on support through family allowances, unemployment allowances and social income and followed by the rise of parental unemployment rates and salary cuts. Simultaneously, the promotion of children's rights was left in second plan, since priority was given to financial bailout of banks and public debt cuts of peripheral countries, despite popular movements of civic resistance. In Portugal, this situation is well characterised and is expressed on a retrocession of the condition of the child as a subject of rights (Sarmento, Fernandes e Trevisan, 2015). At the same time, the tragedy of refugee children in the Mediterranean Sea has revived and disseminated the massive horror of childhood, with real and symbolic effects in children's lives and in social representations of childhood (Sarmento, 2016). In this context, some European policies are funding compensatory or palliative actions towards child poverty and social exclusion of children. With structural European funding and inspiration, Portugal is developing a program of action to fight child poverty, seen as compensatory, palliative, assistentialist and management-based (CLDS, axe 2). From a critical analysis of several projects in the scope of this program implemented in the North of the country, this paper discusses a set of European inspired public policies of child poverty, deconstructing its premises and grounds and pointing out alternatives.

Key-words: childhood poverty, public policies, CLDS programs

Inequity in the UK child welfare system: advancing understanding of responses to inequality

Geraldine Brady, Will Mason
Coventry University, United Kingdom; Sheffield University, United Kingdom
g.brady(at)coventry.ac.uk,
w.j.mason(at)sheffield.ac.uk

Ongoing UK research has established significant associations between social advantage/disadvantage and children's chances and experiences of involvement with child protection systems. In England a child's chance of being on a child protection plan (CPP) is 10 times higher in the most deprived 10% of

areas compared with the least deprived 10% of areas – suggesting that, as with health and education, child welfare is a matter of inequality. Child maltreatment, however, is largely framed as a problem of failed parental responsibility, with little attention paid to the impact of structural conditions. We present emerging findings from research (Nuffield Foundation 2015 – 2017) where, using an integrated methodology, six case studies were conducted in child protection services across England and Scotland. Given that officially collected data on the family circumstances of the children that are subject to child protection procedures is limited, including information about material circumstances, these case studies focused on the interplay between families' social, economic and material circumstances and the decision to intervene where there were child protection concerns. Our empirical data show how the intersection of political, economic and systemic factors can bear upon professional practices in ways that individualise family suffering and fail to address the centrality of social and environmental conditions within social work. Our findings contribute to an emerging body of research that aims to reframe child welfare as a site of inequality and advances understanding of children and their parents' experiences of inequality and of social work responses to children's needs.

Cling together, swing together? Childhood and welfare recipience in Germany

Florian Engel, Andreas Hirsland, Christian Thiel
Hochschule Fulda, Germany; Institut für Arbeitsmarkt- und Berufsforschung Nürnberg, Germany; Universität Augsburg, Germany
Florian.Engel(at)pg.hs-fulda.de,
andreas.hirsland(at)iab.de, christian.thiel(at)phil.uni-augsburg.de

One of the Welfare State's core tasks is to prevent and fight poverty and thus to guarantee participation as a fundamental civil right. New welfare policies, like Germany's "Hartz IV", shifted from a provisional to an activating regime stressing 'self-responsibility' and thus exerting more pressure on welfare recipients. How do, under these conditions, children perceive their childhood when living in a welfare dependent family?

Referring to data from a qualitative study of families (N=35) living on welfare benefits the presentation will discuss everyday-life perspectives and practices of these families dealing with their marginal position as welfare recipients. This will be done against the background that children's perspectives on and experiences with poverty are mediated through various welfare-state institutions, local circumstances, cultural and family backgrounds. Methodically our research covers interviews with parents as well as with their children, appropriate to data triangulation. Thus, child poverty in contemporary Germany appears in many different shapes, each of them having an impact on poor children's wellbeing, their chances to participate and their future perspectives. This leads to more general conclusions about the specific situation

of poor children and the phenomenon of child poverty within an affluent society.

The research project is carried out by the Institute for Employment Research (Nuremberg) in cooperation with the University of Applied Sciences Fulda and the University Augsburg as part of the Evaluation of the Hartz-IV-reform by order of the German Federal Ministry of Labour and Social Affairs.

Undeserving poor children? Expectations for the behavior of children in need

Ildiko Husz

Hungarian Academy of Sciences, Centre for Social Sciences, Hungary
husz.ildiko(at)tk.mta.hu

The distinction between the 'deserving' and 'undeserving' poor has a long history, although the criteria change from time to time. To be classed as 'undeserving' may serve as grounds for exclusion from certain benefits and services and may have consequences for the whole family. The proposed study will present – through the example of provision of meals for children in need during school holidays in Hungary – how classification as 'undeserving poor' is applied in services for families suffering food deprivation, leading to children being excluded from provision.

Our previous research found that about three percent of children in Hungary regularly go short of food. Families experiencing food deprivation are primarily assisted by state social services. Since 2002, meals for children have been supplied during school holidays.

Results: Our interview-based research found that providers set definite normative requirements regarding the behaviour of persons receiving social meal provision, and that the families in need, both parents and children, frequently breach these requirements. A frequent complaint is that the food they cook is not eaten. The organisers of the meals consider this to be 'ungrateful' behaviour, in breach of the norm, and in some towns or villages it serves as grounds for not organising meals for children in need during the holidays. Food thus serves a device for putting pressure on poor parents to change their childcare habits and parental practices and for 'setting them in the right direction'. The reasons for not eating, however, are often socio-cultural in nature. For example, social benefits cause families' demand for food support to vary cyclically; and the dishes provided through public catering are often unfamiliar to poor children.

RN04 | Session 05b New Methodologies and Ethics of Research with Children II

Immigrant children's experiences of meeting a new food culture: Methodological reflections

Marit Loveland, Randi Dyblie Nilsen
NTNU, Norway; NTNU, Norway
marit.loveland(at)ntnu.no,
randi.dyblie.nilsen(at)ntnu.no

This paper will focus on methodological reflections from an ongoing research project that first and foremost aims to grasp immigrant children's experiences of meeting a new food culture. Many ethnographic studies within Sociology of Children and Childhood have focused on in-depth knowledge from one or a couple of field-sites. In this paper, we will explore how one may carry out a PhD study that is based on ethnography carried out at multiple sites - "multi-sited ethnography" (Marcus, 1995). Basing the study in multiple locations allows for a focus on food related events, inter-generational relations and the production of meaning. Children and their families face their host country's food culture in various settings throughout their everyday lives and the focus for this project is on the experiences, context and meanings of these meetings. The paper aims to reflect on how understanding the positions children inhabit as active agents and the complex inter-generational relations in the context of Norwegian discourses on food and health, may benefit from such a methodological approach. In addition to being active participants in their everyday lives, immigrant children are also interpreters, mediators and negotiators in familial food communication as well as being intermediaries between their family and diverse settings in the host country. The project aims to bring narratives of food and eating from both children and parents together in order to better understand the challenges faced by the immigrant population as well as the multiple meanings of food and mealtimes. This requires a broad, flexible and open methodological approach that include both multiple field-sites and multiple methods, as will be discussed in this paper.

Innovative methods for studying children's everyday life

Marianne Notko, Tiina Lämsä, Kimmo Jokinen, Jaana Viljaranta, Asko Tolvanen
University of Jyväskylä, Finland; University of Jyväskylä, Finland; University of Jyväskylä, Finland; University of Eastern Finland, Finland; University of Jyväskylä, Finland
marianne.notko(at)jyu.fi, tiina.al.lamsa(at)jyu.fi,
kimmo.j.jokinen(at)jyu.fi, jaana.viljaranta(at)uef.fi,
asko.j.tolvanen(at)jyu.fi

The last few decades have witnessed many changes in families and children's lives. Therefore, in family studies we should deepen our understanding of the everyday practices in which children and families are engaged, such as doings, moral concerns, emotions, interaction, daily relationships, coordinates of time and space, routines and rules. When focusing on daily life, the researcher faces a methodological question: in what ways can the relevant aspects of daily life be captured in an ecologically valid way? A method often used for capturing this kind of everyday life is the diary. Diaries create a picture of daily phenomena by providing contemporaneous and detailed information about settings, events and reactions. Research methods employing the new technology may be found

especially interesting by children and adolescents. Family Research Centre, University of Jyväskylä has contributed to this development work by creating a new tool, the mobile diary (e.g. Rönkä et al., 2010; 2015; 2016; Malinen et al., 2013; Lämsä et al. 2013). In our multidisciplinary project “Daily transitions, children in multiple family forms (DALFA)” funded by the Academy of Finland 2015-2019, emphasis is on everyday activities, daily emotions and social relationships of children with an innovative internet based method using voice and visual material. The data was collected from 215 Finnish children aged 6-7 years with special focus on transition from pre-school to the first grade in elementary school. In our presentation we will discuss about the process of the data collection methods and present some preliminary results.

Studying Spatial Perception of Children and Young People in the Finnish-Russian Border Area with Mental Maps

Virpi Kaisto

University of Eastern Finland, Finland

virpi.kaisto(at)uef.fi

Mental mapping is a method for studying a person's geographic perception and cognition. It affords a lens into the way people produce and experience space. An individual's spatial perception is deeply affected by culture and, therefore, mental maps can also be analysed as mirrors of collective worldviews. This paper illustrates how we applied the method to study how Finnish and Russian children and young people perceive the Finnish-Russian border area. We collected 195 mental maps in five schools in Finnish and Russian border towns in 2013, 2014 and 2016. The pupils were on 4th-5th and 8th-9th classes. We analysed the maps with qualitative content analysis to scrutinize how the pupils describe their and the neighbouring side of the border, and the border itself. We were interested in how they draw borders and connections between the two national territories and whether the perceptions of the Finnish and Russian pupils of this space differ from one another.

On the maps, the pupils use a large variety of elements, ranging from nature to video games and from traditional symbols to opinions addressing topical social and political developments. With these elements, they often compare the Finnish and Russian sides with each other. The maps suggest of “spatial socialization” (internalized collective views and values), but also of the myriad elements that shape the way people relate to space, including mundane everyday encounters.

In this paper, I will discuss our experiences of employing the mental mapping method and linking the findings to literature, theory, and practice.

Children's capabilities in a European austeritarian context: what do children think about their wellbeing?

Lucía del Moral-Espín, Lina Gálvez-Muñoz, Mónica Domínguez-Serrano

Universidad Pablo de Olavide, Spain; Universidad Pablo de Olavide, Spain; Universidad Pablo de Olavide, Spain

ldelesp(at)upo.es,

lygalmun(at)upo.es, mdomser(at)upo.es

Since the late 1980s, academy has increasingly paid attention to children as a specific group, with specific characteristics and agency. The capability approach has been key analytical tool in this process. It offers a great analytical potential to study boys' and girls' living conditions, especially when it acknowledges the centrality of care for social provisioning. Capabilities approach and social provisioning perspectives, both, sustain the multidimensionality of well-being and that of sustainability. The literature highlights that a list of capabilities relevant for children's well-being will be different from a specific list for adults in the same society, especially when children themselves express which issues affect their well-being directly. Following this approach, this paper addresses a participative process oriented to the validation of a set of capabilities relevant to children's well-being in an austeritarian context, specifically, the region of Andalusia, one of the most hit by the recent crisis. The process involved 333 boys and girls, between 8-17 years old, participating in Children and Adolescence Municipal Councils of 10 different towns. The research followed a mix-method approach involving an ad hoc survey, four focus groups and interviews with key experts. The results describe, first, children's characteristics concerning age, sex and location. Second, they analyse the importance they give to different capabilities both for children and for adults. The final reflections acknowledge the possible ambiguities included in the idea of 'listening to children' while advocating for what has been called 'meaningful alliances' between adults and children towards the goal of childhood emancipation.

RN04 | Session 06a Children's Citizenship I

Child participation and agency in organised leisure

Daniel Stoecklin, Jean-Michel Bonvin, Ayuko Sedooka
University of Geneva, Switzerland; University of Geneva, Switzerland; University of Geneva, Switzerland

daniel.stoecklin(at)unige.ch, jean-

michel.bonvin(at)unige.ch, ayuko.sedooka(at)unige.ch

The « agency within structure » perspective has become a dominant narrative in the sociology of childhood despite the critics of functionalist and structuralists visions whereby structure appears as external to actors (Giddens, 1979, 1984). An alternative perspective is suggested here whereby agency itself is seen as having an internal structure. It bases on a research conducted on the participation of children in organised leisure activities in Switzerland. Using the capabilities approach (Sen, 1999 ; Nussbaum, 2000), the authors highlight the factors that favor or hinder the transformation of the formal

right to be heard (Article 12 UNCRC) into real freedom. They explore children's citizenship and participation as a sequential process in which the actor's reflexivity plays an important role as a transformative factor. Children's individual and collective agency are explored. Three forms of agency are identified (adaptive, innovative and cooperative) highlighting the dynamics of resources mobilised by actors. The concept of « syntonia » is proposed to reflect the balance between actors and institutions. This balance can be found in either adaptive or innovative or cooperative forms of agency. Hence, there is no hierarchy among participation forms, and this departs from the dominant narrative centred on levels of participation (Hart, 1992). These findings stem from a systemic approach (Stoecklin, 2013) and they enrich the paradigm of the social actor with an original contribution which has important implications not only for the theory of children's participation but for social theory at large.

Paths for a Real Citizenship of Children

Lourdes Gaitán
Asociación GSIA, Spain
lourdesgaitan22(at)gmail.com

The United Nations Convention on the Rights of the Child is the expression of an ideal of childhood conceived in the last quarter of the twentieth century, according to the dominant opinion in the societies of the so-called developed world. In order to promote the implementation of the Convention by the States Parties, a narrative was constructed, that is, a standardized interpretation of the legal text, which is repeated and explained since then, according to the established canon. The special nature of the rights recognized by the Convention even led to a particular way of presenting and explaining them. For this, a pedagogical criterion was applied: the known classification of the three "Ps" (provision, protection and participation). Without denying the effectiveness of this classification for the dissemination of the CRC, this path distances us from understanding the rights of the child as "the human rights that we have when we are children", while on the contrary, it contributes to the construction of a segregated territory of "childish rights". Based on the experience of the application of children's rights in Spain, this communication shows that if we want to move towards the real exercise of citizenship by children, we must explore two paths: 1) a re-reading of CRC in light of the classic definition of citizenship rights (civil, political, economic); 2) a focus on the new forms of citizenship (such as active citizenship and differentiated citizenship) under whose light it is possible to verify the citizenship effectively exercised by today's children.

Children's Society

Elina Mariia Stenvall
University of Tampere, Finland
elina.stenvall(at)gmail.com

In my PhD thesis *Children's Society: Participation,*

Citizenship and Politics as Sociation I explore participation and agency from children's point of view, by studying how children give meaning to their everyday spaces and perform as political actors in their everyday lives. Theoretically, I draw from Georg Simmel's distinction between life from one's own perspective and life produced by the society. Like John Agnew (2002), I use this approach to study "everyday politics".

Based on Simmel's conception of sociation, I have developed understanding about children's participation and agency as "strings of sociation". Within these strings, children's P/participation, C/citizenship and P/politics are understood at the same time as part of their everyday environments (participation, citizenship and politics) and their societies (Participation, Citizenship, Politics). Conceptually, I lean on the work of Nigel Thomas (participation), Lynn Staeheli (citizenship) and Kirsi Pauliina Kallio (politics). In my presentation, I will first introduce the basic idea of the strings of sociation and then focus on children's perspectives. To conclude, I discuss how these lines help to create a broader understanding about children's participation and agency in contemporary societies.

Heteropolitical Pedagogies, Citizenship and Childhood in Contemporary Greece

Yannis Pechtelidis
University of Thessaly, Greece
pechtelidis(at)uth.gr

Yannis Pechtelidis explores an alternative option in education, pedagogy, and children's participation in public life and citizenship in contemporary crisis-ridden Greece. He describes the everyday life of a public elementary school and a pedagogical community run by its members. He argues that a hetero-political activity unfolds within specific heretopic pedagogical space-time constellations. The concept of heterotopia is used strategically in order to clearly distinguish these alternative pedagogical spaces from the concept of utopia and the tradition of excessively rationalistic dream societies. The author critically discusses the contributions of the pedagogical social realities of the study to the empowerment of children's status, and the embodied subjective features that are crafted within these heteropolitical sites. He is especially focused on the intergenerational construction of citizenship, and the production of a hetero-political habitus within these specific heterotopic pedagogical and educational groups.

RN04 | Session 06b New Theories for Understanding Childhood I

Childhood and the social conditions of freedom

Nigel Thomas
University of Central Lancashire, United Kingdom
npthomas(at)uclan.ac.uk

What is it that we want to understand about children and childhood? For me it is questions like: How do

children have real freedom – in the present, in the future? What is the actuality of childhood – locally, globally? How, and when, do children become full members of society? These are critical questions, with an ethical dimension and practical implications, to which critical theory is therefore relevant – in particular, I suggest, that of Honneth (1995, 2014). Honneth's account of recognition was always, in important respects, an account of freedom and how it is 'actualised'. In his more recent work he moves on to look directly at freedom, distinguishing legal freedom (the freedom to do what I want), moral freedom (the freedom to do what I consider to be good and right) and social freedom (the freedom to act effectively in the world, which is dependent on cooperation with others and on mutual recognition). He thus extends his purview from the intersubjective to relations between people and institutions, and attempts a reconstruction of the institutional conditions of human freedom – 'the social foundations of democratic life' – asking what are the values implicit in existing social institutions, how are those expressed in practice, what are the contradictions and what needs to change in those institutions in order to actualise freedom? In this presentation I want to explore the potential for applying this mode of enquiry to children and the actuality of their lives. In doing so I will draw on recent research in Australian schools which demonstrated clear relationships between participation and wellbeing, and pointed to intersubjective recognition as a mediator of those links.

Children's Rights to the Future: Presentism and Global Challenges

David Oswell

Goldsmiths, University of London, United Kingdom
d.oswell(at)gold.ac.uk

In the context of global challenges (such as environmental disaster, war and poverty, etc), children and young people often get invoked as signs of future hope: namely, that through children social futures may be better. In this sense, children constitute a form of investment and often get talked about in terms of arguments about human capital. A recent shift in this broad set of discourses has seen various civil society actors talking about children, not as investments, but in terms of generational rights: namely, the misuse or squandering of resources and environments is seen as a matter of rights for future generations.

Childhood Studies has been critical of constructions of children as future hopes, not least inasmuch as those constructions fall into dominant ideas about children and futurity that see children as developmental subjects (both in terms of their internal make-up, but also their external capacity through growth and education for bringing about social change). Although pertinent, such a perspective fails to take on a series of questions about children's stake, not just in the present, but over time. The paper will investigate this as a matter for social theory.

Going against the flow: reaching ontological depth in the study of children's influence

Cath Larkins

University of Central Lancashire, United Kingdom
CLarkins(at)uclan.ac.uk

Agency is not something children have it is something children do. Children can and do act to influence change in their lives and the lives of others. The capacity for agency in any situation is related to the experiences, resources and opportunities that are available to children and produced within inter- and intra-generational social relations that are shaped by processes of generational ordering. Questions remain regarding the scale of children's agency, the extent to which children's agency is thinned and whether a Minority world, individualised concept of agency is a helpful tool in for understanding childhood and children's lives.

Drawing on interviews with teenagers (who are disabled, have experience of alternative care, or are young carers) and interviews with their families and workers, this paper starts by exploring the structures and mechanisms which constrain children's agency. I unpick their accounts of collective participation activities which aim at achieving influence to show how what might be termed a network or assemblage of resources and relationships have an impact on the influence they achieve. To avoid the fetishism of flows (Roberts and Joseph 2015) I also identify the foundational practices, beneath and beyond the resources and relationships which they name, through which structured divisions are reproduced and influence is constrained. I argue that Archer's (2000) concept of primary and corporate agents provides a useful lens for exploring cases where the reproduction of relatively stable patterns of advantage and disadvantage are being disrupted, particularly through the communicative action of agenda setting (Habermas 2006). This framework for understanding both scale and collective agency could enable children and childhood studies to identify ways of transforming children's social status under capitalism.

Society and sociological theory through a 'childhood prism'

Hanne Warming

Roskilde University, Denmark
hannew(at)ruc.dk

As stated in the call, "understanding childhood properly is to understand society differently". This statement can be traced back to the basic recognition that childhood is part of the social structure, and to the subsequent de-naturalizing of the othering of children and problematization of their position in the social order (Qvortrup 1994). However, childhood sociology is a heterogeneous field, which is reflected, among other things, in the diverse positions on fundamental sociological tensions - such as agency/structure, materialism/discourse, local/global, and particularism/universalism - that are represented within it. This was already pointed out by James,

Jenks and Prout back in 1998, but it may be even truer today. Childhood research therefore reflects society in various and sometimes ambiguous ways; and it both contributes to and challenges broader social theories. I propose using the concept of 'childhood prism' to address the multi-faceted contribution that the field of childhood studies makes to sociology, and I invite a discussion of the achievements, potential and challenges of exploring society and contributing to sociological theory through a childhood prism. Thus, in the presentation, I will offer (a probably non-comprehensive) outline of what we have already achieved as well as of future routes, perspectives, potential and challenges. I suggest that the field of childhood studies offers not only a route to understanding society differently, but also a sociological microscope for studying social changes in the acceleration society (Rosa 2003).

RN04 | Session 07a Children's Citizenship II

Children's genuine participation and generation of social capital in the school setting

Nanna Wurr Stjernqvist, Nicole Thualagant, Helle Terkildsen Maindal, Inge Tetens
Danish Technical University, Denmark; Steno Diabetes Center Copenhagen Health Promotion, Denmark; Roskilde University, Denmark; Steno Diabetes Center Copenhagen Health Promotion, Denmark; Danish Technical University, Denmark
naste(at)food.dtu.dk, nicole(at)ruc.dk, helle.terkildsen.maindal(at)regionh.dk, intet(at)food.dtu.dk

The concern of involving children in decision-making and activities related to their health and well-being in the school has increasingly becoming accepted politically as well as academically in line with the adoption of the UN Convention on the rights of the child. While formal and informal participation is viewed as an integral part of social capital generation according to Putnam, which has been found beneficial for health and wellbeing, little is known regarding how social capital is generated in relation to children and drawing on children as active participants. Drawing on children's perspective and the concept of participation, the aims of this study are therefore to explore children's experiences with their participation in everyday school situations and secondly, to contribute, theoretically, to the conceptualization of social capital in relation to children in the school setting. An abductive research strategy was used based on 10 focus groups interviews with 44 children aged 10-11 and participatory observation at two Danish public schools. We found three forms of participation: 'Child-directed', 'adult/child-directed' and 'adult-directed' that relate to different practises and different social capital types. While children actively contribute to the formation of bonding social capital practices as part of child-directed participation, adult/child-directed participation with its focus on participatory democratic education tends to reinforce bonding as well as bridging social capital. In line with

Putnam's focus on civic engagement the merged perspectives thus highlight the importance of stressing pupils' genuine participation as an active social pedagogical principle alongside structural changes at the whole school level.

In search of empowerment: Young Roma navigating identities and active citizenship in a changing Europe

Maria Roth, Barry Percy-Smith, Cath Larkins, Dympna Devine, Abel Beremenyi
Babes-Bolyai University, Cluj, Romania; University of Huddersfield, United Kingdom; University of Central Lancashire, United Kingdom; University college dublin, Ireland; Universitat Autònoma de Barcelona, Spain
mroth(at)socasis.ubbcluj.ro, B.Percy-Smith(at)hud.ac.uk, CLarkins(at)uclan.ac.uk, dympna.devine(at)ucd.ie, Abel.Beremenyi(at)uab.cat

The rapidly changing social and political landscapes across Europe are providing challenges as well as new opportunities in and across nation states. However, relatively little attention is focused on how such changes impact on local identities, disadvantaged groups and the lives of children and young people. Young Roma in particular suffer disproportionate disadvantage and discrimination and are alienated from political decision making. This poses particular difficulties for young Roma, bringing into question the efficacy of democratic participation and raising questions about the extent to which young Roma might participate in, and benefit from, social and political change. In 2014 the authors were commissioned by the EU to undertake an action project concerned with enhancing the participation and empowerment of young Roma. In this paper, we draw on the learning from this project to discuss the importance of everyday contexts of action for young Roma participation, exposing some of the barriers and complexities at play as young Roma seek to contest their exclusion. Using case studies from UK, Ireland, Spain, and Romania the paper reflects on action research as a strategy for enhancing young Roma participation and build capacity for change as they negotiate future trajectories between traditional cultural identity and new European horizons. Through this paper we aim to contribute to debates and interweaving discourses of identities, citizenship, democratic participation and the importance of the everyday as they inflect on the lived realities of a marginalised group of children and young people in a rapidly changing Europe.

Constraints of Children's Active Citizenship in Excluded Territories

Natalia Fernandes, Maria João Pereira
Universidade do Minho, Portugal; Universidade do Minho, Portugal
natfs(at)ie.uminho.pt, mariajoaopp(at)netcabo.pt

Children play a key role in building knowledge (Lansdown, 2001) about themselves and their worlds,

providing a greater understanding on how they perceive their own lives. Towards that we assumed the framework of the Sociology of Childhood that regards the child as a human being with rights (Fernandes, 2005) and with an active role in the society. The neighbourhood of social housing provides different experiences of life to children from those experienced in other contexts, demanding other theoretical frameworks, namely the Urban Sociology (Grafmeyer, 1994).

Our methodological framework was based on a qualitative research, through a participatory research method that allowed the development of a shared relationship (Francischini & Fernandes, 2016) with 38 children (8-12 years old) and a knowledge production based on their representations and actions. Under these principles it was possible to plan, with and for children, under a participatory research, with active and included dynamics.

Participation has proved to be a privileged tool in the fight against social exclusion, through the development of dynamics and experiences which enabled the performance of an active and inclusive citizenship (Santana et al., 2011).

In this paper we present the social competences of participation children revealed in their contexts of life and their understanding about several social problems for which they presented and worked on solutions to operationalize change in their own social reality. By performing their role as citizens, children assumed protagonism in order to meet their needs (Ballesteros, 2016), however, faced several constraints that restricted their planned participation as we will analyse in this paper.

Schoolarisation in early childhood education and the processes of children becoming pupils in Portugal

Manuela Ferreira, Catarina Tomás
Universidade do Porto, Faculdade de Psicologia e Ciências da Educação, Portugal; Instituto Politécnico de Lisboa and CICS.NOVA.UMINHO, Portugal
manuela(at)fpce.up.pt, ctomas(at)eselx.ipl.pt

The emergence of the quality discourse in education in the 80's and, more recently, that of the school excellence, has also been reflected in Portugal and in early childhood education under forms of childhood governance founded on an increasing schoolarisation of the kindergarten and the precocious processes of children becoming pupils.

This paradigmatic shift, revealing the pressure exerted by the school system and its methods on early childhood education, has implied changes in the relative autonomy of the kindergarten, either in the form of research, measures, standards and guidelines for 'good practices' alongside the increasing formalization of the curriculum; either through (im)perceptible ways under the practices lived between adults and children in the daily life of kindergarten.

From an interdisciplinary matrix between Sociology of Childhood and Sociology of Education this this paper

aims to i) map and analyse the political measures that underpin the process of schoolarisation in early childhood education (1979-2016) and then li) to analyse some of the features in which these measures are currently implemented and experienced by kindergarteducators and children in kindergartens located in Lisbon and Porto.

The identification of sociopedagogical practices tending to reproduce school form, the presence of collection curricula and formal and explicit modes of pedagogical transmission that emphasize literacy and numeracy point to the reconfiguration of early childhood education as a context of schoolarisation and early processes of children becoming pupils. These issues raise a critical reflection on the functions and identities of early childhood education, the educators and children as well as the right to play.

RN04 | Session 07b New Theories for Understanding Childhood II

Learning from Child and Youth Centred Research on Uncertainty in the Global South

Vicky Johnson

University of Brighton, United Kingdom

vicky.johnson(at)brighton.ac.uk

This paper presents the underlying theory, stratification of uncertainty and participatory methodologies that are being applied in the global south (Johnson and West 2017) that will inform European research on uncertainty.

Our starting point is child and youth perspectives, within a rights based framework on uncertainty that builds on the Change-scape framework (Johnson 2010, 2011, 2015), Living Rights (Hanson and Nieuwenhuys 2013) and Bauman's theories of community in insecure times (2001).

Uncertainty in children and young people's complex everyday lives in insecure contexts should not necessarily be viewed as negative; uncertainty may also offer moments of creativity and be viewed as potentially positive by young people as they break bonds with family and community, and seek autonomy and alternative support with peers.

This paper illuminates young people's feelings about uncertainty as they experience processes of marginalisation as they grow up. Moments and feelings of uncertainty are analysed through understanding decision-making processes, intergenerational dynamics and cultural transmissions as young people develop their identities, relationships and networks of support.

The research explores young people's feeling towards the spaces and places that they inhabit, their sense of belonging and their mobility and migration strategies. Crisis in terms of the impact of conflict and environmental fragility and disaster is also examined as cross cutting and link to the analysis of insecurity of political and environmental contexts.

Proposed research in Europe with partners in Brighton, Barcelona and Ghent builds on this YOUR (Youth Uncertainty Rights) World Research in Ethiopia

and Nepal (2016-2019).

Hindrance or Manpower?: The Intertwining of Material Bodies of and Discourses on Children in Wartime Mobilization and Evacuation in Japan

Eriko Motomori
Meiji Gakuin University, Japan
motomori(at)soc.meijigakuin.ac.jp

As social historians illustrated, after modern societies began to examine children within a “development” framework, societies began implementing a series of institutions, which Donzelot called the “tutelary complex,” to protect and socialize children. Although this approach highlighted the construction of knowledge, institutions, and practices surrounding childhood, researchers were faced with the matter of the materiality of children, i.e., small, vulnerable, biological bodies. Regarding this conflict between the construction of childhood and the materiality of children’s bodies, Prout and the “new waves” advocated the study of biological-technological-social networks that construct specific childhoods. This paper will illustrate one such network.

Japan implemented a “tutelary complex” for children in the early 20th century. However, war with the U.S. shook this once-established network of knowledge and institutions, as teenagers were mobilized to workplaces while elementary school pupils were evacuated to the countryside. Weighing the usefulness or uselessness of children’s small bodies, these relocations intended to either supplement the scarcity of manpower or remove hindrances in air defense. To sanction these relocations, the government co-opted the existing knowledge on childhood development, relied on school units for efficiency, and, consequently, used rhetoric such as “labor as education.” The catastrophic results of these relocations were obvious in Hiroshima, Okinawa, and other cities where relocated children were slaughtered in mass.

By examining the details of the network of discourses, material bodies, circumstances, and existing institutions, this paper discusses how the strength of the modern networks intertwined with the reality of children’s bodies, aiming to contribute to theoretical discussions.

An interdisciplinary theoretical framework for understanding child welfare

Sharon Pinkney
Leeds Beckett University, United Kingdom
s.pinkney(at)leedsbeckett.ac.uk

Within this paper I suggest a new interdisciplinary theoretical framework for understanding contemporary child welfare and child protection policies and practices. The framework has child centred policy and practice at its core.

The first theoretical foundation is the children’s rights literatures that have been well developed over the last 25 years. Secondly the paper combines this with insights developed within a feminist approach to the study of child abuse in particular. The third theoretical

perspective is that of the psychosocial which considers the way that children’s interior worlds, lived experiences and emotional dynamics can be further understood. The fourth theoretical approach is provided by delving into anthropology, and in particular, returning to the work of Mary Douglas whose pioneering work on concepts such as purity and contamination beliefs can assist us in understanding public, media and professional perceptions of children who are neglected. The fifth perspective looks at the ways that social inequality and in particular poverty, gender, social class, race and disability, for example, are experienced first hand by children and young people. The sixth theory involves literatures developed within the mobilities paradigm which are enlightening when applied to child welfare practices. These important theories help untangle the issues around places and spaces of child protection and child welfare policy and practice.

The aim of this new theoretical framework is to provide some fresh insights into the challenging and complex issues and dilemmas in relation to child protection, abuse and neglect policy and practice.

Changes in The Model of Child Care in 21st Century Through Historical Records of Child Care Centres in Crete, Greece

Calliope Markaki, Sokratis Koniordos
University of Crete, Greece; University of Crete, Greece
eaglelagoon(at)yahoo.com, koniords(at)uoc.gr

There is a constant evolution of the measures and approaches which derive the social care policies through the years. The past theories of childhood, represented primarily by Aries, Mitterauer, Sieder and Pollock, withdraw under criticism whereas further experience is gained through increase in the data from empirical observation and current social research, which challenge the established perceptions of childhood. The social status of children has undergone radical changes from the 19th century until recently.

This research investigates the socio-economic characteristics of children and families who accessed a representative number of Child Care Centres in Crete from 1970 to 2016, and explores the reasons for children’s admission and duration of their stay. The research findings indicate how perceptions around childcare have evolved through the various changes that took place in Greece in the last 46 years.

The research findings confirm the new trend in childhood study in sociology, which emphasises that childhood and perceptions around child protection are influenced by a wide range of economic, political and ideological factors, and that children can become a separate observation unit and can constitute a separate statistical category, in order to gain an insight on these factors.

In this view, childhood and child protection perceptions are not predetermined but defined by factors and conditions similar to other cultural products. Through our research, child protection is

considered a dynamic social and historical construct; a continuously generated social phenomenon, which is regarded as having value in the present, past and future; and it is being conceptualised as an integral part of the social structure, which affects and is affected by social relations.

RN04 | Session 08a Children's Everyday Lives I

Leave the kids alone. Children's mobility in Italy

Eleonora Meli, Laura Cialdea

ISTAT Italian National Institute of Statistics, Italy;

ISTAT Italian National Institute of Statistics, Italy

elmeli(at)istat.it, cialdea(at)istat.it

During the last decades children's mobility has progressively lost autonomy. Environmental conditions and social perspectives have changed. Many of these changes have affected children's independent mobility; such as every day journey to school and the possibility to play unattended in their neighborhood. More attentive and overcontrolling parents have progressively reduced children's autonomy.

This paper describes children's mobility in Italy, illustrating the possibility that children have to move unsupervised in their neighborhood. Analysis focus on children aged 8-10 and 11-14, exploring data from Italian Time Use Survey, conducted in 2013-2014. Data has been collected from children time use diary, these data have been used to describe autonomy in several aspects of daily life: travel from and to school, journeys in their neighborhood, doing homework and choosing their clothing. The study explores children's autonomy by age and sex, municipalities and regions of residence. Furthermore, some family's dimensions (parents' age, occupation and educational qualification, and also siblings' presence) are explored in respect of children's independence.

Among children aged 8-10 few are allowed to go to school alone; little more autonomy is gained in the afterschool movements, easier if they have siblings. Although the data changes in respect of the 11-14 aged children, only a small number still goes unaccompanied. The very reason seems to be the parents' habit to use their cars for their mobility, which affects very much the way children move around.

Teenagers' traces: exploring the spatial footprint of adolescent activities in Athens

Stefanos Tsigdinos, Maria Latinopoulou

National Technical University of Athens, Greece;

National Technical University of Athens, Greece

dist_lp(at)hotmail.com, latinopoulou(at)gmail.com

It is generally known that adolescence is a period of personal development, not only physically but also mentally and socially. One of the biggest fears among all adolescents is social exclusion. Thus, they are vulnerable to peer influence and the seek of the sense of belonging. While being an adolescent, one gets more and more independent, making his/her own decisions. During this period, they look for places within the city where they feel safe and fulfill their

needs for social interaction, but at the same time they search for places that provide them with the possibility of self-expression and retreat.

But not all public places are appropriate for this kind of social encounter. In today's cities where insecurity and individualism seems to be the most common feelings in public places, those suitable places get more and more diminished. In this research, personal choice is the variable that defines the appropriateness of a public place for a kid. The sample that it's put under investigation are adolescents, since a younger kid is not that free to make his/her own choices about where to go and when. Furthermore, this article focuses on public spaces in the municipality of Athens.

Data analysis is done in a Geographic Information Systems (GIS) environment and aims at mapping of adolescent activities, description of their characteristics and their association with both social features of acting subjects (e.g. age, place of residence) and the characteristics of the urban environment (land use, square formation etc).

In conclusion this presentation intends to outline the choices being made by adolescents in the city of Athens and their impact on the urban public space.

The social space of a kindergarten: how it is constructed by children?

Olga Savinskaya

Higher School of Economics, Russian Federation

savinskaya(at)gmail.com

The research is focused on the development of methods for the study of preschool children's opinion and view. The preschool is considered not only as an educational institution, but as a common home for a social group, which has its own norms and values, a special world of meanings that constitute their "childhood" culture. The kindergarten is the place of day care children, where they realize their goals and desires, build a trust and justice, embodied in everyday practices. How children perceive the "social order", the norms and rules of kindergarten's space? The constructivist approach to the study of childhood is applied in the research.

To achieve this goal the strategy of multi-method qualitative research will be applied. The first stage will involve the using of two projective methods: the 18 gamifying interviews with 5-8 years old children and drawing methods (near 30 pictures) with children' interpretations of drawings. On the second phase, the collected on the first stage material will be evaluated and interpreted by "experts" of "adult world" (educators, sociologists, parents, psychologists, etc.) to saturate and triangulate the results of the first research phase. Because of the project has methodological orientation, is consider the comparative analysis of two methods of data collection and role of expert interviews of the second stage.

Place, Generation and Everyday Life: Reflections from Belfast

Madeleine Leonard

Queen's University, Belfast, United Kingdom
m.leonard(at)qub.ac.uk

The purpose of this paper is to explore how place and generation impact on the everyday lives of teenagers who grow up in segregated communities in Belfast. Gieryn (2000) appeals to sociology to make 'space for place' by calling for an 'emplaced sociology'. The paper responds to this call by illustrating how the physicality of place is an important interpretive lens through which everyday life is accomplished. While teenage identities are multiple and dynamic, they emerge within and from place and impact on the past, present and future. The paper illustrates how everyday life is accomplished by young people living in divided cities, using Belfast as a case study. The paper explores the extent to which young people living in segregated areas view the city of Belfast by outlining their spatial practices within and across their immediate localities and their usage of city centre spaces. Until recently, generation has been largely neglected in understandings of how perceptions of space and place impact on daily life and spatial practices. Yet ignoring young people's understandings of socio-spatial knowledge and experiences of divided landscapes is likely to result in partial accounts of daily life in divided cities. Young people's everyday spatial movements reveal much about the visible and invisible borders of politically contested cities and how they are maintained, strengthened, contested and crossed.

RN04 | Session 08b Childhood in Social Structure

Do socioeconomic status and quality of family life play a part in children's subjective wellbeing? A comparative study on welfare regimes in Europe

Leena Helina Haanpää, Enna Toikka
University of Turku, Finland; University of Turku, Finland
lehaan(at)utu.fi, ensito(at)utu.fi

In this paper we examine whether children's subjective wellbeing (SWB) and perceived life satisfaction is mediated by welfare regimes, socioeconomic position and quality of family life. It is known that countries redistribute wealth with different political systems. Countries counted as social democratic welfare regimes, i.e. the Nordic countries; rank higher on wellbeing indicators and also have less wellbeing-related inequalities. Based on previous research, a model is proposed which is built upon macro- (state), meso- (family), and micro-level (individual) variables aiming to identify mediating effects of welfare regimes by using GDP converted to PPP (purchasing power parity) as macro-level measure. Other items used in constructing a model of wellbeing differences among European children are socioeconomic position (modified version of the Family Affluence Scale, FAS) and family structure as

measures of meso-level variable, and quality of family life as micro-level measure. Adapted version of Personal Well-being Index-School Children (PWI-SC) is used as indicator of SWB (Cummins & Lau 2005).

This study is part of an international Children Worlds (ISCWeB) survey carried out in 17 countries worldwide during 2013-2016. ISCWeB's main idea is to collect data on perceptions and evaluations of children in their mid-childhood (10, 12 years olds) especially on subjective wellbeing matters. In this study, five European countries representing enlarged version (Zambon et al. 2006) of Esping-Andersen's classification (1990) of welfare regimes (Finland, Germany, Poland, Spain, the UK, N=10 000) form the data. Preliminary results indicate that children from different welfare regimes differ in SWB but the strongest effect is on individual-level experienced quality of family-life $F_4, 9167 = 712.71, p < 0.001$ ($Ra2 = .24$).

The societal constitution of childhood and children

Heinz Suenker

Wuppertal, Germany
suenker(at)uni-wuppertal.de

The paper analyses the constitutional conditions of childhood and children beyond the traditional approach of 'generational ordering'.

This happens by using Marx' analysis of different modes of societalisation (Vergesellschaftung) in history - with respect to historical developments and stages.

To childhood and children it 'happens' to be the only group in the bourgeois-capitalist society to be in the form of 'dependency' while all others are formally 'independent'.

Therefore it is discussed what that means for the conditions of the constitution of subjectivity -with special emphasis on questions of agency and participation.

Poverty patterns during childhood – Characteristics and determinants

Silke Tophoven, Claudia Wenzig, Torsten Lietzmann
Institute for Employment Research, Germany; Institute for Employment Research, Germany; Institute for Employment Research, Germany
silke.tophoven(at)iab.de, claudia.wenzig(at)iab.de, torsten.lietzmann(at)iab.de

In Germany – like in most European countries - children are still at greater risk of growing up in poverty. However, most official statistics as well as a number of research findings depend on cross-sectional data. Using longitudinal data enables to enhance the perspective in terms of children's poverty trajectories during childhood. Thereby, the questions arise what characterises poverty patterns during childhood and what determines childhood poverty patterns. Against this background, we examine poverty patterns of children in Germany. For our analysis, we employ the nine waves of the German

panel study “Labour Market and Social Security” (PASS). In order to gain a more precise picture of low-income households, we distinguish between four different household income situations: “secured income position”, “social benefit receipt and income poverty”, “social benefit receipt” as well as “income poverty”. In order to identify typical poverty patterns during childhood, we make use of sequence analysis in combination with cluster analysis. We find differing clusters in terms of timing as well as length of poverty. In addition, we analyse which aspects determine cluster affiliation beside household income situation. The results show that the biggest group of children lives in households with a more or less secured income position during their childhood. However, there is also a group of children that grows up in permanent poverty and a group of children that changes between secured and precarious income situations during their childhood. Beside income position of the household, further determinants of cluster affiliation clearly exist.

Family models, welfare State and children’s subjective well-being

Almudena Moreno, Marta Ortega Gaspar
University of Valladolid, Spain; University of Malaga, Spain
almudena(at)soc.uva.es, maga(at)uma.es

Following on from the theoretical models on the importance of families and family relationships for children’s subjective well-being, in this paper we have tried to design an analytical model to estimate the likelihood that independent variables (family relationships, school relationships, financial situation perceived by the child, as well as the time the child spends on certain activities) can explain children’s subjective well-being. To this end, we collect the variables included in the Children’s Worlds Survey of children aged eight years old 2013-2015 to design and test statistical models that are better suited to our objectives. The estimated mathematical model was applied to four countries with very different family models, welfare regime and school systems such as Germany, Norway, Spain and United Kingdom. The baseline hypothesis was that family relationships will have a greater impact in Mediterranean countries (Spain) and Conservative (Germany) than in Norway and United Kingdom in predicting children’s subjective well-being than other factors such as friends, school and use of time. This would be the case given the characteristics of the welfare regime in Spain, where the family is the primary socialisation environment in early childhood compared to the limited public development of preschool education. In contrast, in the Nordic welfare system, preschool education and public schools are the basic settings for children’s socialisation given that the predominant family model is of two earners where both the father and the mother work full-time.

RN04 | Session 09a Children’s Everyday Lives II

Listening to children experiencing conflict in relation to parental divorce

Sarah Alminde Kærsgaard
Roskilde University, Denmark
saras(at)ruc.dk

In the UNCRC as well as in the Danish national legislation it is specified that children must be heard in matters that concern their lives. A core example of this is parental responsibility cases. In these cases the parents are unable to come to an agreement concerning residence and/ or custody of the child and they therefore bring the matter before the court. In an empirical study set in the court system in Denmark, I have conducted observations and interviews with children, parents, psychologists, judges and lawyers in parental responsibility cases. On the basis of this study I will elaborate on how and under which circumstances children are being heard, when the juridical system is either making court decisions or engaging with the parents in order to settle the matter. Taking a starting point in the concepts presented by Bronwyn Davies: Emergent Listening and Listening as Usual, I will discuss to which extent the children’s perspectives are supported and taken into account. Furthermore I will discuss how dominating understandings of children and their capacity and wishes for involvement, shape arguments both for involving children as well as for not involving children.

The experiences of young people with learning disabilities who have been sexually exploited in the UK – The value placed on their protection.

Anita Franklin, Emilie Smeaton
Coventry University, UK, United Kingdom; Paradigm Research, UK.
anita.franklin(at)coventry.ac.uk,
emiliesmeaton(at)paradigmresearch.co.uk

In the UK, child sexual exploitation (CSE) has received considerable attention in the last few years, with evidence pointing to an increased risk of sexual exploitation for children and young people with learning disabilities. Despite increased risk, no attention has been given to understanding from the child’s perspective; how they understand or experience the risk of CSE, and their routes into sexual exploitation. As part of a large UK study, 27 young people with a learning disabilities aged 12 – 23 who had experienced, or were at risk of, sexual exploitation were interviewed using accessible, child-centred methods. Through listening to their experiences, it is possible to see how societal attitudes towards disability, and structural and political barriers had direct and significant impact on their lives rendering them unprotected from exploitation. The young people identified how they were either too overprotected, or not protected at all, by the processes and structures which dominated their lives. They also shared how the need for friendships, relationships, inclusion and a sense of self-worth

created vulnerabilities. The paper will also voice their solutions about how we can better protect, identify and support young people with learning disabilities from exploitation. These solutions require societal change in how we view and frame the sexuality of disabled young people, and how we understand and respond to the intersectionality of learning disabilities and exploitation in society.

To reflect or reflect? Building intergenerational relationships for change

Deborah Jane Crook
University of Central Lancashire, United Kingdom
djcrook(at)uclan.ac.uk

Schools can be spaces that mirror what is happening in society or they can be spaces through which to imagine better futures, enabling opportunities for change. Narrow interpretations of political participation or 'voice' promote neoliberal governance and ignore children's current and future lives. This paper considers a study that utilised participatory action research to build intergenerational relationships in schools to enable change. A class of 10 and 11 year old children in northern England were able to transform their classroom space through intergenerational inquiry, creating opportunities for dialogue and mutual understanding. The findings suggest that more meaningful participation develops through rich relationships when spaces are shaped through recognition, agency and attention to democratic values.

RN05 - Sociology of Consumption

RN05 | Session 01a Leisure and Digital Consumption

(Big) data-driven programmes and the “post-TV culture”

Bogumila Mateja-Jaworska
Adam Mickiewicz University, Poland
bmateja(at)amu.edu.pl

With the announcement of ‘the era of Big Data’ (e.g. Anderson 2008), many believe that it is only a matter of time when Big Data will supersede traditional kinds of research. The case of Netflix series “House of cards” was particularly often analysed (Smith, Telang 2016) and set as a proof that data-driven programmes are the future of media industry (Wolk 2015). Following the Netflix example, media specialists are convinced that in contemporary creative business “customer data is king” and they may be obtained using algorithms. Big data describing the actual media consumption and viewing habits are often treated by the media industry as an ultimate, “objective” solution to the problems of anticipating popularity of certain TV programmes and creating new ones. In my presentation, I will argue that this kind of “post-television culture” (Strangelove 2015) or “algorithmic culture” (Striphas 2015) opens up new areas for critical cultural analysis and in-depth research. What is more, understanding post-TV landscape and its mechanisms seems to be crucial in order to embrace the changes in production and circulation of meanings in contemporary western societies.

Analog Affect and the Renaissance of ‘Dead’ Media

Alev Pinar Kuruoglu, Joonas Rokka
University of Southern Denmark, Denmark; EMLYON
Business School
alev(at)sam.sdu.dk, rokka(at)em-lyon.com

In late 2016, Guardian newspaper reported that vinyl sales overtook digital sales in the UK (Ellis-Petersen 2016). Kodak announced at the 2017 Consumer Electronics Show in Las Vegas it will bring back Super 8 film cameras, Ektachrome film, and hints at the return of beloved Kodachrome film brand. Analog media have experienced a major resurgence. With analog media – records, cassettes, polaroids, fanzines, VHS film, and others – authors have drawn attention to the emotional intensity (Kuruoglu and Ger 2015), warmth (Bartanski and Woodward 2015), and tactility (Bartanski and Woodward 2015; Marks 2000) of media objects. This paper expands theorizing towards understanding the affective experience of analog in contradistinction to digital media, and in this

way wishes to explain the renaissance of analog media in the era of the digital. In particular, we ask: how do different forms of media lend themselves to affective atmospheres and sociabilities? Based on our fieldwork since 2013, we explore how affect is produced, transmitted, and circulated within a community of skateboarders in Helsinki. Following this scene and its members, we found a strong counter-trend towards digital media and a proclivity towards producing and consuming their own analog media. We find that the material objects, including the skateboards, the analog media, and the media contents, both generate and are embedded in an affective atmosphere. The city of Helsinki also lends itself to “intensive space-time” (Anderson 2009) that the skateboarders and their productions traverse.

All consuming popular media? a Swedish perception study

Tullia Jack
Lund University, Sweden
tullia.jack(at)gmail.com

Media is now omnipresent in everyday life: we are constantly inundated with messages of what we should aspire to and how we should do normality. There is concern that stylised imagery instills a sense of inadequacy, leading to positional treadmills and implicated unsustainable consumption. Little is known, however, about how everyday people actually respond to media (MacFadyen et al., 2003). Representation and reception are not necessarily one and the same. This study uses focus groups to unpack the relationship between representation, reception and application of media narratives in everyday life. To this end I explore ways that everyday people perceive cleanliness narratives in popular magazines. Cleanliness provides a clear case of inconspicuous consumption of water and energy implicated in accelerating cleanliness practices (Shove, 2003). Focus groups are employed for their potential in studying processes of ‘attitude formation and the mechanisms involved in interrogating and modifying views’ (Barbour, 2007: 31) that inform the reception of social narratives, like cleanliness. People constantly produce themselves in all contexts of interaction by ‘telling, negotiating, re-telling and performing their self-narratives’ (Halkier, 2010: 76), offering insights into how representations are interpreted and made sense of in the context of everyday life. By interrogating various media discourses surrounding cleanliness, this study offers insights into ways that representations are perceived and integrated into social normality by everyday people. This is useful in understanding how media is perceived and applied with exciting implications for sustainable consumption.

Consumption of digital technologies across the life course – does age affect technology readiness among media consumers in Finland?

Sanna-Mari Kuoppamäki
University of Jyväskylä, Finland
sanna.kuoppamaki(at)jyu.fi

In a digital society, consumption practices from communication, entertainment, shopping, banking and health care are digitalising and digital literacy has become a necessity for participation in a consumer society. Previous research indicates that digital literacy as well as ownership of digital devices is connected to socio-demographic factors; age, education and income level being the most important ones. In sociological research, less emphasis has been put on technology readiness (TRI) that measures people's propensity to embrace and use new technologies in everyday living (Parasuraman et al., 2015). Technology readiness has four dimensions (optimism, innovativeness, discomfort and insecurity) that are believed to affect a person's predisposition to use new technologies. The study asks, to what extent age and other socio-demographic factors predict technology readiness (TRI) among media consumers in Finland and whether or not life course factors (household structure and social relationships) have an effect on technology readiness. The results are derived from an online based survey collected in 2016 among Finnish media consumers aged 18 to 83 (N=1,366). Preliminary results suggest that age is negatively associated with optimism and innovativeness and positively associated with discomfort. In insecurity, age does not remain a significant predictor, and household structure is associated only with discomfort. By analysing technology readiness among media consumers of different age groups, new insights to digital inclusion and exclusion can be obtained, which simultaneously contribute to the discussion of challenges that digitalising consumer society encounters in a period of economic changes.

RN05 | Session 01b Sociology of Taste

What is the place of taste in the value chain? Coffee shops, baristas and specialty coffee in contemporary Brazil

Mauricio Piatti Lages
University of São Paulo, Brazil
murucopl(at)hotmail.com

This article attempts to investigate the transformations of coffee along its value chain, from the most primary links to the service sector, when it comes into play the appreciation of the sensorial attributes of the product. We have observed that the rise of niche coffee shops in the last ten years has contributed to the systematic change of preferences, as consumers are becoming increasingly interested in more acidic and sensorially complex coffees, instead of the typical bitterness of traditional Brazilian and European coffees. In order to understand how these new material and symbolic

frameworks are propagated, we turn our attention to the professional barista, which acts as a mediator in the relationship between the consumer and the product. In this way, it appears that the production of consumer taste by these intermediary links of the chain acquires a key role in the reorganization of the coffee market. Furthermore, such transformations are part of a larger process in which the production models migrate to a "quality logic", which aims to forge specific niche markets defined by the valorization of quality and origin. In total, we investigated seventeen coffee shops and applied questionnaires to twenty-nine baristas in São Paulo and Brasília. Considering the articulation between consumption and production, the article also seeks to contribute to the understanding of the value production in the very spaces where consumption occurs, extending the reflection to other comestibles and beverages.

Tastebrary(1) as a sociological concept

Sandra Fontanaud
Université de Picardie Jules Verne, France
sandra.fontanaud(at)u-picardie.fr

The field of gastronomy is omnipresent in France and has been got more dense, diversified and complicated since the 2000s : the traditional chefs of the 70s sitting behind their stoves and surrounded by their assistants (replaced by the charismatic leaders of these last years), are joined today by female chefs, pastry chefs, mixologists, coffee roasters, chocolate makers, baristas and other food thinkers.

Since Pierre Bourdieu and *Distinction*(2), we know that tastes and colors are very widely discussed, that they are matters of socialization, social class and cultural good willingness. We can however wonder about the promoters of taste democratization who appeared a few years ago. In what ways do these artisans transform their knowledge and know-how into feelings ? Since when do the consumers expect to live an "experiment" by tasting products ? How does this popularization transform customers into informed and critical amateurs, gastronomes or cooking enthusiasts ? What differentiates a cooking chef developing his labor around a product, from a chef who tries to translate his labor into an emotion or an idea ?

By using the concept of tastebrary and by examining its nature, the goal of this study is to understand how actors of taste receive, maintain and transmit their culture, and how they participate in the democratization of taste and in the definition of their professional field.

(1) Translation of « gustothèque », contraction of "goût" (taste) and "bibliothèque" (library), a term coined by Philippe Conticini, a pastry chef

(2) Bourdieu P., *La distinction. Critique sociale du jugement*, Paris, Les éditions de Minuit, coll. Le sens commun, 1979

Cultural Taste, Social Mobility and Shame. A qualitative approach

Kamil Luczaj
University of Information Technology and

Management in Rzeszow, Poland
kamil.luczaj(at)gmail.com

The qualitative methodology, namely the life story approach (D. Bertaux, I. Bertaux-Wiame), can help draw a detailed picture of upwardly mobile people. Pierre Bourdieu refers to them as “les miraculés du mérite” because they significantly improved their social position over the years, against all the odds. This paper offers a theoretical overview of problems related to the impact of social mobility on aesthetic taste. Upwardly mobile individuals inherit a certain (usually lowbrow) cultural capital and, after the change, they need to adapt themselves to the standards of different culture, which sometimes can be perceived as a foreign culture (Ch. Walley). I will focus on the issues of “rankism” (R. Fuller), “biographical work” (A. Strauss), sociology of shame (T. Scheff), and various notions from Pierre Bourdieu’s theory.

Regrettably, under Bourdieu’s framework, an individual is perceived as coherent individual (ego), even though the obvious lack of consistent identity is visible when one has to constantly switch between “old” and “new” practices, e.g. if different preferences should be displayed in public (at work, in the local community) and different in private (during family gatherings). The switching can be traced especially when there is a need to reconcile incompatible culinary tastes, musical sensibilities, architectural preferences, or practices related to particular brand consumption. The life history method allows researchers to treat an individual as a process (N. Elias, B. Lahire, J.-C. Kaufmann) and the real sociology of individual becomes possible.

Autonomy versus commercialization: An analysis of the advertisement content of the culture sections of European newspapers, 1960–2010.

Riie Lotta Solveig Heikkilä
University of Tampere, Finland
riie.heikkila(at)staff.uta.fi

Previous research has shown that newspaper cultural sections are central foci for classifying and legitimizing tastes. Cultural journalists and especially reviewers can be considered both gatekeepers and tastemakers: they filter what is written about and then participate in defining its value. Apart from the editorial content of newspapers, there is a substantial and growing amount of non-editorial content, constituted mostly of commercial advertisements. Advertisers are at the heart of what Bourdieu calls the “new cultural intermediaries”, central for constituting taste milieus. Advertisements, assigning different values to distinct cultural products and making them desirable for potential consumers, are definitely part of the general “cultural package” of contemporary newspapers. In this paper, I will scrutinize an aspect of commercialization that has not been paid much attention: the advertisements found in the cultural sections of newspapers. I ask how the much-discussed “commercialization of cultural journalism”

claim shows in terms of concrete advertisement content in the cultural sections of six European quality newspapers between 1960 and 2010. Firstly, is there an increase in the absolute or relative amount of advertisements between 1960 and 2010 in the cultural sections and how does this commercial content relate to editorial content? Secondly, how do the advertisements change over time? To answer these questions, I use a large data deriving from Finnish, Swedish, British, French and Spanish European newspaper culture sections and the advertisements found in them and take a both quantitative and qualitative look on them. My data consists of 2799 advertisements and 3393 newspaper pages.

RN05 | Session 02a Markets of Consumption

The Sharing Economy’s Transformation of Lonely Trips to Common Experiences: The Airbnb Case

Francesca Setiffi, Gian Paolo Lazzer
University of Padova, Italy; Ca’ Foscari University of Venice, Italy
francesca.setiffi(at)unipd.it,
gianpaolo.lazzer(at)gmail.com

This research investigates the meanings that consumers give to social practices that take place in the sharing economy. The case study on which this research is based is Airbnb. Within this economic activity, the meaning of ‘home’ has shifted from a private environment to a space that can potentially be shared with strangers. For homeowners – especially middle-class owners – the main reason for participating seems to be the chance to earn money from a short-term rental. Within this form of sharing, there are at least three ways to create a ‘shared experience’: the relationship with the owner, the relationship with other unknown persons in the house or the relationship with people (like friends) with whom the customer is travelling. Considering these relationships means understanding how people experience the sharing economy. For them, cost saving is not the only reason for using Airbnb.

This research is based on qualitative methods and has been carried out in Italy through 28 in-depth interviews with travellers. In brief, there are two main findings:

1. The platform lowers the degree of ‘strangeness’ of the owner and/or of the house. Thus, it emphasises the role of trust as a positive factor for the growth and the development of the sharing economy.
2. The ‘sharing experience’ is a kind of wish – a new travelling experience – that allows consumers to live a different experience compared to hotels, considering a private home is closer to the culture of a particular place.

Airbnb is a recent phenomenon, but for several of the persons interviewed, it is already a ‘new normal’.

Combatting scruffiness. Chaos and order in the retro world

Helene Brembeck
University of Gothenburg, Sweden

helene.brembeck(at)cfk.gu.se

This presentation is based on the notion of a disorganized and shabby history of the thrift industry and the fight against mess and squalor as the key to the transformation of secondhand objects and shops from scruffy flea markets to trendy boutiques. During much of the 1900s, flea markets and thrift stores have been associated with the ugly, uncomfortable and almost indecent closely associated with poverty. Meanwhile, the traditional flea market's chaotic elements have been highlighted as a central aspect of its special aesthetics and appeal. Objects reside in a gray zone between throwing and keeping, between the hopelessly outdated and the potentially kitsch and cool. In the modern inner city 'cozy' shopping areas objects are taking the plunge into store logic where the used, worn and shabby traits are carefully washed away with staff's help. This presentation shows how this transformation is happening using strategies, such as 'washing away', 'shop making' and 'creating flows'. The material consists of interviews with store managers and staff, observation and photo documentation of a large number of retro stores in central Gothenburg. It is in the store objects qualify to become goods and thereby get a second chance in process of circulation. By preening, complementing, redoing and putting in new contexts, second hand objects are transformed to fashionable, 'cool, and 'kitsch', that they are given the 'green values' and made attractive by being placed in artificial worlds associated with nostalgia and sentiment.

Rethinking Trust and Social Capital in trading Chinese Antiquities

Yuying Lee

Yuan Ze University, Taiwan

leeyuying58(at)gmail.com

For avoiding opportunism and reducing risk, consumers tend to use interpersonal relations in many consumption decisions both in the search process and in the choice of transaction partners. This paper illustrates the limitation of interpersonal relation in the field of antique market. Owing to antique market is a small scale business; there is no formal organization to regulate the market. Information asymmetry, opportunism, and deceit are normal in the trade. Therefore, what is important in the transactions are personal trust and guanxi as to ensure the transactions. Ironically, this does not guarantee the traded goods would be genuine because there are numerous fakes in market. In the antique market, actors are competing on economic power and social, cultural capitals. Buying or trading antiques is heavily depending on social network in order to obtain fine artifacts. Antique market is about relationship between traders and trustful sources, about traders and customer in negotiating prices, and about knowledgeable expert interpreting the value of a piece of artifact. Rarity and one-of-a-kind made Chinese antiquities transaction a distinctive type of consumption. There is no space for

consumers/collectors to shop around and compare prices. Buying antique is similar to gambling, rational choice is under contesting.

I applied a variety of qualitative research techniques to examine intricate relation between Guanxi and knowledge in buying ancient jade. These techniques include extensive use of in-depth interviews, observation and the use of a variety of documentary sources. Field trips were done in Beijing, Shanghai, Hangzhou, Hong Kong, and Taiwan from 2009 to 2015.

Gift Is Not Only the Present, But Also the Future: The Food Offerings of Middle-class Turkish Women

M. Fatih Karakaya

Istanbul University, Turkey

zinderud(at)gmail.com

The sociological literature on the transformation of modes of exchange (from Malinowski and Mauss through Polanyi and Sahlins to Caillé and Karatani) tacitly asserts a linear history. According to that linear history, mode of exchange tends to transform from pure gift to commodity exchange, a tendency which is considered as both a cause and an effect of changing social solidarities. On the other hand, the transformation of a small gift practice of middle-class Turkish women, i.e. food offerings to the neighbors paves the way for a counter-argument, which points an alternative history that is more cyclical than linear. In other words, after transforming into a latent indebtedness, food offerings to the neighbors in the course of daily routines of Turkish women tend to take the form of a pure gift within a modernized, individualized, financialized world. Based on a qualitative analysis of the data derived from in-depth interviews, this study at first, aims at describing in detail how this food, and of course the plate traffic takes place in daily lives of middle-class Turkish women. Secondly, this study seeks to illustrate how this practice transforms into something a pseudo-gift, which is still undermining the solidarities by loosening the social ties among neighbors (that is why it is called "pseudo") while still having a potential to maintain solidarity since it is very close to a pure gift form. All in all, this study is willing to point out alternative forms of exchange in daily life within a world dominated by debt oriented market capitalism.

RN05 | Session 02b Ethical and Political Consumption

Universalistic moral discourses, situated moralities: Communicating ethical trade in Poland and Finland

Kinga Natalia Polynczuk-Alenius

University of Helsinki, Finland

kinga.polynczuk(at)helsinki.fi

This paper approaches ethical trade as a communication problem that relays on a moral disposition, which must be constructed through

communication efforts of ethical trade organisations. Originating from the Anglosphere, the moral discourses that surround ethical trade employ the horizontal division between the 'Global North', including Poland and Finland, and the 'Global South'. In this homogenising metageography, North is imagined as a hemisphere of consumption, wealth and privilege, while South figures as a hemisphere of production, poverty and deprivation. From the presupposed prosperity in the North stem the moral obligations of solidarity, care and responsibility that Northern consumers should extend towards Southern producers.

During a year-long fieldwork with ethical trade organisations in Poland and Finland, I observed that although their communication heavily drew on these universalistic moral discourses, it was nevertheless anchored in and accountable to more nuanced economic, political and cultural conditions in their respective societies. Particularly, Polish ethical trade organisations were much more vigilant than their Finnish counterparts about the potential negative reception of their message among the public. Thus, I argue that ethical trade communication responds to the projected 'situated moralities' of consumers. To elucidate this situatedness more clearly, I borrow the vocabulary of world-systems theory which positions Finland at the core of global trade system (among the greatest beneficiaries of the global market and the holders of the largest economic capital), and Poland in the semi-periphery (simultaneously dependent on the 'core', forced to compete with other semi-peripheral countries, and oppressing the 'periphery').

Political consumption and social stratification – some critical thoughts

Eivind Jacobsen

Oslo and Akerhus University College of Applied Sciences, Norway

eivind.jacobsen(at)sifo.hioa.no

Apparently, as it has "moved South" "production" has lost some of its defining role in relation to social stratification in the NorthWest. So has "consumption", as it has been "democratized" by means of mass marketing and -distribution. In the paper, I will discuss whether political/ethical consumption could be seen to represent ways of doing social stratification by other means, whereby social class is performed and class structures upheld.

Political consumerism: towards a new typology of practices

Margarita Komninou

University of Patras, Greece; Technological Educational Institute of Western Greece

mkomninou(at)upatras.gr

Consumer practices which do not render themselves to be easily commodified by the market, such as acts of DIY, downshifting, dumpster diving, reusing, sharing, shoplifting and occupying, are infrequently discussed in the literature of ethical and political

consumption. Why does that happen and what insights can we draw from an attempt to incorporate such practices in the concepts of ethical and political consumerism?

Our failure to address the ideological context of 'consumption' has resulted in perceiving and measuring political consumerism mainly in terms of boycotting and boycotting. By viewing 'consumption' as only relevant to acts of 'purchasing' and 'shopping', the agency of the 'consumer' is bound to certain rules and mechanisms of a capitalist market. Moreover, by arbitrarily ascribing a strictly 'non-economic' motivation behind the 'ethical' and 'political' framings of consumption, we automatically exclude private (economic) troubles from the public sphere (ignoring thus their political nature). Consequently, the typical profile of the ethical/political consumer (well-educated, female gendered, well-off, middle to upper social-class) is perhaps nothing more than the reflection of a bias imposed by our tendency to measure only practices which do not breach the limits of the capitalist market (its internal logic and moral system).

This paper calls for an expansion of the repertoire of consumer action associated with political consumerism if we want to understand consumption as an "arena of politics" and a form of political participation in a democratic manner (where every person gets to "vote"). A working typology of political consumerism practices will also be presented and discussed.

Co-Creation through Crowdsourcing? - Consumer-citizens' involvement in local environmental policy measures

Pål Strandbakken, Harald Throne-Holst

Oslo and Akershus University College of Applied Sciences, Norway; Oslo and Akershus University

College of Applied Sciences, Norway

pal.strandbakken(at)sifo.hioa.no, harald.throne-holst(at)sifo.hioa.no

"Crowdsourcing is a method for harnessing the collective intelligence of online communities to solve specific problems or produce goods" (Brabham 2013: 50). A Norwegian project (iResponse) studies the use of crowdsourcing as a method to involve citizens in a two-way dialogue with local authorities for meeting problems of storm water/flooding, urban air quality and urban planning.

Based on a nationwide web survey (urban areas, N = 1933), we address questions about consumer involvement in smaller decision making processes; using ideas about participatory democracy and co-creation. Due to the novelty of these concepts in the crowdsourcing approach, the survey mainly had an exploratory design, introducing theoretical and sociological perspectives in the subsequent analysis. Results indicate that age and gender influence both familiarity with the concepts and the willingness to engage with and to employ modern technologies like smart phones for political participation.

One aim of this study is to assess whether crowdsourcing based on digital platforms is an

interesting contribution to the political toolbox. If so, to what degree? What sets of barriers have to be overcome, like consumers' lack of knowledge or lack of trust in the system, their possible worries about privacy issues and potentially sensitive information. Will older consumers be left out as digitally illiterate? For what types of environmental problems and possible measures and/or solutions might online crowdsourcing be relevant?

RN05 | Session 03a Food Poverty and Insecurity

New and old forms of poverty in Spain: an analysis of food deprivation during the crisis

Cecilia Díaz-Méndez, Isabel García-Espejo, Sonia Otero

University of Oviedo, Spain; University of Oviedo, Spain; University of Oviedo, Spain
 cecilia(at)uniovi.es, igarcia(at)uniovi.es,
 uo221461(at)uniovi.es

With the crisis, food (in)security has returned to the political agenda in Europe. Unlike many developing regions, the countries of the European Union have long since eradicated the problem of extreme hunger. A relatively new phenomenon in Spanish society is that today a significant number of families and individuals do not have the resources to access food regularly and autonomously. The economic crisis has redirected the public debate towards this issue and has shown that problems related to food insecurity and poverty are not a thing of the past. It has also become clear that there exist significant gaps in our knowledge on the phenomenon.

This paper examines the strategies deployed by households in material deprivation to meet their food needs. The particularity of this work is that two types of households are compared: regular users of food aid (old poor) with households that have accessed food aid for the first time during the crisis (new poor). The objective is to compare the strategies followed by these households to manage deprivation.

The study has focused on the collective of users of two programs of food and social assistance managed by Red Cross (Spain). The methodology is qualitative, through semi-structured in-depth interviews conducted to the person responsible of the food in the household.

Food consumption in Russia: traditional and politicized interpretations of food security

Irina Trotsuk

Russian Presidential Academy of National Economy and Public Administration
 irina.trotsuk(at)yandex.ru

According to the conventional definition of food security (availability, access and utilization of food), the vast majority of the Russian population is not food insecure. However, Russia's political leaders connect food security to national security and, thus, argue that Russia is food insecure based on food imports. The state can manipulate concerns over food insecurity to further state interests and galvanize support for the

government. The surveys conducted by the Center for Agrarian Studies (Moscow) in 2015 and 2016 show that the grass-roots interpretations combine elements of the traditional and politicized definitions of food security. On the one hand, the Russian population feels insecure when considers food prices and one's abilities to buy food products of good quality and in sufficient amount. In the face of higher food prices, respondents indicate two main strategies: to spend less on food, and to grow more of their own food (nearly two-thirds of rural residents). On the other hand, the population supports the food anti-sanctions and food embargo imposed by the government, although the embargo combined with a dramatic decline in the value of the ruble led to lower levels of imports for fresh and frozen meat, poultry, fish, and dairy. This support is primarily due to the fact, that the Western sanctions and Russia's retaliatory food embargo spawned additional emphasis on self-sufficiency and import substitution. Thus, the Kremlin's narrative on food security aligns with popular sentiments.

Food insecurity in the midst of plenty

Arne Dulsrud, Kjærnes Unni, Veena Vidyadharan, Susan Mathew

Consumption Research Norway SIFO; Consumption Research Norway SIFO; Consumer Unity and Trust Society CUTS; Consumer Unity and Trust Society CUTS

arne.dulsrud(at)sifo.hioa.no,
 unni.kjarnes(at)sifo.hioa.no, vv(at)cuts.org,
 sma(at)cuts.org

This paper uses quantitative data from a survey among 772 vulnerable households in Karnataka and Bihar to study how entitlements such as access to land, employment based income and social rights affect food security. We find that the price-income relationship for basic foodstuffs is fundamental for the vulnerable households included in our data material both for understanding their everyday procurement of food and their strategies of handling risk such as failure of harvest or external income. Access to subsidized wheat and rice by public distribution (PDS) out as a key source, with major influence on their everyday diets. Reliance on PDS leads to unbalanced diet based on staples (rice and wheat) among the poorest households. However, access and availability to food through local market distribution is crucial for their food security – particularly for non-staple ingredients. We find that shops and local markets are widely used for the supply of all food commodities, far more than own production and exchange. This indicates that the size of the household budget and thereby purchasing power is crucial for access to sufficient food. Our entitlement approach emphasis a need to include institutions in the study of social practices, that is to address the whole bundle of entitlements, including not only income through employment, but even own production and social rights.

RN05 | Session 03b Structural and Institutional Conditions of Consumption

Looking for Home in Consumer Culture

Anastasia Seregina
Aalto University, Finland
anastasia.seregina(at)aalto.fi

We build and define the places we exist in, but those places also define us. Most significantly, the places we are from give us understanding of where we belong, providing a basis for identity-development. One's home emerges as a central place of being for individuals in contemporary consumer culture. Home seems to be natural and self-evident, yet it is an extremely complex concept that has emerged quite recently as the private, personal place that we naturally understand it as. It is the result of historical, industrial, and technological developments that have shaped individualized and consumption-driven Western culture. Home becomes a central place for consumption: we consume the home itself and its elements, but the home is also tied into individual and communal consumption practices. Moreover, home becomes a central part of consumer culture through ties to various power structures. Yet, through globalization and fragmentation, we may soon be all facing homelessness. The aim of this research is to explore how individuals understand and build up the idea of home through exploring the various aspects it is tied to, such as physical space, family, community, nation-state, as well as political and cultural settings and relations among them. Moreover, I reflect on groups, for whom home is not natural or straightforward, such as migrants, refugees, and third-culture kids. The aim is to gain a better understanding of home as part of contemporary consumer culture, and map out ways in which individuals lacking a feeling of home may become assimilated into their context both through their own and others' practices. This becomes especially important to understand in light of recent economic developments and increasing migration within Europe.

The need for speed: The roles of households, government and industry in data consumption

Janine Morley
Lancaster University, United Kingdom
j.morley(at)lancaster.ac.uk

The volume of data flowing to and from households across Europe is growing. In the UK, average monthly data usage over fixed broadband connections rose from 17GB in 2011 to 132GB in 2016 (Ofcom). In the midst of a 'digital revolution', manifest in large scale investments in digital infrastructures and services, this growth of an inconspicuous form of consumption may seem neither surprising nor problematic. Yet it has important implications, both for equity of access to online services and for the environmental sustainability of the 'digital economy'. This paper argues that sociological research can make a useful contribution to debates on how to responsibly govern

and shape burgeoning forms of digital consumption. It presents findings from interview and diary research with UK households to explore how demand for faster bandwidth is experienced and enacted through a range of everyday practices, most notably streaming TV programmes. Whilst such demand is realised through household practices, it is clear that industry and governments play important roles in shaping the services that are used and the expectations attached to them. These roles are traced through analysis of UK broadband policy and the design of particular services. Overall, this develops an account of how the demand and consumption of digital services are collectively and iteratively constructed, in the inter-relations between practices and at the intersection of systems of provision, policy and consumption. This contributes to a timely and urgent debate, as new and ever-more data intensive technologies and services emerge.

The role of politics in the making of cultural hierarchies: A longitudinal comparison of newspapers from Turkey and Spain

Irmak Karademir-Hazir, Carlos J. Fernández Rodríguez
Oxford Brookes University, United Kingdom;
Universidad Autónoma de Madrid, Spain
ihazir(at)brookes.ac.uk, carlos.fernandez(at)uam.es

Views on culture and art are particularly influenced by the political field, since models of governance, hegemonic ideologies and power relations within a society all shape cultural policies and establish specific cultural hierarchies. While the realm of politics and cultural hierarchies seem to be deeply intertwined, the study of this interaction is often neglected in research on culture and arts. We aim to fill this gap by exploring the ways in which the field of politics influences the making of cultural hierarchies, focusing on the cases of two Mediterranean countries: Spain and Turkey. We draw our sample from data collected during the fieldwork of CUDIGE, which was a longitudinal and comparative project that analysed the cultural coverage of major newspapers from six European countries during the period 1960-2010. The analysis of the Turkish case reveals that the state-led westernization policies of the early years and the neo-liberal turn of the 1980s have major influences on what is included in the cultural pages as well as how the cultural products are evaluated. Meanwhile, the Spanish case shows how the country departs from a right-wing dictatorship where conservative National-Catholic ideology shapes cultural policy to a democracy where new values come to the fore, helping to rearrange the cultural hierarchies and even modifying the own status of culture in Spanish society. In our conclusion, we open up a discussion on how national political contexts can be incorporated to the study of cultural fields and hierarchies.

Nation branding and fashion in Finland

Olga Gurova

Aalborg University, Finland

gurova(at)cg.s.aau.dk

This research approaches fashion from the point of view of nation branding. In previous research we developed a concept of “place-making,” which means collective and collaborative efforts aimed at constructing and representing national identity globally through creation of artifacts and meanings (Chun, Gurova, Niinimäki 2017). In that previous research we focused on “bottom-up” approach and looked at the efforts of Finnish fashion designers to implement place-making and contribute to nation branding. In this current paper the attention is given to “top-down” approach. I look at the state and governmental bodies and their efforts of nation branding “from above”. The research draws from the literature on nation branding as “soft power”, which is used to attract attention to the nation with the purpose to sell the brands and commodities that the country offers (Kaneva 2011, 2015, Volcic, Andrejevic 2015, Castello, Mihelj 2017, Foster 1999). The research also draws from the scholarship on fashion, creative industries and cultural policy. This scholarship considers state as the most powerful agent that can facilitate or hinder the development of fashion industry through various strategies (McRobbie 1998, McRobbie 2013, Entwistle 2009). As a result, I develop category “fashion policies” as a set of implicit and explicit tools of governance through fashion. Using the data collected from document analysis and semi-structured interviews with state officials and experts from various governmental bodies I show how nation branding is implemented through fashion in Finland.

RN05 | Session 03c Rethinking Sustainable Consumption

Imagined futures of circular economy and everyday consumption

Daniel Welch, Margit Keller, Giuliana Mandich

University of Manchester, UK; University of Tartu, Estonia; University of Cagliari, Italy

daniel.welch(at)manchester.ac.uk,

margit.keller(at)ut.ee, mandich(at)unica.it

Our motivation for this study is to highlight how ‘everyday futures’ - in other words everyday lives of ordinary consumers - are imagined in discourse and practice around ‘the circular economy’. Projects and visions of collective futures mobilise—sometimes conflicting—understandings of the common good, or “orders of worth” (Boltanski and Thévenot 2006), actual or imagined “teleoaffective” engagements (Schatzki, 2002; Welch and Warde, forthcoming), and implicit models of engagement with everyday life (and in the case of circular economy, centrally, of consumption). Our main ambition in this paper is a conceptual one. We approach ‘circular economy’ from a dual theoretical background in practice theory (e.g. Schatzki, 2002; Warde, 2005) and conventions theory

or ‘pragmatic sociology’ (e.g. Boltanski and Thévenot, 2006). While practice theoretical approaches to sustainable consumption have proven generative, they are weak in addressing the evaluative and reflexive stance that actors are capable of taking towards practice. We suggest Thevenot’s (2001) model of “regimes of engagement” may be productively articulated with a practice theoretical approach to address this lack. Also, we zoom in on the concept of “orders of worth”, understood as nexuses of “general understandings” (Schatzki, 2002) of a particular sort, instantiated in practice. To illustrate our conceptual quest we analyse representations of consumers (or lack thereof) in various programmatic texts on circular economy in three national contexts - Estonia, UK and Italy with a focus on enriching and developing understandings of the cultural dimensions of projections of socio-technical everyday futures.

Social innovation and sustainability. How to disentangle the buzzword and its application in the field of consumption.

Melissa Moralli, Pierluigi Musarò

University of Bologna, Italy; University of Bologna, Italy

melissa.moralli2(at)unibo.it,

pierluigi.musaro(at)unibo.it

Social innovation is à la mode. Since the last two decades, European Union is encouraging policies, practices and projects which are focused on this concept (Vicari Haddock and Tornaghi, 2014). In order to promote a critical approach to social innovation, scholars should play a central role in the analysis of socially innovative practices, from a theoretical, epistemological and empirical point of view (Klein et al., 2016). As social innovation modifies relations among social actors and normally leads to different forms of production and consumption, a reflection on its role within consumption theories should be made. In particular, social innovation can enhance different forms of sustainable consumption. Projects dealing with new forms of prosumerism, local products consumption and responsible tourism can represent some good examples of this trend. Moreover, as social innovation challenges social and environmental problems, a consideration about the link among socially innovative practices, consumption and local development processes is necessary (MacCallum et al., 2009).

The aim of this paper is twofold. From a theoretical level, it critically presents the concept of social innovation and outlines the links with sustainable consumption. From an empirical point of view, it introduces responsible tourism as a possible analytical perspective in order to shape the relations among social innovation, consumption\production and local development. In this regard, some Italian case studies will be presented to show how socially innovative practices and tourism define new forms of sustainable production and consumption of space and local heritage.

Lines of Life: Entwining family memories, activities and more-than-human intimacies

Lydia D Martens

Keele University, United Kingdom

[l.d.martens\(at\)keele.ac.uk](mailto:l.d.martens@keele.ac.uk)

This presentation builds upon the work, started in the special issue on Families, Relationships and the Environment in the journal *Families, Relationships and Societies*, of developing an agenda of research on intimate relations within the broad problematic of global warming (Jamieson 2016). The specific focus of this paper is on how more-than-human intimacies of care become entwined with the lines of life of an multi-generations family, which has returned on a yearly basis, since the early 1970s, to the sea-side location that was the site for the ethnographic research. The analysis draws on an outing with this family to Rocky Shore beach, which included walks to and from the beach and an episode of fishing with members of this family. During the outing and the analysis, close attention was paid to the more-than-human and embodied elements of our activities, which are contrasted and 'filled out' with verbally enacted holiday memories of holidays, walking and fishing. Theoretically, I answer Pyyhtinen's (2016) call for a more-than-human sociological imagination, by engaging with Timothy Ingold's work on lines, walking and the weather world (2004; 2012, 2011). Ingold's work may be seen as one of the trajectories in contemporary social-cultural theory that challenges the dominance of the categories of culture, and that illustrates the pervasive integration of human and more-than-human materialities, relations, intimacies and ethics.

Assessing technological progress' benefits/drawbacks on wellbeing: some insights from Spain

Nela Filimon

Universitat de Girona, Spain

[nela.filimon\(at\)udg.edu](mailto:nela.filimon@udg.edu)

Research evidence on the impact of scientific and technological progress (STP) takes into account various macroeconomic dimensions with the purpose of measuring life quality and sustainability. At micro-level, research focuses on issues like subjective wellbeing, happiness or health, among others, combining various theoretical approaches. The objective here is two-fold: first, to distinguish between the benefits/drawbacks of STP on various social indicators; second, to assess the impact of technological progress on people's behavior in order to identify new potential consumer cultures. The empirical analysis uses quantitative methods and a representative data set of about 2,400 Spanish and foreigners of both genders and age 18 years and older, all resident in Spain in 2012, provided by the Centre for Sociological Research (CIS). Preliminary findings reveal that: the majority of the sample believes that STP is beneficial to life quality (75%);

economic development (69%); and the security and protection of human life (62%); 50% values the STP as beneficial for the preservation of the environment and 28% has an opposite perception. There is general agreement (94%) that new technologies have changed a lot the society but, only mobile phone, PC, internet or email are seen as most necessary; social networks not so much. Overall, new technologies make people become lazier, isolated, less physically connected with friends/relatives although it is easier to make friends. Generational patters apply: men exhibit a more optimistic nature (benefits) while women are more pessimistic (drawbacks); the perception of the STP's benefits decreases with age.

RN05 | Session 04a Consumption and Health

Diet and Public Health Campaigns: Implementation and Appropriation of Nutritional Recommendations in France and Luxembourg

Rachel Reckinger, Faustine Régnier

Université du Luxembourg, IPSE, FLSHASE; ALISS

UR1303, INRA, Université Paris-Saclay

[rachel.reckinger\(at\)uni.lu](mailto:rachel.reckinger@uni.lu), [faustine.regnier\(at\)inra.fr](mailto:faustine.regnier@inra.fr)

Based on two surveys – a French and a Luxembourgish one – with in-depth-interviews, this article examines the implementation of nutritional recommendations in two European countries. Each of them has promoted at governmental level a public health campaign regarding food consumption and daily diet. In which way – and by which social categories – are the recommendations taken in and put into practice, and if so, which appropriation processes and interpretations occur? Do the social, societal and cultural differences between Luxembourg and France, in terms of standard of living and dissemination of norms account for differentiated appropriations of dietary incentives? We will first compare the overarching goals as well as the dietary norms these two programs promote, in terms of similarities versus particularities both of the recommendations' content and of the way they are communicated. We will then examine the perception of these norms. The comparison France / Luxembourg shows that socio-cultural logics override national ones: the way in which individuals perceive the recommendations and appropriate them reflect more the social affiliation than the national one; gender and the events of the life cycle, particularly parentality, are also relevant to the reception of dietary recommendations. Transversal to all social milieus and in both national contexts, interviewees operate a selective internalisation of the perceived recommendations in a proactive yet pragmatic posture of personal responsibility. Ultimately, public dietary recommendations are only appropriated if they match people's daily priorities and constraints, as well as the general cultural values of their social milieu. This allows us to conclude to transnational, transversal, plural and distinctive everyday-cultural models of food consumption and differing notions of a "proper" diet.

Situating healthcare and healthcare consumers in retailing

Rui Liu

Lund University, Sweden

rui.liu(at)ism.lu.se

When major retailers move into the healthcare market and establish new types of retailing format, such as retail clinics, healthcare is no longer far from the retailing arena. Meanwhile, the rhetoric shift from patients to healthcare consumers signals a change of strategy within publicly-funded healthcare and demands it to think about how their service should be packaged and delivered. It therefore is necessary to ask what accounts for a good healthcare service and whether retailing practices and ideology can provide some pointers for healthcare. Equally important is to understand what it means for individuals when they are addressed as consumers and how they nuance this social identity in the healthcare context.

This paper puts healthcare and its users into the retailing landscape, examining how a retailing space where healthcare service can be consumed as a commodity is legitimized and illustrating how individuals interpret their consumer identities in different social settings in the health markets. I conclude that, although retailing may not, and probably will not, be the ultimate remedy to an efficient healthcare, it offers a set of orders and rules that have been accepted and followed by a majority of individuals. While these individuals move across different retailing spaces and marketplaces, they constantly negotiate with the social identities that are given by the society and adjust their behaviours accordingly. In this respect, healthcare consumer is also made a fluid and contested conception that is loaded with tensions between individual and collective values.

Healthy Lifestyle in Poland: Fashion or a Step Towards a Healthy Living?

Agnieszka Maj

Warsaw University of Life Sciences, Poland

Agnieszka_maj(at)sggw.pl

One of the most significant changes in lifestyles of the Polish citizens which can be observed within the past few years is a growing number of people declaring, that they are leading a healthy lifestyle. According to the research results published by Public Opinion Research Center (CBOS) in 2016, the number of Poles who declare applying to the rules of healthy living has risen by 13 percentage points within the last four years. The abovementioned trend is reflected in a growing popularity of sports activities, such as running or visiting gyms, especially in big cities, as well as a growing interest in goods and services dedicated to body and health care. In my presentation, I would like to investigate the perception of reasons of this shift towards a healthy living among the Polish people. Do they perceive the current pressure for maintaining a good body look as a step towards healthy living or a fashion stimulated by suppliers of products and

services which are supposed to refine the human body? What is the ideal of "healthy body" for representatives of different occupations, gender or age groups? Do they find it important to conform to the ideal? How have their body care practices changed in comparison to the past times of problems in acquisition of goods in the former political system? Trying to address these questions, I will refer to the results of my qualitative research study.

RN05 | Session 04b Food Practices, Thrift and Scarcity

Managing conflicting obligations: Negotiating the value of thrift in domestic food provisioning.

Jennifer Cole

University of Leicester, United Kingdom

jmc85(at)leicester.ac.uk

During times of economic instability, consumers are positioned as needing to 'cut back' and make savings. However, in a contemporary society where significant value is also placed on healthy eating and buying good quality produce, this need to save can be a cause of conflict. Griffith et al (2013) note that during the 2008-2012 recession, the UK saw a reduction in the amount of fresh produce bought, and an increase in processed foods consumed. This is indicative of the impact of rising food prices and smaller budgets on food provisioning decisions.

This paper based on the analysis of interviews with 36 women aged 25-55 focuses on how these women practice food provisioning in relation to the concepts of thrift and saving, whilst simultaneously 'eating well'.

Findings demonstrate that thrift is a relational value that is found across class and income spectrums. It is negotiated with, and addressed, through a range of differing priorities and practices dependent upon circumstances.

In addition to the economic pressure felt, we also see that consumers negotiate with the impact of time on their food provisioning and how this sits with their economic status. Again this impacts on food practices and conceptualisations of thrift.

As such, an individuals' understandings of thrift is fluid and always considered, and constantly re-evaluated, in relation to necessities, competing demands and shifting proximities to scarce resources. Understandings of which are primarily shaped by gender norms around motherhood and domestic labour.

The paper will explore these different practices and values of thrift in detail.

Care at the food bank: exploring policies, practices and normativities

Hilje van der Horst

Wageningen University, Netherlands, The

hilje.vanderhorst(at)wur.nl

Many Western countries have seen the emergence and spread of food banks over the last decades. In the Netherlands food banks have been founded as local, grass root initiatives since 2002 and reach an ever growing number of households. The objective of this, and most other food banks in the Netherlands, is two sided. The organization distributes food past the expiration date and other unsellable products to households with very low spendable incomes to reduce both waste and food scarcity.

For this paper I draw from fieldwork in a particular food bank in the Netherlands consisting of interviews with food receivers and food bank volunteers, as well as observation of various food bank related practices. I unravel the objects of care that are practiced in this food bank. Care is found in setting guidelines to ensure food safety, in reassuring people that they can eat food past the expiration date and in attending to people's feelings of shame about coming to the food bank. However, in some cases, harm and care prove to be intimately related. While distributing food past the expiration date was established as care for the environment, it also caused harm in receivers who felt they were degraded by eating 'waste'. In order to understand the different paradoxes I unravel how care practices order realities. I conclude by comparing the diverse normativities about what counts as good and what as bad care in the food bank.

Is it possible to shift consuming and eating behaviours? The case study of a cooperative food store, the Bees coop

Estelle Fourat, Catherine Closson, Laurence Holzemer
 Université Libre de Bruxelles, Belgium; Université Libre de Bruxelles, Belgium; Université Libre de Bruxelles, Belgium
 estelle.fourat(at)ulb.ac.be, cclosson(at)ulb.ac.be, lholzeme(at)ulb.ac.be

The share of food budgets is narrowing, which a priori limits the access to sustainable food (1) by populations most affected by the economic and social crisis. In this context, the FALCOOP (2) scientific project aims to develop and consolidate new forms of cooperation and feeding, and in particular to connect these populations to alternative food systems, specifically to the cooperative supermarket Bees coop, located in a neighbourhood of Brussels which is characterized by high unemployment, low incomes and strong multiculturalism. Thus, the protocol includes the development of activities on food, according to the needs of several groups (from 12 to 14 people). A cycle is co-created by researchers, volunteers of the cooperative, its potential publics least familiar with this model of consumption, through the assistance of community organizations. Ultimately, this is the hypothesis: it should contribute to the evolution of practices since a) Participative Action Research (McIntyre, 2008) favours the pooling of existing knowledge among co-participants and the creation of action plans to address issues through collective experience, and b) because existing similar

experiences support a transition of eating behaviours (Chiffolleau et al, 2016). Thus, the protocol scrutinizes change of subjectivities around sustainable food and of dietary practices, as well as social factors restraining dietary practices. The paper will describe modalities of this research on food using the PAR, and present initial results.

Temporality and the practices of eating

Marie Plessz, Stefan Wahlen

Marie Plessz, INRA, Paris, France; Stefan Wahlen, Wageningen University and Research, Netherlands, The

marie.plessz(at)inra.fr, stefan.wahlen(at)wur.nl

Theories of social practices acknowledge the (temporal) organisation, performances and intersections of everyday life in family and household contexts. A commonly used approach is to zoom in and to decompose social practices into different elements, with the agreement that temporality is an essential aspect of how practices organise social life. On the contrary, we would like to zoom out on a set of integrative practices. The "doing food" of making practices of eating possible is exceptionally interesting, as ingesting food is socially embedded, organised and performed in conjunction with a variety of other practices, from grocery shopping, meal preparation, and setting the table to cleaning up and washing the dishes. Hence, practices of eating are very intricate and combine a nexus of different practices coming together. We aim at characterizing this complexity by highlighting different dimensions of temporality in the practices of eating. Therefore, we analyse data from the Dutch Time-use surveys 2011/2012. The uniqueness of this data is manifested in its length of observation: with one-week diaries per household member we can capture rhythms that extend beyond the single day. In our analysis, we compare the set of practices of eating along dimensions of temporality: duration, tempo, sequence, synchronization, and periodicity. This research (in progress) will enrich the understanding of the temporalities of eating (often restricted to intakes or to durations) while strengthening the connection between the theoretical foundations of practice theories and their empirical tests on time-use data.

RN05 | Session 04c Theories of Consumption**Exploring the Role of Deceleration in Liquid Consumption**

Katharina C. Husemann, Giana M. Eckhardt
 Royal Holloway, University of London, United Kingdom; Royal Holloway, University of London, United Kingdom
 katharina.husemann(at)royalholloway.ac.uk, Giana.Eckhardt(at)rhul.ac.uk

Recent research on consumption has suggested that liquid consumption, marked by flexibility, movement, lightness, speed and access, and defined as a dematerialized and less singularized form of consumption, valued ephemerally and for its use value, poses several challenges to consumers. Consumers find it increasingly difficult to build up and maintain meaningful, safe, durable, and trustworthy connections to the social, cultural and material world that usually prevails in more solid consumer lifestyles (Bardhi and Eckhardt 2016). Drawing from Rosa's (2013) theory of social acceleration, we investigate the role of speed in liquid consumption. We find, based on ethnographic data from the Camino de Santiago pilgrimage in Spain, that consumers can actively seek out 'oases of decelerated liquidity,' in which they engage in liquid consumption (Bardhi and Eckhardt 2016) in a decelerated form (Rosa 2013). That is, consumers engage in all four characteristics of liquid consumption. In addition, consumers also decelerate on three dimensions: embodied, technological and episodic. This decelerated liquidity allows consumers to experience 'resonance' that is a mode of relationships between a person and a segment of the world that is experienced as vibrating, responsive and meaningful (Rosa et al. 2016). This study contributes to the sociology of consumption by highlighting the role of speed in dealing the challenges of liquid consumption. We argue that the concept of 'oases of decelerated liquidity' helps us to understand how to use a decelerated form of liquid consumption to deal with an increasingly risky, unstable and unsettled global landscape.

What changes hands when we freecycle.

Konstanty Strzyckowski
 University of Warsaw, Poland
 kstrzycz(at)is.uw.edu.pl

Many examples of the sharing economy aren't about sharing. They're rather an access based forms of accumulation mediated by internet platforms and digital apps. However there are some that provide more direct, altruistic forms of exchange. They respond to the problems existing in a market system, seek to optimize the use of untapped resources and reduce consumer waste. Facebook based peer-to-peer group „Uwaga, śmieciarka jedzie!” with over 20.000 of members distributing unwanted items offers important theoretical implications for the classic gift giving paradigm elaborated in anthropological and sociological studies (Mauss 1925; Malinowski 1922).

Unlike the commercial platforms of sharing economy, it bans profit making, providing an alternative to markets while keeping vintage goods out of landfill sites. The group stays committed to its ethos of material culture preservation, waste reduction, mutual help without any direct obligations or reciprocity, money transfer or bartering. As such it represents an idiosyncratic sharing system distinct from the market exchange and classic gift economy. The paper presents the results of research on freecycling practices in a given collective. It addresses questions concerning the true nature (gift or commodity?) of what's being exchanged. It considers whether freecycling represents a purer form of sharing, a system of social solidarity based on gift exchange and social relationships among consumers. How distant it is from market principles and utilitarian rationality? Is it a departure from the market economy or maybe it's just a strategy allowing consume more with less resources?

The currencies of Narrative: Deleuze and the narrative technologies of Bitcoin

Paul Haynes
 Royal Holloway University of London, United Kingdom
 paul.haynes(at)rhul.ac.uk

It has become a cliché of contemporary social theory to observe that we are surrounded by narratives. In marketing and consumer culture this is particularly relevant as many key aspects of the consumption and marketing: advertising, promotional strategy, brands, identity myths, desire, seduction, etc are much more obvious examples of narrative forms than found elsewhere. Conceptualisations of narrative are however extremely limited, typically representational and grounded in human experience and consciousness. This paper attempts to conceptualise narrative through a Deleuzian perspective, as a differential and immanent form, one that replaces the representational with the expressive. This approach will be exemplified through the narrative technology embodied by the blockchain ledger that underpins Bitcoin and other similar cryptocurrencies. The impact on consumption theory and marketing for rethinking narratives will be evaluated with examples from blockchain technology and Bitcoin.

Feminism, Theories of Practice and New Economies of Domestic Consumption

Emma Casey, Lydia Martens
 Northumbria University, United Kingdom; Keele University, UK
 emma.h.casey(at)northumbria.ac.uk, l.d.martens(at)keele.ac.uk

In this paper, we explore how feminist theories and theories of consumption can inform each other in a conceptualisation of the 'new economies' of domestic consumption that have developed in the latest phase of capitalist austerity. In our 2007 collection *Gender and Consumption*, we identified a number of key priorities for feminist studies of consumption, including

the need to reconsider existing meanings of 'the domestic'. In this paper, we explore the extent to which these priorities have been realised. We focus especially on two concomitant theoretical developments in contemporary feminist research and consumption sociology. In feminist studies, there has been a recent escalation in explorations of class, gender and 'culture', focussing on reality TV, celebrities, motherhood, bodies, fashion and the sexualisation of consumer culture, to name some examples. Furthermore, we have also witnessed a rise of studies of women as entrepreneurial actors operating within boundaries of new consumer economies. Characteristic here is the emphasis on moral discourses of consumption that interweave neo-liberal ideals with notions of self-hood, and that cement individualisation discourses through its categorical work. At the same time, the broad field of consumption sociology has witnessed the expansion of research that uses, assesses and develops practice theories, and which illustrates a growing interest in mundane domestic practices and material culture, and the 'lives' and relational quality of everyday objects and infrastructure. Arguably, in some of these developments, 'culture' is silenced as domestic environments are rendered socio-technical environments populated by indistinct human practice carriers. The paper traces a path through this research in order to propose new directions for feminist accounts of domestic consumption practices.

RN05 | Session 05a Food Practices and Normativities

Doing 'proper' food? Conceptualising mundane moralities in a so called 'weak' practice theoretical approach to food consumption

Bente Halkier

University of Copenhagen, Denmark

beh(at)soc.ku.dk

Practice theories have become one of the much used theoretical perspectives within sociology of consumption, particularly in relation to studying food consumption. However, there are still a number of areas where conceptual development and adaptation is necessary in order to use a practice theoretical approach for empirical investigations of food consumption in everyday life (Warde, 2014). One of these areas is normativity in practices and how these kinds of mundane moralities are related to normalisation of collective routines. In the paper, I am suggesting some conceptual adaptations of normativity and normalisation to existing understandings of the relation between reproduction and change in so called 'weak' practice theoretical approaches to consumption. The conceptual adaptations take their starting-point in and are exemplified empirically by examples from a number of my different qualitative studies of how consumers handle normative contestation of their food routines (e.g. Halkier, 2017).

Halkier, B. (2017). Normalising convenience food?

Cooking evolutions and globalization: Dynamics as perceived by culinary art students in 5 continents

Maxime Michaud

Center for Food and Hospitality Research, Institut

Paul Bocuse, France

Maxime.Michaud(at)institutpaulbocuse.com

Food consumption is as well a universal social aspect – as it covers a biological need – as an important part of cultures. Inside food consumption, cooking habits are less studied, yet one of the most significant cultural trait. Nowadays more than ever, cooking habits are rapidly evolving, incorporating foreign influences (e.g. recipes, appliances, technics, ingredients) through several means (e.g. internet, TV, travel, shops, restaurant, information campaigns) worldwide. Given the various factors that could impact the perception of cooking, further research to identify the most influential is needed. The aim of this study was to examine how cooking experts from 5 countries in (5 different continents) perceive the dynamics and the extent of the influence of those factors and global trends (e.g. health, environment) in the cooking habits of them and their relatives.

Twelve long semi-structured interviews of undergraduate culinary art students from France, Mexico, USA, South Africa and Korea were performed during June and July 2016 by anthropologists at the Institut Paul Bocuse Research Centre. The interviews have been analysed with the help of a QDA Software.

Although cooking habits are effectively modified by foreign influences and global modernity, it appears that local cultural patterns determine the way these influences are integrated. The young generation is still attached to its cultural roots, including food. However, there was a trend of individualization of cooking habits, demonstrated by personal choices regarding food, linked to health, well-being and environment (e.g. vegan food, gluten-free, lactose-free, organic food). Paradoxically, these behaviors presented as "individual" seems to be the most shared trend in the different countries.

Domestic skills or how to reconcile food safety and food waste concerns

Severine Gojard, Berangere Veron

Centre Maurice Halbwachs, INRA, CNRS, EHESS,

ENS, France; AgroParisTech, France; Centre Maurice

Halbwachs, INRA, CNRS, EHESS, ENS, France

severine.gojard(at)inra.fr,

berangere.veron(at)agroparistech.fr

Recent literature about food waste in the domestic sphere has pointed out the tensions between concerns for food waste and for food safety—tensions

increased by a recently growing sensitivity to health risks related to food matters (Watson and Meah, 2013). Other works have shown that food waste should be considered as a consequence of “the contingencies of everyday life” faced by households (Evans, 2011). Using data from a study about the sorting of leftovers, we explore the link between food waste and the criteria to dispose or keep fresh food and leftovers. In addition to confirming the widespread sense of guilt about wasting food, we examine how safety concerns do not necessarily imply more food waste, when consumers use competence and domestic skills, for efficient stock techniques and control as well as for the use of leftovers. We use in-depth semi-directive interviews with 25 participants, all with a partner and two children, but from various social backgrounds, on their daily food habits at home. We show that some participants with a high safety concern and specific organizational skills display efficient storage techniques (use of different kind of boxes to keep leftovers, deep-freezing) whereas other with lower sensitivity to food safety or fewer skills have less systematic or less rigorous preservation techniques. Those different practices pertain to different modes of domestic organization, relying more or less on meals planning and culinary skills.

Everyday household food practices and food quality labels. An ethnographic study in Norway

Gun Mikaela Roos, Virginie Amilien
Oslo and Akershus University College of Applied Sciences, Consumption Research Norway, Norway;
Oslo and Akershus University College of Applied Sciences, Consumption Research Norway, Norway
gun.roos(at)sifo.hioa.no,
virginie.amilien(at)sifo.hioa.no

In this exploratory paper, some of the processes, practices and dynamics that accompany foods with quality labels (including protected designations of origin - PDOs, protected geographical indications - PGIs, organic food, as well as foods distributed by short food supply chains) will be investigated based on ethnographic fieldwork among Norwegian consumers. The research is part of an on-going EU funded project “Strength2Food” that aims at enhancing sustainability of agri-food chains and food quality schemes. Theoretically, this paper draws on a practice theoretical perspective on food consumption as well as convention theory. This paper, which is based on the first (of three) visits to 6 Norwegian households, explores consumers’ valuation of products promoted with food quality labels; the practices and routines of everyday life with which these products are associated; and justifications for planning, acquisition, storage, cooking, eating and disposal of these products.

RN05 | Session 05b Consumption and Crisis

Corporate welfare: supply and demand in times of employment and lifestyles changes

Ariela Mortara

IULM University, Italy
ariela.mortara(at)iulm.it

In the difficult times following the economic crisis of 2008 Italy, as other European countries, reduced welfare spending thus forcing people to further rethink their consumption behavior. Indeed, in the past few years, according to ISTAT data (2014), households have reduced their consumption expenditure in most areas from clothing and travel, to mobility and health. In this uncertain context, in which consumers/citizens have lost faith in institutions, private companies have partially covered an institutional role providing some welfare policies (Nica, 2013).

The paper will present the first result of a research on the role of corporate welfare (Mallone, 2012) in a context of changing employment models and lifestyles.

The ample research design includes a quantitative phase that was conducted through the web application Limesurvey. The aim of the online questionnaire was to explore the most pressing needs and the most disappointed expectations of people toward corporate welfare and to analyze the implications of these activities in terms of individual, family, and social situation.

The 14055 complete questionnaires (8603 female and 5452 male respondents) have been collected from November 27th, 2016 to January 19th, 2017. The convenience sample age ranges from 12 to 89 years, with a mean age of around 30 years. Among the respondents there are 3082 permanent employees, 1319 independent workers, 649 occasional workers, 574 unemployed/looking for a job.

Consumer Movements of the Crisis

Andreas Chatzidakis
Royal Holloway University of London, United Kingdom
Andreas.Chatzidakis(at)rhul.ac.uk

This study investigates consumer activism during the Greek crisis: the biggest economic contraction recorded in a Western country during peacetime. Whereas prior studies focused on the impact of austerity on consumption, we focus on how resistance to consumer culture has been reconfigured during the crisis. We observe that consumer movements previously concerned with cultivating new subjectivities and materialising ideals of more egalitarian and sustainable communities, are now preoccupied with addressing the failures of the market and the state in provisioning. In doing so, the anti-consumerist initiatives redefine everyday consumption as arena for solidarity building, where symbolic meanings give way to use values, identity politics to distribution politics, and marketplace resistance to realpolitik. The emergence of new, solidarity-based forms of consumption challenges the view of consumer activism as primarily responsive to mechanisms of market domination (e.g. Littler, 2005), unable to engage in socio-economic solutions that extend beyond attempts to shift public consciousness.

Investigating the state of consumerism in times of debt crisis: Methodological issues and Conceptual tools

Dimitris Lallas
Hellenic Open University/ School of Humanities,
Greece
lallasdimitris(at)gmail.com

Austerity policies, as part of neoliberal debt management, induce the decrease of consumption expenditure, concerning mainly the middle and lower strata. But, does the crisis of consumption mean crisis of consumerism? An affirmative response would mean that we reduce a cultural phenomenon just to its economic dimension. This paper purports to present the basic methodological orientations and conceptual tools of an ongoing postdoctoral research on the state of consumerism in period of economic recession. This research follows two methodological directions. Firstly, we examine whether and to what extent discourses, values, meanings and practices of consumerism have been delegitimized concerning the way that social subjects perceive, think and evaluate themselves and others, the world of goods/objects/commodities, the space and time of everyday life, and the way they signify, organize and perform their daily practices. Secondly, we have to examine contemporary forms of government and specifically whether there are techniques and discourses that 'call' individuals as consumers and so attempt to define their field of action and 'conduct' consumers' conduct.

In order to follow these methodological directions, it's necessary to move on a concrete conceptualization of 'consumerism' as a specific cultural trend. We have also to utilize theories of practices in order to study and critically evaluate consumer practices. And, finally, if we draw upon foucauldian term of 'apparatus', we will be able to constitute the conceptual tool of 'apparatus of consumerism', namely a set of institutions and techniques of government that purport to conduct individuals' conduct and construct them as consumers.

Food sharing practices and sharing economy: How the economic crisis is reshaping Italians' food consumption habits.

Roberta Paltrinieri, Piergiorgio Degli Esposti
University of Bologna, Italy; University of Bologna,
Italy
roberta.paltrinieri(at)unibo.it,
pg.degliesposti(at)unibo.it

Since 2008, the European and global economic crisis and the digital revolution are the two main agents of change transforming consumer behaviors.

The process of digitalization is impacting markets and society at every level, and can be tied to the economic crisis in many sectors – especially concerning the relationship between mass distribution and small retailers.

Within this framework, market segmentation reproduces old and new forms of social stratification and inequalities based on income, access to food, and

access to information.

The aim of this paper is to discuss the final results of a national survey of several universities. The survey analyzes how Italians' relationship with the food they purchase has changed as a result of both the economic crisis and increased buying opportunities.

In this context, the notion of the prosumer and a sharing economy arose as the main interpretative variables of a reality in transition in which Italians adapt their alimentary needs. In doing so, they rediscover forms of the neighborhood partially forgotten and partially digitally assisted. These new consumer behaviors are also representative of a peculiar political choice that has led to a global and local solidarity movement in which people are supporting local producers and local communities instead of mass distribution.

Even if the trend in this direction is evident and more ethically driven than economically, the survey emphasized how consumers enlisted in sharing economy circuits are always under the price dictatorship typical of a capitalistic system.

The survey methodology used is one of a mixed method approach – both quantitative and qualitative – and also took advantage of some experimental techniques such as visual sociology and SNA.

RN05 | Session 05c Consumption and the Body

Femicide in Italy. The fear told through media and online conversations.

Piergiorgio Degli Esposti, Antonella Mascio
University of Bologna, Italy; University of Bologna,
Italy
pg.degliesposti(at)unibo.it,
antonella.mascio(at)unibo.it

In recent years Italians media have increasingly devoted more space to the topic of femicide, due to the rising numbers of women killed by husbands or ex partners after years of abuse and persecution.

The path that led toward public involvement has gone through the policies and forms of media narrative, which have shifted over time attention from the fact (the murder) to the causes that led to the murder (non acceptance of the end of a love relationship, surveillance techniques implemented by the murderous partner, fear to report harassment) to describe the dynamics of what is called the concept of "continuum of violence".

The opposition fear / courage appears central today in the media narratives dedicated to femicide in the news and on several TV series used as case studies (Amore criminale, Polizia femminile singolare, Donne: il volto della violenza – broadcasted by Sky).

Key question of analysis is how much the media have contributed to a social discourse on femicide in Italy? Is it possible to affirm that their work is helping certain groups of women to talk about their fears? Our survey is based on content analysis of a sample group of 6 national newspapers, and 20 online discussions present in specific social networks such as Facebook, Instagram and Twitter, observed with tools provided in

Nvivo software.

The goal of the survey is to compare the narrative modes used by the mainstream media with those used by the Social Network platforms, to understand the ways in which this theme shapes and to what other fears solicited by the media is connected.

Sexual Fields, Sexual Capital, and the Prosumption of Racial Sexual Stereotypes: A Consumer Culture Inquiry into Hook-up Apps for Men who have Sex with Men

Christian A. Eichert, William Richardson
City, University of London, United Kingdom; University of Exeter, United Kingdom
christian.eichert(at)cass.city.ac.uk,
willr24495(at)gmail.com

Fragmentation, marketization, and commodification of intimate life has attracted considerable interest within sociology (e.g., Ansari & Klinenberg, 2015; Bauman, 2003; Illouz, 2007, 2012). We study consumers' self-presentation strategies within the "racialized, sexual marketplace[s]" (White et al., 2014, p. 769) of location-based smartphone 'hook-up-apps' for men who have sex with men (MSM), and approach the technology-mediated consumption of bodily desire, in which the consumer is both, the subject who desires, and the object of desire.

Our qualitative thematic analysis draws on netnography, auto-ethnography, and interviews with a racially diverse sample of men from the UK and US, who find partners for local casual sexual encounters in a virtual space, in which racial sexual stereotypes shape potential partner selection and expectations (Paul, Ayala, & Choi, 2010). Wilson et al. (2009), for instance, find that black men are more likely to be described as dominant, aggressive, and masculine, while Asian men are stereotyped as being submissive, docile, and feminine.

Informed by sexual fields theory (Green, 2014), self-objectification theory (Fredrickson & Roberts, 1997; Martins, Tiggemann, & Kirkbide, 2007), and work on virtual representations of race (Nakamura, 2008), we identify four distinct strategies how consumers navigate field-level racial sexual stereotypes, and develop self-presentation strategies that enable them to cultivate field-dependent sexual capital in their online quest for offline casual intimacy.

We contribute to the understudied field of consumers' intimate life in consumer research (Bettany, 2016), by addressing timely and relevant social phenomena such as hook-up culture (Wade, 2017), marketplace representations of race (Crockett, 2013), and consumers' self-presentation in virtual spaces (Belk, 2013; Iqani & Schroeder, 2016; Murray, 2015).

Patient-customer and aesthetic surgeon - reflexive actors in a consumer society

Carmen Giorgiana Voinea
University of Bucharest, Romania
carmen.giorgiana.voinea(at)gmail.com

Part of an ongoing qualitative research on aesthetic

surgery in Romania, the article explores the narrative accounts of the two main actors' involved in this bodily change - the patients and the surgeons - and the process of negotiating the intervention. I take a critical stand to previous research that depict both patient and surgeon as simple carriers of sociocultural norms of beauty and I argue that they are highly reflexive actors. Although aware of the macro pressures, the practice is a way of affirming their personal identity for the patient, and professional identity for the doctor. The patient is constantly aware of the "gaze of others" (family, friends, acquaintances, agents of the beauty industry, the surgeon) that carries the standards of beauty, but in the preparation process for the surgery they show reflexivity and affirm their identity. Furthermore, as the aesthetic surgery industry has a free market dynamic, from mere patients they become patient-customers. The surgeons are also part of this consumer society dynamic; while evaluating the patients' bodies and normalizing them to meet the standards, they are aware of the responsibility they hold in front of the patient-customers, they are themselves being evaluated, and actively work to build their professional identity. They constantly legitimate their practice compared to other medical specialties, an ongoing process for plastic surgeons since the beginning of their profession. Data are drawn from semi-structured interviews with patients (women) and surgeons, participant observation in clinics and surgeon's association's meetings, medical literature, mass-media, and social media content.

Self-tracking apps : Diversity of practices or standardization of diet ?

Faustine Régnier
ALISS UR1303, INRA, Université Paris-Saclay
faustine.regnier(at)inra.fr

Digital devices imply economic and social transformations, and the impacts of the new technologies on diet and health are a major societal challenge. Based on a corpus of 79 in-depth interviews among users of 3 types of digital devices « diet / fitness » in a socially contrasted sample, in 3 different French regions, this contribution will examine the uses and the impacts of self-tracking devices on diet and body perception. We will identify a typology of users (in relation to socio-demographic characteristics, uses in daily life, motivations) and determine the main social factors helping or preventing from the use of such devices. Exploring the advantages, for individuals, of the digital technologies, we will assess the impacts of digital devices - both self-quantification and use of social network - in influencing individuals' dietary choices and physical activity. Finally, we will discuss if digital health technologies have led to a normalization and standardization of behaviours, and thus to new forms of domination and control, or whether, as their promoters claim, they offer a better self-knowledge and new kinds of empowerment to their users.

RN05 | Session 06a Food Retailing and Eating Out**Online grocery shopping as part of everyday life in Sweden – focus on organisation, learning and social interaction**

Anna Post

University of Gothenburg, Sweden

anna.post(at)ped.gu.se

In Sweden as in many other countries, online grocery shopping has become a growing trend as it offer a partial solution for many of the problems connected to modern food consumption. Families and individuals need for convenience has been an important driving force in this development. However, making purchases online differ from buying in a physical store, and it challenges existing habits and practices in families. With smart phones, families can purchase food whenever they like, at any time. The aim of this paper is to examine how online grocery shopping is evolving and establishing in families and the consequences of this. Practice theory is used, and the analysis pay special attention on the micro-doings involved in everyday life. Human Ecology theory is used, as it shows how individuals contribute to each other's well-being. Inspired by ethnography, interviews and observations in households have been conducted. Due to the increasing digitization families have adapted to a certain practice where mobile phones are natural elements in a purchasing situation. The analysis illustrates how purchases are organized and how families navigate between online and traditional shopping, anchored in practice. It also indicates how food companies act for social learning about food and meals and act as inspiration. Online grocery shopping often lead to more time for work, or spending more time with family and friends or to reduce stress in everyday life.

The Transformation of Italian Cuisine: How Virtual and Valuable Foods are Shaping Traditional Restaurants

Gian Paolo Lazzer, Francesca Setiffi, Carlo Bagnoli
Ca' Foscari University of Venice, Italy; University of
Padova; Ca' Foscari University of Venice, Italy
gianpaolo.lazzer(at)gmail.com,
francesca.setiffi(at)gmail.com, bagnoli(at)unive.it

This contribution discusses the main findings of a study that aims to analyse the recent developments of the restaurant business in Italy. Eating-out practices are changing; meanwhile, so are all the practices related to the organisation of a restaurant, such as cooking or service. Restaurateurs' habits and routines, including their standards of excellence, do not seem immutable.

To investigate the topic, a qualitative approach was chosen. We collected 52 interviews with restaurant owners and 15 interviews with experts from other sectors (art, medicine or engineering, for example) or entrepreneurs who have created an innovative business related to food.

The main findings assess the relationship between the concept of tradition and two factors challenging and shaping Italian cuisine. The first is the mass media's influence and what can be called virtual food: the definition and dissemination of standards of excellence proposed by celebrity chefs are changing how consumers approach the restaurant world, including restaurateurs' social status. The second is the rise of new values connected to food. Experts and professionals that operate in other sectors are particularly influencing the concept of valuable food. In turn, the influence of valuable food and virtual food is giving birth to new practices and organisations associated with traditional restaurants.

Foodies and recession. Changing culinary habits.

Jari Pekka Mustonen, Taru Lindblom

City of Helsinki, Finland; University of Turku

pekka.mustonen(at)hel.fi, taru.lindblom(at)utu.fi

In our paper, we consider eating habits and culinary practices of the young adults living in the capital of Finland, Helsinki. The results are based on two different sets of survey data; first from 2013 and second from 2016. The newer data has not been analysed and thus all the results are new.

The analysis leans on the notions presented in the literature on distinction and cultural capital. We are interested in presenting the culinary practices of people who eat our often and who consider food as a hobby – “the foodies”.

The time range includes the economic recession which has inevitably influenced people's consumption practices. At the same time more and more restaurants are opened in Helsinki and in general, food culture is taking huge steps. We want of explore the possible changes in culinary consumption and attitudes. From the first set of data we found two different foodie types; “stay-at-home-foodies” and “eat-out-foodies”. Both foodie groups are significantly more well-off socio-economically than the groups that are not as eager in their culinary endeavours. It can be suggested that being a foodie represents yet another potential source for social reproduction and social inequality.

We assume that in a few years foodism has somewhat changed and will examine this hypothesis empirically by using the newer data. We think that on one hand practices have democratized (“trickle down” and “trickle up”) but on the other hand, the foodie scene has fragmented; foodies are interested in more and more narrow and restricted dimensions of culinary products or phenomena be it craft beer from Tuscany or condiments from Vietnam.

‘Turkish Tomatoes Do Not Enter Japanese Households but Stay in Kebab Shops in Tokyo’: Identity in the Global Food Chain

Emine Erdogan

University of Warwick, United Kingdom

e.erdogan(at)warwick.ac.uk

This paper focuses on the last stage of the global

tomato chain: Kebab shops in Tokyo. Through following the particular tomatoes, which are grown and processed in Turkey for Japanese market, the paper reveals that Turkish tomatoes are not used for domestic consumption in Japan, but are purchased by catering companies and/or consumed in low-grade restaurants such as Turkish Kebab shops.

Drawing on in-depth interviews with Kurdish workers in two different Turkish kebab shops in Tokyo where particular tomatoes I have followed are used for making döner kebab sauces - which are popular among migrants, tourists and low-income Japanese people -, the paper demonstrates that tomatoes themselves are gendered, classed and ethnicised throughout the entire production process and they resemble their producers in terms of their identities. In doing so, the paper answers the question of how the identities of producers, consumers and the products themselves both shape and are shaped by each stage of the global tomato commodity. This opens up a new path of re-thinking about the meaning of 'global' in the light of local identities.

RN05 | Session 06b Consumption and Different Generations

Luxuries, necessities and consumer generations

Terhi-Anna Wilska

University of Jyväskylä, Finland

terhi-anna.wilska(at)jyu.fi

This paper is a review on theories and concepts related to luxuries, necessities and consumer generations in modern consumer societies. I will analyse the concepts of necessity, luxury, and excess, referring to classical theories and academic discussions of e.g. A. Smith (1993/1776), T. Veblen (2007/1899), J.M. Keynes (1963/1930), and J.K. Galbraith (1958), as well as to more recent writings, such as the work of Z. Bauman (1988; 1998), J. Schor (1998), R. Frank (1999), C. Campbell (1987), R. Belk (1995), R. Abbott (2012) among others. I will also discuss the generational approach to consumption and social change, mainly based on the theories of K. Mannheim (1952) that stress the importance of generational identities formed in youth, however also questioning the Mannheimian tradition and introducing a post-Mannheimian approach, which accepts social change and continuity as critical parts of the human life course (e.g. De Martini 1992; France and Roberts 2015). This paper also describes how luxury and excess have been perceived in different times and how the concept has changed. Acknowledging the fact that consumer goods are experienced in different ways by different generations, I argue that generations should not be regarded as mere age cohorts, but also as socially constructed groups that are also influenced by political, economic, and cultural changes in societies. This suggests that even though the world of goods may seem similar to people in the same age cohort, the perceptions of necessities and luxuries also vary along with social conditions values, attitudes and everyday practices.

Contemporary conspicuous leisure and consumption in social media. Some evidence from young people in Athens

Konstantinos Theodoridis

Manchester Metropolitan University, United Kingdom

konstantinos.theodoridis(at)stu.mmu.ac.uk

Contemporary conspicuous leisure and consumption in social media. Some evidence from young people in Athens.

In this paper, I assess the extent to which a transformation of the traditional economic display has occurred in modern online mass consumption societies. In particular, it contextualises young people's quest for status and prestige through their online presence in an era of economic recession, social media expansion and difficulty of wealth accumulation.

It has long been known that economic agents engage in signalling behaviour, for example, through conspicuous material consumption. I argue that an individual's social media profile is now a platform for signalling virtual consumption indicating perceived value to the community and symbolic status. Thus, a new form of conspicuous social media consumption is developing based on the competitive accumulation of online activity. Uploading images and videos becomes a prerequisite in seeking a reputable place in the social media community with potential horizontal status gains.

The research examines based on semi-structured interviews of a pilot research project in which I assess the promotion of a new virtual indicator of status value and prestige among Greek youth. I consider whether material constraints motivate young people's move into a virtual world where they pursue prestige within groups through social media consumption/production. Implications regarding broader discussions of the contemporary consumer culture are considered.

The paper offers an account of conspicuous leisure and consumption in the context of the network society through the lens of social networking sites.

Youth cultures, consumption and self-representation. A youth digital self-expression styles analysis

Geraldina Roberti

University of L'Aquila, Italy

geraldina.roberti(at)univaq.it

In our society, youth identity construction path seems to be quite rough; if traditional identity markers crisis makes this process uncertain and provisional, meanwhile enables young to experience new, original role models.

In such scenario consumption and its sharing through new media hold a basic role, because they allow young people to construct and thus to show immediately their own subjectivity to the others, with no mediation. Selfie tool, in particular, has got a new central role within youth practices, since it allows young to express themselves sharing their own

consumption choices with the peer group at once. In the light of considerations such as the foregoing, we decided to carry out a qualitative research on a sample of University of L'Aquila (Italy) students, in order to investigate elements that currently characterize their consumption culture, with a special focus on the new media role. To this end we realized a series of focus groups involving these students and subsequently more significant issues were examined by means of semi-structured interviews.

Our main objective was to assess how the symbolic significance of consumption is incorporated in students' self-definition dynamics and which is the selfie role in such a process.

The main findings emerged are that motivation to share one's own purchase through smartphones and digital platforms (f. e. through the mirror-selfie tool) proves to be functional both to assert one's own identity (so as to create a kind of personal digital storytelling) and to satisfy the approval wish of peer group.

Environmental Habitus and Intergenerational Transmission in Cross-National Comparison

Tally Katz-Gerro

University of Manchester, United Kingdom

tally.katz-gerro(at)manchester.ac.uk

Recent scholarly attention finds that individuals' pro-environmental orientation is related to their parents' pro-environmental values, attitudes, and behaviours. This research takes environmental behaviour into the family domain, and proposes to investigate the links between environmental behaviours of three generations to measure the impact of cultural and economic contexts on intergenerational transmission of environmental behaviours.

Our main theoretical heuristic is the notion of environmental habitus, arguing that a pro-environmental stance may run in the family, not necessarily because individuals follow the imperatives of the environmental movement or because they hold an environmental ideology, but because their families hold values and behavioural dispositions of frugality, modesty, or conservation that have consequences for everyday pro-environmental behaviour. Furthermore, we examine environmental habitus comparatively, asking if it takes different forms in two different national contexts – Israel and South Korea. These countries are characterized by different cultural and economic contexts, different framings of environmental issues, and different historical trajectories starting from pre-World War II and continuing up to today. Analysis is based on focus group interviews of three generation families and draws from theories in the sociology of the family, sociology of consumption, social psychology, and environmental sociology. The findings contribute to the understanding of the determinants of environmental behaviour, cross-national differences in environmental behaviour, and the influence of intergenerational social reproduction on environmental orientations.

RN05 | Session 06c Practices and Practice Theory

Practice approach to experimental culture

Senja Laakso

University of Helsinki, Finland

senja.laakso(at)helsinki.fi

Sustainability experimentation has emerged as an approach that provides novel tools for tackling complex issues such as climate change or excess use of natural resources. However, different actors are likely to experience experiments in different ways, and the perspective of ordinary, local people involved in experimentation has not received much attention in experimental governance or management of transitions. For experiments to promote local (or regional, or even national) sustainability, these experiences are nonetheless important, to gain understanding on the adoption of new patterns of consumption due to experimentation. How participating in an experiment affects participants' routines and everyday living, what effects these experiences have for the success (or failure) of experiments, and how could future experiments – and local policy in general – take these experiences into account? My presentation focuses on local experimentation in Jyväskylä, Finland. The results from three case studies show that the success or failure of experiments depends on the complex dynamics of everyday living, and on practices that may not even be targeted in the particular experiment or intervention. Practice theoretical approach helps to understand the reasons behind stability, or change, in everyday routines, thus opening up new areas for experimenting. The results also show that small-scale experiments can be important in terms of learning and changing the ways of thinking at the local level, from residents to actors in policy and governance. As experiments work at multiple levels, these experiences of local actors are important for understanding how experiments work and contribute to sustainability transitions.

Eco-social interventions in Lausanne: bringing power into practice theories

Béatrice Bertho, Marlyne Sahakian

Université de Lausanne, Switzerland; Université de Lausanne, Switzerland

beatrice.bertho(at)unil.ch, marlyne.sahakian(at)unil.ch

The Lausanne-based public utility, Services Industriels de Lausanne (SIL) recently launched a program to increase the efficiency of electricity consumption among lower-income households, building on a similar initiative that has been underway in neighbouring Geneva for a number of years. Working at the level of a community, energy "ambassadors" are recruited and trained to visit homes and replace lightbulbs, hand-out electric kettles, and promote the replacement of larger appliances with more efficient models. Through a practice theory lens, these "interventions" present an interesting case study for analysis, as more than one

element of a practice can be studied: the material dimension of consumption, through changing appliances and lightbulbs, but also the social norms that are upheld or contested in this process, in addition to the competencies, skills and beliefs of both ambassadors and household members. This interaction between representatives of the utility company, typically hired through social reinsertion programs, and people in lower-income brackets represents a specific production-consumption interface, where power relations become quite apparent – particularly in how paradigms of change are constructed and communicated. Individual responsibility for energy efficiency is often emphasized, with little regard to existing habits, cultural dispositions or infrastructure lock-in – when the housing size and layout itself promotes a certain level of consumption. We propose to study the case of the SIL eco-social interventions through Foucault's theories of power, to further enhance social practice theory as an analytical tool in relation to un-sustainable and un-equal consumption practices.

Emotion, motivation and consumption: a practice theory approach

Daniel James Welch

University of Manchester, United Kingdom

daniel.welch(at)manchester.ac.uk

The paper reviews recent practice theoretical approaches to emotion and affect and assesses their potential contribution to the sociology of consumption. How emotion is implicated in the “motivational structure of consumption” (Campbell, 1994) has been a foundational concern of consumption scholarship. Illouz (2009) has called for “vigorously injecting the notion of emotion into the sociology of consumption” (p. 377). However, emotion and affect are highly contested notions in social and behavioural science (Harre and Parrott, 1996). Since the millennium, the burgeoning attention of social and cultural theorists to emotion and affect has led some to characterise this as an “affective turn” (Greco and Stenner, 2008; Harding and Pribham, 2009). And in recent years, a growing body of work has developed practice theoretical accounts of emotion and affect: in sociology (Reckwitz 2012, 2017; Weenink and Spaargaren, 2016); history (Scheer, 2012); social psychology (Wetherell, 2012, 2013, 2014); and human geography (Simonsen, 2007). Practice theory accounts of emotion offer a critique of, and alternative to, influential “non-representational” theories of “affect” (e.g. Anderson, 2010; Massumi, 2002; Thrift, 2004) that posit affect as inarticulable, pre-discursive and pre-social (see Barnett, 2008; Leys, 2011; Wetherell, 2014). Despite the ‘practice turn’ in the sociology of consumption, and with one or two exceptions (e.g. Rafferty, 2011; Sahakian, Bertho and Erkman, 2016), consumption scholarship drawing on practice theory has largely yet to engage with this theoretically allied field. Drawing insights from these approaches, the paper goes on to unpack the potential for the sociology of consumption of Schatzki's (2002, 2010)

concept of “teleoaffectivity”—which articulates how motivation towards goals (teleology) and emotion (affect) are mutually implicated in practices and larger social formations.

The multiplying of household appliances: constructing normality across socio-economic groups in Western Switzerland

Marlyne Sahakian, Béatrice Bertho

Université de Lausanne, Switzerland; Université de Lausanne, Switzerland

marlyne.sahakian(at)unil.ch, beatrice.bertho(at)unil.ch

This contribution seeks to understand how normality, or expectations around social norms, is constructed within distinct social groups and in relation to energy-intensive appliance acquisition – contributing to social practice theories and (un)sustainable consumption studies. Household appliance acquisition in Europe has continued to grow since the 1950s, tied up with notions of modernity and progress, as well as changing social norms around household chores (Sahakian 2015). Size standards around large appliances differ across contexts: the two-door North American refrigerator model has yet to become a standard in Europe, where households tend to use one-door models, smaller in height. Drawing from a Swiss research project studying household electricity consumption in Lausanne and Geneva and engaging with a social practice approach, we study the multiplying of large appliances – in quantity and size – focusing on refrigerators and dishwashing machines. In the case of families with high social and financial capital, the multiplying of dishwashing machines and incorporation of North American standards for refrigerators reflect expectations around social norms regarding cleanliness and order. Similar trends are underway among lower-income families, with less financial resources, but where we also observed appliances multiplying in the home, based this time on social norms around caring for extended families and managing food stocks. In the first case, a sense of aesthetics is upheld by blending large household appliances into the interior design; in the second case, the appliances are not hidden away but on display, with refrigerators set up in bedrooms when space elsewhere is not available.

RN05 | Session 07a Arts Participation

Researching culture: participation, policy and practice in a semi rural Scottish village

Jill Elizabeth Ebrey, Andrew Graham Miles

University of Manchester, United Kingdom; University of Manchester, United Kingdom

jill.ebrey(at)manchester.ac.uk,

andrew.miles(at)manchester.ac.uk

This paper is based on multifaceted ethnographic work undertaken since 2014 in a peri-urban ‘edge’ community close to Aberdeen, in north east Scotland, as part of the Understanding Everyday Participation-Articulating Cultural Value (UEP) research project

(<http://www.everydayparticipation.org>). UEP research 'proposes a radical re-evaluation of the relationship between participation and cultural value' and as such, asks searching questions about the relationship between culture and democracy. Building on our recent article (Miles and Ebrey: 2016), in which we articulate the need for greater attention to be paid to often forgotten communities in between the country and the city (Williams 1973), this paper suggests how we might work towards developing new forms of cultural policy; including those which breach the binaries of 'urban' and 'rural' and help to bring the material and symbolic together in a meaningful dialogue to address inequalities in cultural provision (Stark et al 2013, 2014). Drawing further on Williams' notion of a 'common culture' (Williams, 1958,1967), we discuss how understandings of 'culture' 'participation' and 'democracy' are negotiated in the context of local histories of economic and social relations, giving rise to 'structures of feeling' which are rarely appreciated or addressed in policy discourse. We conclude by arguing that a recognition of such ordinary, everyday cultures and their social and cultural value is essential if we are to mitigate the democratic crisis which we now face in Europe and further afield.

Arts Perception: Cultural Capital, Cognitive Processes and Emotional Outcomes

Weingartner Sebastian, Jörg Rössel
University of Zurich, Switzerland; University of Zurich, Switzerland
weingartner(at)soziologie.uzh.ch,
roessel(at)soziologie.uzh.ch

The most influential approach to analyze the social conditions of cultural consumption is Pierre Bourdieu's class theory developed in the sixties. One of its central building blocks, Bourdieu's theory of art perception, states that different social classes not only differ in the cultural goods they consume, but also in their way or mode of consumption. The latter is because observing, perceiving, and appreciating a piece of art always involves a process of decoding. This process is dependent on the particular aesthetic competence of the observer and therefore on her level of cultural capital. Hence, according to Bourdieu, different modes of appreciating art depend on individuals' cultural capital endowment.

However, Bourdieu partially revised his theory of art appreciation in a later article from the early eighties. There, while continuing to emphasize the importance of aesthetic competence for different forms of art perception, he rejected the notion that applying art and art history categories and schemes had to be a conscious, intellectual process. Hence, a well-developed aesthetic competence may rather result in an intuitive, emotional familiarity with a piece of art than in a conscious, intellectual process of decoding. In our presentation, we attempt to integrate both perspectives, showing that cultural capital determines both the cognitive processes underlying different modes of arts perception and the emotional outcomes

of arts appreciation. Furthermore, we zoom in on the association between cognitive processes and emotional results of arts consumption. For this purpose, we resort to standardized survey data of a recent contemporary arts show in Zurich. Our data do not only include differentiated measurements of cultural capital, but also detailed information on cognitive aspects and emotional reactions when perceiving (contemporary) art.

Cultural participation and network diversity among older age groups

Mathijs De Baere, John Lievens
UGent, Belgium; UGent, Belgium
Mathijs.DeBaere(at)UGent.be,
John.Lievens(at)UGent.be

The relationship between social network characteristics and arts participation is often ignored in studies on cultural consumption. Specifically for the older part of the population this link can even be more relevant, since professional networks in this age group are no longer active and, consequently, leisure network connections become more important as primary source for social capital. Besides, the focus on cultural consumption among the older age groups is relevant in itself because of the specificities of these ages such as more leisure time, less structuring of time and more financial resources. Also from the side of cultural policy and the cultural sector the older age group is specifically interesting, given its large size (because of the ageing of the population) and the fact that elderly people remain more (culturally) active at older ages than previous generations. Our paper focuses on the question whether having a diverse social network is linked with higher levels of cultural participation among older age groups. To this end, we use data gathered among a representative sample of the Flemish population in 2009 (Survey on participation, 2009), encompassing 729 respondents of 55 years old or older. The relationship between diversity of social network and participation in cultural activities, controlled for other relevant variables, is studied by means of a multinomial logistic regression. Results show a positive association of network diversity with out-of-house cultural activities. Conclusions are drawn with respect to the social capital enhancing effect of art and cultural participation.

The gender gap in highbrow cultural consumption in the Netherlands (1983-2007): Age effects and cohort effects

Susan Lagaert
Ghent University, Belgium
Susan.Lagaert(at)UGent.be

Research consistently indicates that women are more involved in highbrow cultural activities than men. However, a cross-time perspective on this gender gap in cultural consumption is currently lacking. Therefore, in this contribution we will study whether the changing position of women in the Dutch society has resulted in

a diminishing gender gap in highbrow cultural consumption, disentangling between-cohort differences and age effects. We apply Hierarchical Age-Period-Cohort models on Dutch repeated cross-sectional data (1983, 1987, 1991, 1995, 1999, 2003 and 2007) on cultural consumption to evaluate whether the gender gap in highbrow cultural involvement has changed throughout the last decades and to what extent age - and cohort effects can explain these changing gender differences. With regard to age effects, cumulative disadvantage theories suggest that gender differences intensify as men and women grow older. With regard to cohort effects, gender differences are expected to be smaller in younger cohorts: younger cohorts are more likely to be socialized in a gender-equal context, leading to smaller gender gaps, while older cohorts were socialized in a period when more traditional ideas about men and women prevailed in the Netherlands, which may have caused lasting behavioral differences between men and women.

RN05 | Session 07b Gender and Consumption

The performative agency of fashion apps on gender construction

Lena Hansson
University of Gothenburg, Sweden
lena.hansson(at)gu.se

Fashion has a history of playing an important role in society and in shaping consumer culture and has with the emergence of web 2.0 technologies increasingly come to be mediated and consumed digitally. In this paper, the 'performative agency' (Mason et al., 2015) of fashion apps on gender construction will be explored. The performativity approach have been used within economic sociology and recently also in marketing to show how theories, practices, and technologies (Callon, 1998; Zwick & Cayla, 2011; Mason et al., 2015) affect the shaping and formatting of market and marketing practice. The fashion apps are conceptualized as new digital consumption devices and the analysis will show how they exercise 'performative agency' on the construction of gender in their specific settings and through the styling and consumption practices that are afforded by the apps. Gender is here not viewed as fixed or defined but as performed (Butler, 1990). However, the apps do not exercise performative agency as simple digital and technical tools but as socio-material networks of marketing and consumption ideas, discourses, social relations, practices, technical skills, materiality etc. The paper is part of an ongoing study of the digitalization of consumption and builds on an 'object ethnography' (Carrington, 2012) of a number of fashion apps and the derived social media posts along with unstructured interviews with app owners. The paper contributes to an understanding of the performativity of gender in the context of fashion consumption in mobile digital settings.

I eat what I'm up for – Young guys, masculinity and nutrition

Sabine Haertl, Susanne Ihsen
TU München, Germany; TU München, Germany
sabine.haertl(at)tum.de, ihsen(at)tum.de

„I eat what I'm up for“ – that is what a young guy joining one of our group discussions told us. These group discussions are part of the interdisciplinary competence cluster of nutrition research enable which deals with healthy food choices in all stages of life in Germany. In our subproject we focus on gender and diversity dimensions.

This talk handles how masculinity is constructed in the sphere of nutrition. We enlighten how young men are positioning themselves in the ambivalence between the norm of optimizing oneself by work on the body and the practice of having junk food within the peer group. This practice can be understood in three ways: (1) as process of constructing youth, (2) as distinction from femininity and (3) as resistance against self-optimisation of health representing the hegemonial discourse. The current state of research tells us on the one hand that – over all - women are eating healthier than men. On the other hand, the example of nutrition displays the fragility of masculinities which turns out especially obviously in the youth. Young men are required a steady construction of masculinity which takes place in a mutual process of representing and attributing. Thereby, incorporated knowledge is built and this provides habitual security.

This talk deals with the relationship of norm and practice concerning the nutrition of young men. This is empirically highlighted by the outcomes of focus group discussion and biographical interviews. The results are positioned in the sociology of bodies, masculinity research, habitus theory and the sociology of nutrition.

Fashion and beauty blogging: post-feminist devices for marketing, intimacy and resistance?

Magdalena Petersson McIntyre
University of Gothenburg, Sweden
magdalena.petersson(at)cfk.gu.se

Since its early days, fashion blogging has evolved from amateur documents of mundane and everyday practices of beauty and dressing into multi-channel businesses with advanced marketing schemes. During this transformation many bloggers have been made aware that the road to success lies in creating a persona that reveals intimate details of everyday life as well as sharing and giving full disclosure regarding such practices. Consequently, bloggers constantly negotiate boundaries surrounding questions of intimacy, feminism and beauty. Drawing on the idea that bloggers may be understood as devices that help construct a market (McFall 2015, Cochoy 2016), the paper builds on in-depth interviews with fashion and beauty bloggers to discuss the different techniques bloggers use to make sense of their online activities. The paper relates to questions of whether outfit-of-the-day, selfies and other similar online cultures of self-presentation should be understood as post-feminist

practices of resistance or whether digitalization merely deepens the links between surface, intimacy, femininity and consumption, employed by capitalism.

Physical appearance as an asset in a consumer society: differences in norms for men and women

Erica Åberg, Tero Pajunen, Outi Sarpila
University of Turku, Finland; University of Turku, Finland; University of Turku, Finland
erica.aberg(at)utu.fi, tero.pajunen(at)utu.fi, outi.sarpila(at)utu.fi

Physical appearance plays a fundamental role in consumption driven societies. Consumers are not just encouraged, but expected to constantly evaluate, modify and control their body and looks, and by doing this, to express their innermost identity (Bauman, 2007; Featherstone, 2010; Shilling, 2012). In the ideal form, this logic of consumer culture applies to both genders equally. However, previous research points to a different direction by distinguishing gendered differences in the norms of taking advantage of one's physical appearance (e.g. Martin & George, 2006). Using appearance for economic purposes is morally unacceptable for women, in particular (Sarpila, Pajunen & Åberg, 2017). In this article, we conceptualize physical appearance as an exploitable asset, and analyze whether the norms of taking advantage of one's appearance differ between men and women in different areas of life. More specifically, we examine the acceptance of using appearance as an asset in working life and in other spheres of social life. We use a unique data with a split-ballot design to study the possible double standards in accumulation and exploitation of one's physical appearance. Our data is drawn from a Finnish nationwide survey collected in 2016 (N=1600).

RN05 | Session 08a Institutions and Relations in Food Consumption

Institutional Norms and School Lunch Patterns, a European Comparison

Christine Tichit
Centre Maurice Halbwachs, INRA, CNRS, ENS, EHESS, Paris, France
christine.tichit(at)inra.fr

The economic crisis is stretching the historical and social aim of school lunch policies, which has been to provide at least one meal a day to each child. Beyond the question of free meals, the issue of school lunches is now being impacted by new consumer movements and cultural distinction claims, such as a demand for organic or halal food. Building on the diversity of school catering models in Europe, the paper will propose a comparison of institutional offers and their impacts on food consumption conditions and children's socialization in regard to food.

The paper first focuses on the comparison of three typical school lunch patterns in Europe: the French national school lunch, the Danish homemade lunch boxes, and the mixed British pattern that may combine

school meals, lunch boxes and alternative offers on site at school. These catering patterns are based on different historical traditions and national contexts, are more or less homogeneous, structured and standardized at local level, and determine the modalities by which norms are transmitted: collective and egalitarian in the standardized French offer, family-based with the Danish lunch boxes, and individually based in the British offer of alternatives.

The paper will also review some of the findings from a survey of teenagers from across the EU attending a European school offering a variety of catering alternatives at school (institutional canteen, lunch boxes, cafeteria, etc.), leading to a comparative typology of these teenagers' relationship to the school lunches according to their national origin.

Managing packed school lunches with many children and low income: Immigrant families' struggles to include themselves in Norwegian food culture

Silje Elisabeth Skuland
Oslo and Akershus University College of Applied Sciences, Norway
silje.e.skuland(at)sifo.hioa.no

Everyday consumption is fundamental for including and integrating immigrants in capitalist welfare states such as Norway. Participation in shared food practices such as school lunches is no exception. My aim here is to discuss how immigrant families manage packed school lunches on tight food budgets. The packed school lunch, which usually includes open sandwiches with spread, is expensive when there are many mouths to feed. How do immigrant families negotiate financial constraint, and in what ways do they comply with the packed school food norm? The data of the paper consists of qualitative interviews with 30 immigrant families from East-Africa, Middle-east Asia, South America and Poland who struggle to make ends meet. In Norway, reduced welfare spending affects immigrant families in particular and more than half of all children in households at risk of persistent low-income have an immigrant background. Preliminary results show that immigrant families strive to comply with norms of normality, which limits eating non-Norwegian foods during the school day. Although pressure to integrate immigrants through employment and education has increased during the current right-wing government, the role of everyday consumption is mostly ignored. The compliance to the packed lunch norm among the immigrant families in this study provides a good case on how everyday food consumption, ethnicity and financial constraints intersects with increased pressure to become normal.

Failing breakfast: family unity and food consumption

Daniela Pirani
Royal Holloway University of London, United Kingdom
pbva014(at)live.rhul.ac.uk

This paper observes how families negotiate the

normative power of food, accommodating the contradictions that arise between ideal advertising models and everyday practices. Drawing from an empirical research on how families experience everyday breakfast, the data here presented were collected interviewing 35 Italian participants, sampled between heterosexual and LGBT families. Consumers' interpretations of a common topos in advertising, the family having breakfast together, casts a light on the power discourses engendered in the context of early morning domesticity. This study reveals how, in participants' accounts, the family that eats together still holds a strong symbolic value in doing, displaying and staging family. Food is here understood as a normative set of practices functional in regulating familial routines through the ritual of meal consumption. However, families recurrently fail to reproduce this ritual. Interviews reveal that breakfast is experienced as a liminal meal: families can fail to eat breakfast together without undermining the value of shared meals and family unity. Aware of intertextual references, consumers dismiss normative advertising images –especially in terms of gender representation– without dismissing the related food practices. Unlike lunch and dinner, in fact, families struggle to gather around the table given time restriction, individual habits and conflicting schedules. Nevertheless, the importance of having breakfast resists in family narratives, while the failure of doing so is rarely addressed if not concealed. This insight offers a potential theoretical contribution addressing how food practices can be strategically invested or disinvested of symbolic meanings according to family needs, preventing deviance from an ideal model to be experienced as a failure in doing family.

Pet food consumption and human-animal relations. Producers and human consumers values and attitudes.

Roberta Bartoletti, Giulia Cecchelin
University of Urbino Carlo Bo, Italy; Independent
Researcher
roberta.bartoletti(at)uniurb.it,
cecchelin79(at)gmail.com

We present the main results on the second step of a research on the role of pet food consumption in human-animal relations. Human-animal relations are becoming an innovative central topic in social sciences (Ingold 1988, Tester 1992, Arluke, Sanders 1996, Franklin 1999, Descola 2005), and should be better investigated also in the field of sociology of consumption (Bartoletti and Cecchelin 2016).

In our paper we focus on companion animals. Food consumption play clearly a central role in the relation between pet owners and companion animals.

We first analysed the Guidelines of the European Pet Food Industry Federation and a sample of pet food packaging being marketed in Italy at the moment. We found that health is the value most strongly promoted, followed by taste and (marginally) convenience. An affectionate and responsible domination is the prevailing relationship between humans and their

companion animals in on pack-communication, but we noticed also the emergence of an uncanny figure of the pet, which is both tamed and wild at the same time.

In the second step of the research we focus on the values and the human-animal relations promoted by producers in advertising and on human consumers attitudes and behaviour in pet food consumption (interviews with a sample of pet owners in Central Italy).

RN05 | Session 08b Cultural Stratification

Cultural connections: the role of cultural interest in accessing social network resources

Roza Meuleman
Radboud University, Netherlands, The
r.meuleman(at)maw.ru.nl

Previous research has argued that by discussing and demonstrating interest in culture, people identify shared preferences and group membership. Relatedly, policy makers often assume that cultural participation facilitates bonds between people of different backgrounds. Nevertheless, it remains relatively unclear to what extent cultural interest assists in the formation of social network relations.

Based on the status argument by Bourdieu and building on the idea of homophily, it is argued that people from higher status positions use highbrow cultural interest to identify (dis)similar others and to establish social ties with high status members whilst excluding people from lower status groups.

Because Bourdieu mainly reasons in terms of the (strategic) behaviour of higher status groups, some label his status similarity arguments as asymmetric. This study will therefore examine to what extent the influence of highbrow cultural interest on social network resources works differently for lower status groups. Highbrow cultural interest might – to a certain extent – offer the opportunity for people from lower status positions to gain access to higher status groups, a process labelled as 'cultural mobility' by DiMaggio.

The current study tests these two competing frameworks by combining insights from cultural sociology and social network theory and by examining to what extent people's interest in highbrow culture affects the socioeconomic resources in their close (e.g. friends, family) and extended social network (e.g. acquaintances). A dynamic panel design is used to address issues of causality.

African American Dreams: An Examination of African American's Aspirational Consumption

Cassi L. Pittman
Case Western Reserve University, United States of
America
clpittman(at)gmail.com

Drawing on in-depth qualitative interviews with 55 middle and working class African American New Yorkers this paper investigates their aspirational

consumption, revealing that non-poor blacks maintain racially-based ideological inclinations that affect their consumption. While they subscribe to individualistic attitudes about the material requisites of success, social mobility, and prosperity, encoded in the American Dream, they simultaneously maintain a collective orientation that is deeply rooted in their racial identity and ideas about racial uplift. From examining their aspirational consumption it becomes clear that race affects and differentiates blacks attitudes and preferences as consumers. Respondents often indicated that giving to their church and helping friends and family members were prioritized over purchasing luxuries for themselves, indicating that blacks diverge in their aspirational consumption from previous research on Americans more broadly. In accounting for their accomplishments and achievements, they see their success as the consequence of other's good will and investment in their advancement, as well as a result of their being "blessed." Again, indicating a collective orientation even to account for their individual success. While a substantial body of research has demonstrated how race unites the political interests of blacks across the board and serves as an impetus for political behavior, this paper argues that their consumption wish lists too are shape by ideological commitments to fellow in-group members. Lastly, this paper presents a depiction of blacks' collective racial financial imagination that critiques the pervasive idea that blacks are on the whole conspicuous consumers and excessively materialistic.

Mobility, participation and class identity: using mixed methods to explore the temporalities and social-spatial dynamics of cultural practices in the UK

Andrew Miles, Adrian Leguina
University of Manchester, United Kingdom; University of Manchester, United Kingdom
andrew.miles(at)manchester.ac.uk,
adrian.leguinaruzzi(at)manchester.ac.uk

'Understanding Everyday Participation - Articulating Cultural Values' (UEP - <http://www.everydayparticipation.org>) is a five-year research project exploring the dynamics of, and stakes attached to, informal and 'unofficial' participation practices in the UK. It puts particular emphasis on the relationship between participation and place, and between patterns of participation and life course trajectories. We know that both social mobility and place matter for cultural participation but for reasons of paradigmatic constraint, data limitations and methodological complexity their intersections have rarely been studied. In this paper we combine quantitative data from the 1958 UK Birth Cohort Study (also known as the National Child Development Study) with qualitative life history interviews conducted with sub samples of panel members in Scotland, North-West and South-East England when they reached the age of 50 in 2008 to explore the relationship between socio-spatial mobilities and

participation practices. Here, we explore several questions about the intersections of biographical, generational and historical change in the process of 'cultural class formation', viz: How far is cultural consumption in adulthood determined by consumption across the lifecourse? And in particular, what is the relationship between mobilities (social and geographical) and cultural participation? Here we mix text-mining techniques with correspondence analysis in order to integrate quantitative and qualitative perspectives on mobility, place and participation. Our early findings indicate that semantic fields for participation modes and class identities are associated with distinctive and contrasting mobility trajectories.

Cultural capital and nascent middle class: cultural consumption of Czech elite university students

Ondřej Špaček
Charles University, Czech Republic
ondrej.spacek(at)fhs.cuni.cz

The cultural stratification in Central European countries represents to large extent understudied field of cultural consumption. Long-term development of social institutions refrains to use straightforward interpretation of the nature and content of local (national) legitimate culture (see e.g. Eyal et al. 1998; Pellandini-Simányi 2016). Tension between state-socialist cultural policy and enduring legacy of bourgeoisie society make content of legitimate culture obscured. This paper makes an empirical inquiry into this issue. Its based on large-scale survey of students of Charles University, largest elite university in the Czech Republic. University students as a future middle class members are immersed in the school environment – one of the major breeding grounds of cultural capital and legitimate culture (see e.g. Börjesson et al. 2016, Igarashi & Hiro Saito 2014). MCA will be used to unfold the space of taste and consumption of this "unfledged" middle class. Following the proposition of emerging cultural capital(s) (Priour & Savage 2013, Roose 2015), varied fields of cultural consumption will be put into scrutiny (e.g. movies, TV series, but also urban space consumption, gaming or eating out). The analysis will focus on potential divides between middle class fractions (see Jarness 2015). Following questions will be addressed: How nascent middle class fractions represented by students of different disciplines vary in their positions in cultural space? Which major dimensions of cultural capital could be identified in cultural space of young generation? How is cultural and political cosmopolitanism intertwined in the social space?

RN05 | Session 09b Leisure, Digital and Media Consumption**Is playing a videogame a craft?**

Tom Brock, Emma Fraser

Manchester Metropolitan University, United Kingdom;
Manchester Metropolitan University, United Kingdom
t.brock(at)mmu.ac.uk, E.Fraser(at)mmu.ac.uk

Explanations of computer game consumption tend towards a focus on the relationship between play, narrative and its context(s) to explain consumer behaviour. The dominant narrative that underwrites these explanations is that play, through gaming, is often undertaken to escape reality and that games are consumed to help people actualise desires and fantasies that are otherwise unattainable in their everyday lives. Thus, it has been argued that games offer a variety of 'imaginative escapes' from routine life, such as the collection of in-game items or achievements, which are seen to provide players with a sense of 'progress' that is otherwise lacking from their working lives. In this article, it will be argued that what is missing from these accounts is a discussion of Richard Sennett (2009) calls 'the craft of play' - where play inaugurates material practices of repetition, modulation, and consistency that are constitutive of craft labor. The article intends to explore the relevance of Sennett's thesis to a sociological analysis of gaming, and uses ethnographic research on video gamers to unpack the ways that play becomes akin to craft labor. The study reveals that players get great satisfaction from negotiating the relationship between pleasure and rigorous practice and identifies that, for some, it has become a vocation, one which has called into question their pre-existing relationship to work and employment. The article concludes by suggesting that gaming is not simply an escape from reality but a way of re-appropriating the experiences of craft.

Smart toys? - on children's access to connected play technologies and what it can entail

Ingrid Kjørstad, Ardis Storm-Mathisen

Oslo and Akershus University College of Applied Sciences, Norway; Oslo and Akershus University College of Applied Sciences, Norway

ingrid.kjorstad(at)sifo.hioa.no, ardis.storm-mathisen(at)sifo.hioa.no

Internet of Things (IoT) – the ecosystem of smart applications and services where sensors are attached to devices so they can connect to the internet – is no longer only a reality in supply chains and control systems, but has spread to the common consumer market and into the world of children. A rather recent development is the introduction of a number of "smart toy" products on the market (i.e., with a chip, microphones, cameras, voice monitors, internet connection and apps). Sales of interactive dolls and robots are boosting and there is reason to believe such toys are to be found in many homes already and increasingly so in the years to come. Knowledge as to

what this means are still scarce, but recent reports suggests there are serious security and privacy issues connected to these interactive "smart toys" (Consumer Ombudsman Norway 2016, Norwegian Data authorities 2016). The products can be used to eavesdrop and for customised marketing. Hence, users, and not the least children, can become vulnerable because of the information they are sharing and receiving through the product. This paper attends to the issue by discussing findings from a 2017 survey that set out to map the access of Norwegian children to "smart toys" and a follow-up case study that assessed the user risks connected to how various kinds of such products open up new types of direct and indirect contact between children and the internet.

Senior tourism: a tool for enhancing social inclusion, a form of symbolic consumption or a strategic choice for the profitability of tourism stakeholders?

Athina Nella

Hellenic Open University

a.nella(at)chios.aegean.gr

As stated from the title, senior tourism can be seen from different perspectives, among which social policy, consumer behavior and marketing viewpoints. During the last decades there is considerable debate on the radical demographic changes taking place around the globe with ageing population being a critical issue for most European countries. These trends have already created severe impact on the nature of tourism demand and are shaping accordingly the future of tourism offerings.

Consequently, social scientists, tourism researchers and marketers are showing increasing interest for "senior or grey" tourists. Marketers and market strategists, on the one hand, put their emphasis on affluent tourists aged over 65 years old, as they combine both time and purchasing power available for leisure activities; in this case leisure can be as well viewed as a form of symbolic consumption. From another standpoint, economic hardship poses another view and questions regarding senior tourism: how can economically restrained seniors be benefited from social tourism programs?

A literature review of relevant published research is examined to identify aspects and trends concerning senior tourism. Occasions for escape, companionship, reminiscence, rest and relaxation, time with family can be important motives or "push" factors. Attributes such as weather and climate, beautiful scenery and attractions are among the "pull" factors. Regardless of the motives, tourism and social policy makers and tourism stakeholders as well need to understand the special needs, characteristics and tourism behavior of seniors in order to capitalize major demographic trends for the sake of individual wellbeing and social inclusion at large.

Leisure consumption in Iran, individualistic and collectivistic challenges

Hossein Mirzaei, Saeedeh Amini

Institute for Social and Cultural Studies of MSRT & University of Tehran; University of Allame tabatabaei hmirzaie(at)ut.ac.ir, samini(at)atu.ac.ir

Iran is a country in middle ground of individualism and collectivism. Family-oriented individualism is a defensible description of this society. We should explain that single individuality has not a considerable rise in Iran and family-oriented individualism is still justifiable. Leisure consumption is one the important dimensions of social life. The leisure and the way of spending it is an important subject. However the individualism is increasing in Iran and we could see this increase in different forms, but the researches indicate that only a quarter of population spend their leisure time alone, and more than half of Iranians spend it with their families. This research is going to study the type and style of leisure consumption in Iran during recent decade by using secondary analysis researches and survey method. It will explain leisure consumption in the light of theoretical approaches and possible explanations in this regard and reflect the silhouette of leisure consumption from the viewpoint of individualism and collectivism.

RN05 | Session 10a Food and Sustainable Consumption

Narratives of sustainable consumers: A critical discourse analysis of articles in "The Grocer"

Ulrike Ehgartner

University of Manchester, United Kingdom

ulrike.ehgartner(at)postgrad.manchester.ac.uk

Contemporary sociological perspectives on consumption are urging to shift the attention away from consumer behavior, towards the wider organization of infrastructures from a provisioning perspective (Warde 2005, Shove 2003, Barnett et al. 2011, Heidbrink 2015). However, while these approaches primarily associate infrastructure with the provision of tangible facilities (such as agricultural land, transport systems, buildings, institutions), this paper indicates that there is another important part of the infrastructure that enables a sustainable development; namely the discursive framing that limits or liberates the rhetoric space to discuss societal issues such as "sustainability". Within this research, therefore, the given infrastructure is conceptualized as the discursive space of sustainable values and behavior. Following a constructivist approach, this paper approaches sustainable food consumption as a complex set of socially constructed discourses which are fed by various agents such as ethical trading organizations, businesses, lobby groups, cultural institutions, NGOs, government-related bodies or academics. Carrying out a critical discourse analysis (e.g. Fairclough 1995, Fairclough 1992, Wodak 2009) of journalistic material on grocery sales, I explore the roles ascribed to consumers when sustainable food provision and consumption is contested. Particular attention is paid to dynamics of the discursive framings of "sustainable agents" and their interrelation

to changing societal conditions over time. Rather than presupposing morally concerned consumers as pre-existing categories, this paper concludes that the "sustainable consumer" is a "rhetorical figure" (see Barnett et al. 2011) which is effectively reproduced in current debates.

Exploring a social economy approach to sustainable consumption: Polanyian perspective on AFNs in Taiwan

I-Liang Wahn

Feng Chia University, Taiwan

ilwahn(at)fcu.edu.tw

Multiple alternative food networks (AFNs) emerged in Taiwan in recent years as a civil society response to problems of food safety, agriculture, and environment. These AFNs promote, among other things, a more active role for the consumer and advocate sustainable consumption as a way to change food provision. However, existing literature on sustainable consumption has paid insufficient attention to social organization of consumers. The paper explores a social economy approach to sustainable consumption that emphasizes active citizen participation and democratic decision making in creating alternative economic activities. It employs a Polanyian perspective on the "instituted economic processes" to understand these AFNs as reconfigured economic processes and explores different consumer roles in a consumer cooperative, a farmers' market, a CSA initiative, a buyers' club and an online news and market platform. It found that the organization of consumers in these AFNs served to facilitate collective learning that embed consumption as a critical part and a driving force to sustain new processes of production and exchange. Moreover, different extent of consumer participation brings different forms of collaboration and solidarity among consumers and producers, mobilizing socioeconomic resources to support the initiatives and beyond. The research argues that a social economy approach enables us to see that sustainable consumption requires putting consumption in the multiple economic processes and building new social processes is crucial for sustaining economic processes. The paper concludes by calling for more research on how networking and dialogues generate trust, new rules for interaction and evaluation of the goods and services.

Is reducing meat consumption threatening our way of life? Pro-meat discourses and practices in Switzerland

Laurence Godin, Marlyne Sahakian, Alice Wieser

Université de Lausanne, Switzerland; Université de

Lausanne, Switzerland; ETH Zürich

laurence.godin(at)unil.ch, marlyne.sahakian(at)unil.ch,

alice.wieser(at)bluewin.ch

Given its high environmental impact, reducing meat consumption is a major target of research and activism around sustainability practices. Yet it remains a controversial topic, at the core of a debate opposing

on the one side people who are passionate about animal rights, health and environmental issues, and on the other individuals and groups who consider meat as a staple in their diets, and as central to their way of life. To date, research on sustainable food consumption has given much attention to the environmentally- or animal-conscious groups and their practices. Meanwhile, consumers promoting meat consumption or standing up for their 'right to meat' have largely been neglected.

To close this gap, and as part of a Swiss national research project on transitions toward 'healthy and sustainable diets' (SNSF), we engaged in focus group discussions, participant observation in supermarkets, and in-depth interviews with pro-meat consumers. We sought to unveil the rationale behind their eating practices and their opposition to change, which often takes place despite a familiarity with the health and environmental consequences of meat consumption. At the same time, the discussions exposed the emotions and values associated with meat by the 'carnivorous' segment of the population.

This strategy gave us access to often-neglected voices in the research on food and sustainability. It also offered insights in the dynamics of resistance and change regarding the adoption of more healthy and environmentally-sound diets, which have implications for the further study of sustainable food consumption.

RN05 | Session 10b Consumption, Inequalities and Exclusions

Conspicuous Consumption of Youth: Evidence from Russia

Karen Avanesyan, Vladimir Kirik
University of Vienna, Austria; Southern Federal University, Russia
karen.avanesyan(at)gmail.com, vkirik(at)gmail.com

Conspicuous consumption of youth is an unstudied phenomenon in the Russian sociology. Existing research on this problem in Russia was conducted mostly in psychology and used methods of the psychometric testing. Against this background, our study aims to give a sociological understanding of the factors that lead to conspicuous consumption within a Veblen's framework. Taking into account findings of the previous international research, we were particularly interested in studying of the influence that a reference group, social class, and status dissatisfaction have on the propensity of the Russian youth to consume conspicuously. Furthermore, we also examined the effects of academic performance and discipline of study. In order to find answers to the elaborated questions, we employed a survey and conducted 600 face-to-face interviews with male and female students in the age between 17-22. The sample covered 5 Russian cities in the south-western region. We employed a multivariate data analysis, particularly ordinal and local polynomial regression models. The analysis revealed that a student from the upper class with economics or law background and satisfactory academic grades has the highest

propensity to conspicuous consumption. Although male students tend to conspicuous consumption more than female, gender does not have a practically significant effect. Moreover, we found a strong positive relation between a reference group and conspicuous consumption as a dependent variable. Finally, the study revealed that status dissatisfaction of students from the lower and lower middle classes leads to a greater performance of conspicuous consumption.

Beauty Parlours - for the Masses or for the Classes?

Dorota Olko
University of Warsaw, Poland
dorota.olko(at)gmail.com

Presentation is based on the case study of a beauty parlour in a deprived quarter of Warsaw, as well as on the in-dept individual interviews carried out in the framework of the research project on bodily practices of Polish working class. One of the aims of this project was to address the hypothesis that working class has its own vision of (1) the role of the body in everyday experience and (2) proper ways how to care for the body.

While physical activity or eating seem to be — at least to some extent — spaces of working-class autonomy, the attitude of the investigated group to the beauty treatments is more ambiguous. Working-class men and women usually claim that cosmetic treatments and sophisticated practices of caring for body are common and acceptable, but at the same time they treat such activities and services as „something not for them”.

However, for some working-class women visits in the beauty parlours are desirable and the only accessible way to have some time and space for themselves. Popularity of such places in city quarters inhabited by working class is a proof of that phenomenon. In the presentation I would analyse the meanings attached by lower-class beauty parlour's clients to beauty treatments and the ritual of visiting beauty salons. Investigating these practices is situated in the context of the place of the bodily practices in everyday life and the role of bodily experience in building relationships with other people.

The Emergence of Post-Subcultural Identities in Marginalized Consumer Groups

Marius Luedicke, Christian Eichert, Fleura Bardhi
City, University of London, United Kingdom; City, University of London, United Kingdom; City, University of London, United Kingdom
m.luedicke(at)city.ac.uk, mail(at)christianeichert.com, Fleura.Bardhi.1(at)city.ac.uk

Consumer researchers have historically relied on the concept of subculture to study contested and marginalized consumer collectives. Particularly gay men have often been studied as a consumption subculture (Kates, 2002; Visconti, 2008). Macro-social change toward higher social acceptance of gay consumers, however, has challenged the assumption

of gay men's minority threat, boundary work, in-group solidarity, and shared identity – the defining markers of subculture (Hebdige, 1979; Schouten & McAlexander, 1995).

What happens to the collective identity of a marginalized group when the outside threat that constitutes it is eroding? We study gay consumers in Germany to explore this important question. We ground our qualitative thematic analysis in interviews with gay men, expert informants including legislators, LGBTQ activists, journalists, and market actors, extensive historical and media sources, and ethnographic insights into contemporary non-heterosexual life. We use Social Representations Theory (Moscovici, 1976/2007, 1981; Wagner & Hayes, 2005) to challenge the subculture identity paradigm, and develop a framework of five collective identity positions that emerge under different configurations of society-level and group-level representations. We identify seven corresponding consumption strategies that illustrate how these identity positions materialize in the marketplace and enable consumers to manage a potentially contested identity across time, space, and context.

By offering a more nuanced understanding of market-mediated collective identity positions under fluid regimes of marginalization, our study primarily contributes to research on contested consumer collectives (Crockett, 2013; Kates, 2002; Kozinets, 2001; Peñaloza, 1994; Scaraboto & Fischer, 2013). Additionally, this research contributes insights on how consumer collectives that are structured around inescapable categories such as race, ethnicity, or disability, may manage transitions toward social acceptance.

RN05 | Session 11a Gambling, Gaming and Play in Society

Consumption for the Public Good. Gambling as a Funding Source for "Good Causes"

Pekka Juhani Sulkunen
University of Helsinki, Finland
pekka.sulkunen(at)helsinki.fi

Gambling regulation often aims to lower the risk of gambling-related harm and to provide consumer protection, but these are not its only functions. Gambling involves a "rent", an excess amount of revenue over the cost of providing the service plus normal profit and taxes. This surplus is usually directed to specified "good causes" and used to justify legalization and expansion of gambling activities. The other side of the argument is to prevent crime and corruption. The money flows within and outside of the regulatory system, and the institutional structures of regulation themselves, generate dependencies and interests. The more gambling develops, the stronger these interests become. This paper describes in what way and to what extent different regulatory regimes are able to collect gambling money for good causes and assesses how successful they are in justifying gambling policies in this way. The conclusion is that in

many advanced economies gambling returns are a significant funding source for sports, culture, science, as well as health and welfare services, comparable to the returns from alcohol or tobacco taxes. There is no systematic difference between regimes based on monopolies, licensed companies or associations as gambling operators. Gambling as a funding source for public services is redistributive from poor to rich, does not eliminate crime and generates a cost from problem gambling leading to financial trouble, health and social losses. The analysis is based on data from governments and gambling operators.

Problem Gambling as a Social Risk – the Impact of Life Cycle and Social Class

Thomas Jean Amadiou
Renmin University of China, China, People's Republic of
thomasamadiou(at)gmail.com

Gambling is intrinsically linked to the issue of intensified inequalities in European societies since the economic crisis in 2008. First because these devices of random allocation of resources attract a public mainly from the popular and precarious classes. But also because gambling exposes their practitioners to significant risks related to addiction that can lead to increased impoverishment (over-indebtedness, theft, divorce, social isolation, etc.). Gambling plays undoubtedly a role in the risk of poverty, that remains largely unexplored.

The issue of addiction to gambling has mainly been addressed in the context of a medical apprehension of the phenomenon, but social factors are increasingly apprehended in relation to the psychiatric or neurological dimensions. At the social level, the dynamics of extreme consumption of gambling are linked to a complex interaction between class, life cycle and familial situation. This paper extends a growing concern in the field of addiction studies for the interplay between "micro" dynamics of addiction, namely individual careers and life events (divorce, job loss, etc.), and "macro" factors such as social status and class.

I will present the results of a quantitative analysis carried out from the OFDT-INPES health barometer 2015, on the consumption of gambling in general population in France. A model of the dynamics of exposure to the risk of problem gambling will be proposed.

How to become a gambler? Set of meaning attributed by young people to the practice of betting

Federica Chiusole
University of Bologna, Italy
federica.chiusole2(at)unibo.it

Since the 1980s gambling has become a global phenomenon legalized and popular in Western societies. Even being globally spread, each local context adapts this practice according to its cultural canons and its set of shared meanings. In this sense,

also Italy is characterized by a wide offer of places and practices. To understand how the different forms of gambling are conceived as legitimate and continued to be practiced everyday is fundamental in order to better understand the whole structure of late capitalism.

Within this theoretical framework, this contribution aims to observe the betting practices diffused among youth population in Italy. Actually, betting is something traditionally embedded in the Italian culture; however, the pluralization of betting palimpsests occurred since the 2000s, as well as the possibility to bet online, have profoundly modified these practices.

This contribution tries to analyze the first results of an empirical research on gambling, that I am currently conducting in Bologna (Italy). The research is based on qualitative methods, i.e. in depth-interviews with betting shop holder and players and participant observation inside betting shops.

The aim of this research is trying to understand how young people, grew up in a symbolic frame and with an exposure to gambling that differs from the adults' experience, consider this practice and what meanings they attribute to it. Though the analysis of qualitative data, and following an interactionist perspective (Becker, 1969), the contribution is going to provide some considerations on how young people become gamblers; on the importance of social context in shaping the gaming practices; and on the set of moral values that young people attributed to their everyday practice of gambling.

The gambler, the game and the machine – An actor-network analysis of Finnish and French recreational gamblers

Michael Egerer

University of Helsinki, Finland

michael.egerer(at)helsinki.fi

Background: In the international research literature, the interaction between the game and the gambler is often conceptualised as “the zone”, and a space separated from ordinary life. This perspective, however, neglects the varying regulations concerning placement of gambling opportunities.

Aim: This article asks if Finnish recreational gamblers, who gamble in an everyday environment, perceive their gambling activity and its risks differently than French gamblers, who gamble often in the time-out environment of a casino.

Method: Reception Analytical Group Interviews RAGI, a stimulated focus-group method, were conducted. The data consist of 14 Finnish and 14 French groups with altogether 110 participants. Actor-network theory informed the analysis.

Results: The other gambler takes the position of an important actor in both countries. For the French gamblers, however, the other gambler appears in a more positive light and enables to enjoy any type of game more. In the Finnish context, the character of the other-gambler depends on the context and the kind of game. In the casino the other-gambler is also part of the enjoyable gambling experience; in poker

the other-gambler acts only in enabling the game of the gambler via the money they bring into the game.

Conclusions: The regulatory context of the different type of games has an influence on the interaction between the game and the gambler beyond the game characteristics. Taking the findings of the international research from mostly Anglo-Saxon context to inform policies elsewhere has to be seen hence as questionable.

RN05 | Session 11b Consumption of Water and Energy

Energy saving in Norwegian households as part of the green transition

Torvald Tangeland, Nina Heidenstrøm, Gunnar Vittersø

Oslo and Akershus University College of Applied Sciences, Norway; Oslo and Akershus University College of Applied Sciences, Norway; Oslo and Akershus University College of Applied Sciences, Norway

torval(at)hioa.no, Nina.Heidenstrom(at)sifo.hioa.no, gunnar.vitterso(at)sifo.hioa.no

Due to more resource intensive lifestyles in developed countries and the global population growth, consumption of energy is increasing worldwide. In Norway, the electricity consumption level in households' is high compared with other European countries. However, the direct impact on climate is low since 96 percent of the electricity produced in Norway comes from hydropower. The Norwegian energy differs thereby from other European countries where energy supply, especially for heating, largely is based on CO₂-intensive energy sources like coal, oil and gas. The aim of this paper is to explore what energy saving measures Norwegian consumers have implemented, and how simple and effective they believe these measures to be. It is based on two nationally representative surveys among the adult Norwegian population. Data was collected in 2010 and 2016 and the total number of respondents was 1000 in each year. Results indicate that consumers rate the measures with low energy saving potential as the most efficient and easiest to implement, that they are more interested in buying less energy intensive technologies than to reduce the consumption level, and that they expect investments to be paid off within a 3-5 year period. Electricity saving in Norwegian households may contribute to electrifying the transport sector, which now accounts for 13 percent of the total greenhouse gas emission, but also to free electricity that can be transported to other European countries and contributing to greening their energy mix.

Reproduction of heating habits: the role of materiality

Anders Rhiger Hansen

Aalborg University, Denmark

arh(at)sbi.aau.dk

Materiality constitutes an important element in most

everyday practices, where certain objects (e.g. technologies or buildings) can be necessary to the performance of practices or have more of a background role. In addition, according to social practice theory, material objects are sites of knowledge that practices are organized around. This means that material objects “incorporate” certain ways of knowing how to act within specific practices. This idea has particularly drawn attention from the field of sociology of sustainable consumption, where it has proved useful in empirical studies of for example energy consumption and use of technologies.

However, these studies focus on how material arrangements shape cultural understandings of social practices, and not how these materially-shaped understandings becomes incorporated in bodies and thereby affects later performances of practices in other material settings.

In this paper, I use heat consumption habits as the case to investigate how previous experiences with specific material arrangements affect embodied habits and thereby later practice. Using regression models on extensive administrative data, I estimate the effect of the built environment (e.g. energy efficiency, size, and type) of occupants' homes in 2000 on their level of heat consumption in 2013.

I study finds that occupants that lived in more energy efficient and larger houses in 2000 tend to consume more heating in 2013, and that the effect varies across material context. This result suggests that occupants “carry” certain materially-shaped habits with them from one practice to another, and moreover, it emphasizes the role of houses in reproducing heat-related habits.

Different habits of hot water use – different ideas of cleanliness?

kirsten Gram-Hanssen, Toke Haunstrup Christensen, Line Valdorf Madsen

Aalborg University, Denmark; Aalborg University, Denmark; Aalborg University, Denmark

kgh(at)sbi.aau.dk, thc(at)sbi.aau.dk, lvm(at)sbi.aau.dk

In smart energy approaches the timing of energy consumption gets increasingly important as the integration of intermittent renewable energy sources in the energy system also requires adjustments in the consumption profile. The main research and policy interest so far has been within electricity consumption, though also district heating companies begin to show interest in demand response and understanding the background for different types of consumption profiles. This paper builds on a qualitative study with households on their energy consumption for domestic hot water (DHW) use. Statistical cluster analysis shows how different households have different time of use patters for DHW; e.g. some have morning peaks and others evening peaks. Based on this, households from different clusters were selected for interviewing on their showering and bathing habits and on how these relate to differences in understanding of cleanliness as well as how cleanliness practices interact with other everyday practices. Interviews will be analyzed from a practice theoretical perspective,

and includes analysis of the temporal structuring of hot water usage and how this can be explained by dynamics related to dispositions, procedures and sequences (Southerton, 2013). Also, the study will explore the relations between hot water usage practices and other household practices through notions like bundles and complexes.

The gap between energy attitudes and behaviour: Does it vary between European countries?

Anita Borch, Zoltan Kmetty, Caitlin Bent

Oslo and Akershus University College/Consumption

Research Norway (SIFO), Norway; Ariosz LTD;

Energy Saving Trust

anita.borch(at)sifo.hioa.no, kmetty.zoltan(at)ariosz.hu,

caitlin.bent(at)est.org.uk

This paper address people's attitude and behaviour related to energy savings. Whereas some studies indicate that people that are concerned about the environment also tend to act more environmental friendly, other studies shows no connection between 'theory' and practice. So far, most studies on residential energy consumption have explored the connection between attitudes and behaviour at national level. Based on a web-survey conducted in Denmark, Hungary and the UK in 2016, we widen the perspective in this paper and compared the connection in the northern, western and southern/eastern part of Europe. The research question is: how does people's attitudes and behavior connect in these countries? Observed differences between the three countries have been identified and interpreted in light of three causal explanations entitled: 'energy information gap', 'energy alienation' and 'constrains of everyday life'. Inspired by the social-political theories of Gösta Esping-Andersen, we hypothesize that the connection between energy attitude and behaviour in Denmark, Hungary and the UK has different explanations rooted in each country's distinctive energy and social policy.

RN05 | Session 11c Arts and Cultural Consumption

Gender differences in the cultural participation of the elderly

Francisca Mullens, Jessy Siongers, Ignace Glorieux

Vrije Universiteit Brussel, Belgium; Vrije Universiteit

Brussel, Belgium; Vrije Universiteit Brussel, Belgium

fmullens(at)vub.be, jessy.siongers(at)ugent.be,

Ignace.Glorieux(at)vub.be

Several studies indicate gender differences in cultural participation, they show a higher participation rate in receptive highbrow cultural activities among females. These gender differences are often linked to traditional gender roles concerning life spheres and labour division; men are considered responsible for the production of economical capital of the family and women for status- and cultural capital production. Some argue that gender related leisure patterns are more the case among older generations since they

have grown up with stricter gender role patterns. On the other hand, when people reach retirement, their life alters severely. Conceivably this life event alters the life world of men more than that of women. Women tend to have more family and domestic responsibilities while their work path is more fragmented. Therefore, men and women's leisure activities may also change in different ways after retirement.

In this paper we want to analyze the cultural participation of elderly (>50). To this end, we use data of the Flemish Participation Survey 2014 (total n=3965) encompassing 1901 respondents aged 50 or older, and the Flemish time use study of 2013 (total n=3260) encompassing 1272 respondents aged 50 or older.

Our analyses are threefold. First we will examine if gender differences in cultural participation differ according to age (total population). Next we will focus on the elderly. We will compare the cultural activities of active and retired people, in particular the gender related differences. Finally, we will investigate which factors (socio-economic background, occupational career, ...) influence the cultural participation of elderly men and women.

Trends in contemporary art discourse. Using topic models to analyze 25 years of professional art critique

Henk Roose, Willem Roose, Stijn Daenekindt
Ghent University, Belgium; Ghent University, Belgium;
Ghent University, Belgium; Erasmus University
Rotterdam, the Netherlands
henk.roose(at)ugent.be, willem.roose(at)gmail.com,
stijn.daenekindt(at)ugent.be

We explore changes in discourse in the field of contemporary art over the last 25 years. Using topic modeling, we analyze 6,965 articles published between 1991 and 2015 in *Frieze*, a leading art magazine. We find a plurality of topics characterizing discourse on contemporary art. Not unexpectedly, media- or genre-specific topics emerge, such as film/cinema, photography, sculpture/installation, etc. Interestingly, also extra-artistic topics characterize professional art critique. There is room for articles on new digital technology and on art and philosophy, as well as growing attention for the relationship between art and society. Our analysis shows that despite the 'social turn' since the nineties—i.e. art paying more attention to social forms and content—'autonomous' discourse continues to be prevalent. Descriptions of aesthetic, formal characteristics of artefacts and their art-historic context remains central in discourse on contemporary art.

Culture as future development motive: Museomix case from the knowledgeability to the social capital as growth factor

Lucia Marciante
University of Bologna, Italy
lucia.marciante2(at)unibo.it

The innovating practices of digital museology are the answer to the economic contraction in the post-modern society. These practices of collaborative consumption change the way to consider culture as development motive and offer a choice in the challenge against the dialogue dearth between capacity to aspire and traditions, at the same time. This is the case-study of Museomix, a creative maketon of French matrix, born in Paris in 2011. The aim of Museomix is to put people on the mainstream in the creation of value for museums. Indeed, this project intend to activate creative practices, considering them as growth tool for the museums audiences' participation. The hypothesis is that little museums could become a cultural place where consumers can be engaged and active audiences-citizens. By the ethos "Do-It-Yourself" and the idea that co-create is more entertaining than only consume, the main question is if these practices could fill the gap between museums and web cultures participative. The Museomix global project (museomix.org) aims to a museum: that is inclusive; where each participant in the process of creation finds its own place; that is a laboratory which grows together with one's audiences; where the communities are into the network.

Key concepts coming out, such as: consumer's agency, audience development, empowerment either of the single and of the community, knowledgeability, innovation, participation. The social capital is the value added in the sense that the quality of the generated relationships can foster integration, inclusion and solidarity for the growth of local communities.

RN05 & RN09 | Session 07b JOINT SESSION: Re-thinking Market Capitalism: The Rise of Alternative Forms of Economic Exchange I

Transnational Motorways: The Secondhand Car Trade in a Country of Emigration

Anatolie Cosciug
Bielefeld University, De / Babes-Bolyai University,
Romania
anatolie.cosciug(at)fspac.ro

60 to 70 percent of the entire car stock in Romania was imported from elsewhere in EU in the last two decades. In this research I use a mixed-methods research strategy to observe how migration play a special role in both the development and the expansion of the cross-border car trade. Romania is a migrant-producing-nation: some 15 percent of Romanians work abroad, mostly in countries such as the Spain, Italy, UK, or Germany. First, international migration created a market for imported cars by injecting cash into the Romanian economy. In the past 15 years, 50 billion euros were sent by migrants back home. 70-80 percent of those financial remittances were spent on home appliances (40–50 percent), extension/modernization of houses (40–50 percent), and automobiles (10–20 percent). Second, many of Romania's three-million-migrants living and working abroad return home when they may reproduce (European) consumer behaviors seen and

experienced in the destination countries. Migrants use Italian-inspired design to modernize their houses, cook Spanish dishes, wear trendy occidental clothes, or drive well-known German car brands that demonstrate their modernity, cosmopolitanism, and the success of their migration experiences (Anghel et al. 2015). Third, former migrants had a distinct advantage in the trade with imported secondhand vehicles. Most of the imported cars come from countries where significant Romanian migrant communities exist, so prior experience in these countries is highly valuable. One of the reasons is that while abroad, migrants develop language skills, increase their social networks, and learn how to navigate the institutional settings that directly influence their ability to import better secondhand cars for less money.

Timebanking: negotiating the social space

Teppo Eskelinen

University of Jyväskylä, Finland

teppo.h.i.eskelinen(at)jyu.fi

Recently, alternative forms of economic exchange have drawn wide interest. A visible example of such economic forms is timebanking, the practice of trading services with time-based community currencies. Grounding their idea of value in the equal value of everyone's time and the idea that no-one is devoid of valuable skills, timebanks aim at strengthening the social fabric in communities and fostering the "core economy", as opposed to capitalist market exchange.

Yet as timebanks gain ground, they face also increased pressures to negotiate the social space available for them, amidst the domains of government and the market. The timebank activists will have to negotiate their position towards different systems of governance, policy pressures, and the capitalist market's attempts to "commodify everything". The timebanks will likely undergo some changes in the process, but the key question is, does such social space exist, or can such social space be created, in which timebanks could be recognized as having a system of operation and valuation which is not reducible to either government or market.

In my presentation, this will be analysed through presenting a case study of the Helsinki timebank in Finland, and an analysis of interviews with timebank brokers and activists in London area. The analysis will show, how the process of negotiating social space is different in a traditional welfare state and in the UK "Big Society", and what are the similarities and differences of the challenges and dilemmas faced by timebanks in these two social settings.

Between exchange and gift-giving? Economic moralities of self-organised long-distance ridesharing

Juhana Venäläinen

University of Eastern Finland, Finland

juhana.venalainen(at)uef.fi

This paper discusses self-organised long-distance

ridesharing as a perspective to the underlying political tensions in the so-called "sharing economy". The analysis arises from the study of Facebook-based ridesharing groups in Finland. With more than 170000 members, these groups (ca. 60) have become the dominant way of coordinating rides from city to another. In contrast to commercial, centralised, and platform-based solutions, such as Blablacar, the groups have been established independently, for the mutual provision of services in a particular region. As such, they also have the freedom to devise their rules and practices relatively autonomously.

Self-organised ridesharing can be understood as a form of peer production that challenges the established public transport services as well as the more commercially oriented platforms of sharing. It portrays a "transport commons" with potential of upscaling earlier practices of ad hoc mutual aid (e.g. hitch-hiking) to a more institutionalised level. However, ridesharing communities are still volatile to external and internal pressures that threaten their sustainability as "alternative" (non-market) economies.

The focus of this paper is on the internal tensions within the ridesharing communities, and in particular on the role given (or not given) to monetary compensation in mediating the justness of exchange. Through an analysis of the discussions in three Facebook polls in the largest nation-wide ridesharing community on the "just price" of a ride, the paper addresses the question of what kind of economic moralities frame the ridesharing communities as institutions of sharing.

"One for Me and One for who Needs it". Agape and "Suspended Goods" Beyond the Exchange

Gennaro Iorio, Silvia Cataldi, Andrea Gallelli

University of Salerno; University of Rome La

Sapienza; Freelance researcher

iorio(at)unisa.it, silvia.cataldi(at)uniroma1.it,

andrea.gallelli(at)mail.com

Why sometimes people use own resources to help unknown others? What drives an entrepreneur to adopt expensive socially responsible behaviours? What prompts a public employee to spend time with a customer beyond the working hours?

In the every-day life there many social phenomena based on un-conditionality, disinterestedness, surplus. Such phenomena remain outside the field of explanation of approaches such as rational choice theory or neo-utilitarianism, being described as paradoxes of social action.

Drawing from critical theories, we propose to (re)introduce the sociological concept of agape-love as a theoretical frame for those social mechanisms that elude reification, quantifiability, instrumental thinking.

Agape-love, as formerly introduced by Luc Boltanski (1990), is focused on the present, avoiding any consequence calculation, refuses comparison and equivalence, doesn't involve reciprocity. We propose to reconceptualise agape, integrating it with theoretical insights by different social scientists (such as Honneth

and Sorokin), with new reflexive and institutional accounts, and provide it with empirical foundation (Iorio, 2014).

We present the case of “suspended goods” and read it in the look of agape. It is a relatively recent practice widespread in various fields (examples are suspended groceries, books, coffee, holidays) that consists in purchasing goods which will be actually consumed by others who cannot afford them.

We argue that agape is a powerful concept, capable of linking micro and macro levels, useful both to enlighten agents’ motivations in apparent non-rational (choice) situations, but also to describe the aggregate effects of collective behaviours that produce alternative economic regimes or welfare systems.

RN05 & RN09 | Session 08a JOINT SESSION: Rethinking Market Capitalism: The Rise of Alternative Forms of Economic Exchange II

Why live in Marinaleda? An analysis of individual motive for living in a social movement community

Marianne Walker

University of Leicester, United Kingdom
mariannegwalker(at)gmail.com

The main objective of this research project is to illustrate why people choose to live in Marinaleda; an agricultural community in the Seville Province of Spain described as a ‘Communist Utopia’. Villagers are regularly involved in a struggle to create and maintain their style of cooperative, with actions ranging from expropriating local land from aristocrats, to providing for the unemployed of the region through, for example, raiding supermarkets. The village is thus viewed throughout the project as a form of social movement, fitting in line with Bloomers (1988) definition “A collective enterprise that establishes a new system of living”. This qualitative study analyses motive for participation, focusing on the principle themes found in relevant literature such as personal interest, relating to social and economic benefits, and of collective identity. From this study it was found that personal benefit should be seen as a departure point for participation and thus inhabitancy. The idea of collective identity, with key links to shared ideological values, was however, seen as the current most important factor in inhabitancy. This ultimately showed a transformation of participation motives, showing how collective action and shared experiences change motives.

Solidarity economy and rights-based approach

Laura Marjut Kumpuniemi

University of Eastern Finland, Finland
laura.kumpuniemi(at)gmail.com

Solidarity economy is a global civic movement and, also, takes form as a wide range of grassroots economic activities creating alternatives to capitalism with a bottom-up approach. Solidarity economy is most often defined through a set of ethical principles that guide the activities and decision-making. The

ethical values like equality, democracy, and reciprocity set a basis for activities that can vary from producer or consumer cooperatives to time-banking and from collective savings unions to participatory budgeting. Solidarity economy is seen to have a rather political character because it is trying to expand the concept of the economy by changing the way of seeing economy purely as a private matter and focused on striving for profit. Instead of this, the aim is to increase people’s possibilities and ability to make economic decisions about their own lives and strengthen the well-being of people and environment.

In my presentation, I will focus on the ethical basis of solidarity economy and do an analysis about solidarity economy through a rights-based approach. Could solidarity economy and its diverse activities have an impact on human rights? I will be looking at theoretical and practical connections between solidarity economy and rights and give some examples in the context of Bolivia where I am conducting my field research for my PhD research about solidarity economy and rights.

Copperatives as a tool to introduce economic democracy to the market

Kaja Małgorzata Kietlińska

University of Warsaw, Poland
kajakietlinska(at)gmail.com

Modern economic business models, in opposition to most of the modern European political systems, still continue to function with a somewhat outdated hierarchical model of power. This means that for the majority of companies there is a very significant division between employees and employers, and their respective roles and rights within a firm.

Cooperatives are one of the models which are based on the idea of introducing democracy into company structure. These are companies which give equal rights to their workers, including the right to express their opinion, for these opinions to be heard and considered, to take part in the decision making process by participating in the voting, and to share the responsibility and profits for their collective work evenly. Studies reveal that employees working for such companies not only are happier, more satisfied, and earn larger salaries, but also are more productive and engaged. Also cooperative modeled companies are more flexible to the changes of the market than traditional ones, which gives them greater stability during times of economic crisis. Furthermore, in general they are much more beneficial to local markets because their profits are evenly distributed to the workers who spend locally and improve local money circulation instead of being transferred to owners and other financial institutions often far away from these markets. This approach not only changes workers attitude towards the company, but also makes a certain changes in the way they think about participation and creation outside their workplace. Also cooperatives tend to promote other good values, such as ecology, respect for natural resources, waste reduction, alternative energy, animal rights, fair trade, bio-agriculture. They are serious alternative to

capitalistic model.

The Sustainable Economic Policies in Iran

Hamideh Dabaghi, Ali Sarkamari, Seyyed Ahmad Firouzabadi

University of Tehran, Iran, Islamic Republic of; Islamic Azad University, Iran, Islamic Republic of; University of Tehran, Iran, Islamic Republic of
h.dabaghi(at)yahoo.com, ali_sarkamari(at)yahoo.com, Afirouzabadi(at)ut.ac.ir

The concept of Sustainable development consists of many different aspects which all of them emphasize on managing resources due to the future. Policies and making policies are the main tools that help government does the best. So they should make policies due to local needs, capabilities and regional features. But if not, it will lead to inappropriate distributing the population, resources, facilities and provisions activities, spatial imbalances and social inequality. This article focuses on two elements of the fourth and fifth development plans as two last macro plans in Iran: "sustainable planning" and "economic policies", by using descriptive analysis to explain what is behind the macro development plans. The results show that: there is an attention to just a part of all indicators which is related to distribution facilities and provisions activities. We have used a content analysis of main texts in development plans. In addition analysis of the fifth development plan with the same measure indicates that: there are not laws which are related to indicators such as the demographic indicators through planning, providing spatial zoning (city or village) as a place where economic policies are done and zoning space is based by immigration. In addition there is an attention to the spatial distribution aspect of development the fourth development plan which is neglected in fifth development plan. Additionally, comparative study shows that there is many advantages in the fourth Development Plan than the fifth.

RN05 & RN09 | Session 09a JOINT SESSION: Re-thinking Market Capitalism: The Rise of Alternative Forms of Economic Exchange III

Sharing economy and automobility: A comparison of app-based and off-line hitch-hiking

Valentin Iulian Gabor
University of Bucharest, Romania
iulian.gabor(at)sas.unibuc.ro

As an increasing body of research indicated, we are facing a huge wave of new economic organization. Shifting our focus from an institutional type of trust, to an individual or to a network-based trust, online technologies take advantage of this dynamics and are reshaping our behavior. Companies like Blablacar, Airbnb or Uber, through their web platforms, are creating new patterns of consumption for their users, participating in the same time at a rise of alternative forms of consumption. My research, began in 2015, takes up the case of ride-sharing culture. I explore the

differences between what I call online hitch-hiking (using apps like Blablacar) and street hitch-hiking (the 'traditional' way). Using participant observation and informal interviews, I collected data drivers (truck, private cars, buses) and the hitch-hikers. The findings indicate that app-based hitch-hikers reference, most often, efficiency, transparency, lower costs, predictability, 'community' membership, and trust. 'Off-line' hitch-hikers emphasize 'freedom', euphemize risk, rapport building with drivers and negotiation.

Understanding Organisational environments: case studies from Europe

Giulia Colombini
Università di Pisa, Italy
colombini.giulia(at)gmail.com

Since the beginning of the recent crisis, many organizations across Europe have been going through a phase of profound changes. The organizations of the social economy are evolving in many different directions guided by the influence of their specific context. The environment is a relevant element to understand the evolution and the diffusion, during the past years, of different type of organizations of the social economy in different countries.

In this paper we analyse how a specific context can foster the diffusion of a particular type of organisation. We adopted the complexity theory of organizations (Morgan) and the method of action-research (Lewin) to study the relation between the internal and external environments in order to understand how organisations spread, thrive or collapse.

In particular, the analysis focuses on three cases from Italy, Spain, and Scotland. In Italy we studied the merger between two social cooperatives operating in the same field and in the same region; in Spain we studied two different NGOs in the process of reorganising their activities after a phase of funding cuts; finally, in Scotland we observed an unprecedented flourishing of social enterprises over the last few years and we focus our attention on five case studies.

The approach we propose allows to understand how organizational behaviour is influenced by the link connecting the internal dynamics of organizations and the uncertain environment surrounding them.

"The less is more" - minimalism as a remedy for overconsumption?

Renata Dopierala
University of Lodz, Poland
renata_dopierala(at)poczta.onet.pl

Minimalism became popular after the economic crisis in 2008. In general, it means a lifestyle based on intentional reducing of material possessions and seeking what is important in individual life (values, ideas and so on). Contrary to the consumerism, minimalists declare that do not concentrate on material objects as a symbol of status or social position. At the same time it should not be consider neither as strictly anti-consumerism nor anti-

materialism. So how can we define it? Minimalism can be considered as a set of practices of high level status (what Baudrillard name „discreet” consumption), and a new form of ideology. But, on the other hand, minimalism can be conceived as a strategy to rationalize financial problems and an adaptation mechanism to cope with the consequences of late capitalism system (such as precarity, marginalization and exclusion, lack of opportunities for achieving goals and ambitions).

In the paper I (i) shortly present main presumption of minimalism and its relations to voluntary simplicity movement, (ii) consider two variants of minimalism: a „luxury” and a „poor” one, (iii) examine minimalism as an example of an alternative form of the economy (e.g. reducing the excess things, exchange of material objects, non-cash transactions). Minimalists’ books and blogs will be analyzed.

New Socioeconomic Formations against Corporate Embodiment in Digital Networks

Athina Karatzogianni
University of Leicester, United Kingdom
athina.k(at)gmail.com

This research focuses on new algorithmic governance and socio-economic formations, particularly in the area of “sharing economy”. It discusses fieldwork research in Barcelona, Paris, and Berlin. Twenty-six in-depth interviews with activists, experts and practitioners were conducted between Nov2015-Nov2016 across institutional, academic and activist settings, in combination with ethnographic observation. I draw from cyberconflict theory to map the interrelations across sociopolitical, ideological, organizational and digital elements influencing these formations (Karatzogianni, 2015, see also previous work). This paper discusses exclusively ideology and particularly the “commons” as a justification register for individuals and groups involved in new modes of production and governance. I argue that this register is problematic in two critical ways. First, because the “commons” replaces capitalism’s earlier “common good” as a justification register, i.e. the use of digital commons for ideological purposes, in the sense of Boltanski and Thévenot’s (2006) economies of worth to reproduce inequalities, hierarchies and continuous labor exploitation (Karatzogianni and Matthews, 2016). Second, it does not produce a higher logical order of dissent, which surpasses capitalism as a social code. Platform cooperativism and other alternative models are explored and discussed with participants to ascertain whether they provide a strong alternative to current algorithmic governance and production able to overcome the quasi-totalitarian character of global trusted networks (corporate, governmental and third sector).

RN05 & RN09 | Session 10a JOINT SESSION: Financialisation of the Everyday I

Living in Debt: Gendered Experiences of Household Indebtedness in Greece and Turkey

Pelin Kılınçarlıan
Koç University, Turkey
pkilincarslan(at)ku.edu.tr

In the last decades, use of credit cards and consumer loans has become a prominent phenomenon. Debt-based consumption is now such an ordinary practice that many households depend on credit to sustain basic needs. Easier availability of financial means, weak schemes of social protection, commodification of social life and growing socioeconomic inequalities have all played a role in creating the reliance on debt. Lower-income groups in particular are forced into borrowing for the necessities of social reproduction with credit operating as a neoliberal mode of inequality management. Given the pervasiveness of the phenomenon, it is essential that we know more about how debt and indebtedness is experienced: How do the recipients of credit perceive and practice indebtedness? What kind of intersectional subjectivities does debt create? What are the possibilities of politicization and depoliticization in these subjectivity formations? This paper aims to explore these questions comparatively in the everyday experiences of women who are residents of indebted households from low-and middle-income groups in Athens and Istanbul. On the one hand, the two cases represent weak economies, where debt is relatively a new phenomenon, and they currently share the highest rates of growth in household indebtedness with highest levels of household consumption among the OECD countries. On the other hand, they differ from one another in terms of gender inequality patterns. Based on in-depth interviews with women in the two contexts, this paper will point out the importance of the need for understanding indebtedness as a gendered process blurring the boundaries between production and reproduction, households and markets, the broader environment and daily life.

Confidential Economic Life and Relations in the Simplicity of Everyday Life

Gülsevrim Eysel, Yelda Erden Topal
Middle East Technical University, Science and Technology Policy Studies, Turkey and Van 100. Yil University, Turkey; Middle East Technical University, Science and Technology Policy Studies, Turkey
gevsel(at)gmail.com, yeldaerden(at)gmail.com

It is popular and widespread in the new capitalist era that opening the daily lives to new technological

developments for creating new /additional incomes or reducing the expenditures. This aim of the entrepreneurship changes according to different sectors. While it shows itself at the limited home-consuming solar energy in energy sector, it is seen in the new roles of gynecologists in the use of female body parts and genetic material in the reproductive biotechnology sector.

These two seemingly different occupations are forced to have some illegal or informal roles and opportunities which goes to the same result: Commercialization of everyday life. The research question of this presentation is how regulations lead some professionals and entrepreneurs to invest individually, risky or to be confidential partners of the clients. These two different sectors will be fed from two different PhD theses' interview findings. The whole data will be discussed through critical approach and Frankfurt School, mainly with the key concepts of Herbert Marcuse about individualistic technological rationality.

In the energy sector, Turkey has some legal limitations, additional costs and long /difficult procedures in the commercial use of solar energy. Similarly, in the reproductive biotechnology sector, Turkey has strict ban on the use of the third parties' genetic material for reproductive aims. This presentation, differently will not only focus on the commercialisation of everyday life, but also on the dailiness seeming of commercialisation.

Time problems of private investors' decision-making. About the temporal dimension of the financialisation of everyday life

Michael Walter, Lydia Welbers
University of Bremen, Germany; University of Bremen, Germany
mkwalter(at)uni-bremen.de, welbers(at)uni-bremen.de

In our paper we will focus on private investors' time problems in regard to their decision-making practices on the financial market. Based on 40 in-depth interviews with private investors and ethnographical observations in 8 investment clubs in Germany we will discuss the following questions:

- How do private investors deal with specific timing constraints and uncertainty about the future as an effect of the volatility of the financial markets?
- Which types of „rationalities“ can be found, such as planning, incrementalism or coping?
- And how are private investors' time practices on the financial market connected with their conduct of everyday life and their socioeconomic status?

In our analysis we will show that there is a wide spectrum of private investors' decision-making practices. On the one side of the spectrum, we can identify practices – based on the investor's aspiration to act methodically and calculatingly – with a long-term future horizon in order to neutralize the inherent volatility of the financial market. On the other side there are (sub-)incremental practices with an extremely short-term future horizon that aim to take profit from the volatility of the financial market. In this

context, the analysis shows that the different time problems and practices of decision-making are strongly interrelated with the individual investors' conduct of life and socioeconomic status (e.g., age, family status, labour situation, economic and cultural capital, saving habits and motives etc.). In a broader perspective, our findings indicates, that the temporal logic of financial markets deeply entrenches the everyday life of private investors. Thus our paper contributes on an empirical basis to illuminate the temporal dimension of the current financialisation of everyday life.

Methodological Innovation in Study of Discursive Financialization: How to Analyze Ideologies in Economic Discourse(s)?

Tomáš Samec
Charles University, Czech Republic
tomas.samec(at)fsv.cuni.cz

The article presents an innovative methodology for assessment of discursive financialization. Discursive financialization accounts for processes in which institutional agents employ discursive strategies and practices to transform subjectivities (e. g. citizens to investors) and normalize certain set of values connected to economic behaviour of households. The question raised is how to deal analytically with accounts of financialization in seemingly non-ideological contexts such as financial literacy manuals for households or blogs providing quasi-consulting advices for the homebuyers. The presented method of analysis is inspired by the developments in Critical Discourse Analysis (CDA) and Structural Narrative Analysis (SNA) and combines the contextual and reflexive character of CDA approach with a formal rigor of SNA. Specifically, the method focuses on how to identify reliably evaluative and descriptive accounts in texts under scrutiny. Dataset serving to develop the method comprised of a) guidebooks for households from the socialist era (1948-1989) from the former Czechoslovakia; b) contemporary manuals, issued by the Czech National Bank, for the Czech citizens suggesting financially responsible behaviour and c) blogs authored by the real estate agents that contain tips concerning searching for and buying a house. It is concluded that joining insights and principles of CDA and SNA may overcome the methodological difficulties in the study of ideologies in discourse of financialization, namely the lack of contextual information (who are the readers, how they interact with texts, what linguistic and cognitive resources they use) and risk of essentialization and generalization of ideological accounts.

Financialisation of the Everyday II**

Worries, fears and hopes: Construing and mobilizing emotions in financial education

Daniel Maman, Zeev Rosenhek
Ben-Gurion University of the Negev, Israel; Open
University of Israel, Israel
dmaman(at)bgu.ac.il, zeevro(at)openu.ac.il

The individualization, privatization and marketization of risk management are constitutive features of financialized capitalism. As individuals are held responsible for their financial situation, an imaginary emerges of the subject as a calculative risk-manager, who is expected to engage with financial markets as the main way to assure her financial wellbeing. However, due to the growing complexity of financial practices and instruments, most of the population faces fundamental difficulties in navigating the financial sphere. The notion of financial literacy and practices of financial education have emerged recently as a salient instrument to cope with this situation. As a technology of governance, financial education is directed at constituting proper financial subjects with the cognitive, moral and emotional dispositions deemed as necessary to engage effectively and responsibly with financial practices.

This paper examines the themes and notions deployed in programs of financial education currently conducted by state and non-state organizations in Israel, probing how proper conduct in key financial activities -- credit, saving and investing -- is defined and justified. The analysis suggests that though financial education is presented as essentially informative, emotions occupy a prominent place in it. Both positive and negative emotions around financial practices are construed and mobilized in order to shape individuals' expectations and to prompt them to take particular financial decisions and actions. This emotional dimension contributes to connecting individuals' subjectivities and life experiences to the individualization and marketization of risk management that characterizes the neoliberal institutional order, thereby contributing to normalizing the financialization of everyday life.

Artificial Intelligence and Financial Applications – Opportunities and Threats of Financialization for the Daily Life of Consumers.

Sebastian Nessel
Graz University, Austria
sebastian.nessel(at)uni-graz.at

Given the rise and usage of financial-assistance-apps (FAA) based on artificial intelligence, it is surprising that studies in the field of financial sociology have yet neglected this topic. This talk will address this yet neglected topic applying a practice perspective. It's main focus is on the practical consequences of the rising use of FAA to plan and administer consumers' financial transactions. First, new technologies in the

financial sector are outlined. Attention will be given to developments that affect consumers' day-to-day usage of financial technologies, especially FAA. Second, potential benefits and threats to individual consumers' financial decisions based on FAA are discussed. I will show that FAA may enhance consumers' financial literacy but can also lead to unintended challenges when it comes to budget restrictions as these are more tight to external forces. Third, I address societal consequences of new financial technologies. Here, my focus is on the consequences FAA may have on societal developments and on social inequality. I will show that new financial technologies can be an opportunity as it enhances actors to better plan their budget but also a threat as actors have to give a bunch of information to financial institutions and, thus, could, in a Foucaultian manner, be subject to external scrutiny. As I will show, these developments are hence subject to political and societal struggles about what FAA guidelines could or should include. Finally, I discuss implications of new technologies for further studies in the field of the sociology of finance. I will underline my arguments with first studies in the field and by analyzing process generated data such as articles in leading tech-Journals or interviews with techfirm-CEOs.

Mobile Money and its social and economic impact: The case of M-Pesa in Kenya

Maria Nawojczyk, Umulkher Abdillah
AGH University of Science and Technology, Poland;
Masinde Muliro University of Science and Technology,
Kenya
maria(at)list.pl, abdullahi(at)student.agh.edu.pl

Mobile money presents an unparalleled opportunity to deliver a basic suite of modern financial services to the "unbanked" millions across the world. The World Bank predicts that by 2020, mobile money could impact the lives of some 2 billion people in developing countries, heralding a new era of financial services where banking will no longer be the privilege of a small upper class. The mobile revolution, which has already reached millions of the poor, may well be the vehicle that helps lift them out of poverty as new and affordable financial products are rolled out in the next phase of development. For a long time, the focus of the financial inclusion debate has been on credit and savings services. At this point onwards, the study will focus on actual collection and analysis of empirical data on the constructs of mobile money and its impact on changes in social practices and on economic growth. The main focus of the study is to assess the relevance of mobile money to the economic growth of Kenya between 2007-2015. Additionally it looks at what is mobile payment, the success factors of the most successful mobile money implementation, M-PESA (Mobile Money) in Kenya. The study is based on quantitative analysis of survey data from World Bank Enterprise Surveys, World Bank Global Financial Index and Kenya FinAccess Business Survey 2014. The story of mobile money we will be grounded theoretically in the concept of network

society and ANT following Castells and Latour.
Financialization and social inequalities in the Italian capitalism

Joselle Dagnes, Angelo Salento
 University of Torino, Italy; University of Salento, Italy
 joselle.dagnes(at)unito.it,
 angelo.salento(at)unisalento.it

Over the last three decades, financialization phenomena originated from the Anglo-Saxon capitalist model have spread in several countries.

Nevertheless, since financial system's transformations have to deal with national contexts (institutional, economic, cultural factors), some observers argue that in some countries the existence of traditionally-based specificities should be protective against the increasing influence of finance.

The paper aims to challenge this belief. We highlight how in the Italian capitalism the persistence of traditional elements (e.g. ownership concentration and control, patronage relationships) has not prevented from the adoption of financial patterns of accumulation. In Italy, particularly from the 1990s, the volume of financial assets and transactions has increased dramatically, and non-financial companies tend to pursue financial short-termist accumulation rather than production.

Starting from this framework, the paper argues that the Italian structural characteristics have been exploited as a resource in the transition to new strategies of short-termist accumulation. In fact, thanks to the existence of strong connections within a small elite, it is easy to develop informal coordination when changes occur, in order to guarantee economic and social reproduction processes. The paper will then show that the spread of financialization processes within Italian companies and families is leading to growing inequalities in terms of social inclusion and access to essential goods and services. The research is carried out through a mixed-method approach – combining the analysis of official documents, quantitative analysis (i.e. social network techniques), and qualitative in-depth interviews to key economic actors.

**RN05 & RN12 | Session 11d JOINT SESSION:
 Consumption and the Green Transition for a
 Changing Europe**

**Understanding food routines: focus on
 interactions between food waste and eating well
 with practice theories**

Margot Dyen, Lucie Sirieix, Sandrine Costa
 Montpellier Supagro, France; Montpellier Supagro,
 France; Montpellier Supagro, France
 margot.dyen(at)wanadoo.fr, lucie.sirieix(at)supagro.fr,
 sandrine.costa(at)supagro.fr

After the European Parliament's recommendations to reduce food waste (FW) by 2025, several national initiatives have emerged. A recent report of the European Court of Auditors questions how FW can help facing other environmental challenges (European

Court of Auditors, 2016). Consumers have been identified as the actors who waste the more, so they are privileged targets for sensitization (ADEME, 2016). Another recent European report questions the link between FW and nutritional labelling (French Senate, 2017). This echoes scientific results suggesting an interconnection between FW and healthy eating (HE) (Evans, 2011; Graham-Rowe et al., 2014). In this context, how can consumers deal with FW reduction and HE in a daily routine? We question in this study the potential synergies or contradictions between these topics. We adopt a holistic view of daily consumption, based on a practice-based approach paying attention to the materiality and to the social aspects of bodily incorporated actions (Hargreaves, 2011; Reckwitz, 2002; Shove et al., 2012). Our qualitative methodology is based on semi-directive interviews with 23 participants, conducted with a projective method of collage aiming at describing daily food practices from shopping to storage; a second step consists in observing shopping, stocking, cooking, eating and storage practices with 10 of the 23 participants. Various nexuses of practices coexist in individuals' routine, and participants engage in each of their nexus depending on temporal, social and motivational influence. Those nexuses can combine (a) both FW reduction and HE (b), address only one challenge or (c) none. These results give cues for a new approach for public policies aiming at modifying consumer behavior and contribute to the theoretical reflections on practice theories application.

Turning poor households into sustainable consumers : the trap of moralization

Hadrien Malier
 EHESS, France
 hadrien.malier(at)gmail.com

While research has shown that the majority of sustainable consumers are middle or upper class, educated and white individuals, how can the perspective of lower-income and racialized communities which are incited to adopt eco-friendly practices help complete our understanding of such practices and movements ?

From November 2014 to July 2015, I conducted an ethnography of the work of volunteers missioned to engage and support inhabitants of public housing residencies in the process of greening their lifestyle and consumption. The program, implemented by local authorities and public housing agencies, aims at mobilizing families through a broad set of advice designed to make their lifestyle less impactful for the environment. I spent 9 months with two teams operating in two different poor neighborhoods in Paris's suburb. I also conducted a dozen of formal interviews with the major actors who coordinate the mission and with actors who participate to the implementation of the same strand of policies in other urban areas across France.

The intervention will use inputs from Foucauldian studies to describe what responsabilization does to the people it addresses. Drawing from ethnographic data,

I analyze how the project to transform residents' behaviors is articulated to a negative moral representation of disadvantaged communities (they are supposed to be the ones who care the less for the environment), which leads to moralization and implies some sort of social control. The intervention will argue that such policies which aim at reforming the subjectivities of lower-income families are both inefficient and unfair, since they result in the moralization of the social groups whose lifestyle is actually the less impactful for the environment.

Consumption, Sustainability and Social Change during Hard Times

Monica Truninger, Luisa Schmidt, Joao Guerra, Pedro Prista

University of Lisbon, Portugal; University of Lisbon, Portugal; University of Lisbon, Portugal; University Institute of Lisbon, Portugal
monica.truninger(at)ics.ulisboa.pt,
mlschmidt(at)ics.ulisboa.pt,
joao.guerra(at)ics.ulisboa.pt, pedro.prista(at)iscte.pt

The impacts of the international economic crisis and the following national debt crisis in Portugal were visible though the increase of unemployment rates, the retrenchment of the welfare state, and the escalation of poverty and social inequalities (Carmo & Costa, 2015). The crisis reached its higher intensity during the period 2011-2014 when the government implemented a stringent austerity package to curtail public debt. During this period, media reports based on market research pointed towards significant shifts in consumption practices (e.g. less eating out, less car use, more own food production). In order to understand better the scale and type of shifting consumption practices during the crisis we conducted a national survey on sustainability based on a representative sample of the Portuguese population (1500 respondents), which offers insightful data. The survey included several questions, among others, environmental values based on the HEP/NEP scales, sustainability meanings, food habits, food waste practices, main changes in consumption related practices. In this presentation the results will be interpreted bearing in mind whether the consequences of the economic crisis in Portugal had in any form configured a transition towards more sustainable consumption patterns. The main objective is to understand how the Portuguese relate to sustainability and its plural dimensions (ecological, economic, social and governance) and what were the main shifts in practice carried out by the respondents during the crisis. By so doing we aim to engage in a critical manner in the debates around thrifty, green and frugal practices during hard times and constructively unpack the relations between economic downturn and sustainable consumption (Evans, 2011; Hinton and Redclift, 2009).

RN06 - Critical Political Economy

RN06 | Session 01a Theorising and Conceptualising Neoliberalism and its Authoritarian Traits

Authoritarian neoliberalism and the state: towards transnational fascism?

Yuliya Yurchenko

University of Greenwich, United Kingdom
y.yurchenko(at)greenwich.ac.uk

'Austerity policies for the poor, tax cuts for the rich and TNCs' - this seems to be the dominant foundational principle of the state in the current neoliberal authoritarian phase (ANL; Bruff 2012) of capitalist imperialism. The state is reformatted into a transnational institution that allows for accumulation of capital to occur through, around, and by (elaboration of Robinson 2004) state/society complex (Cox 1981) control. The state/society complex as an entity is too reformatted: ontological primacy of capitalist interest in state policy decision-making begs for inclusion of capital into the complex as an autonomous force. In political discourse such primacy is being legitimised by compartmentalisation and extreme othering of marginalised groups and labour. Nationalist rhetoric associated with ANL is obtaining fascist features with excesses of policing, of physical and symbolic violence, and with normalisation of that violence. In Gramscian theory terms what we are witnessing is 'consensualisation' of forms of coercion previously unacceptable as part of hegemonic consensus. So, capitalist imperialism survives despite the ongoing recession by reinventing itself as transnational fascism where ideological hegemony of neoliberal accumulation is preserved even when survival of its previously instrumentalised institutions and legal frameworks e.g. EU, are under threat.

Does the world need a jolt? A critical approach to contemporary social movements and their relationship to authoritarian neoliberalism.

Madelaine Moore, Anne Engelhardt

Kassel University, Germany; Kassel University, Germany
maddim(at)gmail.com, engelhardt00(at)gmail.com

Since the crisis, many have focused on the way that neoliberal capitalism has morphed in order to stabilize its own reproduction. However, these transformations cannot be understood in isolation from the protest movements that have opposed it (Huke, Clua-Losada,

Bailey, 2015). Protest dynamics, networks and movements have emerged that challenge some of the conceptual divisions that exist in social movement and labour theory. It is proposed that studying these as part of a social whole may better encapsulate the specificities of the current conjuncture of post-crisis resistance to neoliberal capitalism, offering a deeper understanding of the contradictions that could be harnessed for an emancipatory politics. This paper draws on an analytical framework that aims to explore the interdependent relationship between social reproduction and sites of production in the stabilization of capitalist relations (Harvey, 2010). This draws heavily on the notion of accumulation by dispossession showing that sites of production and reproduction, as well as the actors in these spaces are interrelated, and thus strategies and theory that equally approaches both are better equipped at conceptualizing the totality of capitalist relations (Federici, 2012). The paper is a comparative study exploring the logistics strikes in Portugal and the anti-fracking movement in Australia between 2012-today. These two cases, that on the surface fit the classic opposing categories of "old" and "new", highlight that these categories are problematic and limit any analysis that seeks to better grasp the totality of our current conjuncture. By unpacking the dynamics of these movements rather than purely the short-term visibility or immediate outcomes we propose that we will better capture the contradictions of contemporary neoliberal capitalism.

Framing the Neoliberal Canon: Resisting the Market Myth via Literary Enquiry

Kathryn Starnes, Ian Bruff

Manchester Metropolitan University, United Kingdom;
University of Manchester, United Kingdom
k.e.starnes(at)gmail.com, ianbruff(at)gmail.com

Despite widespread recognition that neoliberalism's valorisation of the 'free market' stands in considerable tension with 'really existing' neoliberalising processes, there is still much underlying respect for such claims. In contrast, the paper contends that a re-examination of the canon of neoliberal thought as literary texts rather than political or economic arguments reveals that neoliberalism has never been about free markets. Using Friedman and Hayek as exemplars, our reading of neoliberal texts focuses on author framing gestures, particular understandings of the term 'science', techniques of characterisation and constructions of epistemological legitimacy. We argue this approach reveals a narrative that masks the heavy intellectual burden borne by states and households, not markets. This has significant implications for contemporary understandings of authoritarian neoliberalism and of how to critique/resist it.

Champions of Neoliberal Authoritarianism: Scope for Transnational Union Strategies

Darragh Golden

University College of Oslo and Akershus, Norway
darragh.golden(at)afi.hioa.no

Much of the extant literature on authoritarian neoliberalism emerged as national governments and supranational institutions responded to the 'Great Recession'. However, the neoliberal authoritarian dynamic is intrinsically played-out through the medium of nationally rooted MNCs, which draw their competitive advantage from distinctive institutional environments, including systems of employment relations. This paper proposes shifting the level of analysis by focusing instead on 'national champions'. Ryanair is a representative exemplar of such, much to the envy of others. 'British Airways ... is desperately trying to become more like Ryanair' (Economist, 2016). Aviation is a key sector in the Irish economic model. Airlines, such as Norwegian, are registering Irish subsidiaries not only to avail of low corporation tax but also lax labour regulation. This has brought pressure on the Norwegian government to deregulate their labour market. Ryanair's management is considered authoritarian and its CEO has frequently launched anti-public service diatribes, recently describing the national broadcaster as a 'rat infested North Korean union shop'. Having successfully seen off unions in Ireland and Britain, Ryanair is currently, through A4E, taking on the air traffic controllers' right to strike on the basis of free movement. Hence, MNCs are more and more weighing in on political debates regarding a broad range of issues and in a variety of fora. This paper will not only assess the structural factors that explain Ryanair's success but will also examine the transnational union strategies to organize Ryanair employees and their prospect for realization in the context of authoritarian neoliberalism.

Centralise and insulate. The interlocked dynamic between austerity political economy and emergency legal mechanisms in Italy during the global crisis (2008-2016)

Adriano Cozzolino

University of Napoli L'Orientale, Italy
adriano_cozzolino(at)virgilio.it

The paper explores the interrelation between austerity political economy and the legal mechanisms through which austerity measures had been implemented during the global crisis in Italy (2008-2016). The key argument is that in Italy the authoritarian character on neoliberalism has taken a specific form, central to which is the (ab)use of emergency decrees and confidence vote, legal practices shared by the four executives (one centre-right, one technocratic, two centre-left) succeeded in the crisis. The purpose of the paper is shedding light on statehood practices aimed at insulating austerity political economy and marginalising political alternatives in order to strengthen market discipline and safeguard capital accumulation process. The key argument, in brief, is

that processes of neoliberalization entail a substantive restriction of the democratic action for social and political opposition.

RN06 | Session 01b Industrial Restructuring and Labour in Europe

Competitive Europeanisation and Multiscalar Fragmentation – Political Economy meets Sociology of Work and Industry

Stefanie Hürtgen

University of Salzburg, Austria
stefanie.huertgen(at)sbg.ac.at

Even before the current economic crisis, sociology of work and industry put particular attention to phenomena of wage-pressure, site-competition, rising flexibility, insecurity and precariousness of work in nearly whole Europe. However, up to now, debates and findings from this discourse are not really connected with the most important critical theoretical approach to Europe, which is the frame of its "competitive architecture" (coming from Bastiaan van Apeldoorn, Dorothee Bohle, Patrick Ziltener and many others). In my talk I will argue that it is highly necessary to develop a link between the two disciplines, for both, empirical as well as theoretical reasons. Empirically, only with focus on labor and work, ruling discourses about nationally framed European "winners" and "losers" can be questioned. Thus, theoretically, the focus on labor and work allows the deepening and further development of the competitive Europeanisation frame, i.e. its identification as multiscalar competitive Europeanisation which includes inner-national scales such as regions, production sites, workforce-categories etc. On the other side, sociology of work and industry will doubtlessly profit from the widening of the critical European Political Economy perspective, in particular with the chance to overcome its still widespread self-limitation as a case-study-discipline.

Europeanisation as Depoliticisation: Industrial Restructuring in the French Steel Sector (1980-1984)

Alexis B. Moraitis

The University of Warwick, United Kingdom
A-S.Boutefeu-Moraitis(at)warwick.ac.uk

The recurrent crises of the steel industry have constituted a thorn in the side of European countries for the past 40 years. At the same time the management of European steel has since the late 1970s increasingly become an affair of the European Commission. Drawing on the growing literature on depoliticisation, this paper examines the causes behind the delegation of responsibility for the restructuring of the sector to the Commission. It is argued that this process constituted a calculated political strategy enacted by national governments who wanted to insulate themselves from the domestic political pressures that accompanied the socially

painful industrial adjustment. To substantiate these claims this paper proposes an analysis of the French Ministry of Industry's archives from 1980 to 1984. The evidence found indicates that both centre-right and socialist governments had formulated a preference for an extensive devaluation of the sector's obsolete capacities to counter overproduction in the steel market. In order to bypass labour's resistance to restructuring, the French state urged the adoption of a European-wide restructuring plan imposed by the Commission. Scapegoating the latter, allowed French authorities to wed the objectives of industrial rationalisation and tacit acceptance of the measures by the sector's workers.

Based on French steel's experience, this paper attempts to bring further insights about the inclination of national governments to outsource the responsibility of popularly abhorred economic policies to European or other supranational institutions in order to safeguard their political legitimacy. This phenomenon, ultimately, calls into question the capacity of a government, regardless of its ideological colours, to curb the imperatives of capital accumulation.

The hegemonic projects of EU labour market governance and the crisis of European integration

Rasmus Hovedskov

University of Sheffield, United Kingdom
r.hovedskov(at)sheffield.ac.uk

In this paper, I use the case of EU labour market governance to contest prevailing arguments in Critical Political Economy on the relationship between European capitalism, institutional reforms, and neoliberal governance. Particularly, I question the extent to which the strengthening and de-democratization of economic governance at the European level is indicative of a crisis of neoliberalism. Rather than interpreting EU institutional reforms as indicative of a crisis-ridden and increasingly authoritarian phase in transnational neoliberalism, I draw on a critical integration theory to construe the reforms as the outcome of competing hegemonic projects operating in the context of a profound crisis of the European integration project itself. I argue that recent reforms of EU labour market governance have significantly strengthened the surveillance and enforcement mechanisms of the dominant neoliberal project of European market integration, but have not resolved the fundamental social conflicts over European integration. The conflicts operate along two lines: between neoliberals and social democrats, over the relative emphasis on market liberalisation and social cohesion, and between pro-European and more national projects, which cut across typical left-right distinctions. While pro-European social democrats and neoliberals have been able to reach tentative compromises for the principles for EU labour market governance, a growing Euroscepticism in both camps threatens to undermine this compromise, and indicates the growing crisis of European integration. The problem for progressive

forces, I argue, is that the crisis of integration will not necessarily upset the neoliberal trajectory of European politics.

The Political Economy of Rail Privatisation in Britain

Tom Haines-Doran

SOAS, University of London, United Kingdom
644367(at)soas.ac.uk

The nature of ownership of Britain's railways has become a highly contested social issue in recent years. The Railways Act of 1993 disposed of the state operator British Railways in favour of a complex structure of private ownership and regulation, ostensibly for the purposes of generating greater levels of economic efficiency through intra-industry competition, in order to lower state subsidy and fares. Instead, privatisation has led to vastly increased costs, and therefore both subsidy and fares have increased significantly, while the system had suffered from perennial outbreaks of operational and financial crises. Work in the field of Critical Accounting has shown why this is the case. Railways in Britain are inherently loss-making in their own right, even if they do provide great benefits to the wider economy. In an industry thus reliant on state subsidy, any form of private sector involvement increases claims on revenue, which will either need to be met by increasing user charges, or state subsidy, or both.

This paper argues that rail privatisation should be seen as a form of neoliberal Accumulation by Dispossession (Harvey), whose main beneficiary is private finance. Put this way, the 'failure' of rail privatisation can be recast as a success, insofar as it has successfully provided a vehicle for the redistribution of wealth from passengers and taxpayers upwards. The paper ends with a consideration of the difficulties a progressive government would face in attempting to renationalise the railways, given the entrenched position of the financial sector in the industry.

RN06 | Session 02a Beyond Defeat and Austerity: Disrupting (the Critical Political Economy of) Neoliberal Europe

Beyond defeat and austerity: Disrupting (the critical political economy of) neoliberal Europe

David Bailey, Mònica Clua-Losada, Nikolai Huke, Olatz Ribera-Almandoz

University of Birmingham, United Kingdom; University of Texas Rio Grande Valley; University of Tübingen; Universitat Pompeu Fabra
d.j.bailey(at)bham.ac.uk,
monica.clualosada(at)utrgv.edu,
huke.nikolai(at)gmail.com, olatz.ribera(at)upf.edu

This paper presents the key findings and arguments of a book project co-authored with Monica Clua-Losada, Nikolai Huke and Olatz Ribera-Almandoz. The book seeks to develop what it terms a 'disruption-oriented'

approach to the critical political economy (CPE) of European integration. It argues that, whilst CPE accounts have tended to highlight the way in which the EU imposes neoliberal discipline upon European society, we should instead be more aware of the way in which such disciplinary attempts are contested. The book attempts to do this, by highlighting both the role of dissent in explaining the actions of the EU institutions during the lead up to the 2008/2010 global and European crises, and the continued capacity for dissent during the so-called 'age of austerity' that emerged out of those crises (which the EU has (rightly) been criticised for propagating). The discussion focuses on four spheres: work, welfare, education and housing. The paper concludes by making the case for greater attention still to be paid to emerging grassroots opposition and solidarity movements in Europe, as the only viable means by which to fend off the increasingly ominous moves towards nationalist disintegration that currently characterises the European Union.

Toward a Critical Theory of States: The Poulantzas-Miliband Debate After Globalization

Clyde Barrow

University of Texas Rio Grande Valley, United States of America

clyde.barrow(at)utrgv.edu

We have recently lived through a global financial crisis that originated in the United States and, despite the platitudes of an anti-statist free-market neo-liberal ideology, nation-states were deeply involved in resolving this crisis. If "the state" is again a preeminent actor in the global economy, then state theory and the problem of the state should also return to forefront of political theory. However, even if we must return to state theory to understand the post-2007 world, what is to be gained by a return to Poulantzas and Miliband, particularly when they both published their major works on state theory well before globalization became a major topic in the social sciences? While Miliband did not specifically articulate a concept of globalization, he did recognize that the international dimension of class struggle was assuming extraordinary, unprecedented importance in capitalist social formations and this claim is now a basic thesis of the new "non-territorial" concept of imperialism being advanced in state theory today. Similarly, Poulantzas also did not use the term globalization, but he was acutely aware of the "internationalization of capital" and he viewed this change in the geography of capitalism as one that was generating a new form of capitalist state he describes as authoritarian statism. Both Poulantzas and Miliband argued that nation-states were not "retreating," but internally restructuring their state apparatuses and realigning those apparatuses with the newly dominant fractions of internationalized capital and thus it is necessary to undertake new "Milibandian analyses" of this process of state reconstruction in the various nation-states and simultaneously specify the contours of the new state form.

RN06 | Session 02b Damaged lives. Precarious Work

Avenues of resistance to capitalism: precarisation and collective action among artist-workers

Joana Soares Marques

University of Sao Paulo (USP), Brazil

joana.marques(at)usp.br

This paper investigates forms of resistance to the precarisation and commodification of work in contemporary capitalism, through the analysis of alternative forms of social and production organization that are embodied by collectives of artist-workers in Brazil and Portugal, notably the theatre collectives. The notion of artist-worker relates to those who are self-conscious of their condition as workers and act politically and aesthetically from that condition. Framed by a concept of Emancipatory Social Science, the paper examines the forms of self-organization and the dynamics of collective action, challenging the processes of precarisation that are particularly pressing within artistic labour. It draws on the author's PhD research that was based on the comparative study of Portuguese and Brazilian realities, through a methodological strategy that integrated the analysis of historical, statistical and documentary sources, conducting a survey, interviews, participant observation and the deepening of two empirical studies.

The research has shown that artists are a group of workers highly precarious that, although underrepresented in traditional forms of labour self-representation (parties and unions), express a certain orientation towards collective values, allowing to consider this "artistic precariat" not only in terms of exploitation, but also from its emancipatory potential, contributing to the emergence of innovative and intersectional forms of collective action and solidarity between different precarious groups (artists, students, factory workers, illegal migrants, women, ethnic minorities).

Translating precarity

Gabriela Julio Medel

University of Bristol, United Kingdom

gj16212(at)bristol.ac.uk

The concept of precarity has gained attention in the last decades in the literature of labour studies, but it is, by no means, a new concept and it exceeds the field. Looking on the recent political events in different parts of the world, it seems timely to review the ideas of precarity and its links to disaffection, and to do so from the space of work, where power and authority relations are lived more directly.

The presentation will cover the work of the first year of my PhD research project that aims to explore disaffection towards the workplace and political institutions among workers with precarious employment conditions in two Latin American countries, Chile and Argentina.

The presentation will review the concept of precarity, from its origins in the French literature to its expansion to European and Latin American countries with a particular emphasis on Chile and Argentina. It will discuss the polysemy of the concept and the different scholarly approaches on the issue, from authors that have a restricted view, focusing on job precarity, to those who understand precarity as an ontological condition. Likewise, the critical positions regarding the concept will be considered. Finally, the presentation will assess the pertinence of the precarity concept to the study of Chile and Argentina, two Latin American countries that saw an early and drastic implementation of neoliberal policies, that workers from both countries have endured for a couple of decades now, and with new generations born in this precarious scenario.

Class dimension of the precarity

Yulia Epikhina

Institute of Sociology of Russian Academy of Science,
Russian Federation
epikhina(at)gmail.com

There is no single definition of the concept of precariat (Barbier, J.C. 'Precariousness' of employment: Linguistic and conceptual differences, Political discourse and academic debate in five countries, Germany, Spain, France, Italy and the UK, Presentation for the ESOPE meeting, München, March, 5th. 2002). One of the early definitions came up in the works of P. Bourdieu who invented this term to separate permanent workers from workers with part time employment or casual jobs. (Bourdieu P., 1963, *Travail et travailleurs en Algérie*, Mouton et Co, Paris, p. 361). The "precarity" can be analyzed as a special type of relationships between the employer and the employee in the labor market. In other words, the "precarity" is a special case of the market situation in the Weberian definition of class situation. In the paper the precariat is analyzed in the Weberian tradition of class analysis that allows for the usage of the EGP class model. The analysis is underlain by the data of the "Social differences in the modern Russian society" survey conducted in 1998, 2007 and 2015. The main assumption of the study claims that since the first wave of the survey (the year of the total economic crisis) the precarity "has abandoned the realm of the service contract and is moving towards (in J. Goldthorpe's term) and begins the feature of classes characterized by the work contract. Besides, the precarity state is affected by the volume of resources available to the worker, skills being a most important resource of all.

The Limits of Precariousness: The Polanyian Countermovement and German Labor Relations

Stefan Schmalz, Daniel Meyer, Sarah Hinz, Ingo Singe

Friedrich-Schiller-University Jena, Germany; Max Planck Institute for the Study of Societies, Cologne, Germany; Friedrich-Schiller-University Jena, Germany; Friedrich-Schiller-University Jena, Germany
s.schmalz(at)uni-jena.de, meyer(at)mpifg.de,

sarah.hinz(at)uni-jena.de, ingo.singe(at)uni-jena.de

For a long time, precarious labor arrangements were said to be omnipresent in East Germany. As a result of the disembedding of labor market regulation after reunification, low wages, atypical employment and long working hours were characteristic features of East German labor relations. However, recent years have seen a marked decline in unemployment, due to economic revitalization and population decline. By discussing the impact of labor market development on industrial relations, we observe a Polanyian countermovement to the commodification and precarization of labor. Our argument is twofold: First, employers recognize that existing despotic factory regimes turn dysfunctional as poor working conditions have contributed to a lack of trainees and physically demanding jobs have led to early retirement of workers. Second, unlike in the times of industrial decline that followed reunification, the disciplinary regime of precariousness tends to erode. The growing assertiveness of workers is not only reflected in a renewal of collective representation, but also in hidden forms of industrial conflict against low payment, high flexibility requirements and poor working conditions. Our paper will build on an intensive case study in one manufacturing site located in East Thuringia. The case study combines qualitative methods (22 semi-structured interviews with management, worker representatives and employees, completed in November 2016) and a quantitative workplace survey (N>=350, to be completed in March 2017). We also draw on earlier research projects such as a project on union organizing in East Germany (21 case studies).

Unpaid Artistic Labor Under Neoliberalism: Transforming Cultural Workers into Cultural Entrepreneurs in Post-Socialist Slovenia

Katja Praznik

State University of New York at Buffalo, United States of America
katjapra(at)buffalo.edu

In the light of political transformations of socialism and the emergence of the neoliberal governmentality, this paper investigates the rise of, and contradictions specific for the unpaid artistic labor in the post-socialist context. I offer a distinctly feminist angle to the discussion of unpaid artistic labor as I relate the exceptionality of artist labor to the unwaged, feminized domestic labor. In both cases, I argue, the perceived natural calling to housework or artistic work makes this labor invisible under capital where the wage nexus is what would recognize the artist as a worker. Through an analysis of cultural policy measures that implemented competitive relations in the cultural labor market in post-socialist Slovenia, the paper demonstrates: (1) how cultural policy redefined art workers as cultural entrepreneurs by relying on the ideas about the exceptionality of artistic labor, and (2) how this changes signal the rise of neoliberal governmentality. In neoliberal political economic culture, which generalizes the principle of competition

as a behavioral norm and enterprise as the model of subjectivation, I argue, the exceptionality of artistic labor coincides with the neoliberal dogma of self-expression and freedom to be embodied in entrepreneurial subjects. The rise of neoliberal governmentality thus points to a post-socialist contradiction specific for the unpaid labor: while the state still funds cultural production as a public good, it regulates artistic labor by employing exploitative techniques, which manufacture entrepreneurial subjects.

RN06 | Session 03a Politicising the Neoliberalisation of Education and Digital Culture

Closed by Choice: Charter School Facility Finance and Public School Dismantlement

Stephanie Farmer

Roosevelt University, United States of America
sfarmer(at)roosevelt.edu

Advocates of market education reforms herald school choice as a more efficient way to deliver education services by letting parental demand, via market (i.e. school) competition, determine whether a school stays open. As the case of Chicago from 2000 to 2014 reveals, the opening of new charter school facilities was an uncoordinated and unplanned process, resulting in market saturation and redundant schools. By examining Chicago Public Schools (CPS) and Census data, my

research shows that throughout the 2000s, CPS opened over 140 charter schools, primarily in low demand markets: neighborhoods with declining school age population, near new choice schools, and near public schools with declining enrollments. Since charter bonds and other facility acquisition expenses (i.e. rent) are paid back with Chicago Public Schools' tax revenues, I examine Illinois State Board of Education charter school financial audits to determine the magnitude of debt taken out to finance charters in low-demand neighborhoods. I find that the inefficient rollout of charter schools significantly contributed to CPS' budget stress, undermining the already troubled fiscal stability of the public schools. Instead of introducing regulatory mechanisms to make the charter location process more rational, the local education austerity state used declining enrollments and the magnitude of debt to actively dismantle the "public-ness" of education by shrinking public schools through \$1 billion in budget cuts to frontline education and closing 10% of all CPS public schools. Cuts and closures tend to be unevenly administered in primarily working class and poor African-American children and neighborhoods, forcing these communities to shoulder the brunt of the destabilizing consequences of inefficient charter school openings.

Education of "good workers and managers" in neoliberal capitalist Japan

K.- Ulrike Nennstiel

Hokusei-Gakuen-University, Japan
nennstiel(at)hokusei.ac.jp

In many Western countries Japanese schools have the reputation of being very authoritarian and rigorous. This, however, is only half the truth. Japanese schools put emphasis not only on competition and selection but also on team work and solidarity. Many students enjoy school life for the school club they belong to. In the club as well as in classes everyone is trained to "behave properly", trained the appropriate manners towards senior members, to give one's best for the team as a whole, and to compete hard in order to raise the level of achievement. Only the "top performers" will be able to succeed, be it in sports, in arts or in academics. Only those getting the highest score in the entrance examination will be admitted to the most prestigious universities, clearing the path to the most attractive jobs the economy has to offer. How well these "most successful" people fit into the capitalist system has dramatically been exemplified by the case of a young diligent worker ending her life owing to overwork one and a half years after graduating from the "best" Japanese university.

Analyzing reports of high school students, information offered by mass media, scientific studies about the backgrounds of "karōshi" (death from overwork), and the debates in parliament which were held in reaction to the public demand for more effective laws to limit overwork, we will demonstrate the contemptuous effectiveness of authoritarian neoliberalism in destining everybody to voluntarily submit to its goals.

Understanding the Consequences of Teacher Recruitment and Mobility in Italy: from Work to Politics

Elena Gremigni

University of Pisa, Italy
elena.grem(at)tin.it

This paper proposes a reflection on the consequences of the Italian legislation about teacher recruitment and mobility, and aims specifically at highlighting the limits of the L. 107/15.

The convoluted plan introduced by the law - which was titled "the good school" - in the Italian government's intentions would have led to a broad base of support for the ruling parties, but it ended up causing discomfort to many teachers, mostly women, forced to work far away from their relatives, often in difficult conditions because of the low wages. As a consequence, it is not surprising that the improper management of the school staff caused an opposition to the government's choices, including the constitutional referendum held in December 2016.

In order to understand the effects of the law on the professional trajectories, existences and political choices, a number of letters sent by the teachers to some journals specialised in the educational field were analysed. Moreover, further data have been collected through a participant observation within some groups of teachers on major social network sites.

The research outcomes show that the law is a clear expression of a neoliberal policy, and it has increased the complexity of the scholastic system, causing the

deterioration of the quality of public education and producing many negative effects.

Beyond the political consequences of teachers' commitment, there is no doubt that without restoring professional dignity to the "left hand" of the State, in Bourdieu's language, the "good school" will remain just an empty label.

RN06 | Session 03b OPEN SESSION: Collective Experiences of Sexism and Racism in Academia

Stories of oppression, tales of resistance. Sharing experiences of and strategies against sexism, racism and other forms of discrimination in academia

Caroline Metz, Angela Wigger
Manchester University, United Kingdom; Radboud University Nijmegen, Netherlands, The
caroline.metz(at)manchester.ac.uk,
a.wigger(at)fm.ru.nl

This panel invites scholars and activists to share stories and personal experiences of sexism, racism and other forms of discrimination and oppression in academia and beyond. All accounts are welcome, whether they concern silencing, verbal assault or outright physical harassment on the part of colleagues or superiors; racialised or gendered student behaviour; imbalances in representation and content in the curriculum, in conferences or in other settings; or institutionalised forms of discrimination regarding salaries, maternity/paternity leaves, promotion schemes, or the distribution of admin and other work. By sharing these stories, the objective is to shed light on the fact that these experiences or observations - as well as the physical, emotional and intellectual distress that go with it - are not simply personal but are also social, political phenomena that reflect wider structural hierarchies in society. Although they are in no way natural, these hierarchies may have become subtle, imbricated and normalised. The panel thus seeks to make them explicit and visible, but also to trigger a critical awareness of the ways in which we reproduce, consciously or unconsciously, sexist, racist and otherwise discriminatory structures. The panel then invites to debate successful and unsuccessful strategies and responses, and reflect collectively on how we can react in individual situations, in order to ultimately deconstruct and above all resist institutionalised sexism, racism and other oppressive structures in academia and beyond.

RN06 | Session 04a From Post-Growth Capitalism to Authoritarian Temptation: A World-Historical Sea Change?

Authoritarian neoliberalism paving the way to authoritarian statism?

Maria Markantonatou
University of the Aegean, Greece
markantonatou(at)gmail.com

This is a submission to the special session 'From

Post-Growth Capitalism to Authoritarian Temptation: A World-Historical Sea Change?

Abstract

Since 2010 austerity politics in Greece have caused a series of dramatic effects on the country's economy (skyrocketing of public debt, recession, rapid cuts in public expenditure at the fields of health, education, welfare etc.) and society (rise in total and youth unemployment, pauperization, increase in inequality, precarity etc.). Despite intensified social resistance expressed not only by hundreds of strikes and protests, but, most importantly, by the transformation of the country's political landscape of the last decades, austerity imposed by creditors remains unaltered. With reference to Greece – as the Eurozone country worst hit by the crisis which after 2010 stimulated the design of ultra-neoliberal Eurozone legislation and the creation of additional surveillance mechanisms for fiscal discipline –, the presentation will discuss current political efforts to impose liberalization. Similar efforts had been characterized as "conscious and violent state interventions" (K. Polanyi) in the context of the 1930's crisis and as "authoritarian statism" (N. Poulantzas) in the context of the 1970's crisis. The current crisis management in Greece and elsewhere increasingly tends to generalize in Europe a governance pattern characterized by shrunk national democracies, policies of "state of emergency", the institutionalization of punishments to debtor countries and an increasing detachment of economic policy from national societies. As a result, the very idea of the monetary union and even the EU are all the more disputed, new conflicting models of economic governance and (geo)political tensions emerge, and authoritarian, extreme-right and nationalist political forces gain influence across Europe, seriously threatening democracy and even leaving several dark future scenarios open.

New Care Regimes and the Crisis of Social Reproduction: The Contested Terrain of Care in Contemporary Capitalism

Brigitte Aulenbacher
Johannes Kepler University, Austria
brigitte.aulenbacher(at)jku.at

This is a submission to the special session 'From Post-Growth Capitalism to Authoritarian Temptation: A World-Historical Sea Change?': For decades we are witnessing a new phase of capitalist socialization of social reproduction encompassing care. De/Commodification of labor and care, transnationalization of work and politics and new governance are contested pathways transforming care regimes. On the one hand, referring to economic growth, care has become a business in the range of care technologies and care industries or agencies with child, elderly, health care provision for solvent clients. On the other hand increasing demands of care, the economic shift in care provision, declining welfare states, austerity schemes after 2008 are going along with care gaps, new forms of precarity and

exploitation, and critique or protest referring to everyday life practice as well as alternative visions. The contribution, first, shows how the consolidation of class-specific interests refers to and re/produces social inequalities and polarizations, also basing on gender and ethnicity. Second, referring to the example of care provision by care agencies and their promise to bridge the care gap demands for justice as well as pitting precariousness against precariousness become obvious. The conclusion, third, figures out how credible alternatives can interfere in the distributional struggles of a, in principle, careless society providing care as a privilege for a minority and what questions of inequality and justice arise and have to be considered.

New Distributional Conflicts and the Right-Populist Revolt

Klaus Doerre

Friedrich Schiller University Jena, Germany
klaus.doerre(at)uni-jena.de

Capitalism without rapid and permanent growth creates fertile soil upon which a new populist right can thrive. Class-specific inequalities and exclusion have increased dramatically, yet class movements and organised class politics from below are in many ways at an historical ebb. Class relations take effect even if experiences of injustice do not result in collective activity towards the improvement of shared grievances. In the absence of political orientations which mobilised classes could theoretically produce or at least prompt, class relations take effect via the mode of competition, and via collective social de- and re-valuation. The state assumes a vital role in this process. Political demarcations linked to the allocation of social goods trigger class-formation through collective debasement and stigmatisation of major social groups. Adding to this are collective debasement and negative classifications through which members of the lower classes seek to prevail in processes of social competition. In this sense, the central claim of this paper is as follows: the more difficult or impossible remedying distributional relations perceived as unjust from the top to the bottom (from the rich to the poor) appears, the more likely it becomes that wage-earners will tend toward exclusive solidarity and, consequently, become susceptible to right-populist slogans and concepts. One of the challenges facing the trade unions today emerges from the fact that right-wing orientations and sympathies for right-populism are often present among their active members. The article proceeds from a discussion of the situation in Germany and a comparison to other European countries, drawing on theoretical concepts developed by the author (capitalist Landnahme) as well as on empirical research.

Portugal: between 'Contraption' and 'The flying cow'

Elisio Estanque

University of Coimbra, Portugal
elisio.estanque(at)gmail.com

The cycle of anti-austerity contention between 2010 and 2013 in Portugal reveals a complex picture, where traditional actors, including trade unions and left-wing political parties, emerged as key actors. Notwithstanding, the principal "engine" that gave rise to this change was a cycle of social mass protests who helped to break down the former Right-wing majority. It's true that, at that time, nobody in Portugal could admit that – meaning the proximity between PS/socialists and PCP/ communists – would be possible. One of the criticisms became a new concept focused on PS Government until today: «The Contraption» . This notion, suggested by a right-wing opinion maker, was initially directed to the Socialist Party, but the public opinion picked it up and spread it out until now. Other observers, more sympathetic, have also named this political solution as «The flying cow», a metaphor to emphasize the "miracle" that it would be to watch a cow flying, similar to such surprising agreement among this different – and normally divergent – political parties. Departing from that political scenario in Portugal we propose a sociological analysis about the role of social movements and their articulations/tensions they've played with political Left-wing political parties and questioning the current Government solution (and what will happens in the next future).

In spite of all negative expectations, the political alternative found in Portugal brought some important accomplishments regarding precarious work, social rights and working class conquests, albeit not being considered a consistent solution. Until now (January 2017), it has worked. So, "the cow still flies"...

RN06 | Session 04b Accumulation by Dispossession and the Possibilities for Hope

Logics of Exploitation: Subsumption and Imprinting

Federico Chicchi, Emanuele Leonardi, Stefano Lucarelli

University of Bologna, Italy; University of Coimbra, Portugal; University of Bergamo, Italy
federico.chicchi(at)unibo.it, leonardi(at)ces.uc.pt, stefano.lucarelli(at)unibg.it

Neoliberal policies are deeply traversed by circuits of exploitation. Yet it is unclear how they stand in relation to wage-labour as an institution, namely to the crucial element in Marx's description of subsumption – the process through which the social relations of production penetrate the labour process itself. From this perspective, exploitation is closely linked with wage-labour. In the last decades, however, wage-labour has lost much of its centrality in industrial relations.

Following a critical political economy approach, our paper advance the hypothesis that there are forms of exploitation which are not predicated on wage-labour. Those, we argue, show a different logic than the one shaping subsumption. Today, capital must grant/impose to social cooperation a certain degree of

self-government *ex ante*, in order to subsequently capture the value they produce, *ex post*. For this reason we propose a new concept, that of imprinting, to complement – not to supplant – the notion of subsumption. Imprinting works through a double injunction: “(1) be as different from the social norm as you wish, experience your autonomy in its fullness, (2) as long as the outcome of your behaviour is translatable into the variable metrics of financial conventions – money”.

Thus, imprinting grasps exploitative practices predicated on human capital as governmental control of self-entrepreneurship, as Foucault would put it. However, our conviction is that it is key to focus on the structural articulation of imprinting and subsumption: it is at such crossroads, in fact, that it becomes possible to understand new, emerging forms of subjectivity in the context of a permanent economic crisis – most notably in Europe.

Normalising corporate counterinsurgency: The everyday operations of RWE in Hambach and beyond

Andrea Christiane Brock, Alexander Dunlap
University of Sussex, United Kingdom; Vrije Universiteit, The Netherlands
a.brock(at)sussex.ac.uk, a.d.dunlap(at)vu.nl

The German Rhineland is home to the world’s largest opencast lignite coal mine – the Hambach mine. Over the last six years, the mine has experienced an increase in militant resistance, leading people to occupy the Hambach forest, civil disobedience and sabotage. The mine provides a European case study to examine the repressive techniques deployed by mining operator RWE and the state to legitimize coal mining in the face of a determined opposition, anthropogenic climate change, loss of ancient forests and displacement of local communities; manufacturing legitimacy and pacifying dissent. Drawing on different strands of political ecology literature and work on corporate counter-movements, this paper peers into extractive industries and their corporate social responsibility engagements through the lens of corporate counterinsurgency, by, first, providing some background on the Hambach mine and RWE’s unique (and powerful) position in the German political economy. After explaining the rise of resistance in the area, the paper then discusses counterinsurgency by outlining the different techniques used to win the ‘hearts’ and ‘minds’ of people around the mine. This includes securing the support of regional political leaders, lobbying, involvement in social events, infrastructure projects, astroturfing and ecological restoration and offsetting work, which combine with overtly repressive techniques by public and private security forces that together attempt to ‘divide-and-conquer’, legitimise the mine and intimidate and criminalise activists. This paper contends that counterinsurgency techniques are becoming normalised into the everyday operations of RWE, naturalising its image as “good corporate citizen” and legitimising the violence towards human and

nonhuman nature inherent in the corporate-state-mining-complex, as it is becoming part of the “green economy” and made “sustainable”.

Degrowth: A Bumpy Ride Towards Intragenerational Global Justice?

Corinna Dengler, Lisa Marie Seebacher
University of Vechta, Germany; University of Vienna and Business, Austria; University of Vienna and Business, Austria
corinna.dengler(at)gmail.com, lisa-seebacher(at)hotmail.com

Degrowth is a proposal from and for the Global North and according to Kallis, Demaria, and D’Alisa (2015: 5) it should be pursued in the North “not in order to allow the South to follow the same path, but first and foremost in order to liberate conceptual space for countries there to find their own trajectories of what they define as the good life”. In this sense, degrowth scholars and activists commonly claim that degrowth paves the way for intragenerational global justice. However, in various discussions with academics from the Global South (e.g. the Indian ecofeminist Bina Agarwal, personal communication, January 20th, 2017), degrowth is (dis)regarded an utopia of wealthy Global North countries that neglects the inherent ties of the Global South’s necessity to grow and the interlinked (at least not de-)growing demand in the Global North.

The proposed article aims at shedding light on this putative contradiction by elaborating on the following research question: To what extent can degrowth in the Global North promote intragenerational justice and how can possible negative (short-term) impacts on the Global South be offset? By the means of a profound literature review and expert interviews, the article tries to portray degrowth in the Global North as beneficial for both the Global North and the Global South and hence as a fruitful and holistic way forward towards a post-capitalist society.

RN06 | Session 05a Unravelling the Political Economy of Technocracy and Expertise

Lay practices of research to the study of technocracy in the EU

Gerardo Costabile Nicoletta
University of Naples Federico II, Italy
kostabile(at)gmail.com

In the midst of the European financial crisis, experts from international organizations have appeared in the political discourse as the only subjectivities capable of disciplining the attitudes of governments and citizens. Holders of expertise, an abstract quality, experts are often seen as the instrumental assets of government policies, private and public organizations, and are generally considered the actual pivot of global governance. Given that non-accountable functionaries act as agenda-setters, some scholars, both critical and not, have suggested that the European Union and other international institutions are essentially

technocratic. However, technocracy remains an empty sign lacking political and social significance. Contextualizing technocratic experiences in broader socio-historical processes helps avoid normative narratives usually separated in different disciplinary domains, whereby all that which is technical is closed in a black box only highly specialized scholars are able to uncover. The analysis of expertise as the basis for the legitimization of technocracy must start with those who are excluded: lay people. The creation of expertise in the socio-historical dynamics of European capitalism shows how expertise works as a powerful device for creative strategies of production and reproduction of dominant social and technical division of labour, producing each time their own specific subjectivities. Post-disciplinary and counter-reflexive attitudes, radical agency-centrism and socio-historical contextualization as well as genealogical obstinacy, compose a theoretical framework through which overcome the limits of research practices which assume meta-historical and meta-theoretical axioms mainly based on the naturalization of social and technical division of labour, as well as asymmetrical (geo)political relations.

Querying the Neoliberalism of Authoritarian Neoliberalism: Managerialism and European Economic Governance

Ian Alexander Lovering
University of Sussex, United Kingdom
i.lovering(at)sussex.ac.uk

The punitive and invasive nature of European responses to the sovereign debt crisis has signalled for many a growing 'authoritarian neoliberalism'. Indeed, punishing Eurozone bailout programmes and tightened deficit spending rules strongly suggests an authoritarian turn in European governance. However, this paper argues that the connection of this authoritarian turn to neoliberalism is less than straightforward. Shifts in European economic governance arguably go beyond the specific form of state intervention envisaged by neo/ordoliberal theory, which focuses on extending a principle of competition. The reliance, for example, on data analysis within a supranational economic surveillance regime (i.e. European Semester) contradicts a Hayekian belief in the fallibility of governmental knowledge. Neoliberalism, therefore, arguably provides only a partial explanation for recent governance shifts. In contrast, this paper will argue that a concept of 'managerialism' provides a novel perspective on the authoritarian turn in European governance. Despite being typically reduced to the 'technical' side of neoliberalism, managerialism possesses a distinct historical lineage, stemming from the US military, and philosophical basis, as a decision-making science. Managerialism's connection with the growth of executive power and use of monitoring techniques makes it pertinent to recent authoritarian shifts in governance, without relying on neoliberalism as a system of knowledge. Following a critical review of approaches which seek to connect neoliberalism and

authoritarianism, the paper applies a concept of managerialism to a case central to 'authoritarian neoliberalism': Eurozone governance.

After Orthodoxy: The role of economic expert discourse in the European political economy

Jens Maesse
Giessen, Germany
jens.maesse(at)sowi.uni-giessen.de

This paper studies the discursive logic of economic expert discourses and its impact on the cultural political economy of Europe. Whereas critics of neoliberal globalization study the role and influence of orthodox economics, this project will take into account the political-economic role of a certain form of economic expertise, which does not fit into the categories of "economic orthodoxy" or "economic heterodoxy" either. "After orthodoxy" refers to a new realm of economic knowledge, between academia and economic policy. This sort of economic expertise is characterised by a pragmatic attitude towards economic policy and draws on neo-Keynesian debates and post-neoclassical microeconomics. By analysing how economic expertise is presented by expert discourses, perceived by different audiences and contributes to the formation of political economic relations, this paper provides insights into a highly important realm of knowledge. This paper applies new theories from post-structuralism and discourse theory and will combine approaches from discourse linguistics with sociological concepts of power, institutions, professions and social structure. In order to show how the process of the trans-epistemic construction of economic experts operates, this paper will present the research agenda of a Discursive Political Economy of Economics (DPEE). Drawing on examples for illustration from European austerity expertise, a discourse analyses will complement the methodological reflections.

Hegemony and Power: Perceiving Rationality in an era of transitions

Sotiris Koskoletos, Theofanis Papageorgiou, Antonis Papangelopoulos
Harokopio University, Greece; National Technical University of Athens, Greece; National Technical University of Athens, Greece
sotiriskoskoletos(at)yahoo.gr,
papageorgioutheofanis(at)gmail.com,
antonis_pap17(at)hotmail.com

Political economy thought has faced a significant period of 'anomalies' characterized by lack of hegemonic paradigm in the aftermath of 2008 crisis. In that specter, a new strategy of capital emerged, revolving around a new moral and ethical binding of the subjects, dominated by fear and punishment. The scope of this paper is to question the formulation of economic and political subjectivities and collective identities, by pointing out the critical dimension of the "lived experience". Habitually, human behavior was perceived in terms of mere economic action giving

way to 'homo economicus'. Furthermore, neoliberal rationality, sketches aspects of criminalization and moralization of life drawing arguments from the 'ordoliberal' narrative. On the other hand, the legitimization of the new rationality of capital colliding in the unwillingness of 'people' to adapt in this new regime. The Freudian ungreivable attachment to what is lost seems to motivate behaviour, making people counter-react to the mismanagement of crisis, and oppression performed by the European elites. Recent political developments seem to shed light into the pursuance of citizenship, welfare state, and the ethical and cultural regime of modernity. In this framework, a crucial question is located into the consideration of the binary nature of collective identities. Notwithstanding current dystopia, this question could be proved more than a simple optimistic assumption in the experimentation and further conceptualization of a new model explaining human behaviour.

RN06 | Session 05b Resistance and Subversion in Spain

When Corporatism Fails: Trade Union Strategies and Grassroots Resistance to the Spanish Economic Crisis

Olatz Ribera-Almandoz, Jon Las Heras
Universitat Pompeu Fabra, Spain; The University of Manchester
olatz.ribera(at)upf.edu,
jon.lasherac(at)manchester.ac.uk

The economic crisis that erupted in 2008-2010 in Spain did not only bring to the fore the contradictions of a mode of capital accumulation based on mass housing construction and property speculation, but it also thrust millions of workers and families to unemployment, poverty and precariousness of life. This article builds upon a strategic-relational approach to analyse the multiple forms in which workers and class organizations have struggled against the capitalist crisis in Spain. It does so by focusing, on the one hand, on the reaction of Spanish trade unions to macroeconomic austerity and labour market restructuring and, on the other hand, on the alternative responses from self-organised workers and social movements.

We argue that three major conclusions may be derived from these fragmented class responses to the economic crisis in Spain. First, the subordination of class interests to the stabilisation of the economy and the corporatist strategies developed by the main trade unions –Comisiones Obreras (CCOO) and Union General de Trabajadores (UGT)– resulted in their incapacity to organise an increasing proportion of workers, including unemployed and precarious workers. Second, despite radical and active sections within CCOO and UGT were engaged into the organisation of important mobilisations during the height of social movement reorganisation, the leadership of both trade unions was excluded and marginalised. Third, workers had the need to establish new and more radical forms of resistance based on

autonomous self-organisation, pre-figurative practices and direct action in order to contest the new forms of labour disciplining.

Where are the workers? Understanding forms of resistance to the crisis in Spain.

Monica Clua-Losada, Ramon Alos, Jordi Guiu, Albert Jimenez, Pere Jodar, Olatz Ribera-Almandoz
University of Texas Rio Grande Valley, United States of America; Universitat Autònoma de Barcelona; Universitat Pompeu Fabra, Barcelona; Universitat Pompeu Fabra, Barcelona; Universitat Pompeu Fabra, Barcelona
monica.clualosada(at)utrgv.edu,
ramonalosmoner(at)gmail.com, jordi.guiu(at)upf.edu,
mistersix(at)gmail.com, pere.jodar(at)upf.edu,
olatz.ribera(at)upf.edu

During the cycle of struggles initiated by the 15-M in 2011, there has been a great body of literature devoted to understanding the meaning, characteristics and aims of the different movements that have appeared (Indignados, PAH and Mareas, etc). What has been a common trait to much of this literature has been either the invisibility provided to workers or the highlighting of trade unions' connivance with the state. In this paper, the claim is that this cycle of struggle cannot be understood without putting labour at the core of the analysis. While traditional trade union actions may have declined during the period, workers' obstinacy and disruptive actions have actually increased and morphed into a broader set of community based demands.

Working-class resistance to the dominant economic discourses: A case study from northern Spain.

Anna Carrillo Arnal
University of Missouri-Columbia, U.S.
acfh7(at)mail.missouri.edu

The present study analyses how the inhabitants of a working-class neighborhood contest the dominant economic discourses and develop alternative explanations of their economic situation. Based on in-depth qualitative interviews with thirty working-class men and women of the neighborhood of La Verneda (Barcelona, Spain), participant observation in numerous meetings and activities in the neighborhood, as well as archival research on the past social struggles of the neighborhood, I conclude that the working population of La Verneda does not reproduce the dominant economic discourses, such as the neoliberal and the neoconservative discourses, because there is a counter-discourse that has achieved a certain "hegemony" within the neighborhood. This alternative discourse results from the historical experience of struggle in the neighborhood for the improvement of living conditions, the resistance against the Franco dictatorship, and the fight for workers' rights. The discourse, which draws importantly from Marxism, stands for workers' rights and the welfare state, rejects cuts on the budget for

social services, and glorifies neighbors' organizations. At the same time that this counter-hegemonic discourse allows working-class individuals to challenge the dominant economic discourses, it is one of the main elements preventing mobilization. Many of the young and middle-aged workers of the neighborhood reject the traditional communist rhetoric and suggest that the neighbors' organizations, which are formed by traditional manual workers who militated in communist or socialist parties, are not actually open to them. The study also provides important insights on the socializing role of neighbors' organizations and workers' unions and political parties.

A classless revolt? The countermovement against neoliberalism in Spain

Jorge Sola

University of Balearic Islands, Spain

jorge.sola(at)uib.es

In the last five years, two novel political phenomena have disrupted Spanish politics and waken interest or admiration in other places: the 15M or indignados movement and Podemos party. In spite of their differences, they can be seen as two phases of the same political cycle: the social mobilization around some diffuse demands was followed by the electoral competition of a centralized party with a more articulated program. Despite the attention they both have received, their class dimension has rarely received attention –in contrast to the centrality enjoyed by class in the Left tradition. This paper aims to study this issue from different angles: putting it in historical context, we analyze the elusive presence of class in the Spanish public discourse, the class background of the activists and political cadres leading the 15M movement and Podemos, the relationships they have established with the labour movement, and the strategies that have been put in place. Our thesis is that the apparent absence of a class dimension hides a hegemonic prominence of the middle class throughout this cycle of mobilization. Finally, we discuss the possibilities and limits that this has for the reach and significance of political and social change.

RN06 | Session 06a Revealing the Global Competitiveness Delusions in EU Economic Governance

A prime example of authoritarian neoliberalism: The competitiveness-crisis nexus in the EU politics of internal devaluation

Angela Wigger

Radboud University Nijmegen, Netherlands, The

a.wigger(at)fm.ru.nl

In response to Chancellor Merkel's call for a 'Competitiveness Compact' at the World Economic Forum in Davos in January 2013, the European Commission launched a package of new economic policies that are argued to be key for realising a

"Genuine Monetary and Economic Union". Part and parcel of this package is the goal to reverse the longstanding structural trend of deindustrialization in Europe. In the Communication 'For a European Industrial Renaissance' (2014), the Commission aims at increasing Europe's manufacturing share from currently 15 percent to 20 percent of EU GDP by 2020, arguing that 'a strong industrial base will be of key importance for Europe's economic recovery and competitiveness'.

Boosting the competitiveness of EU based manufacturing industries may sound politically appealing, particularly against the backdrop of a rising popular fatigue with further fiscal austerity and the concomitant call for an overall belt tightening. Reforms in the spirit of competitiveness are dangerously deceptive however. What may appear as a resurgence of an active Keynesian-type of industrial policy in fact seeks to calibrate neoliberal structural adjustment programmes in an outright authoritarian fashion. The suggested measures essentially boil down to nothing else than what is referred to as "internal devaluation", which lays the burden of adjustment on labour rather than capital.

The paper outlines the Commissions' new competitiveness crisis strategy against the backdrop of the overall authoritarian neoliberal crisis management, showing and why the current policy course entails the prospect of a further deepening of structural imbalances and economic disintegration in the Eurozone. The paper suggests strategies for resisting such forms of authoritarian capitalism/neoliberalism.

The EU as an international player: promoting stability and development?

Johannes Jäger, Thomas Roithner

University of Applied Sciences BFI Vienna; University of Vienna

Johannes.Jaeger(at)fh-vie.ac.at,

thomas.roithner(at)univie.ac.at

The foreign policy of the European Union officially should be guided by policy coherence. The promotion of stability, peace and development within and beyond the EU are central aims but these aims may be conflicting. The dominant way of understanding assumes that a liberal market-oriented economic policy contributes to economic and social progress and therefore to political stability and peace. The paper questions this assumption by showing that this interpretation is based on a neoclassical understanding of the economy which fails to adequately address the dynamics of economic development and crisis. Therefore, we argue that alternative perspectives like as critical international political economy are needed. Such a perspective offers a more comprehensive and adequate understanding of economic and political dynamics and developments. The strength of this approach is illustrated by analysing the external policy of the European Union and EU member countries and the (de-)stabilizing effects of these policy strategies.

The Euro Crisis and Finland's lost export competitiveness: Formation of the hegemonic narrative

Joel Samuli Kaitila
University of Jyväskylä, Finland
joel.kaitila(at)gmail.com

Finland has faced continuous economic hardship and high unemployment since the Eurozone crisis. According to the hegemonic diagnosis, this is due to a loss in Finland's export competitiveness. In brief, Finland's labour cost competitiveness deteriorated simultaneously with the global financial crisis and this explains its poor export performance, persistent unemployment and sluggish GDP growth. This view informs the current government's policy stance, which directly targets a reduction in Finnish companies' labour costs.

This article analyses the formation of the hegemonic diagnosis of Finland's competitiveness problem. In general, the diagnosis derives its credibility from the hegemonic status of neoclassical economics in Finland. More specifically, two key planks are of great relevance. First, since 2013 several expert economic analyses from institutions such as the Bank of Finland and Ministry of Finance as well as the Confederation of Finnish Industries have laid the groundwork for the narrative. It is shown how the experts have successfully argued that from 2007 on Finland's unit labour costs have grown disproportionately in relation to its main competitors largely because of excessive wage increases. Secondly, although the suggested link between excessive wage growth and lost competitiveness has been questioned academically, the consensus narrative has been virtually unchallenged in the wider public arena. Curiously, the Central Organisation of Finnish Trade Unions has been largely accommodative of the policy measures derived from it although they imply a decline in labour's share in national income. It is argued that this position reflects a longer term shift in the organisation's policy stance, where adapting to EU's low inflation environment has become a priority over distributional issues. The hegemonic narrative rests on the coincidence of these elements.

World Sick - Modell Deutschland and the crisis of German overaccumulation

Jesse Glenn Hembruff
King's College London, United Kingdom
jhembruff(at)gmail.com

Although Germany was briefly referred to as the "Sick Man of Europe" throughout the 1990s and early 2000s, Germany has sat alongside the Troika as one of the most important players in managing the debt crises that have hit Europe. In particular, Chancellor Angela Merkel and the conservative Bundesbank have often been portrayed (following the crisis) as being in an antagonistic relationship with the countries in the periphery, whose profligate ways have made them incompatible monetary union partners with the spendthrift Germans. However, such simplistic

explanations are not sufficient for a full understanding of the causes and consequences of the European sovereign debt crises. Instead, I focus on the evolution of the post-Bretton Woods organization of German capital accumulation, with a focus on the doctrine of ordoliberalism and Modell Deutschland. I argue that Germany's postwar economic success eventually produced a crisis of overaccumulation, with its form determined by the institutional characteristics of Modell Deutschland. I do so by examining these institutions through the lenses of labour, fixed capital, and money-capital. In turn, efforts to address this crisis of overaccumulation influenced the political-economic landscape of Europe. I argue that Germany has pursued three strategies in addressing its crisis of overaccumulation: 1) devaluing labour; 2) spatio-temporal fixes in production and consumption; and 3) financial integration and expansion, in concert with European monetary integration. Germany was able to exploit its central position within the Eurozone to facilitate these fixes, but because crises can only be displaced, never resolved, these fixes in turn created conditions for subsequent crises in the Eurozone's periphery and helped to define the current political-economic landscape of Europe.

RN06 | Session 06b Progressive Politics and the Statist Left

Does the Left Devour its Children? Critical Political Economy Perspectives on the Rupture(s) between Leftist Parties and Social Movements.

Henrik Feindt, Corinna Dengler
University of Vienna, Austria; University of Vechta, Germany; University of Economics and Business Vienna, Austria
henrik.feindt(at)posteo.org,
corinna.dengler(at)gmail.com

The proposed paper discusses obstacles for radical praxis and real democracy under leftist governments claiming that critical self-reflection is a necessary precondition for emancipatory bottom-linked government projects.

As Zelik (2013) points out, emancipatory politics are not necessarily advanced by governments that consider themselves 'leftist'. On the contrary, the actual coming into power of left-wing movements sometimes has even been opposed to a real democratization of society. A critical realist metatheory and the theoretical lens of regulation theory combined with a Gramscian understanding of state and power will allow us to pinpoint the transfactual conditions of the aforementioned 'turning point', thereby answering the research question: What are the underlying mechanisms of the repeatedly observed rupture(s) between left-wing governments and the social movements that have brought them into power?

The paper is structured as follows: In a first step, we review and synthesize existing critical political economy literature on the subject matter before, in a second step, discussing the example of Ecuador based on empirical data gathered during a field

research stay in Quito in 2016. Similar to other countries commonly referred to as 'Latin America's New Left', the Correa government has in recent years "become very dogmatic against criticism from the left" (Martínez-Alier, personal communication), making course corrections virtually impossible. In a third step we use the gained insights from the case study to discuss the hindering mechanisms to real democratization before we critically reflect upon how the 'turning point' could be averted.

"For the Many, Not the Few": the Irresistible Rise of Jeremy Corbyn

Lewis Bassett

University of Manchester, United Kingdom
lewisbassett24(at)gmail.com

The presentation will offer an insider's account of the general election in the UK in which Jeremy Corbyn led a populist campaign to deliver a monumental upset to the British Conservative Party. The impact of "Corbynism" is discussed both at the national level and from the perspective of England's most marginal seat, Derby North, where Chris Williamson, a former bricklayer and staunchly pro-Corbyn candidate, claimed an impressive victory for Labour. The presentation will make the case that Labour's election campaign can be thought of in terms of the literature on populism and that such a strategic turn for the left of the party can be understood partly as a consequence of the "hollowing out" of Britain's organised working class. The author is a PhD student at the University of Manchester, an activist with Momentum and a part-time parliamentary researcher for the Labour Party.

Municipalist Upwind – Progressive Local Politics in the Crisis of the Capitalist Political System

Norma Tiedemann

University of Kassel, Germany
normat(at)posteo.de

The relation between social movements and the state has never been without tensions. However, in times of crisis, when multiple contradictions converge in a politically, economically and socially destabilising conjuncture, state institutions seem to radiate a certain attractiveness in terms of transformatory strategy. Today, after periods of erupting party systems and the discouraging development of Syriza and Podemos who attempted to occupy national state power, a reorientation of left forces towards local state apparatuses is observable. It is in municipalities and cities where experiments of new forms of democracy and political organisation are practiced. The new municipalism of the Spanish citizen platforms trying to reform institutions in their townhalls is one prominent example. Closely related are local initiatives which aim to circumvent the national and European level to create a bottom-up migration regime – creating sanctuary and solidarity cities or cities of welcome. In both cases, local state institutions are targeted by social movements and supposed to be utilised for a

rearticulation of citizenship and protagonist democracy to develop counterhegemonic bastions.

These developments are analysed from a materialist state theoretical perspective interested in the interplay of political and economic conjunctures and the counterhegemonic agency of movements. Why is it that the local scale and the city are currently, but surely not for the first time in history, gaining centre space in political strategy, especially though not only, for the left? How does this attempt of re-appropriating local state institutions play out empirically with regard to democratic reinventions and transformation of the neoliberal and exclusionary political economy of Europe? The presentation is a theory-driven examination of an emerging phenomenon in the context of a socio-political crisis.

The role of advanced capitalist countries in the New International Division of Labour: the case of the UK and British labour

William Harvey

University of Manchester, United Kingdom
william.harvey(at)manchester.ac.uk

This paper seeks to examine the role of advanced capitalist countries – specifically the UK – in the face of a fully revised and updated New International Division of Labour thesis that seeks to shed light on the specificities of capitalist development in various parts of the world today. The paper identifies three essentially global dynamics that the British state has increasingly sought to mediate on a national basis: firstly, the demand by capital for more complex labour; secondly, the relative deskilling of the production process; and thirdly, the rise of a degraded surplus labour population. On the basis of this, the paper will argue that the mediation of these tendencies amounts to a fundamental attempt to transform the social and human capabilities of 'British' labour in the wake of changing materialities in world markets. The mediation of these dynamics is therefore a form of disciplining labour through a transformation in the productive subjectivity of the collective labourer. The paper seeks to illustrate these dynamics through an in-depth analysis of the New Labour government, which, it argues, represented a coherent attempt – in rhetoric at least – to discipline 'British' labour in this manner. This is contrasted with the current Conservative government's approach to the same dynamics, which the paper argues has thus far failed to find a coherent approach to the disciplining of 'British' labour.

RN06 | Session 07a Exploring the Limits of Solidarity Economies

Pre-distribution, Basic Income, and the Institutions of Economic Democracy

David Casassas

University of Barcelona, Spain
dcasassas(at)ub.edu

The debate on pre-distribution, which is emerging in many domains of social sciences, does not seem to

be a temporary fashion. But is it really an unproblematic novelty? At a first glance, one must agree with pre-distributive theorists that the idea of pre-distribution – establishing regulatory frameworks enabling widespread social participation within economic life – has the capacity to create an exciting new agenda for democratic thinking. However, some developments of the pre-distributive agenda hide conceptual problems and ambiguities. Firstly, what's new within mainstream pre-distributive approaches – the refusal of tax and transfers – might erode relevant sets of resources for individuals and groups to pursue freer lives. Secondly, such refusal of tax and transfers might also oppose exactly what is needed to establish the kind of regulatory frameworks theorists of pre-distribution uphold. Thirdly, what seems politically promising within pre-distribution is everything but new: in effect, transformative classical political economy, from the 18th to the 21st Centuries, has always underlined the importance of ex-ante conferring upon individuals and groups resources of many sorts for them to enjoy effective freedom, that is, for them to have real capacities to co-determine how to work and live. This paper will try to make sense of the contemporary pre-distributive political agenda by exploring basic income as a conceivably pre-distributive tool helping build a (post-capitalist) free-choosers democratic economy. In the light of this, it will also assess the prospects of basic income as a suitable institutional device for a democratic making of the European economic space.

The role of grassroots food banks in the building of solidarity among vulnerable people

M. Antonia Carbonero Gamundi, Maria Gomez Garrido, Anahi Viladrich

Universitat de les Illes Balears, Spain; Universitat de les Illes Balears, Spain; City University of New York
macarbonero(at)uib.es, maria.gomez(at)uib.es,
Anahi.Viladrich(at)qc.cuny.edu

In the context of the current economic crisis and poverty in Spain, food banks have lately burgeoned as an emergency solution for vulnerable groups that are at risk of social exclusion. Traditional food banks have been criticised for allegedly perpetuating dependency, and therefore creating unequal relationships between donors and recipients. However, in Madrid, in the years after the 15M movement, some local food banks emerged as part of a grassroots movement that resignified an old form of assistance, by promoting forms of solidarity relationships. This has been achieved through a logic of public denunciation of poverty as a structural problem therefore freeing vulnerable people from being blamed on their situation, as well as a series of actions that create inter-recognition among food bank participants. Our paper presents the main findings drawn from an ethnographic study conducted in two food banks in the city of Madrid between May and December 2016. The study's main results highlight the role of grassroots food banks as key actors in building novel forms of social mobilization and political action

in Spain that defy traditional charity models of social assistance. By organizing themselves on the basis of a horizontal model of decision-making, grassroots food banks' activists aim to empower at-risk groups by providing public legitimacy to their claims while meeting their most immediate food needs. The paper also explores some tensions in the movement, namely its relation with public institutions and the relationships between activists and at-risk groups.

Theory and Practice of Work in the Social and Solidarity Economy. Constructing a theoretical framework for the analysis of concrete experiences.

Iker De Luz Colás

University of the Basque Country, Spain
iker_dlz(at)hotmail.com

In a context of global and multidimensional crisis such as this, we can see how our western societies founded on the employment-work are immersed in a profound process of change as well as their meanings and forms of organization (Beck, Giddens & Lash, 2006). Although many authors from different academic areas have pointed the evidence of a profound crisis of employment-based societies (Prieto, 2000; Durán, 2006), we consider that is of vital importance to put back on the table the category of Work -distinguished from the employment - for further analysis from the perspective of different social initiatives that are now proliferating. The Social and Solidarity Economy (SSE) movement, among others, takes up the category of Work from a wider and multi-dimensional approach based on contributions from the Critical Theory and social movements (especially ecologist and feminist ones). Its particular form of searching social emancipation from everyday life, locally and through Work makes it an interesting field where its way of understanding, organizing and practicing Work is mixed with, clashed against and distinguished from the hegemonic one. The main objective of this research consists in analysing and contrasting the forms of understanding, organizing and practicing Work in these experiences; and contrasting theory with the practice. Six paradigmatic cases in the Basque context which belong to different economic sectors and networks will be analysed and compared: Fagor Arrasate (Mondragon Corporation – industry), Urtxintxa Eskola (Ner Group – education), Fiare Ethical Banking (REAS – finances), Hiritik At (OlatuKoop – service sector) and Laborantza Ganbara (Vía Campesina – agriculture). The theoretical framework and analytical tools used for the analysis of these concrete experiences will be presented in this paper.

Listening against Policescape: Towards the Sonic Commons

Srdan Atanasovski

Serbian Academy of Sciences and Arts, Serbia
srdjanatanasovski(at)yahoo.co.uk

In this paper I aim to locate everyday practices of

“listening against” as a way of creating new spaces of commons in the urban. I start with discussing strategies of sonic policing (understood in Rancièrian terms), which I emphasize as a potent vehicle in replicating the patterns of cultural hegemonies. By “sonic policescape” I do not only refer to the wide system of urban sounds (and noises), but also to specific established practices and economies of everyday listening. I particularly discuss how listening is shaped by the omnipresent divide on “public” and “private” spheres which is performed in the capitalist city, by consumeristic ‘horror silentii’ and its particular assault on threshold spaces, and by contemporary technologies of space/time reduction and commodification of space. Thereafter, I locate various strategies of resistance performed individually and collectively which I describe as “listening against”. I discuss the potential of absolute listening (listening to sonic intensities) as de-signifying practice, engaged listening as listening to urban contradictions, and, finally, intervention as listening, whereas listener actively endeavours to reshape the urban sonic fabric. My examples range from everyday commuter cycling to activities of self-organized choirs and anarcho-feminist collectives. As I will emphasize, these practices show that “listening against” is always based in understanding of urban sounds as political acts and in readiness to negotiate the urban space, and therefore it can be considered as everyday revolutionary practice in producing the commons and alternative economies of the everyday. My research has been performed in period 2014-2016 in Belgrade and Vienna and has been theoretically informed by works of Henri Lefebvre, Jacques Rancière and current neo-Marxist debates on the issue of commons.

RN06 | Session 07b Social and Sexual Reproduction and the Political Economy of Healthcare

Debt Economy and Women’s Sexual and Reproductive Rights: A Transnational Feminist Analysis on Turkey, France, and the U.S.

Ayse Dayi, Eylem Karakaya, Brigitte Marti
University of Lausanne (UNIL), Switzerland; Center for Transnational Women’s Issues; Center for Transnational Women’s Issues
ayse.dayi(at)unil.ch, eylemkarakaya(at)yahoo.com, bridgelmarti(at)gmail.com

Expanding financialization and debt economy that characterize the present order of neoliberalism (Berardi, 2012; Lazaratto, 2012) lead to an ever-increasing assault on sexual /reproductive rights of women. Despite the evidence of disastrous effect of globalized neoliberal politics including austerity measures (as in Greece) on reproductive/sexual health, globalization debates continue to take place as if sexuality is completely marginal to political economic processes and with the exceptions of the work of Cooper, Petchesky, Correa, Sen, etc., the effects of the political economy on reproductive health and sexuality are still under-examined in gender studies, women’s health policy and sociology of health. In

order to fill this gap, we are currently conducting a multisite feminist ethnographic research analyzing the effects of neoliberal health restructuring on sexual/reproductive health care and rights in Turkey, France, and the U.S. In this paper, we reveal the various mechanisms of debt economy, such as (1) construction of public debt and dismantling of the public sector, (2) increased bureaucratic hurdles and (3) laws that police women’s bodies that restrict sexual/reproductive health rights of women in France, Turkey and the U.S. Through such transnational analysis, we aim to show the unmaking of European health care and women’s reproductive care, highlighting the links between debt construction and sexuality/ reproduction with the hopes of rethinking (together with Greek scholars and activists) ways of building transnational solidarities for equal and dignified sexual/reproductive care.

Ensuring Social Reproduction Through Exclusion? A Historical-Sociological Analysis of Paid Domestic Work in Spain

Virginia Kimey Pflücke
University of Cologne, Germany; Max Planck Institute for the Study of Societies (MPIfG)
pfluecke(at)mpifg.de

Capitalist societies are structured by the separation of the private and public sphere. While the commodification of unpaid work keeps pulling women into household-related services, it takes place very differently from what materialist feminists as Silvia Federici had demanded in the 1970s: The ‘wages for housework’-campaign sought to shake up capitalist reproduction by including the unpaid work of the proletarian housewife into wage labor. Today, the rising number of domestic employees as well as their poor working conditions are instead sustaining the status quo.

Building on critical feminist political economy, this paper explores the labor relation of domestic workers in Spain from a historical-sociological perspective: Tracing the exclusion of the servant from citizenship since early 19th century, I analyze the interplay of ideological and economic processes in Franquist and post-Franco Spain through archival documents, statistics and interviews gathered in 2015. I elaborate the role of religion, gender ideology, workers’ organization as well as the politics of austerity in the (un-)making of a female working class.

Analyzing paid domestic work in the context of authoritarian neoliberalism today, it shows that the private has long been a site for labor struggles. Today, over 700.000 people work in private households in Spain. Only a third of the workforce is registered, almost half are migrants, and over 90 percent women. Their marginalization within the workforce and labor regulation is legitimated through gendered and racialized institutions. This exclusion ensures the provision of social reproduction within a society in crisis, maintaining the home as foundation of capitalist production.

The Political Economy of Trans-Related Healthcare: The commodification of Trans-bodies between Medical Knowledge and the Global Market

Pedro Vasconcelos, Sofia Aboim
ISCTE-IUL University Institute of Lisbon, Portugal;
University of Lisbon, Portugal
Pedro.Vasconcelos(at)iscte.pt,
sofia.aboim(at)ics.ulisboa.pt

This paper examines the transnational political economy underpinning the constitution of healthcare regimes addressing gender variance and targeting transgender people. When self-determination is being recognized as a principle for legal gender change, a material analysis of the effects and processes of access to health provisions implies considering three aspects. Firstly, the ways in which maldistribution cohabit with the recognition of multiple trans identities. Secondly, a transnational perspective is paramount, whether we analyse the uneven access to healthcare or the formation of a 'class' of experts (the specialists on transsexual care) that operate in the global market. Thirdly, considering biopower and the relation power-knowledge as market-driven rather than state-driven implies a wider formulation, which intends to expand Foucault's original contribution on the basis of marketized strategies and the commodification of (trans)bodies. Drawing on qualitative fieldwork with trans-people and healthcare professionals in Portugal and the United Kingdom, we argue that the commodification of health at the global level impacted protocols and standards of care. When rights are being gained and laws privilege self-determination, thereby fostering a regime of self-governance of gender identities, the material support to transgender people decreases with neo-liberal capitalism dominating the offer of care for profit. While the State controls still the bureaucracy of gender identity, the transnational market provides the services to transform the gendered body. Consequently, and along class lines, opportunities for expanding a global market of privatized trans medical care filled the gap, reproducing inequality at the expenses of a political economy for social and gender justice.

Understanding the Role of Capital in Turkish Health System Reform

Eren Karaca
Binghamton University, United States of America
ekaraca1(at)binghamton.edu

With a general aim to understand social policy (trans)formations in non-advanced capitalist countries, this paper will focus on the political economy of healthcare reforms with particular reference to the Turkish case. The transformation of social policy agendas worldwide after the 1980s has been one of the important scholarly concerns that seek to understand the neoliberal era. Although there had been different accounts dominating the social policy/welfare state literature before the neoliberal shift, it seems that the impact of the neoliberal

ideology has shifted the discussions at a greater pace. As the scholarly interest in identifying and explaining the differences of welfare systems and then the neoliberal hegemony in the scholarly debates as well as in the policymaking circles propagated through international institutions have upsurged, the systemic explanations have lost their influence. This dominant ideology needs to be challenged both theoretically and ideologically, and social policy/welfare states literature seems to remain an untouched area in this sense.

Inspired by the earlier structural, and mostly Marxist, explanations of welfare systems, this paper will attempt to relink the processes of capital accumulation and social policy (trans)formations. Contrary to the existing literature focusing on the social policy as a relation between state and people, I will conceptualize the social policy (trans)formation processes through capitalist relations led by the deep and complicated relationship between state and capital. As a case study, I will look closer to the not-so-visible relationship between the Turkish health care reform that has mostly been interpreted as the AKP's neo-populist tool and the national and international capitalist groups' motives behind the reformist policies.
RN06 | Session 08a Banking on the Future, Sovereign Debt Crisis and Alternatives

The gendered agency of the ECB and the crisis of the Eurozone

Frederic Heine
University of Warwick, United Kingdom
f.heine(at)warwick.ac.uk

Critical Political Economy has, recently, paid more attention to gender relations and social reproduction. However, many elements of Waylen's (2006) critique can still be said to be true of much of critical political economy, particularly in the context of the crisis of the Eurozone: while CPE at least (sometimes) talks about gender, it does so overwhelmingly by criticising the gendered effects of austerity, seen as following from a capital accumulation dynamic determined by a (class) structure, while women are cast as its passive victims. When CPE does take account of gendered agency, it is often equated with women's agency and with resistance in general, but fails to paint a more complicated picture.

This paper tries to reverse the conversation by looking at the gendered agency of one of the institutions responsible for the governance before and during the crisis: The ECB. Approaching political economy from an unapologetic cultural angle, the paper seeks to trace the cultural underpinnings of a mode of governance premised on a punitive stability culture, embodied by a central bank – and central bankers – whose claims to independence, neutrality, and vigilance were left unchallenged. While building on work that has stressed the cognitive dimension that neo- and ordoliberal dogmatism played in the setting up of the Maastricht criteria, the paper argues that the masculine performances of central banking provide an important factor in the making of a particular regime of politico-economic governance that proved toxic for

social and gender equality in Europe.

Waylen, G., 2006. You Still Don't Understand: Why Troubled Engagements Continue between Feminists and (Critical) IPE. *Review of International Studies* 32, 145–164.

The bad cop turns good? The IMF and the Greek bailout in Neoliberalism 2.0

Oreste Ventrone

Università di Napoli Federico II, Italy
oreste.ventrone(at)gmail.com

The IMF (and the World Bank) was born as the product of a very innovative piece of institutional architecture. One of its most original features was the separation of the economic from the political and the two domains were object of distinct negotiation processes and conferences. IMF and World Bank, intended to take care of economic and financial matters, were created at Bretton Woods in 1944, and were given an entrepreneurial structure where the power was proportional to contribution ability. As a result, power in the two institutions was concentrated in the hands of some ten countries with the US at the top, endowed with veto power.

Since the 70s, World Bank and IMF were seen as the carrot and the stick of the spreading wave of neoliberalism in the developing world. On the occasion of their 50th anniversary, they have been object of the campaign "50 years is enough", calling for their closure because of the social damage provoked by their operations. In 2006, on the verge of price hikes for raw materials, some of IMF's biggest debtors even reimbursed most of their debts before the term. Now, having a substantial role in the management of the European crisis, IMF shows an apparently softer position compared to its European counterparts. The question this paper will try to answer is: Did the IMF change its stance or it just met with an even more extreme form of neoliberalism?

The political economy of gambling regulation: beneficiaries, stakeholders and conflicts of interest

Virve Marionneau

University of Helsinki, Finland
virve.marionneau(at)helsinki.fi

Gambling is a multidisciplinary topic that touches a variety of fields from economics to psychology, law and social sciences. As such, it is also an excellent case study of political economy. Gambling generates funds for society either through direct taxation or through special funds. These finances make up about two percent of national budgets in western countries.

This paper will consider the kind of beneficiaries, stakeholders and conflicts of interests that this form of revenue collection creates by discussing the example of France. The discussion is based on qualitative interviews conducted with beneficiaries (n=11) and providers or regulators (n=3). In France, gambling proceeds are distributed to a variety of different beneficiaries: the bulk of proceeds is directed to the

general budget, but recipients also include local governments of casino or race track communities, historical beneficiaries such as charity and sports organisations.

I identify two types of conflicts of interests that arise from the political economy of gambling regulation. First, the state is often both the main beneficiary but also the regulator and provider of gambling, creating a morally problematic situation in which the same actor has to balance between the competing interests of revenue maximisation and consumer protection. Second, beneficiaries other than the state are powerful stakeholders that will want to protect their finances even at the expense of those suffering from gambling problems. This is problematic since many of these organisations have the mission of promoting the 'public good'.

The results of the French case will also be compared to a similar dataset collected in Finland to discuss the role of different national regulations and legislation in possibly accentuating the conflicts of interest.

Leveraging Out of All Proportions: A Genealogy of Contemporary Money-Making, Banking and Debt Finance

Stefano Sgambati

City, University of London, United Kingdom
stefano.sgambati(at)city.ac.uk

In the wake of the 2007-08 crisis, it has become clear that banks are not really financial intermediaries shifting capital from savers to borrowers. Quite the contrary, through securitisation and shadow banking, they have redistributed net worth from debtors to creditors (the "functionless investors"). What is more puzzling, banks have revealed their true nature as professional debtors: the extent of banks' debt exposure is such that many have been granted (via central bank accommodation) the privilege not to pay for their "sins". Meanwhile, our understanding of banking is torn between two views that seem to be incompatible by nature. According to the first, banks intermediate money through their credit infrastructure but are not themselves able to create new money. By contrast, the second view argues that banks do create money out of nothing in the process of lending their credit. Significantly, despite their contrasts, both views conceptualise banking as the financing of other people. In so doing, they fail to grasp that, like any other capitalist entrepreneur, banks are in the business not really to create and/or intermediate money for the sake of others, but first and foremost to 'make money' for themselves. The paper thus investigates the specificity of modern bank agency in performing (rather than simply enabling) financial practices of money-making. Hence, it outlines a genealogy of bank leverage, which is traced back to early developments in English banking, and puts forward the thesis that modern banks make money as they leverage other people's savings. Banks can indeed treat the money they hold in trust as their equity, and use it as a further lever for their money-making and debt-financing business.

RN06 | Session 08b States of Emergency: Authoritarianism in Turkey

'Army and Political Regime in Turkey'

Gonenc Uysal

Independent researcher, Turkey

uysal.gonenc(at)gmail.com

This paper argues that the organisation of the military is determined by social and economic relations, and political, juridical, and ideological forms in a given historical context. The transformation of the military can be regarded as a response to and as a result of the changes in relations of production, and thus, class relations and pattern(s) of capital accumulation. Therefore, this paper borrows its theoretical and conceptual framework from Marxism in order to examine the transformation of political regime of Turkey beginning in the 2010s by focusing on the neoliberal-Islamist transformation of the Turkish military.

Beginning in the late-2000s, Adalet ve Kalkınma Partisi (Justice and Development Party) has begun to restructure the military both in practice and in the institutional framework in accordance with the authoritarian project of neoliberal-Islamism. In the 2010s, particularly beginning with the failed coup attempt in 2016, the JDP broadened its relative autonomy to religionise/Islamize the organisation of military corresponding to the deepening of organic relations with Gulf capital and favouring of mainly the Islamist bourgeoisie. In the meantime, the JDP dissolved the boundary between coercion and consent regarding its position vis-à-vis the subordinate classes where the military continued to play a significant role. Therefore, this paper argues that the neoliberal-Islamist transformation of military has corresponded to the aim to decisively defeat the subordinate classes while recently displaying the elements of fascism.

From 'Democratisation' to 'Authoritarianism'? Putting Turkey's AKP in its Place

Mehmet Eрман Erol

Ordu University, Turkey

mehmetermanerol(at)odu.edu.tr

Turkey has been governed by the political Islamist Adalet ve Kalkınma Partisi (AKP - Justice and Development Party) since the 2002 general elections. Conventional approaches to the AKP generally identified the party's first decade in power with democratisation, social and economic reforms and progress. In recent years, however, the AKP government is considered to have taken an 'authoritarian turn' as anti-democratic stance of the government reached inconceivable levels which manifested itself blatantly especially in events like the Gezi Park protests of 2013. As such, the political regime of Turkey is conceptualised as 'competitive authoritarianism', 'illiberal democracy', and 'hybrid regime' by various domestic and international commentators who once supported the AKP. This paper's argument contrasts sharply with the above-

mentioned 'good AKP goes bad' stance. The conventional 'authoritarian turn' approach is class-blind and touches only to the surface; it is descriptive rather than being analytical and dismiss capitalist social relations of production and the 'authoritarian character of neoliberalism' (Bonefeld, 2015; Bruff, 2014) which characterised earlier periods of AKP government as well. The paper rather takes a class-based approach and focuses on state-labour relations. As far as management of labour power is considered, the paper argues that since 2002 the AKP shows a great continuity with the post-1980 military-framed neoliberal authoritarian regime which aimed at 'putting an end to class-based politics'. In line with this approach, the paper analyses the politics of labour restructuring, the AKP's trade union policy, and neoliberal reforms in the labour market in general.

State Restructuring in Turbulent Times

Ipek Eren Vural

Middle East Technical University, Department of Political Science and Public Administration, Turkey

ieren(at)metu.edu.tr

The history of modern democracy in Turkey embodies various forms of authoritarianism. While the evolution of neoliberal authoritarian state dates back to the 1980s, since 2010, there have been a series of new developments, which eventually culminated in the failed coup attempt in July 2016, and the subsequent declaration of a state of emergency. This paper proceeds from the premise that the state restructuring and the political struggles observed during the state of emergency period, which had been already extended twice since July 2016, may indicate a wholesale transformation in the power bloc. Adopting a relational conceptualisation of the state inspired by Poulantzas, the paper proposes to trace this transformation by analysing the internal contradictions across different fractions of the capital in Turkey. To that end, the paper analyses the substance of the executive decrees issued since July 2016, as well as the formal positions adopted by the associations of different capital fractions in Turkey about the use of state power. A comparative assessment of the responses adopted by different capital fractions on issues such as the proposed regime changes, restrictions on rights and freedoms, and the conduct of economic and foreign policies, are then used to highlight the nature of state restructuring.

Understanding the Term within the Context: What Means Financial Literacy Practices in Turkey?

Nurdan Atalay Günes

Mardin Artuklu University Turkey; University of Kent

Post-Doc Researcher

znurdan.atalay(at)yahoo.com

The motto of the 21st century is to spend, to consume and to participate social as a consumer. The expected result of this motto is the debt. There are increasing debt levels observed at various levels from state to household and of course to individual. Under this

extreme debt, there are strategies emerged as 'proper ways' to behave. One of these 'proper ways' is a financial literacy. Financial literacy can be summarized as gaining the 'proper' financial skills like spending properly, investing and saving. This paper critically examines books written by Özlem Denizmen who is founder of Association of Financial Literacy and Accession in Turkey. She is one of the outstanding figures who regularly do TV shows, write newspaper column, owns website about the issue. Analyzing her discourse about the financial literacy display what is included and what is excluded. Mainly, the practice of learning of financial literacy excludes the political, social and economic contexts in that individuals embedded. Through the analysis of these books, this paper also tries to underline these contexts and to re-conceptualize the idea of financial literacy in contemporary Turkey.

RN06 | Session 09a The Political Economy of Urban Struggles

From Syntagma to Brussels? A materialist and discursive approach to assess the transnational contestation of austerity

Bernd Bonfert

Radboud University Nijmegen, Netherlands, The
bernd.bonfert(at)gmx.de

The contestation of austerity has become an integral function of the European left. While it has achieved no definitive successes against austerity, the left has become a major political presence in various countries by establishing activist networks and gaining electoral support. These struggles remain strongly nation-centered despite the widely recognized need for a combined transnational strategy against the European austerity regime. The reasons for these shortcomings include limited resources, longstanding disputes and the necessity to engage austerity measures on their immediate level of implementation. Additionally, I would argue that comparatively little attention is paid to existing attempts at transnationalization – from international solidarity to supranational institutionalization – thus further enforcing the primacy of national contestation. Critical political economy research needs to find ways to address the developments in this area, since a thorough understanding of their specific nature and trajectory is invaluable to fully discern the formation of counter-hegemony in Europe.

Following seminal researchers like Tarrow (2011) and Flesher Fominaya (2016) I propose combining a materialist perspective on austerity and its contestation with discursive approaches to social movement research. This analytical framework is able to provide a comprehensive analysis of the power relations and dynamics sustaining austerity politics as well as the structures, actors and practices that counter them. This paper seeks to showcase an extended PhD research design based on this framework, which aims to analyze the dynamics and challenges of transnational cooperation between

movements, unions and parties in order to assess their political and strategic cohesion.

Housing on the frontier of uneven development and social struggles on Europe's eastern periphery

Agnes Gagyi, Zsuzsanna Posfai

University of Gothenburg; Hungarian Academy of Sciences

agnesgagyi(at)gmail.com, posfai.zsuzsi(at)gmail.com

One of the frontiers where reorganizations of accumulation meet social resistance in the present crisis of capitalism is that of housing. Financialized capital is (yet again) redirected towards investment in the built environment, and specifically housing; social struggles arise from the threats this poses to social reproduction. Cities have been pointed out as a prominent arena for the politicization of conflicts between accumulation and social reproduction for long. Although this process unfolds globally, it is concretely articulated in variegated ways on different points of the global economy. Our approach connects insights on the urban frontier to a long-term dynamic view on localized aspects of uneven development, and asks how present conflicts in the field of housing are situated within that context. We discuss the case of present dynamics of the Hungarian housing market and the structuring forces of public policies in this field. We argue that the housing market is an important driver of uneven development on various scales. One such aspect we identify in the dynamics of the urban-rural divide as a local polarization between metropolitan and satellite functions of world-economic integration. We analyze strategic problems of housing movements in Hungary today against the background of structural hierarchies produced through Hungary's long-term integration into global accumulation processes. This approach complements our understanding of the complex field of social forces within which housing conflicts are set, and provides a specific angle on the strategic questions they face as they strive to give political articulation to systemic tensions.

Hyperliberal Capitalism and the Utopia of Exclusion

Mark Ian Bailey

University of Nottingham, Ningbo, China, China,
People's Republic of

mark.bailey(at)nottingham.edu.cn

Beginning with the writings of John Locke in the 17th century, the possession of private property has remained a central institution of liberal governance, but it requires a deliberate rationing of access that renders capitalist society a 'utopia of exclusion'. In the present, the Utopia of Exclusion has reached new and

altogether more subtle and sinister forms, as is evidenced in the hyperliberal city as an 'Evil Paradise' (Davis and Monk, 2007). 'Evil Paradises' present fantastical monuments to capitalism in gaudy displays of unimaginable wealth whilst simultaneously ignoring a dark side: the increasingly absolute separation between the lives of the haves and the have-nots. This paper therefore aims to critically analyse the manner in which the 'utopia of exclusion' operates in the modern hyperliberal city, from the macro to the micro level, and asks if the technologies that are essential to the seductive power of the utopia of exclusion paradoxically present opportunities to construct alternative, inclusive forms of community. In the final part of the paper, the analysis moves on to critically examine the multiple ways in which the Utopia of Exclusion is being resisted by progressive movements, from the Newham Estate protests in London, through the Slow Cities Movement, and similar contemporary examples from around the world. The paper argues that there is nothing necessarily inevitable or pre-ordained about either the Evil Paradise or the Utopia of Exclusion, but with the rise of new right-wing populist movements that are in many respects a reaction to precisely that sense of exclusion and marginalisation produced by both, enacting progressive solutions will be much more difficult going forward.

The quest for reproduction in urban social movement research: With Silvia Federici towards a self-reproducing movement

Nina Fraeser
HafenCity University, Germany
nina.fraeser(at)hcu-hamburg.de

With Caliban and the Witch Federici pins down that not only the dispossession of common lands and the subsequent 'freedom' to sell ones labour on a market (Marx: 'doppeltfreier Lohnarbeiter') have been fundamental for modern capitalism but also the discredit of the figure of the witch: (a woman) who maintained herself detached from both a Feudal or Capitalist 'master' as well as from a man (and family). By shedding light to these 'other' radicals Federici allows us to re-conceptualise today's struggles. Recent urban social movements have made it indisputable that prefigurative politics need to problematise precarisation among the employed, the under-employed, the 'not having the right papers to be employed', the unemployed and so forth. Drawing on anarchist-feminist principals recent occupations and other recent urban social movements have attempted to from a 'common subject' (Federici 2010). At the core of such movement practices is the refusal to separate the productive from reproductive processes or the aim towards what Federici called 'a self-reproducing movement'. While current urban social movements tackle multiple crises in the spheres of production and reproduction at once, they are still widely measured by policy influence, mass mobilization and campaigning work rather than outcomes of everyday reproductive practices,

processes of politicisation and solidarity building. Through the methodological consideration of a queer-feminist critique it becomes possible to uncover, discuss and contextualise unfitting dichotomous categorisations that limit our current understanding of social movements and the spaces in and through which they prefigure alternatives. I want to discuss the above by way of preliminary insights to my fieldwork in Hamburg on spaces of commoning.

The Historical Roots of Urban Overproduction in Spain

Javier Moreno Zacaarés
University of Warwick, United Kingdom
J.Moreno-Zacares(at)warwick.ac.uk

This paper explores the long-term causes of urban overproduction in Spain in order to understand the Spanish path into the Euro Crisis. Most critical political economists group the crises of the European South under the scope of a single crash detonated by the structural imbalances of the Eurozone. In doing so, they give causal primacy to exogenous factors and explain away the particularities of each case. However, these particularities are often no small detail: the enormous expansion in urban development that crashed the Spanish economy was a feature without parallel in the Portuguese, Italian or Greek crises. Contra exogenous perspectives of the Euro crisis, this paper historicises the long-term patterns of urban speculation in Spain to argue that the Spanish crash was in fact the outcome of a slow institutional maturation that is historically specific. This hopes to contribute to a broad discussion about the role of history in political economy and our understanding of social change

RN06 | Session 11a Global Trumpism - The Resurgence of Fascism?

The Public, the Mass Media, and Inequality: The Prospects for Resistance in the Trump Era

daniel chomsky
university of texas rio grande valley, United States of America
daniel.chomsky(at)utrgv.edu

President Donald Trump promises to represent ordinary people. Yet his administration and his congressional allies have already signaled their intention to enact large tax cuts that would disproportionately benefit the wealthiest Americans. In this paper, I explore the relative influence of ordinary citizens, social movements, business interests and government officials over the mass media and political outcomes. The emergence of Occupy Wall Street generated increased attention to inequality and progressive taxes in 2011 and 2012, but President Obama also adopted inequality as an issue in his campaign for reelection. So it is difficult to determine the relative impact of social mobilization or official action in that instance. The inauguration of the Trump administration may provide a clearer test. Public

support for higher taxes on the wealthy remains strong and conflicts with the policy goals of the political class. I will record every reference to taxes in the New York Times during the first months of the Trump administration, collect all sources expressing an opinion on taxes, and determine the degree to which the Times favors ordinary citizens, social movements, business figures or government officials. This study should indicate whether public views are more likely to be reported when they are represented by social movements or when they are consistent with elite preferences and interests. It should illuminate the democratic possibilities for ordinary citizens, and identify the actors who exert political influence through the mass media in general and in the more hostile environment represented by the Trump administration in particular.

The return of the national imperialist state

Joerg Nowak

City University of Hong Kong, Hong Kong S.A.R. (China)

joerg.nowak(at)gmx.de

The ultimate political consequence of the great financial crisis is the retreat into and renewal of the national imperialist state, centred around an authoritarian-nationalist project. But this 'return of the state' that was never absent is deeply embedded into the neoliberal form of today's global capitalism. It caters to working class interests of its citizens to some bigger extent (or at least promises to do so); but this remains largely a symbolic gesture. This Talmi interpellation of the national proletariat – not much unlike classical fascism – is accompanied by a profound political weakness and instability of these regimes. Not only are they haunted by their promises of welfare and employment, they also are confronted with deeply divided and fragmented state apparatuses in which different state agencies pursue radically different strategies. This goes far beyond the institutional chaos that reigned over the classic German fascism in the 1930s and 1940s with its sprawling multiplicity of state and para-state agencies, and is also completely different from the usual competition between different corporate factions that expresses itself in some extent of elite fragmentation in liberal democracies.

What is Neoliberal about Neoliberal Policing?

Malte Michael Laub

King's College London, United Kingdom

malte.laub(at)kcl.ac.uk

Militarisation, privatisation, tactics like stop-and-frisk and broken-windows-policing--the police appear increasingly authoritarian. Not least the cases of fatal police violence against black people and the policing of the ensuing protests in cities like Ferguson in the United States brought the topic in the middle of the public debate. Summing up recent policing transformations from increased militarisation, via a more important role for private police actors to a

certain focus on the policing of poor and minority communities, the term "neoliberal policing" has found its way into both public debate and academic contributions. However, what does it mean? What is distinctive about neoliberal policing, what distinguishes it from styles of (authoritarian) policing in the past? What is the role of policing under neoliberalism?

Drawing on political economy, sociology and criminology, this paper explores the novelty of "neoliberal policing" by putting recent transformations of police into both historical and theoretical perspective. Employing a range of authors like Neocleous, Wacquant, and Bruff, the relation between the neoliberal state and policing is analysed, claiming that policing is essential for the shaping of the neoliberal society. However, neoliberal policing must not be seen as utterly new but as based on rediscovered policing styles of the past.

Massaging Capitalism: the US Right and its Political Resurgence.

Rodney Loepky

York University, Canada

rloepky(at)yorku.ca

The events of November 8th, 2016 gave rise to a spectacular outcry of shock and dismay around the world. How could the US electorate bring to office a candidate so blatantly misogynistic, spiteful and politically corrosive? The turn of the Republican Party towards a demagogic figure must be placed within a political economy of the right as a space of 'resistance'. This paper seeks to explore both the contradictions inherent in the right's 'resistance' to contemporary US political trajectories, as well as the strategic aims of those who foment this 'resistance'. Since the backlash of Tea Party activists in the first term of the Obama Administration, scholars have been dissecting the motivations and authenticity of the right's most assertive groups, assessing their impact nationwide while also trying to ascertain their exact goals. This impact has been consistently downplayed and, at times, pronounced dead -- prognostications that now seem to have been unwise. Charlie Post has argued that the hard right in the US, in fact, now fills the progressive space that the Democratic Party has long since abandoned, which has bolstered their success in a way that also mystifies the Republican establishment. Nonetheless, the paper will explore how this 'progressive' movement has been nurtured along the way, strategically utilized by those seeking an austere policy agenda that promotes an less obstructed path for capital in the US political scene. That the GOP may have got more than it bargained for in this electoral round is a secondary point -- the right wing resurgence will continue to be harnessed for the purpose of transforming the US political terrain in ways that are more conducive to enhanced accumulation.

Where is the Joyful Society? Community and the Return of the Uncanny

Joost Van Loon

Catholic University Eichstätt-Ingolstadt, Germany
joost.vanloon(at)ku.de

"Vrolijk Gezelschap", a painting by Jan Steen, can be deployed to illustrate "pre-modern sociality". As a signature hallmark of Jan Steen, it creates an ambience of chaos, noise, diversity and an absence of authority, order and sense of purpose. This stands in sharp contrast to Durkheim's sketches of the organic solidarity that is required to support the functionally differentiated constitution of modern, industrial nation states and which formed the basis of Parsons' conception of the evolution of society. Vergesellschaftung (a term Simmel deployed to describe the process of the unfolding of society) seems to be equated with the erosion of enjoyment, perhaps only to be replaced by a spectacle of entertainment, organized by the culture industries. In this paper, I reflect on the concept of joy, an affect that – unlike hope and fear – seems to be missing from contemporary sociological reflections on, for example, political culture. As from the start of the discipline, there have always been sociologists who have been critical of Vergesellschaftung in favour of more "cozy" concepts such as "community", I will also consider the issue of "joy" as an affective charge of "communitas" and reflect on the pleasures (rather than joys) of repressing the strangeness within that are always part of this and seem to erupt with the catharsis of self-assertive identity politics. I discuss an example of contemporary "right wing populism" in Europe in the light of Freud's concept of the uncanny with an aim to sociologize this as the antithesis of the joyful society.

Follow the Secret: Scandal as Social Form and Cultural Object

Mark D. Jacobs

George Mason University, United States of America
mjacobs(at)gmu.edu

How should the sociologist read a scandal? Scandals are not aberrant events, but rather ubiquitous ones; whether routine or sensational, they animate social interaction and cultural emergence. Society is only possible, according to Georg Simmel, because

individuals exist simultaneously within it and without it. This premise implies that secrecy is one of the omnipresent forms constitutive of social life. As Edward Shils argues, this form itself creates some degree of fascination independent of content. And as Shils's student Erving Goffman details in his landmark description of "the presentation of self in everyday life" (in many respects, an elaboration of Simmel's essay "Secrecy and the Secret Society"), secrecy thus motivates the dramaturgy of everyday life, in which members of competing "teams" collude "backstage" to orchestrate the "frontstage" performances designed to protect their own secrets and expose those of others; indeed it is this process that describes the boundaries of the respective teams and helps create social identity. This dramaturgy is the stuff of scandal, which is therefore itself a universal form of social life. The scandal unfolds according to what Marshall Sahlins terms "the structure of the conjuncture," along the fault-lines of social change and cultural emergence. The key to comprehending a scandal, as a number of case studies will suggest, rests in underlying social tensions and competing cultural frames.

More Than a Product: Strengthening Literature in Sociological Analysis

Jan Vana

Masaryk University, Faculty of Social Studies, Czech Republic
173329(at)mail.muni.cz

Literature is more than a reflection of social structure. Literary texts communicate emotions to the reader by means of their aesthetical function. Demonstrating the importance of aesthetics in the sociological analysis of literature, (1) I summarize the historical development of social knowledge which is usually referred to as "sociology of literature". (2) I discuss the uses and limits of the dominant Bourdieusian approach towards literature. (3) Building on the strong program of cultural sociology, I provide an outline of the concept of iconicity and the phenomenology of reading to sketch a novel approach in the sociology of literature, which is explanatorily powerful, but also sensitive to meaning structures as well as the reading experience of literary texts. In the final chapter, (4) I demonstrate this approach in analyzing the novel *Sister* by Czech writer Jáchym Topol, a literary reflection on (and not just of) the Velvet Revolution.

RN07 | Session 02a Sociology of Culture General Session II

Irrational basis of rational consideration about the god's divinity. Dionysiac source of modern philosophy and study.

Jadwiga Stefania Skrzypek - Faluszczyk, Agnieszka Iskra - Paczkowska

University of Rzeszow, Poland; University of Rzeszow, Poland

jadwiga_f(at)interia.pl, agnieszka.iskra(at)wp.pl

In today's western society irrational element is

becoming to supersede in behalf of ethics and rational reflection on the world. Even in the field of religion there is a phenomenon of its reduction to the meaning of ethics or dogma as a compilation of beliefs, depriving the group of believers of their creative and community dimension.

Because what is irrational seems to be not only valueless but it is also opposing rationality. The study of ancient Greece culture demonstrates the fallaciousness of the thesis. I affirm that rationality is rooted in irrational sources.

This article exhibits that the Dionysiac religion represents the base of philosophy interpreted as a rational reflexion on the world and divinity. The basis of holistic thought (idea) about the world, knowledge about the deathless and godlike character of the human soul is irrational religious experience existing in rituals and religious service. The Dionysiac religious is neither homogeneous nor unequivocal but therefore it gives the rise to Orphism as well as Apollonian religion. The fulcrum of the beliefs collection is the conviction about the omnipotent god and his dominance, cyclicity of appearances and at the same time permanence of that deathless, the most substantial element which can be linked to the god's divinity.

In the present work I have made use of the K. Krerenyi research. He published the issues relevant to Dionysus cult and sketched the nature of this polymorphic god, identity with the endless form of life that is zoe, in his work "Dionysus".

Consistent image relating to the beliefs and the cult of Dionysus we can find in the works of Dodds, Rohde, W. Otto, Elied, Seaford, Detenne, Burkert.

Theatre and social and cultural theory – exploring elective affinities anew

Isabelle Darmon

University of Edinburgh, United Kingdom

Isabelle.Darmon(at)ed.ac.uk

Sociology has long been fascinated by affinities between theatre and the social life it purports to study. Some of the finest theoretical tools and analyses of the discipline have emerged from this at times metaphorical, at times structural, resonance. But whilst they made use of the theatrical toolbox, theories of the dramatization and of the dramaturgy of social life do not analyse the specificity of theatre. In this paper I review and document the status of theatre in two recent such constructions, as aesthetic instance of 'crystallisation' of a more general 'cultural pragmatics' (Alexander); or as vehicle for connections that we miss in 'real life' (Latour). The paper is a contribution to a broader attempt at theorising domains of culture and the arts as having their own logic of organisation of their 'matter'. Starting from the Weberian idea that affinities can only relate domains with identified immanent logics, I seek to unravel such logics for specific theatrical configurations. This allows me to explore affinities between typification, the staging of stances and conflict, which characterise certain theatrical configurations, and a Weberian

conception of social science, as topographic mapping for subjectivation and the conduct of life. Alain Badiou asks: where does an immanentist conception of art (alongside love, science, and politics) leave philosophy? The same should perhaps be asked of social and cultural theory, if we are to reinvigorate its take on the contemporary world and its contribution to forming human beings taking transformative stances, rather than competent technicians.

Crisis of duration, subjectivity and 'new individualism'

Carmen Leccardi

University of Milan-Bicocca, Italy

carmen.leccardi(at)unimib.it

Among the many challenges sociological knowledge faces in the new century, there is undoubtedly the loss of centrality of the dimension of duration in social life, a process connected to the depth and intensity of the processes of change that we observe on a global scale. The redefinition of social time, which this loss refers to, has powerful repercussions on public life, relations with politics, and also, jointly, with biographical construction, the expression of identity, forms of solidarity and social bonds. The 'crisis of duration', while it critically interrogates the conceptual network with which we have analysed social integration, founded on the central role of social institutions as mediators between the individual and society, also requires a rethinking of the forms of sociological imagination that we have inherited from the last century. In this new framework, how can we put everyday life and history, subjectivities on the one side and democracy and justice on the other, into relation? In my opinion, a reflection on contemporary redefinitions of the concept of individualism can contribute to re-strengthen the sociological imagination and critical thought. The central issue becomes the following: is it possible to rethink contemporary individualism not only as an expression of privatism, but also as fruit of the redefinition of the relationship between the present and future, between subjectivities and institutions? The presentation will face these questions, underlining how 'new individualism' can also be bearer of dynamics able to promote critical subjectivity and ethics of personal responsibility.

Legitimization, Popularization and the Transformation of Cultural Hierarchies in European Newspaper Culture Sections, 1960–2010

Semi Purhonen, Riie Heikkilä, Irmak Karademir Hazir, Tina Lauronen, Carlos J. Fernández Rodríguez, Jukka Gronow

University of Tampere, Finland; University of

Tampere, Finland; Oxford Brookes University, UK;

University of Helsinki, Finland; Universidad Autónoma

de Madrid, Spain; University of Helsinki, Finland

semi.purhonen(at)uta.fi, riie.heikkila(at)helsinki.fi,

ihazir(at)brookes.ac.uk, tina.lauronen(at)helsinki.fi,

carlos.fernandez(at)uam.es,

jukka.gronow(at)helsinki.fi

The paper summarizes and reflects on some of the main results of a large-scale research project exploring the ways in which cultural classifications and hierarchies have changed from 1960 to 2010. Have the old distinctions between 'high' and 'low' dwindled and lead us into a more de-hierarchized, democratized and tolerant culture? The project tackles these questions through the lens of a specific institution in the field of cultural production – the culture sections in European quality newspapers – over the last fifty years, covering wide geographical variety. The newspapers included in the study range from two Nordic countries (Finland, Sweden) to two large Western European countries (France, the UK) and finally to two Mediterranean countries (Spain, Turkey). The newspapers are examined by systematic content analysis, both quantitative and qualitative. The analyses focus on the supposed trend toward increased heterogeneity of the cultural content, the rise of popular culture and the corresponding decline of traditional highbrow culture. Moreover, special attention is paid on the ways in which aesthetic, commercial and political valuations are intertwined in cultural coverage and how the relationships among these evaluative principles have changed. The results substantiate and add to the previous knowledge on the post-1960s cultural change, which essentially can be conceptualized as two simultaneous processes of 'openings' of culture: the legitimization of popular culture and the popularization of traditional legitimate culture.

RN07 | Session 03a Cultural Practices I

Are People Omnivorous or Univorous in Cultural Activities? : Quantitative Analyses

Jun Kobayashi, Shinya Obayashi
Seikei University, Japan; University of Tokyo, Japan
jun.kobayashi(at)fh.seikei.ac.jp,
obayashishinya(at)gmail.com

This paper examines whether people consume cultures in an omnivorous way or univorous way. According to DBO theory of analytical sociology, people desire (D) to act with a certain belief (B) under an objective constraint of opportunity (O). So, we hypothesize that people are more likely to be cultural omnivores when they believe that they have freedom to consume cultures and have enough high income. Using SSP 2015 data in Japan, we measure cultural omnivorousness by a geometric mean of high and middle cultures activities (subsample 2,769 respondents). We found (1) by the distribution, 52.5 % of them were omnivores. (2) By main effects of education and income in regression analyses, higher status promoted cultural omnivorousness. (3) By interaction effects of subjective freedom and income, coexistence of belief and opportunity promoted cultural omnivorousness. Therefore, cultural activities are not exclusive as Bourdieu argues. Analytical sociology enables us to clearly incorporate roles of belief in cultural activities.

Camel Wrestling: Actors, Relationships and Practices

Devrim Erturk
Mardin Artuklu University, Turkey
devrimpasa(at)hotmail.com

This paper intends to discuss the social relations produced by traditional camel wrestling on the western coast of Turkey. A social environment is being constructed by the geography where the camel wrestling is held, by the actors involved, and the practices in the wrestling. Within this field, cultural practices and social relations contribute also to the formation of cultural capital by being inherited from generation to generation.

Camel wrestling, which leads both the actors and the groups formed by these actors come together in this capital transfer, makes it possible to observe and understand these social relations rather than merely being a struggle for superiority between the two camels. Here, actors gain identity and status through their involvement in this wrestling. On the other hand, this identity and status, which the actor has acquired, reproduce themselves as a source of solidarity and prestige within the group. These generated relationships are also inherited from generation to generation.

In this study, the relationships that camel wrestling produced are tried to be analyzed from a Bourdieuan perspective. Camel wrestling, which has its own set of rules and generated social relationships, can be regarded as a transfer of capital also by virtue of its character that it is inherited from generation to generation. Theoretically camel wrestling, which will be analyzed by Bourdieu's conceptual framework, will also be supported by ethnographic data obtained from field research. This ethnographic data were obtained from in-depth interviews and participant observations conducted between January 2015 and June 2016 with the actors following camel husbandry and camel wrestling in Çanakkale, Balıkesir, İzmir, Manisa, Aydın, Muğla, Denizli and Antalya on the western coasts of Turkey, where camel wrestling has been held.

Dearest Spanish timetable. Proposals for a rhythm change

Javier Callejo, Cecilia Díaz-Méndez
University of Oviedo, Spain; University of Oviedo, Spain
mcallego(at)poli.uned.es, cecilia(at)uniovi.es

A timetable is an instrument that articulates a society. It serves to link some activities with others, setting the rhythm of daily life. It offers the possibility to repeat regularly activities. It offers the possibility of sharing activities. A schedule is essentially necessary to regulate the coexistence, to establish an order in the daily life of the citizens.

In Spain, once again, the public debate on the change of schedules has begun. There is significant resistance to change, but it is not clear why. In this

paper we are going to question some of the premises on which this debate is based in order to reflect on the modification of the timetable in Spain.

The supporters of a necessary change in the schedule argue that: Europe has a working schedule of 9 to 5; The working day in Spain is mostly “jornada partida”; Spaniards spend more time than Europeans eating; The Spaniards want a change of working day; There is a positive relationship between low Spanish productivity and working hours. Some of these premises are false, as we shall see. To demonstrate this, we used the data of the Center for Time Use Research (Oxford University), dedicated to the homogenization of time use surveys of different countries. We will expand this information with data from INE. The work constitutes a modest approximation to the processes of social institutionalization of the schedules and, therefore, of the time.

On the edges of the field: independent publishing in the 21st Century

Simon Stewart

University of Portsmouth, United Kingdom
simon.stewart(at)port.ac.uk

A few years ago, some predicted the ‘death of the book’ and others predicted the total dominance of transnational corporations in publishing. Research demonstrates that neither of these prognostications has proven to be true. Drawing on semi-structured interviews and publicly available secondary data, this paper contributes to debates about the state of play in the subfield of independent publishing by focussing on the contexts within which publishers operate and the value-judgements they make. How do independent publishers reconcile commercial and artistic imperatives? How do they decide which books to publish? On what basis do they make their value judgements? These questions and others will be addressed in the course of this paper, which draws attention to a relatively under-researched area of cultural production that is flourishing and yet never loses its sense of vulnerability.

RN07 | Session 04a Cultural Practices II

Sensory-consumer culture of capitalist society.

Muslimat Gazieva Akhmedova

Russian State Social University, Russian Federation
muslima11(at)rambler.ru

Sensory-consumer culture is a way of existence of the market of intellectual production (ie the organized forms of production and transmission of spiritual values), not the culture itself with its high humanistic ideals. Sensory-consumer culture has a certain effect on the everyday human world, formed by its value system, needs, tastes, etc. The role of this type of culture in people's daily lives become increasingly significant, and in the current circumstances it becomes the main supplier of normative values of behavior, thus affecting all sectors of society, including

the elite.

Creative Industries Policy in Taiwan: After the Neoliberal Reform

Hui-Ju Tsai

Loughborough University, United Kingdom
h.tsai(at)lboro.ac.uk

This article argues that neoliberal reform has generally failed to promote the public interest in cultural and creative industries policy-making in Taiwan. Creative economy has heavily influenced the development of cultural policy discourse. Particularly, Taiwanese government was to embark on a major cultural policy shift towards neoliberalism after concluding that its adoption of ‘creative industries’ policy from Britain in 2002 had failed to reform the structure of media and cultural industries. Neoliberalism, global capitalism and the profitable growth of global cultural industries gradually penetrated the direction of cultural policy in Taiwan. The imbalance of priorities in cultural policies has been linked to the chronic short-termism of cultural governance. The huge public sums into the expansion of creative industries sector in the last decade as a trajectory of neoliberalisation in Taiwan. It illustrates that the creative industries policy-thought has neoliberalised and been embodied in three salient characteristics about the privatisation of public space, the financialisation of public subsidy & investment, and the commercialisation of higher education. The three main problems clearly demonstrate that private capital investment in the public sector, without long-term planning to foster talent, is inefficient. This paper is divided into three main sections which address the three neoliberal results. Finally, the article briefly attempts to show how we might develop new perspectives for evidence-informed policymaking and the wider public interest.

Seeing justice being done? Courtroom broadcasting, transparency, and public participation

Sarah Moore

University of Bath, United Kingdom
s.moore2(at)bath.ac.uk

“Not only must justice be done; it must be seen to be done.” This aphorism, attributed to Lord Chief Justice Hewart, has lately been revived in support of a set of legislative changes across England and Wales that mark a historic shift in the public's relation to justice and the media's access to the courtroom. The government hopes that the broadcasting of footage from trials and appeals, enabled by rescinding the long-time ban on cameras in the courtroom, will increase the visibility of legal proceedings and, in turn, improve public trust and understanding. This is an untested ambition. Encouraged by news corporations, the government has embarked on a path towards the filming of criminal trials with little more than a hypothesis about the effects on public confidence. Drawing upon findings from an audiovisual analysis of courtroom footage and focus groups with members of

the public, this paper considers what the introduction of courtroom broading tells us about the operation and meaning of justice, transparency, and public participation in the legal realms of twenty-first century liberal democracies. As part of this, the paper considers whether video footage transforms the courtroom into technocratic sites of process or, by contrast, performative arenas where justice is enacted. A tension between these aspects — technocratic vs performative — has long existed, but the introduction of courtroom filming brings it into sharp focus and gives an urgency to the question of how justice should be “seen to be done”.

Cultural Production by the Second-generation Entrepreneurs in China

Xiao Mei

Chinese Academy of Social Sciences, China, People's Republic of
meixiao(at)cass.org.cn

This paper analyzes the cultural production of the second-generation entrepreneurs in China. Social reproduction theorists often depicted social processes during which a better-off class reproduces itself through transmitting economic, social and cultural capital from one generation to the next. The younger generation tries hard to master the “tricks of the trade” and aspires to live up to the standards of their privileged class. Yet the cultural endeavor of the second-generation entrepreneurs in China is completely different. All they want is to be different from their parents, despite the fact that their ambition to be different is subsidized by the wealth of their parents, or the fact that their ultimate mission is copy their parents' success. Drawing on qualitative data collected from interviews with second-generation entrepreneurs in China, I argue that it is exactly because the second-generation Chinese entrepreneurs choose to produce a culture of their own instead of reproducing the culture of their parents' generation, they may stand a chance of reproducing the social status and economic prosperity of their class, given the specific social and economic conditions of the Chinese society. Drawing on Paul Willis's concept of cultural production, I explore cultural production by the second-generation entrepreneurs as on the one hand a creative, dynamic and contested process, and on the other an important reproductive mechanism.

RN07 | Session 05a Cultural Practices III

Targets of Internet Jokes in Post-socialist Slovenia

Peter Stanković

University of Ljubljana, Slovenia
peter.stankovic(at)fdv.uni-lj.si

The presentation addresses differences between the jokes told in Slovenia during the period of socialism and jokes shared in Slovenia nowadays. As in all East-European countries, jokes have been very

popular in Slovenia during the socialist era and also have had clear targets (politicians, immigrants etc.). In the decades after the introduction of market economy in 1989 however, the jokes appear to be less important part of everyday life and have more diffuse targets. In order to understand which social groups (if any) are typical targets of contemporary Slovenian jokes and how are these targets connected to relations of power in society, an analysis of sample of 250 jokes published by five most popular Slovenian Facebook groups has been conducted. The analysis has proved that targets of recent Slovenian jokes are indeed very diverse, which could be taken as an indicator of the fact that in capitalism, sources of existential anxieties are less visible and are therefore in popular discourses projected into many social groups.

Is Western charm still in power? Changing image of the foreign goods in Poland since the 1970s.

Barbara Tolłoczko

Graduate School for Social Research, Institute of Philosophy and Sociology (Polish Academy of Sciences), Poland
b.tolloczko(at)gmail.com

It's almost a sociological “cliché” to state that irrepressible circulation of things (products or commodities) causes unification. On the other hand, it is also acknowledged that globalization causes some contestation: conscious resistance, different reception, glocalisation, synthesis or contestation. On the everyday level of human life those large processes may be captured in the interaction between people and products. Things and people are on the move – they meet in certain time and space which produces certain meanings. The movement of things shapes human perception of others and the vision of their own identity, as well as strongly influences the structure of dividing the world into categories such as local, global, European, regional, national, Western or Eastern. In my paper I will address the issue of the flow of things and its consequences on people perception. Theoretical problematization of terms such as marginalization, identity, capitalism and cultural value will be based on the research I have been conducting in Poland for over two years, in which I focus on the changing meanings associated with foreign goods in Poland since the 1970s. The environment of a communist country with closed borders serves me as a laboratory for reconstructing the vision of the “other” and “self”. The systemic transformation of the 1989, which enabled the Poles to experience foreign goods, was a background for changing perception and attitudes. Finally, some space will be given to the shape of contemporary encounters of people and foreign things in Poland and their consequences: what do terms like Western, local, foreign or Polish connote?

The Typology of Cultural Participation in South Korea

Myoung-Jin Lee

Korea University, Korea, Republic of (South Korea)
leemj(at)korea.ac.kr

Studies on cultural omnivores have focused on consumption activities, largely overlooking cultural production activities. However, consumption and production activities are both essential fields of cultural participation. Through the use of comprehensive data about cultural consumption and production activities, this study attempts to explore patterns of cultural participation in Korea. It also investigates the determinants of these different patterns. Four major findings resulted from the study. First, four different types of cultural participation were derived: omnivorous prosumers, omnivorous consumers, omnivorous producers, and univores. Second, members of the new middle class, with higher educational levels and higher household incomes, are more likely to be omnivorous consumers or omnivorous prosumers. Third, demographic factors such as gender and age also have effects on the patterns of cultural participation in Korea. Lastly, it was revealed that the larger an individual's social network, the greater the probability of being a cultural omnivore of any type. This study contributes to the expansion of the boundaries of prior discussions on cultural omnivores.

Online City Archives: Visualization of Social Histories

Cicek Coskun

Baskent University, Turkey
ccoskun(at)baskent.edu.tr

Museums and city archives are important places for considering and remembering a city's and a country's social memory and history. City archives in Turkey are important information and record centers in this manner. In recent years, some city archives turned to online systems. Throughout this process, it became possible to search city histories from different places of the world without any need for going that city.

This study attempts to search some examples of online city archives of Turkey with comparison from different countries' cities and their social affects. With this aim, city archives and museum's social importance will be discussed first. Second, selected online city archives will be analyzed.

RN07 | Session 06a European Identity (and) Politics I

The role of emotions in preserving and sustaining the Latvian cultural tradition the Song and Dance Celebration

Anda Lake, Liga Vinogradova

Latvian Academy of Culture, Latvia; Latvian Academy of Culture, Latvia
lake.anda(at)gmail.com, liga.vinogradova(at)lka.edu.lv

The Song and Dance Celebration is traditional cultural mega-event in Latvia since 1873, based on song and dance practiced by amateur art groups. In 2003 Tradition and Symbolism of the Song and Dance Celebration Process in Estonia, Latvia and Lithuania has been inscribed on the Representative List of the Intangible Cultural Heritage of Humanity (UNESCO, 2008).

Although the level of participation is satisfactory (in 2013 2.6% of population were involved in art groups), policy makers and researchers are interested to study the preconditions of preserving this tradition in a changing and innovative environment. The motivation of the participants of various art groups is important to preserve the tradition. Previous quantitative and qualitative studies have shown that the most important reason for taking part in this tradition is emotions you can't get anywhere else, (Latvian Academy of Culture 2014) and participants can get positive emotions not only from the Celebration but also from everyday practices of the art groups (Laķe and Vinogradova 2016).

The aim of the research is to establish what is the meaning of emotions in preserving the Song and Dance Celebration tradition. The main research question: what is the connection between positive emotions and various types of art groups and different models of everyday practices they have?

Theoretical foundation is based on the sociology of emotions as well as the idea that positive emotions increases group's solidarity (Turner and Stets 2006). Research is based on quantitative and qualitative methodology, including visual research methods (photo-elicitation and photo documentation).

Changing Public Discourse on Refugees - Tackling Cultural, Structural and Direct Violence

Andrea Gabriele Plöger

Alice Salomon University of Applied Sciences, Germany
ploeger(at)ash-berlin.eu

This proposal aims at resuming the lessons from applied social work with media (participatory video and a blog) which we tried to set up at the Alice Salomon University in Berlin together with students with diverse backgrounds and unattended minor refugees from Afghanistan and Syria. In our project also the teachers have mixed backgrounds, two out of four are also refugees and share the precarity of a life in exile and the confrontation with islamophobia and the growing racism against people of colour with many of their students. Our approach was designed to be participative and to serve as a starting point for a self-managed project and as a frame for research on cultural strategies to counter the spread of different types of violence against the most vulnerable members of a society in a situation of growing societal segregation and exclusion.

During the last year public discourse on unattended minor refugees in Germany rapidly developed into a frame for structural, cultural and consequently also direct violence after reports on crimes committed by

unattended minor refugees. Our analysis of the situation in Germany (and Berlin) will focus on the problems we have encountered in the realization of the project correlating with altered public discourse on asylum seekers in Germany (and Europe) and the acceleration of exclusion in all realms of society. We perceive this as being inherently connected with the increase of cultural, structural and direct violence against so proclaimed „non-citizens“ in a „neoliberalising“ Berlin, Germany and Europe and will elaborate on strategies to subvert the public discourse by self-representation of refugees. This aims at mitigating the violence and establishing an intercultural dialogue instead of othering.

RN07 | Session 07a European Identity (and) Politics II

Does capitalism equal free market plus democracy: a contemporary discourse – Europe and Latvia

Dagmara Beitnere-Le Galla
University of Latvia, Latvia
dbeitnere(at)gmail.com

M. Weber's ideas of the development of capitalism are in agreement with K. Marx's description of capitalism. As technologies evolved, the model of economic relationships changed the foundation of social life, which can be seen more than ever nowadays, in the modern era of information technologies, from critics who refer to capitalism as "satanic mills", to "limited democracy".

According to G. Zimmel's description of capitalism, and similar to A. Smith main work on the fundamental principles of a free market society, increasingly a framework of the new era goes missing, in which the moral issues have a crucial role.

In the postcommunist countries, modern capitalism was understood as the union of the free market and liberal democracy. Latvia was one of the first EU countries which was hit hard by the global recession, and the first to implement austerity policies. This triggered migration to economically more advanced countries in Europe. The "drainage" of the labour force out of the new EU member states and the impunity of media, undermined the authority of liberal democracy. Do we live in an era in which capitalism has lost its energy following the second world war and the prevalence of the counterculture in the 1960's?

Does global capitalism's increase in power transform liberal democracy?

This report includes interviews with policy experts in Latvia and a representative of the European Court of Justice to highlight discussions on issues of how to understand modern capitalism.

How to construct a cultural sociology of Brexit in three not so easy steps

David Inglis
University of Exeter, United Kingdom
dinglis99(at)gmail.com

Being a cultural sociologist in the UK today is not much fun. In line with the wider liberal intelligentsia, the cultural sociologist is likely to have voted for the UK to remain in Europe, and the triumph of the Leave campaign seems deeply traumatizing. It is difficult for cultural sociologists to examine the nature and consequences of Brexit in a neutral and distanced fashion, and the time spent on doing cultural sociology might better be spent in punching Brexiteers in the face. However, cultural sociology must seek to advance through adversity and black comedy.

This paper proposes how to create a satisfying cultural sociology of Brexit, which combines analytical rigour with measured political fury, while retaining a cosmopolitan perspective in the midst of the horror – just as Durkheim himself sought to do during WWI. Accordingly inspired, the paper proposes three necessary moves in building a cultural sociology of Brexit.

First, an analysis of the right-wing media framings which successfully defined Brexit as essentially an issue of alleged uncontrollable immigration, and the failure of liberal and left counter-narratives, including the failure to construct as a martyr of Brexit the murdered MP Jo Cox. Second, conceptualization of Brexit as a massive 'de-cosmopolitizing' spurt, of the kind familiar to Elias and Beck, together with the recognition of more hidden dynamics of re-cosmopolitization and the generation of new cosmopolitanisms, including the paradoxical Scottish nationalist variety. Third, the unpicking of the nature of the cultural trauma being experienced by the defeated Remain side in the referendum and by EU citizens who face radical uncertainty in an increasingly neoliberal/neo-fascist UK. Various cheerful points are made about these matters.

Fashion cosmopolitanism and the de-cosmopolitization of European realities

Anna-Mari Almila
University of the Arts London, United Kingdom
a.almila(at)fashion.arts.ac.uk

According to thinkers as diverse as Gabriel Tarde and Ferdinand Tönnies, fashion is an essentially cosmopolitan phenomenon, directing one's pride beyond one's nation. For centuries, fashion systems have been highly cosmopolitan, while also reproducing global inequalities: fashion hubs such as London, Paris and Milan traverse European space while being connected to other global cities, exploit peripheral locations, and influence sartorial choices all across the globe. But as Europe shifts politically rightwards, a major question comes into view that the sociology of fashion and fashion studies urgently need to address: How are 'de-cosmopolitization' processes, where borders are re-drawn, immigrants are demonised, and ethno-nationalism is on the rise, impacting upon and being dealt with the highly cosmopolitan systems and networks of fashion? The question necessitates new combinations of cultural sociology and political sociology, in order to understand how fashion is being restructured in light

of values that it seems opposed to, in terms of both its central structures and the political affiliations and imaginaries of fashion actors.

Two empirical domains are investigated in this light. First, how different social classes in Finland are responding differentially to the perceived cosmopolitanism of fashion at a time when Finnish politics is ever more dominated by right-wing populism. Second, given that Brexit is a major phenomenon of de-cosmopolitization with ramifications for all of Europe, London fashion world's reactions are crucial to examine. Comparing these two cases allows us to consider the ways in which fashion is being affected by anti-cosmopolitan trends of the kind that would be recognised by thinkers such as Norbert Elias and Ulrich Beck.

Exclusion and transgression

Yrjö Martti Kallinen
University of Tampere, Finland
yrjo.kallinen(at)uta.fi

This paper is based on my thesis project on the trajectories of life of a delinquent group of young men. The culture of the group is counter-normative in deeply contradictory forms. It celebrates freedom within desperate limitations, is joyful and immersed in the present while desolate and indifferent about the future, simultaneously creative and destructive, loyal and hostile. While the group-life is bound with strong solidarity, mutual understanding and a voracious appetite for excitement and adventure, an immensely active gleeful resentment against all limitations of the normal society characterize its relations outside.

My focus in this paper is on the cultural logics of exclusion. This relational dynamic seems to begin at an early age by being barred out of 'normal' communities, social routes and forms of affiliation. The shared experiences of exclusion initiate a pursuit for self-determination, rebellion and belonging found in each other and expressed in the group-culture. The cultural response of delinquency towards the prevailing social order leads to ever harsher forms of control, domination and exclusion by the society. Thus the too spirited an approach towards freedom and resistance to subordination lead paradoxically to their exact opposites.

While my point of departure is in the lived experience of the members of the group, I aim to theoretically clarify the cultural logics of delinquency in relation to its social conditions of formation and existence. I argue that these logics, relations and conditions should be understood as deeply enfolded and expressive of a society imbued by very real forms of inequality.

RN07 | Session 08a European Identity (and) Politics III

Social Construction of the Polity: Transformation of Cultural Political Approach in EU – Construction

Ruirui Zhou

University of Hamburg, Germany
zhs.doublefarsight(at)aliyun.com

This paper makes an elementary research on the relationship between the narrative – construction of EU and its relationship with the German cultural policy.

European Union as a transnational political community dries attention from beyond academic sides. It is usually believed that beyond organizational institutions a political community needs a set of narratives which points to “an ultimate road” in the future. Noticeable enough is that until now, neither does EU have narrative of ultimality, nor does it based merely on handover of the politics to a higher power from national states. Moreover, it appeals on a cultural identity which constructs itself from a “bottom – up” process.

Tracing back to the construction of the cultural policy in German, this paper is convinced that the German cultural political approach is “emerging” the European society. When “Cultural Politic as Social Politic” came into being, a trend of culturalization of the society and the socialization of culture went through. Cultural construction of living community influences and changes the political discourses. The traditional borderlines between politics, society and culture go blurring.

This paper endeavours to trace it on multiplicity of mechanism. Cultural and institutional processes routinise themselves and transform to each other. The transformation of cultural policy approaches begins to express itself on the macro level of narrative construction of the politics.

This paper affords not only a theoretical interdisciplinary contribution both to political and social science. It is not only an unique case-study on that how the policy on culture in narrow sense influences the culture in broad sense, but also a contribution on further theoretical development.

Refugees in Europe: for a sociology of strangeness

Rita Ribeiro
University of Minho, Portugal
rmgr(at)ics.uminho.pt

The history of humanity is the history of its displacements and migrations, but also the history of material and symbolic borders separating nations, religions, classes, castes, languages and ethnicities. When social boundaries are erected there are always those who are left out, those who are denied the right of entry and belonging, discriminating members from outsiders. The crisis triggered by the mass influx of war refugees into Europe in recent years leads us to question the figure of the stranger and its ambivalence as discussed by authors such as Georg Simmel, Alfred Schutz or Paul Ricoeur. Their theoretical perspectives on the issue show how strangeness is connected to worldviews and ideologies defined either by cosmopolitan openness (Kantian kosmopolitê) or by identity closure of communities. The current crisis,

rather than showing how refugees are strangers to Europeans and Europeans are strangers to refugees, shows that Europeans are strangers to Europeans for they do not recognize themselves in a community of humanist values. Despite international conventions and a strong heritage regarding human rights assurance, there is a very high risk that Europe will not provide refugee protection, as confirmed by the refusal of some European Union Member-States to accept refugees or the agreement with Turkey to prevent the arrival of these unwanted masses into Europe. Our main purpose is to discuss the construction of the refugee as a stranger in contemporary European imaginary, namely in political discourse and in the media.

Democratization of culture. Democratization of art. Artistic voice of present situation in Europe.

Izabela Franckiewicz-Olczak
University of Lodz, Poland
izafranc(at)wp.pl

Artists have active role in nowadays discussion about the situation of Europe. Their artistic statements meet up with juridical, political responses. What is the place of artistic view in present culture. What are the answers for the most rudimental questions of modern art: what does art mean? is art understandable? does the art have the power to change something? Using the Karl Mannheim thesis of the democratization of the culture and Luhmann's system theory, the author is trying to find the role of artistic world in present European situation.

Paradoxes of Identity and Nationalism in the Greek Goth Scene: Germanophiles Greek goths during the "new fiscal German occupation"

Panas Karampampas
EHESS, France
p.karampampas(at)gmail.com

This paper discusses nationalism and the peculiar placing of goths as contemporary Greeks who embody conflicting identity traits. Historical tensions between Greece and Germany are rife. This has been particularly the case during the Greek fiscal crisis, which escalated anti-German feelings among Greeks. Greek goths try to position themselves between Greek anti-German and goth pro-German feelings. On the one hand, as goths they love Germany, but, as current Greeks, they appear to "suffer" from a new German occupation due to austerity measures and the prominent position that Germany holds in the EU. Germany is currently the contemporary 'Mecca' of the European and global goth scene. Simultaneously, Greek goths hold a peripheral position in Greece that creates difficulties in their everyday lives. They also perceive Germany as a goth-friendly country where goths are not marginalised. Additionally, they often stereotype Greek ideas and practices as backward, conservative and in cases, discriminating towards people who differ. Thus, the majority of Greek goths are identified as Germanophiles while they try to

disassociate from Greek conservative practices. At the same time, contradict themselves as they engage with performances branded as 'Greek'.

Therefore, focusing on the contradictions of the embodied practices of Greek goths I will demonstrate how Greek nationalistic narratives oscillate and create paradoxes on their identities; paradoxes which already pre-exist in the Greek identity.

RN07 | Session 09a Austerity and Resistance I

Culture of Austerity, Household Survival Strategies and Revival of Mechanical Solidarity

Predrag Mihajla Cveticanin, Nemanja Krstic
Faculty of Arts, University of Nis, Serbia; Faculty of Philosophy, University of Nis, Serbia
pcveticanin(at)gmail.com, nemanjdzda(at)gmail.com

Although central concepts of Durkheim's "The Division of Labour in Society" [1893, 1902, 1984] – mechanical and organic solidarity and moral and material density – are rarely found in contemporary research programs – globalization processes, the global economic crisis, and austerity politics have rendered questions of solidarity, anomie, regulation and deregulation, and the mechanisms of social integration highly relevant. A number of authors who have conducted a Durkheimian reading of the globalization processes [see Hirsch, Fiss, Hoel-Green, 2009] pointed out that the factors which Durkheim identified as the influences on moral and material density, have an enormous impact on global social transformations today, but that paradoxically, unlike in XIX century industrial transformations, they lead to revival of mechanical solidarity [see in particular Tiryakian 1994, 2005]. In our work, we follow how the processes on the meso plan [politics and culture of austerity, high unemployment rates, a reduction in the resources available to public institutions and the reduction of welfare benefits in South-East European societies] and the micro plan [the development of various household survival strategies and the creation of informal institutions in the societies of South-East Europe] contribute to the disintegration of these societies (based on organic solidarity) and to a return to the forms of mechanical solidarity, and thus identification with the social networks of kin and symbolic kin and collectives based on shared ethnicity and religion. This article is based on the results of the "Life-Strategies and Survival Strategies of Households and Individuals in South-East European Societies in the Times of Crisis" research (2014 – 2016) and the Horizon 2020 research "Closing the Gap between Formal and Informal Institution in the Balkans" (2016 – 2019).

Precarity, or austerity as life-form

Rudi Laermans, Annelies Van Assche, Katharina Pewny

University of Leuven, Belgium; University of Ghent, Belgium; University of Ghent, Belgium
 rudi.laermans(at)kuleuven.be,
 annelies.vanassche(at)UGent.be,
 katharina.pewny(at)UGent.be

Precarity has become a key notion in both academic research and political discourses on migrants, creative work and other phenomena. In the paper's first section, we try to encapsulate the main lines in the at once multidimensional and intersectional discourse on precarity since its emergence at the turn of the twenty-first century. By way of empirical illustration we subsequently concentrate on the work and living conditions of contemporary performing artists as prototypical precarious workers and investigate the extent to which different levels of precarity affect them. In doing so, we distinguish relevant aspects related to socio-economic precarity and discuss forms of mental and physical precarity inherent to the performing arts profession. In the concluding section, we relate the observations on performing artists to the more general claims on precarity discussed in the opening chapter.

Symbolic struggles in contemporary Serbia: The interplay of discourses on 'culture', politics and social inequality

Tamara Petrovic Trifunovic

Faculty of Philosophy, University of Belgrade, Serbia
 even304(at)gmail.com

This paper investigates how the complex notion of 'culture' (Williams 1976), due to its polyvalent richness, can serve as a powerful tool in constructing stratificational categories, identities and symbolic boundaries in everyday life (Bourdieu 1984; Lamont 1992), and also as a 'multi-purpose weapon' of symbolic struggles in public discourse (Živković 2011). Whether it signifies manners, sophistication, a longstanding tradition, an expression of collective genius, or engagement with the 'high culture'; it is often used both as descriptive and normative term – something 'We' are affiliated to, while some 'Others' are less or not affiliated at all. Previous research has shown that cultural distinction is one of the most tenacious discursive tools in creating symbolic divisions in contemporary Serbian society (Jansen 2005; Spasić 2006; Simić 2012). Conflicts rooted in different political orientations are routinely intertwined with discourses on culture, constituting political cleavages and the antagonism of two cultural models (a variation on the 'culture wars', between the two discursive 'Serbias'). This type of language of cultural evaluation and exclusion also provides a mode for articulation of resistance to the established social order, however, the one which might undermine solidarity between social actors (not only in Serbia – similar discursive practices were present after 'Brexit' and Trump's victory). It is therefore important to shed light on the symbolic mechanisms through which

socio-economic grievances and political contestations over the failures of political actors to bring about progressive social change are discursively translated into the questions of cultural differences. The elaborate study of symbolic struggles in Serbian media, rooted in van Dijk's critical discourse analysis, was conducted on a sample of daily newspapers and weeklies from 2001 to 2015.

Philosophy against power: Solidarity, resistance, and underground seminars in communist Czechoslovakia

Dominik Zelinsky

The University of Edinburgh, United Kingdom
 Dominik.Zelinsky(at)ed.ac.uk

This paper explores the understudied phenomenon of underground philosophy seminars in Communist Czechoslovakia. Underground seminars emerged after the Communist Party seized power in the country in 1948 and introduced wide purges and restrictions that, among others, targeted the "politically undesirable" university students and staff. Wishing to pursue their intellectual interests, however, former students and lecturers, or those who could not even enrol at university, began meeting clandestinely and continued their discussions of forbidden topics in philosophy and social sciences. The apex of underground seminars came in the 1970s and 80s, during the so-called "normalisation" that followed the quelling of Czechoslovak reform movement by the armies of the Warsaw Pact in 1968. During that time, underground seminars established international contacts and hosted, despite severe police harassment, lectures by dozens of foreign lecturers: among them Jürgen Habermas, Richard Rorty, or Jacques Derrida.

To explain the phenomenon, this paper draws on theoretical resources of Durkheimian cultural sociology. It seeks to understand the seminars as sophisticated rituals that generated mutual solidarity and, generally, contributed to the maintenance of the anti-regime resistance networks. Moreover, the paper refurbishes the Durkheimian sociology of intelligentsia by highlighting the neglected role of content discussed during such rituals. While it maintains that the secretive seminars had been powerfully binding social events as such, the paper argues that the works that were discussed and practices of their interpretation played a crucial role in the constitution of participants' social identity and formation of their understanding of their situation vis-à-vis the repressive regime.

RN07 | Session 10a Austerity and Resistance II**Community as contact zone: the power dynamics of making community and possibilities for resistance on a British council estate**

Sarah Leaney

University of Brighton, United Kingdom
 s.leaney(at)brighton.ac.uk

The concepts of class and community often collapse

into one another, are used interchangeably and assumed to be synonymous. I began my own research on the formation of class on a British council estate assuming the presence of community. As a contained area of social housing, shaped by housing policies which define need through measures of disadvantage, I conceptualised community as a consequence of 'communal beingness'. In this way, I positioned community as the product of class formation, assuming those who share a material and social position in society will form an affective relation shaped by shared value systems. However, this conceptualisation of community masks the role of power in the formation of what is recognised as the legitimate community.

In this paper, I draw upon post-structural theorisations of identity to explore community as formed in relation to its constitutive outside. The paper theorises community as contact zone as a way of thinking about the processes by which community is produced within moments of negotiation within unequal power dynamics. Despite the explicit asymmetry of power, the moment of contact is a negotiation, a coming together and grappling between different cultural values. Thus, in the moment of contact there is space for the subversion and critique of dominant discourses. This paper explores possibilities of resistance and subversion of dominant representations of the needs of the community, arguing that though agency is bounded by dominant discourses, they may be drawn upon as resources to resist devalued positionings.

Incompetence of orientalism approach for perception of Iran in Qajar Era

Mohammad Reza Javadi Yeganeh, Saeedeh Zadghannad, Abbas Faghih Khorasani
University of Tehran, Iran, Islamic Republic of;
University of Tehran, Iran, Islamic Republic of;
University of Tehran, Iran, Islamic Republic of
myeganeh(at)ut.ac.ir, zadghannad(at)gmail.com,
abbas.faghih(at)gmail.com

The reportage and travelogue of Westerners describing Iranians and their physical appearance, events, culture, customs (etc.) during Qajar period (1789-1925) often refer as one of the most interesting presentations of national character.

At the heart of this paper lies a critical engagement with the orientalism theory and representation of East –including noble savage/ uncivilized –by Westerners. It sheds light into relations based on religion and religiosity as a significant element of Western's travel writings of Iran. The main question however is how contemporary sociological research about Iran can benefit from re-thinking about orientalism in travel writing from Iran.

Doing Inequality - a cultural approach to understand processes of social inequality

Falk Eckert, Laura Behrmann
TU Dresden; German Centre for Research on Higher Education and Science Studies, Germany

falk.eckert(at)tu-dresden.de, behrmann(at)dzhw.eu

Within the last decades inequality maintains an everyday experience or rather common known phenomenon of market centered societies. The feeling of the growing inequality in European societies is closely linked to new boundaries and the growing popularity of populism. Hitherto, as well as inequality generates structural differences between classes and therewith classes themselves, there are barely collective forms to cope with (e.g. social movements). If we understand whereby social inequality is (re)produced, maintained or changed in our societies, it becomes possible and even plausible to think about causes and consequences of inequality, which broaden likewise our conceptual scientific and societal understanding. Focusing on the "making" of inequality, the micro social- and actor perspective brings the individual and interaction level in the middle of our investigations. Thus, social inequality, as a „societal reality“, is not a [pre-given] "objective fact", but an "interactional matter of Doing" or even Undoing (Butler 2004; Hirschauer 2014).

Our research asks: Which characteristics on present phenomena of societal changings become visible and understandable according to an actor- and process perspective on inequality?

Finally, we generated a typology of four micro social processes of inequality: categorizing, evaluating, participating and relaying/passing. In our paper we discuss these processes with regard to current empirical based research and concepts as gender differences, institutional power of evaluation, social exclusion, and dissemination of wealth or poverty. Therewith we provide a conceptual and empirical based analytical tool to understand new cultural phenomena under the lense of social inequality.

RN08 - Disaster, Conflict and Social Crisis

RN08 | Session 01a Disaster, Conflict and Social Crisis (General Session I)

Multilevel governance and good government: A solution for urban poverty in Greece?

Dionyssi Balourdos, Maria Petraki
National Centre for Social Research, Greece; National and Kapodistrian University of Athens
dbalourdos(at)ekke.gr, mariapet21(at)yahoo.gr

During the recession, a new surge of poverty struck urban areas in Greece. Slower economic growth both at national and local level, as well as the erosion of the welfare state, have contributed to this poverty surge. Moreover, there is a widespread perception that this poverty has become increasingly concentrated in certain neighborhoods, known as “inner city” or “poverty zone”, and that such neighborhoods have mostly become the habitats of homeless, unemployed, immigrants groups and others. This is, of course, the one side of reality in Athens, as the “old poor” have become poorer and stay in poverty for extended periods of time, but at the same time, below the poverty line fall people who had never been there before.

The objective of this paper is (a) to approach methodologically urban poverty, (b) to describe briefly the situation in Greece compared with other EU countries, (c) to report on high-risk groups, (d) to examine whether the urban poverty is affected by the “quality of governance” and (e) to critically examine the question of why the possible policies addressing the phenomenon are not effective.

We use data from EU SILC and from a survey conducted in 2012 with a sample of 800 households of urban population (Athens municipality) in Greece. More precisely, statistical data will be discussed, with a view to focusing on proposals of new social interventions.

Our analysis suggests that the urban “new poor” groups should be recognized as a new target group. Thus active social policy should place emphasis on addressing the needs of this new group.

Gender-based violence and solidarity in times of crises: comparison of contexts of war and natural disasters

Anita Dremel, Irena Cajner Mraović
University of Zagreb/Croatian Studies; University of Zagreb/Croatian Studies

Our objective is to compare the criminogenic potential of crises resulting from war and natural disasters, respectively, as an indicator of a drop in solidarity, in relation to gender-based violence (GBV). Disasters usually lead to the weakening of social control, although some researchers consider this a myth. We will discuss previous research and seminal examples comparatively, and review main hypotheses, frequent myths and theoretical explanations of the rates of GBV in contexts of crises brought about by war and natural disasters. Then we will present results of our University of Zagreb-funded research on social control and deviance in disastrously flooded areas in Croatia in 2014, and compare them to the official data on reported GBV. Our results suggest that the rate of GBV in the context of crisis of solidarity, social control and cohesion brought about by natural disasters do not increase, unlike the rate of GBV in the context of war, which is extremely high. Theoretical explanation of this significant difference is based on studies of war and gender which see, among others, deep structures of patriarchy underlying socialization into gender identities as important factors in the reproduction of militarism. Raping of women is the most frequent form of GBV in war, and is a strategy of enemy feminisation as a form of symbolic domination. Our findings can help (social policy/education) reduce GBV as a global health and development problem that cannot be fully understood out of the context of social structure normativity – gender norms and gender roles, namely, support GBV and often make it tolerable or even invisible.

The Sociological Roots of Europe: Challenges, Prospects and the Way Forward

Atia Ali Kazmi
National University of Sciences & Technology,
Islamabad, Pakistan
atiaalindu(at)gmail.com

The sociological roots of Europe lie deep in the past and present of its development, organization, networks and institutions. The spectrum of practices and patterns of this social order and changes over the previous decades carry ample lessons not only for other regions but for Europe itself. Like a resident of Islamabad finds it unthinkable that South Asia can form an economic union, a Londoner or Parisian of 1918, who survived the Great War, would not relate to the “emphatic idea of Europe”. After World War II the notion of integration of Europe was seen as an “antidote” to the extreme nationalism which had distressed the continent. The European Union thus gradually emerged, comprising almost half a billion citizens, on the basis of shared vision and joint actions to make Europe strong and copiously unified, with a global strategy based on common foreign, security and economic policies.

There are lessons for South Asia in the making of Europe. Instead of zero-sum games reminiscent of pre-Cold War Europe, economic integration of South

Asia can make one-fifth of world's populace its power house. A workable idea is to foster space for inclusive and comprehensive peace, growth, prosperity and equal distribution of wealth. The research paper will focus on the possible pros and discontents of Europe's sociological order from a South Asian perspective and navigate the contemporary course building on strengths and collective role.

Ways of cooperation with Roma migrants from illegal settlements in Poland.

Inga Hajdarowicz, Katarzyna Czarnota
Jagiellonian University in Kraków; Adam Mickiewicz University in Poznan
ooingaooo(at)gmail.com,
czarnota.katarzyna(at)gmail.com

The phenomenon of migration and challenges in the new hosting country has been often analysed in relation to newcomers arriving from states outside of the European Union. However, in Poland these are the citizens of the EU who face discrimination. Systemic segregation and exclusion of economic Romanian Roma immigrants living in Poland since the 90s caused that this group is deprived of the right to work, health care, welfare and adequate housing.

In Poland only few non-governmental organizations and private persons try to cooperate with members of this community. Very often it means helping them without engaging Romanian Roma in decision-making processes what, in the long term, leads to designing activities that have negative impact on Romanian Roma community and strengthen existing power relations. Roma encampments built from recycled materials represent the most radical forms of collective response to the problem of lack of access to housing. Additionally, their homes are located in hidden areas inaccessible (eg. deserted allotments, wasteland on the outskirts of settlements, etc.), of the fear of aggression attacks.

During the presentation, the authors will conduct critical analysis of existing forms of cooperation with the community of Romanian Roma and the challenges faced by people who want to enter the emancipatory forms of cooperation with Roma immigrants (at the level of bottom-up and systemic projects). Based on the several years experience of cooperation with the Roma community possible fields of cooperation and barriers resulting primarily from the class differences between immigrants and the researchers and activists will be presented. The analysis will be based on the results of the intervention research project conducted at 6 encampments in Poland.

RN08 | Session 02a Disaster, Conflict and Social Crisis (General Session II)

Can referendums face the rise of Euroscepticism in the European Union or can they threaten the process of the EU integration? Grexit versus Brexit.

Nikos Sarris
National Centre for Social Research, Greece

nsarris(at)ath.forthnet.gr

The outbreak of the economic crisis in Greece highlighted in an elegant way the crisis of the political system and the lack of confidence in representative institutions. Through a series of research findings (Eurobarometer, Pew Research Center, Public issue etc.), this paper presents the increasing distancing of citizens from the procedures of representation and the general lack of trust by both the Greeks and Europeans in institutions. According to Eurobarometer's data, Greece holds the first position between EU-28 in many of distrust indicators.

Considering the European Union's political and economic predicament in contemporary states, referendums are a very attractive tool used to win the loyalty of voters. The democratic legitimacy of the European Union is being questioned, and moderate governments and their Eurosceptic opposition alike are turning to voters for their own political gain, using referendums as part of their electoral campaigns. Do referendums constitute a substantial way to mobilize citizens to overpass political apathy and the crisis of the Political?

Through a comparative analysis on the referendums in Greece in 2015 and in Great Britain in 2016, the paper attempts to answer the question whether forms of direct democracy, such as referendums, can substitute the lack of trust in representative institutions, particularly regarding European issues, and thus contribute to a better quality of democracy.

The paper argues that given that the two referendums had different goals, each government used the outcome in the most suitable way. In Greece the government ignored the plebiscite, while in Britain the referendum's outcome is going to be implemented. A pan-European referendum under certain conditions could be an attractive tool for the empowerment of democracy in Europe.

When the catastrophe saves the world. About the positive potential of the nuclear accidents in the context of environment

Aleksandra Brylska
University of Warsaw, Poland
ola.brylska(at)gmail.com

Based on the principle of the case studies I would like to examine the narratives and images created in the context of the Chernobyl and Fukushima's catastrophes. By analysing particular cases I would like to investigate how the memory of the catastrophe is created and how these events have an impact on the relations between men the (post)catastrophic environments. I would like to state that atomic catastrophe can be treated as a subversive change, which by removing the whole social group from specific territory, causes that spaces catastrophe affected by disasters become the better place for the future generations. In my paper I would like to reflect on the thesis that the catastrophes, especially those related with the atomic energy, have the positive potential in them. You may almost say that the human

disaster is the hope for the future.

Overlapping crises: Euro Maidan protests, regime change and military conflict in Ukraine –effects on social trust and self-identification.

Alberto Veira-Ramos, Tetiana Liubyva
Universidad Carlos III de Madrid, Spain; Institute of Sociology, National Academy of Sciences of Ukraine
alberto.veira(at)uc3m.es, tlubivaya(at)gmail.com

Big changes began to take place in Ukraine when the EuroMaidan revolt began in November 2013. These included a regime change in February 2014, reforms in governance and anti-corruption measures. Lack of diligence and efficiency to comply with the people's expectations led to increased distrust on institutions. However, the effect of external aggression (occupation of Crimea in March 2014 and Donbass revolt in April 2014) may have counterbalance some of the negative effects of increasing distrust on national institutions and democracy by enhancing internal cohesion and patriotic sentiment.

Data from national-wide survey Ukrainian Society, carried out by the Institute of Sociology of National Academy of Sciences of Ukraine since 1992 (sample size 1800 respondents) has allowed us to build time series of variables accounting for attitudes towards government, institutions and self-identity of Ukrainian people and to use specifically designed and tested indicators measuring people's readiness to protest or revolt. Data is representative at regional level.

We have observed that protests, regime change and military occupation are episodes that have significantly altered levels of trust on national institutions, geopolitical orientation, perceptions regarding the functioning of democracy and self-identity of the Ukrainian public.

It is noteworthy that before the crisis period begun, an overall decrease of trust levels on governmental and civic institutions and on fellow countrymen was taken place between 2008 and 2012. After protests, regime change and military occupation occurred, distrust in some institutions accentuated but in other cases the trend completely reversed.

Whilst trust in parliament, government, courts, media and banks has worsened, attitudes towards local authorities, civic organizations, the Army or fellow compatriots have improved.

Cultural mobilities in migration studies: Albanian immigrants in Greece's economic crisis

Maria Panteleou
University of the Aegean, Greece
pantmaria(at)hotmail.com

In the modern globalized world, the multiple and frequent movements of immigrants, the complicated social networks that create and link two or more countries, the uncertain economic, social and political settings of the states directly affect the lives and future decisions of people pushing us to adopt new theoretical and methodological approaches, which can better grasp their transnational experiences. The

approach of cultural mobilities suggested in this paper addresses the culturally and socially constructed aspect of modern mobilities through the lived experience of the immigrants themselves and studying within the specific social and economic contexts where it occurs. Ethnographer's work is to follow mobile practices of immigrants, adopting a multi-sited approach, in order to capture all of their experience without distinguishing 'here' and 'there' which in modern times seem blurred, due to frequent movements, unforeseen paths and economic instability of countries. The case study of Albanian immigrants who work seasonally in Greece (Corinth) and often move inside the country in order to find work due to the economic crisis and visit several times a year their home to maintain their links with their relatives or other family matters demonstrates that the distinction between country of origin and destination obscured in contemporary times. The mobilities of people affected by the economic and social conditions of countries thus seal the uncertainty of their future plans. These complex circumstances create mobilities; both of them are overlapping notions and must be studied together.

RN08 | Session 03a New Faces of Terrorism in the Contemporary World

Islamist factor impact on local conflicts

Zhanna B. Onzimba Lenyungo, Violetta A. Annikova, Helen A. Markova
RUDN University, Russian Federation; RUDN University, Russian Federation; RUDN University, Russian Federation
onzimba(at)mail.ru, fialava(at)mail.ru, abellen(at)yandex.ru

Recent years have seen growing tension between Muslim and Christian communities, among Muslim communities of different branches and political factions within the same community. Members of these factions proclaim their major if not the only objective - enforced establishment of the "Islamic government", "Islamic state."

Such aggression leads to crisis situations escalating into local conflicts with protracted nature which threat to international security.

Russia has not remained aloof from global trends. Since the second half of the 1990s, the active dissemination of various forms of Salafism and Islamism has begun, especially in Chechnya and Dagestan. Polls show that religious extremism is caused by such factors as corruption in the government with its oligarchic character, moral degradation of society, religious illiteracy, social system tribalism and the influence of international Muslim organizations.

The Islamic movement in Russia does not have deep historical roots. It has a diffuse character. But it gradually draws into its orbit, not only the Muslims, but also those who have nothing to do with Islam in their origin, education and culture, spreading to new regions - even where the Muslims represent a small

minority.

The extent of Islamist movement radicalization is determined not so much by domestic but political and military situation in the Middle East, as well as the nature of Russia involvement in these processes.

The whole world community is to consolidate all its efforts today to overcome local and global conflicts on ethnic and religious grounds.

New Modes of Political Violence: The Case of Turkey

Can Güven

Boğaziçi University, Turkey
canguven1990(at)gmail.com

The course of political events in contemporary Turkey evokes a general sense of unsustainability and decadence. While the crisis appears to be multifaceted, as one could trace it in the domain of economy or in the institutional level, what is at stake and what appears to me to be more decisive is that, the emergence of constant threat of different modes of violence that increasingly have an ambiguous relation to politics. Be it implemented by state actors (in its peak razing cities as in the cases of Şırnak, Cizre, and other Kurdish settlements) or non-state actors (as in the cases of attacks targeting civilians intentionally or unintentionally) what seems to be as common is that violence enters the sphere of everyday life, or more precisely networks of life processes, and radically traverses it. This essay attempts to critically analyze the current context prevalent in Turkey on three levels in order to expand upon current political strategies to move from it: Firstly, it focuses on how these new modes of violence operate through examination of the conduct of warfare. Secondly, it raises a question of whether or not this emergence of new modes of political violence correspond to a transition in the modalities of power relations (precisely in the grass-roots levels). And lastly, this essay draws attention to the issue of the production of subjectivities by way of analyzing how power relations operate and resistance emerges through social networks, and also the affective dynamics that are embedded in.

Terror and Community Resilience: Long Term Impact on Community Stability

Alan {Avi} Kirschenbaum

Kirschenbaum Consulting Ltd, Israel
avik(at)tx.technion.ac.il

Conditions of continuous and extreme threats to lives and property can theoretically lead to a possible breakdown of existing community social structures or, on the contrary, toward enhancing community social cohesiveness. To examine these alternative possibilities, a research strategy was chosen to evaluate the impact of continuous extreme terror attacks on community social life. The study design compared community behaviors prior to ongoing terror attacks with community behaviors after five years of ongoing terror attacks. The study incorporated two Israeli communities formally in and near the Gaza

Strip, based on a random sample of 370 household heads responding to a structured interview questionnaire. Pre-terror behaviors from a national random sample were compared to corresponding behaviors in the communities under terror attacks. Employing a measure of "Community Social Cohesion", a composite of social network densities, levels of risk perceptions and disaster preparedness components, the results pointed toward a general strengthening of community-oriented behaviors. While risk perceptions rose dramatically, reflecting the reality of five years of terror, key measures of social network densities also increased in strength. Interestingly, the levels of preparedness generally declined. These adaptive survival strategies inherent in community based social networks provided proof that even under extreme conditions of constant terror attacks, social capital inherent in the ability to form various informal social network based organizations can, and do, enhance community cohesiveness and ameliorate the reality of annihilation.

RN08 | Session 04a Globalisation, Liberalism and Economic Crisis: Experiencing Social Disasters

Dealing with a business enterprise in Athens during the crisis: the case of beauticians

Dimitra Kondyji

National Centre for Social Research (EKKE), Greece
dkondyli(at)gmail.com

This case study concerns a small scale qualitative research conducted during spring and summer of 2016 in the area of Athens. In the context of this work, we focus on the following aspects: exploring incentives and challenges that young beauticians as entrepreneurs face during the current socio-economic crisis at the professional and private spheres, investigating ways and strategies that these professionals use in order to either develop or maintain their business enterprises, studying the dipole of beauticians exercising an entrepreneurial activity classifying to the category of "emotional labour" and women receiving services caring themselves of other people and leaving under similar conditions and finally investigating how they tackle with every day routine in order to meet professional ambitions and personal expectations. Additionally we their current situation as well as entrepreneurial prospects will be assessed. Concluding remarks will concentrate on elucidating prioritization and needs between professional and private spheres whilst we will also concentrate on a number of resilient policy suggestions.

Experiencing multi-dimensional disasters: the case of women notaries in Greece

Joanna Tsiganou, Maria Thanopoulou

National Centre for Social Research, Greece; National Centre for Social Research, Greece
jtsiganou(at)ekke.gr, mthano(at)ekke.gr

The contemporary ever-lasting economic crisis in

Greece disguising the enforcement of neo-liberal transformations in both, the state and the labour market, have created new conditions for the practice of liberal professions as is the case of notaries. It is to be noted that the notary profession has been affected by the over-taxation, the collapse of the construction sector and the legal explosion. These conditions have deteriorated the practice of the notary profession and have annihilated its hitherto enjoyed merits and benefits: the exercise of public functions, authority, reputation, income, prestige.

Qualitative research has shown that notaries are nowadays experiencing an abrupt downward social mobility. Especially for the case of women notaries qualitative data suggest that they are experiencing multi-dimensional disasters in their personal, professional and family lives such as poverisation, derregulation, frustration, de-professionalisation, uncertainty. The scope of the proposed paper is to present and discuss how the violent social transformations - social disasters at the macro-level are reflected on the societal micro-level and are experienced as personal and professional disasters leading the middle social strata to insuperable difficulties and serious problems of social reproduction.

Human costs of the crisis. Ethics of reporting suicide

Izabela Korbiel, Katharine Sarikakis
 Universität Wien, Austria; Universität Wien, Austria
 izabela.korbiel(at)univie.ac.at,
 katharine.sarikakis(at)univie.ac.at

Europe is "sleep-walking into a catastrophe". With the outbreak of the financial crisis in Europe the material conditions that underpin much of citizens' everyday lives and well being have dramatically deteriorated. Signs of social disintegration, economic and political polarisation due to mass impoverishment, and construction of new vulnerabilities are the new realities. The human cost of EU institutions policies is seen in the rise in suicides: the agriculture crisis drove hundreds of farmers to suicide largely due to financial pressures arising from a crisis in the agriculture industry, counting 600 in France, 500 in Germany, 400 in Belgium and Italy. Austerity is explicitly stated as the cause of the rise of suicides in Greece, a country historically at the lower end of suicides in the world, such as the public act of suicide by Dimitris Christoulas at Syntagma Square in Athens in 2012.

We interrogate the ethics of established praxis of media in generating- or stifling- a public debate about suicide that medicalises actors as "sick" who must be isolated from society. We explore this silencing process of suicide as political speech, which expresses dissent and is born out of acute social crisis. We situate professional practices of health experts, policymakers and the media against the backdrop of discourses that concern relatively stable, welfare based societies vs. societies of conflict and crisis. We further interrogate the ethics and ideological underpinnings of the dilemmas: protection of society –

from the "sick" body- vs right to information in the public interest.

On being a refugee: The Trauma of Forced Displacement as a Form of Social Disaster

Chryssanthi Zachou, Anastasia Tatsi
 American College of Greece-Deree; MA Goldsmiths
 College -University of London
 czachou(at)acg.edu, anatatsi(at)hotmail.com

Chryssanthi Zachou & Anastasia Tatsi
 The global refugee crisis is notably perceived as primarily a European and Greek crisis. With over 21 million fleeing their countries mostly to escape conflicts and war, this massive phenomenon constitutes a large scale social disaster with global implications. It is perceived as a disaster by the individuals involved, their countries of origin, the receiving societies, the world at large. Although the causes of displacement are complex, the experience of dislocation as a form of disaster is to large extent shaped by a number of physical, and social barriers (i.e. border controls, state policies, active resistance by governments and citizens of host societies). Based on life stories of forcibly displaced individuals in Greece, this paper, analyzes the experience of dislocation and forced livelihood. It explores how individuals assess their current conditions of living in relation to the past, as well as the meaning they assign to the "asylum seeker" or "refugee". Apart from the high death toll, their lives are disrupted in multiple ways. Their narratives reveal a number of losses: loss of loved ones, assets, human and social capital, physical, emotional/psychological health, loss of integrity. Stranded in protracted situations, they become dependent on humanitarian assistance, unable to work, provide proper schooling, and sustain an independent living. With the experience of dislocation defined as a major disaster that has radically transformed their lives, the paper further explores the individuals' perceptions of the causes of their forcible displacement, as well as the ways of coping with the trauma in individual and collective terms.

RN08 | Session 05a Critical Infrastructure Risks and Emergent Responses

Integrative Currents? Electrifying Turkey-EU Relations in Times of Blackout

Bilge Firat
 Texas A&M University, United States of America
 bilge(at)tamu.edu

After decade-long intense negotiations, Turkey joined the European Network of Transmission System Operators for Electricity (ENTSO-E) in 2015. Since then, electricity currents roam freely in an expanded European territory that makes up the world's largest electricity market. By sharing transmission codes with each other, ENTSO-E members solidify an electricity union in the wider European region, promising to integrate the peoples, their territories and their

resources in the region that are otherwise divided by political and material barriers. Facilitated by incessant transmission wiring, harmonized electricity current coding, liberalized trade, and integrated financial markets, the synchronization of “Turkish” and “European” electricities followed two major blackouts that were decisive in Turkey's finally joining in the ENTSO-E. Taking as its cue the physical blackout of late March, 2015 that exposed how vulnerable Turkish electricity infrastructure was to oversupply, poor line management, or cyber-attacks and the ever-darkening political blackout that the Turkish-EU membership negotiations are currently undergoing, this paper examines the relationship of material and immaterial infrastructures of electricity generation and transmission to the broader questions of power and integration in the wider European region by honing on the negotiations of power and grid expansion between the centers and peripheries of it.

Joint thinking between emergency management and climate change adaptation projects

Nina Baron, Nina Blom Andersen
Metropolitan University College, Denmark;
Metropolitan University College, Denmark
niba(at)phmetropol.dk, nban(at)phmetropol.dk

With limited resources and struggles concerning responsibility for disaster risk reduction, it is relevant to explore if climate change adaptation can be more than an expense. In this project we explore how climate change adaptation projects outside larger cities can provide value to local communities in ways that reach further than only flood protection.

This research focuses on the different types of actors, such as municipalities, utility companies, citizens, politicians and emergency management organizations and how they contribute to climate change adaptation measures in local communities. The Danish municipalities have different practices for climate adaption and flood protection projects. Cases in three different Danish municipalities are investigated to identify variations in those practices. We do this by analyzing case studies focusing on dikes – their building, maintenance and administration. Dike building and maintenance are often the center of conflict, grounded in different values connected to local areas. However, insights into those controversies can be a way to gather knowledge about potential improvements of local communities. How can resources spent on this kind of flood protection also have positive impacts, such as improvement of nature, livability, local tourism and business opportunities? Through this research, we aim to spur learning and broader understanding of potential ways to improve the value of climate change adaptation projects outside of cities.

Informal preparedness resources for electricity and ICT breakdowns in Norwegian rural and urban households

Nina Heidenstrøm
Oslo and Akershus University College of Applied

Sciences, Norway
nina.heidenstrom(at)sifo.hioa.no

Household preparedness is commonly defined as a households' capability to respond to and manage a potential hazard by having necessary resources, such as family emergency plans, necessary supplies, and information about local emergency response plans, in place. These formal preparedness resources have been a key factor to determine the degree to which a household is prepared for a crisis. Here, we seek to illuminate a more taken for granted part of a households' capability to manage a crisis, their informal preparedness resources that are an integrated part of everyday life. By employing practice theory, we identify both human (formal and embodied knowledge and motivations), material (dwellings, technologies, consumer products) and social (networks of friends, family, neighbours, colleagues) resources. More specifically, we study informal household preparedness for electricity and ICT breakdowns in Norway. The data material consists of 31 interviews (10 in an urban area, 21 in two rural areas) and a representative survey of Norwegian households (N=1005), providing in-depth narratives of coping without infrastructure, and a generalizable overview of preparedness resources. The results indicate that few households have formal preparedness resources at hand. Furthermore, rural households are more concerned about and better prepared for infrastructure breakdowns than urban households who to a larger degree trust other actors to take responsibility. By connecting formal and informal preparedness measures, we enable a fuller picture of how a household would deal with a potential hazard, as well as in what ways they might be vulnerable if a crisis should occur.

Infrastructure Risk and Biography of Artefacts: Multiple Dynamics and Temporalities

Antti Silvast, Mikko Virtanen
University of Edinburgh, United Kingdom; University of Helsinki, Finland
antti.silvast(at)ed.ac.uk, mikko.jz.virtanen(at)helsinki.fi

Energy risk and security have become topical matters in Western and international policy discussions; ranging from international climate change mitigation to investment in energy infrastructures to support economic growth and more sustainable energy provisions. As such, ensuring the resilience of more sustainable energy infrastructures against disruptions has become a growing concern for high-level policy makers.

Drawing on interviews, participant observation, and policy analysis, this presentation unpacks the work of the authorities, electricity companies, and lay persons that keeps energy systems from failing and helps them to recover from disruptions if they occur. In-depth social science works have already covered several aspects of these issues: including infrastructure security policy, high reliability organizations, and energy system transitions and

innovations on multiple societal levels. However, among the main challenges in this discussion has been reliance on a single kind of actor, field site, viewpoint, or setting as the main source of information; such as only critical infrastructure protection, middle managers in electricity companies, or citizens experiencing power failures.

To address this tendency to centre analyses on particular actors, the presentation draws from the biography of artefacts perspective, developed at the Universities of Edinburgh and Helsinki. It analyses three important sites in the Finnish electricity infrastructure: history of national infrastructure security, actions in specialized electricity control rooms, and electricity blackouts in households. Data from these sites cover long-term priorities and short-term dynamics of critical infrastructure risk, and include design, maintenance, as well as end use perspectives. The presentation pays specific attention to how the field studies were designed, using existing theoretical and empirical understanding about them, and uncovers how interconnections among these sites can be traced.

RN08 | Session 06a Mass Migration and Refugee Crisis: Trends, Causes and Social Impacts I

The Greek Response to the Mass Influx of M.E. Refugees and Migrants

Nicholas Petropoulos

Pedagogical Institute of Greece (formerly), Greece
erc(at)otenet.gr

The present paper has a fourfold scientific purpose: (1) to describe the trends of in-migration to and out-migration from Greece during the last three years 2014-2016 (2) to describe the response(s) of the Greek government and the Greek population to the mass emergency movement of populations (3) to delineate the main responses and problems of refugees and migrants in Greece and (4) to review the factors, internal (economic, political, civil protection organization etc.) and external (EU countries, conditions in entry countries, bilateral and multilateral agreements etc.) which have aggravated or mitigated the management of the mass influx of refugees/migrants in Greece. For documentation, the author will rely primarily on secondary data, i.e. on the statistics of national organizations (Governmental and NGO), the UN High Commissioner for Refugees (UNHCR), International Amnesty, social scientist analyses and the international/national press. The paper ends with recommendations for mitigating the mass emergency population movements.

Value dominants of migration in a post-conflict situation: on the example of Chechnya and Kosovo

Musa Movlievich Yusupov

Chechen State University, Russian Federation
musa_y17(at)hotmail.com

Migration in history has played a huge role in the

development of new areas, the implementation of economic and cultural exchange. However, migration from conflict areas today is associated with humanitarian injuries, the possibility of various challenges occurrence and risks in the host countries. Subject: comparative analysis of value migration motives in a conflict and post-conflict situation in Chechnya and Kosovo.

Methods: The study used conflict, cultural approaches, methods of quantitative analysis of statistical and sociological indicators.

Result: The social and political tension in the pre-conflict situation in multiethnic regions is perceived differently by different national groups. Some of them are interested in maintaining stability, the other in changing the status of the region. During the armed conflict, there is a mass forced migration of representatives of all ethnic groups in other regions of the country and foreign countries. With the onset of peace, many of them come back, but the problem of restoring of the political, legal institutions, economics, infrastructure, unemployment, corruption, low level of confidence prompts some people to go back, not as war refugees, but as social and economic refugees. It is characteristic that from Chechnya do not want to leave the optimists - 81,5%, pessimists - 54,8%.

Conclusion. The migration during the conflict dominates the value of physical security and post-conflict - values of social, economic and legal security. And so it is important to create security on the territory of the conflict zone, and with the establishment of peace to implement national and international investment projects for economic recovery and job creation, to monitor the strengthening of the legal order, the formation of trusting relationships in the society.

Disaster Management in Times of Crises

Daniel F. Lorenz, Cordula Dittmer

Freie Universität Berlin, Germany; Freie Universität Berlin, Germany
daniel.lorenz(at)fu-berlin.de, cordula.dittmer(at)fu-berlin.de

This most recent year has seen an increasing number of persons with refugee status cross national borders into Germany. The associated care of said persons in numerous emergency shelters, first accommodations, or other forms of lodging have presented state, aid and private organisations with extreme challenges. This situation represents the largest care and shelter operation in Germany since the Second World War and hence had to be organised and implemented in an extremely short period of time across all federal territories. Given this widespread nature, there were multiple, and occasionally very different approaches endeavoured by individual federal states, municipalities, and cities in which disaster response units being utilised and working in nearly every place of accommodation for refugees in spite of the fact that states of disaster or emergency were never officially declared. This paper investigates which mechanisms came to bear in selected regions and establishments

and how the contextual relationship between disaster management and the agencies responsible in non-disaster times was negotiated on, and via the various federal levels.

This paper basis its foundation upon expert interviews with central actors in civil protection and disaster management as well an exhaustive document analysis.

Mass displacement to cities and the challenge for urban resilience

Amy Kirbyshire, Emily Wilkinson, Virginie le Masson
Overseas Development Institute, United Kingdom;
Overseas Development Institute, United Kingdom;
Overseas Development Institute, United Kingdom
a.kirbyshire(at)odi.org.uk, e.wilkinson(at)odi.org.uk,
v.lemasson(at)odi.org.uk

People displaced by conflict and disasters increasingly end up in urban areas, rather than refugee camps. While this trend has many benefits for displaced and local populations alike, the arrival of large numbers of displaced people poses challenges for the host city. National and local governments must take steps to build the resilience of urban systems to be able to absorb migration flows in response to these pressures, now and in the future, in order to minimise harm and maximise benefits for all urban residents.

We present a fresh examination of disasters and conflict-related displacement to cities, from an urban resilience perspective. Our paper is concerned with the very large numbers of people moving out of disaster and conflict affected places, and into urban areas, within national borders or in neighbouring or nearby countries. Given the ongoing conflict in the Middle East, we give special attention to those fleeing conflict in the region.

We explore how different parts of the urban system respond to large influxes of people moving into areas which are often already suffering from inadequate housing, a lack of basic services and insecurity. We discuss the impact of mass displacement on the well being of all urban residents, both new and existing, and set out a options for moving toward a more progressive policy and research agenda on mass displacement to urban areas. This research connects with the emerging ideas regarding the 'right to the city' for displaced populations, and highlights opportunities for cities in making better use of the capacities and skills of new arrivals to promote well being for all residents.

RN08 | Session 07a Mass Migration and Refugee Crisis: Trends, Causes and Social Impacts II

Recognizing Domestic Violence Against Women As Persecution On The Basis Of Membership In A Particular Social Group

Ekinsu Camur, Kubra Cihangir Camur
Ankara University, Turkey; Gazi University, Turkey
ekinsucamur(at)gmail.com, ccamurster(at)gmail.com

In this paper, it is analyzed whether the refugee claims

based on domestic violence against women can be classified as "membership in a particular social group", which is the fifth protected ground for granting asylum. Domestic violence and gender-based discrimination against women are both serious issues especially in the countries where the attempt of State in order to protect aforementioned women is explicitly insufficient. Lack of proper governmental protection forces these women to flee other countries as a last resort. Women seek asylum from other countries, face with fatal treatment if they are sent back to their home countries. Thus, legal answer to the question of whether domestic violence can be used as tool while determining the borders of a particular social group is required to be find. Under the international conventions, 'asylum' definition is made regardless any gender-based ground. That is why gender-based asylum claims including claims of women who are subjected to domestic violence vary from State to State as this problem is solved within their domestic laws. These different practices regarding same international problem prohibit to obtaining uniform solution. In this paper, approaches of different countries (USA, England, Canada) have been evaluated through comparing ruling of different State Courts. In order to adopt uniform approach toward this issue, domestic violence against women should be recognized as persecution on the basis of membership in a particular social group, especially in cases where the State fails its obligation of protecting women who face with domestic violence. Only by adopting such uniform solution, the supranational objectives of international refugee law can be satisfied.

The Effects of Mass Migration on Urban Life Standards in Turkey

Binali Tercan
Abant Izzet Baysal University, Turkey
binalitercan(at)hotmail.com

Mass migration, which caused from a natural or manmade events as social conflicts, can threaten a society or a relatively self-sufficient part of a society with major unwanted consequences. Setting of pre and post preparedness, recovery and development activities have very important roles in reducing the future social and spatial hazard risks on over populated urban areas in short period.

The major concern of this study is to make a critical evaluation of the relations and the role of planning in post migration process by examining the outcomes of previous cases of mass migration events between 1990 and 2017 in Turkey.

By this study, it is exposed that, mass migration from rural to urban areas or from different countries to Turkey are very important for liveability level of cities. It is not going to be sustain liveable cities effectively, unless other criteria such as traditional, socio-cultural, psycho-social, economic, legal and institutional coordination are not taken into consideration systematically.

The Middle East Refugees, Turkish Efforts, and a New Urban Planning Agenda through Public Involvement

Kubra Cihangir Camur
Gazi University, Turkey
ccamurster(at)gmail.com

By the end of 2016, more than five million people had been displaced from their homes from conflict in Syria and the vast majority of refugees are hosted in primarily in neighboring countries, and mainly in Turkey. This paper aims to strengthen our understanding of the Middle East Refugees-related formal policies and informal responses to the influx of refugees along with their impacts on urban areas in Turkey, the most affected country of the Mediterranean Region. Scrutinizing international networks and existing projects for the Middle East Refugees in affected Mediterranean cities will enhance the scope of the study. The study will present an analysis of legal framework through general refugee policies and international approaches (projects) showing policy change impacts, in order to highlight the international, national and local level decision making and potential adaptation options of the Middle East Refugees in Turkey. Incentives and barriers to the adaptation of refugees in urban areas in relation to spatial planning efforts will be briefed, including policies associated to settle them. Current planning policies have proven unsatisfactory for either the receiving society or the refugees. A renewal of planning policy by the use of public involvement and participation may suggest a new, progressive opportunity to ensure more tolerated implementation of refugee strategies and urban adaptation programs for the affected Turkish and similar Mediterranean cities.

'Refugee crisis' and global labour relations

Katarzyna Czarnota, Inga Hajdarowicz
Adam Mickiewicz University, Poland; Jagiellonian University in Kraków
czarnota.katarzyna(at)gmail.com,
oooingaooo(at)gmail.com

Political mechanisms of legal, social and economic segregation of refugees and migrants have reproduced and deepened existing hierarchies and inequalities in global labour relations. The consequences of these processes strengthened by current, so called, 'refugee crisis', tightening of border regimes, militarisation and closing of Balkan Route, will have a significant impact on future integration policies. One of the fields that require further research is limited access to labour rights of migrants and refugees. Although this phenomenon is experienced by a significant proportion of migrant population, these are the poorest who are also exposed to economic racism.

The presentation will tackle the influence of current migration policies on increasing social and class inequalities between migrants, refugees and European citizens, on the example of Germany and

Turkey. The authors will critically analyse examples of integration policies, especially planned changes in labour law as well as examples of violation of labour rights and exploitation of refugees and migrants in textile factories and industry.

The presentation will be based on interviews with Syrian workers from economically disadvantaged families, conducted in Turkey, Greece and Germany in 2016.

RN08 | Session 08a Vulnerability in Times of Socio-Economic Crisis: Recent Developments, Conceptual Issues and Innovative Approaches

Social resilience in European communities. The construction and testing of a participatory index

Andrea Volterrani, Massimo Giannini, Stephanie Havekost, Markus Leimegger, Aurelio Dugoni
University of Rome Tor Vergata, Italy; University of Rome Tor Vergata, Italy; Samaritan International, Germany; White Cross Bozen, Italy; Anpas, Italy
andrea.volterrani(at)uniroma2.it,
massimo.giannini(at)uniroma2.it,
s.havekost(at)asb.de, markus.leimegger(at)wk-cb.bz.it, aurdugon(at)gmail.com

The paper presents the results of the participatory construction and testing of a social resilience index in four communities in three European countries (Italy, Germany and Latvia) involving citizens, nonprofit organizations and public institutions. The social resilience index is composed of three pillars: 1) social vulnerability, 2) social cohesion, 3) the management of the risk management process. For the measurement of social vulnerability and social cohesion we have been used indicators (Eurostat and EuSilk) with reference to the individual situation in the labor, social relations, health, home, family, education. For the risk management process we paid attention to the dimensions of the communication, coordination and stakeholder involvement, the involvement of the population, the training of citizens. The survey was carried out both through on-line questionnaires to stakeholders and citizens either through focus groups with stakeholders. The research results carried out by a joint partnership (University/voluntary organizations in Italy, Germany and Latvia) will highlight a) the relationship between vulnerability, social cohesion and resilience; b) the relationship between social cohesion and management of the risk management process; c) cultural differences in European countries in the approach to risk management process; d) the role of citizen involvement, training and prevention communication in social resilience.

Resilience – a New Blueprint of Neoliberal Governmentality?

Stefanie Graefe

Friedrich-Schiller-Universität Jena, Germany
stefanie.graefe(at)uni-jena.de

The current ecological, economic and political crisis can be described as a crisis of capitalist growth ideology. Against this background, risk management is getting more and more important not only on a political level but as a necessary resource of everyday life. It is therefore not by chance that the concept of resilience is gaining more and more importance in policy discourses. At the same time, resilience is promoted as a hopeful and even emancipatory principle for accomplishing the transition to a post-growth society. For visions inspired by a critique of capitalism and growth, the concept of resilience has a certain appeal insofar as it does not aim at material enhancement but system preservation. As such, it seems to have a kind of built-in immunity to the exponential use of resources and the ideology of merit. In my contribution, this assumption is challenged against the background of current theoretical debates about post-democracy and resilience. Given its defining objective of flexible crisis response, the concept of resilience is analysed as a potentially de-politicizing paradigm that favours an alert life-style of permanent vigilance and readjustment of individual behaviour and therefore not only systematically fortifies new hegemonic forms of subjectivity but also contributes to the renewal of neoliberal governmentality.

Social Resilience as a Process based on Multiple Dynamics: Left Behind Family Members' Strategies after Soma (Turkey) Industrial Disaster

Zeynep Beşpınar, Fatma Umut Beşpınar
Marmara University, Turkey; Middle East Technical University, Turkey
zeynep.bespınar(at)marmara.edu.tr,
bespınar(at)metu.edu.tr

This paper aims to rethink and question resilience paradigms in the case of deadliest industrial disaster in Turkey which happened in a mining field in Soma on May 13, 2014, with 301 dead and 90 injured causing political and social riots in this small Aegean city. One and half year after the disaster, we conducted in-depth interviews with members (wives, daughters and sons) from 25 families who were left behind to understand their strategies and practices. We asked family members' life conditions and experiences before the disaster, the transformation of their life conditions and strategies after the disaster and their future prospects. Manyena's (2006) contribution on the conceptualization of resilience by questioning resilience as an outcome or a process is significant for our study. As Kwok et al. (2016) argue, social, economic and institutional system and conditions are noteworthy to understand the dynamics of community disaster resilience. Socio-cultural

setting, which regards women's agency as a threat to the communal values and norms, limits family members' capacity to deal with the difficulties. Social policies, which do not recognize the human role in disasters and taking the responsibility for action building, may endanger the resilience processes of individuals, families, communities and actions. Family members' high level of socio-economic dependency on their father/husband, loss of resources and increase of social pressure to control their everyday life shape family members' resilience processes by showing the significance of the multiplicity of factors such as self and collective efficacy, social support and trust.

The participation of Children & Young People in Disaster Management: a European view

Israel Rodríguez Giralt, Miriam Arenas Conejo, Daniel López Gómez
Internet Interdisciplinary Institute (IN3) - Open University of Catalonia, Spain; Internet Interdisciplinary Institute (IN3) - Open University of Catalonia, Spain; Internet Interdisciplinary Institute (IN3) - Open University of Catalonia, Spain
irodriguezgir(at)uoc.edu, marenasc(at)uoc.edu, dlopezgo(at)uoc.edu

CUIDAR- Cultures of Disaster Resilience among children and young people is an ongoing EU-funded project (H2020) involving members from Italy, Greece, Portugal, Spain and the UK. We present here the first results: a scoping review of disaster policy, practice and projects for what they say, or do not say, about children and young people in the partner countries. That information has been complemented with interviews to key informants in each country, and with an additional review of academic and research based literature.

The scoping reveals that although there is a global concern about this issue, particularly under the influence of Sendai (2015) international framework, children and young people's participation in disaster management is still an emergent field in Europe, if compared with other countries such Australia, New Zealand, Japan or the USA. In the five European countries analysed, there is no clear national risk-reduction strategy and despite practitioners and experts deem children and young people's participation to be crucial, our scoping reveals several obstacles (in civil protection and in educational institutions frameworks and practices) for the implementation of children-centred approaches. In general, children and young people are seldom included in the management of disasters as they are mostly considered as a homogeneous and vulnerable group. But a few experiences found point out that they can also have an active role in disasters management: for example, as allies of civil protection (in prevention, preparedness and recovery tasks) or as co-researchers in finding innovative solutions in disaster risk reduction strategies.

RN08 | Session 10a Linking Disaster Research and Conflict Theory

Civil Society and Disaster Resilience in Turkey

Oya Acikalın

Karamanoglu Mehmetbey University, Turkey

oacikalın(at)gmail.com

Civil society accumulated considerable knowledge and experience after the 1999 Marmara earthquakes in Turkey regarding emergency help, recovery, reconstruction and risk mitigation. This presentation questions whether this accumulation has contributed to society's resilience locally and nationally, following the Van earthquakes in 2011. The Marmara experience produced significant progress in certain aspects while stayed deficient in others concerning disaster resilient society. This presentation compares Marmara and Van experiences to identify the vital points in civil societal participation in building up resilience, and it discusses the historical-societal circumstances under which, how and to what extent this becomes possible. The comparison is part of a meta-analysis based on 150 texts written in the 2000's on the social aspects of post-disaster efforts over a century in Turkey. The findings indicate that traditional societal-cultural-personal resilience in both cases help manage negative impacts despite economic and political weaknesses, while it indirectly plays a negative role in developing resilience against disasters. The underlying factors include the historical relationships patterned among individuals, society and the state, which affect the autonomies of personality, society, culture, economics and politics; their efficient coordination constituted over antagonistic-agonistic struggles; and the egalitarian-inclusive characteristics of community-based organizations. The literature on civil society's contributions to post-disaster efforts concentrates mainly on the first six months of the Marmara practice; the rest of Marmara experience and its comparison with other cases remain partial, if not missing. This presentation is a contribution to fulfilling this gap.

Which growth model is the "fairest of them all"? Striving for equality and inclusiveness in times of austerity.

Sotiria Liakaki

Independent Researcher, Greece

sliakaki2001(at)gmail.com

In this paper, we will attempt to shed light on the content of the public debate that accompanies the concepts of growth and social justice in crisis-ridden Greece during the last two years.

Emphasis will be given to the repertoire of ideas invoked and policy measures implemented in various fields by the SYRIZA-led government, whose reference to and use of the "fair growth" term are omnipresent in its public discourse, encompassing an important conceptual and strategic role for said government's policy choices.

First, our contribution will attempt to discern the very

concept of the "fair growth" notion as well as the complex nexus of social justice, economic growth and equality of opportunity through a systematic examination of the "equitable" and "inclusive" growth approaches encountered in literature and research.

Secondly, this conceptual endeavor will be followed by an attempt to identify "fair growth" instances in current Greek public policy. What measures could be considered as promoting "fair growth" and what does it mean in terms of governance and democratic participation?

Thirdly, utilizing theoretical tools introduced and elaborated by the Quality of Government Institute (University of Gothenburg), we will turn to the crucial relationship between quality of government, equality and growth in search of policies enhancing social cohesion.

Finally, in our closing remarks we will conclude with a brief but concise note on the ideological and political framing of the Eurozone crisis. Is there any "window of opportunity" left for pursuing the "fair growth" model, not only within each member-state but also in the context of the EU as a whole?

"We had everything and it belonged to us, and now we just have a bunch of donated stuff!"— Gainers and losers before, during, and after the 2013 flooding in Germany

Cordula Dittmer, Daniel Lorenz, Jessica Reiter, Martin Voss

Disaster Research Unit, Freie Universität Berlin, Germany; Disaster Research Unit, Freie Universität

Berlin, Germany; Disaster Research Unit, Freie Universität Berlin, Germany; Disaster Research Unit, Freie Universität Berlin, Germany

cordula.dittmer(at)fu-berlin.de, daniel.lorenz(at)fu-berlin.de, jessica.reiter(at)fu-berlin.de, martin.voss(at)fu-berlin.de

Disasters expose previously existing social positions and societal power structures, as well as their dynamic reorganization. According to Bourdieu, social positions and power relations are depending on the individuals' possession of economic, social, cultural, and symbolic capital. We view disasters as social processes characterized by radical changes in the value of specific capitals, which in turn substantially influences the social environment. Through the perspective of those affected by the 2013 flooding in Germany, we analyze these variant positioning processes, the shifting and revaluation of capital, as well as the dynamic positioning of individuals. Additionally, we will present a theoretical model based on work by Bourdieu that, with the help of the revaluation of capital, exemplifies the extent to which the flooding affected individuals. Through qualitative and quantitative research, we demonstrate the emergence of "losers" and "gainers" within the context of the disaster.

We pay particular attention to the conflict between the total loss of previous values, the reconstruction of the material environment, and the subjective perceptions of affected individuals through which the gains and

losses associated with disasters are socially processed.

Are the Nordic Welfare States prepared? Legal obligations and contingency planning of local social services in a disaster context

Guðný Björk Eydal, Ingibjörg Lilja Ómarsdóttir
University of Iceland, Iceland; University of Iceland, Iceland
ge(at)hi.is, ilo(at)hi.is

The Nordic Welfare states are known for their strong systems of social security and services but little is known about their roles in times of disasters. The aim of the paper is to present conclusions from the research project The Nordic Welfare Watch - in Response to Crisis. It asks whether the local social services have a formal role in the contingency planning of the emergency management systems in the Nordic countries. Few case studies (Cuadra, 2015; Rapeli, 2015; Eydal and Ingimarsdóttir, 2012) have been conducted in the Nordic countries, hence this is the first comparative research project of its kind. Primary data from policy documents and legislation was analysed and compared in order to examine if and how the role of local social services is addressed in the legislation on emergency management systems and social services in the five Nordic countries. Scholars and stakeholders from all the five Nordic countries worked on the project that was led by following scholars, in addition to the authors of the paper: Carin Cuadra, Sweden, Rasmus Dahlberg, Denmark, Bjørn Hvinden, Norway, Merja Rapeli, Finland and Tapio Salonen, Sweden. The conclusions of the project show that the countries in question have chosen different paths when addressing the role of the local social services. In order to fully make use of its potential in the aim of enhancing resilience and decreasing vulnerability both on individual and community level, ways to increase comprehensive collaboration between the countries and the relevant sectors are recommended.

N08 & RN35 | Session 09a JOINT SESSION: The European Refugee Crisis: Information Needs and Information Systems

Between Security and Humanity: Elite and Media Discourse on Refugees and Migrants in Croatia

Mateja Čehulić, Dario Čepo, Siniša Zrinščak
Faculty of Law, University of Zagreb, Croatia; Faculty of Law, University of Zagreb, Croatia; Faculty of Law, University of Zagreb, Croatia
mateja.cehulic(at)pravo.hr, dario.cepo(at)pravo.hr, sinisa.zrinscak(at)pravo.hr

From September 2015 to March 2016 over 600 000 refugees crossed the Croatian border, on their way to safety along the Balkan route. It was the greatest humanitarian, social and security challenge since the war in Croatia in the 1990s. This initiated debates about consequences for the stability and the economic sustainability, but also about the impact on the

Croatian national identity and values. This paper identifies discourse on refugees in Croatian society and its development over time. Specifically, it analyzes the discourse on refugees as a political, cultural and security threat. It also assesses the attitudes of political, civil society and religious actors on the public opinion.

The paper uses content analysis of four daily newspapers and one (Catholic) weekly in the September 2015-September 2016 period and, as well as semi-structured interviews with representatives of secular and religious organizations/activists who were active in the field. We explored if there were differences between the secular and religious press reporting, but also whether the media delivered facts about the crisis.

The paper will provide insight into the aspects and dynamics of shaping public opinion through the change of the discourse on refugees and contribute to the understanding of the social context of dealing with refugee and migrant processes.

"Project Immigrants": the Company of Services to the Person of Pescara without frontiers

Dario Recubini
Università degli studi "G. d'Annunzio" di Chieti-Pescara, Italy
gestione(at)asp.pe.it

The project aims to present the experience of the local ASP (Azienda di Servizi alla Persona) in the management of applicants for international protection. The (literally translated) Company of Services to the Person, in fact, has carved its name in the essence of his mission: Company that focuses its activities on people without any distinction.

The migratory phenomena, which have always been part of human history, today are the inevitable result of the ongoing humanitarian crisis. The current phenomenon of migration is a complex sum of two distinct streams: refugees fleeing war and persecution of any kind, and migrants who voluntarily leave their country in search of better conditions of life.

In this context, the ASP since its inception in 2014 is engaged in the front row in the reception of international refugees in collaboration with the Prefecture of Pescara and the Home Office, welcoming and providing services to foreign people in their facilities.

To migrants who leave their families, their homes and fleeing their country the ASP, as well as offering them a bed, meals, clothing and basic necessities, provides a variety of services for the integration they can be summarized as: a) linguistic and cultural assistance; b) information on immigration rights and duties and status of foreigners; c) assistance for the drafting of an asylum application; d) health care, to be made at the local health centers or general practitioners. That because the ASP considers the understanding of the Italian language and the Italian laws are the keys to a real inclusion and integration of immigrants.

Refugees and unaccompanied minors in Greece: evidence from the field.

Theoni Stathopoulou

National Centre for Social Research-EKKE, Greece
theosta(at)ekke.gr

The unprecedented migration flows that Europe has witnessed since the spring of 2015 have become the focus of intense public debate and concern, fuelling social and political tensions across EU member-states. The EU-Turkey agreement has further complicated the lives of nearly 60.000 people entrapped in Greece, among them a considerable number of unaccompanied minors.

The paper will present the findings of the "REHEAL" survey conducted by the National Centre for Social Research in Greece in six refugee camps across the country during the summer of 2016 as well as the results of the "REHEAL-UaM" a pilot study on unaccompanied minors during the same period.

The main goal of the survey was to examine the reasons for fleeing the homeland, evaluation of living conditions in Greece, as well as self-reported health status, health care needs, and discriminative and traumatic experiences of the refugee population residing in the selected camps. REHEAL-UaM was conducted in the shelters of Attica with the use of adolescent depression scales and a questionnaire designed specifically for the pilot by the HRT (Harvard Program in Refugee Trauma)

Refugee Journeys as Catalysts of Transformed Subjectivities

Anamaria Aureliana Topan

University of Innsbruck, Austria
aura.topan(at)gmail.com

The paper addresses the recent refugee crisis in Europe, focusing on an underresearched, but vital aspect for the understanding of the complexities involved into the process of refuge. Specifically, the journey the refugees take from a broken context to their destination, in this case Munich/Germany. The main thesis of the paper is that the refugees as they arrive are not an end product to be dealt with. They are a part of a multifaceted process, in which the journey is of paramount importance. It sheds light to the fact that there is no simple justification or causation in the process of the refuge; there are no straightforward approaches in dealing with the consequences of the asylum journey. The main methodological tool is the interview with refugees from reception centers in Munich. Their narrative accounts are essential in examining how they cope, first of all, with trauma and abuse. These, in turn, have a huge impact on what kind of needs, aspirations and future they envisage for themselves. Ultimately, it is about making the transformative experiences of refugees visible. Their articulation is the most importance step for a healthy dialogue with the host community, whether on political, economic or social level. Now more than ever, considering that the debate surrounding the refugee politics in Germany is heated

and instrumentalized by a number of actors according to various political or economic agendas.

Therefore, the figure of the refugee understood within the ambivalences and complexities of their journey comes across as more than a simplistic image of victimhood and vulnerability. It helps contextualize an authentic understanding of refugee experiences and identify the potential they bring to possible refugee policies.

RN09 - Economic Sociology

RN09 | Session 01a Theoretical Perspectives in Economic Sociology

Rationality, Norms, and the Sociological Reconstruction of Economic Theory

Mark Gould

Haverford College, United States of America
mgould(at)haverford.edu

This paper characterizes the interface of economic and sociological theory, focusing on Parsons's analysis of the "problem of order" and on Weber's and Marx's analyses of the emergence of machine capitalism. I demonstrate the consistency of both perfect-information, Arrow-Debreu models and models of competitive markets under machine capitalism with the assumptions of neoclassical theory, most especially the contention that all actors always act rationally, maximize against constraints. I also demonstrate that imperfect-information models and models of capitalist production that are not competitive generate anomalies that manifest certain fallacies within neoclassical theory, especially the contention that we can explain social action successfully if we assume that all actors are instrumentally rational all of the time.

Methodologically, I show that my analyses have consequences for an evaluation of Friedman's contention that the empirical veracity of the assumption of rationality is irrelevant because the predictions that derive from models where rationality is assumed are empirically warranted. These empirical predictions presume other attributes of the "real world," like competitive constraints, that are not always present, and thus that the predictions are often false. We will conclude that the veracity of the assumptions in our models is often crucial to the model's empirical warrantability. Even when the assumption of rationality is justified, it should not be taken a priori; it requires explanation. Actors may conform to a variety of normative orientations, and since the conceptualization of these alternative, positively-stated normative orientations is impossible within utilitarian theory, this suggests that neoclassical theory must be reconstructed sociologically.

Global Political Economy and Grounded Theory

Yvonne Franke

Georg-August-Universität Göttingen, Germany
yvonne.franke(at)uni-goettingen.de

Empirical research in Global Political Economy (GPE) has proved astonishingly resistant to qualitative research methodologies. It resisted the cultural turn marked by a renaissance of qualitative approaches in many disciplines and subfields in political science (see for an overview Blatter et al. 2007). Even in the very core of the discipline, in International Relations, qualitative methods have become more and more popular (see e.g. Klotz/Prakash 2008). Certainly case studies have dominated Global Political Economy over the recent decades (Odell 2001: 171), but methodological designs based on open field research like anthropological methodologies or Grounded Theory are rare.

This results from the positivist ideas at the core of the discipline which are reflected in its terminology, theorems, and concepts of economy and its articulation with society. Certainly, over the last two decades, these structuralist or even positivist concepts have been theoretically challenged by approaches bridging the gap between economic and cultural patterns, such as the varieties of capitalism approach (Hall/Soskice 2004). And yet, there has not been much progress in using qualitative research not only as a mere tool to acquire information, but as a methodological approach. The proposed paper aims to show that Grounded Theory as a methodology and a method is first of all an excellent tool to avoid structuralist pitfalls in GPE. It allows to capture cultural and societal elements that are habitually overlooked by standard economist approaches. Secondly, GT provides a framework for bridging the micro-macro-gap of GPE approaches. And third, it offers to a certain degree the possibility to reflect on analytic tools shaped by (post)colonial respectively western domination.

The Language of Economists: A Quantitative Textual Analysis of Top Italian Economists' Newspaper Articles in the Crisis Years

Lucio Baccaro, Sinisa Hadziabdic

University of Geneva, Switzerland; University of Geneva, Switzerland

Lucio.Baccaro(at)unige.ch,

sinisa.hadziabdic(at)unige.ch

This paper focuses on economists as public intellectuals and their contributions to the public sphere. It aims to produce a quantitative textual analysis of the Italian economists' understanding of the Italian crisis, and their views of what policy makers should do to address it. The corpus is constituted of all newspaper articles written by top 5% Italian economists between 2007 and 2015. The analysis aims to identify dominant themes and axes of discourse. Preliminary findings suggest a remarkable degree of homogeneity in the discourse of Italian top economists. The main culprit of the Italian crisis is the Italian state: bloated, corrupt, and inefficient. The cornerstone of any viable solution is widespread liberalization. Europe is an indispensable external anchor that pushes sluggish domestic actors to shape up. Interestingly, arguments for liberalization often rest

not on efficiency but on equity considerations: a market society is the best way to institutionalize a meritocratic distribution of rewards. Liberalization is presented as a left-wing, progressive project, and opposition to it as self-serving resistance by entrenched interests.

Modeling Institutional Anomie Theory on Individual Level as a Causal Mechanism

Jacek Bieliński, Andreas Hövermann
Institute of Sociology, Collegium Civitas, Poland;
University of Bielefeld, Germany
jacek.bielinski(at)civitas.edu.pl,
ahovermann(at)posteo.de

Institutional anomie theory (IAT) was developed to explain deviant behavior. Steven Messner and Richard Rosenfeld argued that deviant behavior can emerge as a result of domination of economy in institutional balance of power. The domination of economy is expressed through processes of 1) accommodation of non-economic social roles to norms and values typical for the economic social institutions, 2) devaluation of non-economical social roles, 3) penetration of values and norms typical for the economy into other, non-economic social institutions. IAT was successfully employed both at macro and micro level analysis of different forms of deviant behavior and such phenomena as e.g. enmity towards minority groups. Nevertheless, IAT is rarely conceptualized as a casual mechanism.

The goal of this paper is to demonstrate that IAT can be conceptualized and successfully operationalized in terms of causal mechanism. I formulate theoretical model of such causal mechanism, and test it against empirical data with structural equation model.

Empirical analyses are based on data from a survey conducted by TNS in December 2016 on a representative sample of Polish population over 15 years of age. The sample size was 1051 respondents. The results show that high levels of marketized mentality (acceptance of norms and values typical for economic social institutions: individualism, universalism of rules, achievement orientation and money fetishism) have strong direct effect on accommodation, devaluation of non-economic social roles and normative disorientation (anomic pursuit of success). Simultaneously, accommodation, devaluation and normative disorientation are independent of each other.

RN09 | Session 01b Sociology of Debt

How do young family households manage nonmarket economic transfers from their parents?

Marta Olcon-Kubicka, Mateusz Halawa
Polish Academy of Sciences, Poland; Polish Academy of Sciences, Poland
molcon-kubicka(at)ifispan.waw.pl,
mateuszhalawa(at)gmail.com

Based on 28 ethnographic case studies from Warsaw, Poland, this paper offers an empirical study of the

practices of relational work around inter vivos downward transfers of money, gifts, and property from parents to their adult children. Based on multiple home visits, interviews, observations, and financial diaries, this paper tracks the domestic uses of money and finance among young middle-class couples in Warsaw who are starting new households, but do so with significant assistance from their families. All under the age of 35, our interlocutors grew up after the social and economic reforms of 1989 and are now going on their own in social and economic realities that would be unrecognizable to their parents in their youth. Our analysis will explain how young adults match their understanding of social ties with appropriate forms of money and property in context of enduring and rearranged moral frames. We will describe these in terms of moral meanings, distinctions and justifications, and show how money and property is variously qualified as gift, entitlement, loan, compensation, or inheritance by different actors in the family. Case studies fall into two broad categories: (A) repeated, smaller transactions in a short-term cycle, including cash gifts, food or small loans; and (B) large, long-term cycle transactions, including housing or participation in the mortgage. Ethnographic descriptions include wedding preparations, which include expectations of cash gifts to be converted, dowry-like, to mortgage down payment.

Spiralling debt. The time regimes of debt collection

Elias Storms
Universiteit Antwerpen, Belgium
elias.storms(at)uantwerpen.be

Over the past years, various authors have established that the notions of debt and time are inherently linked. In its essence, a debt is a quantified promise to pay at some point in the future, which leads some authors to argue that debt closes (e.g. Lazzarato) or conversely continuously reconfigures (e.g. Adkins) the debtor's future.

This contribution will explore another and hitherto neglected role of time in the everyday economic lives of debtors: the specific *time regimes* imposed through debt. To explore this dimension, I will look at the point at which debts at the household level become most tangible: the moment of collection, especially via judicial enforcement. This paper will focus on how debts can grow and 'spiral' out of control when different time regimes clash with one another. Empirically, I will pay close attention to the tools with which time regimes are deployed, such as administrative and calendric punctuality, and pecuniary punishment of deviation from standardised payments.

Pertinent to the topic of this session, this contribution looks at the interconnectedness of time, collection and over-indebtedness. By doing so, I hope to accomplish two things. First, to explore the general relevance of time regimes as technical and power-infused configurations impacting the over-indebted. Second,

but equally important, to help understand how the time regime of debt collection, through its spiralling effects, is a part of the social problem of over-indebtedness.

Life After Debt: a critical analysis of the engagement/non-engagement of debtors with the Insolvency Service of Ireland

Zach John Roche
The University of Limerick, Ireland
zach.roche(at)ul.ie

The Insolvency Service of Ireland (ISI) was established in 2013 to respond to a crisis situation involving more than 150,000 mortgages in long-term arrears, and €157bn of personal debt (the third highest in the OECD). The ISI's strategy has been to teach financial skills to insolvent debtors, combined with up to 6 years of financial supervision, after which some debt is written off. Through this institution the aftermath of the economic boom and crisis is being dealt with, and life after debt has become possible for some Irish debtors. However, although debt is prevalent in Ireland and has been linked to stress (Mind 2008), food poverty, and financial/social exclusion (Combat Poverty Agency 2009), only 5,675 debtors (out of an estimated 200,000 who qualify) have applied for the ISI's services.

The ISI's internal research states that the reason behind this gap is primarily due to a lack of awareness by debtors of its services (Insolvency Service of Ireland 2014). Some scholars (Stamp 2013) and NGOs (Society of Saint Vincent de Paul 2013) have disagreed, arguing that the ISI is creditor focused, and overly complex.

This research goes beyond these explanations by providing a qualitatively driven sociological explanation for why the ISI has failed to persuade the vast majority of debtors to use its debt relief programmes. This project adopts a novel theoretical approach which offers new insights into indebtedness. This project synthesises micro (interviews) and macro-level data (policy analysis) by utilizing governmentality theory to analyze the power relations inherent in debt and the impact debt has on everyday life by examining the coping strategies debtors utilize to survive.

Debt as Power? Rethinking the politics of the debt state

Sahil Jai Dutta
University of Warwick, United Kingdom
sahiljaidutta(at)gmail.com

In the current age of austerity, the idea that states subject to too much debt are vulnerable is ubiquitous. The revival of fiscal sociology that accompanied the publication of Wolfgang Streeck's *Buying Time*, has focussed on the regressive political outcomes of a state overly dependent on debt. But what happens when public debt can function as money? The 'moneyness' that some debts can acquire transforms its political dynamics, because debts that circulate as money do not need to be repaid. This paper examines how the moneyness of British public debt allowed the

state to amass levels of debt well beyond what it could ever realistically repay. Far from a burden, the state's ability to issue its debt as a form of money provided it significant social power in neoliberal times. It gave the state a readily accessible pool of financing and established a monetary infrastructure through which it could govern the broader economy. Consequently, I argue that the British state does not have to be a passive recipient of creditor agendas in raising public finance. This shifts the perspective on the politics of monetary governance. The 'debt state' is often cast as one where democratic power is ceded to financial markets as the state strives for the 'credibility' necessary to support its growing debt. Instead, I show how the state uses the place of public debt securities in the banking system to adjust flows of liquidity in the economy more broadly, empowering the state with a potent mechanism of economic governance. In the neoliberal age where financial markets seem all empowering, the moneyness of debt helps to recapture a crucial agency of the debt state.

RN09 | Session 02a Status and Coordination on Markets

A "conventional" theory of market dynamics: changing conventions on a regional wine market

Luka Jakelja, Florian Brugger
University of Graz, Austria; University of Graz, Austria
luka.jakelja(at)uni-graz.at, florian.brugger(at)uni-graz.at

For the greater part, economics and (economic) sociology have both focused on static and structural conceptualizations of markets. While classical approaches (Weber, Schumpeter, Polanyi) emphasize the changing nature of Capitalism and Markets, the strength of New Economic Sociology has been to explain the abiding structures of markets. The paper advances the theoretical framework of the „Economie des conventions“ – one of the most thriving and original French originating contributions to economic sociology of the last decades. The analytical distinction between institutions and conventions allows incorporating four different market situations: normality, blockage, dynamics and crisis. However, the question of how new conventions and institutions are formed – a central element for understanding the processes of blockage, crisis and change – remains unanswered. By drawing on empirical material derived from qualitative interviews conducted with the main market intermediaries of a regional wine market, it is argued that the incorporation of concepts like: ideas, charisma and "carrier groups" of ideas could advance the explanatory power of the theory of conventions in regard of market dynamics and change.

Relationship management in a personal business. Content trade markets as coordinators of transnational intermediary networks in the TV industry

Christoph Musik

St. Pölten University of Applied Sciences, Austria
christoph.musik(at)fhstp.ac.at

International trade fairs and markets in media industries have a long history dating back to the early modern period in the case of trade in books. Even the relatively new medium of television established its first content markets in the early 1960s. Despite the fact that in recent years digital transformations have had disrupting consequences on the industry, annual content trade markets such as MIPTV/MIPCOM in Cannes or the European Film Market (EFM) in Berlin still or more than ever are an essential element of transnational trade in audiovisual goods.

The paper addresses the research question of what role trade markets play in the present television entertainment industry and focuses on the practices of market participants at these annual events. The paper presented is based on ethnographic fieldwork at MIPCOM in October 2015 and EFM in February 2016. Further, qualitative semi-structured interviews with Austrian market participants, especially acquisition executives of broadcasters and daily market news were analyzed.

A major result is that relationship management and networking is the core activity taking place at and around trade markets. Physical co-presence and face-to-face encounters are emphasized and highly valued by participants as a fundamental condition to act successfully in the future. The identity of a "personal business" is deeply inscribed in the cognitive basis of TV content trade. In this sense content markets act as primary coordinators of different transnational cultural intermediary (Bourdieu 1984) networks and how these are aligned, resulting in specific dominant flows of content. The empirical results strongly connect to the classic new economic sociology and new institutionalism concepts of social embeddedness (Granovetter 1985) and cultural embeddedness (Zukin & DiMaggio 1990).

RN09 | Session 02b Finance and Banking

A Sociological Approach on the Development of the European Banking Systems

Florian Brugger

University of Graz, Austria
florian.brugger(at)uni-graz.at

The outbreak of the current financial and banking crises has encouraged much interdisciplinary research on the European banking systems. Apart of economic contributions several jurisprudential, historical, sociological and anthropological studies investigated European banking systems' historical developments, social embeddedness and regulations. Usually it is argued that the current banking sectors were formed in the last 30 years, while earlier developments are of

little importance. This contribution shows that, in particular, four main epochs determined the part of Europe's banking sectors development: Absolutism and Mercantilism in the 18th century; Industrialism, Liberalism and Saint-Simonianism in the 19th century, Keynesianism after World War II and the Neoliberalism since the late 1970s.

The four central historical epochs are characterized by a certain 'order system'. Following Max Weber it is assumed that the banking sectors are embedded into a wider cultural, economic and political order ('order system'). Each historical epoch shaped the banking systems by its unique 'order system', however both the 'order systems' and the banking systems are influenced by its historical inheritances. Hence national banking systems are characterized by the national 'order system' and its path dependent development. Understanding the banking system as embedded into a wider part-dependent cultural, economic and political order avoids a purely materialistic or idealistic interpretation and gives an explanation for national differences in the development of the banking sectors. The contribution focuses on the part-dependent developments of the French, German and British banking systems.

Are there particular French and German "financial market rationalities" regarding the ECB's monetary policy?

Malte Flachmeyer

University of Basel, Switzerland
malte.flachmeyer(at)unibas.ch

While the European Central Bank (ECB)'s crises management apparently succeeded in fairly stabilising the European financial sector and lowering the interest rates for crisis-ridden member states, questions about legitimate objectives and means of monetary policy have become (again) highly disputed within the Eurosystem. Drawing primarily on a document analysis, the research approach to be presented aims at the disclosure of normative, 'ideal' criteria anchoring judgements on rationality and legitimacy within this debate.

In the first section I discuss some theoretical reflections on central banking practices in interaction with financial market discourses as well as contrasting German and French traditional views on monetary policy. Generally it is argued that the past and future evolution of European monetary policy should be traced against the background of both financial market expectations and the need of monetary policy (including the money emitting financial sector) to be trustworthy and reliable in the eyes of the general public. My overall approach therefore consists in scrutinizing the public interplay of different forms of justification and critique in the course of the ECB's crisis management on the basis of a comparative qualitative analysis.

The presentation empirically focusses on German and French financial market actors' positions towards the most recent asset purchase programmes and the zero interest rate policy since 2016. The relating political

communication is explored notably in the form of documents published by major banks (e.g. research and policy papers; contributions in the financial press). Is the growing and increasingly open dissent on efficient and legitimate central banking also reflected in (this part of) the German and French “financial market community”?

The ECB’s Banking Supervision: The Logic of Legitimation in the European Union

Valentina Ausserladscheider
University of Cambridge, United Kingdom
va284(at)cam.ac.uk

The newly instigated European banking supervision conducted by the European Central Bank (ECB) is presented as the next milestone in the history of European integration. On the basis of EU-wide stress tests, the ECB took over banking supervision from national authorities. While the ECB’s discourse concerning its additional function conveys a political, social and cultural narrative promising the European citizens’ gain from an integrated banking supervision, I argue that this discourse veils a different mechanism. This piece of work makes the case that these recent developments foster economic technocracy, disembedding the economy from politics and society. By investigating the ECB’s legitimisation discourse by applying critical discourse analysis, I pinpoint the strategies by which the ECB justifies technocratic governance free from political interference. I thereby contribute to scholarly literature claiming that there is a crisis of democratic capitalism characterised by inherent tensions between democracy and capitalism. More specifically, I present a case study of the way in which this crisis is suspended by rendering democracy voiceless, taking away the European demos’ say on economic issues.

Public debates on financial regulation: The justification of arguments on the regulation of the loan-to-value ratio in Norway.

Trond Loynning
University College of Southeast Norway, Norway
trond.loynning(at)usn.no

Financial regulation is for the most part the domain of experts, involving highly technical issues often in transnational fora like the Basel Committee on Banking Supervision. While the regulation became highly contested in the aftermath of the financial crises, in general financial regulation is somewhat removed from public discourse and often from elected politicians as well. This article analyses an exemption from this. In 2010, a regulation of the loan-to-value ratio was introduced in Norway, specifying that as a rule, this ratio could not exceed 90 % of the market value of the property. This ratio has since been lowered to 85 %. In the Norwegian context where homeownership is very widespread, this proved to be a controversial regulation, resulting in a heated debate in Norway over several years, involving many different actors, including politicians, journalists and academics. In the paper, articles in national and

regional newspaper are analysed, using Boltanski & Thevenots pragmatic perspective on how actors legitimize their reasoning and critique. A main finding is that arguments opposing the regulation is most often based in the civic world, for example arguments on how the regulation exclude some (unprivileged) classes from the housing markets; while proponents of the regulations is based in the managerial or industrial world. There are surprisingly few directly market-based arguments. Somewhat paradoxically however, since critics tend to highlight the increasing inequality resulting from market-based governance, in this debate those critical of the regulation often indirectly argue for the fairness of the market world.

RN09 | Session 03a Markets and Morality

The honourable merchant exemplified by the Grand Bazaar in Istanbul. Framing the impact of »The Person« on economic systems

Gabriele Maria Sigg
Humboldt-University Berlin (General Sociology),
Germany
Gabriele.M.Sigg(at)protonmail.com

It is a widespread opinion to consider the capitalistic system as the main issue in global and economic crisis. But what exactly is a system? A system is - provocatively spoken - what is the common way of »thinking, perceiving and acting« (Bourdieu), which is incorporated in the majority of the people. Therefore my thesis is, we have to take a closer look at the character-building of »The Person« (Arendt), which has changed from traditional to modern society.

In my Ph.D. thesis, I examined the changes from the traditional merchant, which finds its origin in the idea of the honourable merchant, to the modern businessman (Homo Oeconomicus) by the example of the Grand Bazaar in Istanbul as it is the oldest trading centre in the world. My investigation is based on sociological and philosophical theories (e.g. Aristotle, Sombart, Weber, Simmel) combined with fieldwork (participant observation, qualitative interviews) on the Grand Bazaar.

In my presentation, I aim to show how social institutions like the family and guilds were responsible for the character-building in traditional society. In the traditional guild, one not just learned a craft, but also how to be an honourable and upright person. Modernity separated the building of virtues from one’s factual work. The main focus of my talk will therefore take a closer look at the pre-institutional and cultural dimensions of economic systems, the »non-contractual elements of the contract« (Durkheim), and furthermore, the character-building process, in which I see it as our current task to create an updated model for modern societies.

Ethical Banks between Moral Self-Commitment and Economic Expansion

Sarah Lenz, Sighard Neckel

Goethe University Frankfurt, Germany; Hamburg University, Germany

S.Lenz(at)em.uni-frankfurt.de,

Sighard.Neckel(at)wiso.uni-hamburg.de

In the last years, ethical banks have experienced increasing numbers of costumers, deposits and investments. Potentially conflicting aspects of such a banking sector, which is trying to reconcile both economical and moral standards and to connect social and ecological responsibility with economic profitability, has by now not received a lot of scholarly attention. By focusing the decision-making processes on contentious investments, we argue that impacts, constraints, and paradoxes of normative orientations as well as moral discourses within ethical banks can be examined.

Drawing on the theoretical work of Luc Boltanski and Laurent Thévenot ("On Justification"), we argue that normative orientations materialize in daily practices and "disputes". A reconstruction of such "disputes" gives information about the varying moral struggles employees have to face in the course of their professional practice, articulating moral reservations or normative consents to enterprise decisions.

Based on qualitative data (interviews, documentary analysis), we outline the general principles of those banks and ask for the tensions of ethical self-commitment and economical rationalities, and how these tensions are negotiated.

Our analysis points out a paradox of ethical banking. Due to their economic expansion some investments, which correspond with their ethical self-commitment, tend to be a luxury they cannot afford. The fact that the guidelines of ethical banks have gained wide societal acceptance can be interpreted as a strengthening of ethical principles. However, ethical investments tend to be undermined by the need to cope with economic expansion.

Multiple movements and one market: The strength of social movements and producers' self-categorization

Philip Balsiger, Simone Schiller-Merkens

Université de Neuchâtel, Switzerland; Max Planck-Institute for the Study of Societies

philip.balsiger(at)gmail.com, ssm(at)mpifg.de

Social movements can be an impetus for the creation of moral markets. Through their framing of grievances and issues, movements can bring about changes in social values, norms and beliefs, which open up sociocultural spaces for more morally framed entrepreneurship, leading to the emergence of "moral markets". Studies on the role of movements' cultural resources in markets have largely concentrated on markets that develop in proximity to one particular movement. However, markets are often "nurtured" by more than one movement. This is in particular the case of markets commonly referred to as "ethical",

such as ethical tourism or ethical fashion. Activities in these markets build on cultural accounts advocated by different social movements: environmentalism, animal rights, global justice, and others. Which cultural resources do producers use in such markets? Are some movements more likely than others to leave their cultural traces in these markets and if so, why?

This paper explores these questions in a cross-national comparative analysis of producers of ethical fashion in the UK and in Germany, both countries that differ with respect to the relative strength of two core movements for many moral markets, the environmental and the social justice movement. We analyze the frames and certifications fashion designers refer to in their self-categorization and thus address the question of how moral values advocated by movements get translated into producer identities in a rising moral market. By showing the role of movement strength and elite support for producers' self-categorization, we contribute to research at the nexus of organization studies and social movement studies.

The Structure of Fair Trade Consumption

Patrick Schenk

University of Zurich, Switzerland

schenk(at)soziologie.uzh.ch

The rise of fair trade is a prime example for the moralization of markets in western societies. However, the field of fair trade is not homogeneous but characterized by a tension between a reformist orientation that primarily seeks to fight poverty in the Global South and a radical orientation which strives to fundamentally change the rules of international trade. While labeling initiatives represent the former view, the latter position is embraced by alternative trade organizations (ATO). These organizations not only differ in their ideological orientation but also in the primary distribution channels and presumably the audience they cater to. For instance, commentators have claimed that people who buy in supermarkets, which are exclusive to labeled products, base their purchase decision more on egoistic criteria, such as intrinsic product attributes (i.e. taste), while buyers in World Shops, which are the primary channel of ATOs, are more altruistically motivated. From a field theoretical perspective, this debate thus points to a structural homology between the field of fair trade organizations, the distribution of fair trade products and the consumers in the social space.

However, systematic empirical analysis concerning the differences between consumers at the radical and the reformist pole of the fair trade field are nearly nonexistent. To address this research gap, I quantitatively investigate differences in motivations, values, political engagement and social-structural position between these consumer types using data from a survey conducted in Switzerland. The results yield marked discrepancies between these consumers, although the differences are not always in the direction previously posited in the scholarly debate. This study thus provides novel insights into

the connections between production, distribution and ethical consumption.

RN09 | Session 03b Financial Education and Literacy

Financial education in Sweden: From a fully-fledged welfare state to financialization of everyday life

Jane Pettersson

University of Gothenburg, Sweden

jane.pettersson(at)gu.se

Sweden was for a long time regarded as The Social Democratic welfare state. However, since the 1980's Sweden has, successively, 'caught up' with the rest of the world in terms of neoliberal governance. Even, some argue, to a greater extent than many other countries. This is evident in, for example, the relatively high degree of mortgage loans, popular investments and savings in shares and mutual funds. Consequently, Swedish households' economies have become increasingly intertwined with global and complex financial markets. This development is often referred to as a financialization of citizens' everyday lives, which, inevitably, places new demands on the individual. As a consequence, citizens' lack of so-called financial literacy has become subject to official concern. As in many other countries, the solution is claimed to be financial education. In this paper I analyze Swedish policy documents to explore how authorities justify recent financial education initiatives. The results suggest that participation in financial markets is proposed as a solution to the consequences of a dismantled welfare state. Thus, the 'financialization of everyday life' is realized in and through financial education and the fostering of 'financial subjects'. This implies that welfare state citizens with inherent social rights are now expected to transform into financially competent consumers and investors. These initiatives are directed towards both the general public and to so-called risk groups. The results also show that financial education in Sweden is imbued with both traditional values of social democratic universalism as well as with neoliberal market logics.

The strange non-death of financial literacy education

Marcus Wolf

University of Bremen, Germany

marcus.wolf(at)uni-bremen.de

The aim of the contribution will be to investigate into the 'career' of the concept of financial literacy education as a project of the financialisation of everyday lives.

As will be argued, financial literacy education - despite calls for stronger versions of consumer regulation after the crisis - witnessed a substantial push by its integration into global policy programmes of the OECD and G20. The main question will thus be which main narratives on everyday financial

(mis)behaviours, knowledge and lifestyles where at the center of this ascent and how we can understand the ambiguous support coalition for the concept - encompassing central banks, financial ministries, financial industry and consumer organizations.

In order to grasp the influence of the financial crisis and sub-prime loans on the framing of financial (il)literacy, a main distinctive line of analysis will be the question of debtor vs. investor education. Also, questions of national variations of financial education (OECD everyday finance vs. developmental everyday finance?) will be discussed.

The analysis will use data on the global network of financial education professionals as well as policy documents and interview material from major political actors in the field (OECD, EU Commission, debtor and consumer organizations, financial industry).

The analysis of financial literacy education after the financial crisis can help us both to better understand the normalization of a specific form of financial consumption and the normative changes that accompany a financial market society.

Financial literacy and financial capability of Russians (2014-2016)

Olga Kuzina

Higher School of Economics, Russian Federation

kuzina(at)hse.ru

This study aims to assess the level of financial literacy and financial capability of Russians by using the World Bank's methodology of cross-country comparison developed under the Russia Financial Literacy and Education Trust Fund. The data were collected during the all-Russian surveys in 2014-2016 (N=1,600 respondents). The paper provides a brief description of the methodology and a dynamics of the level of financial capability of Russians in three years (2014-2016). Regression analyses were used to determine which factors were significantly related to financial literacy and financial capability, as well as if financial literacy and financial capability influence retirement planning and overindebtedness of consumers.

RN09 | Session 04a Corporate Social Responsibility and Sustainability

Carbon Futures in Companies

Michael Kunkis

University Hamburg, Germany

michael.kunkis(at)uni-hamburg.de

There is an extensively accepted agreement amongst the global community that CO₂-emissions must be reduced to avoid dangerous climate change. Resulting climate policies not only impact CO₂-emissions but also influence the economy and companies. Our current research project sets focus on the relationship between political climate goals and the future prospects of companies. The main focus of interest was set on companies of energy production as well as energy-intensive industries. These companies are confronted by a great deal of uncertainty, e.g. by

changes in the financial landscape. Another main source of uncertainty stems from changes in the political framework. But it is necessary for companies to stabilize their expectations of action to create the possibility to act. It is also necessary to investigate whether there are specific future expectations in the company and how these are developed and constructed. Therefore we examined possible variants of 'imagined futures' with regard to the possible transformation towards a 'low-carbon economy'. In our empirical field research we conducted two case studies (in-depth interviews, document analysis). Our research demonstrates how companies produce and process ideas, expectations and imaginations about their future as an organization, especially in light of the broad political and social debate about the need for a structural change towards an economy that is no longer fundamentally based on the burning of fossil fuels. It will also be shown how companies are adapting to a future in which CO₂-emissions are increasingly regulated.

CSR activity profiles in unfavourable economic circumstances. The case of the companies listed on the Athens Stock Exchange

Alexandros G Sahinidis, Alina B Hyz
Technological Education Institute Of Athens, Greece;
Technological Education Institute Of Piraeus, Greece
asachinidis(at)teiath.gr, alinahyz(at)teipir.gr

The purpose of this study is to identify the patterns of Corporate Social Responsibility (CSR) activities, in adverse economic circumstances, so as to understand the importance ascribed by the companies to each of their stakeholder categories. Social responsibility is a process by which companies manage their relationships with a variety of stakeholders which can have a real impact on the success of the business. In this paper we investigate the activities of CSR in Greece. We examine how companies spend their CSR resources in a depressed economy and the respective activity patterns among the companies listed on the Athens Stock Exchange (ASE). Our empirical evidence is based on the content analysis method. The study included 2014 data, collected at the end of 2015. Our results demonstrate that, contrary to our expectations, the most popular CSR activities related to the human resources and the least practiced were the society related ones. The findings show a concern for the employees of the companies and their morale, that supersedes the interest for the other stakeholder categories. Moreover, a significant difference emerged between the CSR programs of the various industries. This indicates that for reasons unbeknownst to us, companies de-emphasize the importance of the consumers and the ailing society and cater to the needs of their internal constituents. The significance of this study stems from the fact that it sheds light for the firms' policy during the period of financial constraints, which are apparently counterintuitive.

Sustainability Management for Scientific

Institutions - a Framework to conduct Societal Responsible Research

Markus Winkelmann, Jürgen Kopfmüller
KIT, Germany; KIT, Germany
markus.winkelmann(at)kit.edu,
juergen.kopfmueeller(at)kit.edu

There is an emerging discussion among scientists and scientific managers about the necessity to consider the research process itself as a subject to sustainability considerations. The systematic reflection of everyday research routines in terms of sustainability is no common practice so far, nevertheless necessary to meet the societal expectations to be pioneers for societally responsible problem solutions.

At the core, the proposed framework consists of eight criteria, which taken for themselves are neither surprising nor new, but taken together allow a systematic reflection about societal responsibility of research practices. The process of research itself is in the focus, independently from particular topics of investigation. The purpose is to enrich the given standards of good scientific work by transdisciplinary junction of research processes to societal discourses to ensure the connectivity of research to relevant societally discussed topics, and to provide, accordingly, a framework for scientists and scientific managers to reflect their work.

The presented concept is a result of a joint project (LENA) of the three extramural German research institutions Leibnitz, Fraunhofer and Helmholtz Association. The project was funded by the Federal Ministry of Research and Education in order to create a joint understanding of socially responsible research and to initiate an implementation process to stronger relate extramural research to societally relevant topics.

The presentation wants to initiate further discussion about the topic of societal responsible research and an exchange about the understanding of the topic and according current practice in different European countries.

Sustainable investments – innovative instruments for sustainability or reproduction tool for financial capitalism?

Natalia Besedovsky
University of Hamburg, Germany
natalia.besedovsky(at)uni-hamburg.de

Sustainable financial products promise to provide financial profits in combination with a positive impact on the environment or social issues. Starting as a relatively small niche market, the market for sustainable investment has been exponentially growing in the last decade. Next to the increasingly influential institutional investors, a growing service industry of law firms, certification and rating agencies that defines, constructs, evaluates, and promotes these kinds of products has arisen. Furthermore, governance agencies endorse the idea that markets are a good solution for the problem of sustainability, for instance the UNEP Finance Initiative. However,

contrary to the logic of sustainability, which is based on regeneration and future orientation, this market, like most financial markets, is based on short-term profit maximization. Combining the literature on financialization with the perspective of valuation studies, this paper uses reports, documents and white papers of providers of sustainable investments, rating agencies, and governance agencies to explore the narratives, justification strategies, and evaluation practices of these different actors.

RN09 | Session 04b Monies, Risk and Finance

Monies, programmable tokens and decentralization: the blockchain as a vehicle for alternative forms of exchange

Inês Domingues Figueira Faria
School of Economics and Management of the
University of Lisbon, Portugal
inesdffaria(at)gmail.com

The post-2008 environment of scepticism and contestation of mainstream banking and finance led to the emergence of alternative monies, alternative forms of peer-to-peer economic exchange and creative forms of social organization challenging established modes of centralised monetary and financial governance.

Bearing in mind the relevance of socialities within economy and monetary systems (cf. Maurer 2006; Graeber 2012), this paper explores decentralised forms of exchange based on the blockchain software – a distributed, immutable, encrypted transaction network that supports bitcoin, the first cryptocurrency (Nakamoto 2008). As a system, this decentralised technology serves as a vehicle for the creation of numerous projects going beyond the notion of cryptocurrencies as cash, especially since programmable monies as tokens appeared. These programmable tokens enable for the transaction of specific assets and services between peers through automated contracts registered on the blockchain ledger.

Inspired by the assemblage of technological and human actors within society (Mackenzie and Wajkman 1999; Latour 2005), as well as by social theories of money and value production (Maurer 2006, 2013) this paper reflects upon tokenised blockchain-based financial exchange projects. The discussion will be grounded on a case study illustration from research carried out in the Netherlands and further virtual arenas. It will explore motivations, pragmatics, and socio-technologic relationalities within virtual worlds, but also projects' relations with specific jurisdictions, mainstream finance and other enterprises within the blockchain ecosystem.

The social value of money? Economic agency mediated by a complementary currency: the case of Sardex.

Giacomo Bazzani
University of Turin - University of Florence, Italy
giacomo.bazzani(at)unito.it

Sardex complementary currency reached, within a few years of activity, a level of turnover and membership to be considered a relevant actor for the Sardinian economy. Sardex is a credit unit with a corresponding value in euros but it can not be converted. The homonym company (Sardex Ltd.) manages the service of lending for business-to-business exchange. Currency involves the island's entrepreneurs in complex forms of socio-economic exchange, competition and cooperation. The device enable a specific form of market regulation and socio-economic exchange with uncommon outputs for markets and economic action. The dimensions of this specific form of regulation are analyzed following the three main problems of market coordination: valuation, competition and cooperation.

The issue of cooperation in the markets concerns the uncertainty about the behavior of other actors, mainly with respect to payments and to the quality of the goods exchanged. Exchanges and markets themselves are enacted only with trust among the actors. The case of Sardex suggests that a currency would be able to develop forms of trust and cooperation between members that exceed the mere exchange of goods and individual utility, but that are also oriented to a collective interest.

Ethnographic research and interviews focuses describe, whether and by what mechanisms, Sardex brings participants to a form of economic action oriented to collective interest by the metaphor of "market as politics". The device helps the coordination between economic actors, opening up new markets and business opportunities, and at the same time, strives to connect them with trust, common sense and pro-social behaviour.

From re-politicization to a de-politicization of finance: the case of the Portuguese parliamentary committees of inquiry

Daniel Seabra Lopes
School of Economics and Management of the
University of Lisbon, Portugal
dseabralopes(at)gmail.com

Politicization is an established concern of the sociology of finance (see De Goede, 2004) which has gained momentum with the 2007-2008 global financial crisis and its sequels (Esposito, 2009; Langley 2013). And yet, though several regulatory changes have since then occurred in different countries, accompanied by a number of national and transnational political movements, it seems clear that we still live in the same world dominated by a few large and loosely supervised trans-sectorial financial conglomerates that began to emerge in the late 1960s — to the point that, as some authors argue, crisis did not occur (Roitman, 2014). This proposal offers an empirical case-study of the politicization of finance by focusing on the Portuguese parliamentary committees of inquiry that, from 2010 onwards, discussed a sequence of national banking crisis that followed the 2008 financial meltdown, thus bringing the political

discussion of financial issues to an unprecedented level in the country. Based on interviews conducted among elected members of Portuguese parliament from different political parties that took part in these committees of inquiry, this communication tells the story of this politicization movement, analyses the perceptions of concrete political actors on financial issues and considers the virtues and limitations of such a public scrutiny. The communication concludes by situating this empirical case-study within the contemporary sociological debate of the politicization of finance, relating it with the issues of technicality, internationalization, and the influence of megabanks.

Negotiating Risk: The Relationship Between Financial Risk Management and Profit

Anne Elisabeth Atlee van der Graaf
Sciences Po, France
anne.vandergaaf(at)sciencespo.fr

This paper portrays the role of financial risk managers as negotiating risk with profit. Standard financial and economic theory put forward that when one wants more financial profit, more risk needs to be taken. Financial organisations have a similar division of labour, with risk management separated from the profit makers. In the social studies of finance, the focus has lied on profit making in finance. While there has been research on financial risk, it has focused on the concept of risk rather than financial risk. The roles of risk managers within large financial organisations remain understudied. Risk management activities could be conceptualised as negative to the profit centres, standing opposite to the risk takers, preventing risky behaviour, but ethnographic data shows a more dependent situation. Based on participant observations, network data of observation locations and 86 in-depth interviews in insurance and banking, the paper shows that risk management is about negotiating with profit makers. The negotiating tools are influenced by the distance to the profit makers and regulatory pressure. With the help of regulatory legitimacy that is given to risk management in regulatory texts, risk management has obtained legitimacy in the organisation. However this legitimacy does not directly extend itself in a control over financial decisions.

RN09 | Session 05a Wealth, Income Distribution and Social Inequality

Perceptions and Preferences Regarding Income Distribution in the Czech Republic: Standing out or Following Suit with Other Developed Countries?

Ivan Petrušek
Czech Academy of Sciences and Charles University,
Czech Republic
ivan.petrusek(at)soc.cas.cz

In this paper, perceptions of existing income inequality and preferences for ideal income distribution are studied in the Czech Republic. Consequently, two

distinct research questions are being addressed. Firstly, how do citizens of the Czech Republic perceive the existing income distribution? Secondly, what income distribution would Czechs prefer? The analysis is based on a representative survey conducted as a replication of two similar surveys carried out in the United States and Australia (Norton and Ariely 2011, Norton et al. 2014), where respondents were to assess proportions of total income/wealth belonging to respective income quintiles and proportions of total income/wealth these quintiles should ideally have. In this paper, I argue that both the perceived income distribution and preferences for ideal income distribution are significantly influenced by economic inequalities existing within a country. Whereas the two studies conducted in the United States and Australia have shown that their citizens enormously underestimate the level of existing economic inequalities, Czechs have on average a relatively accurate perceptions of income inequality in the Czech Republic. Level of economic inequality in these two developed economies is significantly higher than that of the post-communist Czech society. Moreover, my results show that under the Rawls' "veil of ignorance", majority of Czechs preferred income distribution corresponding with the actual income distribution in the country. Again, this is in contrast with findings from the United States and Australia where people favoured more equal society than their own. My research suggests that preferences for more equal societies may not be universal across developed economies.

Preserving and Reproducing Wealth: Economic Strategies and Attitudes of Wealthy Inheritors

Hanna Kuusela
University of Tampere / University of Helsinki, Finland
hanna.kuusela(at)uta.fi

The (post-)industrialization and financialization of capitalism were expected to challenge established elites, replacing the capitalist class with meritocratic managerialism and impersonal ownership. By now, it has become evident that this prognosis was far too optimistic. Wealth inequality has grown markedly in the past decades, the economic elite is still disproportionately recruited from the upper classes, and most recently the work of Piketty has made wealth accumulation and inherited wealth highly discussed topics.

By drawing from public records and semi-structured interviews of wealthy Finnish inheritors, who belong to the top 0,1% earners of their society, the paper explores the composition of this group, its character as an economic actor, and its strategies of reproduction. The paper discusses this group's varying attitudes to wealth; how it should be acquired; what it can be used for; and how it is to be managed and transmitted (Swedberg 2005). By discussing the attitudes and social meanings the extremely wealthy inheritors attach to their wealth (Zelizer 1997) next to their views on economic activity, the paper investigates how social meanings of wealth are linked

to economic decisions.

Approaching wealth not only as possession, but also as a capacity to shape institutions, the paper shows how (the value of) inherited capital is reproduced, secured, and converted to social power and social stratification in a supposedly merit-driven society. The paper discusses how this happens both through social mechanisms (e.g. upbringing, family councils, family values) and economic strategies (e.g. expected return, dividends, tax planning, investment strategies).

The distributive consequences of welfare marketization and tax competition: Comparative findings from European economies

Michael Nollert

University of Fribourg, Switzerland

michael.nollert(at)unifr.ch

In contrast to Latin America, in Europe welfare states use to equalize income and wealth distribution because they reduce primary income inequality by public social transfers and progressive taxation. However, since the 1980s the view gets popular that income taxes are too high and private enterprises offer more innovative, qualitatively better and cheaper services than the welfare state. Indeed, OECD data indicate that private social (mandatory and voluntary) expenditures are increasing as opposed to public social spending. Although criticism is sometimes voiced against the privatization of social welfare and oligopolistic market structures, the effects of the drift from public to private social benefits are hardly examined. Also, according to IMF (2014) the median top personal income tax rate (based on a large group of economies across the globe) dropped from 59 percent in 1980 to 30 percent in 2012. However, only few studies analyze the impact of trends in tax system on redistribution.

The presentation focusses on three issues: First, the question is whether and to what extent welfare markets reimburse the victims of neo-liberal capitalism. Second, the question arises as to whether and to what extent private social expenditures affect economic inequality at all. Indeed, the few existing empirical analyses suggest that private social services don't imply an equalizing effect. Finally, the focus will be on whether and to what extent current tax reform erodes the redistributive effects of the welfare state.

Does Believing in Mobility translate in less Sensitivity towards Distributional Inequality?

Licia Bobzien

Hertie School of Governance, Germany

l.bobzien(at)phd.hertie-school.org

Intergenerational income mobility and income inequality are negatively associated in a cross-country perspective—tellingly illustrated by the Great Gatsby Curve. The pledge that a more unequal society comes along with greater opportunities for all individuals stands in stark contrast to this result. While literature identifying determinants of redistributive preferences

shows that mobility beliefs are an important factor when it comes to the question to what extent inequality should be equalized, the question follows why individuals seem to tolerate immobility of incomes and simultaneously high levels of inequality.

This paper tests the possible explanation that procedural beliefs and inequality perceptions do not match the empirical association the Great-Gatsby-Curve uncovers. It is asked to what extent procedural beliefs influence distributional perceptions and to what extent this mechanism is framed by welfare state regimes. To do so, a pseudo-panel analysis based upon two waves (of the International Social Survey Programme (1999 and 2009) is conducted for 23 European countries to explicitly match individuals in structurally identical positions. This allows to investigate if changes in procedural beliefs drive changes in inequality perceptions and offers the advantage to compare cohorts across countries and across time by eliminating time-constant unobserved heterogeneity between cohorts. Results indicate that variation in procedural beliefs as well as variation in experienced mobility can explain variation in distributional inequality perceptions within cohorts over time. That is, believing in a less mobile society makes cohorts more sensitive to distributional inequalities. The felt Great-Gatsby curve is reversed; believing in mobility is related to perceiving less inequality. Cross-country variation may be institutionally framed.

RN09 | Session 05b Firms, Platforms and Work Organization

Small training firms matter. How do they deal with the tension between production and training?

Carmen Baumeler, Nadia Lamamra

Swiss Federal Institute for Vocational Education and Training, Switzerland; Swiss Federal Institute for

Vocational Education and Training, Switzerland

carmen.baumeler(at)ehb.swiss,

nadia.lamamra(at)ifffp.swiss

In collective skill formation systems such as Germany, Austria, and Switzerland, firms, state agencies and intermediary organisations work together to provide vocational education and training (Busemeyer & Trampusch, 2012). From the standpoint of economic and organisational sociology, all firms are coined by their context and depend on the institutions, norms and ideas that exist in society (Mikl-Horke, 2011). Regardless of their size, all training firms are situated in an area of conflict between production and training. Due to rising cost pressure in the last years, this tension has increased.

In Switzerland, nearly one in every five companies trains at least one apprentice. However, this training activity is unevenly distributed when one considers firm size, with small and medium sized companies responsible for most apprenticeship training. Around 70% of all apprentices were trained in companies with fewer than 50, but 40% in micro-firms with fewer than ten employees.

As Granovetter (1984; 1973) showed, small firms are highly relevant when it comes to providing work places. Despite the importance of these firms, not much is known about their everyday challenges when fulfilling their double mission of production and training. Therefore, we ask the following research question: How do micro-firms deal with the tension between production and training requirements?

We analyse nine learning sites in micro-firms to assess everyday workplace training conditions. Conducting semi-structured interviews with workplace trainers, we were able to analyse the everyday workplace training and to identify the various strategies used to fulfil their double mission.

Surviving through generations. The generational turnover process in family-run firms

Lia Tirabeni

University of Turin, Italy
lia.tirabeni(at)unito.it

As the most common form of organization, particularly among small and medium-sized enterprises, the family-run firm is crucial in creating economic and social wealth. However, family-run firms usually face big challenges to survive and prosper across generations. Particularly problematic is the generational turnover: there are many businesses that struggle, unable to face and overcome this challenging moment.

The aim of the paper is to investigate the generational turnover process analyzing four Italian long-lived firms and their generational turnover processes. Each one of these firms has gone successfully through this process more than once.

The research question concerns: how is the ultimate candidate chosen? What kind of process drive this choice? In what ways is the successor chosen, especially if more than one candidate is eligible?

I adopt a qualitative methodology, specifically in-depth interviews, documents analysis, and field observations. As research strategy, a case study method with a multiple-case design approach is chosen.

By analyzing the empirical data, I first identify common recurrences and typical paths. Later, drawing on the classical Simon's decision-making process, I identify the generational turnover process as composed of (i) three stages, when only a potential successor is present; or (ii) four stages, when there is more than one individual. Then, I highlight some specific aspects of both the cases. Finally, I make some propositions in order to address future research and provide practical implications.

Changing preferences? German employer associations in the "asylum crisis"

Marcus Kahmann

Institut de Recherches Economiques et Sociales (IRES), France
marcus.kahmann(at)ires.fr

Between 2015 and 2016, 1.2 million refugees arrived

in Germany. Employers and their organizations engaged in the large civil society coalition that emerged in the summer of 2015. Comparative research has shown that employer associations contribute to shaping labour migration policy, be it within the Common Market (Menz, 2005) or with regard to third-country migrants (Menz, 2009). It has argued that the preferences of labour market interest associations reflect the national productive system they are in embedded in.

This contribution sheds light on German employer associations' policy preferences in the context of the "asylum crisis". Unlike labour migration schemes, asylum procedures select people on non-economic grounds. How, then, can we account for the apparent shift in policy preferences?

This paper argues that employers' support for the liberal application of asylum policies and the resulting labour market mismatch hinges on a double bet (Kahmann & Hege, 2016) The first is to favour the development of institutions and mentalities corresponding to an "immigration society". The second is to recover a part of the asylum seekers and "tolerated refugees" (Geduldete) as qualified workers. The new possibilities to secure their status via employment testify of the rise of work as a deservingness frame in EU-integration policies (Chauvin et al. 2013). Employer associations have been a significant actor in these changes, suggesting that future research needs to go beyond a focus on employer preferences in admission policies.

Exploring the potential for collaboration and inclusion in the new economy: the case of digital work platforms

Markieta Domecka, Darja Reuschke, Pelin Demirel, Paul Walland, Brian Pickering

University of Southampton, United Kingdom;
University of Southampton, United Kingdom;
University of Southampton, United Kingdom;
University of Southampton, United Kingdom;
University of Southampton, United Kingdom
m.domecka(at)soton.ac.uk, d.reuschke(at)soton.ac.uk,
p.demirel(at)soton.ac.uk, pww(at)it-
innovation.soton.ac.uk, jbp(at)it-innovation.soton.ac.uk

With the rise of digital work platforms, such as AMT, Upwork, Freelancer and others, the importance of online marketplaces has dramatically increased. Whereas new technologies brought about the potential of collaboration and inclusion by overcoming the traditional axes of discrimination, the dynamics of platform economy outpaces regulatory efforts, which may simply contribute to exploitative work arrangements, disempowerment of workers and the reproduction of social inequalities. Currently, a significant power imbalance exists between digital intermediaries, customers and workers. The intermediaries enforce platform rules that shape the ways work is commissioned, performed, paid, and evaluated. This development encourages a culture of competition rather than collaboration, creating new lines of rivalry among freelancers competing for

projects/tasks in global markets and among digital intermediaries competing for market share. Within the framework of agency and structure debate and on the basis of empirical analysis, this paper will explore whether and how digital work platforms facilitate or hinder collaboration and inclusion. Analysing, on the one hand, structural powers of control and regulation and, on the other, the agential powers of self-organisation resulting in platform cooperativism, it will be demonstrated how digital marketplaces may develop their participatory, collaborative and inclusive potential. The empirical work comprises data collected through in-depth interviews and focus group discussions with freelancers, platform owners, academic and business experts in the UK. From these conclusions about co-creation in online marketplaces, business models of digital work platforms and their social impact and policy implications will be drawn.

RN09 | Session 06a Poverty, Decommodification and Aid

The subjective wellbeing of those vulnerable to poverty in Switzerland

Jehane Simona

University of Neuchâtel, Switzerland

jehane.simona(at)unine.ch

This paper investigates how being in-between poverty and security impacts the level of subjective wellbeing of those concerned by this position. While the concept of poverty has been widely explored and analysed, people being vulnerable to poverty and who are struggling to maintain a certain standard of living are often neglected. The vulnerability to poverty measurement allow to capture people living in this precarious situation. The case of Switzerland is interesting as, compared to its neighbours, the country is doing well economically and has one of the highest level of quality of life. The research question is thus the following: "How is the level of subjective wellbeing affected by being vulnerable to poverty in Switzerland?". In this research, we first look at this particular group of the population and compare it to those in a secured position and to the poor. In a second time, we analyse the effect of being in this position on the level of subjective wellbeing. The main hypothesis is that strong difference in terms of wellbeing will be found comparing the three groups (secured, vulnerable and poor).

In order to analyse how being vulnerable to poverty impacts the level of subjective wellbeing, we use a longitudinal database, the Swiss Household Panel (available since 1999 onwards). In this paper, we run our analysis (OLS model) on the last available wave, that is to say, 2015. For the construction of the vulnerability to poverty indicator, we will be using data from 2010 to 2015.

How do networks of mutual aid extinguish poverty in Russia: intergenerational perspective

Mayya Shmidt

National Research University Higher School of

Economics, Russian Federation

Mashmidt_1(at)mail.ru

Due to current economic crisis, the supply of resources that State can targetly spend on social transfers, diminishes. Targeting is disturbed, transactions are often directed to categories rather than households. Furthermore, the information about population incomes (judgments about who falls under the definition of poverty are based on this information) are often fictitious due to the shadowiness of labor activity. State can select the only operational definition of poverty, based on economic poverty measure. Networks, however, support families in need without taking into account their degree of recognition as such by the State. This paper departures from the assumption that actual well-being lies in the possibility of both social capital accumulation and inclusion in the social networks that provide 'collective survival', rather than in income level.

The objective of this contribution is to describe the patterns of extinguishing poverty by addressing reciprocal exchanges within social networks. Study provides explanatory models of legitimation of getting aid in the intergenerational perspective. Related to the general purpose, the main tasks to be accomplished could be confined to: (a) determine composition of resources, that circulate within the network of mutual aid and heterogeneous composition of donors and recipients; (b) determine differences in mobilization of networks to conquer poverty of its members depending on their age and causes of becoming poor (c) determine how does young adults and seniors legitimize eligibility for getting assistance. Thus, by presenting the qualitative descriptive model of exchange practices within contrasting age groups, this study gets a relatively novel picture of "web of reciprocity" that accompanies the daily life of the poor.

Explaining differences between income poverty and material deprivation

Jonas Frederik Beste, Mark Trappmann

Institute of Employment Research (IAB), Germany;

Institute of Employment Research (IAB), Germany

jonas.beste(at)iab.de, relevanteemails(at)gmail.com

Poverty research often relies on household resources as measured by equalised household income. This approach implicitly assumes that a household rationally uses its income to improve its welfare and there is no considerable regional variation in price levels. Evidence suggests that these assumptions may not hold. An alternative approach directly measures a household's standard of living and defines households below a certain threshold as deprived. This study focuses on the inconsistency between the two approaches. Which households are deprived despite having sufficient income and which are able to achieve a sufficient standard of living despite income poverty? Data from the German panel survey "Labour Market and Social Security" (PASS), which focuses on welfare receipt and labour market participation, are used to investigate mechanisms leading to these two

types of incongruity. The findings indicate that education, social networks, personality traits and individual health influence poverty transmission and that the influence of regional price levels is surprisingly small.

Just My Luck! Can Random Selection Dampen Hubris?

Joël Berger, Rost Katja
University of Zurich, Switzerland; University of Zurich, Switzerland
berger(at)soziologie.uzh.ch, rost(at)soziologie.uzh.ch

There has been a debate on whether manager selection through competition fosters hubris in the successful applicants (e.g. Hayward & Hambrick 1997). As an alternative selection procedure, which should not give rise to hubris, a combination of performance selection and random selection has been suggested (Frey & Osterloh 2016). Although there is ample indirect evidence for the hubris hypothesis (e.g. Homberg & Osterloh 2010), it is nearly impossible to directly test the hypothesis with field data. This holds even more for the question of whether a combination of performance selection and random selection could solve the problem.

In the experiment, subjects will be selected as group-managers. In the random selection treatment (i.e. the control treatment), the group-manager will be selected randomly. In the performance selection treatment, the highest-performing subject will be selected. In the performance/random selection treatment, a combination of both selection methods will determine the manager. Then, hubris will be measured. For this purpose, the managers (and also the other group members) will divide a sum of money between themselves and the other group members (behavioural measure). Additionally, the subjects will answer the hubris sub-scale of the Narcissist Personality Inventory and the Self-Efficacy-Scale and they will state their perceived fairness of the selection rule.

The experimental design will allow us testing whether performance selection fosters hubris in the selected individual (1), whether a combined performance/random selection method dampens hubris as suggested by Frey & Osterloh (2) and it will additionally provide us with a fairness evaluation of the different selection methods (3).

At the time of writing this abstract, no data has yet been generated.

The public support towards entrepreneurship in Belarus: we are all a little bit puzzled

Iryna Andras
Belarusian State University, Belarus
iryna.andras(at)gmail.com

In post-Soviet economies like Belarus social integration of entrepreneurs is overly dependent on

public opinion. Public opinion surveys on entrepreneurship are conducted with a small number of issues under discussion by selectively questioning the overall population. The empirical base is the republican opinion survey Belarus-2030 conducted by the Institute of Sociology of National Academy of Sciences of Belarus (Minsk) in 2014. A representative quota sampling with elements of random selection was used to choose respondents. The sample volume is 1495 respondents. According to this research, the most significant problems for small and medium businesses in Belarus are the insufficiency of start-up budget and working capital (40.3%), corruption of the authorities and officials (39.7%), administrative burdens in the areas of registration, licensing, etc. (32.1%). In the years to come, in terms of providing a favorable business environment, it is necessary to provide ease of opening business (36.8%) and legal stability, transparency (34.1%), to increase accessibility and quality of state services for business (30.6%). The current situation in Belarusian economics towards entrepreneurship is "rather favorable" (27.8%) and "favorable" (9.6%), "rather unfavorable" (25.1%) and "unfavorable" (8.8%), 27.7% of respondents were undecided, 0.8% did not answer. The population considers that entrepreneurs contribute to the development of economy (79.5%), pay taxes (75.5%), create new jobs (77.3%). However, 36.2% of Belarusians have a positive attitude towards entrepreneurs, 35.7% – neutral, 9.9% – negative, 17.8% – undecided, 0.4% – no answer. Thus, Belarusian public opinion highly appreciates the economic role of entrepreneurship, but Belarusians are uncertain about entrepreneurship as a phenomenon as a whole.

Costs of informal networking in the South-East Europe: an empirical investigation

Adnan Efendic, Mirza Mujaric, Nenad Markovic
School of Economics and Business University of Sarajevo, Bosnia and Herzegovina; Center for Interdisciplinary Social Applied Research, Bosnia and Herzegovina; Law Faculty "Justinian I", UKIM Skopje, FYR Macedonia
e.adnan(at)cisar.ba, m.mirza(at)cisar.ba, nenad.markovic(at)gmail.com

As the core pillar of informal institutional environment, informal networks serve variety of purposes, from exchange of information, experience and ideas between agents to provision of goods, services, and favours that are not freely exchanged on the market. Establishing, maintaining and expanding informal networks is not free. While the existing literature investigates transaction costs of formal institutions, informal costs of networking remain a neglected dimension. This paper discusses costs of informal networking of established businesses in a South-East European (SEE) region. The paper is based on quantitative and qualitative data coming from 56 semi-structured interviews conducted in five SEE countries: Albania, Bosnia and Herzegovina, Macedonia, Serbia, and Slovenia.

The paper starts by investigating the presence and purpose of informal networking, since many studies indicate a widespread informality in SEE region, mainly created as a substitute for inefficient formal institutions. The main research attention is on informal networking costs; this work provides information on their respective size, structure and a comparative dimension for different sub-samples. We also investigate how these informal costs are associated with networking in terms of size and type of informal networks (e.g. strong vs. weak ties). In addition, the research links the size of informal costs to the interplay between formal and informal institutional environments in these countries.

Work experiences and attitudes towards work of long-term Romanian migrants

Alin Croitoru

Lucian Blaga University of Sibiu, CeSMiG University of Bucharest, Romania
alin.croitoru(at)ulbsibiu.ro

The presentation explores the adaptive nature of work values and attitudes towards work in the case of Romanian people with international migration experiences. Using a qualitative approach based on in-depth interviews conducted with low skilled returnees, the analysis is built on the idea that long-term migration experience (at least 5 years abroad) influences people's attitudes towards work and affects their work values. Usually, scholarship done in migration studies emphasizes differences in attitudes towards work between natives of the county of destination and immigrants, but this presentation is rather focused on the evolution of work values and work experiences before, during and after migration. Returnees' subjective stories about work in Romania and abroad will constitute the raw material for differentiating between different types of migratory experiences. A special category of migrants includes people who emigrated immediately after completing their education and who had their first work experiences abroad and not in Romania – in this case the transition from education to work is overlapped on their migration experience. At the same time, the presentation will analyze if human capital related to work is transferable from one national context into another (from origin to destination and vice versa). On the one hand, the preliminary analysis of the qualitative data allows us to propose a tentative typology of returnees' work trajectories related to these three periods of time: before, during and after the experience of migration. On the other hand, we emphasize how the migration experience reinforced or changed returnees' work values and attitudes towards work.

Boxing in stem cells. Innovation and issues of regulatory commensurability between stem cells and biopharmaceuticals.

Saheli Datta

King's College London, United Kingdom
saheli.1.datta(at)kcl.ac.uk

This paper considers the prospects for innovative stem cell therapies from the regulatory perspective. Currently, regulations and norms governing stem cell therapies are the same as for biopharmaceuticals although some incremental reconsiderations are underway. In this paper, I first argue that stem cells are a disruptive innovation. Drawing on firm level data of approved stem cell therapy producers worldwide including financial statements and staffing data, the study shows that stem cells production processes are disruptive- they run parallel to existing (bio)pharmaceuticals production systems, pivot towards new entrants and new end-users at the lower-end of the market, introduces goods inferior to existing ones and gains first-mover advantages (Christensen, 2000; Markides, 2006). This leads to and supports the second claim that the intrinsic incommensurability between the science and production of stem cells and biopharmaceuticals raise substantial issues of regulatory incommensurability when existing 'biopharmaceutical' regulations are used to govern stem cells. Drawing on regulatory data from drugs regulators worldwide particularly the USFDA and EMA I show that regulatory incommensurability's exacerbated by weak regulatory adaptation mechanisms in science regulation systems are weakening prospects of scientific discovery which is challenging as "science [is] contorted to fit the regulation, rather than the other way around" with unknown prospects for science that "will [not] lend itself to this sort of revision" (Gottlieb & Klasmeier, 2012). Yet, the extent to which regulatory adaptation mechanisms will be able to modernise the more difficult areas of stem cell therapies like 'autologous use' (using patients own cells for treatments) will depend on political will for transformative structural change (e.g. scientific authority) that is likely to be a political process as disruptive as the science of stem cells.

Economic Environment and Innovation Activities of the Small and Medium-sized Enterprises in Hungary

Gergely Horzsa, Ágnes Györi, Ágnes Czako
Corvinus University of Budapest, Hungary; Corvinus University of Budapest, Hungary; Corvinus University of Budapest, Hungary
horzsagergely(at)gmail.com, agnes.gyori(at)uni-corvinus.hu, agnes.czako(at)uni-corvinus.hu

In recent decades, a lot of theoretical and empirical researches have been focused to corporate innovation activities. International researches show that innovation is a key factor of company's competitiveness on the market. Researches provide information mostly on R&D activities within multinational companies but information is scarce about innovative activities of SMEs. Empirical studies show that the rate of innovative SMEs in Hungary is very low – even if we take the knowledge-intensive

sector into account. Our research project focuses on the following question: What are the types of innovative activities of Hungarian small businesses and what possible environmental factors can slow down Hungarian SMEs' renewal. Our study is based on a survey conducted in 2017 with a random sample of about 1,000 small and medium-sized enterprises in Hungary. We ran regression models and performed cluster analyses to identify firm profiles. Preliminary findings show that the innovative behaviour of the Hungarian SMEs is determined by company's own indicators and the sector depends largely on supporting policies of the national government. It seems, that modernisation problems are largely due to 1) the decreasing amount of financial support on behalf of the state, 2) the fact small companies have no own funds for R&D, 3) and the narrowing scope of markets. Core finding of our study is that successfully accomplished innovations are mainly organisational and/or marketing ones, instead of product developments. The innovative entrepreneurial practices are related to IT development within the company and in the organisations of financial market. Innovative companies implement new financial products.

Stable worlds on cryptomarkets? Resolving the problem of cooperation

Meropi Tzanetakis

University of Vienna, Austria

meropi.tzanetakis(at)univie.ac.at

Cryptomarkets operating on the darknet are a recent phenomenon that have gained importance only over the last couple of years (Barratt 2012, Martin 2014). However, in the meantime they constitute an evolving part of illicit drug markets. Although selling and buying a variety of psychoactive substances on the Internet has a long history, technological innovations enable systematic drug trading on the net. Technological innovations like the combination of anonymising software and virtual currencies such as Bitcoin allow users to proceed with (illicit) drug transactions with almost completely anonymous identities and locations. This paper builds upon Beckert's (2009) social order approach to explore how the coordination problem of cooperation is being resolved by social practices of users of cryptomarkets in order to allow for 'stable worlds' (Fligstein 2001). The cooperation problem refers to an asymmetric distribution of information and freedom of choice regarding price, product quality and possible intentions of exchange partners. Social practices of cooperation help to reduce the social risks entailed in the exchange process. To explore such social practices, this paper draws on digital ethnography (Coleman 2010) of cryptomarkets, including online monitoring of marketplaces, online observation of various discussion forums related to anonymous drug marketplaces and self-presentations of users on cryptomarkets. Insights into cooperative practices are presented and implications for the trade-off between 'possibility of freedom and necessity of control' (Jasanoff 2004) are discussed.

The Brain Drain in East Asian High-Tech Industry: The Impact of Secular Stagnation on the High-Skilled Labor Outflow from Japan, Taiwan to China

Mayumi Tabata

National Taipei University, Taiwan

mayumi(at)gms.ndhu.edu.tw

With the development of capitalism in East Asia, the impact of stagnation on the East Asian economy and society has become an important topic. This study focuses a mobility of high-skilled labors in the East Asian high-tech industry, and tries to explore the background and reasons for the mobility of Japanese and Taiwanese high-skilled labors from homeland to Taiwan and China. Specifically, it explores the process of the brain drain in the East Asian high-tech industry and society that was caused by the secular stagnation in Japan and wage stagnation in Taiwan. Skilled brain drain from developing countries to developed countries has been the typical pattern of cross-national human resource mobility in the past. However, in recent East Asian industrial society, high-skilled labor outflow from developed countries to technological developing countries is becoming the dominant pattern due to a serious economic slump in developed countries. The field study shows that Japanese regime of accumulation and human resource management collapsed during the "lost two decades", a considerable number of Japanese high-skilled engineers in major electronics giants were laid off, and some of them transferred their job to Taiwan and Korean companies. Similar situation also happened in Taiwan, Taiwanese high-skilled engineers in high-tech firms were suffered from wage stagnation in the past two decades, started to transfer to China. This study investigates how the stagnation caused damage to the Japanese and Taiwanese regime of accumulation and triggered off a brain drain in East Asian high-tech industry. The findings provide empirical support for a new perspective of Asian capitalism: the role of brain drain from technological developed countries to developing countries in the development of East Asian capitalism.

RN09 | Session 08b Economic Policies and Deregulation

On 'Being Helpful to the debate' - knowledge design of OECD Economic Surveys

Maria Duclos Lindstrøm

University of Copenhagen, Denmark

mdl(at)soc.ku.dk

The OECD-publication "Economic Surveys" has since 1961 monitored the economies of OECD's member countries (and selected non-members) to identify policy areas where the countries seem to be underperforming and to suggest policy action. As such, they are an important instrument for the OECD to promote the organization's cross-comparative, evidence based policy paradigm to both publics and

governments. As research objects, the surveys offer a way of entry into understanding how the OECD operates as a knowledge organization deeply engaged in intergovernmental policy coordination, peer review and policy development. The paper will present a detailed institutional ethnographic analysis of how the Economic Surveys are drafted and designed to “be helpful to policy debates” within and across OECD’s member countries. Empirically, this account draws on interviews, document analysis and observations from the intergovernmental peer review sessions at the Economic and Development Review Committee (EDRC), as well as from the redrafting-sessions where OECD-secretariat and the country under review meet to negotiate a final draft of the survey. Dorothy E. Smith’s institutional ethnography provides a theoretical framework for analyzing how texts coordinate institutional action and a set of methodological guidelines for how to trace what Smith calls “the intention of the text”. This enables the analysis to move from the close attention to the micro processes and negotiations of the survey text and its policy recommendations to an empirically grounded analysis of how OECD’s economic surveys and the ongoing monitoring practices of peer review partakes in intergovernmental processes of policy coordination and economic governance.

The impact of economic deregulations and income disparities on contemporary societies. Methods for redistribution, regulation and counteraction for social stratification.

Lukasz Kiszkiel, Katarzyna Winiecka
University of Bialystok, Poland; University of Bialystok, Poland
lukaszkiziel(at)gmail.com,
katarzyna.winiecka(at)gmail.com

The main aim of this article is to demonstrate the causes and effects of progressive economic inequalities that afflict the inhabitants of the modern world.

Growing each year economic stratification in many countries is such a pressing issue that even the World Economic Forum, organized in 2014 in Davos, recognized it as one of the most dangerous threats to social order in oncoming years.

Thus, view of liberal economists dominating until recently that “tide lifts all boats” , which is synonymous with the belief that at some point we all benefit from economic growth, and therefore inequality are not a problem anymore proved false. The recent Economic World Crisis is a vivid example. Nevertheless, not all economic inequalities are harmful. Some of them are straight out essential for the economy, in order to stimulate the height and progress, to award talented, to appreciate hard work and ambitions. However, the extreme levels of wealth concentration occurring today, undermine the idea of equal opportunities, making societies even caste. Today, almost half of the world’s wealth is owned by one percent of the population.

Issues cited above are the core of the discussion

presented in the article. Considerations are conducted on the basis of sociological discussion and ambient data from empirical studies that relate to the aforementioned problem (R. Wilkinson, K. Pickett (2009); G. Therborn (2013), T. Piketty (2014)). Additionally, the authors focus on a review of the proposed solutions for this global problem and make their own evaluation.

The Making of Economic Policy: A Case Study

Edwin Sayes
Nazarbayev University, Kazakhstan
edwin.sayes(at)nu.edu.kz

How is economic policy made? What counts as evidence in the context of economic policy? How important is economics as a discipline in the making of economic policy? What role might sociology have in the making of economic policy? This paper presents an initial set of responses to these questions. In particular, it reports findings from a case study of multiple public sector institutions within a single Australiasian jurisdiction. This case study focused on public sector research related to economic productivity, policy proposals related to productivity, and formalised policies related to productivity. This research was undertaken with the partnership of public sector institutions in this single jurisdiction and utilised qualitative methods (including interviews with public sector officials and analysis of key documents).

In-house or outsourced public services? A social and economic analysis of the impact of spending policy on the private wage share in OECD countries

Nicola Pensiero
UCL Institute of Education, United Kingdom
n.pensiero(at)ucl.ac.uk

Over the past three decades, the involvement of private firms in the provision of public services, through the government’s outsourcing, has grown and the private wage share of income has simultaneously declined. This paper analyses the relationship between the two phenomena from a political economy perspective. The proponents of power relations theory have not paid much attention at the consequences of the different spending programmes for the bargaining relations between labour and capital. We know that welfare state systems counteract the capitalist tendency to treat labour as a commodity, yet an in-depth analysis of the consequences of spending programmes on the bargaining relations between capitalists and labour is lacking. Building on this tradition of research, this paper analyses for the first time how the different components of government spending affects the distribution of income between capital and labour. I distinguish between types of expenditures that enhance the bargaining position of labour – i.e. unemployment benefits and public sector employment - and labour-saving and pro-business types of expenditures – i.e. government outsourcing to private firms. The results are derived from various

panel regression techniques on a panel of 19 OECD countries in the period 1985-2010 and show that expenditures on public sector employment prevented the wage share to decline further, even after controlling for labour market institutions, globalisation and technological change. Conversely, expenditures on outsourcing substantially contributed to reduce the wage share. Implications for theory and policy are drawn, including the support for a public employment-led spending policy. If the goal is to reduce inequality, expenditures on public sector employment should grow faster than expenditures on outsourcing.

**RN09 & RN34 | Session 09a JOINT SESSION:
Capitalism, Solidarities and Religion: The Market
as Religion and Religions in the Market**

**Happiness Found in Belonging: Relationship
Between Social Well-Being, Participation,
Personal Religiosity, and Subjective Well-Being**

Adam Hamori
Educational Authority, Hungary
hamori.adam(at)oh.gov.hu

Earlier research into social functions of religion suggested that there has been a clear and consistent positive link between religiosity and happiness even when controlled for socio-demographic background. The existence of the link has been empirically evidenced in different contexts, which has been explained by diverse mechanisms both on the theoretical and empirical levels: by economical utility, meaning-giving or compensation functions of religion, quiescence found in prayer, personality traits, and so on. Social participation, civic involvement, or a group belonging in general may also play a role in reducing uncertainties of the surrounding world and thus contributing to subjective well-being. However, some suggest that these micro-level effects might be overruled by, or interact with, surrounding economic context and overall social well-being.

This paper aims at scrutinizing the relationship between subjective well-being, subjective perceived social status, well-being in the wider social context and religiosity in contemporary CEE-countries. The key questions are 1) if denominational affiliation, religious practice and congregational belonging matter in subjective well-being, 2) whether these effects are present if controlled for other types of attachment, and 3) how important the effect of religiosity is if economical well-being in the national context is also considered. All seven consecutive waves of the European Social Survey since 2002 included comparable indicators of subjective well-being, religion, social participation, and socio-demographic status. To answer the above questions, multi-variate statistical methods are applied including indicators of religious identity, religious behavior, social status, social involvement, as well as macro-level economic and well-being indicators characterizing national contexts.

The Relationship Between Religiosity and Informal

Economic Practices in Southeastern European Societies

Danijela Gavrilovic, Jelena Dinic
Faculty of Philosophy Universiti of Nis, Serbia; Faculty of Philosophy Universiti of Nis, Serbia
danijela.gavrilovic(at)filfak.ni.ac.rs,
jelendzi(at)yahoo.com

The dominant religions in the South-East European countries (Slovenia, Bosnia and Herzegovina, Macedonia, Albania, Kosovo, Serbia), Islam, Catholicism and Orthodoxy, contain social teachings and norms which regulate certain forms of economic practices. In the conditions of transition and orientation towards the EU, postsocialist societies, these ones included, develop various forms of informal institutions (Aliyev, 2015; Burawoy and Verdery, 2000; Grødeland and Aasland, 2007; Ledeneva, 1998, 2013; Smith and Stenning, 2006; Stark, 1992, 1996; Wedel, 1986, 1992), economic ones as well, with some of them being contrary to the elements of religious social teachings and religious ethics. In the process of the revitalization of religiosity after the fall of socialism in this region (Zrinščak, 2004), a question can be posed on whether the attitude and the application of certain informal economic practices, which range from the illegitimate to the illegal (corruption, tax evasion, employment through connections), correlates to some extent with the level of religiosity and the type of religion confessed in certain countries, as expected.

Following a concise overview of the work ethic elements of the religions present in the observed countries (Islam, Orthodoxy, Catholicism) with regard to the dependent variables, i.e. informal economic practices, the paper considers the relationship between these variables on the basis of the data from the empirical research conducted within the Horizon 2020 project entitled "Closing the Gap Between Formal and Informal Institutions in the Balkans", no. 6935237 (6200 respondents from the abovementioned societies).

**Commodification of spirituality? The case of
mindfulness in times of mediatisation**

Marta Kolodziejska
University of Warsaw, Poland, Poland
ma.kolodziejska(at)gmail.com

This paper presents the results of a preliminary study of the relationship between mobile application use and the mediation of spiritual practices. I will focus on the growing popularity of mindfulness and its commodification through the development of mobile apps (such as Headspace and Buddhify). While mindfulness is rooted in Buddhist meditative practice, its increasing popularity is related to its effectiveness in increasing one's cognitive skills, empathy, concentration, etc. and reducing symptoms of anxiety and depression, which has been shown in several studies (most famous ones done by Jon Kabat-Zinn). Mindfulness has also been appropriated by positive psychology, becoming a part of contemporary therapeutic culture. I will argue that through

appropriation by various apps and digital media in general, mindfulness can be considered a posthumanist practice distilled from its religious connotations through commodification, which is used for improving various areas of one's life, and represented as a form of self-management. Furthermore, since contemporary app design deploys the knowledge of neurological and psychological mechanisms in order to create attractive and "addictive" products, it can also be argued that the popularity of mindfulness can be partially attributed to it fitting the agenda of long-term customer engagement. The presentation will end with an open question of the possible effects of the relationship between mobile apps and contemporary spiritual practices.

'Credit for Need': 'Need' and 'Necessity' as Moral Bases of the Financialisation Process in Turkey

Ferda Nur Demirci

Koç University, Turkey

ferdanurdemirci(at)gmail.com

Financialisation is intensifying by resulting in differing models in different geographies, in accord with local contexts by replacing moral attitudes towards economy and finance. In Turkey, there has occurred the invention of a specific type of consumer credit as a result of this process; the 'credit for need', and it has dominated the all other financial instruments after its invention in 2006. Today, the number of debtors who utilize this credit has reached to 10 million. In addition to the tangible domination of this type of credit, it is a turning point for the financialization of Turkish daily life in terms of its contribution to renovate moral attitudes towards finance.

With the strategic utilization of the notion of need in the financialisation process of Turkish economy, there has emerged a new moral discourse that mainly refers to the urgency of economic needs and the self-reliance of families and households, and paves the way for a harmonious encounter with modern financial instruments, which even bypasses the religious anxieties towards finance. By relying on the concept of need, there has occurred a moral re-invention which eliminates the religious discourse that 'engaging with finance is illicit' (because of Islam's prohibition of interest) and it is replaced with a novel moral discourse based on the urgency of familial needs. Accordingly, I will propose to present a discussion that focuses on invention and introduction of the credit for need, the involvement of religious actors into discussion by redefining their attitude towards finance and consumer credits through the notions of needs and necessity, and debtors' reference to the concept of need by explaining their specific reasons to involvement in finance market.

The theory of religious markets revisited: new evidence from Ukraine, 1992-2012

Tymofii Brik

UC3M (Universidad Carlos III de Madrid), Spain

tbrik(at)clio.uc3m.es

The religious market theory states that church completion increases religious participation of people. However, this theory has met a lot of resistance in recent decades. The role of church competition has been particularly criticized by scholars of post-Communist societies. However, prior studies of church competition in post-Communist societies have shared certain limitation including but not limited to using invalid measures and outdated theoretical assumptions. This paper aims to overcome such limitations and to reinforce the argument of church competition. A central argument of this paper is that a specific dimension of church competition in Ukraine, i.e. a nationalistic competition within Orthodox denomination has positively affected religious affiliations, church attendance, subjective religiosity, and praying of people. This effect was theorized to be stronger for respondents who display Ukrainian national identities. These theoretical expectations were corroborated by means of hierarchical regression analysis. The role of within denominational church competition remained positive and significant after controlling for a set of individual and contextual predictors of religiosity. A new dataset of religious communities was merged with the surveys collected from 1992 to 2012 in order to circumvent validity issues, which were common in the previous literature. In contrast to many previous studies, this paper employs the instrumental variable (state regulations) to claim causal influence of church competition on religiosity of people.

RN09 & RS07 | Session 10b JOINT SESSION: Economic Crises and Social Resilience

Examining organizational resilience: how firms in the Russian light industry succeed in turbulent economic environment

Regina Romanova

National Research University Higher School of Economics, Russian Federation

romanova(at)hse.ru

The light industry in Russia has undergone strong transformation after the collapse of the Soviet Union. Lacking the stable orders from the state, light industry firms could not compete with international players. As a result, there was a dramatic drop in production. The future survival of the industry was unclear. However, despite bleak prospects, market uncertainty and an unfriendly market environment, a relevant number of companies not just survived but thrived. This research is aimed to find out how firms "sustained their well-being in the face of such challenges" (Hall, Lamont 2012)?

Organizations are multilevel systems and therefore studying organizational resilience require bridging individual (firm) and system (industry) levels of inquiry (van der Vegt, Essens, Wahlstrom, George 2015). Hence, in our report we will focus on two research questions. First, what are the attributes of these firms, which allow them to distinguish themselves positively

from less successful firms in the industry? Second, what strategies successful firms use in order to respond to external pressures and eventually succeed?

This study uses diverse empirical sources: interview with firm owners and top-managers, group discussions, recorded during Russian light industry forums in 2014-2017 (in total 5 events), World Bank's Business Environment and Enterprise Performance Survey and the Investment Climate Assessment.

Results indicate that in the case of the Russian light industry unstable environment entails different configurations of firms, employing conflicting but equally effective ways of achieving high performance. The findings also stress the importance of interaction between market players during crisis. Constant communication with government agencies, alignment of efforts between companies (and sometimes between competitors) and overall beneficial network position positively affect organizational resilience.

Neo-liberal Economic Policies and Agriculture in Turkey: An Analysis of the Socio-economic Positioning of the Peasant

Emin Yigit, Gulhan Demiriz, Benan Havva Baran
Adnan Menderes University, Turkey; Adnan Menderes University, Turkey; Adnan Menderes University, Turkey

The main dynamics of globalisation, which was decisive over all aspects of social life as well as made its mark in the era since 1970s, consistently creates itself with different appearances in global extent. In a local dimension, on the other hand, the local components are included into the process. With this respect, the neo-liberal policies are a crucial partner of this self-creation mechanism. In Turkey, neo-liberal policies since 1980s affected not only the agriculture and the form of agricultural production but also transformed the rural and its peasant. The dynamics behind all these developments can be stated as the policies of global actors, the demands of global capital as well as Turkey's claim to become an actor within global arena. Inevitable, this process has determined the life-sustaining conditions particularly of the farmer peasants. Hence, it is obvious that the networking between global policies, global actors and nation-states, and the reflections of neo-liberal policies in the local level as a result are the main determinants of the new forms/strategies of life in rural areas.

With this, the main question in the centre of this research is the socio-economic positioning and the experiences of the peasants because of transformation in the type of agricultural production in the case of Turkey's neo-liberal economic policies. The main aim of this research is to analyse changes in farmer peasants' agricultural productions and their socio-economic positioning in the presence of neo-liberal policies and agricultural implementations. Research was carried out in Western Anatolia region of Turkey by using in-depth interview technique.

Financialisation of the Everyday: Financial Resilience and Wellbeing Among Households

Christian Poppe, Unni Kjærnes

Oslo and Akershus University College of Applied Sciences, Norway; Oslo and Akershus University College of Applied Sciences, Norway

christian.poppe(at)sifo.hioa.no, Unni.Kjærnes(at)sifo.hioa.no

Deregulation of the global and national economies during the 1970s and 1980s fundamentally transformed the ways that societies operate and produce welfare. One key idea was that persons and households should take on more responsibility for own welfare by investing and accumulating marketable assets. Growing market values would then lead to more favourable and sustainable financial situations, enabling further investments as well as higher levels of consumption. It would also mean personal freedom from state dependency and a chance to live lives of one's choosing. Thus, financial wellbeing — understood as financial security and freedom of choice for individuals and households — became the ultimate goal for modern welfare states. The route to achieving it went through financialisation; a system where finance has a larger and freer role in the production of economic growth at all levels of society. It included releasing the growth potentials in the private sector by providing a wide range financial products to facilitate asset-building and consumption. Particularly mortgages, consumer loans and credit cards appeared as attractive ways of achieving more welfare quickly. However, such products also introduced new risks and forms of socio-economic inequality. Using survey data from Norway, this paper takes stock of 35 years of household participation in the financialised economy. We ask (i) how sustainable are Norwegian households' financial situation? (ii) What are the impacts of varying degrees of resilience on financial wellbeing?

Crises and social resilience of post-soviet Ukraine: sociological evidences of everyday life consumption and work practices

Olga Vasylyvna Ivashchenko

Institute of sociology NAS Ukraine, Ukraine

Olgivash(at)gmail.com

Crises and social resilience of post-soviet Ukraine: sociological evidences of everyday consumption and work practices

The paper presents sociological analysis of socio-economic state of crisis solum with accent on everyday life practices in terms of social resilience conception.

Prolonged post-soviet crises showed how crises of socialism became post-socialist crises with the biggest concern about involving nonmarket society to the market economy, when goods and services variety together with price liberalization after long term of soviet deficit economy, full employment and specific welfare system shocked soviet people in turn of basic needs and job search.

Crisis actualized accessible consumption, turning everyday routine to problematic deal, which infringe usual life practices the people used to for a long. Search of coping with practices, actualized or invented for living survival inevitably reorganized life routine, changing life style, consuming practices 'wrapping', but even life priorities; adaptation to existence danger and psychological threat. Post-soviet countries present an example of experienced long lasting crisis, beginning from collapse of socialist economy, 80-s-90-s, further stressed by financial crises of late 90-s and 2008-09, coming to the trial of political-economic crisis 2014-2015, as it happened to Ukraine. Sociological monitoring data (1994-2017), official statistics give ground for proving strong social resilience ability of Ukrainian society.

RN10 | Session 01a Drop-out of School

Long and winding roads: the educational trajectories of youngsters at risk of early school leaving in Flanders

Lore Van Praag, Rut Van Caudenberg, Ward Nouwen, Christiane Timmerman
 University of Antwerp, Belgium; University of Antwerp, Belgium; University of Antwerp, Belgium; University of Antwerp, Belgium
 lore.vanpraag(at)uantwerpen.be,
 Rut.VanCaudenberg(at)uantwerpen.be,
 Ward.Nouwen(at)UAntwerpen.be,
 Christiane.Timmerman(at)Uantwerpen.be

While the education has become more important in European societies, increasingly more youngsters are at risk of missing this opportunity to achieve an educational qualification. Combining insights of the fields of study on early school leaving and educational trajectories, in this study, we aim to understand the educational choice making of young people at risk of early school leaving. In doing so, we examine how the educational trajectories of these youngsters are shaped and how these trajectories, on their turn, contribute to the decision to leave school without educational qualification. Making use of qualitative interviews with 34 youngsters in Flanders (northern part of Belgium), who were repeatedly interviewed as part of the European research project RESL.eu, our findings show that the educational trajectories of these youngsters were – in terms of educational choices – very diverse, characterized by frequent, not so logical changes across fields of study, institutions and type of educational programs. These educational trajectories can be seen as the result of a series of short-term inconsistent decisions made during the school career, in which youngsters relied on the information available within their social networks. These social networks were characterized by a lack of knowledge about the existing educational opportunities and with no tradition to search for all information about these options and the consequences hereof. Additionally, choice making seemed heavily influenced by the often insecure living conditions in which these youngsters live. The consequences of such inconsistent educational trajectories are manifold and were found to relate to early school leaving.

Between conflict and consensus: school and family negotiating educational trajectories and

post-school destinations of students at risk of dropping out school

Marta Curran
 Universitat Autònoma de Barcelona, Spain
 martacurran(at)gmail.com

The relation between parental involvement and school success has been a central research theme in the field of sociology of education. In this sense, there is a vast literature that has extensively demonstrated how parental involvement and school-family interactions are highly influenced by social class. There is, however, less research on the actual mechanisms and factors that explain this relation. The aim of this article is to analyze the role of parents in explaining educational trajectories among students at risk of dropping out school at the end of secondary compulsory education. In particular the paper analyses two main issues: firstly, the different parental attitudes, practices and expectations of parents from different social backgrounds, secondly, it explores school-family interactions in negotiating educational trajectories (i.e. grade retention, participating in lower tracks groups) and choice-making processes to post-school destinations. To discuss this, the paper draws on data from a qualitative study based on in-depth interviews with students, teachers and families in four secondary compulsory schools in Barcelona. As a result, a typology of different patterns of school-family interactions is elaborated. This typology demonstrates the effect of class in school-family interactions but also the heterogeneity of attitudes and school-family relationship among families within the same social background.

Vocational and training programs to face early school leaving: representations form young people and policy makers

Judith Jacovkis
 Universitat Autònoma de Barcelona, Spain
 judith.jacovkis(at)uab.cat

Facilitate the return to education to young people with low educational levels is of crucial importance for enlarging social cohesion and economic development in Europe. The objective of this paper is to focus on Early School Leavers (from 18 to 29 years old) that are currently enrolled in vocational or training programmes. The aim of the proposal is to address the following questions: What do young people expect (in educational, labour and social terms) from their participation in vocational or training programmes? What are the expectations of policy makers involved in the provision of these programmes? What is the impact of gender, ethnicity and social class in shaping young people representations regarding these programmes? In order to answer these questions two theoretical perspectives are articulated: Cultural Political Economy helps us to understand the logics and assumptions behind these programmes and the way they may be affecting the expectations of different agents. Life Course Research provides theoretical tools to analyse the changes and continuities in the

subjective interpretation of life courses shaping young people expectations. A qualitative field work has been carried out in Girona (Spain) consisting in life stories with young people enrolled in vocational and training programmes and interviews with policy makers in charge of their design and implementation. Policy documents at regional and European level have been also analysed to frame the political context in which these programmes are implemented. The results point our critical questions regarding social inequalities framing the provision, development and representations of these programmes.

RN10 | Session 01b Higher Education: Challenges and Strategies

The missing link between politicians and social scientists in establishing the EHEA

Jana Heinz

Technische Universität München, Germany

jana.heinz(at)tum.de

Education as the new fault line in society can also be noticed in the area of European higher education (EHEA). Thus, the European Union receives European higher education and research as important stakeholders in the global competition for economic growth and social participation. Consequently, following the Bologna Processes (BP) competitive tools and neo-liberal policies have been incorporated in the name of transparency and need for improvement.

In the framework of these changes, I analyse policy actors' documents and social scientists' articles on the BP and the emerging EHEA. Based on this second-order analyses I ask (1) how relevant actors in policy and social sciences create the EHEA and (2) how they influence each other.

Empirical analyses were conducted by means of discourse analyses of policy reports, such as the Bologna communiques, implementation reports and about 200 articles from social sciences between 2003 and 2015 with a focus on the BP/EHEA.

Results show that generally politicians' reports have no link to social sciences' analyses of the BP and the emerging EHEA, instead, BP actors assign their own statistical research centres to collect data. On the other side, social scientists tend to analyse developments initiated by political actors within discipline specific frames of theories and methods. Similarly, the majority of articles do not go beyond their scientific field by explaining why and how policy could employ the studies' findings. Thus, the picture arises that social scientists predominantly leave the field to politicians in creating the EHEA.

Coping with higher educational expectations: Gender, class and unequal challenges in prestigious contexts

Anne-Sofie Nyström, Carolyn Jackson, Minna Saminen Karlsson

Center for Gender Research, Uppsala University, Sweden; Dept. of Educational Research, Lancaster

University, UK; Center for Gender Research, Uppsala University, Sweden

anne-sofie.nystrom(at)gender.uu.se,

c.jackson2(at)lancaster.ac.uk,

minna.salminen(at)gender.uu.se

This paper explore the challenges of coping with prestigious and competitive HE programmes. How do different learning and social contexts, gender and class, inform students' experiences of stress and strategies manage these? The analysis is informed by sociological stress research and theories about self-worth and social identity. We draw upon data from a large, ongoing, three-year (2015-2018), cross-national (Sweden and England) comparative interview project that investigates student identities, masculinities and academic failure and success in Medicine, Law and Engineering physics. Data are being generated by focus group interviews and individual interviews with students and staff, and analyzed in Atlas.ti using a constructivist grounded theory approach. Our data suggest that these programmes, in part, attracted students because of being renowned as challenging. However, most had not anticipated the challenges in terms of their academic identities; many students had to negotiate a change from being a top student to being an 'average' or 'low' achiever, and many struggled with to find a sustainable work/rest balance. Students used a multitude of strategies which we explore in relation to gender and class; e.g. increased academic effort and withdrawal from other activities, displaying calmness and concealing poor test results, and, also, seeking academic and emotional support from peers. By examining undergraduate stress and well-being in prestigious contexts, we will begin to shed more light on (1) how privilege are maintained, reinforced, and might be challenged, and, also, (2) the pressures and demands on many middle-class young people and the effects on their wellbeing.

The Collegiate Experience and Students' Values

Dwight Neil Haase

United Arab Emirates University, United Arab Emirates

dhaase(at)uaeu.ac.ae

The current political climate in the US is not only anti-establishment, but also decidedly anti-academia. News media commentators have labeled academics the "totalitarian left," and an online blacklist now contains the names of over 100 liberal and leftist professors. And while these anti-academic sentiments currently are waxing, they are not new. For example, Joseph McCarthy targeted academics in his attempts to purge leftist movements in the 1960s, and 12 years ago commentator David Horowitz released a highly publicized book identifying professors he claimed were dangerous because of their liberal views.

In spite of these allegations, no evidence has been shown that college students are being indoctrinated or even swayed by their professors' views. Our research attempts to ascertain what effect the collegiate experience has on students' values by comparing

responses to the World Values Survey questionnaire for students at the University of Toledo with varying years of enrollment in various disciplines. The findings shows that the collegiate experience has little or no effect on personal values, but it has a slight moderating effect on students' political values – reducing the incidence of extreme views on both the left and right. We conclude that certain politicians and commentators perhaps should feel threatened by academics not because their values are diametrically opposed, but because college encourages more nuanced and qualified thinking, which is not conducive to the current wave of populism.

The findings also show that religiosity is the best predictor of college students' values, which the authors discuss in the context of other studies of the collegiate experience and student outcomes.

Practices and strategies of student and their parents for higher education. The case of orientation forums for higher education in “Île de France”

Anne-Claudine Oller, Jessica Pothet, Agnès van Zanten

OSC-LIEPP-Sciences Po/LIRTES-UPEC, France;
2L2S-ESPE de Lorraine-Université de Lorraine; OSC-LIEPP-Sciences Po
anneclaudine.oller(at)sciencespo.fr,
jessica.pothet(at)gmail.com,
agnes.vanzanten(at)sciencespo.fr

If the ratio of access to higher education (HE) has progressed and keeps itself at high levels in France, the real side-effects of HE democratization are small (Albouy, Tavan, 2007). Huge inequalities and disparities persist. Our study proposes to analyze more carefully the strategies and behaviors developed by parents and students during the orientation process to HE.

The enquiry is dealing with the role of families and friends network, scholars institutions and markets for orientation to HE. The analyze will deal with orientation forums for HE of the Île-De-France. This inquiry combines both qualitative (observation of 15 orientation forums) and quantitative (a questionnaire was submitted to 1000 students and 1000 parents visiting orientation forums) methods.

There is a huge over representation of middle classes and middle-high classes, especially in the private pole of middle classes (van Zanten, 2009). Parents turn to a bunch of supports considered as things able to give them skills in the optic of being able to guide correctly their children in their orientation choices.

Orientation forums are identified by parents as a place of information on HE. However, the whole spectrum of HE is far from representing, not only in a fair manner, but also in a way as objective as possible. These forums are places of prescriptions, which, by delegating the social links part in the construction of students' trajectories, are addressed in fine to students from middle and upper class.

RN10 | Session 01c Gender and Education I

Angry white men: Gendered responses to inclusive teacher education

Emily Gray
RMIT University, Australia
emily.gray(at)rmit.edu.au

2016 witnessed a consolidation of a Western brand of 'populist authoritarianism' that draws upon the 19th Century tropes of the shady immigrant, the sexual deviant and the undeserving poor to create 'shared objects of loathing' (Brown, 2006) in the popular imagination. We are witnessing a collective turn away from discourses of equity and inclusion within mainstream politics, and a rise nationalism that positions the (working class) white male as part of a 'silent majority' that has been ignored by successive neoliberal regimes.

This paper engages with the implications of the 'post-truth' era for higher education and reports on a small study carried out with six higher educators who teach compulsory classes based on inclusion and diversity within the practice-based disciplines of nursing and teacher education in Australia. The paper uses the work of feminist theorists to explore gendered responses to pedagogical encounters recounted in the data, and examines aversive responses from white male students that were experienced by participants. I will offer a reading of these experiences that links white male objections, particularly around the teaching of gender and race, to the growth of neoconservatism that precipitated the contemporary rise of populist authoritarianism. The pedagogical encounters that I explore reflect the notion that the white male is a figure that is brought undone by allowing the subaltern to speak. The paper also explores what it means to teach as the Other within the contemporary milieu, as all six participants are queer and/or people of colour.

GenderMINT 4.0 – A Longitudinal Study on Women in STEM Degree Programmes: Transition from High School to University and Disposition

Yves Jeanrenaud, Martina Reutter, Florian Forsthofer, Nina Brötzmann, Rico Krieger, Susanne Ihsen
Technical University of Munich, Germany; Technical University of Munich, Germany; Technical University of Munich, Germany; Technical University of Munich, Germany; Technical University of Munich, Germany
yves.jeanrenaud(at)tum.de, martina.reutter(at)tum.de, florian.forsthofer(at)tum.de, nina.broetzmann(at)tum.de, rico.krieger(at)tum.de, ihsen(at)tum.de

The environment of the study and vocational orientation for women in STEM professions has changed considerably in recent years. Digitization

contributes to the flexibilisation but also to the eradication of the job world. Measures for the promotion of women in STEM lead to initial success and while student and graduate numbers are rising slightly so does the proportion of women. At the same time, socialization-induced changes in attitudes among young women have to be diagnosed, which influence their decisions on life and work.

This educational divide is highlighted by the longitudinal study "GenderMINT 4.0" which started in October 2016 and is funded by the German Federal Ministry of Education and Research (BMBF). It examines the effects of different influences on the study choice and the study success of women in STEM, how gender and diversity-oriented change processes in universities and enterprises work in this context and how the interactions of the various influences on the process of career choices. To this end, a method mix of quantitative and qualitative social research is implemented: Students at High School, STEM students at university, companies and universities are surveyed and interviewed in order to examine the course of studies and the career advancement of women in STEM fields in a deepening and comprehensive manner and to identify relevant cultural and structural changes in universities and enterprises. The results lead to recommendations for the improvement of measures for gender and diversity-related generation of young people and serve the development of a specific further training format for actors in STEM fields. Results from the first wave of surveys are expected to be available in Q3 2017.

Exploring Gender (In)equality in Education in Turkish Schools

Gökhan Savaş

Social Sciences University of Ankara, Turkey

gokhan.savas(at)asbu.edu.tr

The project titled "Promoting Gender Equality in Education" aimed at contributing to the goal of achieving gender equality in Turkey has been developed with the support of and co-financed by the European Union and the Ministry of National Education (MoNE) of Turkey. The project was implemented in 40 pilot schools selected in 10 provinces, namely Batman, Erzurum, İzmir, Karaman, Malatya, Mardin, Sivas, Şanlıurfa, Samsun and Trabzon. The target groups of the projects were teachers, school administrators, inspectors, school counsellors; preschool, elementary school, secondary school, high school students and their parents, and policy makers and NGOs and civil society organizations operating in the field of education and gender. This paper will discuss basic findings and implementations of the project's baseline and needs assessment study whose purpose was to identify and assess the current situation of schools in terms of gender equality and gender sensitive school environment from the perspectives of students, teachers, school principals, inspectors, parents, MoNE personnel in provincial offices, unions and MoNE personnel employed in the central organization. The

study mainly focused on the following questions: What are the views and attitudes of the participants on gender and gender equality? What are the views of the participants on physical conditions of schools and classrooms? What are the views of the participants on school and classroom practices? To what extent the physical conditions and school and classroom practices are gender sensitive in the pilot schools of the project? What are the recommendations of the participants for ensuring gender sensitive schools? Results will be interpreted within the socio-cultural context of Turkish society.

Parents' Engagement in Schooling: Why Do Boys Receive More Support than Girls?

Debora Mantovani, Giancarlo Gasperoni

Alma Mater Studiorum-University of Bologna, Italy;

Alma Mater Studiorum-University of Bologna, Italy

d.mantovani(at)unibo.it,

giancarlo.gasperoni(at)unibo.it

Sociologists of education have devoted relatively little attention to examining whether, and to what extent, parents interact with schools and teachers, on what issues and whether such engagement varies *according to children's gender*. This often overlooked topic deserves to be explored, since students' academic success is closely associated with the degree of parental involvement and participation in school activities. Prior analyses of data drawn from PISA (Programme for International Student Assessment) shows that the parents of female students are significantly *less* likely (with respect to parents of boys) to meet with teachers, even controlling for other relevant variables (ethnic identity, social origins, academic performance). But it has been difficult to identify underlying causes, due to the lack of data concerning parental engagement in PISA databases. Are girls simply less "problematic", or are they being put in a disadvantageous position? PISA's 2015 edition, however, includes significantly more extensive information on parental engagement, pertaining to both support for children and interaction with schools; it appears plausible, therefore, that secondary analysis of PISA 2015 data will be able to shed light on this gender gap, lead to a deeper understanding of parents' engagement, and offer insights about girls' confidence gaps and career aspirations linked to maths and science. The analysis will focus primarily on Italy but will also feature a comparative approach involving other European countries administering the PISA parent questionnaire.

RN10 | Session 02a Educational Changes

Higher vocational education in the age of neoliberal conversion

Goran Puaca

University of Borås, Sweden

goran.puaca(at)hb.se

What is indicative of current developments in higher

education institutions (HEI) is how the terms of knowledge that make up neoliberal rationalities and entrepreneurial practices are gaining influence at the expense of academic traditions. The logic behind these HEIs' practices can be seen as the ambition to offer 'products' in an educational 'market'. Higher vocational education are especially exposed to these changes, in terms of how the selection and organisation of knowledge is closely related to local conditions of assigned relevance and the practical orientation of learning. In Basil Bernstein's terms, 'a horizontal knowledge orientation' is prevailing. This on-going research project investigates current trends in Swedish HEIs. After the 2011 implementation of institutional autonomy reform in Sweden, HEIs have increasingly transformed into new public management-inspired organisations, where adjustments for employability and economic benefits have gained significance at the expense of academic and pedagogic values. The Swedish higher education sector as a whole, however, is characterised by diversity. The current project aims to examine which governing mechanisms and forms of autonomy are apparent in three cases of higher vocational education. The project design aims to uncover analytical distinctions of different actors' perceptions and objectives within the institutional conditions that form the meaning and objectives of education through interviews with academic professionals and decision makers in HEI. The initial results expose the intrinsic relationships among forms of collegiality, professional autonomy and management ideals in how frictions between academic integrity and adaptability to entrepreneurial practices are handled.

A Social Network Analysis of Comenius multilateral partnerships under the Lifelong Learning Programme

Theodoros Zevgitis, Anastassios Emvalotis
University of Ioannina, Greece; University of Ioannina, Greece
tzevgit(at)gmail.com, aemvalot(at)gmail.com

This paper deals with European Education policies as implemented in the Lifelong Learning Programme (LLP) by Comenius multilateral school partnerships. The study is based on a collection of data collected from the European Shared Treasure. The above data was grouped by country, recording the number of partnerships each country formed with other countries. Then the data was processed in accordance with the Social Network Analysis (SNA) theory. The use of SNA gave a new perspective and richer understanding at partnership structures. Calculations such as shortest path, betweenness centrality, closeness centrality were used to analyse the data.

The objective of the analysis was to understand how schools from different countries connected to each other and the relations and patterns they formed. A further aim was to clarify why these patterns occur and what their consequences are. In addition, the analysis was used to identify the countries whose schools played a central role in Comenius

partnerships.

The main results of the analysis showed that the Comenius partnerships help the participants establish strong ties among them. However, the countries with the highest participation in partnerships are stronger networked and are more likely to collaborate with others. Additionally, the analysis revealed the central role schools from countries like Italy and Germany seem to play in partnerships. Specifically, only six countries handle the connection among the 33 countries which only two are distinguished. Finally, Italy and Spain played a central role in partnerships and are more likely to collaborate with other countries.

The National Education Plan and the Challenge of Educational Inequalities in Brazil

Célia Elizabete Caregnato, Leandro Raizer
Universidade Federal do Rio Grande do Sul;
Universidade Federal do Rio Grande do Sul
celia.caregnato(at)gmail.com,
leandroraiser(at)gmail.com

This empirical research analyzes the transformation and expansion of secondary and higher education in Brazil over the last decades, considering the National Education Plan and the challenge of educational inequalities. Despite the rapid growth in the rate of enrollment observed after 2005, factors such as income, cultural capital, ethnicity, gender, and urban-rural areas - are still strongly related to educational inequity process. Also in relation to the labor market, the Brazilian secondary education system appears to be extremely selective, with a low percentage of student workers accessing and remaining at that level of education. Instead, it is necessary to consider the endogenous problems of the system itself: inadequate teacher training, large numbers of students per class, low pay, among others. Another point to consider is the poor quality of education offered (as indicated by several national and international systems of evaluation), and the crucial difference between public and private institutions. In conclusion, the research highlights the existence of a "perverse educational pyramid" in the country that, despite the policies and programs implemented in recent years, persists and reduces the social role of education, shaping a strong reproductive educational system.

Changing Patterns of Governance in Education Today - What Changes? The Case of Greece – An Exploration

Vasiliki Kantzara
Panteion University of Social and Political Sciences,
Greece
vkantz(at)panteion.gr

Many social scientists argue that the recent education reforms following the Bologna Process and other European Union treaties on education aim at improving education. Other scientists, on the contrary, maintain that education is being commodified and inequalities have increased instead of decreased. In Greece, the major educational measures under

conditions of crisis (2009-14), dealt with budgetary cuts and altering management structures. The budgetary cuts affected the provision of education services to several categories of pupils, as for example, preschool, compensatory or special education. At the same time, instead of finding funds for the aforementioned provisions, education policy focused among other things on changing patterns of governance, especially in tertiary education.

At closer look, the changed patterns and structures in the management of education are based on a kind of logic called "formal rationality", according to Weber. New management positions, both academic and non academic were created (e.g., faculty dean, and institution council). Additionally measures were introduced that affected the way work is being controlled, such as evaluation of work performance both at individual and collective level.

The questions I pose in this paper are, What kind of changes are introduced by the recent educational reforms in the structure of governance and what are the consequences?

The answer to the questions above is based on research material from Greece. The theoretical framework draws on the classical theories of Durkheim, and Weber, and on more recent approaches on governance.

The results show that due to the introduced changed, institutional relations of power tend to become more complex and opaque. Educators and students participate in a system that becomes more abstract and depersonalised. Do all these improve quality of education?

RN10 | Session 02b Ethnicity and Schooling

Multicultural School Leadership and The Ethnic Prejudice of Belgian Pupils

Roselien Vervaet, Peter Stevens
University of Ghent, Belgium; University of Ghent, Belgium
Roselien.Vervaet(at)UGent.be,
Peter.Stevens(at)UGent.be

Worldwide migration processes are associated with increasing ethnical diversity of schools in western societies and coincide with a growing number of studies focusing on out-group attitudes of ethnic majority pupils. Research carried out on explaining variability in ethnic prejudice mostly focuses on individual student-level characteristics, neglecting the influence of school leaders and teachers. However, school leaders and teachers are able and have a professional responsibility to reduce ethnic prejudice among ethnic majority students in their schools. This can partly be done by paying attention to other cultures in school regulations, school policy and in the classroom. Many studies offer school leaders and teachers suggestions on how to develop more multicultural attitudes and social behavior, but rarely, the actual effects of these multicultural practices on pupils are examined. Therefore, this study will examine the association between multicultural school

leadership and ethnic prejudice of Belgian pupils in the Flemish context, taking into account individual and school characteristics that have been shown to be related to ethnic prejudice. Multilevel analyses were performed on data from the Racism and Discrimination in Secondary Schools Survey, collected during the school year 2014-2015, including 2006 Belgian pupils in 38 Flemish secondary schools. The analyses showed that the degree of multicultural leadership in schools is not related to pupils' ethnic prejudice. However, Flemish pupils in schools with a more multicultural teacher culture, i.e. where teachers use more examples from a variety of cultures in their discipline, were less ethnic prejudiced.

Understanding the impact of school's ethnic composition on Mathematics results of the students with immigrant origin in primary school

Teresa Seabra, Helena Carvalho, Patrícia Ávila
Instituto Universitário de Lisboa (ISCTE-IUL), Lisboa, Portugal; Instituto Universitário de Lisboa (ISCTE-IUL), Lisboa, Portugal; Instituto Universitário de Lisboa (ISCTE-IUL), Lisboa, Portugal
Teresa.seabra(at)iscte.pt, helena.carvalho(at)iscte.pt, patricia.avila(at)iscte.pt

Scientific interest concerning the impact of school's compositional effect on student performance has intensified throughout the current century, as the subject has been vastly explored by researchers in various national contexts (Agirdag, Van Houtte & Van Avermaet, 2012; Jensen & Rasmussen, 2011; Van der Slik, Driessen & De Bot, 2006; Schnepf, 2007; Goldsmith, 2003, Lleras, 2008). These effects have usually been studied taking student outcomes as measured by standardized tests on different school subjects and levels of education.

In Portugal we conducted a research using an extensive database (16 269 students and 417 schools) with the results of fourth grade students on Portuguese Language national standardized tests in the Lisbon Metropolitan Area (2009-10). We intent to reveal what are the main factors behind students results in public schools giving special attention to the effect of ethnicity, considered both at the student level (its national origin) and at the school level (the schools ethnic composition). A multilevel analysis was developed involving both individual level variables and school level variables to answer the following research questions: Does the schools' ethnic composition effect on Portuguese Language scores stand when students' gender, social and ethnic origins are taken into account? Does this effect stand when the schools' social composition is taken into account? How does the schools' ethnic composition moderate the relation between having/not having an immigrant background and students' Portuguese Language scores, when the socio-economic status (SES) of both students and schools is controlled?

“Does ethnicity matters when we speak of justice in education?”: top-down and bottom-up perspectives on education policies in Lithuania

Kristina Sliavaite

Lithuanian Social Research Centre, Lithuania

kristina(at)ces.lt

Due to demographic processes the general number of school age pupils has been declining in Lithuania in past decades and this led to the restructuring of schooling sector. These processes affected not only schools with Lithuanian (state) language of instruction, but also schools with national minority language of instruction (Russian, Polish). The Amendments to the Law on Education in 2011 equated the state language graduation exam at schools with state and national minority language of instruction. These transformations were met with some protests and critique by some leaders of national minority groups. The paper discusses how these processes are perceived and experienced by different social actors. What is considered as (un)just in education policies by different actors? The paper applies the theoretical approach by N. Fraser and researchers who contribute particularly to the issues of justice in education (eg. C. Vincent (ed.) 2003). The macro level policy might be considered just from a policy planners perspectives, but experienced as unjust in everyday contexts and on micro level. The paper argues that at the micro level the perception of justice is related to identity and recognition. The paper is based on the data collected during qualitative research in the main cities of Lithuania in 2016-2017. This research was funded by a grant (No. LIP-031/2016) from the Research Council of Lithuania.

Class educational styles of Polish communities in the UK

Przemyslaw Sadura

Warsaw University, Poland

sadurap(at)is.uw.edu.pl

One of the rarely addressed issues concerning Polish community in the UK is the question of class differentiation in building the relationship with the British society (Pustulka 2016, Garapich 2008, D'Angelo & Ryan 2011). The paper aimed to fill this gap focusing on class styles of education in Polish communities in the UK.

Poland's accession to the EU in 2004 changed the pattern of migration from Poland to the UK (see Ryan, et al, 2009; Lopez Rodriguez 2010, White 2010). The consequence of this new migration trend was the large numbers of Polish children arriving in British schools: according to the Office for National Statistics in 2015 there were 213,000 Polish nationality residents aged 0-18 in the UK.

The analysis presented in the paper based on the project titled 'Londoner-Pole-Citizen' implemented by the Centre of Migration Research, Poland & Centre for Community Engagement Research, Goldsmiths College, University of London, UK (CCER); Lewisham Borough Council and Lewisham Polish Centre. In the

course of the research 2 IDIs & 4 FGIs were collected. As a comparative material the literature on class diversity of educational styles in UK (e.g. Ball 2003) will be used as well as 200+ IDIs with members of working, middle and upper middle classes collected in Poland during 3 research projects coordinated by the author (Sadura 2015; 2017).

Class style of education is seen as a part of broader category of class lifestyle used by Bourdieu (1984) and his followers. The paper use the empirical analysis to address the theoretical issues of relation between migrant class habitus, Polish/British class structure, the educational system(s) and the state(s).

RN10 | Session 02c School Choice

Believing in culture, complying with competition: educational strategies in the Swedish upper middle class in the time of free school choice

Ida Lidegran, Mikael Palme, Ylva Bergström

Uppsala University, Sweden; Uppsala University,

Sweden; Uppsala University, Sweden

ida.lidegran(at)edu.uu.se, mikael.palme(at)edu.uu.se,

ylva.bergstrom(at)edu.uu.se

The study explores how the strengthened educational competition following in the wake of the market reforms in Swedish compulsory education, with schools battling for pupils and families struggling for entry into the schools of their choice, affects educational strategies in the upper middle class. While a statistical analysis of the space of compulsory education in three Swedish regions suggests that its basic social structure remains stable, it also points to the importance of the educational supply in local educational markets for families' educational strategies (Poupeau 2008, Felouzis et al 2013). In-depth interviews (N=30) with families pertaining to various fractions of the upper-middle class testify to that the increased competition is a concern for families with particularly strong cultural assets. It brings to light a dilemma that traditionally has been obscured, or, to use a Bourdieusean concept, misrecognized (Bourdieu 2000). The beliefs, doxa, connected to the general culture by virtue of which culturally strong fractions have dominated the educational system, such as the perception of education as a sacred dimension of human development, procured for its own sake and understood as a development of inner talents, is challenged by the need to see education as calculated investments in competitive assets, often to the detriment of others. While the necessity of watching over one's interests constitutes a new challenge to the trust in the purity of educational values, giving room for strategic maneuvering in order to secure good company and high marks, the particular balance between the ideals of education as Bildung and as calculated investment reflected in the educational strategies of the upper middle class largely mirrors the opposition between its cultural and economic fractions.

Circuits of power: the regional educational

fractures of the UK and educational trajectories of the south-eastern elite

Sol Gamsu, Michael Donnelly
University of Bath, United Kingdom; University of Bath, United Kingdom
s.gamsu(at)bath.ac.uk, m.p.donnelly(at)bath.ac.uk

A deep and fundamentally structuring fault-line within the British and especially the English educational system runs between the elite institutions of the South-East of England and schools and universities across the rest of the country. Recent work has analysed the concentration of elites in the 'golden triangle' of elite universities concentrated in London and the South-East of England (Wakeling and Savage, 2015). Other research (Gamsu, 2016) has suggested that these elite universities in the South-East are fed by a distinct group of elite 'feeder' schools, both state and private, which are themselves concentrated in and around London. Drawing on and extending the concept of 'circuits of schooling' (Ball et al. 1995) we examine the existence of 'circuits of power' whereby a group of students from privileged backgrounds and elite schools in the South-East of England attend Oxford, Cambridge and certain London universities before returning to the capital for work. Our analysis uses an exceptionally detailed dataset of all university entrants across the UK (n=412,000) for 2014-15. Using social network analysis and spatial, GIS techniques we trace the socio-spatial trajectories of these elite students and show how these circuits of power separate and insulate these privileged students from London and the South-East. Drawing on case studies of private schools in the North-East of England and Scotland we also contrast different trajectories within the middle class across the UK. With the insulation of English elites from the rest of the country a key factor leading to Brexit, this analysis provides a timely reminder of the deep problems of an exclusive, insulated and divided educational system.

Explaining Migrants' Educational Choices in Stratified Education Systems

Christian Hunkler
Max Planck Institute for Social Law & Social Policy, Germany
Hunkler(at)mea.mpsoc.mpg.de

Educational choices are consequential for future education and labor market prospects. Several studies documented substantial differences in educational choices between ethnic minorities and natives. Conditional on performance and social class, they choose more ambitious academic tracks. The dominant explanation is 'immigrant optimism': migrants may be positively selected with regards to ambition, drive, and optimism.

We argue that the literature on EC effects would benefit from addressing two gaps: First, EC effects have rarely been tested in stratified education systems which offer viable vocational alternatives for low performing students at the upper secondary level.

Secondly, the optimism hypothesis has largely been studied neglecting alternative explanations such as information asymmetries or anticipated discrimination. Specifically, we study the educational choices of students at the end of compulsory school in Germany using data from the NEPS, a panel survey that began with ninth graders in 2010. At this stage in German education, students at lower level secondary school types are faced with the decision to either continue general, academic track education or to pursue dual vocational education and training (hereafter "dual VET").

Our results demonstrate that minority students favor academic track education over vocational education alternatives despite the fact that vocational options are more favorable in Germany than in countries with more comprehensive secondary education systems. We find no evidence that migrants 'avoid' vocational education because they lack information or because they anticipate discrimination. In contrast, the findings are consistent with the immigrant optimism hypothesis. We find that – ceteris paribus – transmitted family norms in the form of parental expectations play a key role in explaining ethnic choices.

Not in my schoolyard: School segregation, school preferences and residential segregation in the urban area of Ghent (Belgium)

Thomas Wouters, Nele Havermans
University of Leuven, Belgium; University of Leuven, Belgium
thomas.wouters(at)kuleuven.be,
nele.havermans(at)kuleuven.be

Patterns of segregation can be discerned in the ethnic and socioeconomic composition of schools in Flanders (the northern region of Belgium). Although school segregation is sometimes perceived as the mere result of residential segregation, studies suggest that school preferences of parents can additionally contribute to an uneven distribution of groups between schools. Very little research has however investigated residential segregation and school preferences in one explanatory model of school segregation. This paper examines how residential segregation and school preferences affect school segregation in the urban area of Ghent (Belgium). To answer this research question, we integrate popular theoretical frameworks in the economic literature (Schelling model, market models) with insights from sociology on in-group preferences, cultural and social capital, and residential segregation. Rank-order logit analyses are performed on data of the centrally-administered platforms (CAP) in Ghent. In the CAP, parents indicate their order of preferences for schools in Ghent. As a result, actual preferences can be observed instead of realized school choices. We include variables on distance to school, parents' socioeconomic and ethnic background, neighborhood and school characteristics. Preliminary findings indicate that residential segregation explains school segregation for a considerable part, but parents' preferences for school

composition and school quality also play a significant role. These preferences depend strongly on parents' background. Overall, this study shows that parents' school preferences give rise to self-segregation.

School choice in a context of unrestrained choice: the case of Flanders (Belgium)

Simon Boone, Jef Vlegels

Vrije Universiteit Brussel, Belgium; Vrije Universiteit Brussel, Belgium

simon.boone(at)vub.ac.be, jef.vlegels(at)vub.ac.be

School choice policies have been at the centre of attention in sociological research focusing on the reproduction of social inequalities through education. Studies conducted across Europe have shown that free school choice leads to more segregation. In fact, these mostly qualitative studies show that parents differ in their ability to influence their children's school choices. While middle class parents can activate their social, cultural and economic capital to ensure that their children enrol in the school of their choice, for working class parents choosing a school is a more complicated task.

We want to add to the knowledge on school choice by studying it in a particular context. In Belgium free school choice is a constitutional right, so that there are virtually no limits to the choice set available to parents. Nevertheless, processes of school choice have been neglected, as it is assumed that it matters more which educational option you are in than which school you attend. We will study school choice in a context of unrestrained choice by applying a novel technique stemming from social network analysis – Exponential Random Graph Models. Using unique data from two cohorts of pupils in Flanders we will build a two-mode network of schools and pupils to study the influence of parent and pupil characteristics on school choice. We take into account social class, ethnic background, school performance, home-school distance, school sector and school type. The results will be discussed in the light of findings from studies conducted in other European education systems.

RN10 | Session 03a Teachers and Professionalisation

Frameworking the divide: How teachers view students differently according to the program they attend

Ines Elezović, Maja Jukić, Matija Batur

National Centre for External Evaluation of Education, Croatia; National Centre for External Evaluation of Education, Croatia; National Centre for External Evaluation of Education, Croatia

ines.elezovic(at)ncvvo.hr, maja.jukic(at)ncvvo.hr, matija.batur(at)ncvvo.hr

ines.elezovic(at)ncvvo.hr, maja.jukic(at)ncvvo.hr, matija.batur(at)ncvvo.hr

ines.elezovic(at)ncvvo.hr, maja.jukic(at)ncvvo.hr, matija.batur(at)ncvvo.hr

Selection of secondary school is the decision highly determined by numerous background and often subjective factors. Furthermore, there is a pre-conceived divide of secondary schools by quality in general public. Bourdieu's reproduction of the social

structure based on individuals' habitus, i.e. individuals' objective past position in the social structure that is also structuring its future life path (Bourdieu, 1987), explains this process well. Situated in educational system, it can be seen as determinism at its worst.

Recently in Croatia new VET curriculums were introduced for 26 qualifications. They were designed according to European Qualification Framework and experimentally introduced in 49 high schools. Alongside, new program type emerged which combined general education (gymnasiums) and VET curriculums (vocational schools) forging the concept of "vocational gymnasiums" (VG). Five VG programs were assessed in 17 high schools within external evaluation process.

This research included all VG students (N=422) and teachers (N=443) and sub-sample of VET students (N=854) and teachers (N=1039). In group interviews, 68 VET and 37 VG teachers participated. Specific questions and findings focus on differences between VET and VG programs in: 1) perceived students' educational capacity and 2) teachers' and students' perceptions of educational process.

Although both VET and VG teachers were highly motivated for teaching experimental programs and perceive themselves as competent to do so, they perceive their students differently. VET teachers tend to perceive their students as lower achievers and assess the classroom climate lesser than VG teachers. In interviews, VG teachers express their predominant wish for the program to attract "gymnasium profile students". Thus, teachers actively reinforce this self-fulfilling prophecy of students' educational pathways being defined by certain type of programs.

Italian Educators Views on Education for Integration in Multi-ethnic Societies

Rina Manuela Contini

University of Chieti-Pescara, Italy

rm.contini(at)unich.it

The complexity of migration fluxes in the educational systems in Europe require an urgent examination on the effective educational policies that could integrate culturally-diverse students in the host country's educational system and societies. In Europe, Italy leads other European Union Countries in terms of number of immigrants. At the end of 2014 in Italy there were 5,014,000 foreign nationals' residents (Idos, 2015). In 2014, out of more than 1.1 million foreign minors, 814,187 were those enrolled in the school year 2014/2015, (the highest increase regarding minors born in Italy: +8.4%).

This proposal discusses the perspectives of Italian educators and school administrators on the new educational challenges facing Italian schools within a new multi-ethnic society. In this study, they share their vision on the intercultural integration and, on the most successful educational policies suitable for the plural societies. In specific, the study discusses the school practices for intercultural integration adopted in Italy with reference to educational policies implemented in other European countries: a) welcoming practices; b)

learning/teaching Italian as second language (L2); c) multilingualism approach; d) school networks; e) intercultural curriculum.

The results serve to examine innovative educational programmes and practices to successfully integrate culturally-diverse people. The 'lessons learned' serve to internationalize the issues, and take a deeper look at the current school realities.

The role of teachers in explaining students' cognitive engagement: Quantitative and qualitative insights from Belgium and Spain

Jannick Demanet, Aina Tarabini

Ghent University, Belgium; Autonomous University of Barcelona, Spain

jannick.demanet(at)ugent.be, aina.tarabini(at)uab.cat

Cognitive engagement – students' level of investment in learning – is a precursor for educational success. Studies found teacher beliefs to affect cognitive engagement, but little research has investigated the relative influence of beliefs and practices. Starting from goal theory, we hypothesize teachers' beliefs and practices concerning the social goals of education to increase students' cognitive engagement. Moreover, we expect practices to be more important than beliefs. The first research objective is to test these claims, taking study involvement and motivation as cognitive engagement indicators. A second objective is to investigate a possibly mediating role of emotional engagement – specifically, students' sense of teacher support. We combine quantitative and qualitative insights from two European countries: Belgium and Spain. In Belgium, multilevel analyses are applied to data gathered from 11.844 students and 2.104 teachers in 84 secondary schools (2004-2005). In Spain, ethnographic case studies (2015-2016) in five compulsory secondary schools have been developed, including 54 in-depth interviews with students and 30 with teachers. Preliminary results suggest that when teachers undertake activities to pursue social goals of education, students are more likely to value studying and to be motivated with their schooling, but this does not seem to be explained by emotional engagement. The paper concludes discussing the impacts of students' and schools' socioeconomic status in the configuration of differences in teachers' practices and beliefs between both case studies. In addition it reflects on some political, institutional and social conditions that are necessary to broaden teachers' practices and beliefs beyond purely academic goals.

Understanding Teachers' Perceptions Of Their Social Status: the Influence of Local Settings And Long-Term Pathways

Magali Danner, Géraldine Farges, Sandrine Garcia, Jean-François Giret

Université de Bourgogne Franche-Comté, France;

Université de Bourgogne Franche-Comté, France;

Université de Bourgogne Franche-Comté, France;

Université de Bourgogne Franche-Comté, France

mdanner(at)u-bourgogne.fr, geraldine.farges(at)u-bourgogne.fr, sandrine.garcia(at)u-bourgogne.fr, jean-

francois.giret(at)u-bourgogne.fr

Our proposal aims at examining the educational divide by questioning the social status of the teaching profession. In different national contexts, changes in the teaching profession have been studied (Maroy, 2006 ; Tardif, 2012). From a « professional » model, with large autonomy, the profession is now based in several societies on a contractual model (Osborn, Broadfoot et Mc Ness, 2003). In the French contemporary society, teachers, who are state-employees, seem to be protected, but the teaching profession is regularly poorly attractive and job dissatisfaction is salient (OCDE, 2005, Harris 2016).

Our purpose is to understand the perceptions teachers have of their social status. We formulate the hypothesis that the perceptions of a diminished social status may be related with deteriorated work conditions but also with intergenerational downgrading and the possibility for graduates to turn towards other job areas.

Our analysis will be based on a research programme granted by the French Ministry for Education. We focus on primary education teachers. Quantitative methods, using both public databases and a first-handed survey (based on a national sample of 8000 teachers) are used to find regularities in teacher's perceptions according to sociodemographic and professional variables. Simultaneously, in-depth interviews (N=40) are conducted to understand how teachers describe their work and their social position.

The main results indicate that primary education teachers' work, in the French context, can be defined both by large autonomy, but also by ambiguous relationships with the educational hierarchy. We demonstrate that teachers' work largely depends on local settings, that may considerably influence what is said on one's particular condition as well as on the social status of the whole profession.

RN10 | Session 03b Advantages and Disadvantages

Fighting disadvantage as cultural colonization. A critical analysis of the English discourse on Early Years Education, Social Class and Achievement

Angela Scollan, Federico Farini

Middlesex University, United Kingdom; University of Suffolk, United Kingdom

a.scollan(at)mdx.ac.uk, f.farini(at)uos.ac.uk

This presentation discusses the results of a sociological analysis concerned with the hegemonic discourse on the relationship between educational achievement and social class which permeates the debate about Early Years Education in England.

Since the landmark report Effective Provision of Pre-School Education (2003), mainstream pedagogical research in England has recognised Early Years Education as a resource to counter socio economic disadvantage from the early years of life, narrowing the gap in educational achievement. This claim underpins legislation (Every Child Matters 2003, Children Act 2004, Early Years Foundation Stage

2008/2012, Children and Family Act 2014) and was recently renewed by a report commissioned by OFSTED (2014).

This presentation argues that the conceptual framework of mainstream research and legislation relies on the distinction 'advantaged/disadvantaged', borrowed from psychological theories on child's development (for a review see Bjorklund and Pellegrini, 2000). Such distinction supports a 'deficit approach': children from low Socio-Economic Status (SES) are in a position of disadvantage when entering primary education due to deficit in their socialization (Johnson&Kosykh, 2008). The ideology and cultural capital underpinning educational curricula is unchallenged, while the cultural capital of children from low SES is transformed into a deficit to be narrowed, a problem to be solved.

In the conclusion, the valorisation of diverse knowledges and values in School activities is argued as alternative to cultural assimilation, solving the aporia of inclusion of low SES children in education based on their marginalisation a deficit group. In particular, the possibility of a paradigm shift, from 'filling the gap' to 'building on diversity' is connected to child-initiated pedagogies, where low SES children are conceptualized as active contributors rather than disadvantaged object of educational programmes.

Parenting and School Performance in Disadvantaged Subregions of Hungary

Éva Perpék

Hungarian Academy of Sciences/Corvinus University of Budapest, Hungary
eva.perpek(at)yahoo.com

Series of studies revealed a positive correlation between children's school performance, family background and home environment. Present paper focuses on these relationships in Hungary, where transmittance of inequalities through education is more typical than those in other OECD countries.

The research is based on a representative survey on children and their families of 23 underdeveloped Hungarian subregions, conducted in 2013-2014. In these subregions, both the proportion of Roma children and children living in poverty is overrepresented; thus we can adequately map interdependencies among income conditions, ethnicity, home environment and school performance. Namely, we intend to answer the following questions: (1) Are there any differences between parenting practices in (a) poor and wealthy, as well as (b) Roma and non-Roma families? (2) If yes, can these differences be detected in school performance of children?

The main methods of the research have been crosstabulation, linear regression and variance analysis. In the spirit of mixed methods, we also analysed semi-structured interviews to draw a more comprehensive picture. According to our findings, home environment of families proved to be similar in certain aspects; but when it comes to parenting practices requiring financial investments, significant

distinctions have been measured across family types. The strongest predictor of school performance was parent's expectations about educational attainment of a child, and these expectations are differently influenced by income poverty and ethnicity.

In all phases of the research we strongly relied on human and social capital theory of Bourdieu (1997) and Coleman (1988); parenting styles of Lareau (2002, 2011); HOME (Home Observation for Measurement of the Environment) studies of Bradley and his colleagues (Bradley, Caldwell, 1984; Bradley et al., 1988b; Bradley, Corwyn, 2005).

The transformation of the ghetto depends on SEAs implementation instead of social background

Lena de Botton, Adriana Aubert

University of Barcelona, Spain; University of Barcelona, Spain

lenadebotton(at)ub.edu, adriana.aubert(at)ub.edu

There are numerous diagnoses and studies on poverty and their negative impact on people's lives. Poverty is a complex multidimensional phenomenon that affects all areas of human development (Sen, 1999) such as education, access to housing, work, health services or social participation among others. However, poverty is more than simply lack of resources or an income level, as it is the result of the opportunities that are available to develop personal skills. The scientific literature identifies a close relationship between low levels of education and social exclusion as an important mechanism for the development of these capacities. However, in the approach to the problem of poverty, there is little scientific literature that identifies scientific contributions to overcome it. Thus, from the R&D project Socio-educational Successful Actions to Overcome Poverty (EDU2011-24173), and through the analysis of vulnerable cases, successful educational actions have been identified that are contributing to transform environments of exclusion and poverty. This paper points out those SEAs that have an impact beyond the school and they are nowadays improving people's lives. As for example, the inclusion of vulnerable groups as volunteers in children's learning activities as a positive role model in schools and as a way to empower these people in order to have more self-confidence, to be involved in training programs, or to find work. In consequence, we are going to identify the positive impact of SEAs to improve people's lives and overcome poverty, and the relationship among the educational and social dimensions.

Advantages and challenges in the school environment: Pupils' perspectives of school life in Wales.

Kevin Smith, Constantino Sansao Dumangane Jr.
Cardiff University School of Social Sciences, United Kingdom; Cardiff University School of Social Sciences, United Kingdom
smithk26(at)cardiff.ac.uk,

DumanganeC(at)cardiff.ac.uk

Schools are complex socialisation spaces of learning, play, compliance and resistance. Often the complicated nature of schools is undermined by over-simplified representations by the media, and to some extent educational policy. Even the description schools provide to the community at large can inaccurately portray the concerns, successes and failures staff and pupils face in their daily experiences. Since 2013, the Wales Institute of Social & Economic Research Data & Methods (WISERD) has conducted a multi-cohort, longitudinal study involving nearly 1500 pupils in 29 secondary and primary schools across Wales. During sweep one of the study, pupils' were asked to provide three words that best describe their school. This paper explores the question: How did 849 Year 8 and 10 pupils describe their schools in the WISERD Education pupil survey?

Over 2000 words and short-phrases were recorded and coded for quantitative analysis using the "positive," "neutral," or "negative" value of the response, with Scott's Pi Alpha used to determine coder reliability. Gender, ethnic and socio-economic variation among pupils' descriptions was explored using descriptive statistical analysis. Thematic analysis was conducted to explore the qualitative nature of the data. While the findings of the majority of pupils' surveyed held their school in a positive light, they also provided insight into some of the challenges they face. This paper discusses these pupils' positive and negative responses to illuminate the sophisticated complexity of school life.

RN10 | Session 03c Education and Social Standing

On top of the game – Upper-secondary elite schools, strategies and educational marketization in a Swedish context

Eric Larsson

Stockholm University, Sweden
eric.larsson(at)edu.su.se

During the last 25 years, Sweden has seen a continuous stream of reforms promoting educational marketization – among other things the initiation of privately owned but publicly financed free-schools, school-choice guided by merits (grades) and decentralization. This has for instance meant that the number of upper-secondary (post-16) schools in the Stockholm region has increased from 51 in 1992 to 183 by 2015, contributing to a fierce in-between school competition. Extensive research has been carried out to evaluate these reforms, especially focusing on issues of segregation and education in low-income areas. However, elite schools have traditionally been overlooked in this analysis. Moreover, the few existing studies on elite schools have largely been carried out through statistical or historical analysis.

Drawing on a one-and-a-half-year ethnographic study into three upper-secondary elite schools, located in the prosperous and gentrified inner-city area of

Stockholm, the intention of this paper is to shed some light on the contemporary struggles and 'inner-life' of these prestigious institutions. Or more precisely, the aim is to show how students educational strategies, school history and the everyday culture interact and operate as defining markers for maintaining the position as an elite school in the fierce in-between school competition. The data comprises interviews with approximately 110 students, school professionals (teachers, principals, guidance-chancellors etc.) and municipal administrators. It also contains field notes from the day to day practices such as lessons, meetings (teachers and parent groups) and open day houses, documents, photos, marketing pamphlets, school newspapers, webpages and secondary statistics.

Social Selection in the Romanian Education System. A Case Study in an Elite High School in Bucharest

Sebastian oc

Research Institute for Quality of Life, Romanian Academy, Romania

sebastian.toc(at)politice.ro

This paper starts from the assumption that quantitative studies carried out in Romania do not provide enough explanatory power in order to understand how school and family related factors systematically affect the academic achievement of Romanian high-school students. The present research consists of an in-depth analysis of the process through which the students of an elite high school in Bucharest manage to obtain educational achievement. The methodology is qualitative, using data from semi-structured interviews and participant observation carried out in an elite Romanian high school, across a 6-month period. The purpose was to link the socialization process and "regular practices" from a high school classroom with the more general problem of the reproduction of social inequalities through the educational system. I argue that maintaining the prestige of the institution requires a rigorous selection mechanism that most of the time is equivalent with "social selection" and which is generally considered legitimate by teachers. Also, imposing high standards (sometimes in contrast with the national curriculum) and "desirable values" such as hard work and individual responsibility is part of the process of maintaining the good image of the school and its place in the national hierarchy. One important consequence related to this process is the increasing inequality between schools that affects the life chances of Romanian students.

The Relationship between Field of Study (Faculty) and Social Standing In Turkey

Ayşe Gündüz Hoşgör, Aylin Çakıroğlu Çevik

Middle East Technical University, Ankara, Turkey; TED University, Ankara, Turkey

hosgor(at)metu.edu.tr,

aylincakiroglucevik(at)gmail.com

According to conflict theory, higher education

reproduces inequalities and allows privileged groups to carry on their advantaged position the society. Additionally, the educational attainment process is strongly related with the social background of individual and it varies by gender. In this sense, the matter is whether there has been equality of educational opportunity (i.e. equal chance) regardless of gender, race, and social standing so on. If not, it is the fact that higher education perpetuates class inequality and status quo. Within this framework, this paper will try to explore the following questions: What is the social background of the students by each field of study (faculty) in Turkey? Is there a relationship between social standing and field of study? Does social standing vary by field of study as well as gender? These questions will be tried to be answered by using the Eurostudent Survey IV (2011) which is nationwide representative and internationally comparable data (N=17229). The sample sizes of the faculties are like that: Education is 3235; literature and human sciences is 1210; social sciences is 4186; natural sciences is 2178; engineering and architecture is 3738; agriculture and forestry is 327; health sciences is 2007; services is 348. According to findings, there is a significant difference between social standing and faculties: For example engineering and architecture faculty has the highest social standing mean (6.7413 out of 10) whereas education faculty has the lowest mean (6.0281). Considering that engineering is the higher-paid job than education, faculties reproduce social inequality although some of them allow social upward mobility.

The relationship between education and negative stereotypes about welfare recipients in European attitudes

Daniel McArthur
London School of Economics and Political Science,
United Kingdom
d.mcarthur(at)lse.ac.uk

Levels of education are an important predictor of support for the nationalist and populist movements that threaten social cohesion and democracy in Europe. In this context, it is crucial to understand what role education plays in attitudes towards stigmatised groups.

In recent years there has been academic interest in stigmatising portrayals of the poor in media and political discourse. Using this literature, and the literature on deservingness perceptions, this paper seeks to understand the implications of education as a political divide for stigmatising attitudes towards the poor. It will do so by engaging with the following question: what is the relationship between an individual's education and their belief in negative stereotypes about welfare recipients?

Data from the European Social Survey and the British Social Attitudes Surveys will be used, allowing an examination of whether the relationship between education and negative stereotypes varies across countries or time. Multi-level regression modelling is used throughout.

I argue that there is a large educational difference in negative stereotypes about welfare recipients; individuals with higher levels of education have lower levels of negative stereotypes. This difference cannot be explained by demographic variation among individuals with differing levels of education, nor entirely by their value orientations. Furthermore, the educational gap in negative stereotypes is smallest in the most economically unequal countries.

The paper suggests some interpretations of this finding; for example, that less educated individuals place a greater emphasis on work as a sign of respectability and worklessness as a sign of deviance.

RN10 | Session 04a Parents Involvement and Schooling

: Logics in interaction with the primary school: shaping parents' process of educational decision-making at the transition between primary and secondary education.

Marie Seghers, Piet Van Avermaet
Ghent University, Belgium; Ghent University, Belgium
marie.seghers(at)ugent.be,
piet.vanavermaet(at)ugent.be

Self-selection in educational decision-making is an important explanation for the persistence of educational inequalities. Especially within stratified systems, educational transitions serve as important thresholds for pupils' future educational trajectories. Whereas the occurrence of secondary effects is well documented, less is known about the process of educational decision-making, preceding the actual decisions. Drawing on elements of cultural reproduction theory, researchers have pointed at the importance of home-school relations in order to understand how social inequality in education arises and is perpetuated. In the present study we want to add to the knowledge of self-selection in educational decision-making by studying parents' interactions with the primary school. To this end we conducted qualitative research. At the beginning of grade six, i.e. the final year of primary education, we observed 92 parent-teacher conferences held between October – December 2015, in 4 primary schools in the city of Ghent (Flanders, Belgium). These observations were followed by in-depth interviews with 32 parents.

Working class parents were more dependent on the primary school for information about secondary education. Moreover, analysis of the parent-teacher interactions and the narratives reflecting on those occasions revealed clear social class differences in the way parents approach schools in their quest for information. Compared to middle class parents' sense of entitlement, working class parents' sense of constraint hindered an effective engagement with the primary school, leading to different outcomes for the parents involved. Based on these findings implications for educational policy regarding study counseling will be discussed.

Reading books to children: a mixed method study

of the role of parents and schools in promoting language skills.

Clément Pin, Carlo Barone, Agnès van Zanten
Sciences Po, France; Sciences Po, France; Sciences Po, France; CNRS, France
clement.pin(at)sciencespo.fr,
carlo.barone(at)sciencespo.fr,
agnes.vanzanten(at)sciencespo.fr

The literature on educational inequality has emphasised the importance of inequalities in early cognitive skills and the key role of parental involvement in this regard. In particular, differences in the language skills of toddlers are increasingly interpreted with reference to socioeconomic differences in parenting styles more or less oriented towards developing language use and communication skills (Lareau 2003). Reading aloud books to children is regarded as a particularly important activity that is the target of several interventions to promote language skills among low-educated families. We present the results of a mixed-method study that focused on differences by socio-economic and immigrant status in parental attitudes toward reading and in reading practices. We carried out 25 in-depth interviews with parents of children aged 4 to 5 in disadvantaged neighbourhoods of the city of Paris and we integrated these data with a questionnaire to a random sample of 930 children aged 4 in the same area and a standardised test of the vocabulary breadth of children based on the Peabody Picture Vocabulary Test. Additionally, we carried out interviews with the teachers and school principals of the schools of these children with a focus on reading activities and materials, as well as direct observations of teacher-student interactions based on the protocol of the Early Childhood Environment Rating Scale, in order to assess the capability of teachers to promote the use of vocabulary among children. Our results provide evidence concerning the motivations to read or not to read of the parents, parental reading styles and the role of schools in strengthening or countering the influence of parental involvement.

Laureau, A., 2003, *Unequal childhoods*, Berkley, University of California Press.

How do parents' educational field affect one's choice of educational field? - a new micro-approach to tertiary education in Norway

Håvard Helland, Øyvind Wiborg
Oslo and Akershus university college, Norway; Oslo and Akershus university college, Norway; University of Oslo, Norway
havard.helland(at)hioa.no,
oyvind.wiborg(at)sosgeo.uio.no

This study examines the links between parental education and students' choices regarding their field of study in Norwegian higher education. Building on multiple theoretical frameworks including risk aversion models, micro-class theory, and cultural reproduction schemes, the article pinpoints the consequences of parental educational background for postsecondary

field of study. Complete Norwegian register data for all individuals born between 1955 and 1980 permits a fine-grained examination of diverse fields of study, something which previous studies have not attempted. The findings reveal that intergenerational reproduction of educational fields is widespread across multiple fields. However, the extent of such reproduction varies across fields of study as well as educational attainment levels. The tendency is most pronounced among children of professional educated parents with MA and higher degrees. Moreover, the analyses show that students, who do not choose the same as their parents, tend to choose an education close to that of their parents.

Parental involvement in school life: evidences from the Italian National Evaluation System

Michela Freddano, Emanuela Vinci, Francesca Fortini
Invalsi, Italy; Invalsi, Italy; Invalsi, Italy
michela.freddano(at)invalsi.it,
emanuela.vinci(at)invalsi.it,
francesca.fortini(at)invalsi.it

The development of parental involvement in the scholastic systems has not been linear in all the countries. Often parental participation in the educational systems has been introduced by laws and legislative reforms. For that reason there are formal both forms and stages of parental involvement at school that allow parents to become involved in scholastic activities. However some researches show that sometimes these formal activity of parental involvement at school are not so much participated by parents. International studies show the link between parental involvement and student achievement and that parental involvement differs between and within countries and territories. In Italy the theoretical framework of the Italian National Evaluation System takes into account dimensions and indicators that regard input, outcome and processes. Into the area of organizational and management processes there are those that regard the formal and informal parental involvement in school life. The formal participation of parents is feeble, contrary to the initial expectations and diffuse perception is about participatory disaffection in education such as in other public policies. However schools, more frequently, promote stakeholder involvement, such as that of parents. The main aim of the present paper is to show a snapshot of the parental involvement in school life by using the census sample of the Italian schools, underling similarities and differences towards different types and grades of schooling and correlating parental participation with students' achievement and the condition of economic social and cultural status.

RN10 | Session 04b School Performance and Success**Education and Empowerment**

Birgit Behrensen
 BTU Cottbus, Germany
 birgit.behrensen(at)uos.de

The contribution is based on findings of a research study among teachers in Lower Saxony, Germany (n=700). In 2010 and 2011 my colleagues and I asked teachers how they accomplished individual learner support within their work. By this term we meant all educational activities in classroom and school that have the intention of supporting the learning development of each single child; taking into account the child's personal situation, living environment, specific learning requirements, personal needs and history, as well as future ambitions and opportunities. One key finding was the importance of self-competency to be a successful student. Teachers' support of single students dependet on the students' ability not only to organize their own learning but also to focus on issues interesting to them, to get back to work after being frustrated, to believe in ones own success or to ask for further support. These abilities are shaped to a great extent by the family. Children of western middle class families are more used to value these self-competencies than children of lower classes or from non-western background, because they experience individualized success in the life of their parents and other relatives.

The contribution takes a closer look at the reproduction of social inequality within teaching activities to support students' learning. The theoretical approach arrives from Elias' and Scotson's observations and reflections in "The Established and the Outsiders", which are still valuable today in the intpretation of the dynamics of reproducing social inequality at a micro level.

Educational background as a fault line for study success

Sören Isleib
 German Centre for Higher Education Research and Science Studies (DZHW), Germany
 isleib(at)dzhw.eu

The paper analyses the influence of parental educational background on study dropouts in the german higher education system. Education is not only a fault line within generations but also between generations. A characteristic finding for the german educational system is that educational success in school is depending on the parental educational background of students. Although there are some findings (Isleib/Heublein, 2016) which indicate a similar situation for higher education dropouts there is a lack of research dealing with the effect of educational origin on the dropout decisions in Germany. The contribution tries to fill this gap by asking if there is also an effect of parental educational background on higher education dropout and which

factors might compensate these effects.

The work is framed by a theoretical and interdisciplinary model of the higher education dropout process which derived from social-integrative, psychological, rational choice and habitual explanations of dropouts developed by a german higher education research institution (DZHW). The focus of the analysis is directed on the phase prior to study to show the effect of parental educational background and highlights study motives, social integration in the study, perception of study conditions and the personal situation (children, financial situation) as possible mediating factors of a dropout. Data stems from a nationwide representative study also conducted by DZHW which addresses both dropouts and graduates (n=3.760).

Results show that mainly strong social integration as well as financial security during study are capable to reduce the effect of parents educational background on higher education dropouts.

Young people and motivation for learning in context

Noemi Katznelson, Mette Pless
 Aalborg University, Denmark; The Danish Centre for Youth Research; Dept. for Learning and Philosophy; Aalborg University, Denmark; The Danish Centre for Youth Research; Dept. for Learning and Philosophy
 nka(at)learning.aau.dk, mep(at)learning.aau.dk

In this paper we aim to shift the focus from addressing motivation from a primarily individual and psychological perspective, to viewing motivation as a socio cultural phenomenon, which is produced in the interplay between young people and a given educational context as well as broader social discourses. The paper thus aims to gain insight into young people's meaning making and motivation for learning, not as individual and innate features but rather as 'biographies in interaction with schooling' (McLeod & Yates 2006:16). Furthermore, the study is informed by theories on goal orientations in relation to motivation (Midgley et al 2001, Nicholls 1983). This paper is based on a study focusing on young people's motivation for learning in lower secondary education in Denmark (7th, 8th and 9th grade). The study applies both qualitative and quantitative methods. In the paper we primarily draw on the qualitative data from 6 caseschools (classroom-observations, individual pupil interviews (n 25) and group interviews with pupils (n 30)). Based on an interplay between theoretical inspirations and empirical findings of the study, we outline a number of motivational orientations at play in lower secondary educational settings in Denmark. The motivational orientations complement each other and often more than one are at play in classrooms. We do however find a tendency for performance motivation to dominate, and discuss how this can affect the learning climate in the classroom, how it risks producing a narrow understanding of learning (often closely linked to testing and assessment).

Children's school readiness: The role of family functions and parental self-efficacy

Piia-Kaisa Kristiina af Ursin, Päivi Pihlaja, Minna Kyttälä

Child- and Youth Research Institute, University of Turku, Finland; Faculty of Education, University of Turku, Finland; Faculty of Education, University of Turku, Finland

pkafur(at)utu.fi, ppihlaja(at)utu.fi, minna.kyttala(at)utu.fi

The home environment, in which children are raised, plays a crucial role in schooling outcomes (Winter & Kelley, 2012). Social risk factors such as growing up in poverty, lower socio-economic status, and multiple transitions in family structure have been associated with poorer educational outcomes for children (e.g. Fomby & Cherlin, 2007). While the family plays an essential role in laying groundings for learning, the mechanisms of how family dynamics and practices affect educational outcomes in different family contexts, is not well understood.

The present study examines the strength of association of several social risk factors (socio-economic background, parental education, family income, work status, family structure and transitions), both individually and as part of a cumulative social risk index, on parent-reported child school readiness (subject specific readiness). The role of family functions (parental self-efficacy and involvement) in mediating the impact of social risks on school readiness will be researched.

A rich longitudinal data set collected within the project Steps to the Healthy Development and Well-Being of Children is employed to answer the study questions. The data consists of all mothers who had live deliveries in the Hospital District of Southwest Finland from January 2008 to April 2010 and their children (N = 1656 children, see Lagström et. al., 2013). Structural equation modeling (SEM) is used to explore the multitude connections of a variety of background factors, mediators, and child outcomes. The results of the above described analysis will be discussed.

Swedish young people's out-of-school activities: attendance opportunities and consequences

Alireza Behtoui

Södertörn University, Sweden

alireza.behtoui(at)sh.se

Recent research demonstrate that along with family, peer group and school environment, participation in the organized after-school activities are important contexts of social and civic development of young people. This study is about who have access to these kinds of activities and the consequences of participation in various extracurricular programs for a sample of young people in the last year of compulsory school in Sweden.

As the result indicates, after control for class background, gender, ethnicity and health of respondents, there are positive associations between participation in certain types of after-school programs

(sports, cultural, religious and political) and students' school performance and their educational aspirations. However participation in youth recreation centers (fritidsgård) show a negative association with these outcomes. Furthermore, results demonstrate that diverse background of students (class, gender and ethnicity) affect the rate of participation in various forms of activities.

RN10 | Session 04c Diversity and Schooling

Narrating Racial Boundaries and Emotions: Stories of "Being Chinese Minority" in the National Education System of Postcolonial Malaysia.

Ke Liang Ng

National Taiwan University, Taiwan

liang111590(at)gmail.com

Malaysia has been plagued by the conflicts between three major racial groups -- Malay, Chinese and Indian -- since independence from British rule in 1957. This research shows the social boundary among different racial groups, inherited from the British colonial rule, has been institutionalized and reinforced after implementing 'Affirmative Policy' in 1971. Instead of forging 'national unity', this research reveals the 'Affirmative Policy' leads to the unintended consequences: the reproduction of racial grievance and boundary.

This study examines how the enforcement of 'Affirmative Policy' influences the institutionalization of National Education System, making the Chinese students draw upon the symbolic boundary to differentiate and homogenize the Malays students as a privileged racial group. The data used in this study includes the information obtained from semi-structured in-depth interviews with 34 Chinese students, newspapers and national archives.

Major findings are described as follow: First, based on the 'Affirmative Policy', the racial quota system was built to preserve the economic and educational opportunity of Malays, which embodies and institutionalizes the Malay hegemony. Secondly, the Chinese students who had graduated from the national education institution share the cultural narrative of 'imagined minority' by positioning themselves as a subordinate racial group. Thirdly, the narratives of 'imagined minority' have been developed into a distinct social boundary between Chinese and Malay. Lastly, this study emphasizes the narrative of "being Chinese as minority" not only reflects the fact Chinese students have been discriminated by the preferential policy, but reinforces and co-constitutes the racial boundaries which cultivate political resistance, distrust and grievance among different racial groups.

The Barometer For Diversity In Flemish Schools: An Explorative Study Into School Policy And Teacher Attitudes Towards Diverse Students.

Wendelien Vantiegheem, Piet Van Avermaet
Vrije Universiteit Brussel, Belgium; Centre for Diversity & Learning, Ghent University, Belgium
wendelien.vantiegheem(at)ugent.be,
piet.vanavermaet(at)ugent.be

Cross-national research shows that Flanders provides high-quality education, while scoring consistently poorly on social equality. This is true regardless of whether disability, ethnicity or SES is considered and suggests that something pervasive is going on, transcending the individual level. Additionally, despite the emphasis the intersectionality perspective puts on considering several indicators simultaneously, little research has done so. Hence, we will consider school policy and teacher attitudes towards LGBT students, students with ethnic roots, a disability, and lower socio-economic background, since these groups tend to occupy a vulnerable position in the Flemish educational context. Additionally, we will investigate how structural and compositional features of schools influence these teacher attitudes and school policies. Starting from a representative sample of Flemish schools, 200 educators in primary and 300 in secondary education filled out the questionnaire. Analyses indicate that teachers tend to have the most favourable attitudes towards LGBT-students. Nevertheless, primary school staff seem to consider gender issues "less relevant", while in secondary education teacher attitudes towards ethnic minorities seem to be worse. All in all, teachers seem to hold the least favourable attitudes and self-efficacy towards students with a disability. In contrast, teachers report favourable attitudes, high self-efficacy and positive school policies towards students from a disadvantaged social background. Additionally, few robust associations were found between structural and compositional characteristics of the schools and their policies or staff attitudes. Rather, differences between schools were explained by the reported self-efficacy and attitudes of teachers, suggesting the necessity for further teacher professionalization.

Equality in Diversity at school: a research-based agenda from a Mediterranean comparative case

Liana M. Daher, Augusto Gamuzza, Anna Maria Leonora, Susana Gómez Martínez, Tsiona Vasiliki
University of Catania, Italy; University of Catania, Italy; University of Catania, Italy; University of Valladolid, Spain; East Macedonia - Thrace Regional Directorate for Primary and Secondary Education, Greece
daher(at)unict.it, a.gamuzza(at)unict.it,
leonora(at)unict.it, susanag(at)fing.uva.es,
prog.eu.amthr(at)gmail.com

Since its constitution, the EU social system was imagined as an increasingly mature multicultural society able to face the challenges of how socializing its main social institutions in coping with the "structural" and cultural diversity. In accordance to this

long-term goal, the European educational systems were involved in a process of developing dedicated curriculums and school activities in order to effectively deal with differentiated ethnic and cultural background contexts. Teachers are the strategic actors of this process carrying into this their ideas about equality/inclusion in educational process. Moreover, they play the fundamental role of encouraging pupils to appreciate diversity as richness and cooperative approach to learning activity; they must support pupils in developing a shared educational tongue.

The paper presents the results of an Erasmus+ research project aiming at investigating and comparing teachers needs about challenges and constraints related to the fair managing of highly differentiated educational contexts as well as their strategic proposals to overcome diversities and implement intercultural practices. Ideally, equality into educational process through teacher's action fosters the core of democratic values of liberty and unity.

A regional comparison between three European countries (Italy, Greece and Spain), focusing upon strategies and methods in multiethnic and multilingual settings, will be provided.

The mixed method approach – triangulating between (1) narrative interviews, (2) quantitative survey and (3) focus groups and focused interviews (next regional steps) – will enable unveiling unexpected results related to the complexity of the investigated school contexts stressing upon the teacher demand and participation to deeply renovate skills and practices.

Old and new educational fault lines in students' health-risk behaviour in Central and Eastern Europe

Gabriella Pusztai, Klára Kovács
University of Debrecen, Hungary; University of Debrecen, Hungary
pusztai.gabriella(at)arts.unideb.hu,
kovacs.klarika87(at)gmail.com

Short- and long-term individual impacts of health behaviour, and its shaping by educational institutions is a high priority research topic in the international education research. In our presentation the effect of education on students' physical and mental health behaviour is analysed. According to the international comparisons the Central and Eastern European students are in a greater risk of unhealthy lifestyle and decreased emotional well-being than their Western European peers, and the spatial gap is increased by the faults between social groups through the educational level (Steptoe-Wardle 2001). Our presentation aims to summarize the analysis of social differences of individual students' health-risk practices (smoking, alcohol consumption, drug use). Based on campus effect hypothesis (Tinto 1993, Pascarella-Terentini 2005) we investigated the effects of students' embeddedness in campus society (students' intergenerational and intra-generational integration, civil community membership) as well as contextual level characteristics of a campus (e.g. density of students with risk behaviour on campus). For the analysis we used the database of Institutional Impact

on Student Achievement in Higher Education survey, N=1792. The questionnaire survey was conducted in 2015 among students of 11 Higher Education Institutions in Hungary, Romania, Ukraine and Serbia. According to our research results relational embeddedness in campus society have great influential effect on students health-risk behaviour. The density of health-conscious students of a campus context has extraordinary positive impact, but this type of student community is not frequent enough in higher education. Therefore the intra-generational integration in campus society generally decreases the chance of health-conscious behaviour. Only the voluntary community memberships increase its chance.

RN10 | Session 05a Teachers, Parents and Transitions

The role of the primary school in the process of educational decision-making at the transition from primary to secondary education.

Sarah Thys
Ghent University, Belgium
Sarah.Thys(at)UGent.be

Research has indicated that parental involvement in the process of educational choice in the transition from primary to secondary education is influenced by SES background. In Flanders, the process of educational allocation is loosely organized: a recommendation from the sixth-year teacher, mostly formulated during a parent-teacher conference, is the only advice offered by educational professionals. Despite the suggestion from previous research that the process of educational recommendation varies greatly between teachers and between schools, research has neglected the influence of contextual variables. However, previous research demonstrated that the school and its teachers can contribute to parental involvement. Specifically, the school SES and teachers' sense of efficacy have been found to relate positively to parental participation in parent-teacher conferences. Therefore, this study aims to investigate these effects at the class level, in relation to whether parents indicate that they have received an educational advice for their child. Hierarchical logistic models were tested on data gathered in 2016 of 1044 parents in 36 Flemish primary schools and 65 classes. Preliminary results show that when parents had a good relationship with the school, they were more likely to indicate having received an educational advice for their child. Moreover, receiving an educational advice was more likely for parents whose child's teacher had a high sense of self-efficacy in formulating an educational advice. These results will be enriched with qualitative data on this matter. This study calls for better support of teachers and schools in educational career guidance.

The School as a Socialisation Context: Understanding the Impact of School Bonding and the Authoritative School Climate on Truancy.

Gil Keppens
Vrije Universiteit Brussel, Belgium
gkeppens(at)vub.ac.be

This study attempts to offer insight into school-based strategies to prevent truancy by investigating the relationship between an authoritative school climate and truancy. We use data from PISA (2012) with fifteen-year-old pupils (N=2279) in secondary education in Flanders, the Dutch-speaking part of Belgium, to answer three research questions: (1) Is there a relationship between authoritative school climate and truancy? (2) Is the effect between the authoritative school climate and truancy mediated by individual school bonding? (3) Does school bonding moderate the relationship between the authoritative school climate and truancy? In line with the authoritative school climate model, our results indicate that authoritative schools manage to prevent truancy, irrespective of a pupil's personal background or the school composition. In addition, this study demonstrates that the influence of authoritative socialisation at least partly runs through school bonding and that the link between school bonding and truancy is stronger in authoritative schools.

Fundamental values in Swedish schools - following the work around

Karin Larsson Hult
SHV, Sweden
karin.larsson-hult(at)miun.se

Schools in Sweden are regulated by a number of steering documents, one including a set of fundamental values that are meant to permeate everyday life in schools. These fundamental values are described as being the base for Swedish society, including human rights, democracy, gender equality, solidarity and tolerance. Though it can seem obvious that schools should be permeated by such values, it is also something that can be problematized. Some questions include whether it is possible to define a base with values that are common for the Swedish society, which values are seen as good or bad and why, and the problem many schools face of converting the values to hands-on work. In my research I follow a junior high school with a project focusing on integrating the fundamental values into teaching and everyday life. I am interested in what this kind of work does, what it leads to and what it hides. Using Foucault's (1990) theory on normalization I study what is normalized in the work with fundamental values. Inspired by Ahmed (2012) I "follow the work around" by following what is said in documents, what is said in meetings and what is being done in the everyday life. Based on interviews with staff at the school I will discuss what working with fundamental values does in the everyday life at the school, how it can be interpreted differently, what kind of resistance it meets, what is possible to do and what is not.

Inefficient education as a source of deepening social inequality

Galina Iosifovna Saganenko
Sociological Institute of the Russian Academy of
Science, Russian Federation
saganenko.selina(at)yandex.ru

The problem of educational fault is generated at the two poles of the educational scale, and makes the social gap is wider and deeper:

(A) At one pole, education rapidly is drifting forward and increasing the quality, intensity and efficiency;

(B) At the opposite pole - the mass represented by low-quality education, poor results.

The first pole is ensured by several factors - especially the rapid development of ICT, providing extensive cognitive information and effective technological tools. Family and living circumstances are also contribute significant resources for education.

Situation on the second, disadvantaged, pole indicate in varieties of studies, publications, movies, statistics, Mass-Media, our reflexive surveys. Our surveys show that a huge mass of children and their parents feel uncomfortable in education systems. Thus, on the question "What do you associate "education/school", 1/3 among 400 students described their notions by negatively - poor teaching, outdated material, the teachers' injustice, rejecting totally learning and school.

We define two types of students' reactions. Some have developed an inferiority complex; they take the blame for their poor study. Others express anger, resentment, aggression, have got considerable list of complaints the school. Aggressiveness then spreads to the entire society.

A growing number of dissatisfied parents transfer their children to home schooling.

Analysis of international programs (UNESCO, Dakar 2015; Executive summary OECD 2015) shows their lack of clear descriptions of the teaching principles and methods. Low-quality education then it will be attributed to students, but all the content, format and quality of education can significantly reduce the difference among students and within society.

RN10 | Session 05b Social Inequality in Education I

Social inequality in Education: The distinction between primary and secondary effects of inequality in education in Flanders.

Frederik Jean De Roeck, Dimokritos Kavadias
Vrije Universiteit Brussel, VUB; Vrije Universiteit
Brussel, VUB
frederik.de.roeck(at)vub.ac.be, dkavadia(at)vub.ac.be

Social stratification research has recently paid attention to effects of inequality (EOI) in education. An important aspect of such research lies in the conceptual and empirical distinction between primary and secondary EOI. Following Boudon (1974), primary effects occur when pupils' social background affects their level of academic performance or ability, while

secondary effects influence their (parents') academic choices. Jackson uses this framework to compare a number of Western countries. According to Jackson, differences in EOI between countries are largely determined by country-specific institutional factors. Belgium, particularly the Flanders region, was excluded. The Flemish system is however known for being highly stratified for pupils from an early age.

In this contribution, we use a model introduced by Erikson et al. to disentangle the two effects. These are calculated in two different ways using data collected in 36 schools in two Flemish cities. We use math scores obtained by pupils at the end of their last year of primary education, and a subjective assessment by teachers of the pupil's math achievements. Secondary effects are calculated using educational choices (academic or non-academic track) recommended by teachers at the end of pupils' primary education. This design offers the opportunity to estimate secondary effects even before the explicit tracking of pupils occurred and compare effects for various primary schools. The results indicate the importance of teachers' perceptions in attributing pupils to tracks.

Dialects Stigmatization in the Linguistic Market

Marija Stefanovic
University of Nis, Serbia
marijastefa(at)hotmail.rs

Being a medium of power through which individuals pursue their interests and display their practical competence, language can be understood as a product of the relation between a "linguistic habitus" and a "linguistic market" (Bourdieu 1991). The more linguistic capital ("the capacity to produce expressions for a particular market") a speaker possesses, the more he is able to exert symbolic power (Bourdieu 1977, 1991; Bourdieu and Boltanski 1977). Language usage depends on many factors, such as class, gender, ethnicity, geographical region etc. (Bernstein 1971; Labov 1972; Trudgill 1974). Since an official standardized language can be considered as a linguistic capital which affords its holders symbolic power (Bourdieu 1991), all non-standard dialect speakers possess less of this symbolic power.

In Serbia, a certain language hierarchy is present, where the Southern dialects are associated with a particular cultural space, space characterized by the notion of uneducated rurality, and economical and cultural backwardness (Petrovic 2015), while the standard language is labeled as the language variety of the prestigious social classes and cultural elite.

The results of a qualitative research conducted as part of the Horizon 2020 project "Closing the Gap Between Formal and Informal Institutions in the Balkans" (№6935237) show how Southern speakers develop certain strategies, based on combination of formal and informal language code, in order to gain a symbolic profit. In addition, the paper reveals the modus in which the educational system performs a transmission and reproduction of these language codes and cultural patterns, as well as the attitudes towards one's own cultural identity.

Navigating the School Market in Socially Exposed Residential Areas – the Case of Stockholm, Sweden

Haakan Forsberg
Uppsala universitet, Sweden
hakan.forsberg(at)edu.uu.se

This paper explores how young peoples' strategies of choosing upper secondary education are marked by the segregation and marketization of education. Research is limited to five municipalities in southern Stockholm that are characterized by ethnically and socioeconomically heterogeneous residential areas. Drawing on Bourdieu's concepts of field, capital and strategy the social space of the school market in this particular region and how it relates to school choice is analyzed with specific multiple correspondence analyses (specific MCA). Using individual census data on all students in the designated municipalities from 2008, the social differences between 4 421 students are investigated in regard to their parents' education, occupation and services, income, and national origin and the students' academic merits from comprehensive school.

The analysis reveals that a majority of students in southern Stockholm found their way to the region's local secondary schools but not necessarily to schools in their own municipality. At the same time, a substantial portion of students with both high and low merits went to a broad range of independent schools with heterogeneous recruitment in the central parts of Stockholm. However, only a small group of resourceful and overachieving students found their way to secondary schools with high social and meritocratic recruitment in the inner city of Stockholm. Further analysis indicate that the amount of acquired and inherited educational capital are more important than students' gender and national origin for families' educational strategies in the socially exposed neighborhoods of southern Stockholm. The analysis concludes that the policies of school choice reinforce the existing socio-economic structure of the region and further exclude groups with low volumes of capital from possible trajectories towards an improved social position.

Exploring inequalities in secondary schools: students' perceptions, experiences and opportunities in mixed-ability and ability grouped classrooms

Alba Castejon
Universitat Autònoma de Barcelona, Spain
albacastejon(at)gmail.com

This paper explores the relations between student grouping practices and teachers' expectations, and its impact on students' outcomes. Previous research has shown the importance of school and teacher-related factors in explaining students' educational experiences and results. For example, students in lower ability-groups have less favourable experiences in school (Oakes, 1985; Van Houtte, 2006), as well as

students in social and ethnic segregated schools (Agirdag, Van Houtte, & Van Avermaet, 2012), being teachers' expectations an important mediating factor.

The research is focused on lower-secondary education in Catalonia (Spain), framed in a comprehensive system where students follow the same path until grade 10. However, the formal comprehensive and inclusive model cohabits with informal mechanisms of educational differentiation (such as ability grouping). Using an ethnographic approach, the research was conducted in two secondary schools with a high percentage of ethnic minority and working class students. Schools were also selected according to the type of student grouping: in the first school, students were grouped by ability from the beginning of secondary education whilst, in the second, students were taught in mixed ability groups during all secondary education.

Results are oriented to identify similarities and differences between schools in terms of students' self-perceptions and experiences. There is a particular focus on the relation between these aspects and teachers' expectations and institutional organization and rationales. Results seek to identify mechanisms of inclusion and exclusion in secondary education, and analyse its scope in terms of educational inequality and justice.

RN10 | Session 05c Higher Education in Society

Evaluation and accountability in education: a lever for school improvement or a source intensifying social inequalities?

Mauro Palumbo, Valeria Pandolfini
University of Genoa, Italy; University of Genoa, Italy
palumbo(at)unige.it, Valeria.Pandolfini(at)unige.it

The paper focuses on the educational system governance issues, reflecting on the effects of school evaluation and accountability in terms of school improvement. It explores the complex relationships between evaluation and improvement, starting from the critical interpretation of the Italian National Evaluation System and examining different aspects interesting the majority of education systems worldwide. Firstly, by analysing if the publication of students achievements in standardized tests could stimulate the school improvement or, instead, could produce unforeseen and undesired effects. Secondly, by observing the consequences of a quasi-market system in education field in terms of competition among schools and of choice processes by families, resulting from neo-liberal politics. Lastly, by reflecting on the role of school operators, which would need an adequate training permitting evaluation to become a lever for improvement.

The aim is to explore whether and under what conditions school evaluation and accountability systems could increase social equity and reduce social inequalities or could reproduce or even intensify them.

The authors outline some unintended effects linked to such systems, in particular related to the typically

bureaucratic formal adaptation to the assessment requirements by teachers and headmasters and to the risks that testing becomes synonymous with accountability, which becomes synonymous with education quality, impacting school family choices and increasing social inequalities. On the other hand, the use of the evaluation as a leverage for improving the active participation of school stakeholders could pave the way that leads from school evaluation to school improvement.

“Quality” versus “equality” in European higher education policies

Eleni Prokou

Panteion University, Greece

eproukou(at)panteion.gr

In the past, in many European countries, the fundamental aims of social policy (social justice / cohesion) - in higher education - were expressed through “equality of educational opportunities”. Expansion and massification, along with generous state funding, were governments’ efforts for social justice.

However, since the 1990s, emphasis has been less on “equity” and more on “quality” and “effectiveness”. Economic “efficiency” dominates in the era of globalisation and there are pressures for the creation of the “market-driven” university, which promotes the “knowledge society” and is associated with the individualisation of the responsibility for learning. At the same time, for “quality assurance”, evaluation mechanisms mean that the state exerts control from a distance (through “intermediary bodies”) with reference to the performance criteria of university institutions. Privatisation trends are an expected outcome of these policies, which are related with the reduction of public funding, in the framework of the withdrawal of welfare states, especially in times of economic crisis.

The paper argues that the aforementioned policies are also promoted by the Bologna Process and mostly by the Lisbon Strategy, which refer to issues such as: a) mobility, attractiveness and internationalisation of universities, b) promotion of lifelong learning and policies of accreditation through the generalisation of the ECTS and the introduction of the EQF, c) quality assurance and accountability, d) promotion of “new public management”, e) linking education and research with the labour market, f) promotion of interdisciplinarity, innovation and excellence, g) reduction of state funding in relation to the outcome of evaluation.

Mass participation in Higher education and the emergence of Private Universities in Cyprus

Marios Vryonides

European University Cyprus, Cyprus

M.Vryonides(at)eu.ac.cy

The widening participation in higher education has been a major component of education policy in Europe since the 1990s. In Cyprus there is relatively

high access to higher education. Specifically, 8 out of 10 secondary school students pursue higher education within or outside Cyprus. The emergence and growth of a private university sector in Cyprus in the past decade (2007-2017) met no resistance on ideological or political grounds but was rather actively promoted by left and right wing governments alike. A key driver for this expansion has been to meet a rising demand not met by traditional choices (i.e. public universities, Greece, UK).

This paper will examine how access to public and private universities in Cyprus has developed in the past decade, with a focus on access and equity issues. We will show that the expansion of higher education was primarily driven at a micro level by the ambitions and aspirations of lower social class families to build high value cultural capital and at a macro level by a rhetoric which saw higher education expansion as a field of economic growth. This expansion, however, was not accompanied by more equal access to elite destinations. We will explore the intersection between stratified social backgrounds and the stratifying structures of higher education destinations which include public/private distinctions, different fields of study and the perceived hierarchies of institutions and qualifications gained. As always, larger social inequalities set limits on what education can achieve in terms of producing social equity of outcomes.

Passing and Getting a Licence Degree. Working-Class French Students in the French University

Tristan Poullaouec, Yaël Brinbaum, Cédric Hugree

CENS (CNRS/Université de Nantes), France; Lise-

Ceet, (CNRS/CNAM), France; Cresppa-CSU

(CNRS/Université Paris Lumière), France

tristan.poullaouec(at)univ-nantes.fr,

yael.brinbaum(at)lecnam.net, cedric.hugree(at)cnrs.fr

In Europe, many quantitative articles have led the investigation of inequalities in degree completion in higher education. However, in France, research has recently concentrated on dropout and course choices within university and has more focused on working-class students’ difficulties. Using the national longitudinal survey of pupils entering secondary education in 1995, and followed during their school careers, this paper aims at analysing both the access to higher education and completion in taking into account of the social backgrounds, the immigration of their parents and the school trajectories of these students. We focus on college graduates to show the influence of both social and ethnic origins background and academic success over getting the degree of “Licence” (Baccalaureate + 3 years).

What kind of social background and schools pathways currently lead to university in France? What differentiates students who pass and get a licence from others? And finally, is there just one way to succeed in French university?

Findings suggest that after baccalaureate (the French High school diploma), social inequalities are still important. But they are also deeply dependent on

primary and secondary school path. While North-African second generation students are more likely to access to University than those of French origins with similar social background, they less complete their degree. Our paper although identifies five process types among college graduates. Well known are the “inheritors” and the part of working-class students’ having strong difficulties to get a degree. However our results show that three other types exist: especially, students with honourable academic success, general baccalaureate and rarely concerned with student jobs.

RN10 | Session 06a & RT Session 01 Higher Education

Contesting Knowledge in Higher Education: Ethnocentric Syllabi in Universities

Leon Moosavi

University of Liverpool, United Kingdom
moosavi(at)liv.ac.uk

There are a growing number of voices who critique the ethnocentrism that is commonly found in university campuses. These voices claim that education syllabi and research material produced are often informed by Western perspectives only, and that non-Western perspectives are routinely ignored. This paper will explore the battle for diversity that exists in European universities, explaining the reasons why some are passionately advocating for the greater inclusion of non-Western knowledge across various disciplines. As well as these neglected sources being relevant and illuminating, it is argued that a failure to tackle ethnocentrism in education can lead to the reaffirming of social divisions and stereotypes that can be reproduced beyond the educational sphere. This argument has not only been made in relation to universities, but is relevant to all other stages of education too. This paper will explore some recent campaigns such as ‘Why is my curriculum white?’ and ‘Why is my professor not black?’ which have shown that these calls for a rethinking of Higher Education are often made by students at the grassroots level. While there appears to be an increasing appetite amongst educators and students for new approaches to education that are based on internationalist principles, Europe is arguably experiencing a growth in populist nationalism and xenophobia which means that such efforts are by no means unchallenged. Instead, this paper will consider some of the resistance that exists in relation to the efforts to reshape Higher Education.

Yearning for Mobility at the Periphery of Europe: Motivations and Expectations of Higher Education Students in Turkey to Participate in the ERASMUS Programme.

Besim Can ZIRH, Eren Çalıřkan

Middle East Technical University, Turkey; Middle East Technical University, Turkey
besimcan(at)metu.edu.tr,
erencaliskan17(at)gmail.com

After the Helsinki Summit, having gained the status of “candidate country destined to join the EU,” Turkey became a participating country in the ERASMUS Programme in 2004. Since then, more than 120,000 higher education students have benefited from the Programme. Although the number of participants is relatively low compared to other countries, this scheme has a particular significance for Turkey, being one of the only opportunities for undergraduate students to study abroad. Due to visa regulations and financial limitations, the large majority of participating students would have been unable to participate in an international exchange experience without this Programme. Turkey’s longstanding and complicated relationship with the “West” intensifies this significance. From late-Ottoman modernization in the nineteenth century to guest-worker migration in the 1960s, “going abroad (to study/work)” has usually connoted “to Europe,” almost like a rite of passage. This study aims to understand how the decision to participate in the Programme is taken by higher education students in Turkey in general, and what narratives develop around this process in particular. The research venue will be Middle East Technical University, a public institution whose language of instruction is English, which is one of Turkey’s leading universities, as well as depth and breadth of international ties. Its student body has a reputation for an inclination towards international experiences and the number of applications has steadily risen year on year. Within this framework, a comprehensive online survey will be administered to METU’s 2016–2017 academic year applicant cohort, which is expected to number more than 1,000. 25 successful applicants will further be selected for in-depth interviews before and after their ERASMUS experience.

Social Capital as a Main Source of Information Regarding Higher Education in Poland

Aneta Sobotka

Educational Research Institute, Poland
a.sobotka(at)ibe.edu.pl

In the era of mass higher education the choice where and what to study has an especially large impact on future life and career path. To make a wise decision prospective students have to possess different kind of information regarding effort and time needed for studying, teaching quality, costs associated with studying, chances for graduating and the benefits of studying understood as social status and earnings. Searching for information reduces risk of wrong choice and increases the probability of satisfactory decision. This is especially important for First Generation Students who often lack knowledge about higher education institutions. The information policy regarding higher education is supposed to reduce educational inequalities. In recent years in Poland is observed a significant improvement in access to information which colleges offer the best value and which majors are most in demand. This is associated with numerous studies and publications analyzing situation of college graduates in the labour market,

monitoring graduates careers by universities, publishing universities rankings and greater availability of the Internet access. The main objective of the study was to identify the most important sources of information and the most searched information regarding higher education. The 50 in-depth interviews with last grade high school students were conducted. The analysis showed that although a great availability of official sources of information, information gathered through social networks are treated by students as most vulnerable and helpful when making educational choices. This findings show that information policy is ineffective and should be rethink to outreach the students with low social capital and reduce persisting inequalities in educational choices. The theoretical framework of the study is Nan Lin's network theory of social capital.

The responsibility of higher education for the entirety of education and for society as a whole

Ildiko Hrubos

Corvinus University of Budapest, Hungary
ildiko.hrubos(at)uni-corvinus.hu

UNESCO's declaration issued in Paris in 1998 (World Declaration on Higher Education for the Twenty first Century) called attention to the responsibility of higher education: "higher education is confronted with formidable challenges and must proceed to the most radical change and renewal it has ever been required to undertake, so that our society, which is currently undergoing a profound crises of values, can transcend mere economic consideration and incorporate deeper dimensions of morality and spirituality". The question is what happened since then, how much has higher education progressed in solving this problem. The paper primarily examines the issue in relation to the European Higher Education Area. The main method of research is the analysis of the official documents of the Bologna implementation as well as connected expert materials. The specific research question is how the weight of "general knowledge" has developed in curricula, because we are expecting from this the learning of knowledge and attitudes that prepare students to behave like responsible citizens (European, global). Many among the graduates will be in such leadership positions in society, in the economy, in politics and culture that will give them the opportunity to facilitate the reduction of the depth of social fault-lines. The research brings the BA/BCs programs into focus: the effects of the academic drift and than the utilitarian drift - the liberal arts being forced into the background. The opinion is also expressed that we should get past this issue: another type of knowledge-concept should enter education. The opportunities provided by digitalization may substantially contribute in the performance of this complex task.

RN10 | Session 06a & RT Session 02 Choosing School

Choosing education as a relational possess – the

impact of the social composition of lower secondary school for choice of track in upper secondary school in Norway

Thea Bertnes Strømme

Centre for the study of professions, Oslo and Akershus University College of Applied Sciences, Norway
thea(at)hioa.no

In this paper I explore the connection between students' socio-economic background, both on an individual level and at school-level, and the transition from the unified primary level to the tracked and vocationally oriented secondary level of schooling in Norway. Using survey data from a full cohort of 10th graders in public schools in Bergen, connected to register data on their grades, their choice of school and programme in upper secondary, I find that class is an important factor in explaining pupils' choices of academic or vocational programme in upper secondary school, both on an individual and on a school level. This holds when controlled for teacher data measuring school culture and individual data measuring the pupils' behavioural engagement and grades, and is more important for pupils with high grades than those with low grades. The pattern is also highly gendered – class on a school level is especially important for girls and the interaction between grades and class on a school-level is more important for boys. By drawing attention towards a theoretical orientation that have focused on a relational and institutional part of educational choices, I argue that the dominating theoretical approach explaining the link between social background and school choice is characterized by a too narrow focus on rational decisions made by each individual with or without their parents. Interaction between students or between teachers and students influence the ways in which students make decisions in their educational trajectories, and the combined measures of the class background of students in a school is decisive for this influence.

The Fantasmatic Logics of Education Markets: Exploring Upper Secondary School Choice

Martin Harling

University of Gothenburg, Sweden
martin.harling(at)ped.gu.se

The backdrop for this study are the de-regulations in the 1990's, that turned Sweden to become the most market oriented school system in the world - a fact that is vital for the international relevance of this study. The study maps and analyzes how student subjects are constructed in everyday school life, at school fairs and the role that market principles play in these constructions. In particular focus are the logics that constitute secondary school choice practices, how these practices are legitimized, interpreted and challenged. The primary research question is:

- How are student subjects constructed, governed and regulated in upper secondary school choice-practices of today?

The theoretical framework for the study draws on

Foucaultian governmentality (2008), analyzing governing through perceived freedom, and 'the logics perspective', introduced by Glynos and Howarth (2007) with the typology of social, political and fantasmatic logics. The data consists of a school-ethnography, field studies at school fairs and focus group-interviews with 56 pupils in ninth grade.

The result shows that the market-driven school order differentiates the students as if they were commodities of different value. Here they are assigned to different places and positions, to which they work on themselves through self-technologies of choice, competition and 'investmentality'. Subjectivation in the form of fantasmatic logics can explain how students handle contradictory conditions in everyday practices. For instance, school choice may simultaneously evoke aspirations of change to become someone else, while at the same time choice is used as a technology of becoming who they already are.

Determinants of low educational performances for 15-year-old pupils in Romania

Andreea Vornicu

Babes-Bolyai University, Cluj-Napoca, Romania,
Faculty of Political, Administrative and Communication
Sciences, Romania
vornicu(at)fspac.ro

In an ideal society, education systems, through schools, are supposed to provide equal chances to learning and tuition for all children and hammer down the possible disparities that might appear during school enrolment. Moreover, studies have shown that first learning experiences and secondary school achievements have a positive influence in pursuing higher education and determine the access to labor market. This means that low schooling achievements in this critical time framework might influence all future socio-economic performances. In this respect, Romanian PISA scores indicate that around 40% of fifteen-year-old pupils are functional illiterate, registering low performances to standardized international tests and only 6% of pupils managed to achieve high scores. In other words, there is a large gap between low and high performance pupils and a consistent proportion of Romanian teenagers have a huge knowledge deficit at the beginning of their high school. Therefore, the aim of this study is to explore the main determinants of low educational achievements for fifteen-year-old pupils in Romania. The study is based on 2015 PISA datasets. Preliminary tests have confirmed the general hypothesis that family's socio-economic background represents a good predictor for low educational performances, but there are other factors that might be even more important: school's attributes, teacher's motivation or even pupil's determination to succeed. When interpreting results, national context and education public policies are taken into account and analyzed in conjunction with PISA scores.

Education, Social Justice and Social Inclusion: a Case Study of Kalinga Institute of Social Sciences

(KISS), Odisha, India

Tushar Kanti Senapati, Dwiti Vikramaditya, Iswar Chandra Naik

KIIT University, India; KIIT University, India; KIIT University, India

tushar.senapati(at)gmail.com,

dwiti.vikramaditya(at)gmail.com,

iswar.jnu(at)gmail.com

Education is central to development and to improvement of the lives of people. Education system is an important institution in Indian Society & also central to new imperialism agendas of World for their vision of 'development'. In the era of Neo-liberalization and globalization, we can trace the relationship between the society, education, and economy. After 1990's economic reform in India, the education system is also opened up to global market & becoming an important area of investment. Due to increase in Private Investment in education it has become a place of production and consumption. As a result of privatization of education, the tribal people in the society are not able to access education, which actually means they are excluded from the mainstream society and denying to get social justice which creates inequality in society. It is believed that the injustice and social inequality demands a people-centric policy and practical response to address both its causes and its impact on peoples' lives. The purpose of the paper is to set out the qualitative transformation landscapes of tribal communities through practice intervention of the Kalinga Institute of Social Sciences (KISS) and its impact on tribal people in particular and society as general.

RN10 | Session 06a & RT Session 03 Controversial Issues

Sociological Imagination of Educational Inequality A Case Study of the Educational Conditions of "Left-behind Children" and the Younger Generation of Migrants in China

Huidi Ma

Institute of Chinese culture, China, People's Republic of;
Institute of Chinese culture, China, People's
Republic of

culturechina(at)china.com, mahuidi(at)china.com

China is a part of the world and out of every five people in the world one is Chinese. As Chinese economy is rising, but education as the new fault line in society is also slowing down the pace of its sustainable development. If this situation continues, it'll impact the world both directly and indirectly.

According to the statistics supplied, there is a population of over 61 million left-behind children in China.

At present, roughly 270 million migrant workers from the country reside in cities.

The object of this research paper are these left-behind children and the younger generation of migrant workers and the methodology used is the basic traditional one, including questionnaires, interviews,

in-depth dialogs and conversations, and nonparticipant observation. Follow-up case studies attempt to explore and answer following questions: How does education become a new fault line in China? What impact this fault line has on these left-behind children and young migrant workers as they grow up? What long-term consequences does this phenomenon bring about to social cohesion and the traditional value system? And what policy adjustments is the Chinese government making in dealing with these issues?

Creativity as possibility: revisiting creativity in education

Maria Patsarika

The American College of Thessaloniki, Greece
mpatsarika(at)act.edu

The notion of creativity has received unprecedented attention in educational debates in an era marked by ongoing political change, societal challenges and competitiveness in the global job market. Seemingly opening up new horizons for learning, students' attainment and social progress, there still remains ambiguity, however, as to how policy envisages creativity as part of everyday school practice, which the paper addresses with the following question: how are we to understand and enact creativity at the school? The paper critically examines relevant policy and creativity discourses, and problematizes the disconnect between understandings of creativity and pedagogical practice, to suggest that creativity in learning environments is better positioned in a framework of possibility. Informed by Gibson's 'affordances theory' (1977), Craft's 'possibility thinking' (2013), and critical pedagogy, such a conceptualization sees creativity as tied in with the everyday learning experience and relationships developed at school, and an ethos of experimentation that allows learners to think differently and explore alternatives together – critical conditions if we are to use creativity in education. Discussion of education models and curricula across the world showcases many ways to go creative, against the determinism of standardized approaches often underpinned by education policy. These examples serve as a reminder that creative practice is not far from what is already taking place at school.

Together or apart? Continuing controversy of single-sex education effectiveness

Maciej Koniewski

Jagiellonian University, Poland
maciej.koniewski(at)uj.edu.pl

Among means aiming to boost school effectiveness and guarantee an equal educational opportunities and choice, the most controversial is recently single-sex education. Despite single-sex schools are marginal in most of the Western countries, their public financing provoked heated discussion, especially in the US. The agora for this discussion are mass-media, courts and states' parliaments rather than academic journals. The

controversy was triggered by the legislative introduced by the US government in 2001 (NCLB), which was later extended in 2006. The legislative guaranteed financing single-sex education once its superiority to the coeducational schooling was proven. Eventually, this "evidence based legislation" failed in fair subsidies redistribution, because both evidence being provided by single-sex schooling proponents and their critiques, especially feminist foundations, were rarely based on solid data and often ideologically influenced. As identified by Lynn Liben the arguments offered by proponents of gender-differentiated education, reveal a foundational commitment to gender essentialism (rather than to gender constructivism more commonly embraced by critics of single-sex schooling). Is the resolution of the controversy about single-sex education bound to fail on the ground of educational research and to be dominated by discussion on gender conceptualizations, education goals, and broader human values? This presentation aims to show how seemingly unsuccessful "evidence based legislation" may eventually lead a decade later to highly robust studies, which contribute to solve continuing controversy of single-sex schooling effectiveness. Such studies are to be introduced in the presentation, followed by an indication of yet unsolved problems in the field.

Is entering STEM socially contagious? Contextual factors in women's educational decisions

Alicja Zawistowska

University of Białystok, Poland
zawistowska.alicja(at)gmail.com

Despite the nonexistence of institutional obstacles, majors in science and mathematics continuously attract women to a greater extent than those in technology and engineering. Based on a series of in-depth interviews conducted with female students of various STEM majors in an university and a polytechnic in average-size city in Poland, this presentation attempts to explore the reasons for this divergence. Analysis of the detailed biographical narrations reveals that the women's choice of male-dominated majors coincides with the presence of a significant role model (SRM) in the close social network. An SRM is an individual who is more experienced in a given domain (e.g graduated from technology or engineering major) and who has personal, lasting, and emotional contact with the decision-maker. Data shows that the presence of an SRM was observed most often among female students at polytechnic, and was hardly observable among their university counterparts. Based on this, I argue that presence of SRM in close social network increases the probability that young women will pursue male-dominated major. The theoretical background is offered by the theory of social contagion developed by Ronald S. Burt and other authors. This theory postulates that people who are in close relationship "infect" each other with ideas and innovations. Accordingly, SRMs "infect" mathematically-minded women with the idea of

studying male-dominated majors. They provide various forms of support and information, and debunk discouraging stereotypes. A long-lasting relationship with SRM leads to the development of a strong preference for polytechnics over universities.

RN10 | Session 06a & RT Session 04 School Divisions

Parental involvement in children's education – reconstruction of the role of parents through analysis of blogs

Agnieszka Otręba-Szkłarczyk
Jagiellonian University, Poland
a.otreba(at)gmail.com

The main purpose of the presentation will be explanation of the role parents take in their children's education – parents' convictions about what their children should do (Hoover – Dempsey & Sandler, 2005). Parental involvement in children's education has a number of positive consequences, e.g. positive effects on the student's social life at school and enhanced self-confidence of students, but, above all, it positively influences school achievement (Desforges & Abouchaar, 2003; Jeynes 2007; Patall et al., 2008). The strongest expression of the parental role takes place among parents highly involved in the childrearing and education of their children. Therefore, posts on blogs run by parents – mothers and fathers having different experience, knowledge in this field and cultural capital – were the principal data subjected to the analysis. The results were achieved using R text mining packages and procedures.

The presentation will take a slightly different perspective on the issue of parental involvement in education of children. Firstly, the concept of parental involvement will be conceptualized using mixed-methods approach – the multidimensional scale of parental involvement created by Fantuzzo and co-workers (2002) and a new proposition which conceptualize "parental involvement" as a term accepted by all those involved in the child's welfare and education at school (Fishher, 2016). Secondly, the issues of parental involvement through Web 2.0 technologies are insufficiently researched and need to be critically examined with consideration of discursive factors operating in the contexts in which those technologies are used (Shin & Seger, 2016).

Divisions inside the French society through educational styles

Bertrand Geay, Pierig Humeau, Emilie Spruyt
University of Picardie, France, CURAPP-CNRS;
University of Limoges, France, GRESCO; University
of Picardie, France, CURAPP-CNRS
bertrand.geay(at)u-picardie.fr,
humeaup(at)hotmail.com, emilie.spruyt(at)u-picardie.fr

This paper will investigate the divisions that exist inside the French society, through the conceptions of family and educational practices gathered before young parents. Entering family life is a key moment for

analyzing the effects of parents' educational paths and their life styles. Some important lines of division appear concerning the perception of social justice, gender relations and family relations, according to the school trajectory and the position that individuals take up in the labor market. Parents' life style is extended particularly into their educational style, even from the very first months of their child's life. An important division appears thus within working classes, between very precarious classes which are far off the institutions, and the more integrated ones, more considerate of middle class standards. Inside upper classes parents are distinguished by their consideration of awakening, obedience and fulfillment of the child. This paper will be based on the first results of ELFE (Etude Longitudinale Française depuis l'Enfance) as well as on a quantitative inquiry conducted during 5 years with 50 families coming from different social backgrounds.

Schooling Time among Migrant and Non Migrant Adolescents

Paula Alonso
Universidade da Coruña, Spain
p.alonso(at)udc.es

This article compares the use of time in migrant and non-migrant adolescents within the school framework. By applying the survey technique to 3,600 students of ESO (Spanish Compulsory Secondary Education) throughout the Spanish territory, we analyse from a compared and descriptive approach how that time is managed with reference to their equivalent native peers.

As the article focus on how the schooling time fits in the whole time, we stop to analyse their three main aspects that are good to get to understand the objective and subjective realities of the children: meanings, relationships and performances what education provides to the students.

This article reveals the opportunity for researches on migration to use the time as a valuable resource, through which we try to corroborate our hypothesis about the existence of a differential management of time use, both at home, school and leisure.

Results validate the hypothesis of the differential use that students make of their time according to their origin, shaping individual stories about their socialization patterns.

RN10 | Session 06b Theoretical Approaches to Education**The consequences of mismatch between higher educational fields and occupations for labor market outcomes**

Aleksander Årnes Madsen, Karl Ingar Kittelsen
Røberg

Centre for the Study of Professions, Oslo & Akershus
University College of Applied Sciences, Norway;
Centre for the Study of Professions, Oslo & Akershus
University College of Applied Sciences, Norway
Aleksander.Madsen(at)hioa.no, Karl-Ingar.Kittelsen-
Roberg(at)hioa.no

This study explores the labor market consequences of mismatch between higher educational fields and related occupations (horizontal mismatch). Using Norwegian register data, we analyze different types of temporary and permanent exits from the Norwegian labor market – unemployment, sick leave and disability pension. Exit from the labor market is associated with negative individual and social outcomes such as lower overall productivity, decreased career prospects, and reduced health. The longitudinal data includes the entire population of Norway and their labor market status in the period 2003 – 2013, plus several important covariates. In this study, we try to assess whether mismatch increase the risk of labor market exit. We do this by analyzing time to exit using cox regression over multiple outcomes. Using mismatch as a time varying variable we model the configuration of education-occupation match.

Several studies have found that mismatch between educational level and occupation (vertical mismatch) leads to lower wages, higher risk of unemployment, and increased likelihood of experiencing work related health issues like headaches, fatigue and depression. However, few studies have addressed the possible challenges of working in an occupation not related to the person's higher educational field (horizontal mismatch). We expect horizontally mismatched individuals to have higher rates of unemployment, sick leave and disability retirement. Furthermore, we expect that individuals in licensed professions experience a higher penalty for mismatch. Understanding the impact of mismatch can inform scholars and policy makers of the social and personal gains of matching the attained educational skills of individuals with an appropriate occupation.

Varieties of capitalism, welfare regimes, education systems and educational achievements: closing the theoretical and empirical gap

Adrian Hatos
University of Oradea, Romania
adrian(at)hatos.ro

The objective of my article is to explore the relationship between indicators of varieties of capitalism, educational stratification, individual socio-economic background and the achievements of

secondary level students using PISA 2012 data. My research is justified by two important, and apparently contradictory directions (Busemeyer and Jensen 2012) in explaining the impact of institutional context upon the variations of academic performance measured through international standard tests like PISA, TIMSS etc. One direction connects stratified educational systems with increased inequality in performances and lower average test results. The alternative view is inspired by the varieties of capitalism paradigm (VoC). Estevez-Abe, Soskice and Iversen (Estevez-Abe, Iversen and Soskice 2001) imply a strong relationship between the types of product-market strategies, welfare policies - unemployment and employment protection, (determined subsequently by wage bargaining practices) and types of skill formation. In order to test the two alternative models I will build multilevel regression models of scores in mathematics, science and reading against indicators of varieties of capitalism at country level: unemployment protection, employment protection, welfare, degree of stratification of secondary and higher education, weight of vocational education a.s.o from OECD, WB, Eurostat and other sources.

Which is the most appropriate socio-cultural theoretical approach to understanding pedagogical interactions between a teacher and a student at vulnerable schools?

Jocelyn Lissette Morales Verdejo
UCL, United Kingdom
jocelyn.morales(at)gmail.com

This paper is focused on the discussion of which socio-cultural theoretical approaches are more appropriate to analyse those constructs that are behind pedagogical interactions between a teacher and a student which could be contributing or hinder the learning, construction of subjectivities and identities of children at socioeconomically disadvantaged contexts. Several authors (Moscovici, 1988; Gergen, 1994 and Wagner, 2015) affirm that the background of each teacher is important and constitutes a large part of their preconceptions which could influence their pedagogical practises. From a socio-cultural approach it is possible to recognise several theoretical perspectives amongst them: constructivism, constructionism and the theory of social representations. My main aim in this paper is to evaluate which of them is the most appropriate theoretical approach to understand pedagogical interactions between a teacher and a student at socioeconomically disadvantaged schools. To achieve this, methodological, analytical and practical contributions of each theoretical approach to the study of pedagogical interactions in vulnerable schools are questioned. The methodology used in this research was a review literature of studies published between 2010 and 2016 that included in the title or abstract some of these theoretical approaches. Findings show that each theoretical approach will be more appropriate to the object of study depending on the

methodology that is used, elements that are investigated and the subject that participates in the research. As a conclusion, a sorting by type of participants, objects of study and findings was made. This paper is recommended as a guide to consider how to choose the best methodological and theoretical decisions in this topic.

What is education? – A philosophical contribution to a critical theoretical understanding of the sociology of education

Steen Nepper Larsen

Danish School of Education, Denmark

stla(at)edu.au.dk

“Wer ein WARUM zum Leben hat, erträgt fast jedes WIE.” Friedrich Nietzsche

The what-ness of education, more precisely its process-ontology, i.e. how education exists in the world, must be questioned and scrutinized. Two prevailing and conflicting strategies in the policy of knowledge will be characterized that in each their own way bear strong influence on how education is perceived; an ontology of deficiency (in German: Mangelontologie) and an ontology of excess. The strategies are stylized in a presentation of their ideal forms, albeit they are unlikely to appear in exactly these ways in daily educational life. The German sociologist and philosopher Arnold Gehlen (1904-1976) might represent the first way of thinking – the German philosopher Peter Sloterdijk (1947) the second.

From an existential-ontological and phenomenological perspective it will be investigated how education plays out for and is experienced by the individual student and the university teacher. Based on qualitative interviews as empirical material it will be depicted how students and teachers gain and shape meaning while the study, teach, think, write and communicate. This epistemological and the former ontological horizons will be brought together, although they will never become reconciled

I intend to make clear why the question what is education necessitates a discussion of purpose – rather than a withdrawal to the myopic newspeak of learning-targets and effective learning that seem to be of central concern to propagators of educational politics all around the Globe.

What is Educational Inequality? Beyond Categorical and Fragmentary Thinking, Towards a Relational Understanding of Educational Inequality

R. Nazlı Somel

Helmut Schmidt University Hamburg, Turkey

nazlisomel(at)gmail.com

Scholars share a concern that educational inequality research is in crisis: Studies produce contradictory empirical results, and attempts to fit these into a consistent picture remain inadequate, hindering a comprehensive understanding of the matter. This presentation will elaborate on the causes and

historical roots of the current state of the empirical studies, and offer ways to overcome some aspects of the crisis.

One issue is the absence of an explicit definition of educational inequality. Instead, studies center on theoretical definitions of the specific elements of the problem: e.g. class, gender, or specific educational operations. Without a consensus definition of educational inequality, attempts to relate social categories (intersectionality) or educational operations (processual analysis) with each other, in the context of educational inequality, fail in completing the picture.

If education is a distinct field with a field-specific logic, assigning new meanings to the social categories it incorporates, educational inequality has to be defined on its own. To this end, building upon Relational Sociology, and Tilly and Bourdieu's relational approaches, I define three interrelated characteristics of educational inequality: its relativity, cumulativeness, and being a product of organized practice. These characteristics help to theorize how educational categories form and relate to already established categories of the society, how the field-logic integrates diverse sources of educational inequality (e.g. teacher expectations, peer group effects, tracking) and how the organizational and institutional properties of education allow educational inequalities to persist, in the face of major social and educational changes.

RN10 | Session 06c Higher Education: Social Inequality

Non-traditional students accessing higher education and their persistent struggle against inequality

Alejandro Montes

Universidad Autonoma de Barcelona, Spain

alejandro.montes(at)uab.cat

Over recent years, several European countries have made significant progresses in widening access to higher education (HE) to non-traditional students. The growing diversification of the traditional population in HE also entails a greater access of working class students to tertiary education. However, that progress is still insufficient. Working class students are overrepresented in the dropping out rates from university and several research show the persistence of institutional barriers for guarantying equal opportunities to all social groups in HE. Based on a Bourdieusian perspective, the objective of the paper is to analyse the emergence and significance of horizontal inequalities in HE and specifically to address the following questions: How the educational pathways condition the unequal access to higher education (type of institution, moment of access or typology of studies, among others)? How are the educational pathways of young people shaped? With this aim, a quantitative analysis has been conducted to a sample of newcomer's students at Autonomous University of Barcelona (UAB, Catalonia, Spain), as one of the most representative universities in the Catalan university system (almost 25% of students).

The final sample is N.2.007, representing 30% of all the UAB newcomer's students in 2014-15. The results of the analysis identify four main types of access to HE: traditional academic trajectories, traditional vocational trajectories, non-traditional labour trajectories and non-traditional reflexive trajectories; and the different social composition of each pathway and its signification show the persistence of inequalities in the access to the University.

The relationship between continuous professional development (CPD) and inequalities in the Irish higher level education

Bernadette Brereton
DkIT, Ireland
bernadette.brereton(at)dkit.ie

The potential for higher education to create a more equal society by making a positive contribution to engaged citizenship in an active democracy is well recognized. What is less well recognized is the relationship between the Continuous Professional Development (CPD) of higher level teachers with the core values of Irish higher education while operating within a two-tier unequal system. This paper will examine a 'National Forum for the Enhancement of Teaching and Learning in Higher Education' national project (November 2016 – October 2017) which will see 220 current higher level teachers explore the processes and tools that are used to implement and evaluate the CPD framework for all those who teach in Irish higher education. The paper will evaluate the process and outcomes of this national project and interrogate the new CPD framework which will act as a mechanism for teachers to consider their own professional development through a structured process of reflecting on, planning, gathering evidence and validating their professional development. While inequalities in Irish higher education are strongly tied to structural and funding issues, this paper considers whether this process which sees higher level teachers collaborate on a national CPD project can promote an inclusive, reflective 'community of learners' with positive effects within higher level.

Equalization or reproduction? Consequences of the expansion of higher education on the intergenerational transmission of advantages in contemporary France

Julie Falcon, Pierre Bataille
Université de Lausanne, Switzerland; Université Libre de Bruxelles, Belgium
julie.falcon(at)unil.ch, pierre.bataille(at)ulb.ac.be

This research analyses whether the expansion of higher education has reduced the intergenerational transmission of advantages in contemporary France. We analyse pooled data from the French Labour Force surveys for the period 1982-2014 and undertake an analysis of 11 birth cohorts born between 1918 and 1984. We demonstrate that social background inequality in terms of access to higher education has clearly diminished across cohort, even

within the highest and most selective educational levels such as the grandes écoles. However, we also document, as Torche (2011, 2016) did in the United States, the existence in France of a U-shape pattern in the intergenerational transmission of advantages across levels of education. This implies that within the highest educational levels, social origin has a non-negligible influence on labour market allocation. Insofar as this trend has been rising across cohorts, these findings question the greater meritocratic nature of the labour market among the highly educated (Hout 1988). We conclude by emphasising that more research should be undertaken on the influence of non-meritocratic assets related to social background on the recruitment process and occupational career development.

Massification, privatisation and social reproduction in higher education

Carlos Palma Amestoy
University of Bristol, United Kingdom
c.palmaamestoy(at)bristol.ac.uk

The higher education systems of each country are in continuous transformation. Empirical studies show that higher education worldwide has undergone important processes of change (Cosentino de Cohen, 2003; McCowan, 2007; Jamshidi et al., 2012; Morley, 2012). The most striking of these, undoubtedly, has been the process of massification (Trow, 1974). But this process has not been the only one. Differentially, tertiary education systems in the world have become more feminised, diversified, specialised and, in some cases, privatised. Higher education in a globalised world, therefore, has been converging on what may be called a global tertiary education (Carpentier and Unterhalter, 2011). This phenomenon, in turn, has not been immune to situations of social segmentation, inequality and social reproduction processes. In particular, this paper aims to discuss the characteristics and the transformations of the Chilean higher education system during the last three decades. Essentially, using the theoretical approaches of Pierre Bourdieu (1977; 1979; 1996) and Randall Collins (1979), the paper focuses its attention on three processes: massification, privatisation and social reproduction. The hypothesis of this work states that the Chilean tertiary education system has introduced radical changes since the educational reform of 1981, changes that have made it a highly privatised and socially segmented system. The results indicate that the Chilean system, on the one hand, has become massified, diversified and feminised, and on the other hand, has reached one of the highest privatisation levels in the world. Also, the system shows segmentation and social reproduction mechanisms, which materialise in Chilean society.

RN10 | Session 07a Education: Mobility, Teachers, and Students**Activities of the self: Self-care and entrepreneurship on Higher Education staff learning and development programmes**

Alison Fixsen, Damien Ridge, Steven Cranfield
 University of Westminster, United Kingdom; University of Westminster, United Kingdom; University of Westminster, United Kingdom
 A.Fixsen(at)westminster.ac.uk,
 D.Ridge(at)westminster.ac.uk,
 S.Cranfield(at)westminster.ac.uk

Despite their ubiquitous and growing presence in UK universities, soft skills staff learning and development programmes (LDPs) remain a largely non-investigated dimension of modern university life and culture. Questions need to be asked about the role of LDPs in promoting new managerial, neoliberal values along with traditional self-care practices in a workplace context. This paper draws on symbolic interaction theory to explore findings from an insider ethnographic study into LDPs in a UK university, from the perspective of corporate services and academic staff who participated in them. Findings indicate that as “social worlds” LDPs have remedial and theatrical qualities, which encourage participants to “shed” everyday identities, perform with others, and engage in various “activities of the self” (including entrepreneurship, self-care, self-examination and emotion work), which constitute a hybrid form of self-governance. At the same time, tensions emerged around attempts to performing authentically in a social world where “performance” has different meanings and connotations, i.e., impression management/performance management. From a socio-political perspective these programmes can be viewed as dramatic and manipulative tools encouraging academic staff in particular to “buy into” an entrepreneurial culture with which they might be otherwise reluctant to engage. The categories of “career nomad,” “reluctant entrepreneur” and “course hopper,” which participants were seen to embody, may be transferable to other studies of identity development in the modern workplace.

Social contexts of educational upward mobility

Antonia Kupfer
 Technical University Dresden, Germany
 antonia.kupfer(at)tu-dresden.de

There are, despite of barriers and discrimination, some people from lower socio-economic backgrounds who succeed in education and obtain university degrees. Thanks to a large field of studies we know about these barriers and how discrimination works, but there is little research on the phenomenon of educational upward mobility. Therefore, this paper offers research results on social contexts enabling educational upward mobility. The theoretical perspective is formed by Bourdieu's concept of habitus because of four reasons: this concept

encompasses an idea of the interrelation of structure and agency, it is suitable to grasp social class specific dimensions, it enables an analysis of processes and finally of social changes. The empirical study is formed of 18 biographical narrative interviews with educationally upward mobile working class men and women in Austria and Britain. The interviews are analysed by Gabriele Rosenthal's method of reconstruction, because this method detects interdependencies of life histories and social structures. Among the findings, secure employment positions and material conditions of parents that enable the development of aspirations and educational friendly socialization as well as changes of social structures to improve economic situations of lower classes and cultural changes of gender relations were found to be crucial. Last but not least, mental processes in which precarious childhood and youth lead to a search of truth through studies at universities as a strategy for reaching security, point to the importance of including psychological dimensions into the study of social mobility too. Surprisingly, despite the different welfare regimes, labour markets and educational systems, educational upward mobility was quite similar in Austria and Britain.

Reasons to become a teacher. A study on the attractiveness of the teaching profession.

Antigoni Alba Papakonstantinou
 National and Kapodistrian University of Athens, Greece
 albabap(at)hotmail.com

Teaching is considered as one of the most demanding and challenging professions worldwide. People successfully practicing teaching are thought of as patient, creative, skilled and according to some researchers talented, devoted and strongly engaged in their work. Last decade's research, though, indicates lack of teaching personnel in many European countries, as skilled persons of different specialties do not choose to work in the educational field. On the contrary, Greece is a country with a large group of well skilled and specialized individuals that face high unemployment rates due to the limited demand for teaching professionals.

The present study aims to investigate the reasons that drive graduate students of diverse specialties pursue working as professors in secondary education. More specifically, we tried to answer the following questions: a. What are the expectations of graduate students following seminars on pedagogy and teaching?, b. Which are the positive aspects that they identify in the teaching profession?, c. What are the difficulties that they expect to face when teaching in school?. 200 questionnaires of open questions were distributed and 10 interviews were conducted with graduate students that had followed such seminars. Data were analyzed with content analysis.

Preliminary results indicate that students participating in our research chose to attend the specific seminars in order to get to work as teachers in public or private school units. Most of them consider teaching to be

difficult and tiring, but also interesting and rejuvenating. Moreover, they underline their low expectations from the educational system, they appear pessimistic with regard to their professional rehabilitation and recognize the difficulties in teaching in today's classrooms.

4th Grade Exams in Children Every Day Life: Testimonies in the Media

Benedita Portugal Melo, Ana Isabel Diogo, Manuela Ferreira

Institute of Education of University of Lisbon, Portugal; University of Azores, Portugal; University of Oporto, Portugal

mbmelo(at)ie.ulisboa.pt, ana.is.diogo(at)uac.pt, manuela(at)fpce.up.pt

In the school year of 2012/2013, Portugal instated national exams in the 4th grade, thirty nine years after their eradication from Portuguese educational system. If there already is a group of researchers studying the effects of the enforcement of exams in the teaching practices of secondary school teachers, in families investment strategies in children's school success and in the relationship between youth and school (Antunes, 2010; Torres, 2014) there is still little knowledge about the consequences of the enforcement of exams in the daily life of teachers, families and children of the first school cycle.

This paper presents the results of electronic documental sources, in order to enhance the effects of 4th grade exams in educational models and child conceptions that flow in the internet, since 2012 until now.

From the analysis of live voices of teachers, parents and children difused on electronic documents (broadcasting television program published in internet) we have found two polarised logics: i) a logic centred in the metier of being a child (Sirota, 2006) considering the child as an infant personality whose development should be supported by socialisation agencies, ii) an instrumental logic centred in the pupil-child and in academic results (Perrenoud, 1994).

Our conclusions will enhance: (a) how parents, teachers and children stand between these two poles while ideal types; b) how these poles potentially generate tension and drive this individuals to construct composite justification logics for their actions and conceptions; c) how children transit between the roles of "child-innocence" and "effective pupil".

RN10 | Session 07b Educational Systems: Comparisons and Transitions

Educational Divide in the Quality of Life: Evidence from European Societies

Bernadette Müller Kmet

University of Innsbruck, Austria

bernadette.mueller-kmet(at)uibk.ac.at

Education matters when it comes to quality of life. This paper investigates educational differences in the four qualities of life suggested by Veenhoven (2000): (1)

'livability of the environment', which refers to living conditions and one's position in society; (2) 'life ability', which is expressed in well-being and health; (3) 'external utility of life', which denotes the external worth of a life; and (4) 'inner appreciation of life', which refers to life satisfaction and happiness.

Although the findings of various studies occasionally reveal contradictory effects, the overall pattern shows that high educational levels are related to greater overall life satisfaction and well-being, better living and housing conditions, higher social status and better health conditions. By contrast, lower educational levels often lead to contrary outcomes (even when controlled for income and other socio-economic variables). This paper addresses the following questions: Are there cross-national differences in the size of the educational gaps regarding the four qualities of life? What societal factors may account for these cross-national differences?

In order to answer these research questions, I conduct multivariate analyses using data from the seventh wave of the European Social Survey (ESS). The findings indicate that there are cross-national differences in the size of the educational gaps regarding the four qualities of life. For instance, respondents with a tertiary education show a greater life satisfaction than those with at most lower secondary education. This educational gap varies considerably across countries: It is smallest among Nordic countries and largest among post-communist countries. Finally, the educational divide is discussed in the light of welfare and education regimes that may mitigate the educational divide when it comes to quality of life.

The Role of Education in Vertical and Horizontal Differentiation: A Cross-National Comparison

Will Atkinson

University of Bristol, United Kingdom

w.atkinson(at)bristol.ac.uk

This paper engages with the theme of education as a contemporary source of social division by testing the contemporary applicability and generalisability of Pierre Bourdieu's model of 'social space' developed in *Distinction*. In this model, cultural capital – often proxied by educational level – is key in two respects: as a component of vertical differentiation within society alongside economic and social capital; and as an element of horizontal differentiation, opposing those richer in economic capital and those richer in cultural capital. Subjecting data for twenty countries drawn from the International Social Survey Programme to multiple correspondence analysis, Bourdieu's model is generally found to hold good for a wide range of nations in the 21st Century. There are, however, important national differences, particularly in relation to the strength of horizontal differentiation. Moreover, while education is indeed heavily bound up with vertical differentiation, horizontal differences are often based more on parental education level than respondents'. This perhaps indicates an effect of the growth of higher education systems in many nations,

namely, the increasing reliance on educational credentials among all members of the dominant class for reproduction of their position – a trend already spotted by Bourdieu.

What can European theories explain about the reality of the South?

Amurabi Oliveira

Federal University of Santa Catarina, Brazil

amurabi_cs(at)hotmail.com

In recent years there has been a growing debate on the so-called “theories of the South”, which has made visible the need to seek new theoretical contributions to think about the social realities of the “Global South”, and this has been perceived in several fields of Sociology. It includes the Sociology of Education. In this paper I intend to hold a theoretical debate on the potentialities and limits of “northern” sociological theories in explaining the “southern” educational realities. This is not only to indicate the need for development of new theoretical contributions from the perspective of “southern”, but also to recognize how we need to rethink “northern” theories, reframing them in other social contexts. I will take as a thread of my debate the question of affirmative action in higher education in Brazil, especially those of racial character.

Segregated education, youth radicalisation and European security: The case of Bosnia and Herzegovina

Maja Halilovic-Pastuovic

Trinity College Dublin, Ireland

halilovm(at)tcd.ie

Security in relation to Bosnia is very timely and relevant issue. The conflict that happened in Bosnia was the bloodiest conflict in modern European history and the first case of genocide in Europe since the Second World War. The conflict ended 22 years ago with the signing of the Dayton Peace Agreement and Bosnia is presently an EU candidate country. The Agreement has secured peace but has left this ethnically diverse country a divided society. There exist significant divisions in all spheres of social life between the main ethnicities in Bosnia, i.e. Bosnian Muslims, Croats and Serbs, and significant levels of mistrust, alienation and ghettoization between these populations.

The focus of the paper is the segregated education system in Bosnia and, in particular, the phenomenon of ‘two schools under one roof’ that currently operates in the country (TSUOR). TSUOR describes a policy of ethnic segregation which was introduced by the Dayton Agreement to schools in Bosnia. Muslim, Croat and Serb children attend classes in the same building but are physically separated into different classrooms and taught ethnically differentiated curricula. The paper investigates if two decades of segregated education in Bosnia have had a negative impact on security by creating fertile ground for youth radicalisation in the country.

The paper uses Foucault’s theorisations of biopolitics and Durkheim’s concept of homo duplex to investigate the current situation in Bosnia. It argues that while actual combat may have ceased, the ethnic conflict continues in the field of education where schools represent the new battlefields.

RN10 | Session 07c Gender and Education II

Who thinks engineering is for men? Effects of gender and ambivalent sexism on occupational sex-typing

Dinah Gross

University of Lausanne, Switzerland

Dinah.Gross(at)unil.ch

Teenagers’ gender and sex-typing of occupations contribute to circumscribing the occupations they aspire to, with the potential disadvantageous consequence of discouraging them from following educational or vocational tracks which they may have found fulfilling, but with which they do not identify from the point of view of gender stereotypes. However, little research has examined the determinants of occupational sex-typing. We consider how gender and benevolent and hostile sexism (based on the Ambivalent Sexism Inventory) influence the sex typing of six occupations among a sample of 3125 students in the last three years of obligatory school (12-15 years) in Switzerland. According to our findings, boys display more hostile sexism than girls and girls reveal more benevolent sexism than boys. Sexism affected attitudes towards the most sex-typed occupations: Boys’ hostile sexism emphasises the masculinity of male-dominated occupations, and their benevolent sexism has the same effect on the femininity of the female-dominated lower status occupation. Girls’ benevolent sexism endorses gender stereotypes about the most sex-typed occupations. Gender affects attitudes towards the less sex-typed occupations, boys tending to find them more masculine and girls more feminine. These findings show how gender roles and sexism contribute to reproduce a hierarchical and segregated view of occupations deemed appropriate to each gender.

Feeling more insecure than before: Women in academia in Turkey

Fatma Umut Bespinar, Ayse Idil Aybars

Middle East Technical University, Turkey; Middle East

Technical University, Turkey

bespinar(at)metu.edu.tr, aybars(at)metu.edu.tr

The current turbulent political context in Turkey has significant implications for universities and academic life, as well as for the broader context of gender equality, freedom and democracy in the country. Increasing terrorist attacks in urban centers, the coup attempt and following state of emergency, increasing pressures on universities, including abolishment of the electoral procedure for University Rectors, increasing hostility towards academics and universities that are perceived as oppositional, serious problems of

freedom of expression in both academia and the media, all of which go hand in hand with an increasingly sexist political discourse, have all contributed to a worsening atmosphere in teaching and research practices as well as an insecure and pessimistic general mood in the academia in Turkey. This paper examines the reflections of the general socio-political context of increasing conservatism and authoritarianism in Turkey by focusing on the experiences of women academics in the public and private universities in Ankara. The main argument of the paper is that, while gender inequality is invisible, and indeed denied, in the Turkish academia due to factors such as institutional culture and the general political and social framing of gender issues in Turkey, the most recent political developments further increase the vulnerability of women academics, through its reflections on job insecurity and job losses, intervention on research subjects, restrictions in national research funding, and uncertainties in recruitment and promotion procedures, which deepen the disadvantages that women already face in academia.

Gender Inequalities in Choosing Engineering as a Major: Experiences from “Honey Bees are Becoming Engineers” Project

Esra Gedik, Ezgi P. Kadayifci
Bozok University, Turkey; Middle East Technical University, Turkey
esragedik.34(at)gmail.com,
esgi.pehlivanli(at)gmail.com

The situation of women in fields related to natural sciences, technology, engineering and mathematics (STEM) is one of the significant research topics of the 2000s. The main argument behind this agenda is that some professions traditionally considered to be suitable for women and some for men, due to gender stereotypes. It is also argued that provided the necessary social and economic conditions, women can accomplish as well as men do in mentioned fields. Engineering is one of these professions which is traditionally attributed to men. On the basis of these, the purpose of this study is to determine the factors that influence the choices of female students in high school as they choose engineering as a profession and how we can overcome gender inequalities in education on the basis of female high school students in Turkey.

The data set of this research is collected through a series of high school visits within the course of a project called Honey Bees are Becoming Engineers. We conducted surveys with 420 tenth grade female students in six high schools from selected cities of Turkey. As a result, we argue that female students do not choose to study engineering because of gendered prejudices and gendered stereotypes regarding engineering education and when their perspective change with a positive encouragement, they might consider choosing to engineer as a profession.

RN10 | Session 08a Migration and Education I

Course clear? – Concrete educational expectations and abstract career aspiration of immigrant- and Finnish-origin youth

Janne Varjo, Mira Kalalahti, Markku Jahnukainen
University of Helsinki, Finland; University of Helsinki, Finland; University of Helsinki, Finland
janne.varjo(at)helsinki.fi, mira.kalalahti(at)helsinki.fi, markku.jahnukainen(at)helsinki.fi

Previous studies indicate that youth with immigrant-origins have multi-layered aspirations towards education and transition to work. On the one hand, they hold abstract and positive attitudes that relate to the shared idea that education is the key factor to success and upward mobility. On the other hand, based on perceived returns to education and experiences of discrimination, for instance, they tend to have more pessimistic concrete expectations about the educational achievements. Unlike their majority/native counterparts, the abstract aspirations and concrete expectations of youth with immigrant origins do not often converge. (Jonsson & Rudolphi 2011; D'hondt et al., 2016.)

The overall aim of our study is to analyse the varieties of convergence and divergence between the concrete educational expectations and abstract career perceptions of immigrant- and Finnish-origin youth. The concrete expectations are operationalised as expected enrolment to general academic or vocational track of the secondary education and abstract career aspirations are based on whether youth aims to professional or workers occupation. The aim is to analyse the linearity and certainty of these two envisions, as well as to understand the reasonings, orientations and factors preceding them.

The mixed-method research draws upon thematic interviews (n = 112) and survey (N = 445), executed during the last year of comprehensive school (9th grade). The survey data offers understanding of the frequencies and causalities, and the qualitative data enables us to grasp the meanings and interpretations the youth give to the future expectations and aspirations. We outline our work by theories on educational transitions of immigrant-origin youth, with their outcomes and expectations, and theories concerning institutional opportunity structures (Heinz 2009; Walther 2006).

Do they have the same opportunities? The educational attainment of students with immigrant background in Italy

Rita Bertozzi
University of Modena and Reggio Emilia, Italy
rita.bertozzi(at)unimore.it

Students with immigrant background entering higher education is a little explored topic in Italy, even if there is a large international literature on the subject. The paper offers a contribution to the debate, since it analyzes new empirical evidence on this transition in Italy and some findings of a qualitative case study conducted in an Italian university with a group of students with immigrant background. It investigates

how the school previous choices, the immigrant origins, the social and cultural capital, the individual aspirations, the teacher's advice affect access to the university and what elements of "rationality" and "constraint" affect this choice. Findings clearly show that the proportion of upper secondary school graduates with foreign citizenship who enrol in tertiary education is significantly lower compared to that of Italian students. The analysis highlights the positive impact of the permeability of Italian school system and the negative one of the weak school guidance policies. Results show that school transitions are negatively affected by the low socio-economic capital and the poor school system knowledge due to migrant background. Nevertheless, the rational choices of investment in education are important and strictly connected to the positive secondary effects of migrant origins.

The policy implications are discussed at the end. There is no evidence of specific policies developed by Italian HE institutions with the aim of promoting the access to university of immigrant students. However, the international experience provides some examples of policies that can be adapted and applied to our country.

Self-determined educational biography of young migrants?

Elisabeth Schilling

University of Applied Administrative Science NRW,
Germany

elisabeth.schilling(at)gmail.com

The presentation aims to discuss the impact of the perceived (equal or unequal) chances of migrants for an education to an arrangement of the future educational biography. Migrants are influenced on a doubled way: directly and by means of influencing of different consultant groups. Statistical data connote an objectivation of everyday experiences, they are powerful and delegitimite an individual resistance against their suggestive authority.

Self-determined planning and designing of the own biography becomes especially difficult, if an individual should master several transitions simultaneously. Statistical forecasts are useless in such cases, because they cannot be supported by any appropriate comparison: there is no a substantial comparison group and intersectional effects might be important. Simultaneously there is a great uncertainty especially in such cases: actors as well as consultants are insecure, for instance because of the lack of role models, adequate institutional regulations and structures. Ironically useless statistic data are especially often used for the work with this group because of this uncertainty. In the planned presentation we discuss and analyse emerging discources. We focus upon the discursive patterns of the production of normality.

The presentation is based on a qualitative study with migrants and teachers, concomitant to an integration course. Young migrants were asked about their biographical projects and future expectations.

Teachers were asked to give an assessment of the chances of their students to realize their plans. Further they were asked about their consulting activities. We tried to understand the negotiating processes of the biographical projects also by analyzing some teaching sequences.

RN10 | Session 08b Social Inequality in Education II

Digital Stratification Meets Academic Stratification: GPA as an Outcome of Digital Engagements

Oyvind Wiborg, Laura Robinson, Jeremy Schulz
University of Oslo, Norway; Santa Clara University,
United States of America; UC Berkeley, United States
of America
oyvindnw(at)gmail.com, laura(at)laurarobinson.org,
jmschulz(at)berkeley.edu

In this study we explore the consequences of digital engagements for academic achievement with a revealing case study. The paper explores the link between academic and digital forms of stratification within a public secondary school in California. This school features a differentiated curriculum and serves a relatively uniform low-SES student body characterized by heterogeneous digital engagements and conditions of digital access. As we show with both qualitative analysis and regression analysis under these conditions the students' digital engagements, particularly the duration of digital experience at home and at school, play a key role in shaping the students' academic achievement. Associations between students' digital engagements and students' academic performance reach statistically discernable levels, even when students' curricular and class assignments are taken into account in multilevel fixed-effects models. In addition, where their grades are concerned, students placed within the Advanced Placement (honors) track reap especially large benefits from longer durations of digital experience. By contrast, their counterparts in lower-level tracks derive minimal benefit from longer durations of digital experience. Taken together, these findings make clear that, where teachers demand the use of online resources and where students with varying levels of digital resources are sorted into stratified academic programs, academic performance reflects inequalities in patterns of internet access and usage. We conclude by presenting conclusions regarding the mechanisms which would account for the predictive power of digital experience as a determinant of academic performance among the individuals in our case study with an eye to comparison with comparable European cases.

Does cultural capital matter? The impact of social class background on a professions educational preferences

Bent Olsen

Department of Education and Lifelong Learning,
NTNU, Norway
bent.olsen(at)svt.ntnu.no

The present study investigates plausible correlations between social background and educational values in a group of 700 employees in 80 Danish kindergartens (response rate of 60 %). The question is in what degree the pedagogical efforts of the staff are indebted to their living milieus of upbringing and investments during the life course. The overall approach to educational values reflects Bourdieu's theory of practice. I have thus developed a concept of "normative actions" to overcome biases and shortcomings of common value studies; in addition, this theoretical reconstruction is prepared to gap the distance between staffmembers' everyday practice and the acts of fulfilling the questionnaire. The questionnaires value themes are developed along the grid-group theory of Mary Douglas. A range of indicators of cultural and social capital informs on the respondents social heredity, investments in education and a variety of cultural consumptions. The questionnaire were subject-ed to geometric data analysis (multiple correspondence analyses) as to compare the space of respondents social background and investments with the space of educational preference; in that respect the analysis suits the theoretical framework of Bourdieu. The research results show that the respondents typically agree on pedagogical values across social background, age and position in the professional job hierarchy. However, it also shows that there are correlations between the possession of acquired capital and educational values appreciated.

With Best Intentions: Special Education Students' Experiences with Stigmatization within Inclusive Schools

Christine Steiner, Irene Hofmann-Lun

German Youth Institute, Germany; German Youth Institute, Germany
steiner(at)dji.de, hofmann(at)dji.de

Despite various educational reforms, the German schooling system is still characterized by an early selection of students into different secondary school tracks. The justification for this is that homogeneous school classes provide a better learning environment for the individual students. At the same time, educational success in the German schooling system is more dependent on the student's social background than in other countries. Children and youth with special education needs are particularly affected by this. They attend so-called "special schools" that are separate from the regular schools, which also means that they have little chance of obtaining a promising school-leaving certificate. Above all, because they attend such special schools, they are affected by

stigmatization not only during their time in school but also after leaving the school.

With the implementation of the UN Convention on the Rights of Persons with Disabilities, all students have the right to learn together in school, regardless of their cultural or social backgrounds, or of their individual abilities. At the moment, however, only a small number of students are attending an inclusive regular school. In our project "Students in Inclusive All-day Schools", 12 students reported in extensive interviews about their experiences with their new classmates and teachers. Our findings show that, despite an overall positive assessment of joint learning, some of the young people--in particular young women--are trapped in their outsider status; despite or even due to the inclusive school setting. In our presentation we will examine the contexts of their continued experience of exclusion, and discuss possible interpretations.

Employability differential and youth inequality experiences in a post-crisis context. The case of university graduates of humanities and social sciences in Cyprus.

Sophia Stavrou, Iasonas Lamprianou

University of Cyprus, Cyprus; University of Cyprus, Cyprus

sofiast(at)ucy.ac.cy, lamprianou.iasonas(at)ucy.ac.cy

For the last three decades, the European economic and social models have been driven by the project of a knowledge-based society. However, in the current socio-economic context, especially in the EU Member States most seriously affected by economic crisis, the young populations experience an unprecedented inequality, suffering from high unemployment and high risk of poverty and social exclusion, contradictory to their high levels of education attainment. Our research is a contribution to the field of inequalities in higher education, investigating both institutional and individual processes that can lead to socially differentiated employment and life opportunities for individuals, beyond the important expansion of enrollment. The results which will be presented are based on a qualitative study on the transition to employment of university graduates of Humanities and Social Sciences in post-crisis Cyprus. It rests on a complex set of data including policy-texts, university curricula, and in-depth interviews with graduates, employers, policymakers and academics. The research focuses on an integrative perspective which takes into consideration interactions between youth life-course experiences, educational structures, and labour market factors. Observations are innovative in unveiling unequal opportunities that can result from the positional stratification and horizontal diversity of fields of study and university curricula, as regards their relationship with the labour market, and how they respond to the impetus of the European policy to enhance employability, even within the same academic sector (i.e. between discipline-based, regionalised profession-centred or market-oriented curricula).

RN10 | Session 08c Bullying and Violence in Schools**Youth and socialization: violence as a sociological issue**

João Sebastião

ISCTE- Instituto Universitário de Lisboa, Portugal
joaseb(at)sapo.pt

This communication focuses on the critical analysis of some of the main concepts in use in the analysis of situations of violence among youth, such as bullying, questioning their use in the sociological field.

Analyzing sociologically youth violence implies to build a problematic capable of taking in account of the multidimensionality of the phenomenon, questioning the conceptions that see it as the simple result of poorly socialized children or behavioral disorders.

We will argue that the recurrent use of such concepts without due sociological questioning has led to the diffusion of individualistic and psychologistic explanations of violent behaviors, devaluing or ignoring even the cultural, social and interactive frameworks in which they occur. Based on the sociological debate on violence, namely the contributions of Norbert Elias and Randall Collins, and the results of several researches about situations of violence among young people in different contexts of interaction (in school, dating), we will present a theoretical model that allows the adoption of a definition of violence capable of considering not only the act itself, but also the relational framework in which it takes place.

'Risk talk' and 'vulnerable' youth: cyberbullying experiences among children with disabilities

Sonia Kontogianni

School of Economics and Political Sciences. University of Athens, Greece
skontogianni(at)media.uoa.gr

Historically, research exploring the experiences of children with disability, has largely been undertaken without their involvement. Personal accounts of their internet use receive scant attention as well. Given the fact that, cyberbullying has attracted a widespread public concern in recent years, this paper explores the cyberbullying practices and experiences amongst young people with disabilities. By adopting a historical approach to modern childhood, in order to contextualize bullying, I will draw from Hilgartner's and Bosk (1988) useful conceptualization of social problems as products of collective definition and of the processes of problem-amplifying and problem-dampening. Taking also into consideration, the proliferation and reiteration of a 'narrative of risk' Cradock (2004) when it comes to children in the past decades, I attempt to gain more in-depth knowledge about what lies behind children's and teenagers' with disabilities online experiences of cyberbullying. This paper draws on findings from qualitative research conducted in Athens with students with disabilities and their teachers, in order to explore whether, and if so,

how, they experience cyberbullying as a result of their disability, either by other people with disabilities or by non-disabled people.

Digital anti-bullying program. An e-learning, bullying prevention platformEvgenia Adamopoulou, Panagiota Dionysopoulou
Computer science teacher in Secondary education, Greece; Hellenic Ministry of Education, Research and Religious Affairs, Greece
euadamop(at)sch.gr, yoldi63(at)gmail.com

Violent acts in school are one of the primary problems threatening school safety. Definitions of violence vary according to different environments and cultures. The WHO (World Health Organization) defines violence as; "the intentional use of physical force or power, threatened or actual, against oneself, another person, or against a group or community, that either results in or has a high likelihood of resulting in injury, death, psychological harm or deprivation".

This project is about a school prevention program, which is based on two European programs, the Europe's Anti-bullying Campaign "e-abc" and "Teachers4Europe" program.

We organized five meetings, one per week, which included the projection of a specific animated video about physical, psychological and verbal violence or cyber bullying incident and the related -to the topic- discussion as well. All videos were posted at our e-learning "Digital anti-bullying" platform. In addition, after the implementation of this part of the project, using the "Digital storytelling" method the students created their digital stories –presentations, games, quizzes, posters, videos and mind map presentations-. This educational method helps students not only to understand but also to deepen to the serious school violence issue. The students also participated in a survey about school violence and about their behavior at school and how this project helped them to improve it.

In conclusion, this platform may be used by teachers as an effective bullying prevention program. They can use the animated videos that we have created and we have posted at the site and then they study their case by using our questionnaires. Finally they may implement the digital storytelling method by teaching their students how to create digital presentations.

Violence in Secondary education, An Empirical study in Greece

Magdalini Eleftheroglou

Panteion University, Greece
l.elef(at)yahoo.gr

The purpose of this paper is to examine the relations of violence developed in the school environment, between students and professors in Secondary Education in Greece. For the purposes of our research we chose the qualitative method and in particular the sampling ratio with semi-structured interviews of students. Through students' recorded incidents of violence we try to understand firstly the

way in which relations of violence are expressed, the types and the frequency of violent incidents between students and professors, the graduation and extent of different forms of violence, the kind of school that violent incidents take place, the factors affecting the occurrence of violent incidents and also the factors affecting the occurrence of violent relationship that violent incidents presuppose and entail.

The main purpose of this paper is to examine the way that students perceive the violence between themselves and their professors. Additionally, we try to understand how students assess the violent incidents. Finally, we also try to understand if professors meet the expectations of their students and additionally what kind of relationships would students like to have with their professors.

RN10 | Session 09a Higher Education: Students

The effect of social origin on enrollment in university in Romania

Agnes David-Kacso, Maria Roth
BBU Cluj-Napoca, Romania, Romania; BBU Cluj-Napoca, Romania, Romania
kacso_agnes(at)yahoo.com, roth.mari(at)ymail.com

The secondary effects of social origin on educational attainment are related to the educational decisions of the families (e.g. Breen and Goldthorpe, 1997). Educational attainment being seen as a “decision tree”, Mare’s (1981) model of educational stratification shows that at each educational transition point social origin influences the education related choices of social agents, although educational expansion can compensate the selectivity of the system.

In Romania the high education has undergone a spectacular expansion after the fall of the communist system, the number of student enrolled in universities increasing more than three times since 1990 (Hatos, 2006). In this context the aim of this study is to analyze the effect of social origin on the educational process of Romanian youth. The study follows the influence of SES on the student’s educational aspirations in the final school year, on the enrollment in university and on the chosen specialization. The results of logistical regressions show that parent’s educational level and the family’s economic status predict the high school student’s educational aspirations, and the predictive effect of social origin is stronger on the enrollment in university. Parent’s education and the financial situation of the family didn’t influence the chosen specialization.

The data were collected in the frame of the project “Outcomes of Adolescence. A longitudinal perspective”, being realized two waves of survey (the first in 2012, the second in 2014), from a nationally representative sample of 3508 youth in the first wave obtaining a data base of 1509 respondents in the second wave.

“It’s a life path, it’s not just a product you buy; it’s not like buying a chocolate bar”: exploring student, media and policy constructions of higher

education students in England

Anu Lainio, Jessie Abrahams
University of Surrey, United Kingdom; University of Surrey, United Kingdom
a.lainio(at)surrey.ac.uk,
jessie.abrahams(at)surrey.ac.uk

There are currently over 35 million students within Europe and yet, to date, we have no clear understanding of the extent to which conceptions of ‘the student’ are shared by different social actors and across different countries. What does it mean to be a higher education (HE) student today? To what extent is there congruence about this amongst students, policy makers, the media and higher education institutions (HEIs)? This paper draws upon data collected as part of the five year European Research Council-funded ‘Eurostudents’ project (2016 – 2021) which seeks to address this gap in knowledge through exploring the conceptions of the HE student within and across six different nations (Denmark, England, Germany, Ireland, Poland and Spain). This presentation focusses on early data collected in three strands of the project in one case study country (England). We present findings from our analysis of nine focus groups with students in different HEIs across England, media analysis of two English newspapers and analysis of 16 English policy documents. Through combining these three strands, this paper considers both the similarities and differences in English students’ perceptions of themselves and the ways in which media and policy documents represent them. We discuss the extent to which students are represented and/or see themselves as consumers, political actors, learners and the next generation of workers. We also reflect on students’ perceptions of the way in which they are portrayed in media and policy documents.

Social inequalities as mirrored by extracurricular activities in higher education: The role of student employment and international mobility in academic success

Edit Veres, Agoston Horvath, Adam Hamori
Educational Authority, Hungary; Educational Authority, Hungary; Educational Authority, Hungary
veresedit2010(at)gmail.com,
horvath.agoston(at)oh.gov.hu,
hamori.adam(at)oh.gov.hu

Extracurricular activities have now known to play a key role in higher education progress as well as facilitating school-to-work transition. Underlying causal mechanisms and also the exact nature of these factors are, however, debated. Improvement of future career prospects by employment related to the studies is already widely evidenced, yet whether student term-time employment in general promotes or hinders academic achievement and fosters plans for further higher education studies is somewhat unclear. At the same time, social inequalities in access to international mobility programs and socially unequal motivations of student employment, either for covering

living expenses or gaining professional experience, are proven in many contexts.

Our paper scrutinizes types and social background factors of employment during the time of higher education study, the access of these diverse student groups to international mobility activities as well as their effects on future study plans. These features are presented as factors which contribute to the perpetuation of existing inequalities in higher education.

Our research is based on the secondary analysis of the Hungarian database of EUROSTUDENT VI including appr. 7200 respondents. We apply descriptive and multivariate statistical methods to showcase the social characteristics of different groups of employed as well as internationally mobile students in Hungarian higher education. We analyze the causative direction and significance of institutional, social, economic and study career background of employment, international mobility plans and experiences as well as further higher education study plans resulting from these characteristics.

RN10 | Session 09b Inclusive Education

Managing Inclusivity in UK Universities - The Rise of New Higher Education Professionals

Roxana Diana Baltaru
University of Essex, United Kingdom
rdbalt(at)essex.ac.uk

Over the last couple of decades a growing number of studies have documented the expansion of non-academic professionals in universities all over Europe, a long established trend in the US. Conventional arguments conceptualize this trend as a functional response to the structural challenges associated with universities becoming more inclusive in line with new societal demands and expectations. In contrast, departing from a neo-institutionalist perspective, this paper pursues the cultural dimension of universities' response to structural diversity, drawing attention to the broader environmental forces that shape universities as formal organizations. More specifically, the paper explores the relationship between universities' commitment to pursue inclusivity among students and staff (in terms of gender, ethnicity, nationality and disability) and the proliferation of non-academic professionals. I use panel data in order to model this relationship based on yearly observations obtained from 124 UK universities from 2003 to 2011. I provide a unique systematic investigation into the factors underlining the growth into the proportion of non-academic professionals in the UK. My findings indicate that it is not the diversification of students and staff per se that stimulates the increase in non-academic professionals but the highly standardized approaches, such as provision of support oriented academic services and facilities, that universities employ in order to articulate their rational actorhood in catering for individual differences. The results are robust controlling for institutional size, customer orientation, research activity and performance.

The potential of Dialogic Leadership in Education to promote the inclusion of all voices and increase academic performance.

Adriana Aubert, Carmen Elboj, Tinka Schubert
University of Barcelona; University of Zaragoza;
University Rovira i Virgili
adriana.aubert(at)ub.edu, celboj(at)unizar.es,
tinkatabea.schubert(at)urv.cat

In the present paper, we present the potential of Dialogic Leadership when implemented in schools as learning communities. Over the last decades, scientific literature has investigated the role of leadership in educational institutions and diverse contributions have addressed specific aspects, such as the distributed leadership looking to improve school outcomes or the transformational leadership which adds the importance of school improvement for socially just schools. Further research focuses on the role of the teacher in educational leadership and their role as agents of change.

The concept of dialogic leadership adds to this knowledge with particular attention to the role of dialogue. The theoretical foundations build on the dialogic turn in education and in society in general. Departing from contributions by Habermas and Freire, Padros and Flecha (2014, p.217) define dialogic leadership as "the process through which leadership practices of all the members of the educational community are created, developed and consolidated including teachers, students, families, non-teaching staff, volunteers and any other members of the community". The present paper presents evidences from case studies implemented in Spain and focuses on the implications that dialogic leadership can have on the diverse collectives participating and assuming this leadership role in their educational community. The transformational potential of this practice reaches beyond the performance of school outcomes and improves the academic performance of children, while at the same time contributing to the empowerment of the participating family and community members, especially those from vulnerable collectives.

The practices of developing relationships between the inclusive education process participants: evidence from a Russian university

Sofia Vladimirovna Korzhuk
Institute of Economics and Industrial Engineering SB
RAS; Novosibirsk State University, Russian
Federation
k-sofya-w(at)yandex.ru

Inclusive education for people with disabilities is a relatively new experience for Russian universities. Therefore, there is a need for research of effective ways to introduce inclusive education to higher education system. The purpose of this research is to identify restrictions and perspectives of inclusive education in universities in order to develop ways to improve higher education accessibility for people with disabilities in Novosibirsk.

The research has been conducted in Novosibirsk State University, which has been implementing a project for the inclusion of students with disabilities for more than 10 years. We have performed interviews with students without disabilities, students and graduates with disabilities as well as in-depth interviews with students with disabilities, professionals and professors who work with students with disabilities in Novosibirsk State University. The results include different opinions on inclusive education, description of the impact that inclusive education has on various participants of the educational process and an overview of topical issues in inclusive education. Experience of Novosibirsk State University shows that inclusive education of people with disabilities has advantages for all participants of the educational process. However, given a relatively small number of students with disabilities studying in the university, informal approach to the problems of such students tends to prevail. For further improvement of inclusive components there is a need to work out a formal mechanism of interactions of all participants of educational process.

(Re)purposing Life: Education and Social Inclusion of Underqualified Adults

Luísa Maria Delgado

Instituto Politécnico de Santarém | Escola Superior de Santarém, Portugal
lsdelgado67(at)gmail.com

This paper aims to reflect on the limits and opportunities of adult-targeted courses, as a relevant measure to promote the social and professional integration of underqualified adults — particularly of long-term unemployed individuals — in the context of modern societies.

It results from intensive subsequent research efforts, in which several in-depth interviews were conducted to underqualified individuals, whom at the time were partaking in courses which would later grant them professionalized academic certification.

Such research efforts have allowed us to conclude that these courses gave the adults the possibility to escape the reality of unemployment, as well as to resume an academic journey that had been prematurely put to an end. To the vast majority of these individuals, this return to the school benches represented a moment of (re)purposing and (re)shaping their life projects, acquiring the skills to pursue a qualified job. It also represented a moment to rethink their broad perspectives on school, which consequently had impacting positive effects regarding the way they helped their children who were simultaneously in school. Finally, it is relevant to highlight the impact of these courses on the individuals' self-esteem (observable in the quote 'I can do it!'), as well as the healthy learning environment, which allowed for more long-lasting and satisfactory social bonds.

In addition to the invaluable professional opportunities created by these courses, it is also important to reflect on their limits within contemporary societies, in which

phenomena such as overqualification push to employment the more underqualified tiers of our societies.

RN10 | Session 09c Religion and Education

Is belonging to a religion a possible fault line in public schooling? Reflections and methodological issues

Maddalena Colombo

Università Cattolica del Sacro Cuore, Italy
maddalena.colombo(at)unicatt.it

Public schooling is traditionally neutral as far as religion is concerned. In Europe secularization and universalism of rights have reduced the public role of religion. The difficult management of multi-ethnic classes and the tensions among peers, often due to religious bullying, shows that we aren't in an equal, undiscriminating, and peaceful educational landscape. Even the recurrence of violence and radicalism within the second generation immigrants tell the same. The persistence of the juvenile need to be identified (and distinguished) not only by name, family background, local and cultural roots, but also by the religious community, is a matter for deep reflections for sociologists of education from: the side of student, that of parents/teachers, and that of the public/institutional perspective. What kind of new educational setting is designed by the returning of religions into schooling? Which divides and conflicts will sort out? In this paper I present the main theoretical and methodological categories set up for an empirical study in Italy, where the analysis of religions is associated to immigration and to education of new citizens; secondly, to the perspective of learning from religions (freedom to keep your religion) and interreligious dialogue at school (religious pluralism as a common good). The key question of the study is: Does religion represent: a) reason for conflicts or b) lever for dialogue among lower secondary education students with different beliefs and cultural/ethnic backgrounds? For whom is it a) or b)? The paper presents: the research design (explanatory factor, causal links between the explanatory factor and personal, structural and contextual variables, tool of data collection - scale of "public claim of religious belonging"; main and secondary hypothesis).

Religious Education in Ireland: Exploring the Responses of Community National Schools

Daniel Faas, Aimee Smith

Trinity College Dublin, Ireland; Trinity College Dublin, Ireland

daniel.faas(at)tcd.ie, aimeejtsmith(at)gmail.com

Different approaches are taken in Irish schools regarding religious education, with little information on how students and teachers feel about the model adopted in the 11 new multi-denominational Community National Schools. These primary schools were set up in response to parental demand in areas with higher numbers of immigrants, and where children were not able to secure places in local

primary schools. Children are taught all subjects together including a specially-designed religious education programme, but then are streamed by religion for a certain amount of time each year to receive instruction in their individual faith. The aim of this paper is to explore the experiences of principals, teachers and pupils in Community National Schools. The main research questions are: What is the gap in existing knowledge? What impact does the religious education approach have on friendships? What approaches are taken in religious education classes, and do they differ across faith groups in schools? The study has a mixed-method approach, consisting of a questionnaire with principals in 11 Community National Schools; 2 semi-structured interviews with teachers in each school to hear their perceptions regarding challenges and opportunities regarding the provision of religious education; and 2 pupil focus-group interviews in each school to hear some of the voices of the children, aged 10 (Year 5). Theoretically, we relate our analysis to the denominational versus religious-studies approach in Europe, with Ireland providing a more denominational approach with the opportunity for opt-out of religious education in state-supported schools. The paper makes an original contribution to ongoing political and educational debates in Ireland and Europe around the provision of religious education in schools and the wider role of church-state relationships.

Religious diversity as educational divide. An empirical study on Italian schools

Mariagrazia Santagati
Catholic University of Sacred Heart, Italy
mariagrazia.santagati(at)unicatt.it

Religious diversity is a neglected topic, both in educational and migration studies (Kivisto, 2014). However, education is one of the most sensitive spheres engaged with religion, which is seen as a crucial resource for many immigrants, but also a source of conflict, and a threat for European cohesion and identity (Kristeva, 2016). Drawing from this ambivalent interpretation, the paper investigates the role of religion in multicultural schools, in producing conflicts or fostering dialogue, in affecting educational achievement and relational well-being of students (Colombo, Santagati, 2017).

How important is religious identity in the integration process of immigrant students? Is this diversity an obstacle or a resource for integration? Is educational integration linked to disappearance of religious identity (Esser, 2010)? Or is religiosity compatible with integration (Flieshmann-Phalet, 2012)?

These questions are the starting point of an empirical study carried out in lower secondary schools of Northern Italy, that is part of a broader investigation on "Migration and religious belongings" (2016-2018). The research aims at analyzing how religion is relevant within inter-ethnic relationships in public schools; examining if religion is a triggering factor of inter-ethnic conflicts; deepening how the religious differences are composed and how the inter-religion

dialogue is built.

The study is based on 12 focus group, involving adults (teachers, principals and parents) and students: it allows us to explore the nexus immigration-religion-education, updating the picture of the Italian situation, often represented as a mono-confessional environment fairly reluctant towards the recognition of pluralism (Fabretti, 2011). The participation of different generations and ethnic groups offers also the possibility of sharing points of view on religious diversity (as educational divide or resource) and identifying new ways to prevent and resolve religious conflicts.

Religion and Education in the Czech Republic: Religions in Textbooks for Public Education

Jakub Havlicek
Palacky University, Czech Republic
havlicek.mail(at)gmail.com

The presentation deals with the topic of religions as represented in textbooks for primary and secondary levels of public education in the Czech Republic. It is based on content analysis of officially approved textbook on the subjects of history, geography and civic education, recommended for use by the Ministry of Education. What information in the matter of religions can be found in the textbooks? Which religious traditions and phenomena are represented and how? What is the content and the context of information in the matter of religions? How are religions conceptualized and categorized? As the analysis reveals, the categorization of religions is based on the world religions paradigm (Suzanne Owen, 2011). Normative or doctrinal aspects of religious traditions are stressed, while "lived religion" and the diversity of religious practices are omitted. The textbooks provide information on Christianity, Islam and Judaism, while Christianity has a privileged position. Some occasional references to Buddhism and Hinduism are also mentioned, but other religious traditions as well as minority religions or new religions are missing from the textbooks. As the education laws and framework education programmes for primary and secondary schools reveal, the instruction on religions provided by textbooks is connected to formation of knowledge on socio-cultural identities. The application of world religious paradigm, the stress on normative aspects of "world religions" and the very connection to the educational formation of knowledge on socio-cultural identities help rather to create stereotypes instead of providing the students with the ability to critically assess the diversity of religious practices in history and today.

RN10 | Session 10a Language Education and School Participation**Possible approaches to the problem of not having a language exam by the end of university years**

Zita Somfalvi

University of Debrecen, Hungary

z.somfalvi(at)gmail.com

In Hungary a number of students are not able to acquire the required language exam by the end of the university years. It is a very actual problem in our education system, so in this study I make an attempt to reveal its reasons by finding the possible approaches to the question. I intend to gain up this problem from three possible ways. Firstly I deal with the disadvantageous students; I try to reveal the root or origin of their drawbacks. There are numerous factors of students' socio-biology that make them different from the average. In the second part we try to understand the language learner types, which contain three categories: institutional learning, extracurricular language learning and having supportive free time activities. The last approach to the problem is from the view of language pedagogy. In this part I examine mainly the methodology, the mediation of the language content. To one part of my survey I used quantitative method and I asked students about their schooling, language lessons, residence, cultural life and parents. To the other part I used qualitative method by asking teachers about their opinion of the Hungarian education system, methodology, motivation and disadvantageous students. The results show that the people who did not manage to acquire a language exam by the end of the university years are disadvantageous in the respect of their social strata and residence.

Teaching Monolingualism in the Multilingual School. An Institutional Ethnography of the Reproduction of Linguistic, Racial and Social Inequalities within the Austrian Educational System

Petra Neuhold

University of Vienna, Austria

petra.neuhold(at)gmx.at

Multilingualism is an essential part of everyday life in Viennese secondary schools. A majority of pupils (and some teachers) think and chat in different languages. Furthermore, communication among teachers, pupils and parents is often only possible through translations by dedicated neighbors, pupils, relatives or multilingual teachers. Nevertheless, the German language remains the sole official language of teaching and communication in schools. This contradiction between lived multilingualism and official monolingualism, as well as its entanglement with the neoliberal restructuring of the Austrian educational system, creates a wide range of challenges for pupils, parents and teachers.

In this paper, I adopt the perspective of secondary school teachers on this situation, describing their ordinary practices and the related challenges they

face. The aim of this paper is to map parts of the complex ruling relations that structure teachers' everyday school life and hinder democratic education for multilingual pupils. As a sociologist and secondary teacher, I draw on the methodological strategies of institutional ethnography and auto-ethnography. My dual role enables a critical analysis of the educational reproduction of linguistic, racial and social inequalities by acknowledging secondary teachers' local knowledge, practical experience and emancipatory strategies.

Universal Participation in School Education as a Historical Process in Japan

Shinichi Aizawa

Chukyo University, Japan

s-aizawa(at)sass.chukyo-u.ac.jp

This paper critically highlights characteristics distinctive to the Japanese education system, which emphasizes the idea of equality of school system, and further examines to what extent Japanese society's universal participation in school education was indeed a historical product of its distinct path to modernity over the past 150 years. By delineating the historical process of developing universal participation in each educational stage, from primary to tertiary education, this paper focuses on the relation between education and social class, particularly observing how social class in Japan has been formed throughout school education. This paper delineates the process into four sections. The first is the introduction of mass education to Japan, when primary education had been nominally universalized by the Meiji state to create a new social mobility from 1872 to 1900. The second stage involved the expansion of secondary education in the early twentieth century to strengthen a new class division, though this division remained only for a short time and transformed once more due to the mobilization of war. The third stage involved the expansion of upper secondary education from the early 1950s to the early 1970s, when enrollment rates of upper secondary schools (high schools) increased from 50% to 90%. Lastly, after deregulating rules regarding the institutional foundation of higher education from the late 1980s, the enrollment rate of higher education expanded from 30% to 50% over the course of fifteen years, and higher education also reached the universal stage, implying that the meaning of achieving class mobility via meritocracy had transformed once more.

RN10 | Session 10b Higher Education II**"May the Course be with You": Socio-Cultural Self-Identifications Affect Students' Learning through Perceived Course Relevance**

Margot Belet

University of Leuven (KU Leuven), Belgium

margot.belet(at)kuleuven.be

'Course relevance' - students' perception of a course as related to their interests - has been shown to

stimulate both 'subjective' (e.g. course motivation) and 'objective' (e.g. course achievement) learning outcomes. Still, multiple theoretical frameworks – Gay's 'culturally responsive teaching', 'hidden curriculum' theories (e.g. Bourdieu, Bernstein), certain tenets in postmodernism, discourses about situated knowledge, etc. – share the assumption that teaching techniques do not resonate equally with all students. Instead, their effects are predicted to depend on the degree of 'identity congruence' between the course and students' socio-cultural backgrounds. When testing such 'socio-culturally sensitive' relevance-increasing teaching methods, most research however still stresses their beneficial effects for the entire student group. By contrast, the current study examines how relevance varies within the classroom, due to the (in)congruence between students' identities and the course. It also untangles relevance effects related to the course content versus its medium. An experiment is conducted among 1325 undergraduates enrolled in five introductory Sociology courses at three universities in Flanders, Belgium. They viewed one of four versions of a video lecture about Durkheim, manipulated in its examples' (1) feminine/masculine content and (2) visual/verbal medium. 'Identity congruence' effects are found on perceived relevance when matching (1) example content with students' gender identity and (2) the example medium with students' media identity. Perceived relevance affects course satisfaction and, in turn, achievement. Mismatching content with students' gender identity negatively affects their learning, a medium mismatch does not.

Choices and access of first-generation-university students to an HE institution. An intersectionally informed exploration of inclusion/exclusion dynamics.

Marco Romito
University of Milano-Bicocca, Italy
marco.romito(at)unimib.it

Within contemporary European "knowledge" societies, higher education (HE) increasingly constitute the key field to explore the production and reproduction of inequalities. If secondary education attainment have been increasingly equalized, rates of enrolment and completion of HE are still (and sometimes increasingly) conditioned by family background. Increasing processes of horizontal stratification within the field of HE have been also outlined, so that the processes of choosing an HE institution have become a key field of study.

My presentation will discuss results of an ongoing qualitative research project exploring the processes of transition and social integration in an Italian HE institution of a group of 40 first-generation-university-students (Spiegler & Bednarek, 2013).

Research design is longitudinal. In-depth interviews have been carried out with students just enrolled in their first year at the University of Turin and these students will be interviewed a second time next year.

Objective of the project is twofold. 1) To explore the

cognitive-relational framework conditioning their university choices (Ball et al. 2002). 2) To analyze how multiple social identifications based on social class, gender and migratory background condition FGS initial phases of adjustment to the relational, academic and administrative structure characterizing the HE context (Lee & LaDousa, 2015).

First results show the usefulness of drawing together a Bourdieusian (Ingram, 2009; Stahl, 2013) and an intersectionality informed toolbox (Anthias 2013). By looking at HE choices and at the initial phases of the university experience, I show how interviewees are positioned along multiple axis of social inequalities defining specific spaces of inclusion/exclusion and co-defining their habitus.

Cultural differences in projection of institutional identity and conceptualisations of students on university websites

Predrag Lazetic
University of Surrey, United Kingdom
p.lazetic(at)surrey.ac.uk

The research in this paper presents a comprehensive, comparative cultural analysis of current (2017 versions) of 60 higher education institutions websites in 6 European countries (10 websites each in England, Ireland, Germany, Spain, Denmark and Poland). The theoretical framework that has underpinned many analyses of cross-national cultural differences (including comparisons of websites) is Geert Hofstede's cultural dimensions theory. Hofstede (G. Hofstede (1984, 2011); G. H. Hofstede and Hofstede (2001)) argues that world cultures vary in relation to four key dimensions : power distance (PD), individualism vs. collectivism (IC), femininity vs masculinity (MAS) and uncertainty avoidance (UA). In addition, another analytical dichotomy between high and low context cultures (Hall (1976)) was used. The theoretical dimensions were operationalised for the purpose of analysis of university websites and for each multiple website markers were identified. The website material was analysed with the use of content score charts and by direct coding in the NVivo software. The expectation of the research is that presence of different cultural dimensions varies according to the country score produced by Hofstede et al. (2010).

RN10 | Session 10c Migration and Education II

Under What Conditions Do Immigrant Children Do Well in School?

Paula Andreea Tufi , Monica erban, Mădălina Manea
Department of Sociology and Social Work, University of Bucharest; Research Institute for the Quality of Life, Romanian Academy; Department of Sociology and Social Work, University of Bucharest
paula.tufis(at)gmail.com,
monica_serbanus(at)yahoo.com,
madalinamanea.eu(at)gmail.com

Previous studies have shown that immigrant children's

academic achievement differs both across origin and destination countries, and that there are important predictors of achievement at multiple levels of the analysis: individual, school, community, and country levels. The ways in which these factors operate lead to gaps in educational achievement between children with an immigration background and native children. We use the PISA 2012 data on mathematics achievements of students in European countries to explore under which conditions immigrant children seem to do better in school. We draw on ideas from research on the academic achievements of children, in general: that the way parents interact with schools is an important factor that can enhance children's academic success, that the child's peers may be an important resource in motivating children to do well in school and that both cognitive and non-cognitive traits of children may influence their success. We also draw on ideas from research in the sociology of migration and examine influences of factors that are specific to the migration process. Our preliminary results show that in most countries, immigrant children have lower mathematics test scores compared to their native peers and the size of the gap varies by country. However, it is not necessarily the case that immigrant children's families have less access to resources that are usually considered beneficial for educational attainment. Given this, we ask what are the most important factors that explain the existing gap in educational achievement.

Immigrant integration opportunities in comparative context, and the changing role of education

Dionysios Gouviás
University of the Aegean, Greece
dgouviás(at)aegean.gr

One of the most influential form of comparative assessment of teenagers over the past decade, has been the OECD's PISA programme. During its successive stages (from 2003 to 2015), the PISA programme has shown –among other interesting things– that immigrant students score considerably lower than students without an immigrant background. However, immigrant students are not a homogenous group, which is based only on their place of birth, since their educational and occupational 'pathways' are shaped by the interplay between economic, cultural and social "capital" of their family, and numerous other personal characteristics (gender, IQ level etc.) and structural properties (e.g. sectoral structure of the economy) of their place of living. Given the --evident from sociological studies-- mediating role of familial "capital", especially that of "economic" and "cultural capital", on student achievement, we will use variables that correspond to parental "socio economic status" (SES) and "educational level", to draw some preliminary conclusions about their strength and direction of association with immigrants' achievement (overall and subject-specific) in the PISA testing. Using cross-sectional data from successive rounds of

the PISA assessment, we will try to evaluate

1. the actual change in performance of immigrant teenagers (i.e. 15-year olds) across time;
2. the between-countries differences in the change of performance across time;
3. the within-countries differences in the change of performance across time;
4. the correlation between immigrant students' performance in PISA and their parental SES and education;
5. the change in the above correlations, across time and countries.

Unjustified Optimism: Beliefs about Higher Education Payoffs among Immigrant-Origin Upper Secondary School-Leavers in Italy

Giancarlo Gasperoni, Debora Mantovani, Marco Albertini

University of Bologna, Italy - Dept. Political and Social Science; University of Bologna, Italy - Dept. Political and Social Science; University of Bologna, Italy - Dept. Political and Social Science
giancarlo.gasperoni(at)unibo.it,
d.mantovani(at)unibo.it, marco.albertini2(at)unibo.it

This paper addresses perceptions of expected incomes associated with tertiary education degrees among a sample of last-year upper secondary school students. Data collection was performed during the 2013/14 school year. More specifically, we investigate the expected incomes associated with university degrees in the specific fields of study in which respondents state an intent to enrol. Preliminary results suggest that immigrant-origin youths, and especially first generations, expected higher incomes than their Italian peers. The paper will focus primarily on how pay-off expectations vary among immigrants and natives, but also how these variations relate to other potentially pertinent explanatory factors, such as social origins, gender, prior school performance, as well as variables involving higher education aspirations: field of study, determination to enrol, length of degree programme, beliefs about the link between tertiary degrees and job prospects. Also, earning expectations will be compared to respondents' estimates of higher education costs, expected income in case of no further education and actual incomes earned by Italian university graduates – in order to ascertain the degree of (over)estimation of the income premium youths associate with higher education. Data is drawn from a sample of approximately 9,000 students, approximately 600 of whom have an immigrant background.

RN10 | Session 11a Vocational Training and Education

Soft skills as a possible vector of inequalities in the Swiss dual VET: On-the-job trainers' position with respect to their place in apprenticeship

Barbara Duc, Nadia Lamamra
SFIVET, Switzerland; SFIVET, Switzerland
barbara.duc(at)iffp.swiss, nadia.lamamra(at)iffp.swiss

Based on the alternation between periods of learning in school and at the workplace, the Swiss dual VET system occupies a central place in the training of young people to enter the world of work. The necessity of developing soft skills (social and personal skills) is largely agreed upon within the dual VET system.

Referring to the sociology of socialisation, this contribution emphasizes the importance of soft skills in dual VET. More specifically, it focuses on the attention on-the-job trainers pay to these skills from the recruiting process to the daily practices of training. The contribution leans on a qualitative research whose ambition is to better understand the role of on-the-job trainers in the socialisation of apprentices. 80 semi-structured interviews were conducted in companies of different sizes and belonging to various sectors of activity in the French-speaking part of Switzerland.

The thematic content analysis highlights a paradox concerning soft skills: they appear both as a learning object and as recruitment requirements. Thus, soft skills will be considered as a possible vector of inequalities. Indeed, as soft skills are strongly connected to early socialisation, possessing these skills or being able to display them is a key issue for young people, to find an apprenticeship position, to succeed in the dual VET and to enter the labour market. As employee (sometimes even recruiter) and trainer, on-the-job trainers have to position themselves toward what the company put as priorities. Finally, these key-actors have the opportunity of reproducing inequalities or trying to fight them.

How does vocational orientated education form professional role expectations? A case study among Austrian journalism students

Dimitri Prandner, Robert Moosbrugger
Johannes Kepler University Linz, Austria; Johannes Kepler University Linz, Austria
dimitri.prandner(at)jku.at, robert.moosbrugger(at)jku.at

Using survey data from Austrian journalism students (n=428) we explore the following questions:

- Which differences in the motivations for studying vocationally orientated programs like journalism are tied to the socioeconomic background?
- What role models do students associate with the profession? How do those change as they progress in their studies?
- Are motivations and role models interrelated? How stable are those constructs?

Recent studies show that convertibility of vocational training into advantages on the labour market is an increasing factor when deciding on university curricula, especially in times of economic and social uncertainty. This evokes questions: Are there differences regarding the meaning associated with the professions students train for, particularly in programmes closely associated with specific professions like journalism?

We would argue that this is inherently tied to social

strata and primary socialisation experienced within a certain socioeconomic background, including the educational background of the parents. Furthermore university programmes act as secondary socialisation instances, which not only impart knowledge and skills, but also values commonly associated with a profession.

Thus, we reason that the orientations that resulted from primary socialisation experiences will change over time spent at the university and become more homogenous. Nevertheless motivations and associated role models are interrelated and do not dissolve completely. Using a structural equation model, we show those interactions and how even over time they deeply tie in with socioeconomic factors. Despite studying a case we want to discuss the broader implications concerning professional ethics and their relation to educational programmes.

The role of the academic-vocational divide in shaping learner identities in England and Germany

Michaela Brockmann
University of Southampton, United Kingdom
M.Brockmann(at)soton.ac.uk

Under pressure to produce the skills for a competitive economy, the UK government has been keen to improve the quality of vocational education and training and to achieve parity of esteem with the academic route. Yet, the discourse of the academic-vocational divide has continued to dominate the academic, policy-maker and practitioner debates. The paper draws on two ethnographic studies designed to explore the learner identities of apprentices on different apprenticeship programmes (motor mechanics and engineering) in Britain and Germany. The research is based on biographical interviews with the apprentices, and participant observation in college classrooms and workplaces.

Drawing on Judith Butler's work on discursively constructed identities, the paper examines the unique construction in the two national contexts of 'the vocational' as a powerful social category and explores its role in the apprentices' identity formation. It challenges common assumptions that 'practical' learner identities and the rejection of theory are somehow 'natural' and argues that these identities are instead constituted in learning environments that prioritise certain forms of knowledge.

For example, young people in England performed the identity of the practical learner as a powerful alternative to academic learning. Crucially, this identity was reinforced in the learning cultures of the college and the workplace, ultimately restricting young people's life chances and raising questions about social justice. By contrast, in Germany's highly-regarded dual system of apprenticeship, identities were based on the integration of theory and practice.

RN10 | Session 11b Civic Education**Educational Influences on Fundamental British Values**

Jan Germen Janmaat
UCL Institute of Education, United Kingdom
g.janmaat(at)ucl.ac.uk

In 2014 the British Government called on schools to actively promote fundamental British values (FBVs), seeing this as an effective way to prevent the radicalization of young people. The government considers these values to include democracy, individual liberty, the rule of law, and respect for people of different backgrounds and religions. Rather than criticizing this policy on theoretical or ideological grounds, as many studies have done, the current paper aims to ascertain support for FBVs among young people in England and assess whether levels of support are associated with educational attainment and distinct educational practices. Data from the Citizenship Education Longitudinal Study (CELS) are analysed for these purposes. A multidimensional measure of FBVs is constructed based on policy understandings of the term rather than empirical or statistical considerations. As a result the measure scores low on internal consistency but high on external validity, as demonstrated by the fact that all predictors combined manage to explain no less than 20 percent of the construct's variance. The paper further finds that levels of support for FBVs among 23 year olds are already very high, questioning the necessity of the policy. Among the educational predictors, educational attainment and track attended (academic or vocational) appear to have a much greater influence on FBVs than specific programs or pedagogies experienced during lower secondary such as citizenship education, an open climate of classroom discussion or school-based political activities. This difference could be due to the possibility that the effect of education on FBVs is mainly positional.

NGOs constructing citizenship and youth participation in the context of school cooperation: local and global dimensions

Heidi Emilia Henriksson
Åbo Akademi University, Finland
heidi.henriksson(at)abo.fi

In this paper, I explore the global education movement in Finland, especially looking at how citizenship and youth participation are constructed by NGO-educators involved in school cooperation. Global education, as an umbrella concept, covers topics such as human rights, development, multiculturalism and sustainable development. Both national and international NGOs with different orientations are actively involved in bringing perspectives from civil society to the school environment. In this sense, this educational movement is in different ways linked to other social movements and also to supranational global goals such as the UN's Agenda 2030. For the purpose of this paper, I

focus on how NGOs perceive the agency of adolescents and what kind of changes or actions regarding (global) citizenship and participation they advocate. Moreover, I argue that these constructions of citizenship need to be understood in relation to formal educational structures, funding mechanisms and the position of Finland in the global order. The theoretical background stems from postcolonial and neo-institutional theory and critical pedagogy. In this ethnographic study, 20 NGOs are analyzed both as independent actors and as a global education network. The empirical data consists of field notes, interviews and educational materials that have been collected for my ongoing doctoral dissertation project. On one hand, global education initiatives are about reconstructing citizenship at a local level, for instance by challenging notions of "Finnishness" or by promoting participatory school culture. On the other hand, NGOs aim at linking global issues of refugees and migration, climate change, development and global inequality to the everyday lives of Finnish adolescents.

Tensions and dilemmas in teaching global and national citizenship in Turkey

Kenan Cayir
Istanbul Bilgi University, Turkey
kenan.cayir(at)bilgi.edu.tr

This paper explores the way Turkey and Turkish citizenship are framed and presented in Turkey's textbooks in the context of globalization and recent internal developments. Turkey has been undergoing major transformations for the last decade. In 2005, all textbooks have been revised on the basis of a constructivist approach, as part of country's European Union accession process. This reform could have been an important leverage in replacing exclusionary nationalistic content of textbook with a global and cosmopolitan approach to citizenship. Turkey's political moves till 2016 to resolve long-lasting internal ethnic conflict provided a context to introduce progressive steps in education. Incorporation of minority language courses into the curriculum in 2012 was among important symbolic steps in transforming Turkish citizenship. However, a close analysis of textbooks demonstrates that they still employ a 'securitization discourse' in which Turkey is presented as a country under threat due to globalization. The Ministry of National Education announced in January 2017 that all educational programs will be renewed to include a new vision on the basis of the failed coup attempt of July 15, 2016. This paper will be based on the analysis of existing textbooks and new draft programs regarding their conception of Turkish citizenship. It argues that ethno-nationalist conception of citizenship is re-gaining a ground in Turkey in the face of global and internal developments.

School alienation, school structures and school deviance in Luxembourg

Andreas Hadjar, Alyssa Grecu, Jan Scharf
University of Luxembourg, Luxembourg; University of Luxembourg, Luxembourg; University of Luxembourg, Luxembourg
andreas.hadjar(at)uni.lu, alyssa.grecu(at)uni.lu, jan.scharf(at)uni.lu

Increasing lack of students' bonding to school is conceptualised in terms of alienation from school, defined as a set of negative attitudes of cognitive and emotional estrangement from social actors in school and academic aspects of schooling. School deviance is found to be a major consequence of school alienation on the behavioural level, and appears to be a crucial problem, as it may go along with low achievement, school failure or dropout. Main objective of the study is to analyse the effects of different domains of school alienation – alienation from classmates, from teachers, from learning – on school deviance. In this regard, risk groups for school alienation, concerning social origin, gender and migration background, are taken into consideration. Looking at causes of school alienation and deviance as consequence, meso level factors, namely school and classroom contexts (e.g. proportion of boys or migrants, tracking structures), will be examined. Analyses are based on quantitative panel data gathered in the framework of the international mixed-method project SASAL – School Alienation in Switzerland and Luxembourg. To analyse the outlined research issues, multilevel models will be employed allowing to separate individual level from context level mechanisms. Furthermore, results of qualitative in-depth analyses of group discussions enrich the study. Preliminary findings show that alienation from teachers is a major cause of deviance, while alienation from classmates has no such effect.

RN10 | Session 11c Early Childhood and Education

Discursive frameworks of organizing ECEC: A case study in Finnish municipalities

Petteri Eerola, Kirsti Karila, Maarit Alasuutari, Anu Kuukka, Anna Siippainen
University of Tampere, Finland; University of Tampere, Finland; University of Jyväskylä, Finland; University of Jyväskylä, Finland; University of Jyväskylä, Finland
petteri.eerola(at)uta.fi, kirsti.karila(at)uta.fi, maarit.alasuutari(at)jyu.fi, anu.kuukka(at)jyu.fi, anna.siippainen(at)jyu.fi

Scholarly discussion on early childhood education and care (ECEC) has remained vital through the 2000s. The discussion has especially focused on global discourses of childhood and ECEC. Though we live in a world where global, national and local are closely interrelated, significantly less attention has been paid on local interpretations of these discourses. This is the issue to be contemplated in the presentation.

We examine how local-level ECEC decision-makers rationalize organizing ECEC in their area. In Finland ECEC services are organized publicly by municipalities, and therefore, it offers an interesting case for studying the relations of global and local ECEC discourses. Our research question is what the discursive frameworks of organizing the ECEC are in Finnish municipalities? The data consist of interviews of municipal politicians and ECEC authorities (n=78) conducted in 10 Finnish municipalities in early 2016. In our analysis, discourse analytic approach serves as a broad analytical framework.

We present three discursive frames – local, economy and services – through which the organizing of ECEC at municipal level is rationalized. Within each frame, variation in rationalities was discovered and the variation seemed to be interrelated with the type of the municipality. Due to municipal self-government in organizing ECEC, the variation in rationalities might potentially lead to inequalities in ECEC provision in different municipalities.

The presented study is based on the project Finnish Childcare Policies: In/Equality in Focus (2015-2020), funded by the Strategic Research Council of the Academy of Finland.

Social investment for whom? Early childhood education reforms and persisting inequalities. The case of the Autonomous Province of Trento.

Martino Serapioni
Free University of Bolzano, Belgium
serapioni.m(at)gmail.com

This paper takes issue with the social investment claim that functionalist childcare strategies, built upon currently employed individuals, can prove effective for decreasing inequality in educational opportunity across socio-economic groups (SEGs). I argue that recent efforts to recalibrate welfare states towards activation policies have generated inequitable dynamics of early childhood services expansion. Whereas over the last decades the number of day-care centres and participation rates in formal childcare have increased across the European Union (EU), this broadening of provision has not been accompanied by an equally broad commitment to create a universal legal entitlement to childcare. Likewise, EU countries have been found wanting in enacting adequate measures to remove financial barriers preventing poorer families from taking up more hours of formal early education.

My paper focuses on a paradigmatic example of social investment-inspired childcare expansion: the case of early childhood governance in the Autonomous Province of Trento / APT (Italy) between 1998 and 2015. Over this period, renewed investment has raised childcare participation considerably in the APT, but concurrently it fell short of setting the foundations for a universal model. Childcare policies followed a choice-increasing pattern, ensuing the rise of parapublic and private centres, as well as of family-based services. Whereas attempts to ensure equal access through means-tested subsidies and voucher

schemes were undertaken, public and non-public centres still present flat fees and higher tariffs that crowd out poorer families. The distribution of childcare thus remains skewed along economic lines, with more affluent SEGs recording much higher participation rates.

Too little, too late: care-less spaces and exclusionary narratives for young offenders with 'learning difficulties' and their families

Chrissie Rogers
University of Bradford
c.rogers3(at)aston.ac.uk

Social justice, care and ethics ought to be considered when exploring spaces of systemic violence for young offenders and their families. Particularly, but not exclusively, in considering those with attention deficit hyperactivity (ADHD) or autistic spectrum disorder (ASD). As a result of previous research, I have developed a care ethics model of disability that is a global proposition for all areas of social life, but it is within the education and criminal justice system (CJS) that ethical and care-full work via the emotional, practical and socio-political caring spheres is arguably needed the most. Therefore, it makes sense to explore education and criminal justice narratives, via current qualitative. It is here I identify countless care-less spaces and exclusionary narratives. Furthermore, schooling and the CJS, as institutions, are micro social systems within the socio-political sphere and it is within these systems a broader picture of social justice/injustice, exclusion/inclusion and success/failure can be charted. All things considered, education (one space where offending, violent and challenging behaviour can escalate) and the CJS need re-humanising. Therefore, rather than following a path of blame, whether it is the 'dysfunctional family', the 'deficit' child or the economically deprived nation, we require ethically just practices and caring, care-full spaces as a fundamental part of a re-humanising the socio-political sphere.

RN10 | Session 11d School Tracking and Selectivity

Formal education and ICT skills – stability of educational divisions in the modern world

Marcin Kocór, Barbara Worek
Jagiellonian University in Krakow, Poland; Jagiellonian University in Krakow, Poland
marcin.kocor(at)uj.edu.pl, b.worek(at)uj.edu.pl

Our paper focuses on analyzing the relationship between education level and ICT skills, which are the basis for further learning and other skills development. The role of ICT skills as a factor of decreasing social and educational inequalities is being extensively discussed in recent literature – new technologies allow for easier access to knowledge and extend informal learning beyond formal education. However, different ICT skills level and access to new technologies may lead to a new social divide – digital divide – and

exclude some social categories.

Our paper addresses the role of formal education in ICT skills' development and how the Internet can be utilized for non-formal and informal education. Based on Human Capital Study in Poland data (longitudinal survey of 5 series from 2010-2014, 88000 interviews) we show that ICT and cognitive skills depends on level of education. This fact is particularly visible in case of older people, where ICT skills levels strongly depend on education level. Our results show that higher education level in case of older people is not only a favorable factor for longer professional, educational and social activity, but also allows for better use of ICT skills in further development. We explain this observation referring to the cumulative advantages/disadvantages theory. Our conclusions will be helpful in planning measures to reduce digital division, especially among older people and in supporting them in being active participants of the labour market and in society for longer time.

Social selectivity in transitions to individual and structured doctorates in Germany

Susanne de Vogel
German Centre for Higher Education Research and Science Studies (DZHW), Germany
devogel(at)dzhw.eu

Entering into doctoral studies is highly selective in Germany. The likelihood of starting a PhD strongly depends on gender and educational background of university graduates.

Traditionally doctorates in Germany are pursued individually within a research assistant position at the supervisor's institute, or within external postgraduate work. As a result of the Bologna Process, however, structured doctoral programs have recently gained a following. One of the reforms main objectives lies in the reduction of social selectivity in the transition into doctoral studies. Since appropriate data have not been available so far, it remains unclear whether this objective has been achieved or not.

To put in place a serious response, this article firstly explores if gender and educational background differences differ on the transition to individual and structured doctorates. Secondly, it examines the underlying mechanisms that may account for these differences.

Analyses are based on data from the DZHW graduate panel studies. Findings of multinomial regression analyses confirm that the effects of educational background on entering a structured doctoral program or grant program are lower than those found on transition to individual doctorates. Gender only influences the transition into a PhD within a research assistant position. Effect decompositions show that this gender difference can largely be explained by subject choices, student assistant jobs and parenthood. For educational background differences, performance differences also explain a big part of the effects. The extend of these mechanisms to unequal entry chances, however, differ between various formal PhD contexts.

The Effect of Single-Sex Schooling on Taiwan High School Girl's Curriculum Tracking Selection: A Counterfactual Analysis of Taiwan Educational Panel Survey

Xunfei Li

Taiwan National Chengchi University, Taiwan
xunfeilee(at)gmail.com

Based on Taiwan Educational Panel Survey data, this research analyzes the effect of Taiwan single-sex school environment on high school girls' curriculum tracking (science track or humanity track) selection. Curriculum tracking selection is an important educational behavior because it is closely related to students' future college major and career. As a discussion in the field of school effect, the effect of single-sex schooling has caused arguments since Coleman's report in which he claims that co-educational education may do harm to student's academic achievement and social adjustment. On Taiwan's occasion, the huge gap between gender in high school curriculum selection reveals the aspiration from society, family, and students themselves. Class in high school is highly fixed in which students would influence by their peer profoundly which is different from the western school environment. Problems most researchers in this field encounter are self-selection, omitted confounders, and relatively rare representative dataset. Using propensity score analysis, researcher controls student's academic abilities which are important to predict student's academic behavior, social background and teacher's characteristics in models. Researcher finds out that girls in single-sex classes are less likely to choose science track than girls in co-educational classes in Taiwan. The result does not conform to most of the existing relative research which claims that single-sex environment breaks gender-stereotype threat and improves girls' performance, especially on math and science. Researcher claims that the high disproportion between gender in curriculum tracking selection in Taiwan may generate great peer effect in single-sex classes which leads to the homogeneous behavior and the alternative curriculum tracking system in Taiwan also plays an important role in the result.

Differences in career-oriented information and guidance between schools in four European cities: The role of socioeconomic composition and tracking

Laura Van den Broeck, Mieke Van Houtte

Ghent University, Belgium; Ghent University, Belgium
laura.vandenbroeck(at)ugent.be,
mieke.vanhoutte(at)ugent.be

Providing students with career guidance and information during secondary education is necessary for students to create realistic expectations that are related to their career goals, and to give them insight into the necessary steps to meet these goals. Research has demonstrated that certain groups of students (e.g., low SES students, ethnic minorities) lack relevant information, impeding social mobility.

However, by focusing on the individual student level, potential differences between schools and educational systems in career information remain understudied. Possibly, the inequality between students arises because low SES schools offer less information. As the SES composition of schools cannot be separated of the degree of tracking, this system feature is also relevant to bring into account. In this paper, we study whether the SES composition of the school is related to the amount of career information students receive, over and above the effect of their individual-level social background features. Moreover, we account for the system-level effect of the extent of tracking. We use data from the International Study of City Youth (ISCY), gathered during the 2013-2014 school year from 9174 pupils of the tenth grade across 111 schools in 4 European cities (Barcelona, Bergen, Ghent, and Wroclaw). Preliminary results of stepwise multilevel analyses (MLwiN) suggest that students in low socio-economic schools and students in stringently tracked educational systems indicate less access to career-oriented information and guidance. The findings question the compensating ability of schools as well as the effectiveness of tracking in creating realistic expectations among students.

RN11 - Sociology of Emotions

RN11 | Session 01a Theorizing Affect and Emotion I

Theorising 'the emotions'

Leonidas Tsilipakos
Aston University, United Kingdom
tsilipakos(at)yahoo.gr

Over the past couple of decades the study of human emotion has received focused attention within disciplines as diverse as cognitive neuroscience and sociology. Whereas research advances in neuroscience (e.g. Damasio 1994; but see Bennett and Hacker 2013 and Kenny 2013[1963]) have been predicated on increasing technologically mediated access to the human brain, interest in the emotions within sociology (e.g. Burkitt 1997, 2015; Holmes 2010; Fox 2015) has been premised on a different rationale, namely on claims that the emotions have been previously neglected by sociologists or that there persists a dualistic conception of reason vs the emotions which needs to be undone. This paper will provide some critical reflection on the way in which the 'affective turn' has been conducted so far. It will begin from the observation that the category of 'the emotions' is not conceptually homogeneous, a fact which bears the implication that a robust sociological research programme needs to be based on careful theorising of each particular emotion. Furthermore, the paper will seek to foreground the lines of similarity and difference between various emotions, offering in the process a range of criteria which can sharpen up our understanding. Finally, the paper will attempt to answer the question of what is being studied when 'the emotions' are being studied sociologically.

The Relationship between Emotions and Rationalities in Society

Florian Kreutzer
HdBA University of Applied Labour Studies, Germany
florian.kreutzer(at)arbeitsagentur.de

My presentation offers – using exemplary material with reference to the conference topic – a theoretical framework regarding the relationship of emotions and rationalities in society in three steps: First, I will link emotions and rationalities to perceptions and communications respectively and define both within a dialectics of identity and difference. Emotions will be defined as the reflexivity of perceptions in terms of differentiated identities; rationalities will be defined as

the reflexivity of communications in terms of differences that make a difference. After having analytically distinguished perception/ emotion and communication/ rationality I am going to show in a second step how they are inseparably interlinked in each social situation and action. Using the medium-form theory of Niklas Luhmann perceptions/ emotions and communications/ rationalities will be conceptualized as the two sides of any social action and situation. Finally, I will develop a social phenomenology as a theory of observation that is able to analyse perceptions/ emotions as essential phenomena of social entities as much as we are able to conceptualize communicative self-reflexivity as a condition of individual rationality. From this point of view perceptions/ emotions are observable phenomena of social situations – on the level of interactions, organisations, groups and societies – that are linked to, but cannot be reduced to individual perceptions/ emotions. The medium-form theory together with the dialectics of identity and difference offers a concept interlinking perceptions/ emotions with communications/ rationalities on the one hand and individual and social perceptions/ communications with emotions/ rationalities on the other hand – without dissolving the analytical distinction by reducing it to the one or the other side.

Emotions in judicial decision-making – a review

Moa Bladini, Stina Bergman Blix
University of Gothenburg, Sweden; Stockholm
university, Sweden
moa.bladini(at)law.gu.se,
stina.bergmanblix(at)sociology.su.se

The literature on emotions in law has grown rapidly during the last years, one important aspect being the role of emotions in judicial decision-making. Traditionally, the view of the process of judicial decision-making presumably involves putting emotions aside, but a plethora of studies from several disciplines have shown the importance of emotions for rational decision-making. Emotional processes orient rational action, facilitate complex choices and indicate appropriate behaviour to reach desired goals. The aim of this paper is two-folded; to review and critically appraise previous research on emotions in judicial decision-making conducted by researchers from a range of disciplines; and to add to a theoretical framework that takes forward the study of rational decision-making in judicial practice. Previous research has often narrowed in on specific emotions or some particular aspect, while we focus on a more general level. Specifically, the concepts of epistemic and backgrounded emotions are used to scrutinize the social embeddedness and situatedness of judicial decision-making. Since legal decision-making serves as the quintessence of rational decision-making this framework can presumably be of applied relevance in the understanding of professional decision-making outside of the legal context.

Cynical reason and comfortable continuity – an emotion sociological theory

Åsa Wettergren

University of Gothenburg, Sweden

asa.wettergren(at)socav.gu.se

The paper explores Zizek's notion of 'cynical reason' as entry to a theoretical understanding of how emotions anchor ideology in the self. Cynical reason denotes knowing that in our actions we follow an illusion, and still, we are doing it. In the first part, drawing on the radical perspective that emotion/reason are inseparably intertwined, emotion's link to situated action is illustrated by a model of four ideal-types of emotion management. The model combines the dimensions: 1. Emotion as conducive/disruptive to ongoing action; and 2. Emotion management/emotion as backgrounded/foregrounded (subconscious/conscious). Next, emotion as constitutive molding flows between structure and agency, context and self, is explored. Inspired by Margret Archer's theory of the inner conversation, I argue that ideology – understood through the discourse theoretical lens as constructive meaning-making – becomes embodied performance through the backgrounded calibration of the self in time and in relation to others. Not only is ideology anchored in the self through emotion, but emotion anchors the self in ideology. Analogous with Collin's emotional energy (EE) as common denominator of rational action, comfortable continuity (CC) of the self functions as background EE. Contrary to Collins' EE, however, CC does not orient the self towards maximizing EE. CC orients towards keeping EE in balance – consistent with the feeling of 'authentic me'. This explains both the emergence of cynical reason and its rational existential necessity. In conclusion, I discuss CC as the emotional meaning of Hochschild's 'deep story' and the possibility that its disruption accounts for the current crisis of liberal democracy.

RN11 | Session 01b Migration, Globalization and Emotion

Care chains and care regimes in Southern Europe: the emotional boundaries of a new type of family

Rossana Trifiletti, Stella Milani

University of Florence, Italy; University of Florence, Italy

rossana.trifiletti(at)unifi.it, stella.milani(at)unifi.it

In comparison with the concept of Global care chain first introduced by Ehrenreich and Hochschild, or Parreñas, and describing the migration of care-workers from the second to the first world, feminist European students (King Lazaridis 2000; Lutz 2008; Anderson 2000; Anderson, Shutes 2014; Léon 2014) underlined some specific features of the care-labour flow of migrant women from Eastern to Southern Europe: its character of shuttle migration of middle aged women to countries which became only recently receiving ones and maintained an important illegal

sector in their labour markets as well as in the legalization process of migrants. Such studies described well also the blurred boundary between domestic and care work, between job and emotional involvement and elaborated the concept of care regimes in order to catch the shift from a familistic LTC to a "migrant-in-the-family" system (Bettio 2006; Simonazzi 2009; Léon, Migliavacca 2013). This very specific realm of emerging social practices is a useful field to describe the formulation of new emotional scripts, even if by unspoken feeling rules, since care relationships necessarily involve an enormous amount of contrasting emotions when intersecting market rules. The paper refers to the crossing of results of a survey with institutional informants about a Tuscany Region policy (supporting the matching of care demands and offer) and a former qualitative inquiry in the same territory collecting biographies of (female and male) careworkers coming from Ukraine, Moldova, Romania and Peru and working (or having worked) in cohabitation with frail elderly people in the hard times of the economic crisis. Their agentic reaction in such circumstances suggests recognizing care as common good in new empathy maps of a new form of reconstituted families.

Refugees and Asylum Seekers in Europe: 'Doing Citizenship' through Emotion-based Forms of Social Inclusion

Alessandro Pratesi

University of Chester, United Kingdom

a.pratesi(at)chester.ac.uk

Collective assumptions tend to consider refugees and asylum seekers as an inevitable cost or burden to society rather than as an important resource and opportunity. The European humanitarian crisis raises important issues in terms of social inclusion, citizenship, international relations and social change, but it also represents a unique opportunity for Europe to redefine itself and its identity. We need to overcome distorted, ideological and politicised representations of the current crisis and provide evidence of how innovative, creative ways to redefine our notions of citizenship and social inclusion are activated at the level of interactions between refugees and local communities even when forms of exclusion and institutional racism persist at a structural and political level.

This paper highlights the vast potentialities emerging from the intersection of migration studies, citizenship studies, ethics of care studies and the sociology of emotions. The objective is getting insights in the multiple ways in which new forms of citizenship and social inclusion are creatively performed at the local level through emotion-based interactional and ritual dynamics. This requires shifting the focus from the macro- to the micro- level of analysis and to look at the ways in which people constantly construct their sense of entitlement and belonging and produce forms of relational social inclusion through the sentiments and practices of care. The new theoretical perspective on citizenship and social inclusion emerging from this

paper is aimed to challenge common assumptions on the problematic nature of migration and to reframe this latter as an integral part of the process of human, social and economic development.

The emotional functions of Muslim religion and their effects on inclusion

Yvonne Albrecht

University of Kassel, Germany

yvonne.albrecht(at)uni-kassel.de

In current debates about processes of migration and integration the fear of Islamic extremism increases. There exist many worries about the question whether Muslim immigrants are able to integrate into historically Christian countries (e.g. Adida, Laitin and Valfort 2016). My paper emphasizes that it is necessary to develop a more differentiated view upon Muslim religion. Despite all fears about political radical Islam it is necessary to consider the emotional functions of Muslim religion – especially in processes of migration. These internal functions are strengthened in religious practices and in using spiritual-religious interpretation frames in interactions. The effects of these practices are described as pacification, reduction of stress, composure and the release of responsibility by Muslim immigrants in Germany. On an action level this enables different forms of agency. In that way the emotional side of Muslim religion makes inclusion possible.

Expressions of ethnic identities – exploring emotional articulations of belonging in minority families

Pille Ubakivi-Hadachi, Kadri Aavik

Tallinn University, Estonia; Tallinn University, Estonia

ubakivi(at)tlu.ee, kadria(at)tlu.ee

Families embody some of the most intimate, but at the same time influentially collective sites for identity formation and for the transferral of emotional capital. However, research attempting to analyse how emotional capital and emotion practices frame the familial creation of feelings of ethnic belonging is scarce. Furthermore, as the need to understand the mechanics behind diverse societies' ethnic inequalities increases, it becomes vital to comprehend the ways in which ethnic belonging can be accompanied by symbolic violence and how equal distribution of emotional capital between different families might alleviate its effects.

Thus, it is most enlightening to examine how ties between ethnic minority family members form the setting for the generation of narrative discourse, imbued with emotives and both conscious and subconscious practices of identity construction. We claim that looking at the expressions of emotions in intergenerational contexts is of utmost importance when trying to understand how ethnic minorities reconstruct and create meaningful identity narratives beyond the reliance on individual experiences and characteristics. Our research shows that parents' emotional capital and the (un)expressed emotions in

stories told or exchanged in families influence the ways in which children incorporate parents' experiences, understandings and feelings of ethnic belonging as their own. Drawing on narrative interviews with Russian ethnic minority families in Estonia, it is exemplified how emotion practices stemming from emotional capital enhance and create the symbolic capital generated through specific ethnic and national affiliations.

Based on these findings, insights from the sociology of emotions can contribute to the study of ethnic identities.

RN11 | Session 01c Emotions, Civic Action and Social Movements I

Emotion and Body language in and against the “liberal” participation. Public speaking of farmer grassroots organizations in the transnational Roundtable on sustainable palm oil.

Emmanuelle CHEYNS

CIRAD, France

cheyns(at)cirad.fr

This communication relies on a movie sequence from a participative session in the transnational Roundtable of Sustainable Palm Oil (RSPO). We took the video in a plenary session composed of around 800 participants, mainly European and Asian organisations, debating on sustainability issues to foster a global standard for sustainable palm oil. This sequence shows the moment when an Indonesian farmer took the floor to state very unknown concerns of family farmers and local communities affected by the expansion of palm oil plantations in Indonesia. Although considered important by the small farmers delegation, this public speaking was perceived as a failure by many of the other participants and was disqualified. For European participants, even for European NGO representatives who recognized that the content of the message was appropriate, this public speaking was perceived as “too emotional”. For Asian companies, it was seen as “impolite”. We used this video sequence and other ones showing other participants speaking in plenary sessions (firms, international NGOs, State representatives) in an interactive research. Indonesian farmers participating in the roundtable commented the different selected movie sequences. We also realized interviews with participants commenting the speech of the Indonesian farmer. This work was essential to reveal forms of emotions and body language that are disqualified in the liberal participation promoted in the Roundtable. Strong body emotion of people who reported on violations of their rights and the adverse conditions that they suffer related to their place-based attachments embarrassed non-rooted international community. This latter prefers a smooth body language in a way to avoid confrontation and to compose commonality through detached options of participants, which resulted in the exclusion of farmer and local community' voices.

Regulation of emotions and values. The case of organic farming collectives

Denise Van Dam, Jean Nizet, Michel Streith, Séverine Lagneaux

University of Namur, Belgium; University of Namur, Belgium; University of Clermont-Ferrand, France; Catholic University of Louvain
denise.vandam(at)unamur.be,
jean.nizet(at)unamur.be, michel.streith(at)yahoo.fr,
severine.lagneaux(at)uclouvain.be

This contribution analyzes how the leading members of four collectives in organic farming, making part of the organic social movement, mobilize cognitive, affective and value resources to overcome negative emotions that emerge from conflicts or dysfunctions within their organization. What happens when the leading members are in the throes of strong emotions (anger, contempt, shame, resignation) because of violent conflicts or persistent dysfunctioning within their collectif? This situation can have serious repercussions on the survival of the collective. The study has been conducted in Belgium and in France. Our research method is essentially qualitative: individual in-depth interviews of six stakeholders per collective and participation in meetings and group activities. Every interview was done by two researchers (me and a colleague). We used the technic of the critical incidence (Flanagan, 1954).

Our analyses grid takes into account the trigger event, the emotional feelings, the strategies to regulate the emotions (emotion focused strategy and situation focused strategy), the consequences on the emotional feeling and on the engagement.

The research invalids the leading role of cognitive reframing and shows the importance of values both in the "emotion focused" strategy and in the "situation focused" strategy. Values are present in the whole emotional episode, from the triggering event of the negative emotion to the passing of the emotion.

Trade Unions, Mobilization and Affect – Rethinking Labor Struggle from an affect theoretical Perspective

Katja Larissa Chmielewski
University of Vienna, Austria
katja.chmielewski(at)univie.ac.at

Drawing on the example of most recent labor disputes in the German hospital sector, this paper aims at conceptualizing processes of political mobilization from an affect theoretical perspective.

Against the background of an emotional turn in the Social Movement Studies, the focus on emotions (Flam 2005, Flam/King 2005, Goodwin et al. 2001, 2007) and affect (Gould 2004; 2009) became essential for understanding political in/action. In this paper it will be asked if these insights can also make a contribution to the field of trade unions organizing and mobilizing against precarious working conditions. While in the field of Labor Revitalization Studies the erosion of trade unions power in countries of the

global North is discussed in the context of social transformation processes and the need for a renewed perspective is emphasized, the role of emotions and affect for understanding collective action and political mobilization, has so far been little considered in this debate. Referring to the emotional turn in the Social Movement Studies and by bringing this debate into dialogue with the Labor Revitalization Studies and further (queer)feminist theories of affect, it will be discussed if affect and emotion can be conceptualized as a resource in collective mobilization against precarious working conditions.

The discussion of theoretical concepts will be enriched and exemplified by referring to most recent labor disputes of nursing staff in German hospitals.

Dangerous bodies, matter and emotions: public assemblies and embodied resistance

Mona Lilja, Mikael Baaz
University of Gothenburg Karlstad University, Sweden; University of Gothenburg
mona.lilja(at)gu.se, mikael.baaz(at)law.gu.se

Across the globe resistance is played out by bodies that occupy pavements, streets and squares. The participants in public assemblies, are taking part in various emotional processes while coming together to struggle against, for example, disenfranchisement, effacement and abandonment. In embodied, coordinated actions of resistance the gathering itself signifies something in excess of what is being said at the event; there is a distinction between forms of linguistic performativity and forms of bodily performativity. By bringing in the concepts of emotions, this paper will explore how and why resisting bodies signify something else/more than the vocalised or linguistic demands that they are making.

RN11 | Session 02a Theorizing Affect and Emotion II

Affective Transactions: Rethinking Emotion, Power & Habitus

Jonathan G. Heaney
Queen's University Belfast, United Kingdom
j.heaney(at)qub.ac.uk

This paper will address a number of current debates within social theory and the sociology of emotions concerning the concepts of affect, emotion, and habitus. My aim is to offer and defend a dispositional theory of social practice, based on a somewhat-reframed conceptualization of the habitus, which draws on and critiques not only the work of Bourdieu and Elias, but also the process ontology of Alfred North Whitehead. This question, at its most general, is concerned especially with the constitution of 'emotional habitus', and the relationship between emotions and power. It is approached from a distinct theoretical perspective, here called process-relational realism. This suggests that the individual body, engaged in the process of relational becoming, is constituted and re-constituted via ongoing and

iterative 'affective transactions' with the (social, cultural, and natural) environment. Such transactions give rise to patterns in emotional practice, which relate to power in a variety of ways, and are historically, structurally, and culturally variable; that the socially-embedded, embodied individual's affective transactions are mediated via a specific, normative and transformable affective or emotional regimes. Drawing on and contributing to recent work on these issues (Burkitt, 2014, Wetherell, 2012, von Scheve, 2017), I hope to demonstrate the utility of the 'process world view' for rethinking and re-integrating these concepts not only at the level of theoretical abstraction but also for the design of concrete empirical research.

Why sociology of emotions shouldn't worry about affect-theory too much. – A critique of affect-theory from an interactional perspective.

Katharina Scherke

University of Graz, Austria

katharina.scherke(at)uni-graz.at

The concept of affect in its different varieties has gained interest in recent years among scholars from scientific fields like history, literary studies or political science. Scholars like Silvan S. Tomkins or Brian Massumi (leaving here aside all differences between them) see affects as non-intentional bodily reactions, as something pre-cognitive. Socio-cultural aspects get peripheral in these approaches; they even seem to be dominated by the 'autonomy of affect'. The theoretical framing of differences between the concepts 'emotion' and 'affect' is still an ongoing task for sociology and other disciplines. The paper argues that the success of the concept 'affect' can be explained to some extent by features of the current scientific system, in which approaches and methods from the natural sciences are widely appreciated also in the social sciences and humanities. It will be shown that some arguments of current affect-theories are not new at all and that bodily aspects of emotions could be well integrated into an interactional oriented sociology of emotions. Five interrelated dimensions have to be analyzed in regard to understand the social character of emotions – physiological aspects ('affect'), expression, experience, evaluation, action.

Practice theory, emotionality and the culture of self-help

Marcel Dominique Autschbach, Thorn-Rennig Kray
Justus-Liebig-Universität Giessen, Germany; Justus-Liebig-Universität Giessen, Germany
dominique.utschbach(at)gcsc.uni-giessen.de,
thorn.r.kray(at)gcsc.uni-giessen.de

Contemporary forms of work as well as the "ethos of psychotherapy" (Illouz 2008; Nolan 1998; Rieff 1973) propagate a "belaboured self" (McGee 2005) learning to control and effectively invest its emotional capital. These tendencies have been most notably crystallized and codified in the culture of self-help, prominently addressed by scholars of Foucauldian subjectivation (Hazleden 2011; Nehring et al. 2016; Rimke 2000).

Our contribution, instead, aims at applying Bourdieuan theory of habitus formation (Bourdieu 2000, 2015) to the analysis of advice literature. Even though Bourdieu did not directly address the question, recent debates on emotionality from different fields, such as the studies of migration (Gray 2008) and education (Zembylas 2007) or feminist theory (Probyn 2004), have increasingly turned towards his work. In addition, specific elements of Bourdieuan practice theory, as for example the concept of habitus/hexis (Brumlik 2009; Scheer 2012) or capital (Cottingham 2016), have been discussed in relation to emotionality. We will probe Bourdieu's terminology in the field of self-help literature on the work place and focus specifically on exploring emotionality with regard to two interrelated processes: On the one hand, we will show how a specific discursive praxis of narrating emotion is formed in these books and thus inquire into the relationship of explicit/symbolic and implicit forms of knowledge (Reckwitz 2008). On the other hand, we will look at forms of incorporation of these sets of knowledge and thereby point towards the corporeal dimension of the culture of self-help.

A Sociology of Affective Attachment. The Case of Breathwork

Alexander Antony

University of Vienna, Austria

alexander.antony(at)univie.ac.at

Over the last few years it is possible to observe two interesting tendencies among social scientific approaches to emotions. First, there are attempts to overcome a narrow focus on discrete emotions as different analytic strategies have started to open up for the heterogeneity of affective life. Second, in particular relationist approaches reject the idea that affective states are situated within the individual. In contrast to such views, affectivity is understood as "a matter of socially implemented patterns of intra-actional dynamics within practical domains" (Slaby). According to such an approach complex relational configurations, rather than inner feeling states, serve as a heuristic starting point for empirical research.

Using an autoethnographic research design in combination with considerations from actor-network theory, I want to demonstrate how such an analytic strategy could stimulate research on affectivity. Exemplified with the case of so-called breathwork, I will show how different forms of affective experiences are interactively established and practically evoked. The assumption guiding my research is that we experience our body not as a self-given entity in a passive way, but rather via attachment to specific practices in which affected bodies are enacted in the first place. Moreover, it is argued that empirical research allows us to specify our analytic frameworks. Hence, by referring to the case of breathwork, I will suggest that it might be fruitful to take into account a) different modes of attachment/detachment, b) various sensory orders and c) specific styles of experience in order to sociologically investigate affected bodies in action.

RN11 | Session 02b Emotions, Civic Action and Social Movements II

Affective and Moral Economies of mental health professionals and volunteers in the refugee regime in Greece

Georgios Kesiosoglou, Philia Issari, Stavroula Laou, Antigoni Apostolopoulou
National and Kapodistrian University of Athens, Greece; National and Kapodistrian University of Athens, Greece; National and Kapodistrian University of Athens, Greece; National and Kapodistrian University of Athens, Greece
gkesiosoglou(at)ppp.uoa.gr, issariph(at)psych.uoa.gr, avralaou(at)gmail.com, anapo(at)otenet.gr

This presentation aims to discuss the affective and value practices of professionals and volunteers working with refugees in Greece through the concepts of affective and moral economy. It draws on an ongoing participatory action-research project on the needs and best-practices' proposals of people involved in the refugee regime, i.e. mental health professionals (psychiatrists, psychologists, social workers, nurses), cultural mediators, rescue workers and volunteers. In their everyday work with the refugees in the ad-hoc shelter and hospitality system of the Greek refugee regime, both professionals and volunteers are affected in various ways, while being in position to take up normative moral judgements and to uphold value practices vis-a-vis the present living conditions and the future of the refugees. Coming from a social psychological and counselling milieu, we have attested in pilot interviews that mental health professionals and volunteers register their need for best practices of supervision and psychosocial support again and again, which forms the core of the action-research groups of our study. Thus, this presentation aims to discuss the initial findings on the embodied experiences and affective/value practices elicited during the interaction of the action-research groups, both by the participants and the facilitators/researchers. Such embodied, affective, moral experiences in their work field are crucial for the professional formation and subjective constitution of the participants, in the context of a major social, economic crisis for Greece.

Paradoxes of Compassion

Greta Wagner
Goethe-University Frankfurt, Germany
greta.wagner(at)soz.uni-frankfurt.de

Compassion is a basic human emotion that positions people in relations with 'sufferers' and by this forms social bonds. But how can these social bonds be understood sociologically? Can compassion foster solidarity and reciprocity or is compassion rather an affective part of social dominance and are these bonds per se unequal and paternalistic ones? In the summer of 2015 many refugees arrived in Germany - at times 13 000 people a day. The acts of

hospitality displayed by huge numbers of individuals took many by surprise: Thousands started to engage in small support initiatives to help refugees to learn German, find apartments and to communicate with administrations. Many of them had not been engaged in any forms of social advocacy before. For 70 % of the volunteers who started to engage in 2015 „emotional experiences“ were important for their motivation (Karakayali/Kleist 2016). It seems that their volunteer work was in large parts based on feelings of compassion.

My research question ist: Which pitfalls does an engagement based on compassion entail? Based on qualitative interviews with volunteers in refugee support initiatives in the German countryside, my talk is going to address paradoxes of compassion. I conceptualize compassion as a central motivator for engagement and care which at the same time is a source for paternalistic attitudes by which refugees are not recognized as competent actors.

Emotional labour in mobile contexts: Supporting solidarity actors' resilience

Anitta Kynsilehto
University of Tampere, Finland
anitta.kynsilehto(at)uta.fi

Undocumented mobilities are perceived as a problem by established society yet many struggle to get any access to a regularized status. Many individuals, neighbourhood groups, networks and associations engage with these mobile people in order to provide everyday assistance, information, and human contacts, meanwhile seeking to keep the relation as egalitarian as possible. I call these people 'solidarity actors.' Often the commitment transcends the boundaries of organizational limits, and many work in a voluntary, sometimes ad hoc manner, as has been manifested across Europe in 2015 and onwards, even if this type of engagement is nothing new. Solidarity action is indispensable and personally rewarding, but simultaneously very tiresome and emotionally consuming due to the global political context that does not promise for an end to an increasing need for engagement. Some organisations have begun to pay attention to the well-being of their employees and voluntary workers in order to avoid burn-out and drop-out. However, this is not the case for all organisations, and for more informal groups and engaged individuals this type of support depends on resources one may have via other relational networks, and on the ways in which such issues are recognized as pertinent. Drawing on multi-sited ethnographic research in several European countries and around the Mediterranean Sea, and the author's involvement in various networks, this paper discusses the possibilities for supporting solidarity actors' resilience in contexts that are increasingly hostile to such engagement.

Emotions and solidarity: the emancipative value of shame

Lorenzo Bruni
University of Perugia, Italy
lor.bruni(at)yahoo.it

The aim of this paper is to mark an original sociological way of access to the study of shame. The main theoretical hipotesis of this work is about the distinction between two forms of shame: the first is called “vergogna del me” (Me shame), the latter “vergogna dell’io” (I shame).

The hipotesis will be developed around the idea that shame is bounded to a double kind of signficativity: objective and subjective. Referring to Mead’s social theory’s distinction between two componets of the Self, “Me” and “I”, the author will argue that “vergogna del me” (Me shame) points out a form of shame sociologically relevant, objectivated and socialized, that concern the violation of a given core of social significativity. “Vergogna dell’io” (I shame), on the other hand, points out the subjective dimension of shame. This second form of shame can be shortly defined such as a social compression of intersubjective sources of resubjection.

Once the author have shortly discussed about the distinction between “vergogna del me” (Me shame) e “vergogna dell’io” (I shame), he will focus on a form of “vergogna dell’io” (I shame) called “vergogna dell’io critica” (critical I Shame). After a theoretical definition, the author will propose a case study dedicated to this form. In this case study the author will try to emphasize the normative and emancipative role of shame along with the social introduction of this kind of emotion inside the participation to social movements in a case of eviction. The aim of the case studies is not to offer a strictly empirical check, but to test the hermeneutical capability of the concepts on the social events studied in the case study.

RN11 | Session 03a Theorizing Affect and Emotion III

Empathy and intuition: on the heuristic function of emotions on the study of mental illness

Joana Zózimo
Faculdade de Economia/Centro de Estudos Sociais -
University of Coimbra, Portugal
joana.zozimo(at)gmail.com

Conventionally, rigour and rationality are essential for the quality of research, opposing emotion and the disorganization related to it – as if our thoughts would be paused by what we feel. These assumptions have limited the problematization on how emotions – as empathy and intuition – can be useful in research. In my PhD, though, I was confronted with the importance of discussing emotions not only as an obvious human trace but also as heuristic tools for producing a more accurate description of the realities we study. I claim, as others, that reason and emotion are not separated entities: both making up our abilities to think and

know, and both having emotional and logical underlying features. Hence, ignoring both the benefits and downsides of emotions is a theoretical and methodological error endangering scientific outcomes. Specifically, this calls for keeping an emotional log throughout our research to systematically (i) use emotional information to further understand the data, e.g., if a ‘yes’ is a ‘yes’ or a ‘no’; (ii) discuss emotions’ influence on how we act as researchers and relate to our interlocutors; (iii) theorise on the boundaries of the emotions we come across in our work. Generically, it calls for the emotional training of social scientists not only as a personal resource, but also as an essential tool to figure out the social world, since much of it is enacted emotionally. To support these arguments, I will use examples from my latest research experience with participant observation in a psychiatric department of a general hospital in Portugal.

Disdained or Psychologized: Towards the Sociological Definition of Boredom

Mariusz Finkielstein
University of Warsaw, Poland
mariusz.finkielstein(at)gmail.com

The vast majority of sociologists (sociologists of emotion included) have neglected the emotion of boredom in their research and theoretical contributions. This affective state is either openly disdained as trivial and conceptualized in a common sense manner or perceived as merely individual phenomenon of no social significance. Boredom seems to be exclusively the domain of psychology or philosophy (in its existential dimension). As a consequence, sociological reflection upon boredom is scarce and limited to several, unrelated papers in the last four decades and one book by Orrin Klapp (1986) *Overload and Boredom*. Nonetheless, only two papers contribute significantly to the definition of the phenomenon in question (Barbalet 1999; Darden and Marks 1999).

The presentation aims to collect dispersed definitional motives from literature and to propose the sociological definition of emotion in question based on the qualitative research on boredom among students and university teachers. The methods employed in the study include: focused group interviews with students (n=32), internet survey among students (n=364), individual in-depth interviews with teachers (n=30, in progress) and participant observation during university classes, scientific conferences and university staff meetings (about 400 hours). The primary theoretical approach employed to analyze data will be symbolic interactionism by Erving Goffman (dramaturgical approach). Boredom will be presented as socially-dependent, dynamic phenomenon, the quality of interaction and interpretation of the social experience. The presentation will be concluded with a proposition of Author’s definition of boredom.

Emotions, Appraisal, and Status: The Case of Social Anxiety Disorder

Lisa Smyth

Queen's University Belfast, United Kingdom
L.Smyth(at)qub.ac.uk

This paper argues that the contemporary phenomenon of social anxiety disorder should be explained in relation to intensified forms of social appraisal in late modern societies. Drawing on sociological literature on selfhood and interaction (Honneth 1995; Mead and Morris 1934; Turner 1988), the paper assumes that social interaction offers potential recognition of the actors' self-conception, whether positive or negative in form (Burke and Stets 2009:52; Rosenberg 1979). Anxiety can be understood as a basic aspect of this process, since positive recognition is never guaranteed in interaction. Given that the anticipation and experience of social appraisal provokes patterned emotional reactions (Scherer, Schorr and Johnstone 2001), extreme and debilitating forms of anxiety might be expected, particularly in highly complex societies where appraisal situations have intensified. Those with lower social status, for example associated with inequalities of gender, tend to secure lower levels of positive recognition, in ways that influence further interaction expectations. Interaction motivations and adjustive responses in the agent's self-conception can consequently work to significantly heighten anxiety, in ways that reduce self-esteem and a belief in one's self as a competent social actor.

Two sites of intensified social appraisal are considered: online social networking and employment. The paper argues that Rosa's diagnosis of social acceleration can be employed in developing a sociological explanation of the contemporary phenomenon of social anxiety disorder, and suggest ways in which this diagnosis may have gained prominence as a possible source of refuge from the normative demands of an accelerating social world.

Fear of the Future vs. fear of a future - About the complicated relationship between society and its relation with the future

Natàlia Cantó Milà, Swen Seebach

Open University of Catalonia; Autonomous University Barcelona, Spain
ncantom(at)uoc.edu, swen.seebach(at)gmail.com

Our paper wants to further explore the relationship between society, the future and the emotion fear. We will argue that fear is an emotion that is central to modern societies' relation with the future and that fear creates not only awareness of possible futures, but allows people to prepare for and to prevent future risks. Fear creates so a latitude to act within the presence. However, fear can only provide society's members with power and sovereignty if it is related to concrete future objects or scenarios. If fear of the future becomes generalised (like in the context of ongoing social, political and humanitarian crises), fear

can turn easily in its opposite. This is when fear becomes irrationally projected on easy targets, outsiders, and traditional political actors. Current socio-political phenomena might be explained in this sense. Following this line or argument we will explore why and why not fear and crises can serve as explanation for current social and political tendencies towards populism, racism and xenophobia.

RN11 | Session 03b Emotion, Law and Organization

Structural and organizational emotion management in a legal setting

Stina Bergman Blix, Åsa Wettergren
Uppsala University, Sweden; University of Gothenburg, Sweden
stina.bergmanblix(at)sociology.su.se,
asa.wettergren(at)socav.gu.se

This presentation builds on a chapter in our book: "Professional emotions in court: a sociological perspective". The notion of law as unemotional has implications for how courts/prosecution offices manage emotional inputs and outcomes. Our purpose is to understand the ways in which organizational structures embed, nurture, and orient emotions in courts and prosecution offices. Data consists of interviews and field notes from two large and two small Swedish district courts and their respective prosecution offices. Formal emotion management is mostly prevalent in relation to security. Organisational measures to increase security and prevent threats and violence achieve the ambivalent result of both alarming and calming legal professionals. Prosecutors and judges learn to deal with emotions of grief, horror and disgust in relation to some cases. While the organisation typically provides opportunities for psychological counselling, the emotive-cognitive judicial frame postulates a 'Teflon culture' – a professional culture that questions the professionalism of those who require emotional assistance. The high work load ensures that strong emotions are implicitly dealt with by rushing on to the next case. We furthermore analyse the role of small-talk at breaks and lunches where informal collective emotion management of strong emotional experiences take place, typically as jokes or story-telling. Informal management is also achieved by nurturing mutually trusting relationships to selected colleagues. The empirical examples highlight the stark contrast between the 'ideal of dispassion' of the emotive-cognitive judicial frame and the highly emotional work situation, and shows how the organization works to sustain its ideals.

Judicial emotion and emotion work

Sharyn Roach Anleu, Kathy Mack
Flinders University, Australia; Flinders University, Australia
judicial.research(at)flinders.edu.au,
judicial.research(at)flinders.edu.au

Judicial officers work in the space between the practical demands of judicial work and the abstract conception of judicial authority. They are expected to embody the central legal quality of impartiality, and their everyday judicial practice must implement this value. Judicial work, especially in the courtroom, entails a wide variety of interactions and emotions, requiring considerable emotion work on the part of judicial officers. They must manage their own emotions, to present a demeanour that accords with formal institutional requirements, or to achieve the dispassion thought to be required for rational judicial decision making. The judicial officer may also have to anticipate and manage the emotions of others, in the interactive environment of the courtroom and when making and communicating judicial decisions. Findings from our empirical and theoretical research, undertaken over many years, including surveys, interviews and court observation studies, identify the kinds of emotions and emotion-related behaviour manifested in court, and the ways judicial officers experience and understand the role of emotions in their work, especially in relation to the central norm of impartiality. This research shows that judicial officers, in lower courts, rely on varied resources to perform judicial authority and impartiality, necessarily going beyond formal legal rules and procedure or conventional abstract models of judging. Investigating the ways judicial officers engage in emotion work, and even occasional humour, as practical everyday strategies to perform judicial authority expands understanding of the courtroom as a social and as well as a legal setting.

Influencing Emotional Attributions in Constructing Collective Identity

Anita de Klerk

University of Salford, United Kingdom
a.deklerk(at)edu.salford.ac.uk

England and Wales have currently experienced a paradigm shift in the delivery of offender rehabilitation under the new Transforming Rehabilitation Agenda (TR), which has privatised 75% of the probation service, since February 2015. A plethora of volunteer mentoring programmes were developed by Third Sector Organisations, probation mutual's and private companies allowing them to be able to compete for contracts within the newly privatised regional Community Rehabilitation Centres. However, all these volunteer programmes are underpinned by the hypothesis that mentoring does reduce re-offending without sufficient evidence, practised as a 'theory incarnate', and placing the unqualified, 'well meaning' volunteer at the heart of adult offender rehabilitation. The rhetoric surrounding the increased significance and use of the volunteer mentor has focused on the neo-liberal economic value in assisting the offender back into the work force, without consideration for what it means to be a Criminal Justice Volunteer Mentor.

As part of a broader doctoral project, the study presented here focuses only on the shaping and

managing of emotional attributions associated with the role of the Criminal Justice Volunteer Mentor and how those emotions and attributions are influenced during the training process in order to form the collective identity of the 'mentor'. Based on empirical evidence gathered from becoming a volunteer mentor and observing others in the role, this paper offers an insight into how you become a Criminal Justice Volunteer Mentor through the management of individual experiential attributed emotions for the purposes of identity re-formation and towards the construction of a collective identity.

Mediated emotion, affective (de)legitimation and social media

Ella Lillqvist, Anu Harju

Aalto University School of Business, Finland; Aalto University School of Business, Finland
ella.lillqvist(at)aalto.fi, aaharju(at)gmail.com

Research on both organizational legitimacy and online participation have been dominated by views rooted in rational-cognitive perspectives (Huy, Corley, & Kraatz, 2014; Dahlgren, 2005; Švelch & Štětka, 2016); with this paper, we make an important contribution to these fields by looking at the (de)legitimation of organizations as an affective process. Recently, social media have allowed individuals to more readily take part in legitimation, namely forming the generalized social acceptance that organizations need to survive (Weber, 1978; Suchman, 1995). Emotion also plays an increasing role in public discourse, as the rise of populist politics demonstrates (Demertzis, 2006; Rooduijn, 2015). Social media contexts, in particular, have a personal and emotional character; they therefore constitute "emotional conduits" contributing to condensing affects, such as anger, and driving activism (Gerbaudo, 2012).

We understand emotion as affective practice, that is, as relational and embodied meaning-making, inextricably linked with the semiotic and the discursive (Wetherell, 2012; Ahmed, 2004a, 2004b). Far from being simply an expression of individuals' feelings, affective evaluative language both reflects and constructs an intersubjective consensus of values (Hart, 2014; Martin & White, 2005; Ahmed, 2004a, 2004b). The empirical material contains discussions emerging from controversies around Facebook's business practices: we focus on the discursive struggle between individual users and Facebook (Inc.) over definitions of the rights and responsibilities of each party, including freedom of speech. The methodology incorporates quantitative and qualitative approaches to discourse analysis, particularly corpus linguistics and the framework of Appraisal Theory (Martin, 2000; Martin & White, 2005).

RN11 | Session 04a Collective Emotions and Identity I

Jokes about nazism, 1936-1945 : when private humour becomes a state affair

Alexandra Oeser

Université Paris Nanterre, France
alexandra.oeser(at)u-paris10.fr

The Nazi past is a serious subject, a theme you “cannot joke about”. Nevertheless people do joke about Nazism. An easy way to discredit this behavior is to say that these jokes are extreme right wing and/or anti-Semitic (Dundes/Hauschild, 1983). On the other hand, the laughter between 1933 and 1945 has often been qualified as resistance (Gamm 1979; Hermes 1946, Müller 2009). This view is now being challenged, some authors claiming that jokes were “propaganda by distraction” (Delporte 1993). This proposal reformulates questions on the relation between citizens and the state, by using a sociology of emotions applied to jokes on nazism. We want to understand unruly uses of humour as well as “soft” state repression in a twofold approach, from above and below.

This paper is based upon 250 court procedures found in the German Bundesarchiv mentioning jokes. They not only exhaustively list the jokes, but also the people who were present and laughed as well as those who denounced them to Nazi institutions. We learn about the context (public or private, work or home, with family or friends or anonymous persons). The archives also contain CV’s of those who told the jokes, which gives us access to sociological data such as gender, profession, marital status, salary, and the number of children. On the other hand, these archives give us access to different Nazi institutions that frame and sanction the public wit: the police (who writes a first report), the public prosecutor (who writes the accusation), and the judges (who write the verdict). This paper could be inserted in the session RN11_j or RN11_g

**Emotions as driving a collective identity :
Ethnography of Inside Jokes**

Marion Ink
EHESS, France
ink.marion(at)gmail.com

This communication will define how an inside joke is being performed in young adults’ cliques. For the last six years, I have conducted ethnographic research in student residences in Paris, Chicago and Toronto. I focused my observations on the formation of social groups throughout residents’ daily interactions. At the beginning of the ethnographic investigation, residents did not know each other and did not share a collective memory neither nor a common set of references. This aspect is reinforced by the fact of being international students coming from diverse backgrounds and with different goals. As a participant observer, I have experienced and described the entire process of socialization. In this presentation, I will focus on the use of jokes, as an emotional experience, in the process of friendship, of collective memory and of common identity’s dynamics. The jokes are the results of diverse previous interactions. I will show that they are always triggered by an absurd situation which is highlighted by the laughter of inside members in situ

or ex post. Then, (future) group members activate inside jokes during moments of collective effervescence. Inside jokes tend to be routinized and anecdotized in the members’ daily interactions. This shared emotional experience will be incorporated into the clique’s set of references. Thus, they will lead to a common ways of talking, of behaving performed by the clique’s members.

This micro-sociological study of cliques’ formations in student housing and the use of inside jokes will lead to a global analysis on collective emotions in the relationships’ dynamics. We will see that Inside jokes also enable us to define the boundaries between insiders and outsiders, and their powers on each other

Experience of betting loss and emotions

Marina D’Agati
University of Turin, Italy
marina.dagati(at)unito.it

The paper explores the relationship between experience of gambling loss and emotions from two different points of view: the value of the emotions of football bettor who didn’t win and the daily management of the dissonance of identity experienced. It is assumed that emotions are not necessarily negative in betting loss; they are moreover strategic resources. They allow to reduce or remove the incongruity between the self-conception as a person’s relatively stable sense of real me (a good bettor) and the self-image as an individual picture of himself/herself at any particular moment (a bettor who lost). The study is situated at the intersection of Arlie Hochschild’s sociology of emotions, Martha Nussbaum’s cognitive theory of emotions and Ralph Turner’s approach on the dynamics of identity. Drawing on in-depth interviews with football bettors, the article analyses emotional workings of bettors and it presents and discusses some typical profiles of betting loss management.

**„Little Homelands” and „Great Homelands” in
Polish political debates 2004-2017 from
perspective of sociology and anthropology of
emotions**

Joanna Kurczewska
Polish Academy of Sciences, Poland
jkurczew(at)ifispan.waw.pl

Based on records from public debates – starting with EU accession and ending with debate on Poland’s position in Europe after Brexit – the following theses are proposed.

- 1) Public debates in Poland, independent of the topic, are becoming increasingly emotional;
- 2) Public debates concerning a) national patriotism and b) local patriotism are cultural representations of extremely emotional debates whose “cultural power” is on rise with time;
- 3) In 2004-2017 develops the political polarization of emotions (used as social and cultural markers of “being a Pole” or “being a local” for both participants in the debates -politicians, experts, NGO’s

representatives - as for ordinary citizens) , thematization of debates and of their communicative mission;

4) Political polarization of “emotions” in area of patriotic debates leads first to purification of social vocabulary concerning patriotism, secondly, to radical separation of sublime code of unconditional pride from profane code of petty vices and petty pathologies of interpersonal solidarity and from the code of scorn, thirdly, to nobilitation of emotions in characterizing the patriotism, including the extreme emotions like hate and fear.

The above will be illustrated with cases selected from debates a) on European integration (2004), b) on Smolensk tragedy of 2010, presidential campaign of 2015 and d) debates on self-government and sovereignty of 2017. Last but not least, the paper is intended as a voice in the debate on sources, symptoms and functions of brutalization of Polish public debates on various forms of patriotism through upgrading of extreme emotions in reference to social relations.

RN11 | Session 04b The Emotional Dynamics of Right- and Left-Wing Political Populism

Manipulation, Discourse, and Action

Ruth Wodak

Lancaster University, Vienna University
r.wodak(at)lancaster.ac.uk

A change in right-wing populist rhetoric and contents has become apparent. Creating fear and hope while suggesting change, usually without any programmatic content, has been successful in attracting voters. Why are voters attracted by obvious manipulative and frequently false contents? In this paper, I trace the dynamics of the Austrian Presidential election campaign which first triggered much negative emotion and succeeded in evoking trust that the right-wing populist candidate would be able to protect ‘the people’ from danger. However, in the second and third repeated round, the green candidate won, carried by optimism and positive emotions (as evidenced by opinion polls and exit polls). ‘The politics of fear’ was obviously less successful in this case (Wodak 2015, 2016). I will explore the many factors leading to this totally unpredictable and unexpected result.

“It Was a Tsunami.” Shifting Emotions in Democratization Processes

Donatella della Porta

Scuola Normale Superiore, Italy
donatella.dellaporta(at)sns.it

The paper looks at the shifting moods during and after mobilization for democracy. Emotional work is analyzed by looking at the ways in which the fear of repression is transformed into outrage, through chains of moral shocks. Hope then develops at the peak of the mobilization, making participation a happy experience and contributing to transform the very identities of the individuals involved. Finally,

satisfaction and disillusionment follow transition, although with cross-country differences, contributing to micro-level dynamics of withdrawal from protest. Relying on previous research on passionate movements, I bridge collective emotions to protest, looking at them as some of the conditions activists aim at changing, but also as a constraining power on protest action. The intensity of the emotions that emerge during the process is fundamentally different in eventful transitions versus participated pacts, but also varies within each path, with potential implications for the democratic quality of established democracies

Theorizing Political Emotions

Nicolas Demertzis

National and Kapodistrian University of Athens, Greece, National Centre for Social Research
ndemert(at)media.uoa.gr

Although the term “political emotions” has been coined in respect to the ever-growing sociological and psychological literature on politics and affectivity, little effort has been made regarding its definitional clarity. By defining them as lasting affective predispositions that play a key role in the constitution of political culture and the authoritative allocation of resources, this paper differentiates political emotions proper (or sentiments) from ‘politically relevant emotions’, i.e. transient affective experiences which play a marginal role in the *longue durée* of the Political. The paper argues that: (a) political emotions should not necessarily be consciously felt; (b) there are no exclusively political emotions but only ‘scenarios’ of political involvement and affect occurring in various figurations wherein any emotion may acquire political significance; (c) some typologies are more suitable than others in theorizing political emotions; (d) political emotion (in the singular) can be seen as an abstract conceptual category or as a general phenomenon which accommodates a variety of specific emotions; (e) political emotions are inherently relational and they are felt individually or collectively. An effort will be made to showcase that political emotions are absolutely necessary either for democratic or backlash politics.

RN11 | Session 05a Emotion in Organizations 1: Gender

“Acting Like a Man”: Emotion Management in Police and Border Guard Work

Sophia Yakhlef

Lund University, Sweden, Sweden
sophia.yakhlef(at)soc.lu.se

Conventional views of the police support a norm of emotion management. Aspiring police officers are taught not to show pain or fear and to display an image of control and assertion. If failing to convey such emotions officers might be considered too weak or simply not “man enough” for the job. This is also the case concerning border guarding and border police

conduct. This study draws on data gathered during the study of a partly EU financed collaboration project with the purpose of decreasing and preventing trans-boundary criminality in the Baltic Sea area. The participants included police and border guard organizations from Sweden, Finland, Estonia, Latvia, and Lithuania and lasted for two years (2014-2015). This qualitative study is based on empirical material such as field observations and interviews with participating (male and female) police and border officers. Initially, the focus of the study was international collaboration and collaboration obstacles. The findings suggest that the officers mostly valued informal interaction (such as after-work socialising) in order to gain trust in collaboration partners. An important part of this interaction consisted of police banter, joking, and of telling stories. As most of the participating officers worked in intelligence (or information exchange) they often joked about stereotypical images of "crime fighting" and of the lack of action that their work entailed. Additionally, the findings suggest that joking, bantering or teasing were strategies of handling emotionally challenging situations and of coming to terms with contrasting opinions regarding the clichéd "masculine" image of police work.

Emotional Challenges and Organizational Difficulties: Emotional Strategies and Rules Among Swedish Fire Fighters

Stefan Karlsson
Karlstad University, Sweden
stefan.karlsson(at)kau.se

Studies on the rescue services have mostly shown that the firefighter profession is physical and dangerous. However, this gives a narrow description of the profession, not least in terms of the fact that rescue operations make up a very limited part of the working hours. Using the growing research field of emotional labor as the starting point, this paper shows that the profession also requires great emotional skills. Based on 38 qualitative interviews with firefighters and chief fire officers in Sweden, the paper illustrates numerous forms of emotional challenges, during rescue operations as well as within the internal organisation; e.g. meeting with immediate family at accidents, traumatic operations and work tasks which lead to shame by association. The results also show emotional rules and strategies for how to manage the emotional challenges. Further, the paper argues that place, in terms of geographical town as well as rescue location, is especially important to understand emotional labor in this context, and thus contributes to emotional perspectives by shedding light on the need for contextualization.

Managing Gendered Affects in Corporate Management

Elgen Sauerborn
Freie Universität Berlin, Germany
Elgen.Sauerborn(at)fu-berlin.de

While research on emotions and gender in organizations and in particular in management has a long tradition in the field of sociology of emotions, very little attention has been paid to the role of gendered affects and ambiguous corporate positions of power. A great deal of previous research into feelings in organizations has focused on concepts of emotion management such as emotional labor. Since a large body of literature has investigated mostly the forms and effects of emotional labor from either workers or managers, several aspects of managing feelings at the workplace remain unclear.

Referring to findings of my qualitative study on women in leadership positions and feeling management, I want to present two poorly discussed aspects in literature on emotions in organizations that emerged from the analysis:

First, I want to address ambivalences in feeling management that occur when professional roles lack clear emotion norms or rules. This is certainly true for women in leadership positions who represent both, corporate power as well as the precarious role of 'the other', mostly because they disturb a traditional male dominated area.

Second, I want to illustrate how recent studies on emotional labor often remain narrow in focus dealing only with emotions and therefore neglecting the complex dynamics and relations in positions of power. By addressing the management of affects, I want to examine the bodily and indistinct aspects of ambivalent power relationships.

The role of affective sanctioning in the formation of hyper-masculine identities among young male gang members in Glasgow.

Irene Rafanell, Robert McLean, Lynne Poole
University of the West of Scotland, United Kingdom;
University of the West of Scotland, United Kingdom;
University of the West of Scotland, United Kingdom
irene.rafanell(at)uws.ac.uk,
Robert.McLean(at)uws.ac.uk,
Lynn.Poole(at)uws.ac.uk

In this paper we explore the emotions' role in the construction of particular 'masculine social worlds' characterised by a collective sense of hyper-masculinity among young working-class men in Glasgow belonging to gang groups. We argue that affective social sanctioning underpins and circumscribes the constitution of local masculine subjectivities. We adopt an ethnomethodological approach to uncover specific local 'methods' (and the associated group's status markers) used by the individuals of those collectives to successfully operate within their situated 'lived' experience. Affective sanctioning should be understood as a key method underpinning the constitution of these groups' distinct status makers and the concomitant subjective identities. We show that emerging status markers are idiosyncratic to the group and relatively independent of wider systemic features. To illustrate the distinctive nature of a group's constitutive 'methods' we contrast two groups which, despite co-existing in the same

geographical location (and thus sharing similar wider structural determinants in relation to a general sense of masculine identity) develop different modes of hyper-masculinity: while violence is central to achieving masculine status among young street gang members (YSG), money and physical capital are prioritised among members of Serious Organised Crime Groups (SOCGs). Using empirical data from these two groups we aim to provide a case study for a phenomenological framework which highlights the constitutive power of individual's interactions with particular emphasis on mutual susceptibility to affective inter-valuation practices as the bases for the emergence and maintenance of collective identity and sense of belonging. Most significantly 'markers' of group belonging shape practices that while may be perceived as irrational to an outsider they must be understood as logical, rational and calculative from an insider's point of view.

RN11 | Session 05b Emotion in Organizations II: Emotion Management and Emotional Labour

Collegial Emotional Labour in Nursing Homes and Day Care Institutions

Merete Monrad
Aalborg University, Denmark
monrad(at)socsci.aau.dk

The paper discusses collegial emotional labour through a study of care work in day care institutions for children aged 0-6 years and in nursing homes. Based on 27 qualitative interviews with frontline workers, the article elucidates the collective nature of emotional labour in care work. In the paper, collegial emotional labour is discussed as a resource in care work and it is shown that the emotions of colleagues can be important in coping with work. It is suggested that this resource can be understood as a collective emotional capital in the work team. In addition, the paper analyzes how colleagues relate to each other's emotional labour and how emotional expressions are implicitly related to professional status and hence to processes of distinction between colleagues. Finally, the paper discusses the interplay between the working environment and collective emotional capital. Some workers describe that they experience that collegial discussions of work-related frustrations diminish the collective emotional capital. Based on these experiences, the article raises the concern that work-related frustrations are displaced to individual and private conversations to preserve the collective emotional capital.

Emotion Management and the Professional Culture of Administrative Social Workers in Russia: The Common Standards of Emotion Work and the Moral Mission of Social Care

Olga Simonova
Higher School of Economics, Russian Federation
olgsimon(at)gmail.com

I examine emotion work among administrative social

workers in Russia, an activity vital to the on-going emergence of their professional culture. This examination focuses on administrative social workers, a particular group within the occupation who are, in the main, office-bound social workers who help people process the required documents needed to receive social assistance and benefits. Firstly, I offer an overview of existing research on the sociology of emotions and professions, with a special focus on those studies exploring emotion management. The conclusion emerging from this review is that analyzing emotion work in the field of social work can lead to a deeper and more complete understanding of its specific character and the ethical rules operating within it. Secondly, transcript analysis of administrative social worker interviews was conducted as part of a larger research project on the professional culture of this occupation. This analysis was completed with help of NVivo software and reveals that interviewees are not only clearly aware of emotion work, but also seek to reduce emotional expenditure in their communication with clients and strive to standardize how they work with their emotions. Carrying out emotion work has a key function in supporting a professional identity among administrative social workers and the furthering the development of a professional culture. On the other hand, the emotional expenditures involved and the challenge of 'making the profession worth it' are alleviated by the sense that one's work fulfills an important 'moral mission' in providing social care and assistance.

Emotions and bureaucracy – interactive dynamics in the academic work place

Erika Andersson Cederholm
Lund University, Sweden
erika.andersson_cederholm(at)ism.lu.se

An increasing proportion of people's working hours are devoted to administrative tasks, visible among professional groups such as doctors, teachers and academics. This often entails emotional expressions of sighs and grumbles about "bureaucracy" in everyday working life, in tandem with the critique voiced in social science literature analysing consequences of New Public Management and of the "audit society". In an ethnographic study of university departments, we highlight the everyday interaction among and between academics and other staff members concerning administrative tasks. As these tasks have become accentuated, so have conflicts become visible in division of labour concerning everyday tasks with documents and meetings. Conflicts may be triggered by for example meeting competition and exclusion and inclusion in various groups and committees. In this study, we highlight emotional expressions in relations to these administrative concerns. These may take the form of general annoyance with bureaucracy, open or constrained anger directed towards specific matters or persons, shame of administrative incompetence, or pride, joy and gratefulness in relation to administrative competence. In this paper, we focus on interactions in

both face-to-face meetings and e-mail correspondence. In particular, we aim to shed light on the emotional commitment involved in bureaucratic tasks by focussing on the interactional dynamics played out through the role of a third part, such as an authority referred to, for instance as “cc” in an e-mail, or a specific document such as a protocol from a meeting.

How working with Doctors Without Borders (MSF) can become a frustrating commitment

Ludovic Joxe

Paris Descartes (Sorbonne Paris Cité), France

ludovic.joxe(at)gmail.com

Having observed that some MSF expatriates suffer from frustration in their field of intervention, I try to sociologically understand the process of this phenomenon.

I show that ‘career-oriented’ expatriates are less inclined to be frustrated. They expect a salary from the organization, a career evolution that MSF actually provides. There is no space for disappointment. However, ‘committed’ expatriates have a potential profile to be frustrated. They expect MSF to have a political impact, to save lives and to be ‘efficient’. Depending on the control of Crozier’s ‘zones of uncertainties’, such as the interpretation of the charter, the workload, the team spirit, or the communication with local authorities, two ‘committed’ expatriates can come back from their mission with opposite feelings: one enthusiastic and another depressed. I then show how frustration is actually linked to power and information control.

My research brings together different fields of sociology such as life course studies, sociology of organizations, sociology of emotions, work sociology and management sociology. It also considers African, Asian, and South American expatriates that today represent around 30% of MSF expatriates and have not been studied so far. The variety of political contexts of MSF interventions, the multiplicity of nationalities of MSF expatriates, and the emergency of the crises make MSF a complex organization. This complexity finally questions the importance recently given to ‘psychosocial hazards’ in our societies, since frustration seems to be inherent to a ‘normal’ MSF functioning.

My communication relies on fifty interviews with MSF expatriates and notes taken during nine missions on three continents.

RN11 | Session 06a Collective Emotions and Identity II

From Systematic Forgetting of the 1980 Coup to Yearning for Remembering the 15 July Failed Coup: Competing Politics of Coup Memory and Emotions in Turkey

Ayşe Narlı, Kaya Akyıldız

Bahçeşehir University, Turkey; Bahçeşehir University, Turkey

nilufarnarli(at)gmail.com,

kaya.akyildiz(at)eas.bau.edu.tr

The politics of reconstruction and monumentalizing coup memory in the post-coup/military regime era are essential to demanding justice. The reconstruction of past events and emotions displays how the 1980 coup memory and the memory of the 25 July failed coup are monumentalized and transmitted by various means. Competing narratives encourage/discourage their version of past to be the “truth” for future generations in Turkey.

The paper compares the governmental politics of memory/emotions in the post-1980 coup period with the politics of remembrance aftermath the failed coup attempt in 2016. The study shows that unlike the AK Party government’s leading initiation of the memorialization of the victims of the 25 July failed coup (2016), the post 1980 coup government(s) adopted a policy of forget and forgive. The 1980 coup memory was suppressed in the 1980s and 1990s along with the de-politicization process that silenced the intellectuals and civil society actors about the coup.

Only in 2010, the Museum of Shame, a large collection of pictures of trials, torture and several items belonging to the victims of the coup was installed by the victims of the 1980 coup, who had founded the 78’ers Foundation in 2002 to undertake truth-finding and citizenship rights activities while after the failed coup attempt of 2016 by changing the name of the Bosphorus Bridge to Bridge of 25 July martyrs and several commemoration events have been organized in the public institutions. Our presentation will highlight the politics of emotions and memorialization for these two coups.

“The emotion of shame within the context of financial crisis: A Greek case study

Myrto Voulgaraki

University of Athens, Greece

m_voulgaraki(at)hotmail.com

The purpose of this paper is to explore the magnitude of intensification or transformation of the emotion of shame in a society which is experiencing a period of financial crisis; more specifically within the context of the Greek financial crisis. Is it possible that the financial crisis in Greece could be a direct cause of the redefinition of shame within a framework of established values? Moreover, which could be the consequences of a resultant increase in the emotion of shame?

The starting point of this approximation is that shame, which is one of the primeval emotions of human society, deriving from human communication and relationship, has been increased in civilized societies. According to Elias its development is the outcome of European cultural progress, aimed at social and self-control in everyday life. Shame reflects a feeling of fear generated in childhood; it is a painful experience because it concerns the entire human existence, one’s public image and his or her comparison with others; it may create a sense of personal failure or impasse. As

a result one is immobilized even further because they feel shame for being shameful, and are thus more easily manipulated.

Shame as part of an ethical system which defines the human condition transmutes according to economic, sociopolitical, and historical circumstances of a given period of time. Therefore, this study focuses on Greece in a time of financial crisis, which is manifested as an increase in the unemployment rate, the impoverishment of the middle class, the general feeling of financial malaise, as well as an increase in the rate of suicide and crime.

The role of modern Greek Literature Education in affectively sculpting national subjects

Valia Theofilopoulou

Trinity College Dublin, Ireland

theofilv(at)tcd.ie

This paper delves into a close examination of the content of seventy-six (76) Modern Greek literature anthologies that have been used as the primary didactic material for teaching literature in Greek schools since 1930. The inquiry rests on the intersection of two conceptual axes. The first draws on Michel Foucault's works *Discipline and Punish* (1979) and *Power/Knowledge* (1980), in which the author describes the ways with which schooling produces subjects through a complex interweaving between contestable knowledge systems that function as determinants and regulators of perception and power mechanisms that are exercised over and through the bodies. Gilles Deleuze's ontology of literature as proposed in *Critical and Clinical Essays* (1997) and Proust and Signs (2000) forms the other axis which appreciates literature's inherent non-representational qualities and acknowledges the transformative potential of a reader's encounter with literary material. Despite the clear shift in the manner with which the textbooks under study have been synthesized post 1983, I argue that until today literature education in Greece affectively construes national subjects by encouraging students to aspire to the notions of Greek timelessness and exceptionality. This is effected through the systematic process of selective endorsement, narrow thematic arrangement and framing of certain literary pieces that, as they are disseminated repetitively through State education, they become officially shared compositions of sorrow, nostalgia and pride for a 'perfect' bygone time (and space) and hope for an anticipated common future.

Inter-generational construction of emotions through family talk in the Israeli middle-class

Rotem Leshem

Tel-Aviv University, Israel

leshem.rotem(at)gmail.com

The emergence of an individualistic-oriented emotion discourse that shapes relationships as part of Western middle-class lifestyles has long been recognized. However, there is little research about this process of identity formation in everyday life. This bottom-up

perspective is particularly important in societies where traditional and/or national discourses are prevailing. The Israeli middle-class is a typical case, given the complex interplay it entails between two conflicting cultural codes: a national-ethnic model vs. a liberal-democratic one. Focusing on Ashkenazi Jews who immigrated to Israel from Eastern and Central Europe after World War II and their offspring, I aim to trace the transforming emotion discourse within this currently middle-class group across three generations. My materials consist of 50 in-depth interviews focusing on family relationships, mostly with two or three family members in each case. I examine short episodes in the interview-transcripts which deal with sensitive family issues, using meticulous discourse and conversation analysis. Comparative analysis of these episodes shows a discursive tension between two meta-narratives of self-and-family, which shapes family talk of the different generations – a national-ethnic narrative and a psycho-therapeutic one. Moreover, findings point to a substantial shift from the collectivist framework in the first generation to a full-fledged individualistic style of self-analysis in the third one. This zoom-in perspective on family talk reveals an intriguing inter-generational tension between patterns of reflecting on emotions. It helps us understand better the identity formation of the Israeli middle-class and its current intricacies concerning issues such as parenthood, or obligatory service in the army.

RN11 | Session 06b Emotions, Politics and the State I: State Institutions

Anxiety 'unmaking' institutions? The case of old age provision in contemporary Germany

Ingo Bode

University of Kassel, Faculty of Human Sciences, Germany

ibode(at)uni-kassel.de

During the 20th century, major welfare states in Europe have created institutions sheltering citizens from risks related to biological ageing. Pension schemes made life courses foreseeable, if at unequal levels and with differences between social groups. After the 'neo-liberalisation' of welfare capitalism, the respective institutional arrangements have brought increased insecurity to what important sections of the population (can) expect in terms of old age provision, even in more affluent countries such as Germany. Despite stable and strong normative commitments to the inherited, 'securizing' institutions, major sections of the German population have not contested politically the transition to a more market-based model in pension provision. Many have been 'activated' to buy (more or less) risky personal pension plans whereas others have shown more of a passive behavior. The paper argues that feelings of anxiety have been a 'catalyst' in the process of dismantling the inherited institutions. Three factors seem to matter: an 'uneasy' experience of general insecurity in a more flexible life course; the impact of what can be labeled 'politics of

fear' (Furedi), including at discourse level; and – especially if alleged solutions are experienced as ineffective (e.g. the failure of seemingly alternative routes to secure old age provision) – options to convert feelings of insecurity into affects against simple objects that are independent of the problems encountered. To corroborate this argument, a compilation of survey data (including results from a study run in early 2017 conducted at our institution) and evidence from qualitative research with citizens engaged in pension planning (ibidem) is presented. The conclusion is that if the three factors coincide, strong institutions can become damaged even if people strongly adhere to them.

Marketization and affective technologies of social protection. Affective implications of Karl Polanyi's market society concept

Otto Penz, Birgit Sauer

University of Vienna, Austria; University of Vienna, Austria

otto.penz(at)aon.at, birgit.sauer(at)univie.ac.at

During the last three decades we encounter the dawn of a new welfare regime in the Global North, a new organizing 'principle of social protection', as Karl Polanyi calls it in *The Great Transformation* (1944): workfare or activation policies with a strong emphasis on labor market participation and self-reliance. While Polanyi was concerned with factory legislation and social laws in the (long) 19th century, we will argue that the self-protection of society against the economic market system itself becomes marketized and that the protection of human creativity and affectivity (the subjectivity of the 'whole person') is at stake.

Our theoretical considerations are based upon extensive empirical research on the work of agents of the state, i.e. employment agents, who are supposed to adopt and follow a managerial logic that also encompasses their affective dispositions to activate jobseekers. New Public Management and feeling rules in employment agencies result in the embodiment of entrepreneurialism, in technologies of the self, which govern body and mind, affectivity and rationality according to market demands – a process that we termed 'affective subjectivation'.

In our presentation we attempt to develop Polanyi's analysis of the relationship between economy, politics and society further with concepts of affective governance and subjectivation, of 'governing through affect'. The focus of our examination will be on current 'subtle', affective technologies of social protection, a self-protection of society that turns public authorities and citizens into entrepreneurs of the self and governs their habitus as a whole.

The Post-emotional City: State Constructions of 'Passionate' Places

Roy Coleman

university of Liverpool, United Kingdom

roy.coleman(at)liv.ac.uk

The identity and form of the contemporary city

appears awash with positive emotional relating to 'place', 'identity' and 'belonging'. This is identifiable in terms of place-marketing, branding and other state-corporate activities. This paper explores how the rise of the modern capitalist city inaugurated an experiential economy and emotion-scape of human encounter built on capitalist rationalization, pecuniary habit and competition. Earlier sociologists such as Durkheim, Simmel and Wirth challenged such developments as anomic, manufactured and suppressive of spontaneous and, for them, 'healthy' emotional energies. This paper extends the insights of earlier sociology in exploring how emotions have a role in state power and its atmospheric projection – processes subject to rationalization and management through the state's development of urban contact zones constructing states, markets and citizens. The paper explores a form of postemotional governance and spatialization increasingly ubiquitous in contemporary urban space and indicative of state power that aims to pulverize spaces for spontaneous emotional-political expression (including street protest, art and the carnivalesque). The paper theorizes such developments in relation of urban emotional governance in Liverpool UK.

Emotional stratification in school. Comparison between Finland and South Korea.

Łukasz Remisiewicz

University of Gdansk, Poland

lukremisiewicz(at)gmail.com

Finland and South Korea educational systems are examples of sentences that there are many paths to one goal. Although, there are a lot of differences in the scope of organizational but also emotional patterns in treating education, both countries have ones of the best educational systems.

According to Randall Collins theory of interaction ritual chains the author analyses educational systems as transferring certain symbols by institutionally forced ritual chains. The goal of the talk is to sketch the proof that both systems – Finland and South Korea provide coherent emotional channels of symbolic circulation.

Using collected video data from lessons, the author indicates main emotional ways of teaching style and match it with cultural organization of educational systems. In the case of Finland teachers try to arouse flow experience that in long term perspective would increase emotional energy to further teaching and replicating the schooling symbols. The existence of many interest groups and environments that share the symbols are the reason of circulation of the symbols outside the school. For the other hand, in South Korea lessons are primarily rituals of power that engage focus of attention on low emotional level and learning appears as a sad necessity. Emotional charging is possible by external sources such as educationally-oriented family and competitions.

The talk supports a view from Collins theory, according to which a lack of the channels of emotional energy that lead to symbolic discrepancy in society and education can be a reason of educational

inequalities.

RN11 | Session 07a Collective Emotions and Identity III

Emotion Management as a Consequence of Digital Inequality

Laura Robinson
Santa Clara, United States of America
laura(at)laurarobinson.org

To date, studies of sociology of emotions and sociology of digital inequality have neglected two important areas of inquiry: 1) the emotional consequences of exclusion from daily connectedness and 2) the emotionally charged identity work necessary for the digitally disadvantaged to keep up with the connected. To begin to fill these gaps, this paper unpacks youths' daily rounds shows how digital activities may have radically different emotional meanings and consequences for those with unequal access to resources. Drawn from interviews with youths attending high schools in a high-poverty community, the study reveals the social isolation under-resourced youths experience by drawing on two key sociological concepts: emotion management and identity work. Regarding the former, the research draws its inspiration from Hochschild's concept of emotion management (1979) to reveal the emotional costs and emotion labour demanded by identity performances—particularly those necessary for digitally disadvantaged youths to maintain their digital engagements while struggling for access to basic resources. Concerning the latter, the analysis reveals how digitally disadvantaged youths occupy a liminal digital zone necessitating special kinds of identity performances that levy emotional costs—costs that their digitally advantaged peers do not pay (Goffman, 1959). In making these linkages, the research reveals the pernicious nature of digital inequality as a form of quotidian social exclusion with enormous emotional consequences—a form of social division that is deeply felt by those experiencing it and yet remains largely invisible to the outside world.

FaceTiming the Nation: Art of mobilizing citizens in the age of Fiber Optics through emotions

Yagmur Karakaya
University of Minnesota, United States of America
karak014(at)umn.edu

When Erdogan, the president of Turkey, FaceTimed the nation during the military coup attempt in the summer of 2016, citizens answered his summoning. Disregarding the curfew, they took the streets fighting against the factions of the military, for a month after the coup they joined the rallies called the "democracy watch". In light of this I ask, what are the means of interpellation that make the majority of Turkish population follow the regime's orders instead of the military's? What kind of efforts go into the "war of position" that trenches remain very strong during a counter-hegemonic "war of movement"? In this paper,

I focus on the cultural engineering that goes into building a strong hegemony through collective memory practices which mobilize emotions. Relying on my ethnographic data, I argue that neo-Ottomanist collective memory practices in Turkey serve as mechanism of socialization, that help attach citizens to the state emotionally with an anchoring bond that is hard to break. First, I offer a reading of the Panorama 1453 History Museum Conquest, a cultural hub attracting both domestic and international tourists for an interactive experience to the fall of Constantinople. Second, I analyze the massive commemoration of the 563rd year of the conquest, paying attention to both the collective effervescence inducing program and how the public responds. Both ethnographic cases offer a triumphalist view of Turkish history that acts as an anchor for "a future marked by unprecedented economic success", and protection against "enemies who are ready for a revenge of the conquest

Is it just fun? Teens' participatory practices as emotional playground

Gabriella Taddeo, Simona Tirocchi
INDIRE (National Institute of Documentation Innovation and Research in Education), Italy;
University of Turin (Department of Philosophy and Sciences of Education)
g.taddeo(at)indire.it, simona.tirocchi(at)unito.it

Why youngsters are so fascinated by the so called Instagrammers, Youtubers and other new social media "stars" they meet and follow online?

What are they looking for, and what they find in these protagonists of the web 2.0? Is such type of consumption pure entertainment or has it a role in the social and emotional development of youngsters? Are there differences by gender, social background, school path in living such emotions?

Several researches have investigated about teens through their new media practices (Davies, Coleman and Livingstone, 2014; boyd 2014; Turkle 2013; Ito 2010).

The paper will attempt to answer to such types of questions by presenting some first empirical results of the research "Transmedia literacy, Exploiting transmedia skills and informal learning strategies to improve formal education"

The research is funded by the European Commission into the H2020 Programme and it is involving 8 Countries in a ethnographic and qualitative exploration on the youth participatory cultures (teens 12-18 years old), and their connection with educational purposes.

Through the analysis of the Italian findings, we could analyze how following an Instagrammer, composing a "meme" which connects images and reflections about life or love, or also laughing with a Youtuber, are all ways for youngsters to explore the self, shape and affirm the own identity, talk about themselves in a mediated and remediated way (Bolter, Grusin 1998).

The methodological approach will also include the sociology of emotions perspective (Thoits, 1989, Turner, Stets 2005;2008), in order to deepen our analysis.

We therefore discuss how such mediated emotions can be part of an educational path.

Loneliness and Facebook Usage: A Romanian Case Study

Nicoleta Corbu, Oana Stefanita, Georgiana Udrea
National University of Political Studies and Public Administration, Romania; National University of Political Studies and Public Administration, Romania; National University of Political Studies and Public Administration, Romania
nicoleta.corbu(at)comunicare.ro,
oana.stefanita(at)comunicare.ro,
georgiana.udrea(at)comunicare.ro

The relationship between Facebook use and loneliness has triggered the interest of researchers alongside with a dilemma concerning the direction of influence and the ambivalence of outcomes. A series of studies provide evidence for the benefits of online networking by enabling social interactions and decreasing loneliness and depression. However, the gain can turn into loss depending on the amount of time spent on Facebook and on the type of displayed behaviors. Building on the classic uses and gratifications theory, studies investigating Facebook uses with a focus on loneliness management are largely engaging in a risks-benefits approach. At the same time, studies investigating this phenomenon are almost entirely missing in East-European cultures. By means of 21 in-depth interviews with graduate students, this paper aims at identifying Facebook usage patterns related to the management of loneliness. To this end, the main focus of the research is to identify how and why Facebook is used / chosen in competition with other tools for the management of loneliness and to what extent communication with peers on social media differs from face-to-face communication. Findings show Facebook is largely used to combat loneliness. While it has positive effects on the well-being of active users that maintain a balance between social media and real life interactions, it negatively impacts passive users that spend an increased time on Facebook by heightening boredom and solitude feelings. In terms of uses and gratifications, Facebook is mainly used for communication, surveillance and entertaining purposes to address personal and social integrative needs.

RN11 | Session 07b Emotions, Politics and the State II: Parties & Politics

The Politics of Emotion: Class, Gender and Race within the European Radical Right

Josefine Eva Anna Landberg
Free University of Brussels (VUB), Belgium
josefine.landberg(at)vub.ac.be

How can the mobilization of emotions explain support for Radical Right Parties (RRPs)? And how are these emotions connected to the identities of radical right voters? This paper critically discusses the role of

emotions in the scholarly debate on European RRP. It concludes that the political science and sociology literature often refer to emotions linked to voters' identities as drivers for RRP voting. While emotions are essential for all politics, the reference to the role of emotions is particularly frequent in this debate. Despite even defining Radical Right politics through emotion terminology such as "politics of resentment", "losers of globalization", "angry white men" etc., what emotions are and what they do is left untheorized. It is further argued, that Affect Theory can contribute to our understanding of the role of emotions for Radical Right support. In combination with Intersectionality, Affect Theory can help us understand how these emotions shape voters' identities as well as their interconnectedness with the shaping of their perceived political interests. Not only, are these theories rarely applied to this scholarly debate, but it also makes a theoretical contribution to the understanding of the support for Radical Right politics. Moreover, they do not only contribute to our understanding of the motivations of predominant voting groups such as white men of lower middle class backgrounds. It also sheds light on the motivations of unexpected voting groups such as women and minorities who seemingly have little to gain from Radical Right politics.

"Revenge" as the product of "tactics of emotions": Turkey's failed coup and the experience of the masses

Ferhat Kentel
Istanbul Sehir University, Turkey
ferhatkentel(at)gmail.com

Turkey experienced a "failed coup d'état" on July 15, 2016. The regime, under the rule of President Erdogan's AKP (Justice and Development Party), took drastic "revolutionary-totalitarian" measures against the "betrayal of internal and external enemies" in the aftermath of the coup attempt. While these measures, are surely worth investigating, this paper deals with the direct involvement of a huge segment (at least 50 percent) of the Turkish society against the coup d'état, the physical resistance of thousands of people against the military tanks, and the eventual capture of these masses by the discourses used by the government. The frame of my paper will be the emotional formation of the attachment of the masses – mainly composed by the members, sympathisers and voters of the AKP and to some extent by those of the MHP (Nationalist Movement Party) – to the AKP/state discourses. Using a theoretical framework that combines Gaston Bachelard's *The Poetics of Space* and Michel de Certeau's *The Practice of Everyday Life*, I will try to follow the path of the "reverberations" and "tactics" of emotions, giving way to (or provided by) the radical emotion of "revenge" of the popular masses, against the so-called "arrogance" of the previous secular-Kemalist state politics. Relatively, I will try to show that these emotions of revenge are today consolidated and objectified in the personality of President Erdogan, incarnating the state, and consequently giving to the masses the ultimate force and the resulting

satisfaction of being recognised at the state level; and the indisputable attachment to the nationalistic rhetoric of “friend or foe”.

‘All responsible Finns, however, want to stop living on debt’: Generating emotions among citizens in the Finnish politics of austerity

Janne Mikael Autto, Jukka Törrönen
University of Lapland, Finland; Stockholm University, Sweden
janne.autto(at)ulapland.fi, jut(at)sorad.su.se

Finland has been considered as one of the Nordic welfare states with extensive social rights of the citizens. However, after the parliamentary election in 2015, the new Prime Minister Juha Sipilä declared a radical shift in national policy. His government introduced austerity measures to improve national competitiveness by reducing the public debt with savings of four billions euros in public economy. The austerity measures were estimated to fall especially on socially vulnerable groups of citizens. The policy shift aroused negative feelings, critique, protests and strikes among the citizens. The government, for its part, tried to justify the measures by appealing to people’s feelings, for example, by describing austerity as a joint belt-tightening effort as well as by stating that we cannot have public debt at future generations’ expense. The Prime Minister even held an unexceptional television speech in which he appealed to sense of responsibility of the citizens. In the presentation we analyse how the government tried to get acceptance for austerity measures by appealing to citizens’ emotions. In the analysis, we, first, pay attention to how the measures are emotionally motivated and how citizens should and should not feel about them. Secondly, we examine whether the three government parties with different ideological backgrounds (the Centre Party, the National Coalition and the Finns Party) attribute similar or different emotions to citizens. The presentation is based on the analysis of policy documents and political speeches. In the analysis we take influences from the theories on emotion, narrative and modalities.

Shades of Anger in Political Scandals

Monika Verbalyte
Freie Universität Berlin; Otto von Guericke University Magdeburg
monika.verbalyte(at)fu-berlin.de

Scandal is very often defined through the public moral outrage; however, the nature of this emotion in the scandal theories is barely ever really investigated. Even if some consensus already exists that not the severeness of the scandalized norm violation, but its medial representation and the strength of the scandalizing discourse determines the success of the scandal (Ehmig 2015; Kepplinger & Hartung 1993; Kepplinger 2012; cf. Thompson 2000: 16), emotional reactions of the scandal are still perceived as automatic and spontaneous. If we, though, precisely look at the discursive articulation of emotions, their

much more complex nature is revealed.

First, moral outrage is not the primary emotional reaction of the public, it is a result of emotio-discursive work. Second, emotio-discursive work towards moral outrage could be and often is contested by other possible emotional interpretations of events. Third, emotio-discursive work is a dynamic process with emotions articulated in it changing when the scandal progresses.

My analyzes of two German political scandals reconstruct the “career” of excitement and surprise to anger or disappointment depending on the acceptance of the responsibility attribution to the scandalized politician. Moralizing scandalization and embedding of this blame attribution into the normative discourses construct moral outrage, whereas questioning of moral reasons and good motives behind the scandalization contests its moral status and “degrades” to envy and resentment. In the longer run, when the more stable basis of emotions is needed, norm violation stops to be a one-time failure and is anchored in the personality of politician, scandalization turns into denunciation and starts to spread contempt and hate instead of anger.

RN11 | Session 08a Emotions, Politics and the State III: Post-conflict and Moral Emotions

The Politicization of Shame: Implications for Critical Education in Post-Traumatic Societies

Michalinos Zembylas
Open University of Cyprus, Cyprus
m.zembylas(at)ouc.ac.cy

Against a perspective of shame that would see it as something paralyzing, negative, and destructive, I draw out a different account of the politics of shame in post-traumatic societies. I explore the openings that are created for a productive politics of shame in the context of discussions surrounding critical education via tracing how different kinds of shame are evoked or rejected in collective imagination—both in politics and in education. My goal is to show that a rehabilitation of the political and ethical value of shame challenges the opposition between self and other, and that this act can be beneficial, particularly in educational settings. An effort to transcend the usual dichotomies around the pride/shame debate both in political and in educational discourses will tackle the cultural, political and educational uses of shame and help critical educators gain a deeper understanding of the meaning and implications of shame in critical education. The presentation begins with a genealogy of the politicization of shame in contemporary academic debates; then I give an example of a novel through which I attempt to articulate this constructive non-essentialist politics of shame: the example draws on J. M. Coetzee’s book *Disgrace*, and discusses how this novel constitutes a crucial site for bearing witness to the suffering and shame engendered by apartheid through inventing new forms of mourning and community. The presentation ends with a discussion of the implications of ‘pedagogies of shame’ in

education.

Dangerous emotions - the limits of responsibility - in the shadow of collective violence

Izabela Sakson-Szafranska
University of Warsaw, Poland
sara2000(at)hoga.pl

The 20th century was marked by numerous acts of killing, such as crimes on a massive scale. It is safe to assume that the present century won't be different. We'll witness actions which one of the objectives is to deprive the life another human being. In collective violence the fear of loss of security and of well-being coexist. Most of the mass violence acts are based on security dilemma, fueled by antagonistic emotions. It's important to believe that a group can't survive unless the "enemy group" is eliminated. Emotions are like fuel. They can energize and motivate people, set up social bonds, but also induce the commitment of acts of collective violence against "others". Emotions appear to be absolutely natural. People usually don't notice their social constructs and significance. People are prone to violence when they feel that in regulating certain social relations imposing suffering or death is necessary, legitimate, and ethically gratifying (it is justified). This is why it's much easier to manipulate individuals on an emotional level. The pervasiveness of violence alters the surrounding universe, breaks cultural framework and exceeds the social taboo. The questions of collective violence, changes in international/domestic law and in public awareness are analysed in relation to the role of emotions, concept of "moral panic" and so-called politics of fear. From perceiving the religious/ethnic groups as a threat, through the identification of an "enemy" as a radical and incrementally important security issue, to the social stigmatization of "others" as culturally foreign, defined as folk devils. These concepts will be discussed as a marker of the society moral boundaries, but also in relation to the law (Petrazycki Theory).

Revenge - an interactional analysis of emotional dynamics of violent justice seeking

Poul Poder
University of Copenhagen, Denmark
pp(at)soc.ku.dk

Violent revenge can be driven by moral emotions and seeking (re)establishment of justice. This paper explores the dimension of revenge which has generally been neglected in sociological analysis. Revenge has primarily been studied on the basis of interview with gang members having retaliated, or experimental data on attitudes as to when revenge can be considered legitimate or not. This study is based on a qualitative analysis of 20 cases drawn from a recent study of violence in public places. 16 % of 933 cases of violence (police files covering inner Copenhagen 2010-2012) were characterized by being fully or partly motivated by revenge understood as a proactive aggression applying violence in a payback

action considered proportional to the alleged misdeed. The analysis draws on court files documenting case of violence aiming at getting even and teaching the victim a 'moral' lesson, and on theories concerning interactional dynamics and how moral emotions such as anger, contempt or disgust can motivate revenge. The analysis shows how violent revenge is considered legitimate vis-à-vis moral offenses. While revenge is a calculated option it is, however, rarely carried out calmly as perpetrators seem carried away by the situational dynamics ending up acting more violently than they had pre-considered. The analysis also shows how revenge is pursued on behalf of either a) the perpetrator him/herself, b) another person, or c) on behalf of abstract moral values. In conclusion, future research needs to consider how moral concerns matter as violence is not merely driven by frustration, instrumental incentives or power seeking, but also how situational dynamics can undermine the motivating notion of a proportionate revenge.

RN11 | Session 08b New Methodologies for Researching Emotions

Reading Emotion from Textual Data: A Sociological Approach

Lisa Kalayji
University of Edinburgh, United Kingdom
l.kalayji(at)sms.ed.ac.uk

Textual data in the sociology of emotions sits at an under-examined intersection between documentary and emotions research methodologies. Few sociologists of emotion use documentary data, with most such research coming from historians. There are distinctive methodological questions confronting sociologists of emotion which need clear, practically applicable answers informed by sociological understandings of what emotions are. Drawing on ongoing research on the emotion culture of radical feminism through the independent radical feminist magazine *Trouble and Strife*, in this paper I will explore the methodological implications of a sociological analysis of the practice of feminist book reviewing. Through the emergence of a controversy in *Trouble and Strife* in 1986-87 around the way that feminists review books (closely followed by a separate but related one covered in a symposium on 'feminist book reviewing' in *Feminist Studies* in 1988), the hidden emotional dimensions of this practice are rendered visible. Proceeding from Ian Burkitt's (2014) conception of emotions as relational, Arlie Hochschild's (1979) account of their disciplining function through rules, and Harold Garfinkel's (1967) approach to examining social norms through their breach, the controversy illuminates one way that sociologists can find emotions in text where they are neither named explicitly nor implied through allusions to their somatic manifestations (Scheer, 2012). The development of this methodological approach can help researchers get to grips with what it is to read emotions from text, and increase uptake of the extensive and rich body of archival and secondary

data on emotions.

„Making Emotions Count“: (Self-)Measuring emotions

Sarah Miriam Pritz
University of Hamburg, Germany
Sarah.Pritz(at)wisu.uni-hamburg.de

For one thing, emotions seem to count these days. Contemporary modern western societies can be characterized by cultural transformation processes of emotionalization: Throughout many spheres of society emotions – so it seems – are held in high esteem.

For another thing, emotions are also made count(able) recently. There is a wide number of technological programs and apps that focus on (self-)measuring and (self-)tracking emotions. While some rely on specific kinds of standardized self-observation and self-logging of experienced emotions via various software interfaces, others claim to ‚objectively‘ record emotions from an external perspective through a range of sensors and analysis software.

My contribution will provide a critical assessment of contemporary attempts to “make emotions count”. My analysis will be guided by the following questions: What are the problems (of action) which are thought to be solved by emotional (self-)quantification? What kinds of promises are attached to it? And how does this refer to the broader sociohistorical context of contemporary western societies? What do the various efforts of (self-)measuring emotions exactly look like? What are the implicit concepts of emotion underpinning those techniques and what kind of understanding of emotions do they themselves produce in turn?

I will argue that by combining materialistic-rationalistic concepts of emotions with notions of the utter importance of emotional expressivity, the (self-)measuring of emotions – similar to other contemporary programs of emotion management (e.g. emotional intelligence) – contributes to generating a whole new understanding of emotions as phenomena that can be mentally chosen, formed, optimized and used for self-knowledge, self-fulfillment and personal success.

Expressive Creative Encounters: a strategy for sociological research of emotions

Adrian Scribano
CONICET, Argentine Republic
adrianscribano(at)gmail.com

Expressive Creative Encounters (ECE) are designed as spaces for the subjects to express and interpret their emotions in the context of social research. The expressiveness of the social subjects has always been a controversial issue for social sciences, because nobody can “live-within-the-other”. But the “development” and “improvement” of qualitative social research strategies incorporating the “expressiveness’ capture technologies” in a progressive yet steady way have been able to bridge the gap between what the researcher sees and what the subject expresses.

Creativity is taken as a starting point to produce expressive experiences where individuals “share” and interpret, both with the researcher and with others, in particular social conditions of existence, their sensations and emotions. At the ECE, three organizational units can be distinguished: moments of expression, expressive components and record strategies, which should be thought in a continuous interaction, communication and tension, establishing a flow of action.

Consequently, the argumentative strategy is as follows: a) First, a concise statement of what is meant by the relationship between expressiveness and creativity is presented, then b) the strategies used to address the aforementioned network of creativity and expression of emotions and sensations in qualitative research today is outlined and, finally c) a definition on what constitutes what we call the Creative Expressive Encounters (ECE) with examples of a specific application thereof is discussed.

Misrecognitive discrimination in public places

Martin Aranguren
CNRS, France
martin.aranguren(at)cnrs.fr

Misrecognitive discrimination (MD) is differential treatment on the grounds of membership in a socially salient social group (say, and ethnic group) that brings about inadequate recognition of the discriminatee.

The research program on MD covered in this talk relies on two types of field experiment in public places. The first type of experiment aims to identify subtle forms of discrimination; the second type seeks to assess whether the identified forms of discrimination are misrecognitive, i.e. deviate from socially shared norms of adequate recognition.

After clarifying the concept of MD, the presentation aims to illustrate the program’s rationale through two complete field experiments carried out in the Paris metro. The first study dealt with the discrimination of the Roma. Following a standardized scenario, a confederate actress asked for help to passengers on a metro platform in two conditions (dressed in a Romani skirt or in an unobtrusive style). The experiment revealed among others that passengers subjected the actress in the Romani skirt to a nonverbal pattern known as “visual dominance.”

The second study assessed whether this discriminatory behavior is also misrecognitive. The author pretended to be an interviewer and invited passengers on a metro platform to participate in an survey. Following a scenario, he enacted visual dominance in one condition but gazed “normally” in the other. The results indicate that visual dominance does have a misrecognitive effect on passengers.

Emotions are a key methodological resource in this program because felt misrecognition manifests in the experiences of shame and “humiliated fury.” The program combines the political theory of recognition, the sociology of discrimination, nonverbal behavior studies, and the affective sciences.

RN11 | Session 09a Emotions and Capitalism I**The Commodification of Intimate Fathering: Accounts of Love, Change and Emotional consumerism from Scottish and Romanian Fathers**

Alexandra Georgiana Macht
The University of Edinburgh, United Kingdom
alexandra.macht27(at)gmail.com

Both research and media discourses present the modern 'good' father's role as one of enhanced intimacy (Dermott, 2008), in which fathers' experiences of paternal love become foregrounded. Inspired by Arlie Hochschild's concept of 'commodity masculinity' (1983) and based on data from 47 qualitative interviews with Scottish and Romanian involved fathers of different classes, this article provides a tentative answer to the question 'How do involved fathers resist or embrace the capitalist culture of intimate life?' Previous research has argued that love is culturally-embedded (Padilla et al., 2007) and that in emotional capitalism, romantic love is a resource promoting consumerism and deeply affecting the creation of the modern self (Illouz, 2011). I argue that emotional capitalism influences the dissemination of expectations for intimate fathering, while paradoxically encouraging men's bread-winning practices in a globalized capitalist society. The quality of the father-child relationship is then influenced by practices of love which are performed through tangible commodities, but also resisted through intangible resources. Class seems to have a higher visibility in involved fathers' practices of love than culture, because fathers love by doing. Therefore the construction of the good/intimate father's role through consumption is essential in understanding how masculine emotionality is appropriated in capitalism.

As Long as the Music Plays...: discipline, emotions and financial markets

Erik Andersson
Univeristy of Gothenburg, Sweden
erik.andersson(at)globalstudies.gu.se

It is a misconception that speculative interaction on financial markets is driven by emotions and psychology. Emotions, however, are central for how finance relates to politics and to society. The purpose of this article is to disentangle the emotional dynamic between finance, politics and everyday life, between disciplined finance and the performative realization of a capitalist future. This is the dynamic that gets politicians like Trump and Le Pen elected. This (primarily) theoretical text starts by noting that financial values rest on a continuous materialization of expectations priced into financial instruments, but the fulfillment of these expectations takes place in everyday life. The triumph of neoliberalism became possible thanks to a convergence of the discourse of financial discipline and everyday life. Emotionally and socially one could formulate mundane experience and visions of the future in the same logic as financial

valuation. After the financial crisis, and the ensuing popular sense of loss, poverty, insecurity and abandonment, we see an end to this convergence of futures. The "deep story" (Hochschild 2016) of everyday life has become emotionally irreconcilable with the Wall Street future. Interview and media material indicate that this cognitive dissonance opens up for a wide variety of social and political responses, aspiring for emotional attachment to their respective futures. The conclusion is that capitalism is shaken by the divergence of a financial market disciplined future, and everyday life drifting further away from this future and its promises.

YOLO. Emojis and the economisation of emotions

Barbara Frischling, Ruth Dorothea Eggel
University of Graz, Austria; University of Graz, Austria
barbara.frischling(at)uni-graz.at, ruth.eggel(at)uni-graz.at

"How are you feeling today?"

This contribution focuses on the contextualization of different forms of emotional expressions in online contexts with a cultural analytical approach. Exemplified by "YOLO" and the practices surrounding emojis we seek to deconstruct the role of emotional expressions in the making of a subject. Emotional expression in online contexts can be read as both, the satisfaction of personal needs as well as the fulfillment of neoliberal imaginations of productivity.

Emojis allow for a „quick and dirty“, but also efficient, visual articulation of emotional states. As immediate expressions, emoji-practices also refer to the dynamics and immediacy of online digitally mediated communication. As visual representations of emotional expressions, which usually become visible through bodily expressions in situative contexts, emojis add an emotional layer to the digital communications repertoire: Engaging with online-content, they allow to show anger, love, sadness and happiness etc.

Looking at the users' perspectives, an actor-centered approach allows to emphasize the role of these micro-practices in the broader context of emotional politics. Forms of immediate expression of emotion do not only point to the needs and constraints of neoliberal subject-making, but can further be seen as crucial in online-negotiations of politics, worldviews, beliefs and therefore offer a critical moment of solidarisation and desolidarisation.

Valuing Emotions – Creating Registers of Worth

Uwe Vormbusch
FernUniversität Hagen, Germany
uwe.vormbusch(at)fernuni-hagen.de

It is widely known that capitalism fundamentally relies on its capacity to evoke desire for the world of commodities. But in an even more intricate way capitalism relies on the subjects' capabilities to collectively create and utilize their emotional luggage. But even if emotional competencies, motivation, mood and personal commitment are accepted as being

increasingly important for value creation and competition, there are no institutionalized systems for measuring them. The talk starts with the observation that this is not only a problem for capitalist organizations, but equally for the subjects themselves. In particular the growing class of auto-entrepreneurs and self-employed are forced to evaluate their emotional capital as one of their most important resources.

Furthermore, the talk argues that new forms of representing and calculating emotions are invented not primarily by the state, but by the subjects themselves. In order to make their immaterial capital visible, they are experimenting with new measures and scales. Through the example of quantified self-observation, known as the Quantified Self, the talk will show how formal representations of emotions are brought into being, thereby inventing new registers of worth. It will be argued that on the individual level numbers and calculations promise to give back control to individuals who are trying to overcome insecurities within crisis-ridden societies. On the social level, measuring emotions as part of the individuals' immaterial capital is turning the self into a measured self continuously striving for optimization and marketability. Therefore, self-calculation is part of a major shift in the way value is being made accessible and calculable in contemporary capitalism.

RN11 | Session 09b Emotions, Morality and Normativity

The emotionally reflexive construction of the new norms and etiquette of Internet dating

Mary Holmes, Chris Beasley
University of Edinburgh, United Kingdom; University of Edinburgh, United Kingdom
mary.holmes(at)ed.ac.uk,
christine.beasley(at)adelaide.edu.au

Internet dating is often characterised as a novel realm involving new rules and practices, but academic attention to the emotionally reflexive construction of its norms and etiquette has been limited. Using online accounts of experiences of internet dating we explore the development of new online dating norms as less individualised instances of innovations in social relations. The ways in which people in interaction navigate the technical and actual possibilities of internet dating are characterised as socio-historically situated, embodied and emotional. We propose that users engage in participatory negotiation and navigation of new norms. They do this via ethical considerations and discussions around how to do internet dating which are often done in interaction and infused with emotion. Thus, we can illustrate the continued importance of emotions in how social norms and practices alter in relation to large socio-historical processes and shifts in power relations.

“My Friend Who Never Let Me Down”: Ambiguous Emotions at Pet Cemeteries

Nora Schuurman, David Redmalm

Karelian Institute, University of Eastern Finland, Finland; Department of Sociology, Uppsala University, Sweden

nora.schuurman(at)uef.fi, david.redmalm(at)soc.uu.se

Pets are liminal creatures: they are regarded as friends and family while they are, at the same time, considered to be belongings. Violence against pets is highly socially stigmatizing in most contexts, but at the same time, owners of companion animals may choose to end their pets' lives without facing legal charges. There is a general idea, present both in research and popular culture, of a widespread norm against strong emotional responses to the passing of a pet. The reason would be that pets are not considered fully human, and grieving pets in a way similar to human mourning would challenge the boundary between humans and other animals. Yet, there are numerous products and services specifically designed for bereaved pet owners: condolence cards, bereavement counseling, popular psychology books—and pet cemeteries. Through an ethnographic study of pet cemeteries in Sweden, Finland and Norway, we show how pets' ambiguous status is conveyed through tombstones, decorations and the practices of cemetery visits. Relying on photographs, field notes, interviews with key informants, and the studied pet cemetery organizations' documentation, we explore the material and meaning-making practices that make these places possible. We suggest that these spaces enable a double sense of pets' life: pets are simultaneously grieved as human-like friends and family members through anthropocentric gestures, and as nonhuman others through innovative and norm-challenging ways of grieving. Drawing on Judith Butler's writing on grief, and Giorgio Agambens' conceptualization of “the animal,” we discuss how practices at pet cemeteries convey abstract and sometimes ambiguous understandings of what life is.

Emotions, normative judgments, and argumentation: contrasting the cognitive logic of envy with that of indignation

Frédéric Minner
Institut for Sociological Research (ISR), Swiss Center for Affective Sciences (CISA), University of Geneva, Switzerland
frederic.minner(at)unige.ch

What are the motivational bases that help explain the various normative judgments that social agents make, and the normative reasoning they employ? Answering this question leads us to consider the relationships between thoughts and emotions. Emotions will be described as thought-dependent and thought-directing, and as being intimately related to normativity. They are conceived as the psychological grounds that motivate social agents to articulate their reasoning with respect to the values and norms they face and/or share in their social collective. By empirically contrasting the cognitive logic of envy with that of indignation, I will defend that, by virtue of being modes of thinking, emotions generate cognitive

activities related to the making of evaluative and deontic judgements, the utterance of speech acts, the mastering of normative concepts, and the building of arguments. I will then show that each type of emotion generates its own constitutive judgements and structures normative thinking according to its own logic. My main thesis is that emotions provide sociological explanations for social agents' thinking, for emotions are precisely what motivate and, especially, structure normative thinking. In short, emotions allow us to explain how social subjects reason and argue through norms and values.

Heads Will Roll – Violence as an Emotional Practice of Morality

Madeleine Rungius

University of Liverpool, United Kingdom

M.Rungius(at)liverpool.ac.uk

The Enlightenment critique for humane punishment inspired ideas for sanctioning away from the public “theatres of punishment” and public spectacle, towards invisible sanctioning behind the new architectures of the state from the mid-19th century (Foucault, 1975). The ‘invisible’ guillotine symbolically heralded the start of the modern age, an era that is profoundly shaped by new sensibilities and emotions towards the taming of violence (Elias, 1978). In modernity violence is confronted with enormous pressure to demonstrate legitimacy since violent actions are commonly seen as morally wrong, as actions that are only connected to the darkest of human nature and wayward emotions.

In sociology there remain significant ambivalences in the analysis of the role of emotions in relation to violence and social ordering (although Elias, Mestrovic, and Katz provide exceptions to this). Looking at the emotional practice of guillotining (Scheer, 2012) promises new insights in the distinct normative constitution of modern societies towards violence. This paper looks into the emotional practices and punishment as integral, inseparable and as a sense-making part of reality that shows the interdependencies of emotional practices and social ordering and its consequences for societies' norms and morals. Far from heralding a shift to a ‘civilized’ (as a less emotional, less violent and more rational) era, this paper focuses on the imagination of modernity a “violent-averse era” that never-the-less augments emotional processes that continue to play a role in orchestrating, legitimating and targeting violence as a means to social ordering. In investigating these paradoxes of modernity I will develop the work of Scheer, Sofsky, Mestrovic and Elias to illuminate the role of violence, morality and its emotional support structures within rational, modern punishment structures.

RN11 | Session 10a Emotions and Capitalism II

Mapping the happiness industry: how emotion is manufactured, sold and bought

Alberto Martín Pérez, José Antonio Rodríguez Díaz,

Josep Lluís Condom Bosch

University of Barcelona, Spain; University of

Barcelona, Spain; University of Barcelona, Spain

martinperez(at)ub.edu, jarodriguez(at)ub.edu,

jlcbosch(at)ub.edu

This paper will present the initial results of the three-year research project “The happiness industry: innovation and demand of an emerging sector” (2017-19) funded by the Spanish Ministry of Economy and Competitiveness and developed by researchers of the Sociology Department of the University of Barcelona. The paper will address the methodological issues and provisional results of a web survey on the creation, production and marketing of all sorts of products explicitly involving happiness or paths towards its achievement. The main goal of this stage of the project is to attain a clear delimitation of what can be called the happiness industry: an emerging productive sector in postindustrial societies as well as a particular expression of the current tendencies of production and consumption in contemporary capitalist economies. Theoretically, this research is based on the understanding of happiness as a social product that can also be manufactured, marketed, sold and bought. This goes beyond a common definition of happiness often focused on the operationalization of ideas of life satisfaction and subjective wellbeing. This approach also challenges a vision of emotions as a sole psychological matter, already largely questioned by the sociology of emotions since Hochschild's approach to the commercialization of human feelings. Through a worldwide exploration of websites and social media our research will stress the growing importance of happiness itself as a commercialized product as well as an added value of many other consumption products in our societies.

Production of “Caring Women”: An Affective Investigation

Dilan Eren

Bogazici University, Turkey

dilaneren3(at)gmail.com

The social value of the practice of caring goes beyond what is done and depends on how it is done. In this sense, a “better” caring concerns emotional and affective involvement more than the content of the work. The production becomes the product of the practice of caring which corresponds to production of subjectivities: caring practices produce the “caring women” as an embodied subjectivity for the women involved.

Given the demographic changes and the increase in women's labor force participation, care deficit has been an emergent issue on the governmental agenda in Turkey. Methodologically informed by affect theory, this presentation investigates production of “caring women” in terms of mobilization of their bodies and conservation of their bodily capacities into caring. This discussion concerns the mobilization of laborer bodies of women into caring bodies with respect to both the recent governmental regulations enacted in Turkey

regarding redistribution of women's productive capacities between family and the market, and the circulation of emotional referents as a vital ensuring mechanism.

Since "caring women" bodies will be considered in terms of their interaction with their surrounding bodies, constructed through each encounter, the question of the "environment" becomes crucial as the plane of encounters in this discussion. This is the sense that the "environment" will be examined in relation to the governmental regulations (i.e. laws) and affective discourses (i.e. valorization of sacrifice and love) both of which function to structure and ensure the "biopolitical availability" of women to become "caring women".

Worried Winners: Political Emotions among the Wealthy Elite

Anu Kantola

University of Helsinki, Finland

anu.kantola(at)helsinki.fi

The managerial upper class that occupies commanding positions in the sphere of economics is a crucial group in any society because it has a strong influence on how society works. Studies of these elites often see them as a powerful group of prestige in command. Recently, however, there has been a surge of more refined research on elites as globalization has set the wealthiest upper classes into turbulence. Many at the top have seen their incomes escalating, while at the same time their work practices and elite cultures are in flux (e.g. Ward 2011; Hay 2013; Salverda & Grassiani 2014; Birtchnell & Caletrío 2015). This paper builds on this research and explores the political emotions of the managerial upper class: successful Finnish managers who belong to the richest 0.1% of society. By drawing from semi-structured interviews with wealthy managers, this paper taps into their lived experiences and explores their political feelings towards society and other classes. This paper shows the subtle ways in which the feelings of the wealthy managerial class help to build and sustain a stable self-identity amid on-going social and political turbulence. As globalisation and financial turbulence create a permanent sense of emergency, the political emotions of the wealthy elite—especially belonging, solidarity and resentment—are rewritten. The wealthy elite expresses managerial optimism and can-do feelings concerning their own work and actions, yet they simultaneously see society and its classes in more dismal terms and express their resentment and frustration towards the "lagging" classes.

RN11 | Session 10b Collective Emotions and Identity IV

United in outrage: from a 'moral shock' to affective solidarity during Polish Women's 'Black Protest' of October 2016

Maja Sawicka

University of Warsaw, Poland

m.sawicka(at)is.uw.edu.pl

Emotional underpinnings of collective action are widely acknowledged in the field of sociology of emotions. One of the most persuasive models of the role exercised by emotions in the collective mobilisation was presented by James Jasper in his theory of 'moral shocks,' that is highly affectively loaded situations or events which become an emotional stimulus, inclining individuals towards political action.

In my presentation I employ the Jasper's model to analyse the course of events during Polish Women's 'Black Protest' (3 October 2016): a massive nationwide wave of demonstrations against a new draft of abortion bill, more restrictive than the regulations already in force. Based on empirical analysis of narratives of the participants I reconstruct the trajectory of the 'Black Protest,' identifying the 'moral shock,' which inducted the events, emotions it activated, the rise of a collective identity which emerged during the 'Protest,' and its decline afterwards.

I claim that although Jasper's model properly indicates the key importance of strong emotional impulses as triggers of individuals' engagement in collective action, it does not expose the interactional mechanisms through which given collective identities emerge, and are maintained. In the analysis that follows I highlight the role of emotional display, and emotional communication among the participants as a factor which enables a mutual identification as members of a 'we-group,' and emergence of a collective solidarity based on a shared affect. I demonstrate that such affective solidarity persists only as long as members of the group succeed in communicating and sharing emotions.

Beyond Cognitive Praxis: Decoding the affective aspect of protest participation

Dionysios Mitropoulos

Birkbeck, University of London, United Kingdom

dio.mitropoulos(at)gmail.com

During the last few years, waves of protest and/or social movements emerged all around the globe, such as the Spanish 'Indignados', the Occupy movements, and the Greek 'Aganaktismenoi'. These mobilisations have been accused of having a strong emotional character, being apolitical and dispersed while lacking a specific political agenda. A number of scholars, despite the impact of the 'affective turn' on social movement theory, mostly following rationalist approaches, argue that these protest events/movements are unable to influence parliamentary politics and achieve solid social change. Following their analysis, emotions are perceived as 'means' to mobilise people, in any other case emotions are considered as dangerous for deliberative democracy. However, these mobilisations were very passionate, emotional and popular, lasted for an extended period of time and attracted numerous participants on everyday basis. Hence, on the one hand, the above mobilisations challenge the

perception of emotions as merely instrumental, and on the other hand, challenge the distinction between emotions/affect and reason.

This paper attempts to briefly present a critical reflection on the theoretical implications of the above two issues with concern contemporary social movement theory. The paper will argue that research of social action needs to go beyond the Cartesian division between emotion and reason, and also reconsider the perception of emotions as negative. Finally, the paper will provide evidence on the transformative and mobilising power of affect and emotions which derived from an ongoing empirical qualitative research on the case of the Greek Aganaktismenoi.

Guilt and Redemption During War and Divisions- The Case of the Vegan Movement

Sharon Avital

Tel-Aviv University, Israel
rhetoricavital(at)gmail.com

With over 13% of the population of Israel becoming vegan in the past five years, the campaign for veganism can be seen as one of the more successful campaigns in recent history. This transformation is especially puzzling due to the stagnation of political activism in Israel. This paper asks what enabled this massive transformation and identifies a few sociological and rhetorical elements: The immense protests against the establishment and corporate power of 2011 and the despair that followed their failure; The growing unrest in neighboring ME countries; The influence of popular new age practices such as yoga that promote a healthy life style and nonviolence; And, the successful exploitation of emotions, mainly guilt coupled with a heavy focus on the remedy offered for alleviating said guilt in the form of veganism.

Speakers and activists successfully framed animal suffering as “holocaust,” and “slavery” – terms reserved until recently for humans only. By doing so, they were able to transform conventional hierarchy in which man is superior to animal. Moreover, they were able to tag the same massive corporate power known as responsible for the erosion of the global middle class as responsible also for said “holocaust.” Consequently, the campaign evoked familiar feelings of anger and guilt but channeled them into action. People who were eager to act but frustrated with the local and global politics were able to single out clear evils and a just answer in the form of veganism.

Behind the visible: ‘normalization’ in the Republic of Cyprus

Vicky Karaiskou

Open University of Cyprus, Cyprus
v.karaiskou(at)ouc.ac.cy

This paper will focus on the interaction between visuals and language in public space. It will apply the concept of normalization in conjunction with the role recurrent images and written texts hold in collective

memory and identity. It will use as case study the Republic of Cyprus and will focus on the visibility of collective memory – such as newspaper clips, memorials, signs, photographs, mottoes – in everyday life.

Visibility is a social construct inextricably linked to a certain cultural context. Foster described the term as the process of “how we see; how we are able, allowed, or made to see; and how we see this seeing or the unseen therein” (in Mirzoeff 2006, 55). Foucault, in *The Order of Things* points that we are “governed and paralysed by language” (1994, 297). Neuroscientists and psychologists underline the interrelations among memory, identity and images. They argue that our memory is “essentially reconstructive” (Damasio, 1994, 100) and susceptible to emotion (Dillon et al. 2007); that visual stimuli are more efficient than linguistic in creating reactions (Zajonc 1980); and are pivotal in memory-making process because they render experience tangible.

In the Republic of Cyprus ‘normalization’ is the result of the disciplinary power visibility holds. The paper will maintain that the manifestations of that visibility exploit collective memory and emotions; build identity awareness; support political rhetoric; cement official stances about us and justify the cultural barriers with the other; align perceptions and reassure participatory behaviors among the Greek Cypriots.

RN11 & RN13 | Session 10a JOINT SESSION: Emotions in Families and Intimate Life I: Intimacy and Care

Three emotional stories of daily family life: children, mothers and fathers

Johanna Kristiina Mykkänen, Marja Leena Böök
University of Jyväskylä, Finland; University of
Jyväskylä, Finland

johanna.mykkanen(at)jyu.fi, marja.leena.book(at)jyu.fi

Contemporary everyday family life is a joint venture with contradictions, complexities and ambiguities linked to parents’ and children’s everyday lives. Each family member daily experiences various emotions that are both cultural artefacts and highly subjective.

Emotions in family and daily life are important because they tend to spread to other members of the family and influence the collective family atmosphere. Because everyday life is filled with emotions in constant flux from positive to negative and vice versa, the emotional work family members perform in recognizing others’ needs and taking responsibility for them is crucial for a smooth-running family life. How do different members of a family experience and narrate their daily life – and especially the emotions in it? This study focuses on the perceptions of children, mothers and fathers, while also revealing insights into cultural beliefs and prejudices.

Interviews were conducted with six nuclear and three divorced families, and each participant (n=18) was interviewed twice. The second interview was a photo-narrative interview, for which each participant took photographs pertaining to their daily life (n=352).

Content and narrative analysis were used as methodological approaches. We constructed three types of emotional narratives of the informants' daily lives. Each type consisted of a gamut of emotions from joy and happiness to sadness and anger. Polarized descriptions of daily family life, in which you could be alone or with other people, or exhaust or empower yourself, were commonly given.

„I never pictured that in this way!“ Birth experiences in the family – by fathers and siblings

Inés Brock

MAPP-Institute, Germany

inesbrock(at)hotmail.com

The experience of giving birth to a child is one of the most emotional events in life for most families. But there are only few studies about the special feelings of fathers during birth and not any knowledge about siblings' attendance during or near the delivery.

The aim of the qualitative case study was to create a hypothesis about the participants' expectations and the forming of this mutual event. The question was to generate data about fulfilling this and which barriers and obstacles were perceived. The probands were interviewed within a narrative approach. They associate freely after a comprehensive narrative impulse about their ideas and emotions about the background and the processing. Based on Grounded Theory there could be found some contrasting types and items. Normal births as well as caesarean sections were included. The variability could be broadened because of looking at families with more than one child as well as couples with first-births.

Especially the circumstances of a need-orientated birth should be applied for fathers and the involved siblings too. In summary the bonding and further attachment to the newborn depends on it and will be encouraged when there is an open-minded family climate and when the esteem for one another is high. A remarkable result is that the experience of birth is not only an emotionally strong event but also a well-remembered experience. That leads to an intensive self-reflection about the family relations and gives the opportunity of integrating infants into their family very fast.

Home Full Of Feelings: The Emotional Map Of Home

Małgorzata Kubacka

Adam Mickiewicz University, Poland

kubacka1malgorzata(at)gmail.com

The aim of my presentation is to show how social individuals organise their experience of home referred to as an 'emotional warehouse' (C.Gurney), a place where feelings or sentiments are retained and managed in relation to social rules. The presentation is based on the results of qualitative research project.

The emotional map of home might be characterised by several features. It is temporary and constantly re-created. It does not utterly coincide with the 'real' map understood as an accommodation plan. It determines

day-to-day routine and 'practices of inhabitation' (M.Jewdokimow). Although this map is under persistent changes, the borders and places overlap with each other, it does not mean that the existence of it is equivocal.

There are several areas consist of the idea of home as an emotional place. There are places of socialisation and de-socialisation. Here the concepts of 'being together' and 'being apart' are realised, here social bonds are created and devastated as well. There are also places of divestment where the 'divestment rituals' (G.McCraken) are conducted and cursed places equated to prison or hell. Third kinds are empty, meaningless places where nothing emotionally relevant happens, but where day-to-day routine maintaining is maintained.

All of these places create an emotional map of home. Home which is not only a space where people sleep, eat, and lead their lives. Emotional map of home consists of many parts, many 'real' places, rooms and even many other houses known from the past. Feelings could be seen not only as an empirical indicators of biological arousal but as factors that influence the manners of usage home space which is related to broaden cultural changes of social order.

RN11 & RN13 | Session 11a JOINT SESSION: Emotions in Families and Intimate Life II: Separation and Crisis

High conflict divorces: typology and determinants

Inge Pasteels, Kim Bastaits

PXL University College, Belgium; PXL University

College, Belgium

inge.pasteels(at)pxl.be, kim.bastaits(at)pxl.be

In the 1980's, divorce mediation was introduced as an alternative for courts in order to come to an agreement after divorce. Many years of practice clearly showed that mediation could benefit from ex-partners' capacity to contain emotional distress and focus on children's needs, from some history of parental cooperation and from acknowledgement for the value of the other parent to the child. On the other hand, the usefulness of mediation has been doubted in case of high conflict. More recently, impasse-directed mediation has been suggested as being more appropriate in disentangling the divorce-transition impasse in order to avoid high conflict divorces characterized by individual or family dysfunction. However, clear indicators that distinguish these high conflict divorces or so called "failed" divorces from others haven't been revealed yet. First, this study aims to shed light on emotional (previous conflict and relationship quality) and structural factors (current level of contact) of divorce and introduces a typology of divorces from the ex-partners' perspective using latent class analysis. Preliminary results using the Divorce in Flanders data (2010) show that six types of divorces can be distinguished from which four are characterized by conflict. Second, determinants of high conflict divorces will be revealed using multinomial logistic regression. Preliminary results suggest that having more or younger children

increases the likelihood to experience a high conflict divorce, that support of family members can worsen the conflict and that the emotional structure of the relationship is crucial to predict conflict levels of divorce.

Regretting motherhood? Motherhood and life satisfaction since the 1980s

Klaus Preisner, Franz Neuberger
University of Zurich, Switzerland; German Youth Institute, Munich
preisner(at)soziologie.uzh.ch, fneuberger(at)dji.de

In 2015 Orna Donath published the results of her qualitative study "Regretting motherhood". She claimed that nowadays mothers reported ambivalent feelings – loving their children, but also regretting to be a mother. The study received extensive media coverage, provoking the impression that – first – motherhood considerably lowers life satisfaction, and – second – that this a new phenomenon.

However, the question why mothers' feelings of regret should unfold today more than in earlier decades remains unclear. One might even assume the opposite. On the one hand, non-mothers are increasingly accepted. On the other hand, motherhood comes along with more opportunities and life choices than in the 20th century. For example, nowadays mothers are more likely to proceed their professional careers while fathers and professionals provide care for the children. Against the background of greater life choices, there may be less ambivalences and feelings of regret among mothers. In this line of thought, today mothers should report even higher life satisfaction than mother in the 1980s and 1990s.

In this paper we analyse the relationship between motherhood and life satisfaction since the 1980s in Germany. How does the transition to motherhood affect life satisfaction? Does this relation change over time periods? How can we explain possible changes in the impact of motherhood on life satisfaction? We use data from the German Socioeconomic Panel (1984 to 2014) and fixed-effects longitudinal models to capture the time-contingent effects of motherhood.

Un-Coupling and Emotions. Dynamics of Parting

Eva-Maria Bub, Judith Eckert
TU Darmstadt, Germany; TU Darmstadt, Germany
evamariabub(at)gmail.com, eckert(at)ifs.tu-darmstadt.de

Trends in reference to couples and separation are well known. But what do we know beyond the numbers? What exactly happens with one another during and after a separation? It is this gap and the intention not to take separations for granted that has induced several authors to publish studies with focus on the process of separations (e.g. Vaughan 1986; Fine/Harvey 2007). This process-oriented perspective also informs our qualitative interview study "Couples after Separation" (2016-2018) conducted in cooperation with Cornelia Koppetsch. Still quite often the analysis starts with the end of the relationship,

whereas we wonder if there is a connection between the dynamics of the parting and the dynamics of the relationship. Furthermore, the few studies in this context focus only on one ex-partner. Challenging this one-sided view, our research design combines the perspectives of both ex-partners. Based on our material we would like to discuss the following questions: When does separation start and when does it end? Are couples ever un-coupled? And if yes, among which circumstances? Are there different norms of partnership, solidarity, trust, and loyalty negotiated in terms of the separation? How are they linked to emotions? How does one another feel? And what do these emotions tell us about the process and dynamics of parting? Are there social differences?

Additionally there are also some methodological issues to discuss: For instance how to deal with different versions of the same events? What are the respective speaker roles and how do they influence the storytelling?

It is our intention to bring together the two fields of research - emotions and intimate life - which, so far, have been seldomly linked.

RN11 & RN13 | Session 11b JOINT SESSION: Emotions in Families and Intimate Life III: Friendship and Romantic Relations

The female complaint as an expression of affective inequality in couple relationships

Tiina Sihto, Annukka Lahti, Heidi Elmgren
University of Jyväskylä, Finland; University of Jyväskylä, Finland
tiina.sihto(at)jyu.fi, annukka.lahti(at)jyu.fi, heidi.elmgren(at)jyu.fi

Couple relationships are often regarded as the most important relationships in adults' lives. Romantic relationships are charged with strong hopes and expectations regarding happiness, emotional closeness and equality. Yet, couple relationships can also be a great source of disappointment if these hopes and expectations are left unfulfilled. In romantic heterosexual relationships, the changes in gendered ways of being in relationships have been slow. Domestic work, care and emotional work are often unequally divided, and left as the women's main responsibility. This asymmetry leaves especially women dissatisfied in their relationships.

In our presentation we focus on the discontent emerging in heterosexual relationships, expressed through 'the female complaint'. Researcher Lauren Berlant employs this concept to illustrate how women use mutual complaining to deal with the unfulfilled cultural promises of closeness and reciprocity in heterosexual relationships. When the expectations of an equal heterosexual relationship are not fulfilled, e.g. when men do not do 'their share' of domestic work, the disappointments are channelled into the female complaint. Female complaint is the flip side of the romantic, sentimental culture, and in the end, doesn't question the existing gender hierarchies but rather maintains them.

Our research draws on two sets of data: longitudinal interviews with bisexual women and their (ex-)partners and two focus group interviews with mothers of young children. Our analysis shows that utilizing the concept of female complaint, it is possible to make visible women's discontent and the ambivalent attachment to unequal heterosexual relationships and also search ways out of these structural inequalities in relationships.

Friendship, personal communities and emotional capital

Verónica Policarpo
Universidade de Lisboa, Portugal
veronica.policarpo(at)ics.ulisboa.pt

In what ways are friendships structured by emotions and affects? And how do they contribute to shape the emotional capital of individuals? In this presentation I try to answer these questions, exploring the place of friendships in contemporary configurations of family and intimate life. I draw on qualitative data from 30 in-depth interviews conducted in Portugal, to 30 women and men, aged 21-65, from various socio-economic backgrounds, and living in urban contexts. In these interviews, participants were asked to reconstruct their personal community, understood as the active and meaningful personal ties they consider to be central in their lives, and to explore, in-depth, the histories, meanings and relational practices amongst its members. Crossing contributions from different theoretical traditions (sociology of friendship, relational sociology, theory of practice and affect theory), I argue that friendship practices are crucial to structure affective practices (Wetherell 2012). Not only are they unequally distributed according to different sets of capital and resources, but also substantially contribute in building essential emotional capital for individuals to navigate the emotional complexity of contemporary social environments. Moreover, I argue that friendship relations may intrinsically enhance (or limit) these resources and consequently mitigate (or exacerbate) such inequalities. In this sense, friendship relations may be construed as affective communities (Walkerdine, 2009), contributing to accumulation of a capital of resistance that enables the affirmation and emancipation of subjectivity in contexts of imbalanced power relations.

The Intimate Trial: Couple Interactions during Premarital Abortion in North China

Ruby Lai
The Chinese University of Hong Kong, Hong Kong
S.A.R. (China)
rubyslai(at)gmail.com

Previous researches show ambiguous impacts of abortion on an intimate relationship and often overlook the dynamics of the actual interactions between a couple. Based on ethnographic observations and 62 in-depth interviews with women who have experienced premarital abortion in Shandong, China, this study seeks to synthesize the analytical

framework of abortion and intimacy and explicate the complexity of couple interactions during the course of pregnancy termination. The paper demonstrates how women expect, perceive, interpret and respond to their male partners' actions, analyzing how these interactions may, in turn, reshape the relationships. Conceptualizing abortion as the "intimate trial" of a romantic relationship, it depicts five major events that generate multiple meanings and interactions during an abortion: the immediate reaction to pregnancy, decision-making, medical assistance, care-taking and financial contribution. Based upon the interviewed women's narrations and the author's first-hand observation, the findings reflect the autonomy aborting women exercise through making reproductive and relational decisions; they also reify the collaborative role of men play in pregnancy termination as they show men's constant physical, emotional and financial involvements at different stages. The paper not only illustrates the interplay between abortion and intimacy by revealing how prevailing gender ideologies and courtship norms permeate couple interactions during an abortion, but also mirrors the changes in youth's sexual, dating and marital culture, as well as the reconfiguration of gender relationships under vast socio-economic restructuring in contemporary China.

RN12 - Environment and Society

RN12 | Session 01a Social Theory and the Environment

Essentialism, Marx and Metabolic Rift: A Precarious Foundation for Environmental Sociology

Paul Joseph McLaughlin
SUNY Geneseo, United States of America
mclaughp(at)geneseo.edu

Meeting the United Nations' Sustainable Development Goals will require scholars, policy makers, activists and citizens to address multiple social, political, economic and environmental challenges. To succeed, these efforts must be informed by post-exemptionalist theories capable of conceptualizing the interactions between social structures, human agency and biophysical environments. Ironically, it is the idea of development itself--specifically its essentialist underpinnings--that is the primary impediment to constructing such theories. Current attempts to ground environmental sociology in Marx's analysis of capitalist metabolic rifts demonstrate that sociologists have failed to learn this lesson. I explore this claim and propose a more nuanced assessment of Marx's potential contribution to post-exemptionalist theorizing by employing recent revisions to the standard account of the Darwinian revolution as a metatheoretical lens to illuminate the strengths and limitations of Marx's incipient environmental sociology. These comparisons support Catton and Dunlap's contention that Marxian theory is unecological. However, they also establish the metatheoretical basis for and precise limitations of recent claims to the contrary. Marx succeeded in partially integrating the environment into social theory by relying, not on property essentialism, emphasized in the standard account, but on functional-developmental essentialism. Marx used the latter in his definitions of human nature and modes of production to emphasize the centrality of environmental relationships and the universal necessity of adaptation. However, functional-developmental essentialism's commitment to frame-invariant--i.e., context-independent--dynamic laws is incompatible with contemporary ecological thinking. These deficiencies preclude Marxian theory from serving as a foundation for a comprehensive environmental sociology.

Investigating metabolic flows of cities: a sociological perspective

Alessandro Sciuolo, Dario Padovan
University of Torino, Italy; University of Torino, Italy
alessandro.sciuolo(at)unito.it, dario.padovan(at)unito.it

The relevance of cities in defining the processes that could drive contemporary society towards a sustainable future has been gaining attention for the last decades in the scientific as well as in the political field. While representing a remarkable part of the problem cities may in fact play a crucial role in designing possible solutions, thus configuring themselves as sustainable multipliers.

Urban metabolism is the most effective conceptual framework adopted in ecological studies to define, investigate and measure the environmental impact of the urban systems. The framework has been so far operationalized by the adaptation of diverse methodologies borrowed from different scientific traditions: biological and ecological studies (Emergy, Material Flow Analysis), economics (Input-Output Analysis), engineering (System Dynamics). The strength of the metabolic metaphor stands in the opportunity provided for the definition of the boundaries of urban systems and for the qualification and quantification of the flows of material and energy that they produce. The weakness is the dramatic underestimation of the social component connected to the origin and shaping of these flows, which is precisely the component that distinguishes cities (as social systems) from other systems.

By recalling some of the stimuli offered by the sociology of flows as proposed by John Urry and revised by Mol and Spaargaren, the paper provides a theoretical integration of the current metabolic approach, in order to take into account the social origin and (de)regulation of urban flows. The goal is to offer a contribution to the disclosure of the black-box of the social and economic processes that stand behind the metabolic performance of contemporary (and future) urban systems.

Tensions in hives: bees between diversity and standardization

Lucie Dupré, Fortier Agnès, Alphandéry Pierre, Labatut Julie, Dussy Dorothée, Faugère Elsa, Césard Nicolas
INRA, France; INRA, France; INRA, France; INRA, France; CNRS, France; INRA, France; MNHN, France
lucie.dupre(at)inra.fr, agnes.fortier(at)ivry.inra.fr, pierre.alphandery(at)ivry.inra.fr, julie.labatut(at)toulouse.inra.fr, ddussy(at)ehess.fr, elsa.faugere(at)inra.fr, nicolas.cesard(at)mnhn.fr

Beekeeping has rarely been studied by social scientists despite the strategic issues this activity represents on the environment. French beekeeping refers to any diversified situation in terms of bee breeds, beekeeping practices and knowledge or on the status of beekeepers. Three quarters of the honey is produced by a minority of beekeepers identified as "professionals", while the majority of beekeepers are called "amateurs". We will aim to describe the tensions between the inherent diversity characterizing

beekeeping and the rationalization of this sector through a “National Sustainable Development Plan” implemented in 2013. We’ll address this issue focusing on hives renewal practices. Since the 1990s, rising bee mortality has led beekeepers to renew their hives far more frequently and to diversify their renewal practices: collecting swarms, buying queens, using insemination, etc. This raises questions about bee breeds, genetic diversity and the cognitive and discursive resources. Our research is based on interviews conducted in specific places of France. We question if the diversity of hives renewal practices can refer to the distinction usually made between “professional” and “amateurs”. Our hypothesis is that the reality goes beyond this binary opposition and refers to different relationships with nature and conceptions of beekeeping. Finally, we enquire if such a diversity of practices can take place with the ongoing restructuring of the sector which tends to encourage standardization.

GARCH model to estimate the impact of sociodemographic characteristics and CAP on agricultural greenhouses emissions

Vanessa Zorrilla-Muñoz, Maria Silveria Agullo-Tomas, Marc Petz, Esteban Agullo-Tomas
Institute of Gender Studies (IEG) and Department of Social Analysis; Carlos III University of Madrid (UC3M). Getafe, Spain; Institute of Gender Studies (IEG) and Department of Social Analysis; Carlos III University of Madrid (UC3M). Getafe, Spain; Department of Economy; Carlos III University of Madrid (UC3M). Getafe, Spain; Psychology Faculty; Oviedo University. Oviedo, Spain
vzorill(at)ing.uc3m.es, msat(at)polsoc.uc3m.es, marc.petz(at)gmx.net, estomas(at)uniovi.es

Purpose: This research proposes to analyse the Common Agricultural Policy (CAP) focused on agricultural emissions in Spain regarding sociodemographic characteristics (age & sex). Spanish CAP covers emissions regulation based on the application of environmental friendly ethics according to the EU-ETS and multifunctional aspects in agriculture (land use such as soil and energy management).

Methodology: The analysis of the Spanish legal rules and policy identified empirical environmental attitudes which are provided by the EUROSTAT and MINETUR database between 1990 and 2013. The developed empiric-analytical GARCH model measures the impact between the environmental attitudes (e.g. soil and energy management indicators per capita based on CAP) as independent variables and emissions and population (e.g. total population, age interval, sex) as dependent variables.

Results: The research findings demonstrate high significance between emissions per age interval, sex and, total population (dependent variables) and pesticides, fertilizers, non-renewable energy consumption, and the use of new machinery per capita (independent variables). The variable “use of new machinery per capita” does not influence directly

the reduction of emissions.

Conclusions: The model tests environmental behaviour by consideration of agricultural populations and sex. The model provides a good estimation for discussion about future policy trends (i.e. 2020 and 2030 strategies for EU), EU’s long-term objectives for Rural Development Policy related to CAP principles (e.g. fertilizers, pesticides land use and energy consumption in crops), and, active ageing (retired agricultural elder population extending their work life). Finally, we find a gender gap to review in relationship of environmental attitudes in future proposals.

Untangling indignant radical imaginaries: commons, ecologism and autonomy

Viviana Asara

Vienna University of Economics and Business, Austria
viviana.asara(at)gmail.com

This paper analyses the social natures engendered by the Indignados movement. Taking the case study of Barcelona, it follows the movement’s evolution after the square occupation and untangles three interlinked radical imaginaries prefigured and implemented by the movement in three different territorial projects. Countering growing enclosure and commodification of urban space, and displaying an integration of production, reproduction, consumption and governance, these projects are animated by the commons imaginary. By integrating these different functions, these projects also reclaim control over the conditions of reproduction, and attempt to self-determine their needs by disentangling life from commodity flows, hence expressing the autonomy imaginary. Autonomy nevertheless does not mean avoiding engagement with the state, as these projects connect the struggle over the common with the one over the public, redefining the public as “public from the common”, based on the interrelation between public, cooperative and communitarian spheres. Autonomy has also a territorial groundedness and relocalization dimension, which connects to the third radical imaginary, ecologism. Restoring economic self-reliance and re-embedding the economy within local communities and environments, being informed and motivated by ecological disfunction and waste, and promoting a different type of urbanism, they express an ecological conception of territory. Creating meaningful, collective work and self-employment, getting involved in collaborative and convivial consumption, and transforming everyday life through the “principle of responsibility”, these projects link self-determination of needs with sufficiency principles. While the indignados movement is not strictly an environmental movement, this paper hence argues that (and scrutinizes why) the ecologism/sufficiency imaginary, connected to political consumerism, is at the core of the Indignados’ transformational vision and practices.

Unmaking Europe? Euroscepticism and environmental policies

Jean-Paul Bozonnet

Sciences Po - Grenoble Université, France
jeanpaul.bozonnet(at)sciencespo-grenoble.fr

Euroscepticism is on the rise in most countries in Europe, according to the latest Eurobarometer surveys, and this anti-European sentiment is challenging environmental policies of the EU.

First, Euroscepticism is closely linked to the temptation of withdrawal and nationalism, which are part of a system of traditional values (Schwartz 1994). On the contrary, the pro-European sentiment was linked to openness to other cultures and could broaden personal identity to vast territories and universal values. It was the basis of post-modern civic culture (Almond et Verba 1989), which required a high level of cognitive mobilization (Inglehart 1970).

Second, environmentalism is also linked to a high level of education, and open-mindedness on distant worlds. Indeed, it involves “thinking globally”, and, since pollution knows no borders, it implies also accepting environmental policy decisions taken at the highest territorial levels, specifically European level.

Thus, our first objective will be to test the following hypothesis: Would Europeans opposed to EU integration not also be the ones most reluctant to EU environmental policies, or even to environmental policies in general? In other words, would euroscepticism go hand in hand with the rejection of environmental policies?

Furthermore, it is common knowledge that it is precisely because the European opinion was very favorable, that the DG of Environment (DGXI) has implemented more easily environmental policies, sometimes despite the reluctance of the European Council. Our second objective will examine the consequences of the Euroscepticism expansion: is it really endangering European environmental policies? For this work, we will rely on the recent Eurobarometers, from 2014 to 2016.

Future never happens- are the Luhmanian concepts of futurization and defuturization useful for discursive approach to energy policy analysis?

Aleksandra Wagner

Jagiellonian University, Poland
aleksandra.wagner(at)uj.edu.pl

The aim of the paper is to propose an operationalization of concepts of futurization and defuturization as the mechanisms of coping with the future proposed by Niklas Luhmann in 1976. We are going to discuss their usefulness to discursive analysis of energy policy.

Investments (or lack of) in the energy sector are usually very expensive, have long-term effects and although often they are not irreversible, process of withdrawing from them is complicated and stretched for years. Planning and modelling of future scenarios seems indispensable element of energy policies and coping with uncertainty and unpredictable it seems

their primary challenge. Discursive constructions of the visions of the future are treated in proposed analyses as a part of modernisation discourse (and particularly transition discourse). It is assumed they contain hidden agenda underlying the actions taken in the energy sector (both oriented on creating the change or secure the current order).

Mechanisms of futurization and defuturization described by Luhmann are recommendations theoretical reflection on how society copes with the future in anticipation. They refer to how the future is “opened” by allowing the possibility of different scenarios (futurization) or “closed”- by reducing them to one of the most likely or desired scenario (defuturization). Defining the future can serve the interests of legitimacy or revolution, protecting the status quo or change the reality. It is associated with diagnosis capabilities (including resources such as knowledge, technological development) and based on the value systems.

The (not) making of secondary resource regions

Alena Bleicher, Martin David, Magdalena Walkkamm
Helmholtz Centre for Environmental Reserch, Germany; Helmholtz Centre for Environmental Reserch, Germany; Helmholtz Centre for Environmental Reserch, Germany
alena.bleicher(at)ufz.de, martin.david(at)ufz.de, magdalena.walkkamm(at)ufz.de

For some years resources policies in European countries have seen a renaissance. Such policies aim to supply European economies with raw materials, notably metals and scarce earth metals. In this context the exploitation of secondary deposits such as mining heaps and tailings in European regions is considered. Such an approach might be seen as a chance to create new “resource regions” that could provide a new subjectivity.

This contribution will follow the question of how “resource regions” are made? The question will be answered based on the analysis of two German regions. Both regions have similar characteristics – tradition in mining, structural problems of local economy; also, both have to deal with demographic changes. Nevertheless, regional actors have taken up the idea of being a resource region very differently. In the one case locally based scientists agitate for exploiting raw materials from mining heaps. In the other, regional actors don't see the potential of resource exploitation although research projects have proved the existence of raw materials.

Within this presentation mechanisms will be discussed that bring together and integrate material elements (e.g. heaps and tailings), regional structures, as well as regional and national imaginaries on future development in ways that create regional resource potentials (or not). The analysis mainly draws on concepts of regional imaginaries and frames.

Our analysis shows that central factors in this process are the emergence of regional frames that contradict dominant frames of (national) resource policy and the way how scientific research is linked to the region.

RN12 | Session 01c Renewable Energy Systems**Information Flows in the Field(s) of Japanese Energy and Environmental Politics**

Annamari Konttinen
University of Turku, Finland
ankont(at)utu.fi

Compared to the more conventional model of Japanese politics, focusing mainly on the interplay between the dominant political parties, the bureaucracy, and the big business, academic attention directed at Japan in recent years has drastically reshaped itself. The Triple Disaster of 2011, so called 3/11 (earthquake, tsunami and the resultant radiation leak from Fukushima nuclear plant), and especially the anti-nuclear protests following it, have helped shift the focus towards more varied perspectives of Japanese society and politics, involving multiple-level actors.

This is analogous to changes more generally occurring in the field of political communication studies: representations of one-way communication have given way to multi-actor models. Global information flows, international epistemic communities as well as the participation of transnational actors have radically changed how citizens interact with—and past—their own governments. Political messages are increasingly being produced by citizens and citizen organizations.

As a host of the 1997 Kyoto COP3 conference, Japan is under treaty obligations to reduce its carbon dioxide emissions level and to take other steps related to curbing climate change. Before 3/11, Japan was envisioning the possibility of global leadership on this issue of worldwide importance and high political profile. At the same time, Japan is constantly under international pressure to engage new types of civil society organizations in political decision-making, and Japan's NGOs also have a central role in creating and publicizing *gaiatsu* (pressure from the outside). As Japan now, 6 years after the Triple Disaster, is on the verge of returning back to significant use of nuclear power, energy and environmental politics are likely to remain two central and increasingly intertwined arenas for shifting patterns of political communication.

Energy Access and Decentralised Renewable Energy Technologies in the Global South: a Matter of Energy Justice?

Xavier Lemaire
University College London, United Kingdom
x.lemaire(at)ucl.ac.uk

Energy access was considered not so long ago by international aid agencies and governments only as a matter of extension of the model of centralised generation of electricity to developing countries. The grid was supposed to reach even the poorest in the most remote rural areas. The goal of electricity for all via the grid has proven to be, not only unrealistic, but actually a hindrance to energy access for the poor, the model of centralised electricity generation benefitting

in priority the urban middle-class. Actually, the electrification of industrial countries started with decentralised generation implemented by small local electric companies. And there is a great diversity of “clean” energy technologies to provide adapted energy services - notably thermal ones. The focus on electrification via the grid reflects a now-dated ideology.

Energy justice is a new concept which can relate to the opposition to existing relations of power which could be (or not) modified by the current “energy revolution”. But renewable energy technologies do not necessarily remove relations of dependence of marginalised communities, actually they can just displace them or substitute them with other relations of dependence; and indeed, remote communities even if given access to renewable energy technologies can be further marginalised, unless specific actions are taken to empower them. Nevertheless, recent advancements in renewable energy technologies combined with new ways of thinking energy access are currently completely changing the energy landscape in developing countries; under a number of conditions which this paper examines, the current “energy transition” could provide opportunities for local communities to have a greater role in defining a more equitable access path to energy and contribute to transform their future.

Energy cooperatives as intermediaries in the energy transition: the case of Italy in a comparative perspective

Natalia Magnani
University of Trento, Italy
natalia.magnani(at)unitn.it

My contribution intends to focus on the role of socio-technical intermediation in the energy transition. The emerging literature on this issue stresses how intermediaries perform operations of 'translation' among actors and technology in order to coordinate and articulate better interaction (Bird and Barnes, 2014; Moss et al. 2010). They redefine the social organization of technological systems and help stabilize the innovation processes (Beveridge and Guy, 2009). Among energy system intermediaries civil society organizations play a crucial role. Civil society intermediaries typically take the form of cooperatives.

Hence in the presentation, first of all I will highlight the different forms of energy cooperatives working in the Italian context as mediators between energy consumers, producers and technology and favoring in many ways their re-assembly into one single collective entity. Sometimes, the need for re-intermediation comes from the attempt of civil society to limit the action of commercial third party actors considered outsiders to the values of sustainability, mutuality and self-management carried out by the third sector. Secondly, drawing on both empirical research on Italy energy cooperatives and literature review of European cases I will explore the institutional factors (formal and informal) explaining the main differences in the level and forms of this

intermediation in Southern European countries vs. North of Europe.

What's wrong with energy efficiency?

Elizabeth Shove
Lancaster, United Kingdom
e.shove(at)lancaster.ac.uk

One proven and effective method of curbing carbon emissions is to reduce energy consumption by increasing the efficiency of things like cars, domestic appliances, heating and cooling technologies, and equipment used in industry and in construction. Flying in the face of what looks like obvious common sense, this article reviews arguments against the pursuit of energy efficiency. These draw attention to a variety of generic limitations and problems, all of which deserve more explicit recognition and discussion. Linking these critiques together I suggest that the very idea of efficiency rests on a deeply problematic, ultimately a-social interpretation of energy and that rather than being part of the solution the risk is that this conceptualisation thwarts more concerted attempts to understand the dynamics of demand or to imagine and move towards a lower carbon society. In making this case, I suggest that making space for a more fundamental engagement with demand depends on setting the efficiency agenda aside, and that this is an essential move if sociology is to have more than a marginal role in informing and invigorating energy policy.

RN12 | Session 02a Resilience and Vulnerability

Examining Greece's capacity for Environmental Sustainability (ES) under Syriza

John Karamichas
Queens University Belfast, United Kingdom
j.karamichas(at)qub.ac.uk

Syriza came to power after the snapped elections of January 2015 by forming a government in coalition with the right-wing populist, Independent Greeks (ANEL). Any fears expressed in relation to a possible downgrading of some liberal (e.g. same-sex unions, citizenship to second generation immigrants) and environmental sustainability (ES) proclamations that Syriza had made in its electoral manifesto (Thessaloniki programme) that ANEL and the old-left current may thwart them were put aside and the ES front appeared secured, after all the environmental portfolio was given to a prominent environmentalist. Since then, Syriza led the country to a referendum and a national election that was essentially asking for approval of a new austerity programme. After setting that background, this paper proceeds by subscribing to the rationale that in times of financial instability and uncertainty, the environmental concern is likely to be downgraded among the issue priorities of both the government and general citizenry. By extension, that concern appears to enter into an interdependent relationship to many environmental policy and governance parameters. As such, this paper uses

environmental concern as a centrifugal separator and embarks upon an investigation of capacity for ES in Greece. The indicators will be compared to findings from the austerity period before the advents of Syriza. That comparison is complemented with findings by interviews with environmental activists. The concluding remarks reinforce the perception that any negativities identified in the Greek capacity for ES can be mostly attributed to perennial internal limitations rather than systemic, external imbued commands.

Modes of adaptation to flood and pollution, and resilience abilities in Southwestern European societies

Christelle Gramaglia, Severine Durand, Katrin Erdlenbruch
UMR G-EAU, IRSTEA, France; UMR PACTE, CNRS, France; UMR G-EAU, IRSTEA, France
christelle.gramaglia(at)irstea.fr,
severine.durand07(at)gmail.com,
katrin.erdenbruch(at)irstea.fr

Few studies compare flooding and pollution risks. At the most, we find mention of differences in the literature (Slovic 1987, W. Freudenberg 1997). Freudenberg pointed out that the chronology and spatiality of the phenomena at stake vary greatly. While manifestations of floods are clearly identifiable, the damage caused by toxic substances is more difficult to grasp. This is why the former tend to reinforce social ties (solidarity), whereas the latter have corrosive effects on the social fabric (conflicts can break out and social relations be undermined). This paper aims at comparing data from ethnographic surveys carried out in rural areas of Southwestern France subject to either flooding (Lattes and Béziers or the Aude region) or pollution (Salindres and Viviez). We will examine individual and collective strategies used to deal with risks. How do local residents prioritize the problems they face? How do they adapt and with what costs? Particular attention will be given to personal practices developed to cope with risks (e.g. changes in practices). We will compare them with official strategies, often based on technical solutions. We will also examine how choices are made, according to different socioeconomic criteria. We will illustrate how the adaptations chosen fuel the corrosive or bonding nature of risks. We will then elaborate on resilience in Southwestern European societies which are exposed to risks –or even overexposed to many of them because of the excesses of capitalism-. Doing so we hope, to learn about new possibilities for “living on a damaged planet” (Tsing 2014).

Renewable Energy & Global Political Dynamics: The Hurdles and Limitations towards Reaching A Low Carbon Intensified Turkish Economy

Ibrahim Alsancak
Abdullah Gul University, Turkey
alsancax(at)gmail.com

Like many countries in the world, Turkey is mostly

dependent on fossil fuels. Turkey imports most of the sources it uses to produce electricity. This situation of Turkey creates a burden for both the economy and the environment. Turkey is very rich in potential renewable energy sources. However, only a little amount of the renewable energy potential is in use. In order to have energy security and diversity, Turkey has to use the available alternatives to fossil fuels. The best alternative seems to be the renewable energy sources. Turkey is potentially one of the richest countries in renewable energy. Government sets some goals to increase the use of the renewable energy sources but is it enough? Although Turkey has so much more potential than most of the European Union countries, why is it so behind those countries in terms of renewable energy? I will talk about the incentives and subsidies used in countries which are far ahead in the use of renewable energy sources. I will compare them with the ones in Turkey. I will investigate the global political dynamics, hurdles and limitations towards a greener Turkish economy. I will talk about the recent developments of government about nuclear energy and compare the nuclear energy with renewable energy sources. My argument in this paper is that in order to have a low carbon economy, Turkey has to develop policies encouraging the use of renewable energy sources.

RN12 | Session 02b Natural Disasters and the Role of Technologies

The meaning and shaping of unanticipated consequences in environmental disasters. Conceptual usage and political implications

Rolf Lidskog
Orebro University, Sweden
rolf.lidskog(at)oru.se

Unanticipated consequences has been touched upon by many sociological contributors, not least by Robert Merton. This paper discusses unanticipated consequences within the context of risk society, a society with high degree of risk consciousness among its members and institutions. Starting by a general discussion of the character of unanticipated consequences – its relation to unintended consequences, indirect consequences, side effects and secondary effects – this paper stresses the importance to investigate why certain consequences of social action are defined as unanticipated. The reason for this is that even if our actions frequently spin away from their intended and projected paths of development, yet the new paths are often possible to anticipate as low probability risks. Based on this understanding of unanticipated consequences, this paper analyses a particular case; the largest forest fire in modern Swedish history. Based on two interview studies and a postal survey, it explores how the affected evaluate the causes and consequences of the wildfire. A complex picture is found where the wildfire is seen as a human-caused disasters with far-reaching unintended consequences, but followed by very little blame-making or strong criticism towards the

organisations that are seen as having caused this wildfire. By using framing theory and sociology of risk, this paper explains this seemingly contradictory result. Particularly it shows how the framing of context, causes and consequences of disaster heavily affected how it became to be seen as not totally unanticipated, but nevertheless with little distribution of blame and accountability.

Detention basins versus floodable lands: models of water security face social contingencies

Giorgio Osti
University of Trieste, Italy
giorgio.osti(at)dispes.units.it

Water security is a big problem in Europe. Floods are the most damaging events. European Union and National Governments pay great attention to prevention and reaction to floods. There is a EU Directive on the assessment and management of flood risks. Most countries have adopted the principles proclaimed in the directive: people participation, integrated management, risk planning. Special catchment authorities have been created or reinforced for embodying those principles.

Despite a so rational and systemic frame the praxis is rhapsodic. According to the punctuated equilibrium theory radical changes occur suddenly and for a short period. It depends on the convergence of a variety of causes, that open windows of opportunity. Such an event causes changes on power and interests equilibrium, too.

The evolution of some Italian water detention basin projects will be studied according to punctuated equilibrium theory. The specific hypothesis is however less optimistic on change extension. The implementation of these great public works is due to a variety of contingent factors, but balances of powers, not last expertise (civil engineering), is not so deformable. In any case, detention basin is described as an ideal solution, a constructed image useful for covering its huge cost. The attempts to realise this infrastructure create two opposition trends: one from landowners, who claims for compensations, the other from those proposing micro-solutions: a thick network of small channels and ponds to be realised mainly in the countryside. Legal arrangements, like flowage easements, are useful for translating models into practices.

Pro-environmental behaviours and activism in a comparative European perspective

Egle Butkeviciene, Egle Vaidelyte
Kaunas University of Technology, Lithuania; Kaunas University of Technology, Lithuania
egle.butkeviciene(at)ktu.lt, egle.vaidelyte(at)ktu.lt

Environmental activism and other ways of pro-environmental behaviours have become a valuable part of our contemporary societies. Although there is a growing literature on this issue (Freymeyer, Johnson, 2010; Balzekiene, Telesiene, 2011; Hadler, Haller, 2011; 2013; Franzen, Vogl, 2013; Reyes, 2013; 2014),

a number of questions about the environmental behaviour and activism in a comparative perspective are still understudied. This article investigates environmental activism focusing on a socio-demographical profile of environmental group members across the European countries and patterns of environmentally oriented public behaviours (e.g. civic activities such as signing a petition about an environmental issue, giving money to an environmental group, or taking part in a protest or demonstration about an environmental issue, being a member of environmental NGO) as well as environmentally oriented private behaviours (e.g. sorting glass or tins or plastic or newspapers and so on for recycling, cutting back on driving a car, reducing the energy or fuel you use at home, choosing to save or re-use water and avoiding of buying certain products for environmental reasons). The study also employs comparison of data on the attitudes towards the best ways of getting business and industry and people and their families to protect the environment: should we punish, reward or educate ?

RN12 | Session 02c Sustainability, Mobility and Environmental Conflicts

Urban Inno Pilot Karlsruhe: Participatory electricBike Infrastructure Planning

Pia Inari Laborgne, Monika Heyder, Joanna Skok, Ralf Trunko, Brendan McGill
EIFER/KIT; EIFER/KIT; CyberForum e.V.; University of Freiburg
pia.laborgne(at)soziologie.uni-freiburg.de,
heyder(at)eifer.org, skok(at)eifer.org,
trunko(at)cyberforum.de, brendanmc6(at)gmail.com

The URBAN INNO project (Interreg 2016-2019, coordinated by the City of Rijeka and Cyberforum Karlsruhe) addresses the challenge of a better linkage of actors within urban innovation ecosystems. A major goal is to develop and implement new participatory methods and tools in order to actively involve end-users in innovation processes. The focal point is on central European cities and urban regions. The project aims at enabling the transfer and exchange of urban innovation models and practices throughout Europe. In so-called local pilots, different participatory instruments are tested and evaluated on-site.

The paper will present the pilot Karlsruhe. It is focused on integrative and integrated electric bike infrastructure building, embedded into local energy, mobility and climate strategies. Initial point of the inter- and transdisciplinary approach of the project is the improvement of the collaboration between science, municipal actors and other local stakeholders.

In the framework of this pilot, different participatory approaches are developed and tested addressing local citizens as well as other stakeholders like the local energy provider, trade and craft and NGOs. Measures include ebike-renewable energy-tours combined with workshops and the use of public participatory GIS applications in order to test the applicability for participative urban infrastructure

planning processes.

The paper will present the approach and results of the project.

Dismantling local protests. Business strategies of environmental conflicts resolution

Robert Bartłomiejski
University of Szczecin, Poland
robert_bartlomiejski(at)poczta.onet.pl

Starting from the theory of urban regimes, business has been indicated as important stakeholder involved in development plans. In context of urban environmental conflicts, there are several varieties of business interest groups: developers, investors, contractors, service providers. Each of the above categories form a separate subgroup of interest in environmental conflict in the city. The four groups represent different strategies of dismantling local protests against locally unwanted development. The aim of the paper is to present the results of research based on in-depth interviews (IDI) with Polish entrepreneurs. The respondents were involved in public investments and private developments facing nimbysm in Poland. The collected material has given a unique insight into hidden motivations, interests and practices addressed to local communities, municipal authorities and non-governmental organisations. On the basis of case studies, author has distinguished a few approaches, methods and techniques to gain trust of protesting local community or lower their opposition.

Global civil society and climate advocacy in the Amazon Basin: Limits and lessons learned

Deborah Delgado Pugley
Pontificia Universidad Catolica del Peru, Peru
deborah.delgado(at)pucp.pe

Aware of the impacts that both climate change and related policy reforms would bring worldwide, civil society organizations that support forests communities have been keen participants in international climate change talks. Many of them have capitalized on recent advancements in international human-rights law for their activism. This work presents some early lessons on the integration of human rights into climate advocacy and governance reforms for forest-related climate actions. Lessons are taken, mainly, from two areas: (1) the multilateral negotiations on Reducing Emissions from Deforestation and forest Degradation (REDD+) at the Conferences of the Parties of the United Nations Framework Convention on Climate Change, and (2) the implementation of UNFCCC agreements in countries of the occidental Amazon Basin (Colombia, Ecuador, and Peru).

RN12 | Session 03a Sociology and Climate Change

Climate Change as a security issue in the case of Greece. An application of Q Methodology

Charis Gerosideris
Keele University, United Kingdom

c.gerosideris(at)keele.ac.uk

Resource scarcity, environmental migration, land use and natural disasters, are only some of the examples which indicate the multi-dimensional effects of climate change and its impact on socio-political structures as well as on the everyday life and practices.

This study focuses on the on-going discussion on climate change as a security issue, which indicates that climate change should be understood as unsolved and threaten matter that seeks immediate and specific solutions in the security discipline. The examination of the issue developed focusing on the case of Greece, which is not only an indicative example of the south vulnerable EU countries. The paper develops an insight on the issue of climate change in Greece, pointing out the linkage to security/insecurity issues in regional level and its contemporary connections between environmental security, energy security, national and human security, in global level. Main consideration is given to the absence of approaching climate change as a security issue in Greece, not only in an institutional (state) level, but in a scientific level too.

The study examined four different stakeholders' groups (Greek policy-makers, national NGOs, energy industry leaders, public/citizens) and their perceptions/opinions on the issue of climate change as a security issue by applying Q-methodology. The study critically examined the differences between the stakeholders' perspectives and the existed academic ones on climate change as a security issue. This study points out a new and innovative research methodology in security studies, which, especially focusing in the climate change as a security issue in the case of Greece and the global recession context.

Environmental Citizenship and Climate Change Adaptation in Portugal: The case of ClimAdaPT.Local

Joao Mourato, Luisa Schmidt, Adriana Alves, Joao Ferrao

University of Lisbon, Portugal; University of Lisbon, Portugal; University of Lisbon, Portugal; University of Lisbon, Portugal

joao.mourato(at)ics.ulisboa.pt,
luisa.schmidt(at)ics.ulisboa.pt,
adriana.alves(at)ics.ulisboa.pt,
joao.ferrao(at)ics.ulisboa.pt

Climate change deniers aside, it is widely acknowledged that alongside mitigation efforts, adaptation to climate change is of paramount importance.

However, adaptation efforts, through the design of specific policy instruments bring to the fore the complex, multi-level inter-relationships and coordination pitfalls between decision-makers, policy developers, scientific and local communities.

This paper reports on the ClimAdaPT.Local research project (2015-2017) designed to strengthen municipal capacity for adaptation to climate change in Portugal. Building on the existing and tested UKCIP

methodology for adaptation-strategy-development, this projects spread out to 26 pilot-municipalities in both mainland Portugal and the islands of Azores and Madeira.

Adaptation policies are strongly context dependent. Thus, central to the chosen methodological framework a set of participatory workshops was put in place in order to fully engage local communities not only in the validation but also in the development of their municipal adaptation strategy.

Through the review of the project's development process and community engagement efforts this presentation discusses the challenges underpinning local adaptation governance solutions and the mainstreaming of adaptation into local planning tools.

In particular, we expand on the role of knowledge co-production as an institutional mechanism to strengthen community capacitation and mobilization concerning climate change.

We illustrate how local actors are learning to learn through uncertainty and environmental change. In other words, how they are collectively learning to be adaptive. In sum, we illustrate how through the inclusive development of climate adaptation policies environmental democracy and citizenship can be promoted.

Climate Change, a new metanarrative for Humanity?

João Camargo

Instituto de Ciências Sociais - Universidade de Lisboa, Portugal

joao.camargo.342(at)gmail.com

Climate change might be the occasion, not the cause, of the biggest challenge in the history of Humanity. But despite the scientific consensus not only on the human origin of climate change but also on its impacts (global, regional, national and local), the necessary measures to deter this phenomenon are still far from the speed and range necessary for the challenge.

The planet has finite resources, it is confined in its space and the infinite expansion of economic growth crashes against this reality. The approach of trying to address the problem through minor adjustments to the current productive system is a recipe for disaster. The emergence of a metanarrative of climate change will be imposed by reality, but there will be a major dispute. Narratives prepare and arm groups and populations for an uncertain future, and they will either be survival of the fittest or civilizatory tools in the exact moment when human civilization will be in its most dangerous moment.

Mainstreaming adaptation and mitigation policies on climate change is an important tool to recognize how this is evolving. We've analysed public climate policy in three Mediterranean – Portugal, Spain and Morocco – and conducted interviews to different stakeholders from municipalities to central governments, from scientists to social movements to ascertain the relevance of climate policy and the importance of climate change to stakeholders involved, that is, if can see, or not, signs of this a new metanarrative on the

horizon, and which one.

The process of climate change in mass media discourse using the example of Polish and English-language editions of Newsweek magazine

Karolina, Weronika Cynk
University of Rzeszow, Poland
rss(at)ur.edu.pl

Public discourse generally presents climate change as a serious social problem. This issue is addressed, for example, in Polish and English-language editions of the sociopolitical magazine Newsweek.

Critical discourse analysis (CDA) includes a variety of approaches, and therefore the study of media texts considered numerous variants and components of CDA. The analysis was focused on two issues. The first refers to the characteristics of the discourse, namely:

- the way in which mass media discourse constructs the perception of social reality from the perspective of climate changes taking place (Fairclough, Wodak 1997),
- the creation of a deictic centre – a community of entities united in the face of climatic hazards and detailed hazards being outside this centre (Cap 2006),
- contradictions, unclear statements and methods of persuasion used in the discourses in both editions of the magazine (Wodak 1996).

The second important issue was to analyse transformations in approaches to climatic hazards:

- discursive approach to the shift from the theoretical to practical aspects of climatic hazards (Beaugrande 1999),
- the power of time presented in the discourse from the perspective of necessary actions and future negative effects of climate change (Negt 1984),
- the way discourse produces shared views, beliefs and values being shaped in confrontation with climatic hazards (Bernecker, Dretske 2000),
- the way discursive practices used in texts on climate issues stimulate emotional responses (Hearn 1993).

RN12 | Session 03b Chemicals in the Environment

Unusual suspects – precautions engineers and the public treatment of micropollutants in waste water

Matthias Groß, Nona Schulte-Römer
Helmholtz-Centre for Environmental Research - UFZ, Germany; Helmholtz-Centre for Environmental Research - UFZ, Germany
matthias.gross(at)ufz.de, nona.schulte-roemer(at)ufz.de

In recent years, traces of pharmaceuticals and pesticides in water have received increasing attention from scientists and policy makers. The environmental effects of such micropollutants are still being explored and scientific evidence of their harmful effects is still patchy. Nevertheless, the first measures and technologies for preventing their release into

European water bodies have already been implemented. At first sight, these measures appear to be just another example of a precautionary approach in the context of environmental and water protection. However, looking closer we find that the spokespersons of environmental measures are techno-scientific innovators rather than environmental regulation agencies. We further find that the public representation of the problem is dominated by an innovation discourse of technological advancement rather than a debate on the causes of micropollutants in water.

This paper focuses on the public debate on micropollutants in Germany. Based on a media analysis and field research it shows that projects and measures against micropollutants in water follow an institutional logic of responsible research and innovation rather than precautionary regulations and environmental justifications as they can be found in the context of the European Water Framework Directive.

From public bads to burden legacy: Between nuclear power plants and radioactive waste disposal

Yoichi Yuasa
Kanto-Gakuin University, Japan
yuasa(at)kanto-gakuin.ac.jp

The aim of this presentation is to examine the decision making process of locating a disposal facility for high-level radioactive wastes (HLW) in Japan, from the perspective of burden legacy.

Even in the only country that was the victim of a nuclear bombing, the Japanese government has constructed over 50 nuclear power plants successfully. This is a result of the incentive system that the Japanese government has implemented since the 1970's. The government, however, has been looking for a site for the HLW disposal but to no avail.

Are there any differences between nuclear power plants and the HLW disposal facilities? In this presentation, HLW facilities are considered as a burden legacy and nuclear power plants are as public bads.

Some differences can be found between them. A burden legacy doesn't have any positive aspects. Public bads contains something goods but also have fatal risk. With the burden legacy, beneficiaries and defrayers are completely separated, especially in terms of generation. On public bads, beneficiaries and defrayers are also separated but closer than burden legacies.

Because of the differences between a burden legacy and a public bads, the incentive system for nuclear power plants can't be applied to the HLW disposal. The Japanese government needs a new way for burden legacy but is not as familiar with it.

One of the keys is sentiment of the most inferior positions of those who live in candidate sites may have. They may feel their area is put onto the most inferior position if they accept that kind of facility. In the Japanese case, we will detail this sentiment peculiar

to burden legacy.

Who uses chemicals in his private garden and why? A quantitative analysis of gardening practices in Germany

Jens Jetzkowitz

Helmut Schmidt University, Germany

jetzkowitz(at)web.de

It has been known for quite some time that the extensive usage of pesticides, herbicides and chemical fertilizers has significant implications on biodiversity (see, for example, McLaughlin/Mineau 1995). Nevertheless chemical means are still in use, not only in agriculture, but also in private gardening and in the maintenance of private ground and public areas. Farmers and their lobbyists usually roll out arguments which refer to the market structure and its constraint, competition conditions and on the concept of food security to justify why they continually use these chemicals. House owners, hobby gardeners and the responsible representatives in public administration are rarely interviewed concerning their practices of chemical use.

In this presentation I focus on the question why house owners and hobby gardeners use chemicals. Based on data collected by standardised interviews in 1359 households of 67 settlements in the Wetterau region north of Frankfurt/Main, Hesse, Germany, 9 clusters of gardening styles are distinguished which characterise gardening practise (and the maintenance of private ground) in German rural areas. Furthermore, I use regression analysis to analyse the influence of various independent variables on indicators for the usage of chemicals. In addition to the household level some variables are also tested on the level of settlements. The results show a detailed picture of the motives and structural conditions of chemical usage house owners and hobby gardeners in Germany.

Alison McLaughlin/Pierre Mineau, 1995. The impact of agricultural practices on biodiversity. *Agriculture, Ecosystems & Environment* 55 (3), 201–212.

REACH Impacts and Chemicals Regulation Change in Taiwan

Hua-Mei Chiu

National Sun Yat-sen University, Taiwan

fschiu(at)gmail.com

The EU's REACH Regulations have a strong impact in many countries. REACH has been used as a model for several Asia countries, including Taiwan, to review or rewrite their chemical policies and regulations. This research examines how the environmental advocacy network and the electronic industry featured with chemical intensive use participate in the amendment of Toxic Chemical Substances Control Act in Taiwan. It finds that the extent that the law amendment reflects the value of environmental justice is relying on the conflict and compromise among market and social forces, rather than the good-will of market force. An accommodating strategy, instead of a resistant one, has been adopted by Taiwan's electronic enterprises.

The strategy cannot be solely explained by the emergence of political and social pressure. It is also a result of the consideration of business interests. In order to meet the demand of chemical regulation from their international customers, the enterprises are glad to see the legislation which will allow them to ask for comprehensive information from chemicals providers, hence might reduce the risk of the electronic enterprises in the factories. However, the enterprises might show a reluctant attitude to a strict regulation, such as on information disclosure and the use of new chemical, which might harm the competitiveness of individual enterprises. In addition, the big USA chemicals supplier to Taiwan's electronic manufacturers has influenced the formation of sub-law. This research aims to analyze the dynamic relations between environmental groups, enterprises and the state behind the law-making process.

RN12 | Session 04a Renewable and Non-renewable Energies

Alternative energy for an alternative society? New and old patterns of the Brazilian case

Leandro Raizer

Federal University of Rio Grande do Sul, Brazil

leandroraiser(at)gmail.com

After conducting an extensive comparative research on the development of alternative energies in Brazil and Canada in the first decade of the 2000s, this study sought to produce and analyze new data on the current model of energy development in Brazil. Considered one of the countries with the greatest energy potential, with large renewable resources, the country maintains a medium trajectory in the development of alternative energies. Among the factors that explain this trajectory, the study highlights the presence of a peculiar socio-technical network (Latour, Knorr-Cetina), in which the political-business arena gains predominance, being determinant for the reduction of the transformative potential arising from the emergence of a new model of energy development and its societal consequences. In this context, paradoxically, new technologies and values (sustainability) coexist with technologies and practices of the nineteenth century, with the conservation of an extreme unequal society, with great risks (Giddens) to the preservation of natural resources and the ecosystem.

Between local and global – framing of energy facility siting

Karin Linnea Edberg

Södertörn University, Sweden

karin.edberg(at)sh.se

The current energy transition, evident in many countries around the world, entails changes not only on a policy level but also in the physical landscape. The extraction and transportation of "alternative" and/or "sustainable" energy requires new infrastructure, sited in an existing physical, social and

cultural setting (Boholm & Löfstedt 2004; Owens 2004; Nadaï 2007; Bridge et al 2013; Shove & Walker 2014; Mels 2014).

This article discusses how local actors legitimize their position towards new energy projects by analysing how they frame the localization of a natural gas pipeline and a proposed, but later rejected, wind power park in a specific geographical area. By using a theoretical framework based on frame analysis and theories of social practices (Snow et al 1986; Schön & Rein 1994; Schatzki 1996; Macnaghten & Urry 1998; Reckwitz 2002; Benford & Snow 2000, Perri 6 2005; Shove & Walker 2014), the article shows that the interviewed local actors combine understandings of the physical and social landscape with environmental issues and global politics as well as moral concerns when constructing their frames.

Thus, localization of energy infrastructure accentuates a combination of the local – as infrastructure is geographically located somewhere – and the global, as energy belongs to a sector conceptually and commercially global in character. As elaborated in the article, the frames are hierarchically connected to each other. Further, by claiming that actors use and combine different levels of sustainability to frame and legitimize their position, the article presents an extended interpretation of sustainable energy production.

Making energy grids smart. Investigating apparatuses regulating energy flows

Dario Padovan, Osman Arrobbio

University of Torino, Italy; University of Torino, Italy
dario.padovan(at)unito.it, osman.arrobbio(at)unito.it

In this paper, we describe the assemblages and functioning of conventional energy grids at the beginning of the smartness process. This exercise is useful because it makes possible to pinpoint obstacles, barriers, resistances, conflicts, differences, and necessities in the process of energy grids improving efficiency, security and usability. Usually, the description of an energy smart grid consists of a list of properties that the grid needs to get to be called “smart”. A smart grid give smart information, allows for savings, allows for good and real-time information, connect providers and users. Yet, what is still lacking in the claim for smart grid is an ontological dimension of both energy flows and grid. In our idea, it is not enough to enunciate an amount of technical characteristics that should mark the grid and its smartness. What we are trying to do is to suggest a sociological frame to understand the work of energy smart grids aimed to regulate the flows circulating in the grid and the access to these flows by different agents. To accomplish this task, we use a sociology of flows informed by two main perspectives. The first one is to conceive energy grids as technological zones, in which standard metering, communication infrastructures, and social evaluation assemble. The second one is to conceive energy grids as an apparatus in which asymmetries of power, information, decision-making, intensity floating into the

grid constitute the ontology of the grid itself. A smart grid that wants to align or flattening the original disparities must forge a new apparatus able to make the disparate orders constituting an energy grid converging toward a new order of difference and similarity.

New materialist perspective in empirical research of coal mining industry

Vojtech Pecka

Masaryk University, Czech Republic
vojtech.pecka(at)gmail.com

In past years, climate change became the global issue number one, undergoing a transformation from an abstract imaginary hypothesis into a very real threat of an unprecedented magnitude. It has gained status of the most profound market failure in history and the most acute symptom of the Anthropocene.

Regardless the threat, in the past decade the Czech Republic has invested over 3 billion Euro in coal-fired power plants and has enlarged the area available for coal extraction. Czech energy industry continues to rely on coal in order to take the opportunity to saturate the energetic needs of surrounding countries which are closing their electric facilities. Consequently, the Czech Republic is constantly among European leaders in shares of electricity exported, while destructive effects of climate change have not found their way into an adequate economic calculation or political articulation. It seems as if the only limitation to fossil industry was the finite amount of fossil reserves.

In order to understand such development, present paper offers a new materialist ontology as a research equipment navigating empirical investigation. New materialism enables to grasp the heterogeneity of interconnected environmental, social, political, economical, psychological and technological relationships between a major Czech coal-mining company and climate change politics. The main focus is to present a stabilized conceptual corpus of a Deleuze-Guattarian philosophy, elaborated by number of philosophers ranging from Manuel De Landa, Levi Bryant, John Protevi, Mark Bonta to Graham Harman, utilized in an empirical research of a Czech coal mining company.

RN12 | Session 04b New Trends in Environmental Sociology I

Post-nature and the emergency brake

Luigi Pellizzoni

University of Trieste, Italy
luigi.pellizzoni(at)dispes.units.it

Faced with pending threats, how are we to assess the case for accelerating towards a fully technologized, 'post-natural' condition against the plea for pulling the emergency brake and reconsidering the separation of nature and the human?

The question moves from the acknowledgment that social and environmental struggles are increasingly taking the shape of struggles over time – over the

pace of time.

The case for acceleration is made simultaneously from the right (Ecomodernist Manifesto) and from the left (Manifesto for an Accelerationist Politics). Despite contrasting aims (preserving vs. overturning the social order), the shared idea is of decoupling social systems from natural biophysical systems, pointing towards a 'post-natural' sustainability. The Anthropocene narrative supports a revamp of human exceptionalism, stemming no longer from the separation of nature and technology, but from the former being assumed as indistinct from (or an internal differentiation of) the latter.

Not new, but gaining new salience, is the opposite case, for pulling the emergency brake in the runaway train in which we are entrapped (Benjamin); for slowing down; for an 'idle time' (Lazzarato) or a politics of 'inoperosity' (Agamben); for suspending the thrust to infinite value extraction.

Has the latter outlook any chance to prevail over capitalist and anticapitalist fantasies of 'overcoming' nature? Can it be helpful in devising different takes on labour and technology, supporting alternative forms of community organization and material flows? And, to this purpose: isn't it that we should separate again nature and the human? Yet how, without falling back to dominative objectivism?

Towards Linking the Concepts of Ecosystem Services and Environmental Justice: A Hungarian Case Study

Ágnes Roboz

Corvinus University of Budapest, Hungary
agnes.robosz(at)uni-corvinus.hu

Linking the concepts of ecosystem services and environmental justice is a very recent academic phenomenon. Both concepts represent well-established research fields, but there is much less research on their linkages. The present ongoing research attempts to develop a framework to link the two concepts grounded in a Hungarian case study. The case study in Hungary is constructed around a waterfront development which may significantly alter the potential access to benefiting from different types of ecosystem services. The case site is located in the Southern city of Hungary, Szeged and the second biggest river of Hungary, Tisza. The river provides a lot of ecosystem services which a diverse groups of local inhabitants benefit from. However, a river wall construction was held as a waterfront development project, moreover there are other connected development plans. The present research aims to explore and understand how the proposed project will alter access to freshwater ecosystem services the different local groups and individuals from an environmental justice perspective. Thus environmental justice interprets in this research as the access to ecosystem services. A qualitative research design was developed based on an ethnographic approach (namely ethnographic participatory observations). It has become clear from these observations, that currently a very diverse pool of local stakeholders

benefit from the ecosystem services of the river. However, the present plans developed by the dominant local actors of urban development planning will most probably change the current situation of access and use. Thus the examination of the plans from an environmental justice perspective highlights the potential implications of changing access and use patterns for the diverse local groups currently benefiting from multiple ecosystem services the River Tisza provides.

The Production of Environmentalism Space: Ecotourism Sites, Protected Areas and Conservation Project Fields

Cagri Eryilmaz

Sinop University, Turkey
cagridentiz(at)gmail.com

This presentation aims to reveal the spatial production of liberal environmentalism and calls it with a new term, Environmentalism Space.

According to social ecology of Murray Bookchin, liberal environmentalism making protests, lobbying, projects cannot solve ecological crisis but develops an environmentalist business sector integrated growing capitalist system as well as hiding the domination of nature. Environmentalism sector not only produces consumable green goods but also spatial commodities like ecotourism sites, conservation areas, project fields, green offices/buildings/cities, city parks and many others. In order to reveal how this Environmentalism Space is produced, the integration of the critique of liberal environmentalism with the production of space in late capitalism by Henri Lefebvre is necessary.

In this presentation, Environmentalism Space is analysed with three different examples as ecotourism site, protected area and conservation project field. These examples show that the abstraction of liberal environmentalism produces spaces that homogenize and dominate nature and society. State, capital, media and environmental NGOs act together to impose these spaces. Nature is presented as wild, beautiful, threatened and zoned to satisfy liberal environmentalist concerns and needs of a consumer society. Nature becomes homogenized touristic, protected or conserved spaces where local people are changed into sellers, consumers, visitors and stakeholders.

The Tangled Relationship between Turkish Environmental Groups and Corporations: Framing and Meaning Structures

Ozge Can

Yasar University, Turkey
ozge.can(at)yasar.edu.tr

During the last decade, we have witnessed a tremendous increase in theoretical and empirical body of research which indicates a close intersection between studies on social movements and organizations. An important part of this research entails the investigation of the nature of the

relationship between movement groups and corporations (Soule, 2012). Although considerable attention have been paid, critical questions about the conditions facilitating such interactions, the dynamic nature of them, their contextual contingencies and the complexity regarding contestation vs. collaboration remains largely unanswered.

In light of the above, this study seeks to provide new insights on how opposition of social movements towards corporations is shaped and how their strategic interaction is institutionally and culturally embedded. I intend to achieve this by focusing on environmental organizations' in Turkey, a socio-political and institutional setting rather different from a Western context. I want to tackle this issue by taking not only the demands of environmental groups into account, but also how corporates react and respond to such threats, and sometimes, how they attempt to defuse potential challenges through establishing tactical collaborations, framing meanings, and managing impressions. In addition to the content analysis of reports and other documents from major environmental groups' and big corporations in Turkey, I will also analyze how their interactions are covered in the media, namely, in the news articles. By doing so, I intend to provide a comprehensive illustration of the socio-cultural meanings and discursive processes related to this tangled interplay in a non-Western setting.

RN12 | Session 05a Social and Environmental Sustainability

Disentangling Transdisciplinarity from a Sociological Point of View: A Constructive Critique of Solution-Oriented Research Practices in Sustainability Science

Kristin Nicolaus, Jens Jetzkowitz
Institute for Advanced Sustainability Studies,
Germany; Helmut Schmidt University, Faculty of
Humanities and Social Sciences, Germany
Kristin.Nicolaus(at)iass-potsdam.de,
jetzkowitz(at)web.de

Transdisciplinary research is considered as a key concept of sustainability science, since it is often claimed that problems of identifying a sustainable pathway for societal development can only be solved by a new mode of knowledge production, which supports us to cope with urgent life-world problems. In recent strands of the discourse on sustainable development the idea of transdisciplinarity is concretized by considering how scientists from different disciplines can co-design, co-produce and co-disseminate research with stakeholders that are believed to represent the societal sphere. While the debate has oscillated between the poles of euphoric expectations (cf. Hirsch Hadorn et al. 2006) and critical remarks on its significance as epistemic practice (cf. Zierhofer/Burger 2007), the experience of action research as an example of solution-oriented scientific practice are rarely taken into account. Against this background we critically reflect the

practice of transdisciplinary research by focussing on its social structures and the kinds of activities they enable. Thus, after reviewing literature in the field, we thoroughly examine case studies based on a small purposive sample of transdisciplinary research projects in sustainability science which helps us to categorize research practices against the backdrop of their institutional characteristics. As we do not want transdisciplinarity to be an empty phrase, we wish to contribute to a differentiated understanding of potentials and challenges of transdisciplinary cooperation.

Living up to the ideal - Ideal practices as barriers to the reduction of household food waste

Marie Hebrok
SIFO Consumption Research Norway, Norway
marie.hebrok(at)sifo.hioa.no

Recent estimates show that 1/3 of the food produced in the world is never eaten. In the Western world, consumers are responsible for half of the food wasted. Much is known about the composition of this waste, and about the ones who waste the most, as well as of causes for this unsustainable practice of consumption. However, the latter is still somewhat underexplored. By increasing the understanding of these causes, we may reveal more promising intervention points than have hitherto been identified.

This study finds that practices rooted in shared ideals of planning, health, diversity and thrift are drivers of household food waste. Moreover, it illustrates how the performance or non-performance of these practices are causing food waste. In this way consumers are entangled in a web of ideal practices where good intentions in one place causes bad outcomes in another.

The study of ideal practices related to household food waste is based on 26 interviews with the consumer group identified as wasting the most – young adults and families with children. Other methods included in the study were shop-a-longs, walk-a-longs, inventory and fridge studies.

The acknowledgement of this observation of the influence of ideal practices on food waste, has important implications in how to search for effective interventions to reduce household food waste. These implications point to new areas of intervention that should be further explored by stakeholders within policy and business.

Is This Sustainability? Food and Exclusion in the City

Gregory Katsas

Deree College - American College of Greece, Greece
grkatsas(at)acg.edu

Sustainability is a widely used concept but sometimes it is used as a politically correct, wishful thought. When this happens, it does not do a service neither to the concept, nor to its cause. This paper aims to deconstruct the use of the term 'sustainability' as it refers to food in urban settings.

The paper argues that the way food is consumed especially in an urban environment cannot be sustainable. This is supported by three arguments: The first is connected with the transformation of the economy: cities, especially in industrial and post-industrial economy, have nothing to do with food production. They create unequal access to food which is augmented by the stronger prevalence of globalization. The second argument is founded in the work of Thorstein Veblen and is connecting conspicuous consumption of food with absence of sustainability. Using the arguments of Veblen, it becomes clear that conspicuousness is virtually the opposite of sustainability. In addition, it accentuates inequalities as an increasing proportion of urban populations do not have the means to participate in these patterns of consumption. The third argument is environmental: cities, by their nature, produce more food waste than rural areas. This is also done in a conspicuous way, so it can not be sustainable. All the above create a situation of urban suffocation, contributing to the increasing problem of sustainability in cities.

The paper continues with suggested solutions, which, when studied from a critical perspective, are proven ineffective.

The making and the unmaking of sustainable housing in Europe: the dynamics of a social act.

Sophie Nemoz

Université Bourgogne Franche-Comté, France
sophie.nemoz(at)univ-fcomte.fr

Some months after the Third United Nations Conference on Housing and Sustainable Urban Development (Habitat III, 2016) at Quito where a "global commitment" was reaffirmed, a reflective approach is proposed here. For twenty years, "sustainable housing" has been designated as "a global solution" (Habitat II, 1996). Starting from an international comparison of the local development in France, Finland and Spain (Némoz, 2009), the paper examines the dynamics and their ambivalence in the light of spatiality and temporality lived in Europe. Revisits, at ten year intervals, contribute to this reflexive ethnography of sustainable housing (Némoz, 2017). It aims to understand and to explain the variations over time. The concept of "social act" is borrowed from action theory in sociology, more precisely from George Herbert Mead who defined it as a dynamic totality that is happening, constituted by

gestures (1934). Their particular feature is that they are interlinked and mutually reinforcing. These mutual adjustments will be highlighted by analyzing from an empirical viewpoint the dynamics of what is nowadays commonly called "the transition to sustainable housing". In this regard, the non-linear evolution will be retraced and understood as different stages of a social act whose creativity can be grasped and put into perspective with a larger historic whole.

RN12 | Session 05b Participation and Environmental Conflicts

Is spring silent? Local stakeholders perceptions on the consultation process of municipal adaptation strategies to climate change

Adriana Alves, Luisa Schmidt, João Guerra, Susana Valente

University of Lisbon, Portugal; University of Lisbon, Portugal; University of Lisbon, Portugal; University of Lisbon, Portugal

Adriana.Alves(at)ics.ulisboa.pt,

mlschmidt(at)ics.ulisboa.pt,

Joao.Guerra(at)ics.ulisboa.pt, smvalente(at)fc.ul.pt

The ClimAdaPT.Local project goal is the development of 26 Municipal Adaptation Strategies for Climate Change (MASCC), through the training of local municipality officials, engaging local communities and rehearsing an approach that can be replicated throughout the country. In order to increase the capacity for municipalities to incorporate adaptation to climate change in their planning and territorial management instruments, several methodologies and tools were developed. One of these tools is local stakeholder engagement.

In this presentation, we will show the results of that engagement tool. Workshops were carried out in order to understand perceptions of climate change impact, local risks, and also dispositions and suggestions to be incorporated in the ongoing MASCC, in 26 sessions that brought together the main stakeholders of the local communities concerned.

Each session comprised several discussion tables, in which a moderator and a reporter facilitated the debate, based on a script structured in three fundamental axes: (i) perceptions of the impacts already felt, or not, of climate change in the municipality; (ii) assessment of the viability of the proposals included in the strategy designed by municipal officials, as well as obstacles, responsibilities, suggestions and recommendations; (iii) visions of the future: how climate change and local identity will be articulated in the near future.

In this presentation, we will analyse results regarding climate change perceptions from the different groups of stakeholders engaged in the workshops.

Of Bison and Men - Institutional analysis of controversies concerning European bison conservation in Poland

Krzysztof Niedzialkowski

Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland
kniedz(at)ibs.bialowieza.pl

Poland hosts World's biggest population of the European bison. The species, extinct in the wild in the early 20th century and successfully restored from a few captive individuals, is now strictly protected by national and EU legislation. In recent years a few large European bison conservation projects have been implemented in Poland which contributed to the doubling of the free-ranging population. This conservation success has been accompanied by a heated discussion concerning European bison management, widely reported by media as a "conservation battle". By means of discursive-institutional approach, the paper investigates the socio-political aspects of the European bison conservation and maps key factors influencing the way the species has been managed in the last 60 years. It also identifies political and institutional background to the current conflict. The data was collected through desk research and 22 semi-structured interviews. It is argued that bison conservation has been developing along a path instigated during re-introduction of the species and led by an epistemic community of specialists in veterinary and animal science. Recently, it has been challenged by a coalition of specialists in animal ecology and animal welfare activists who construe bison differently and oppose its culling. These two coalitions try to reinterpret legislation and informal rules regulating bison management and have an impact on conservation activities. Political transformations provided windows of opportunity for their actions. It is suggested that sustainable bison conservation strategy should allow for both approaches to be applied in different sites.

Risk perception, mining industry and local people

Tuija Mononen
University of Eastern Finland, Finland
tuija.mononen(at)uef.fi

Local knowledge and perceptions on the environmental risks related to mining provide important information for understanding the impacts of mining. In my presentation I will explore the preliminary results on a survey conducted to local people connected to two Finnish mining project. The survey will provide a detailed information for developing risk perception by the local people. Risk perception, knowledge and trust of local people connected especially to water management is explored.

My main questions are: 1. How local people and communities have experienced the environmental risks, especially related to waters, of mining industry in their own area? 2. How information about mining and its environmental impacts and risks is produced, interpreted and linked to community level, and 3. What kind of possibilities there exists for integrating local knowledge and scientific knowledge on environmental

risks in mining policy?

The first case, Talvivaara, represents a newer mining project, where the environmental risks have been actualized seriously. Another case, Pyhäsalmi, is an old mine which has been operating long time without any serious water problems. Pyhäsalmi mine is an underground copper and zinc mine. It is one of the oldest and deepest underground mines in Europe. Talvivaara mine is a nickel and zinc mine. Construction started, and the first metals were produced in 2008. Mining is based on bioheapleaching. Talvivaara mining project has been in publicity due to environmental problems.

Taking environmental participation seriously: when and why is participation meaningful?

Göran Sundqvist, Linda Soneryd
University of Gothenburg, Sweden; University of Gothenburg, Sweden
goran.sundqvist(at)gu.se, linda.sonereyd(at)gu.se

Participatory approaches in environmental governance are regularly defended as capable of leading to more robust assessments and decisions. However, the extent to which such a positive assessment is possible remains dependent upon how the object of participation is apprehended and enacted by involved participants.

Public participation in environmental regulation has been a central issue for environmental sociology and science and technology studies (STS). A strong focus has been on who has what kind of relevant competence for the issue at stake, or what kinds of meanings and identities are at play in these processes. A more profound analytical focus on the nature of the issue has been lacking. One exception from this is Marres' suggestion that studies on participation should focus more on "the issue".

In this paper we further develop the focus on what participation is about – the issue at stake – by using the distinction between "negotiable" and "non-negotiable" questions of concern. From this distinction we provide means for unpacking and analysing the variable meaningfulness of participation: participation is less meaningful when the issue is understood as being "non-negotiable" and more meaningful when "negotiable".

We illustrate our framework with examples from the environmental field in which public participation has been promoted as being of importance: nuclear waste management (as an example of a non-negotiable issue) and water management (as an example of a negotiable issue). The two examples are not seen as negotiable or non-negotiable in themselves, rather this is an effect of different science-policy contexts.

RN12 | Session 06a Participation, Citizenship and Environmental Democracy

Competing insulation practices in a capitalist economy

Françoise Bartiaux
Université catholique de Louvain, and FRS-FNRS,

Belgium

francoise.bartiaux(at)uclouvain.be

This contribution is intended to explore the potentialities of social practice theories, especially Schatzki's works, for presenting and discussing the results of an exploratory qualitative and small scale research. Following Schatzki's concepts, this contribution describes practices performed or not in a still burgeoning insulation market, either by professionals and contractors, by homeowners, and by administrative agents and policy makers. Results show that these practices are competing in a capitalist economy and that this competition contributes to create energy-performance gaps. To contribute to conceptualising the results, the concept of 'competing practices' is proposed here to refer to diverse business practices that attempt to create, develop or maintain a market share (sometimes at high costs) in a capitalist economy. This competition between specialized professionals and contractors such as carpenters, plumbers and so on leads to a segmented market according to homeowners' resources in terms of competence, money, and time. Different material arrangements also contribute to this segmentation. This qualitative research is mainly focused on the insulation market and its evolution in recent years in Wallonia, the Southern and French-speaking Region of Belgium. The empirical material is varied and consists of in-depth interviews with professionals, contractors, and homeowners; several meetings were also held with officials of the regulatory competent authority.

Participation within local renewable energy projects: The role of social networks

Fleur Goedkoop, Jacob Dijkstra, Andreas Flache
University of Groningen, Netherlands, The; University of Groningen, Netherlands, The; University of Groningen, Netherlands, The
f.goedkoop(at)rug.nl, j.dijkstra(at)rug.nl, a.flache(at)rug.nl

This paper looks at the role of social networks in facilitating or hindering participation in local renewable energy initiatives (LREI). Typically, in such projects a group of front-runners shoulders the start-up costs. The initiative can however only succeed if more members of the wider community join in at a later stage.

Most existing studies investigating participation in community energy projects focus on individual characteristics of community members, disregarding the network of social relations between individuals. Studies that do include social networks often employ small samples and often rely solely on qualitative data. We use quantitative data from seven villages and neighborhoods in the Netherlands (N=636) to test more precisely hypotheses about the effects of networks on participation. We expect that people are often recruited by acquaintances who already joined the movement. Importantly, individuals with a direct connection to front-runners may trust the initiative

more, may have more accurate information about it, and may feel a strong normative obligation to join.

Moreover, also indirect connections to front-runners through community social networks might matter. Individuals engaged in (local) organizations are generally more involved in the community in the first place, and may therefore be more willing to join a LREI. Additionally, these (local) organizations may indirectly expose them to the ideas of the front-runners through indirect social ties.

We analyze the wider community network and individuals' indirect connections with front-runners through affiliation networks, next to measuring the direct relations with front-runners and others in the community. From these networks we estimate individual level network variables used in a logit regression model of intention to participate. In addition, we compare the community network structure of these communities.

Investigating the social-ecological dynamics in the region of Corinth, Greece

Erasmia Kastanidi
Harokopio University, Greece
ekastanidi(at)hua.gr

Local spaces are associated with a flux related to the constant reshaping of their structures through interactions between social, political and economic processes. When considering social spaces as geographic entities embedded in their ecological environment, the nexus of interactions increases with the inclusion of ecological processes. These interactions, driven by internal and external forces, are more evident in rural areas, where the spatial characteristics have been co-developed by human activities and natural processes, and where social and personal well-being is associated with the presence of ecosystem services. The supply of ecosystem services, such as soil fertility and water availability, is affected by climate change which puts pressure on agriculture. Furthermore, reforms on rural and environmental policies coupled with the effects of the economic crisis have introduced Greek rural areas to an era of high instability. This study focused on understanding the factors that affect the ability of the rural areas in Corinth to cope with these forces of change and maintain a satisfactory standard of living. Rural areas in the region have been found to be dealing with the pressures in different capacities based on a variety of factors, ranging from the social and ecological characteristics to the ways the stakeholders from the relevant sectors think and act in relation to their area of interest. However, a common pattern emerges with many of the interviewed stakeholders expecting that new opportunities are being created through the re-construction of nature and its services as commercial products.

Successes and failures of participatory planning - Evaluation of participatory planning processes in nature conservation

Stakeholder participation in environmental issues has an utmost importance in modern European democracies. One of the most important arguments for participation is that it could merge different subjectivities on the natural environment and engage stakeholders in future processes related to the natural environment. This paper aims to critically analyse 25 participatory processes accompanying the preparation of Natura 2000 management plans in Hungary between 2007-2015. We focus on evaluating the process and the outcome of these participatory management planning processes. For the analysis we build an evaluation framework based on the literature on public participation. The evaluation criteria for process and outcome were chosen and defined. These were tailored to conservation-related management planning processes and stakeholder involvement. The evaluation of the selected planning processes followed a structured qualitative research protocol. All written material (e.g. transcriptions and notes of semi-structured interviews and forums, communication reports and management plans) were analysed, using the qualitative content analysis method. As a result there were serious shortcomings in the analysed processes, independent of the context and the structure of the planning process. Major points for improvement include 1) conflict resolution, 2) early involvement and 3) well-defined goals. Two criteria, 'implementation of the plan' and 'impact on the plan' also raised our attention because of the failure to evaluate planning processes along these aspects properly due to lack of data. Finally it is concluded that a general framework for evaluation is applicable for

participatory processes in nature conservation especially in participatory management planning.

RN12 | Session 06b (Un-)Sustainable Consumption

Self-Provisioning and Re-Commoning Food in Central and Eastern Europe

Balint Balazs
 ESSRG, Hungary
 balazs.balint(at)essrg.hu

The main idea is to illustrate the 'food as commons' concept based on the state-of-the-art review of the extensive practice of food self-provisioning (FSP) in Central and Eastern European countries (and through the specific case study of Hungary). Discourses at the policy as well as the advocacy level about the benefits and potentials of food relocalization have been proliferating, while the significance of FSP has often been downplayed in the academic literature without presenting quantitative or qualitative evidence about the scope of and motivation for FSP activities. The 're-commonification' of food systems in Central and Eastern European countries has a solid foundation and potential. Especially the socially inclusive practice of food self-provisioning as an important non-market source of local food which is unrelated to any market transactions and compliant with principles of sustainability. Food in these practices is not considered as a commodity, and such customary traditions of FSP extend to all strata of society. Actually, FSP is not a survival strategy of the poor as often suggested by the commodity narrative. What dimensions of food are most valued through these practices? How are these practices connected to values of nutrition, culture, community? How can food (security) policies help maintaining FSP? The paper concludes that FSP practices also re-valorize seed, land and gardening knowledge as commons showing that high proportions of these societies are already on a sustainable pathway towards a new food regime.

Sustainable Development in Alternative Food Networks: uncovering the hidden relations between food production and consumption

Maria Touri
 University of Leicester, United Kingdom
 mt141(at)le.ac.uk

This paper engages with the issue of sustainable development in the context of global Alternative Food Networks (AFNs). It specifically addresses the developmental potential of AFNs for the farming communities in the Global South, through the relations that underlie food production and consumption. Alternative Food Networks are a dominant feature of the fight and resistance towards the ills of neoliberal globalization and its social and environmental impact on the global food system. Yet, despite the ample academic attention AFNs have received, much of the scholarship remains focused on the two ends of production and consumption, neglecting in-between

relations that can prove significant for the sustainability of farming communities. The paper begins to explore these relations drawing on a renewed theoretical approach, namely the Communication for Social Change (CSC) theory, and the crucial role of the communication processes that reside between production and consumption. These relations are then examined empirically through a qualitative case study: a community of farmers in South India and their relation with small private enterprises from Europe and North America. The findings reveal significant ways in which these relations can foster sustainable development, as well as the variety of emergent practices that populate AFNs and which merit more scholarly attention and critique.

"Conceptualising sustainability in globalising food provision; networks, flows and actors

Peter Oosterveer

Wageningen University, Netherlands, The
peter.oosterveer(at)wur.nl

The secure the future of food provision, its sustainability needs to be enhanced. However, under the conditions of increasing globalisation in the supply of food there is a particular lack of adequate practices, governance instruments and concepts. Interactions between civil society organisations, governments, the food industry, consumers and primary producers constitute dynamic fields of environmental change in global food provision. Sustainability in food provision builds on changing the social practices of producing, processing, trading and consuming food and on transforming the relations between these practices involving networks and flows. Conceptualising, processes of transformation, evolving roles of different societal actors and interactions between local and global dynamics constitute an important challenge for environmental sociology. In this paper, I will reflect on this challenge on the basis of empirical research in seafood, palm oil and other food items.

Sustainable Wellbeing in the Nordic Welfare state?

Paula Saikkonen

THL, Finland

paula.saikkonen(at)thl.fi

The Nordic welfare states are more equal societies than many others but they consume resources too much. Understandable economic growth cannot be infinite in the finite globe. Yet, the growth is presented as it would bring wellbeing for all. Less asked question is; what kind of wellbeing the Nordic welfare state supports and could it be more sustainable? The aim of the public services is to increase wellbeing or at least bring some support. We wanted to clarify what the comprehension of the social services about wellbeing is. The research question was: how social work supports the wellbeing of the social assistance recipients? Well-being was understood as a complex and relative research object. The theoretical framework based on Erik Allardt's categorization of

wellbeing. According to him, wellbeing includes three categories: living standards (having), meaningful social relationships (loving) and the possibility to be herself or himself (being). The data was collected as part of the larger research project. As the interviewees were people who were on income support it is not surprise that having category appeared to be dominant. It is an important category as it sets the standards for need covered by the public sector. The clients' experiences were that social work focused mostly on the having category despite the fact that the other categories were essential to wellbeing. Lack of understanding about the complexity of wellbeing in the social services is problematic and it might hinder more sustainable alternatives for social policy.

RN12 | Session 06c Social Movements and the Environment

Doing what no one else wants to do – understanding citizen support for a nuclear waste repository in Östhammar, Sweden

Karl Hannes Benjamin Lagerlöf

University of Gothenburg, Sweden

hannes.lagerlof(at)gu.se

Most communities would not volunteer to host a repository containing high-level nuclear waste. Still some do, even with citizen support, which is the case in Östhammar, Sweden. This paper examines how this support is maintained and how Östhammar has become and remained the country's designated site for disposal of the waste. It is proposed that existing theory on nuclear communities is indeed helpful, but that such theory either does not address, or fully explains, local citizen support for the nuclear activities. The nuclear oasis theory does not focus specifically on such support but rather on nuclear communities as unequal, geographically remote, environmentally degraded and disadvantaged sites where nuclear enterprise roams freely. In addition to not focusing on the support, this theory also seems somewhat misleading as Östhammar is situated close to a large city, not more degraded, nor more unequal, than the average Swedish municipality. The industry awareness theory on the other hand describes nuclear communities as entrepreneurial innovators seeing potential where others see useless waste, that economic dependency is of secondary importance, and that they have 'integrated the industrial activity and cognitive understanding into their local culture'. These claims are, however, not underpinned by in-depth empirical research and, hence, tell little of what constitutes this 'cognitive understanding' and 'local culture' more precisely. Building on fieldwork not previously carried out in Sweden, this paper makes an empirical contribution to the study of nuclear communities, but also contributes theoretically by addressing the underdeveloped aspect of citizen support in nuclear communities.

Political use of Twitter in post-Gezi environmental protests

Burak Dogu

Izmir University of Economics, Turkey
doguburak(at)gmail.com

Environmental protests differ from the other protests in the kinds of concern they voice and embrace disconnected forms of collective action focused upon environmental issues (Rootes, 1997). They appear to be bounded by ecological concerns, however their grievances are mainly based on the political atmosphere in which they are nourished. In this regard, recent environmental protests in Turkey can be associated with the protest ecologies that have emerged after the Gezi movement as well as the governmental policies of the ruling Justice and Development Party (AKP).

This study reflects on the post-Gezi environmental protests with a particular focus on the political use of Twitter by a wide variety of players such as the environmental movement organizations, media, political figures, and activists. Based on the analysis of three small-scale environmental protests in Yırca, Iztuzu, and Cerattepe, it points out to the role of Twitter as a political platform connecting players across protests. Network analysis will be conducted to identify and position the players as network-analytic approaches in social movement studies invite the observer to look below the official stories of movements and their activists (Krinsky & Crossley, 2014). After having mapped the protest networks, a combination of quantitative and qualitative methodologies will be used to reveal the type of connections that the players have built during the protests. The interplay between the players and the clusters based on their connectedness will be analyzed considering the microstructural network factors.

Food sovereignty, peasant agriculture and agrobiodiversity: struggles, practices and institutionalization processes in Italy

Alessandra Corrado

University of Calabria, Italy
a.corrado(at)unical.it

In the Italian context different efforts have been made in order to establish principles, practices and rules to sustain peasant agriculture and to promote reterritorialization of food and agroecology. The aim of this contribution is to analyse the efforts for food sovereignty construction presenting firstly a general framework of social mobilization around alternative models of agriculture, and secondly the construction of peasant seed and alternative food networks. Opportunities and constraints of institutionalization processes and informal practices by different actors will be pointed out.

Divestment Movements in Canadian Universities and Their Effects on Institutional Investment Policies

Mihai B Sarbu

Memorial University of Newfoundland, Canada
mbsarbu(at)mun.ca

Many individuals, organizations, and municipalities around the world have taken the decision to divest from fossil fuels. This study is focused on divestment movements in universities because the historical evolution of previous divestment initiatives (such as against tobacco companies and the apartheid South Africa), has shown that universities represent an essential link for the expansion of a divestment campaign: based on these historical precedents, once a movement is adopted unequivocally by universities, it spreads widely in the society at large.

At the same time, there is little research on how effective divestment is in changing institutional investment policies, and there is no agreement regarding its effectiveness in fostering a change from the current use of fossil fuels to cleaner sources of energy.

The purpose of this research is to analyze the impacts of the divestment movements that have taken place in several Canadian universities. This research is mainly exploratory because the divestment movements that are analyzed are recent and the theories that would support an in-depth conceptual analysis have not been developed yet. However, some concepts borrowed from the institutional and the social movements literature are relevant and will be used.

This study will be completed in a Canadian context and will help better understand the dynamics of divestment movements and their influence on institutional investment policies.

RN12 | Session 07a Growth, Degrowth and Ecological Alternatives**The demand for a sustainable city: looking for best practices in Portland, Oregon**

Gabriele Manella

Università di Bologna - Alma Mater Studiorum, Italy
gabriele.manella(at)unibo.it

For many decades, urban demand was affected by the "suburban dream" of having individual houses outside the downtown. As a result, this dream had a dramatic impact on land use, air pollution and, more in general, on the quality of urban life. There are more and more efforts to stop this trend however. Some international networks (C-40 Cities, Transition Towns, European Green Cities Network, etc.) are clearly indicators of this awareness.

My study focuses on the demand for "another" city in which growth must be combined with social progress, quality of life and environmental respect. I will consider the case of a mature urban area: Portland, Oregon (US).

Portland is internationally recognized for more than four decades of experimentation and success in the implementation of various urban sustainability efforts. It is interesting not only for the measures implemented but also for the way through which local community

and university have been part of the process. In particular, I will focus on the best practice of Urban Sustainability Accelerator at the Nohad Toulan School of Urban Studies & Planning. Several aspects of this project will be considered: the methodology, the experts who are involved, the engagement of local population, and the results obtained in terms of sustainability and quality of urban life.

My work is the result of a period as Visiting Professor at the Department of Sociology of Portland State University. My methodology is based on official document analysis, direct observation, and talks with local stakeholders and key informants.

Everyday life and its energy assemblages: the economic crisis as an opportunity for ecological becoming?

Alice Dal Gobbo
Cardiff University, UK
DalGobboA(at)cardiff.ac.uk

The 2008 financial crisis has meant for Europe a much wider social, political and economic questioning of its underpinnings. This delicate contingency combines with an increasingly evident ecologic crisis, indissolubly related to the same capitalist, post-industrialist, consumer economy that cracked in 2008. As the latter is proving unsustainable on all these levels, there is space for a re-structuring of its core tenets: development, industrialism and infinite growth (via consumption). But if governments' action is lagging behind of the urgency of the situation, where can we look for change? Starting from my research experience, I reflect on the potentiality of the everyday as a site of resistance, dissidence and creation. My participant observation study focusses on energy consumption and use in everyday life. The locale is a town in the North-East of Italy, Vittorio Veneto, an interesting example of a formerly affluent area strongly hit by the recession. Inspired above all by the philosophy of Gilles Deleuze (with Guattari, but also in his readings of Nietzsche and Spinoza), I look at the ways in which (collective) desire shapes the energy "assemblages" that subjects live through in their ordinary life. If the dominant (libidinal) economy gears towards the destructive paradigm of hyper-consumption and intensive energy practices, are now arising resistant desires that evade such hegemony? To what extent are they capable of a radical creation of more ecologically sensitive, life affirmative, assemblages? Finally, can the social scientist act as a catalyser of this rupture? I bring attention not only to the opportunities, but also to the risks and contradictions of the ecological subjectivities emerging in this time of crisis.

Cities fostering sustainable transitions through the creation of more sustainable infrastructures. The re-circulating room in Sweden

María José Zapata Campos, Patrik Zapata
School of Business, Economics and Law. University of Gothenburg; School of Public Administration.
University of Gothenburg

mj.zapata(at)handels.gu.se,
patrik.zapata(at)spa.gu.se

In today's consume-and-discard society a steady increase in waste generated per person threatens the overall sustainability of our planet. In response to this global environmental challenge, recent European and national directives have shifted the emphasis to re-circulating and re-using practices. This paper examines the role of cities in fostering sustainable transitions based on the case of the 're-circulating room' in Sweden. The paper starts with a historical reconstruction of reuse parks in Sweden which have also derived into re-circulating mini-parks in city districts and re-circulating rooms in housing block apartments where residents can exchange, borrow, repair or create items, as a combination of a reuse room and a makerspace. In the first part of the paper, we trace how the idea of reuse-park has travelled and been locally translated into different re-circulating rooms in cities in Sweden. The second part of the paper zooms in on the case of the city of Gothenburg where the first reuse park in Sweden was created, and where the City of Gothenburg is in the process of creating several re-circulating mini-parks in city districts in collaboration with public housing companies and civil society organizations. Based on interviews, document analysis and meeting observations, the paper examines the process of creation of this new type of infrastructure, under the prism of institutional entrepreneurship theory, by examining how these projects recombine and mobilize resources (human, financial, material-and spatial), rationales (reframing symbols, transforming abjection to waste into positive creativity) and relations (via internal and external collaboration and the creation of new institutional arrangements, roles and expectations). The paper concludes with a discussion around the role of cities in sustainable transitions towards de-materialization policies.

Institutional Decoupling: The Paradox of Green Energy Development in China

Jenn-Hwan Wang, Sheng-Wen Tseng
National Chengchi University, Taiwan; National Taiwan Ocean University, Taiwan
wangjh(at)nccu.edu.tw, swtseng.tw(at)gmail.com

The rapid economic growth of China in recent decades has generated a dramatic increase of electricity demand, in which as high as 70% of China's electricity was generated from coal until recently. Looking for alternative energy resources now has become the mission of the central state, including developing wind, solar, nuclear, and hydropower. Supported by those green energy resourceful local governments, the Chinese central state's policy has gained a high degree of success, especially on Wind and solar energy sectors. But paradoxically, over capacity has become a salient phenomenon in developing these new energies in those provinces such as Gansu and Inner Mongolia: meaning the grid lines are not enough to send the electricity power out

and the locality does not have the capability to absorb the generated electricity. Even more surprisingly, some of those areas still continue to build coal-based power plants. This paper found that institutional decoupling has been the main cause to this phenomenon. It is due to the central state's policy steering by providing financial incentives, plus the cadres' evaluation system, local officials were enthusiastically developing green energies for the sake of developing local economies. This can be called local government's environmentally bundled economic benefit. However, two institutional hurdles create problems for over capacity: one was the rigidity of grid companies in responding to the increasing demand; the other was the state-owned companies' own interests that were beyond the coordination power of local officials. We will show that the localities which we visited have different patterns of institutional decoupling and those problems will be the major tasks that China encounters in the next few years in developing green energy.

RN12 | Session 07b New Trends in Environmental Sociology II

Governance of the senses: Tackling the perception of sustainable transitions

Nona Schulte-Römer

Helmholtz-Centre for Environmental Research - UFZ, Germany

nona.schulte-roemer(at)ufz.de

This paper focuses on the governance of our sensory perception in the context of environmental changes and sustainable transition. The qualitative empirical focus is on energy, water and lighting infrastructures. Although they shape the look and feel of our built and 'natural' environment, these infrastructures are often 'invisible' and taken for granted.

Yet, when things change, as in cases of sustainable transitions, 'invisible infrastructures' become visible and often controversial. In these moments, so the thesis, individual and collective sensory perceptions of environmental changes play an important role. Residents complain about the disfigurement of landscapes, about smells, noise and light pollution. Innovators react by framing local complaints as 'NIMBYism' and take countermeasures to resolve or forestall controversies and resistance to their projects. The analysis and validation of such countermeasure is a central topic in social scientific research on sustainable transition projects. Financial compensation schemes, participation formats and legislation are well-established research topics. In contrast, perception-related measures are only mentioned but not systematically explored. This research makes a start by analysing comparatively and in different fields of socio-technical transitions how innovators tackle perception-related issues with technical, political, regulative and constructional measures. Examples include the definition of minimum distances, the building of walls and sensor-based evidence production. The aim of this

explorative research is to categorise and conceptualise this 'sensory governance', i.e. the governance of our senses in socio-technical contexts. Theoretically, it draws on pragmatic sociological perspectives and studies on science, technology and innovation (STS).

The effect of temperature shocks on health at birth: evidence from Hungary

Gabor Hajdu, Tamás Hajdu

Centre for Social Sciences, Hungarian Academy of Sciences; MTA-ELTE Peripato Comparative Social Dynamics Research Group, Hungary; Research Centre for Economic and Regional Studies, Hungarian Academy of Sciences

hajdu.gabor(at)tk.mta.hu, hajdu.tamas(at)krtk.mta.hu

In this research we analyze the effect of extreme temperature during the pregnancy on the outcomes of live births in Hungary. Birth registry data of 2 million newborns between 1990 and 2009 are matched with daily temperature data. Matching is based on the place of residence of the mother at the time of the delivery. Birth registry data that covers the entire population come from the Hungarian Central Statistical Office, whereas city-level weather data come from the Hungarian Meteorological Service. We calculate indicators of temperature shocks (e.g. the number of extremely hot days) for each trimesters of the pregnancy. Our dependent variables are indicators of health at birth (e.g. birth weight, pre-term birth, congenital disorder). Although variation in weather over time supposed to be exogenous, we are able to control for important socio-demographic factors that might influence newborns' health, and even for unobserved time-invariant mother characteristics by performing mother-fixed effects estimates. In this way our study identifies causal effects.

Our main research question is whether temperature shocks (defined as occurrence of extremely hot/cold days) in utero influence health at birth. The second research question is the following: in which trimester is this relationship the strongest? Finally, we try to answer the question: how do the estimated effects differ between high- and low-status families?

In one hand, this study adds to the large and growing literature studying the effects of fetal conditions on short- and long-term outcomes (e.g. health at birth, education, labor market success, etc.). On the other hand, our research is also related to the literature analyzing the impacts of global climate change.

Catastrophism as a breach in the sense of social reality: a biographical approach of conversions to "collapsology"

Cyprien Tasset

EHESS, France

cyprien.tasset(at)gmail.com

Catastrophist perspectives are gaining momentum among discourses over environmental issues (Urry, 2011: 36 sq). On the margins of central public debate, more and more discourses are held, that promise the

worse for humanity in the next decades, for reasons deriving from the environmental crisis. Some researchers have studied the role of catastrophism in individual environmental conversions, or in the Transition Towns movement (Semal, 2012). We would like to focus on the catastrophist experience itself. How do social actors turn into self-labeled catastrophists? To whom does it happen? Furthermore, what kind of collective action is possible on the basis of catastrophism?

A few years ago, a small association was founded, dedicated to the promotion of responsible and clear-sighted analyses of the incoming collapse that, according to its founders, would soon result from pollution and depletion. Its founders were neither trained scientists nor integrated in ecologist activism. They were self-taught "collapsologists", coming from rather variegated parts of the middle classes. The association holds meetings, animates a Facebook page and a website. We interviewed several of its members, so as to contextualize their conversion to a catastrophist perspective in their biographical trajectory.

Coming to this object from the sociology of the critique (Boltanski, 2011), we will focus our analysis on the central episode of the interviews: the narratives of the unsettling moments when the interviewees switch to a catastrophist vision of the world, and when their sense of social reality staggers. Finally, we will discuss the paradoxes of catastrophism as a critical scheme.

Towards hydrogen society: pathways to sustainability transition in Japan

Ritsuko Ozaki, Midori Aoyagi, Fred Steward
Policy Studies Institute, University of Westminster,
United Kingdom; National Institute for Environmental
Studies, Japan; Policy Studies Institute, University of
Westminster, United Kingdom
r.ozaki(at)psi.org.uk, aoyagi(at)nies.go.jp,
f.steward(at)psi.org.uk

Hydrogen energy has been identified by the Japanese government as a way to address energy security and energy efficiency, to reduce CO₂ emissions, and to promote industry development. Their Hydrogen Strategic Roadmap presents three phases of development plans towards the realisation of 'hydrogen society'. From our interviews with key stakeholders in the government and industry, and the documents we collected, we see two parallel strategic pathways. One is a vision based on centralisation with an emphasis of the development of hydrogen transport and domestic energy systems that use fossil fuels to produce hydrogen energy for the next twenty years, while keeping the future CO₂-free hydrogen generation in the scope. The other pathway is an outlook for decentralised, local systems, taking more holistic approaches to the realisation of hydrogen society with solar- and wind-powered hydrogen production and locally integrated supply chains. Furthermore, these strategies include varied applications of hydrogen energy to end use consumption. The difference between the two

strategies is the scale of end use application they envisage. Both strategies focus on fuel cell vehicles, such as passenger cars, buses and industrial forklifts, and the domestic hot water and power cogeneration system called 'Ene-Farm'. The latter strategy, however, includes a larger scale of mass hydrogen energy application, with the contribution to the overall carbon emissions in mind. In light of this mixed picture, we explore how to keep a balance between the two pathways and how to manage a successful transition to sustainability.

RN12 | Session 07c Social Theory and the Environment I

"Jellyfish" bloom, swimmers and fishermen: an interdisciplinary comparison between two French Mediterranean lagoons

Guillaume Marchessaux, Cécilia Claeys, Delphine Thibault

Aix Marseille University, Univ Toulon, CNRS, IRD, MIO, Marseille, France; Aix-Marseille University, IRD, LPED, Marseille, France; UMR MARBEC (IRD – Ifremer – Univ. Montpellier - CNRS), LMI ICEMASA, Department of Environmental Affairs, Cape Town, South Africa
guillaume.marchessaux(at)mio.osupytheas.fr,
cecilia.claeys(at)univ-amu.fr, delphine.thibault(at)ird.fr

This communication presents the first results of an interdisciplinary research on the invasive species *Mnemiopsis leidyi*, an exotic predatory ctenophore (some kind of jellyfish). Comparing two French Mediterranean lagoons (the Berre and The Vacarres lagoon in Camargue), this study associates a sociological qualitative survey (semi-structured interviews with local users and managers) and an oceanography monitoring (ctenophore population dynamics and ecophysiology). First, the analyse highlights different types of interactions between gelatinous and users depending on the number and density of organisms, but also on users' activity and ethics. Here, objective factors (e.g. health impact, economic cost...) cross subjective ones (e.g. aesthetic considerations, environmental concern...), favouring or not users' acceptance of gelatinous bloom. Second, the comparison between Berre and Camargue lagoons reveals the need to consider territorial dimensions of human-animal relations. During the early 20th century, the Camargue lagoons were one of the first natural reserves in France, while the Berre lagoon became a hot spot of petrochemical industries. Since, nature protection policies have been strengthened in Camargue, whereas industry has declined around the Berre lagoon and environmental rehabilitation policies have been put in place. But the recent (2005) introduction and proliferation of *Mnemiopsis leidyi* have affected both the Berre and the Camargue lagoons. Local users, especially fishermen, as well as managers, are impacted by *M. leidyi* bloom in both lagoon. Finally, this common issue rises further questions regarding the paradoxical relationship between natural and artificial processes

and its corollary, the permeable frontier between nature and culture.

A Europe of Happiness and Sustainability?

Jochen Dallmer
University of Kassel, Germany
Dallmer(at)posteo.de

While being in a severe crisis Europe is still mainly focussing on economic issues as a common ground, trying to keep the current system up and running, with the vision of regaining a pre-crisis level of economic wealth.

This means pursuing a pathway that has never been sustainable, not economically and especially not ecologically. The Planetary boundaries and all research on climate change etc. make it obvious that such a growth focussed development is impossible to maintain, despite all hopes on 'green growth' there is a strong need for a sufficiency approach to complement technological improvements. But concepts of a degrowth approach remain marginal and sufficient lifestyles are broadly still envisioned as asceticism.

The discourse on 'happiness' and 'the good life' could offer a viable third pathway: Results from the studies on subjective well-being suggest a correlation between happiness and sufficiency. Lifestyles that are less materialistic while not reducing it to a modest life as such, but focusing to develop once capabilities into a realm of pleasure and meaningful deeds.

A good life for all needs a redefinition beyond the one house, one car, one full-time job picture being framed in the 20th century. Ancient and modern philosophies of a happy life roam around either intellectual work or a joyful laziness. In no regard they promote a stressful life pivoting around labour and consumerism.

So might going for the happy life be a good target for a sustainable future in Europe?

Exploitation of Nature and Capitalist World-Ecology in Neoliberal Times

Emanuele Leonardi, Luigi Pellizzoni
University of Coimbra, Portugal; University of Trieste
leonardi(at)ces.uc.pt, luigi.pellizzoni(at)dispes.units.it

Jason Moore's idea of world ecology suggests that capitalism does not have but is an ecological regime. Value creation occurs not upon nature, but through it, that is, within socio-natural relations emerging from the articulation of capital, power and the environment. Moore's analysis can be further historicized by projecting it against current neoliberalization processes. Issues as diverse as carbon trading, biotech industry and solar radiation management show that the way 'nature' is accounted for and enacted in neoliberalism is profoundly entangled with labor (as information-producing activity). Hence, a critique of Cartesian dualism(s) does not necessarily lead to emancipation: cutting-edge neoliberal managerial thinking actually departs from Western binaries, thriving on the indistinctiveness of the natural and the social. In this context one can talk of 'exploitation of the environment' in a Marxist technical

sense, that is, detecting value-extraction directly from nature.

To address such transformation we mobilize the concept of imprinting as a logic of exploitation which takes place beyond the wage-form and supplements what Marx called subsumption of labor under capital: neoliberal environmental commodities (e.g. carbon offsets) contain labor as information and, consequently, embody value through the exploitation of that specific form of labor.

The implications of our argument will be gauged against so-called accelerationism. The case for acceleration is made from both the right and the left. Despite contrasting aims (preserving vs. overturning the social order), these standpoints hypostatize capitalist social relations and share the idea of decoupling social systems from natural biophysical systems, pointing towards a 'post-natural' sustainability. Problematizing this picture should help envisage non-exploitative forms of productivity as a way out from the crisis of world-ecology.

On the trails of SDGs and Paris Agreement

Luisa Schmidt, João Guerra
University of Lisbon, Portugal; University of Lisbon, Portugal
mlschmidt(at)ics.ulisboa.pt,
Joao.Guerra(at)ics.ulisboa.pt

The drive to economic growth has persisted in contemporary societies, despite its effects on the very foundations of the global economy, whereas the discourse of sustainability has not surpassed the level of "wishful thinking". The evolution of the global ecological footprint, which underlines climate change impact, points to a narrow path in the reconciliation of social and environmental imperatives for present and future generations and to a redoubled need for social and environmental equity. Within an approach that postulates a stronger connection between discourse and practice, both Sustainable Development Goals (SDG) and the Paris Agreement achieved under COP21 strengthen the strategy of universal involvement and commitment, recognizing the scarce nature of results obtained so far, and demanding alternative action for effective change regarding a new and strategic global agenda. This presentation reflects on this universal desideratum which requires redoubled attention to the decline – and also recovery - of environmental and social conditions, particularly in a time of perplexing political change. Indeed, the COP 22 (Marrakesh, Morocco, November 2016) was overshadowed by the American elections results, and the victory of the 'negationist' Donald Trump. The long-term consequences of this fact are still difficult to foresee, yet the impact of climate change, and the societal apprehension which has gradually produced the consensus surrounding it, constitute factors which are pushing governments to comply with Paris Agreement and to its efforts to ensure adjustment to change and the reduction of emissions.

RN12 | Session 08a Migration and the Environmental Crisis**“From the African drought to the European utopia”: representations of the environment and social experiences of mobility of refugees and migrants from water-stressed countries**

Inês Vieira

FCSH/NOVA, Portugal

ines.vieira(at)fcsh.unl.pt

Environment, migration and asylum are among the most socially constructed issues of the 21st century. Research and political debates around the intersection of these issues developed particularly in the last years, having recently gained institutional recognition in diverse UN frameworks and conventions.

The social construction of this problem also implied a growing symbolic dimension, particularly through its incorporation on visual and verbal discourses not only through science, but also media and social actors that shape the comprehension of social and environmental issues by the lay audience (ex. Pope Francis).

But a gap can be found in the subjective dimension of this social construction: albeit the reiterated importance to research and develop policies on environmental migrations, the identification of “environmental/climate refugees” or “environmental migrants” has been discouraged (IPCC, Foresight), considering the difficulty of isolating the environmental factor within mobility drivers, as well as the non-identification with such labels by some of the people which could be paradigmatically affected by environmental and climate changes (ex. Tuvaluans).

To explore the subjective dimension of those who move from countries with environmental risk, particularly water stress, we propose to discuss the results of a qualitative PhD research work developed with Ethiopians and Eritreans in Italy and Cape Verdeans in Portugal. The aim is to explore the reflexivity of migrants and refugees and their representations on environmental factors in the countries of origin, the interrelations with other drivers of mobility, and the framing within their own experiences of mobility towards Southern Europe.

Do immigrant shepherds contribute to tackling generational renewal in euro-Mediterranean pastoralism ?

Domenica Farinella, Michele Nori, Athanasios Ragkos
University of Cagliari, Italy; European University
Institute, Italy; Technological Educational Institute of
Western Macedonia, Greece
farinella(at)unica.it, michele.nori(at)eui.eu,
ragkosagrecon(at)gmail.com

While the societal demand for the products as well as the services of pastoral systems is growing, this does not seem to translate into an improvement in the living and working conditions of those who work in this sector. Current dynamics rather indicate that the sons of breeders often seek alternatives outside pastoralism, thus favoring the depopulation of

mountain areas and exposing pastures to a problem of generational renewal. This is the context witnessing a growing presence of immigrant shepherds, who reach southern Europe from other pastoral areas in the Mediterranean, coming to provide skilled labor at a relatively low cost. The paper analyzes in a comparative key the role of immigrant salaried shepherds in four different Mediterranean countries (Italy, Spain, France and Greece). Their presence enables maintaining alive and productive the pastures, reproducing the patterns of a generational renewal associated to an ethnic substitution that has characterized Euro-Mediterranean pastoralism in the last century. The transition from manual labor to entrepreneurship and livestock ownership in this sector shows very low rates for migrants, and this undermines the ability of the incoming population to contribute to the future of the pastoralism. Immigrants only represent though one of the options to revive this sector. In order to promote the sustainability and the development of the pastoralism, it is necessary to ensure decent living and working conditions for extensive breeders and shepherds (foreign and local) alike, and to provide a perspective of upgrading in social as well as economic terms. Sustainable pastoralism will therefore be the result not only of a system of aid and subsidies, but it rather requires the articulation of an enabling political framework.

Bridging the GM divide: Towards a consensus-based mediated dialogue

Aristeidis Panagiotou

Hellenic Federation of Enterprises, Greece

aris(at)posteo.de

The recent EU Directive 2015/412, which has allowed Member States to restrict or prohibit the cultivation of Genetically Modified Organisms (GMOs) on their territory, has brought to light three major dimensions of the GM controversy. Namely, the lack of scientific agreement on central aspects of the technology, the significant pressure on the political field from both GM advocates and skeptics for more robust regulation, and the public distrust towards this particular type of biotechnology. This paper suggests that while these three issues are institutionally distinct as they are anchored in different fields (scientific, political, public/civil), they can be fruitfully streamlined through a face-to-face participatory deliberation process. By critically synthesizing various models of mediated dialogue from the multi-disciplinary field of Conflict Resolution, a seven-stage consensus-based approach is proposed. The aim of this approach is twofold. Firstly, to foster intra-scientific dialogue through specific techniques that the appointed facilitator can routinely employ during specific stages of the process. Secondly, to substitute the typically crystallized in formal frameworks dichotomy of science-based evidence and value-base opinion with the idea of inclusive governance where scientists, decision-makers, and stakeholders are considered as equally influenced by the external environment of action and their own personal idiosyncrasies. Being flexible in its

scope and complexity, the suggested informal dialogue can complement national and international decision-making processes as part of a holistic risk governance framework.

RN12 | Session 08b Science, Technology, and Innovation I

The importance of boundaries. Boundary work in IPBES

Karin M Gustafsson
Örebro University, Sweden
karin.m.gustafsson(at)oru.se

Expert organizations in nature conservation are often described as boundary organizations that facilitate science-policy interfaces. Besides the boundary between science and policy, boundary organizations need to manage other social boundaries, such as between different knowledge forms and between different categories of actors. In order to shape credible, legitimate, and policy relevant knowledge a boundary organization has to make use of competences from both sides of these boundaries. However, this boundary management is to a large extent concealed for those external to it. Focusing the Intergovernmental Science-Policy Platform for Biodiversity and Ecosystem Services (IPBES), this study explores how boundaries are created and managed, as well as how they become important in order to shape credible, legitimate, and policy relevant knowledge. In particular, three boundaries are analyzed: between science and policy, between scientific knowledge and indigenous and local knowledge, and between senior and young experts. Three questions are central; how are boundaries created and managed in the process of knowledge production?; how does boundary work on different boundaries in the same organization intersect and influence one another?; how is boundary work important, and what role does it play for the production of policy relevant knowledge? The empirical material consists of official documents from IPBES and interviews with IPBES fellows. By showing how different boundaries intersect in the construction of expert knowledge, this study deepens the understanding of the preconditions for expert-based policy recommendations in nature conservation.

Technology dreams and meanings (not) related to ICT's energy consumption

Ana Horta
Universidade de Lisboa, Portugal
ana.horta(at)ics.ul.pt

Information and communication technologies (ICT) have an increasing relevance in the functioning of everything. Strong investments have been made in the development of infrastructures and devices toward an increasing digital integration of services, appliances and smart grids. This has been encouraged by policymakers, technologists and businesses considering its potential for improving

quality of life in cities, empowering citizens, streamlining organizations, facilitating the transition to low-carbon economies, and overall, enabling a sustainable future. Potential benefits of information and communication technologies regarding energy efficiency have been envisioned as significant, and debates about the problems raised have been mainly concerned with privacy issues, control and democracy, whereas negative environmental impacts of this expanding ecosystem of digital technology have received less attention. However, research has shown that energy consumption related to information and communication technologies has grown substantially and its carbon footprint still continues to grow. This paper analyzes media discourses and marketing claims on information and communication technologies. These messages are part of the lifeworld of users and may contribute to their understandings and dispositions for using these technologies. The paper aims at identifying and characterizing the meanings conveyed that may contribute to raise users' awareness of (or obscure) the energy consumption of these technologies. Results shed light on the meanings that underpin current patterns of use of these technologies and their consequences for environmental sustainability.

What Renewable Energy Change? The Role of Technical Systems in Energy Uses and Representations

Laure Dobigny
UNIL - Lausanne University, Switzerland /Paris 1
Pantheon Sorbonne University, France

The social and cultural factors that influence energy use are increasingly questioned, independently of the related sociotechnical systems. However, if we consider that technology is not neutral but falls within and implies a specific relationship to the world, we can wonder whether energy uses are really the same regardless of the energy, converter or technical system in place. Based on a socio-anthropological study of five renewable energy (RE) communities in Austria, Germany and France, this paper examines different RE systems from disconnected from grid, to connected to microgrid or national power grid. Two levels of analysis are taken up, in relation to RE uses and forms of energy independence: individual or domestic, and collective or community. Changing the level of analysis makes it possible to question the role of technical system in energy uses and representations, and the specificities of RE use compared to conventional energy use. A decrease in consumption is more significant at the domestic level, with more energy independence than at the collective level. Yet, at both levels of analysis, RE use reveals the tensions between energy production and consumption: RE use falls within specific temporalities or RE intermittency, involves different relationships to energy, rendering it perceptible; and leads to different relationships to nature, based on natural phenomena dependence, as opposed to non RE. These results highlight the significance of technologies and the grid

in energy consumption and representation, or the role this specific infrastructure and system plays in the dematerialization and (re)materialization of energy in everyday practices.

Social media and the environmental movement in Greece, the case of #Skouries

Ioanna Ferra, Charis Gerosideris
University of Leicester, United Kingdom; Keele University, United Kingdom
if43(at)le.ac.uk, c.gerosideris(at)keele.ac.uk

The study of the Greek environmental movement developed focusing on the case of Skouries forest in Halkidiki and the mobilizations against the mining activities of the Canadian Eldorado Gold. This case is considered to be as one of the most contemporary and indicative examples of the Greek environmental movement, which highlighted the contribution of the emerge of collective actions and activism in the Greek crisis context, and at the same time, it pointed out the limitations and the vulnerabilities of the traditional/offline mass media too.

Focusing on these two points, the study developed through the analysis of online data (Twitter), which collected during the period March 2015 to March 2016 (#skouries). The analysis of the data concentrated on the investigation of online networks, pointing out online coalitions, communities and dominant actors (SNA), as well as on the examination of the hashtag #skouries, developing an insight on the evolution of hashtag and discourse (Semantic analysis). The collection and visualization of the data completed using NodeXL and Gephi, whereas the analysis of the data developed having based on the theoretical framework of Cyberconflict, indicating the contribution of digital media in the emerge of collective action, social movements and the socio-political conflict.

At the same time, a major consideration of the study is to understand the linkages between the Greek environmental movement and the contemporary wave of protests and movements, as raised both during the Greek crisis era (e.g. anti-austerity protests, etc.) and the global recession (e.g. OWS, Standing Rock Protest, etc.).

RN12 | Session 08c Food and Society

Transforming practices - Exploring the discourse on meat

Minna Kanerva
University of Bremen, Germany
m.kanerva(at)uni-bremen.de

It is broadly accepted that current meat production and consumption is in need of changing towards a more sustainable system, in the West, but also potentially more globally. Many consider radical changes necessary, even the 'unmaking' of the industrial meat system as we know it. This paper examines change, discusses meat eating as a changing social practice, and considers some current alternative solutions, such as cultured meat, insects or

flexitarianism, an absolute reduction in conventional meat consumption. One way for transforming a social practice can be through changes in meanings and understandings which can render the practice unstable and therefore more open to change. Such a transformation may also result in increasing agencies in a social setting.

The qualitative data analysis will investigate online discourses in the United Kingdom regarding these alternatives, in order to obtain more insights into the feasibility of different, potentially more sustainable, meat eating practices. How do 'eaters' (online commentators) construct the alternatives and the transition process towards sustainable meat? What is meat? What is natural? How do eaters see their own role in the process of change? What is the role of emotions, such as disgust or guilt? Can a process of normalization of the new meats be seen in the discourse? Preliminary results of the data analysis will be presented. This project aims to contribute to the understanding of the process of transforming social practices in general, and the meat system in particular.

Local Elites and nature conservation policies The cases of two french national parks

Valérie Deldrève, Marie Thann-Bo-Morel, Bruno Bouet
Irstea, France; University of Reunion Island; Irstea, France
valerie.deldreve(at)irstea.fr, marie-eugenie.thiann-bo-morel(at)univ-reunion.fr, bruno.bouet(at)irstea.fr

The mobilization of an urban and recreational elite, made up of white and male stakeholders, created the first movement of protection of the "wild" nature in the West and in the colonies (Taylor, 2000, Selmi, 2005). Their influence is still reflected in French national parks. Their reform (2006) gave them more weight in the definition and the functioning of parks. We first observed it at the creation of the National Park of the Calanques (2012), the local users involved were first of all the users most endowed with economic, social and cultural resources. Secondly, we focused on the cases of the National Park and the Natural Marine Reserve of Reunion Island (a former french colony). The most powerful families of the island, landowners, are economic and political actors that the national park or marine reserve have to deal with, while other forms of elites, played and still play a leading role in the priority given to the conservation of endemism or marine life. Some elites assert their capital of indigenusness when the others express their scientific and/or administrative legitimacy. Recreational associations are more discreet although our analysis reveals the complex interplay between places and powers. This paper aims to analyze the interactions between elites and conservation policies in continental France and Reunion Island. We will ask, with a postcolonial and intersectional analysis framework associated with a sociology of the elites, how environmental inequalities are produced and how they accumulate with other forms of inequalities.

Mobilising sustainability: legitimating the existence of the Finnish dairy industry

Markus Vinnari, Pekka Jokinen, Emma Luoma, Eija Vinnari

University of Tampere, Finland; University of Tampere, Finland; University of Tampere, Finland; University of Tampere, Finland
markus.vinnari(at)uta.fi, pekka.t.jokinen(at)uta.fi, emma.luoma(at)staff.uta.fi, eija.vinnari(at)uta.fi

This paper explores the changes in the Finnish dairy industry's legitimating rhetoric from the perspective of the modern day interpretation of sustainability. During the past few decades, the dairy industry has witnessed the rapid modernisation of agriculture, but also threats to its legitimacy in the form of, for instance, the early rise of environmental concerns, increased competition conveyed by the Finnish membership in the EU, the concern about climate change, and the emergence of farm animal protection issues. In empirical terms, we focus on Valio company, founded in 1905, due to its crucial role in the development of Finnish agriculture and dairy industry. Even today Valio's share of the Finnish milk market is 85 percent. The empirical material consists primarily of annual reports and corporate social responsibility (CSR) reports published by the company in 1960-2015. We find that Valio has attempted to legitimize the dairy industry's existence by mobilizing the rhetoric of sustainability and its different dimensions, exemplified by the appearance of 'environmental responsibility', 'social responsibility', and 'animal welfare'. It is concluded that the changes in the company's reporting are associated with the concurrent societal development as well as the position the company has had in the Finnish society.

Sustainability Transition in Practice: UK Consumer Experience of Meat Reduction

Jo Mylan

University of Manchester, United Kingdom
josephine.mylan(at)manchester.ac.uk

A reduction in meat production and consumption is increasingly presented as a key element of a more sustainable food system. Responsibility for this transition is frequently attributed to Western consumers who are urged to reduce, replace and eat "less but better" meat. However, unlike vegetarianism, we know little about why people attempt to reduce the amount of meat in their diet, or the challenges encountered in doing so. Drawing on twenty in-depth interviews with UK meat eaters, half of whom aim to reduce the amount of meat they eat, this paper explores consumers' motivations for, and experiences of, reducing meat consumption. Respondents' accounts are situated in relation to boarder practices of eating and food provision in daily life. Findings suggest that motivations for meat reduction extend beyond individuals' ethical stance toward environmental issues or animal welfare. Rather, efforts to reduce meat eating are explained in relation to nutrition and vitality of the body; concerns about the

conditions of meat provision; past experiences in shaping tastes for food; and the personal relationships and routine activities through which meals prepared and eaten. The analysis contributes to ongoing debates about the mechanisms for promoting consumer behavioral change and the role of consumers in achieving sustainability transitions.

Connecting food systems with climate change. The experience of Portland - Oregon

Nunzia Borrelli

University of Milan Bicocca, Italy
nunzia.borrelli(at)unimib.it

The low carbon' prospective calls for a replacing of energy and matter flows, especially between urban and rural domain. In this framework, research on food systems has become increasingly considerable in the urban governance literature. It is becoming clear that planners should begin to take into account questions about food self-reliance, farmland preservation and food distribution.

The main aim of this paper is to analyse how food systems can be integrated in urban governance in a more efficient way. In order to reach this aim, the case study of Portland in Oregon is proposed.

Portland is located in the Willamette Valley region of the Pacific Northwest, at the confluence of the Willamette and Columbia rivers. The city covers 145 square miles (376km²) and had an estimated population of 619,360 in 2014 (approximately 2,348,247 people live in the Portland metropolitan statistical area -MSA).

Portland is often cited as an example of a city with strong land use planning controls. Over the last few years Portland has been also quoted for its attention to food systems and climate change. This study discusses where issues related to food enter into the climate change prospective in the Portland City Policies.

In order to develop such a study a number of official documents were read, statistical data were collected (by census) and 36 semi-structured interviews with professionals and stakeholders were carried out during fieldwork in August – September 2014.

RN12 | Session 09a Science, Technology, and Innovation II

Actors, Power, and Competing Interests: A Field Perspective on Urban Low Carbon Transitions

Jens Koehrsen

University of Basel, Switzerland
jenskoe(at)gmx.de

In the face of rising efforts to mitigate climate change, cities engage in low carbon transition processes. Actors related to different social spheres (politics, academia, economy, media, civil society etc.) intermingle in these processes. So far, however, a theoretical framework to describe the interplay of different types of actors in urban low carbon transitions is missing. The presentation proposes the

field perspective as an approach to study this interplay. Social fields are conceptualized meso-level social orders in which different types of actors interact based on shared structures in the form of joint understandings, rules, and power-constellations. The approach is applied to the empirical case of the energy transition in a German city. In the course of the interplay of local politicians, businesses, municipal employees, scientists, citizen initiatives, a local energy transition field emerges which is marked by hierarchies, collaboration, shared understandings, and differing positions regarding the purpose of the energy transition.

Unmaking still in the making? Technological trajectories of the German energy transition

Martin David, Alena Bleicher

Helmholtz-Centre of Environmental Research, Leipzig;
Helmholtz-Centre of Environmental Research, Leipzig
martin.david(at)ufz.de, alena.bleicher(at)ufz.de

The German energy transition is often framed as a success story: new actors emerged in the field of policy making and technology development and helped establishing renewable energy production and consumption and by so doing paved the way towards more sustainable futures. However, the German energy transition lacks commitment towards decarbonizing its electricity sector, coal fired energy is still produced in old intensely emitting facilities. This underscores the need to also envision 'dead ends' of energy transitions, which means to divest from coal- or lignite-firing technologies which renewable energy innovations actually try to overcome. The presentation explores the German divestment from coal-fired electricity producing technologies in the face of the German energy transition. One of the findings is that discourses around the German energy transition are biased towards ideas of modernization and innovation, but little attention is given the pathways of ending technological trajectories. At the same time, it seems the ending of technological trajectories is directly linked to the idea of innovation. This raises questions about both the character of energy transitions and its governance. On a general base this also calls in mind the question about where Europe's technological remaking is headed.

Uncovering multi-level governance and policy idea transfer in energy policy using topic modelling on large policy corpuses

Arho Toikka

University of Helsinki, Finland
arho.toikka(at)helsinki.fi

This paper uses a natural language processing method called dynamic topic modelling to map the transfer of ideas between policy levels. The paper presents a case study on energy policy in the European Union, Finland and the Helsinki metropolitan area, using policy documents spanning the past 25 years. The documents include laws and regulations, but also scenarios, roadmaps and

administrative documents, and constitute a massive corpus of circa 2500 documents and tens of thousands of pages. The corpus has been collected with web scraping methods.

The paper uses dynamic topic modelling to map the structure of this corpus and analyze trends over time at the three governance levels. Topic models are a family of machine learning methods that map word co-occurrence in documents to find word probability distributions that are, ideally, interpretable as topics to a human reader. Each document is a selection of words drawn from a mixture of topics. For example, the words "carbon" and "capture" might occur with a high probability in a topic, and that topic might then be interpreted as discussing carbon capture and storage technologies. Dynamic topic models also allow for the evolution of the word distribution, so that the prevalence of "greenhouse effect" might be overtaken with "climate change" as the vocabulary evolves. This paper looks at the evolution of the topic structure and the words within topics in the three policy contexts, and evaluates whether the emergence of new issues and ideas happens first at the international, national or the local level, and whether the three levels are similar in the topics that are discussed and what vocabulary is used to discuss them.

Linking Portuguese and Iberian anti-nuclear struggles with the global environmental justice movement

Lúcia de Oliveira Fernandes, Teresa Meira, Lays Silva
Center for Social Studies, University of Coimbra,
Portugal; Economic Faculty, Fluminense Federal
University, Brazil; Faculty of the Américas, Brazil
luciaof(at)gmail.com, teresabmeira(at)gmail.com,
laysshelena(at)hotmail.com

The anti-nuclear mobilization that took place in the last decades throughout the Iberian Peninsula, has been characterized by civil society's participation of both countries. In Portugal there are some cases that have evolved different approaches: 1976: planned nuclear power plant in Ferrel; 1987, 1998: siting of a nuclear waste storage in the Spanish border; 2003-present: uranium mining environmental impacts and ex-workers health and rights; 2007-present: high risks to environment and health due to operation of Spanish nuclear power plant; 2014: mining project near the border.

Meanwhile the Iberian countries are dealing with the controversial decision process of shutting down the nuclear power plant of Almaraz (Spain). We look at this particular case, where the proximity to the frontier and the potential impacts in the biggest Iberian river – Tejo, have brought together citizens, NGOs and activists to protest and pledge to exit nuclear energy for good, as an example of an improved understanding resulting from the global environmental justice movement.

Our activist-research about socio-environmental struggles was developed in the aim of the EJAtlas and the exploratory project "Environment on the move".

We produced a conflicts inventory and worked on cases document analysis and participated/organized events that promoted interaction between researchers, associations, movements and activists linked with different environmental struggles, including nuclear field. This paper presents the different anti-nuclear grassroots mobilization, exploring the different cases complexities regarding the conceptions of conflict, health, environment, citizenship and issues regarding economic, political, social, technical-scientific and also the broader scenario of mobilization.

RN12 | Session 09b Environmental Management and Democratic Governance

Water management as discursive battlefield: the importance of narratives in the struggle for re-municipalization of water in Barcelona.

Lucia Alexandra Popartan
University of Girona, Spain
luciaalexandra.popartan(at)udg.edu

The re-municipalization of water has become a growing global trend; more than eighty communities around the world have de-privatized water and sanitation services over the last 15 years. It was the economic crisis in the EU countries, however, that turned the re-municipalization of water into the decisive battlefield in the struggle against neoliberal policies. Currently, discourses promoting privatization as a depoliticized, 'no alternative' part of entrepreneurial urban governance (Harvey) are radically contested by narratives on 'right to city' and environmental justice. In Spain, this tendency coincides with the rise to power at urban level of the new 'populist' leftist parties (Podemos, En Comú), also seen as institutionalized grassroots movements. In this context, my paper analyzes the dynamics of Barcelona's water justice movements from a critical discourse analysis perspective. Using a comparative framework with other cities - Paris, Berlin, Madrid - it will trace the discursive strategies/nodal points (Laclau and Mouffe, 2001) at re-politicizing the resources management. It is the purpose of this paper to approach the discursive strategies of mobilization of grassroots movement in the field of water and assess their translation into mainstream urban policy. It will seek to understand how the re-municipalization discourse became hegemonic in the urban policy in Barcelona, in comparison with other cities. It will discern the role of water justice movements in the process as well as the role of the interaction with the institutionalized movements - i.e. political parties such as Podemos, En Comú. The research is based on evidence from (i) critical discourse analysis of the water justice movement's frames; (ii) analysis of decision-making processes in-depth interviews with party and movement leaders; (iii) systematic data gathering.

Citizen education and learning as key components of democratic governance for sustainable

development

Kris van Koppen
Wageningen University, Netherlands, The
kris.vankoppen(at)wur.nl

This paper argues that education and learning are key parameters in democratic environmental governance. It starts with exploring the links between democracy and transparency, explicating the social mechanisms that govern the access of citizens to disclosed information, and articulating the concept of democratic informational governance. Then it takes up key elements in debates on education and learning (including recent views on social learning for sustainability) and brings them to bear on the position of education and learning in informational governance. Drawing on the concept of rationalization of the lifeworld (Habermas), social practice theories (Nicolini), and contextualized learning (Vygotsky), the paper argues that political learning of citizens in everyday life is of central importance to democratic environmental governance, rather than natural science education or advancing critical reflection. The argument is illustrated with cases from climate policy and biodiversity management.

RN12 | Session 10a Environmental Justice

Undermining community heritage and identity? The troubled reopening of the Parina Valley zinc mines

Robin West, Isabel Crowhurst
University of Essex, United Kingdom; University of
Essex, United Kingdom
rmwest(at)essex.ac.uk, icrow(at)essex.ac.uk

When in 1982 the last zinc mine of the Parina Valley (in Northern Italy) closed after over a century of activity, a way of life and the community identity of the Valley's mining villages were brought to an end. Hundreds lost their jobs and the younger population migrated to larger cities. The Valley attempted to boost its touristic potential, but its local economy subsequently dwindled. The mining heritage was kept alive with the opening of two small museums, and the annual celebration of the 'miners fete'. Thirty years later a new mining future was proposed for the Valley. In 2014, following the sharp rise in zinc prices and amid a revival of the European mining industry, an Australian company showed interest in the mines and started ongoing works to recommission them and commence new extraction activities.

Drawing on observations, informal conversations with local people and media analysis, this paper presents a preliminary exploration of the impact the mines' reopening has on the Valley's local community, its economy and environment. We engage with and build on scholarship that explores the interconnections between a renewed trend in extractivism largely headed by overseas corporations, local heritage spawned by traditional mining practices, and broader community interests. In particular, we draw on the green criminological literature discussing potential

negative externalities relating to resource extraction in both social and environmental forms and initiatives that promote social responsibility and sustainable practices. Our aim is to make sense of evident tensions amid corporate-community relations regarding the distribution of benefits the project may bring and fear of the erosion of heritage, the colonization of public space and of the environmental legacy of the project.

Alliance Building and Intersectionality within the Brazilian Anti-mining Movement

Mariana Galvão Lyra
University of Eastern Finland, Finland
mariana.lyra(at)uef.fi

In 2013, the National Committee of Defense of Territories over Mining was created in Brazil as a response to the national Mining Code draft that has been on hold in the National Parliament. Seven issues around environmental and social safeguards were objected to in the Mining Code, with nearly 200 organisations, institutions, and politicians signing the document. The National Committee works as a consensus-building movement incorporating a variety of different perspectives. It unites different agendas for the transformation of the national mining framework and legislation.

In this article, I examine the composition and ideologies of this unique cross-issue alliance building, discuss their milestones (events and factors) through time, and reflect on how the alliance has framed the Brazilian mineral context within this timeline to attract supporters and allies.

The analysis demonstrates how solidarity among members alleviate the tensions between ideological discrepancies and created a political intersection to a some extent given the great diversity of agendas they represent.

Unlike most Latin American studies around natural resources conflicts, our results contribute gathering evidence on how anti-mining movements perform at the national level instead of local protest and grassroots activities. The results also contribute to the overall social scientific mining research community, especially the ones aiming to better understand conflict escalation and stakeholder responses to corporate behaviour.

Teetering on the Climate Edge: The Case of Segregated Roma Communities facing Environmental Injustices in Europe

Filip M. Alexandrescu
Research Institute for the Quality of Life, Romania
filip.alexand(at)gmail.com

This paper articulates a climate justice perspective that challenges current understandings of climate change responses in Europe. Climate justice entails the recognition that the disruptions caused by climate change affect individuals and communities unevenly, with poor ethnic groups often being the most affected. The paper draws on Saskia Sassen's (2015, 2014)

theory of the systemic edge, defined as a point beyond which a condition becomes so extreme that it cannot be comprehended by the common measures of governments and experts and is rendered ungraspable (Sassen, 2015, 173). In analogy, the concept of climate edge is proposed, which is a spatial configuration in which environmentally and socially deleterious conditions become concentrated due to exclusionary social practices, and where societal safeguards against climate change fail systematically, exposing excluded populations to its impacts. The climate edge concept thus raises a critical problem: as the socially induced vulnerability increases, society's scientific and technical apparatus, as it is reflected in current climate change responses, becomes unable to detect and even less to address this vulnerability. The manifold human crises connected to the metabolism of carbon – from the extraction of fossil fuels to mitigation and adaptation policies – can be seen as instances of climate edge emergence. This presentation focuses on one of the emblematic cases of accelerated vulnerability creation that occurs 'beyond the pale' (Filcak, 2012), as has been recently documented for Roma groups physically expelled from Romanian cities or with Romanian Roma immigrants in Italy. The paper provides a preliminary substantiation of the climate edge concept and of its theoretical promise.

The problem of red muds and dust in France through the prism of Environmental Justice?

Juliette Metin, Valérie Deldrève
Irstea, France; Irstea, France
juliette.metin(at)irstea.fr, valerie.deldreve(at)irstea.fr

Our research explores the suitability of environmental justice (EJ) as a broader and integrative framework (Schlosberg, 2007 ; Taylor, 2000) for sociological analysis in France, where none of the movements claim to belong to EJ. The study focuses on the case of the Alteo factory in Gardanne (France) which produces alumina from bauxite, polluting the local environment with toxic residues which are radioactive, caustic, and loaded with heavy metals. Numerous actors are involved: factory workers, local residents, a national park board, recreational users of the park, fishermen, civil organizations, local and national politicians, the media, environmental NGOs, scientists. The bone of contention is the factory itself but also its two major dumpsites, one containing red dust on land and one pouring red mud in the sea in the middle of the national park. Our proposal aims to display how the stakeholders frame the problem (Snow, 2000) and argue to be recognized as "Problem owners" (Gilbert et Henry, 2014). We will show the interest of the EJ framework to understand their disputes about the legitimacy of this capitalistic industrial production, the damages on the natural environment and human health, and their perceptions of these. It allows us to redefine the environmental and sanitary problems through the prisms of class, gender, racial and ethnic relationships at a local and also a more global scale (from bauxite mining in

Guinea to profit-making in a US hedge fund - the factory's owner). How are the issues of justice and solidarity between these scales articulated?

RN12 | Session 10b Environmental Behaviour, Values, and Attitudes

Environmental Issues on Mayors' Urban Agenda: the Case of Serbia

Mina Petrovic

Faculty of Philosophy, University of Belgrade, Serbia
mipetrov(at)f.bg.ac.rs

The analysis aims to investigate the importance given to environmental issues on urban mayors' agenda in Serbia. The paper is analytically based on two concepts - the sustainable and entrepreneurial city. While the first one postulates the balance between the key dimensions of sustainability (economic, social and environmental), the second one presumes the pivotal importance of city (economic) competitiveness to which all sustainability aspects are subordinated. Furthermore, the analysis of mayors' attitudes is located within the conceptual debates on sustainable urban development (compact city vs. urban sprawl dilemma).

The analysis is informed by the questionnaire research conducted with 50 mayors in Serbia. The sample, which covers 40% of cities with more than 20 000 inhabitants in Serbia is composed to represent a diversity in cities' size, geographical position and economic development. The results show the prevalence of entrepreneurial approach among the Serbian mayors, with almost no significant differences according to the examined independent variables: the city's size and level of development, on the one hand, and materialistic/post-materialistic value profile of the mayor and its leadership style, on the other. Although the explored territorial aspects of life quality protection point to mayors' higher interest for the environment, particularly in the big cities, we argue that it refers more to consistency in mayors' inclination towards city competitiveness based on environmental aspects, than to their genuine support to the idea of sustainable city.

House owners' narratives on climate related risks: an intersectional analysis

Karin Jarnkvist

Mid Sweden University, Sweden
karin.jarnkvist(at)miun.se

The aim of this paper is to investigate how the construction of risk intersects with social structures in house owners' narratives on climate related risks with regard to their own homes. When focusing on how house owners make sense of climate related risks concerning their own homes, it is important to take into consideration structures that not only affect risk perceptions and risk behaviours but also shape people's everyday life at a general level. An intersectional analysis makes it possible to highlight

the interconnectedness of such structures and how they affect the owners' understanding of risk. Narratives of 44 house owners in four regions exposed to climate related risks in Sweden are analysed. Most interviews were conducted as go along interviews, in which we visited the interview persons in their homes. The narratives were analysed by narrative method, focusing on how the interview person position herself in relation to risk. Intersectional risk theory was used, according to which risk is constructed in relation to different forms of power structures. The result indicate that different intersections of class, gender, age and place shape different ways of positioning in relation to risk by describing oneself as more or less aware of as well as exposed to climate related risks. The analysis further reveals that different intersections of social structures lead to shifting prerequisites for what kind of preparedness house owners can have in order to prevent and manage climate related risks regarding their homes.

Fruition Tourist and Economic Development: Statistical Comparison of Enjoyment in Natural Parks in Italy and France

Rossana Salerno, Claude Sobry

University of Enna "Kore", Italy; University of Lille2, France.

salerno_rossana(at)libero.it, claudesobry(at)univ-lille2.fr

This observation and research is bilateral, in fact, takes place in two different states Italy and France in different periods of the year 2016/2017. The purpose is to compare the use and enjoyment of the natural tourist or amateur places defined as parks or nature reserves. Although the increasing human presence in natural sites is not a completely new phenomenon, the study of these territories from a dichotomous economy and consumer oriented approach remains scarce – even more in a cross-cultural comparison. French nature parks have a relatively vast literature, studying preservation questions, the characteristics of outdoor activities or the lived experiences on natural sites, for instance. Also, research on tourism is rather extensive, which is not surprising, since tourism is the country's leading economic sector. On the other hand, hardly any studies can be found on the development methods of Sicilian region (protected) natural territories. Beginning is that of observation on the field of subjects, social actors, students and ordinary people who frequent the natural parks. After that use the search tool, which the structured questionnaire helps us to understand, and NVivo software for qualitative analysis and compare the two dimensions of use. The main purpose of this work consists primarily in the territorial reality monitoring considered, through the implementation of an information system designed to show the demographic, social, cultural and economic conditions of the territory, emerging applications by users and services in present therein or to increase through the comparison at the international level.

Muscovites about Social Consequences of Global Climate Changes (On the Base of Empirical Research)

Olga N. Mamonova, Irina A. Sossunova
Russian Society of Sociologists; Academy of
Problems of Quality
foxie(at)inbox.ru, sossunova(at)gmail.com

This work is considered actual issues of social consequences and adaptation of population to climate changes. Results of empirical sociological research conducted in Moscow in 2016 are presented. It is considered actual issues of social consequences of global recession of greenhouse gas emissions and adaptation of socium to climate changes which became highly recognized during last years. In the long view according to climate change issues all basic functions of public opinion may manifest: expressive (control) – the force stays under the power institutes, and which is possible to estimate their activity; consultative – which recommend definite solutions of economic, social and other problems; directive – may contain solutions of irresistible, imperative; informational; nomenclative – which influence to personnel, etc. Herewith interests which lay in foundation of public opinion on climate change formation, are characterized firstly by social prosperity, high (or accessible) life quality; by safety of vital important interests; by satisfaction of development directions and time. Till present public opinion on climate change may be characterized by two significant specific features: incompetence in conditions of some scientific uncertainty. Second one - vivid demonstration of sociological “cloud effect”, i.e. people suppose that somewhere far away some problems are actual and critical, and on “our side” everything is without changes, that are why the significance of them is quite dubious. It is necessary to underline that actuality of sanctions in the broad understanding and their social consequences in the sphere of global climate changes unfortunately can gone unnoticed in contemporary world.

RN12 | Session 11b Environmental Behavior and Attitudes

Multi-Stakeholder Perceptions of Bioenergy in Germany, Greece and the UK: A Comparative Study

Eugenia Petropoulou, Vasiliki Petousi, Constantinos Iliopoulos, Irine Theodorakopoulou, Hanneke Mol, Neil Simcock, Rebecca Whittle
University of Crete, Department of Sociology, Greece;
University of Crete, Department of Sociology, Greece;
Agricultural Economics Research Institute, Athens, Greece;
Agricultural Economics Research Institute, Athens, Greece;

hanneke.mol(at)northumbria.ac.uk,
n.simcock(at)manchester.ac.uk,
r.whittle(at)lancaster.ac.uk

Over the last decade, bio-energy has been included in the broader policy framework for renewables in many EU member countries. The impact and consequences of bio-fuels has predicated complex relationships between different state, capital and society stakeholders, often highly specific to a particular locale. On a global level, bio-fuel debates are framed in terms of biodiversity, conservation and climate justice. This presentation will identify the frequent mismatch between global and local concerns as exemplified by local stakeholders in the context of three European countries namely: Germany, Greece and the UK. At the same time we are concerned with the discursive frames through which bio-fuels are promoted or opposed by different stakeholders from the three countries under study. What are the issues that unite and divide key stakeholders of the three countries around bio-fuels? What are the institutional structures and culture of energy consumption on which a bio-fuels complex depends? What alternative political and ecological visions are emerging to call the bio-fuels complex into question? Are there alternative bio-fuel development trajectories that support local livelihoods, protect the environment and are rooted in principles of social justice?

Based on qualitative research, this presentation addresses and answers the above mentioned questions through the utilization of personal interviews between different stakeholders involved in the bio-fuels regime in the cases of Greece and Germany and a focus group in the case of the UK.

Conceptualising acceptance and analysing acceptance factors of sustainability innovations

Maria Busse, Rosemarie Siebert
Leibniz Centre for Agricultural Landscape Research (ZALF), Germany; Leibniz Centre for Agricultural Landscape Research (ZALF), Germany
maria.busse(at)zalf.de, rsiebert(at)zalf.de

For a successful and deliberative planning and implementation of sustainability innovations, the consideration of their acceptance by affected actors is essential. Analysing the state-of-the art in environmental sociology, the theoretical and methodological foundation of acceptance is still inconsistent and often weak. The paper aims at introducing a new conceptual framework for conceptualise acceptance and at applying it in order to analyse acceptance factors.

The developed framework merges approaches from the sociology and the technology assessment. It considers the social context of decisions and the process-oriented and interactive character of acceptance. With this model, acceptance can be measured on the level of attitudes and values, the level of taking actions (behaviour), and the level of long-term use. In order to apply this framework, we qualitatively analysed factors influencing acceptance

of the innovative strategies for a sustainable use of marginal wetlands in the Spreewald region (Germany). To identify acceptance factors in detail, we conducted 15 semi-structured interviews with land owners, land users, and regional authorities. The interviews were analysed with MAXQDA using qualitative content analysis.

Results show that the acceptance of innovative strategies on the level of attitudes is strongly connected with the individual value perception of these wetlands as element of the regional cultural landscape. Societal important acceptance factors on the level of attitudes and values and on the level of taking actions are previous experiences, level of participation, and trust in actors or institutions. These factors are related to the issue of procedural and distributive justice.

Women activities and attitudes towards environment in Poland – the case study of Upper Silesia region (Poland).

Katarzyna Iwińska
Collegium Civitas, Poland
kiwinska(at)civitas.edu.pl

Coal is a major energy source in Poland, including electricity generation sector. Most coal burning power plants have been operated for over 30 years, thus they soon will have to be modernized or decommissioned. I present the case study research from Upper Silesia, a region of Poland, which is one of the most intensively mined areas in Europe. Moreover one of the basic indicators of socio-cultural identity of the Upper Silesia inhabitants was an extremely intense (as of mid-nineteenth century) industrialization, the development of specific industrial monoculture (mining and metallurgy), and a strong work ethic.

In the paper I will present the results of the qualitative analysis of socio-economic activities and strategies of women, with particular emphasis on strategies in the context of changes in civilization (the idea of sustainable development) and transformation (decarbonisation). The subjects of the research are women, residents of Upper Silesia, who both have family and work responsibilities. Moreover, they are also active participants in the life of their local communities. Women create and reproduce “small community” (around the traditions of the local community) and struggle with economic/ changes.

We are dealing within the framework of sustainable development analysis focused on quality of life (social pillar), professional and civic strategies (economic) and attitudes towards environment (ecological values, energy awareness, etc). Within this frame we present the case study of Silesian women who adapt to the changing situation on the labor market (as a result of restructuring and blanking mines) and implement different strategies to meet the needs of their own, their families and the social environment (in the local community).

RN12 & RN21 | Session 11a JOINT SESSION: Decision Making and the Environment

Testing the Measurement of Environmental Concern: Do Single Items Outperform Multi-Item Scales?

Axel Franzen, Sebastian Mader
University of Bern, Switzerland; University of Bern, Switzerland
franzen(at)soz.unibe.ch,
sebastian.mader(at)soz.unibe.ch

In this paper we assess the test-retest reliability and construct validity of a composite measure of environmental concern as it is contained in the environmental modules of the International Social Survey Programme. We follow the multitrait-multimethod approach suggested by Campbell and Fiske (1959) and compare two instruments, environmental concern and empathy, as well as two methods, face-to-face personal interviewing and self-administered online surveys. Overall, 310 student volunteers participated in the study each being interviewed twice within four to six weeks. We also compare the performance of the composite index with two single items measuring environmental concern. In addition to its reliability and validity we also test the external and predictive validity as well as the sensitivity towards social desirability of the instruments. The study results suggest that the composite index has high reliability and high validity and outperforms any of the single item alternatives.

Regulating Endocrine Disruptors – Between hazard and risk

Susana Maria Duarte Fonseca
University of Lisbon - Social Sciences Institute, Portugal
susana.fonseca(at)ics.ulisboa.pt

In the last decades, there have been regular alerts on the risks that different chemical substances pose for human health, particularly to vulnerable groups. But regulating chemical substances has been a highly contentious issue. Different stakeholders' perspectives, scientific uncertainty, scientific cultures, political decisions, economic interests, mainstream values on how to deal with hazard vs risk, all have contribute to controversy regarding how best to find a balance between innovation, needs, interests and the protection of human health and the environment.

Endocrine disruptive substances are particularly interesting to analyze. This is an area where the debate over the adequacy of current rules for the testing and determination of chemical safety is put more acutely, as these substances challenge structuring toxicology ideas, namely the rule that “the dose makes the poison”. Although this debate is not new, as in fact it has been going on at least since the 40's, when endocrine-disrupting chemicals were first commercially produced, and shaped by previous debates on how to regulate chemicals since at least the beginning of the 20th century, it has gain

momentum giving the present decision process at the EU level to regulate them, by defining what makes a chemical substance an endocrine disrupter.

How is this discussion being shaped and by whom? Have we evolved on the scientific and political debates since the 40s? What lessons can we learn? These are some of the questions this work tries to address, using document analysis (statements of different stakeholders; press releases; legislative proposals; academic papers).

Environmental friendly behaviour and gender

Kristina Eisfeld, Paolo Giardullo
University of Vienna, Austria; University of Padua, Italy
kristina.eisfeld(at)univie.ac.at,
paolo.giardullo(at)unipd.it

According to the European Environment Agency (2016) more than 430.000 people across the EU died prematurely from exposure to particulate matter, nitrogen dioxide and ozone in 2013. This makes air pollution the single most important environmental cause of premature death in the EU. Increasing evidences show that technical measures will not be sufficient in achieving air quality standards and that behavioural-based measures are likely to play an important role to lower the level of emissions. Eurobarometer survey shows that 56% of the European citizens are worried about poor air and roughly two-third of people think their national government and citizens are not doing enough to protect the environment (European Commission 2014). But, do people want to change their behaviour in order to achieve better air? Quantitative studies reveal that positive environmental attitudes do not necessarily lead to pro-environmental behaviour (López-Mosquera et al. 2015). Also, environmental studies report inconsistent findings on gender and pro-environmental attitudes, values and behaviour (Gifford und Nilsson 2014). We want to analyse these issues by focusing on the latest data from the FP7 SEFIRA (Socio Economic Implications for Individual Responses to Air Pollution Policies) survey containing seven European countries with 16,100 interviews. Compared to other perspectives on environmental behaviour, gender is rarely considered as a main entry point into the topic. By taking a cross-cultural, comparative perspective, we want to analyse gender differences and we will try to understand their predictors (e.g. knowledge, social pressure). The results would allow targeted behaviour (policy) recommendations for particular groups.

Risk and politics: Factors explaining Climate Change Concern in Europe using a multilevel analysis

José Echavarren, Aiste Balzekiene, Audrone Telesiene
University Pablo Olavide, Spain; Kaunas University of Technology, Lithuania; Kaunas University of Technology, Lithuania
jmechavarren(at)upo.es, aiste.balzekiene(at)ktu.lt,

audrone.telesiene(at)ktu.lt

For the last years the research on climate change has been a priority for the main scientific and political institutions of the planet, and so has been the study of public's perceptions about climate change. Here we combine both traditions of research, natural and social sciences, in order to examine the factors explaining the social perception of the danger of climate change. We also take into account the institutional context by introducing the role played by the policies of prevention of environmental hazards as well as the importance of Green parties as a triggering element for the perception of climate change. We use the Eurobarometer 80.2 (2013) on climate change, which provides information from over 28,000 individuals in 27 countries. For second level variables we use data from Manifesto Project, Eurostat, United Nations University Institute for Environment and Human Security, Germanwatch Institute, The Growing Blue Project and the Notre Dame Adaptation Initiative. Employing multilevel logistic regressions we find a double mechanism to explain climate change perception in Europe. Whereas in Mediterranean countries the effect of natural hazards are more important (specially water stress), in Northern countries the trigger seems to be the pressure of Green parties.

RN12 & RN22 | Session 10a JOINT SESSION: Perceptions of Environmental Risks and Vulnerabilities Across Europe

Patterns of relations in the Polish flood risk management system: a network analysis

Piotr Matczak, Adam Choryński, Jakub Lewandowski
Institute of Sociology, Adam Mickiewicz University, Poland; Institute for Agricultural and Forest Environment, Polish Academy of Sciences, Poland; Institute for Agricultural and Forest Environment, Polish Academy of Sciences, Poland
matczak(at)amu.edu.pl, adam(at)swarzedz.net.pl, jakub.lewandowski22(at)gmail.com

In the paper a hypothesis is verified, by using the social network analysis, that the lack of strategic planning and coordination of activities related to flood risk management in Poland leads to stabilization of relations patterns (exchange of information, goods, prestige, power relations) between the actors involved in the flood risk management in Poland, and consequently this results in low flexibility and the ability to change, low social legitimacy and low efficiency of activities.

50 semi-structured interviews with experts at the local, regional and national levels in Poland (in municipalities of Poznan, Slubice, Wroclaw and Warsaw) operating in the field of water management, disaster management, spatial planning, the insurance market were used for analysis. NVivo software was used for coding and the network analysis was done via NodeXL. The interviews were coded in terms of the actors characteristics: (1) operating range (local,

regional, national), (2) the type of government (local government, governmental, non-governmental, private), (3) area of activity (sector of the economy, water sector, crisis management, sector planning etc.). Furthermore, relations are coded in terms of the flow of three types of resources: (1) symbols (information, ideas, values, norms, messages etc.), (2) things (physical objects and symbols like money) and (3) the relationships (approval, respect, affection, pleasure etc.). A total of 179 institutions appear and 1 528 relations were coded (502 related to discourse, 710 relationships and 316 resources).

Becoming a concerned collective facing global warming

Alexandre Kudriavtsev, Florence RUDOLF
Insa Strasbourg, France; Insa Strasbourg, France
alexandre.kudriavtsev(at)insa-strasbourg.fr,
florence.rudolf(at)insa-strasbourg.fr

The proposal is built on a research on climate change grounded on more than thirty interviews on different businesses during the last two, three years. The stake is to study how entrepreneurs move from their subjective concern about environmental issues, especially on global warming, to a collective concern. Some different hypothesis are leading this research. One of this deals with the ability of an individual, inserted into an organization like a small business, to profile itself as an actor while changing a personal concern into a collective one. Another one follows how a relative undetermined risk for enterprises as climate risk is taken in charge for some reorganization inside the enterprise. The stake consists more especially to observe how a collective as an enterprise is able to transform itself and which what kind of supports (arguments, alliers, rules, existing mechanisms, etc.). Finally the research defines different steps, different degrees of transformation, depending of these abilities to move from a subjective and singular situation to a more common routine inside an organization. The ability to share a concern and to make it alive inside an organization is one of the main issue of a politics of environment and especially of a politics of mitigation and adaptation to climate change.

Legionella outbreak of Vila Franca de Xira - credibility, trust, and resilience

João Guerra
University of Lisbon, Portugal
joao.guerra(at)ics.ulisboa.pt

Between 12th October and 4th December 2014, there was an outbreak of legionella in Vila Franca de Xira, Portugal, which was declared to be the most deadly infection in the history of this bacterium. The authorities have officially pointed to ADP, a fertilizer factory belonging to the Spanish Fertiberia group, as the main source of the outbreak. This is the case study whose preliminary results will be presented here. Through it, we will try to clarify where the interdependence chain of sustainable development – i.e., environmental and social imperatives to be

carried out within an engaging and participatory manner – is broken or reinforced. Hence, some results of a participatory workshop – held on October 13, 2016 – will be analyzed, taking account of social groups concerns present there: women, men, affected and non-affected, elderly and active-age citizens. The workshop has been attended by almost four tens of people, who have discussed the crisis management and the different ways to overcome its consequences. Indeed, the results of this deliberative session underlined the role of individual (e.g., health, education, housing ...) and collective (e.g., organizational capacity, mobilization, and collective action) means and capacities. After all, environmental and social vulnerabilities emerged together in a physical, social and economic intricate difficult to untangle, within a process where everyone lost something: institutions (especially the most linked to political power) lost credibility and public acquiescence; citizens lost health, quality of life, trust and interest in public affairs; local community lost resilience and territorial status.

Sociotechnical safety assessments - Challenges to risk regulation regimes and risk analysis

Marja Ylonen
Technical Research Centre of Finland (VTT), Finland
marja.ylonen(at)vtt.fi

The objective of the paper is to provide understanding of sociotechnical aspects of safety in three risk regulation regimes in high-risk industries – Norwegian oil and gas and regulation of use of hazardous chemicals in Finland and France. Another objective is to illuminate the challenges that the sociotechnical systems approach to safety creates to risk regimes and risk analysis. The paper draws on studies on regulation and safety (Hollnagel 2014). Safety is often approached from the risk perspective, either from a qualitative or probabilistic risk analysis, and seen as an antonym of risk. However, new safety paradigm, that sees safety as an emergent phenomenon and by-product of several technical and social structures, processes and activities in an organisation, and between the organisations, challenges conventional ways to govern safety. By the same token, it creates challenges to risk analysis, if due to the interconnectedness of several subsystems, root causes are difficult to find and harms are not easily foreseen. Complex and emergent nature of sociotechnical systems makes it difficult to deal with events and accidents as well, because of impossibility to understand causes retrospectively. The data consists of interviews with professionals from the regulatory bodies in France, Norway and Finland. Method of analysis is content analysis. The research questions are the following: How is sociotechnical thinking manifested in risk regulation regimes? How risks are approached in sociotechnical safety assessment? How do the regimes contribute to or hamper sociotechnical safety regulation? Findings show that sociotechnical safety assessment is at early stage.

RN13 - Sociology of Families and Intimate Lives

RN13 | Session 01a Couples, Cohabitation and Family Forms I

New family forms in Switzerland: The similarity of marriage and cohabitation in question

Jean-Marie LeGoff, Valerie-Anne Ryser
Lines, Lives, University of Lausanne, Switzerland;
FORS, Switzerland
jean-marie.legoff(at)unil.ch,
valerie-anne.ryser(at)fors.unil.ch

In Switzerland, non-marital unions have been predominantly a prelude to marital union rather than an alternative to marriage. This situation is however changing. More and more couples remain unmarried when they have children. Vital statistics show an increase of out-of-wedlock children from 7% in 1995 to 22% in 2014. In addition cohabitant couples exhibit more equal division of tasks, more individual autonomy and less traditional attitudes toward family compared to married ones.

Based on a the model of vulnerability conceptualized by Schröder-Butterfill, and Marianti (2006), our research aims to better understand whether cohabitant individuals might be more vulnerable compared to the married ones for several reasons: first, they do not share behavior or belief that is considered as normative by the society they live in; second, they might be more exposed to contingencies, stress, and difficulties coping with them in a context where Swiss institutions do not have legal rules to frame cohabitation; third, cohabitation is linked with less happiness.

Using data from the Swiss "Family and Generation survey 2013" results indicate that cohabitant individuals express more progressive opinions and attitudes about the perception of work and family organization. They also tend to be more equalitarian within the couple. But, they express more vulnerability toward work and family life integration, less positive affect and more negative affect. Cohabitant individuals tend to experiment more time pressure, especially while they have children, and seem to be still more exposed due to the lack of legal rules.

The one but not only – primary relationships in polyamory

Ewelina Baczkowska
The University of Warsaw, Poland
ewelina Baczkowska(at)gmail.com

Sex is still a taboo topic but nowadays it is less taboo than it was once. We talk about sex with more openness, we read about it more and we have bigger expectations towards our sex life. Our love pattern has changed – Giddens' pure relationships are to a great extent based on sexual compatibility of partners and mutual satisfaction.

However there are people for whom experimenting with their own partner is not enough. For them the best way gain a perfect relationship is consensual non-monogamy. This term refers to all intimate relationships in which partners agree to have other sexual or/and romantic partners.

One of the most popular examples of a relationship based on the consensual non-monogamy is polyamory, which can be define as multiple-partner relationships. Even in quite conservative Poland we can see an increasing popularity of polyamory. People who decide to be in this kind of relationship even organize their own meetings and events in Warsaw. They openly talk about their love philosophy and ideas about sex and intimacy.

The author's research is based on individual in-depth interviews with people who chose to live in polyamory and have one primary relationship. The method of selecting respondents used in the research was purposive sampling. The aim of this research is to investigate polish polyamorous groups and to understand a decision of choosing polyamory and its possible influence on one's relationship.

Single foster parents between social engagement and self-centered motives: experiences with and challenges of a contested form of elective affinities

Emma Degroote, Chloë Delcour, Lesley Hustinx
University of Ghent, Belgium; University of Ghent, Belgium; University of Ghent, Belgium
Emma.Degroote(at)UGent.be,
Chloe.Delcour(at)UGent.be,
Lesley.Hustinx(at)UGent.be

[theme RN13_a] In recent decades significant changes in terms of relationships and family took place. Beck and Beck-Gernsheim argue that individuals increasingly shape their own biography and that who belongs to the family and who does not, in an individualized society has become an individual choice of the family members. An example of a late modern family with elective affinities is a single parent foster family, where singles choose to take in a child that they have no biological relation with. In the literature, this specific family form is only discussed to a limited extent. In this exploratory, qualitative study fourteen single foster mothers are asked about their experiences as single foster parents and how they deal with the challenges of foster parenting through in-depth interviews. Three areas of tension were found: the tension between self-centered motives to foster and the perception of foster care as a social engagement, the tension between the temporary nature of foster care and the extent to which the foster

parents attach to their foster child and the tension between the private aspect of foster care and its institutional side. These experiences of tension and the ways in which two different, identified types of respondents deal with them are discussed by means of the theoretical framework of elective affinities of Beck-Gernsheim.

Subjective Wellbeing of Single Mothers in Europe. A Multilevel Analysis of 25 countries

Heikki Ervasti, Takis Venetoklis, Mia Hakovirta
University of Turku, Finland; University of Turku, Finland; University of Turku, Finland
heikki.ervasti(at)utu.fi, ta_vene(at)yahoo.com, miahak(at)utu.fi

Single mothers have been identified as an especially vulnerable group in earlier welfare state literature, and studies on single mothers' objective living conditions and economic conditions support this idea. However, much less is known about the subjective wellbeing (SWB) of single mothers. So far only very few studies have focused on SWB of single mothers in Europe, and to our knowledge no prior comparative international studies exist. To fill this research gap we analyse data from the European Social Survey Round 6 (2012) from 25 countries with multilevel regression methods. Our results show that there are notable country level differences in single mothers' SWB. The differences reflect the type of the welfare state and family policies so that single mothers in the Nordic countries score the highest whereas Eastern and Southern European mothers have the lowest levels of SWB. Moreover, on the individual level, the gap in SWB between single mothers and other women is connected to economic resources and living conditions but also to the lack of partnership, less sociability and health. To conclude, we discuss the possible indications of our analysis for family policies.

RN13 | Session 01b Family Planning and Fertility I

“These things don't happen quickly”: A study of women's expectations and experiences of conception in Scotland

Emily Ross
University of Edinburgh, United Kingdom
emily.ross(at)ed.ac.uk

This paper explores women's perceptions of their ability to conceive, in the context of contemporary debates surrounding the notion of delayed childbearing. The research is taken from a study of women's experiences of a first-time pregnancy in Scotland. Drawing on data from qualitative interviews conducted during the first trimester of gestation, I present fifteen women's retrospective accounts of their attempts to conceive. I demonstrate the pervasiveness of discourses of 'advancing maternal age', heard throughout the UK and across Europe more widely, and the impact of these on subjective perceptions of individual fertility.

I show that in the context of contemporary framings of conception as a difficult task for women nearing their mid-thirties, participants in this study anticipated that becoming pregnant would require effort or labour. Successful conception was seen to necessitate physical and emotional work from women, including newfound attention to their corporeality, the use of self-monitoring technologies, and experiential and statistical information-seeking. I draw on the sociology of emotions to explore how contemporary depictions of fertility impacted upon participants' intimate relationships, and, in the face of uncertainties and doubt with regards their ability to conceive, also led interviewees to engage with particular strategies of emotion management.

The paper documents experiences of the medicalisation and technologisation of the 'pre-pregnancy' period, and the impact of this on participants' expectations for a successful conception. This work has implications for sociological discussions of reproductive citizenship, hope and expectation, and adds to literature documenting the management of uncertainty in everyday life.

Unpursued desires to have children and hazarding unwanted pregnancies – How to explain inconsistent generative behaviour?

Jasmin Passet-Wittig, Detlev Lueck
Federal Institute for Population Research, Germany; Federal Institute for Population Research, Germany
jasmin.passet(at)bib.bund.de, detlev.lueck(at)bib.bund.de

Analyses of data from the German pairfam study reveal that a considerable share of respondents reports a generative behaviour that, at least at first sight, seems inconsistent. Within the sixth panel wave, for example, 10.2% of those respondents who declared that they and their partner had tried to become pregnant during the last year, at the same time stated that they had been using contraception during the last three months. Among those who reported that they had not tried to become pregnant 22.8% stated that they nevertheless hadn't been using contraceptives. This paper examines presumed inconsistencies in generative behaviour using pairfam data from seven panel waves. Unpursued desires to have children and risking pregnancy are the two most prevalent forms. We discuss how these particular response patterns may be explained, referring to social-psychological theory, couple dynamics, critical life course events, socio-cultural and structural differentials, personality traits and methodological issues. Assumptions are tested using longitudinal multivariate analyses. The sample is restricted to people in a relationship. Preliminary findings support two obvious expectations that having a same-sex partner as well as perceiving oneself or ones partner as infertile are strong predictors for seemingly inconsistent behaviour. Findings also suggest that disagreement between the partners' family planning plays a role. Respondents of the oldest cohort, lower educated people, parents and people who live as a

couple only for a short time are, in comparison, more likely to behave seemingly inconsistently.

Childfree and childless identities in a post-socialist context in a qualitative research perspective

Hana Hašková

Institute of Sociology of the Czech Academy of Sciences, Czech Republic
hana.haskova(at)soc.cas.cz

Permanent childlessness among women was unusually low in the former Eastern Bloc. In the 1990s the total fertility rates fell in the region, and the age of women at first birth started to increase. Some experts emphasised the influence of cultural and value changes on such demographic developments; others emphasised structural and institutional changes. The emphasis placed on the impact of changing values on the postponement of childbearing implied an increase in the length of the childfree period in young adults' lives while the emphasis placed on the impact of socio-economic problems implied delaying of parenthood and increased childlessness forced by external conditions. The problem is that the concept of the postponement of childbearing, defined at the macro-level of demographic indicators by a decrease in fertility among younger age groups and an increase in the mean age at first birth, lacks a clear definition of processes at the micro-level of individual experience. I addressed this issue by exploring the experiences of 68 Czech men and women of at least 30 years of age who (so far) were neither biological nor foster parents. I explored their experience of childlessness, whether it was perceived temporary or permanent. Based on the qualitative analysis of the 68 problem-centred interviews, I propose a typology of childlessness. It highlights the existence of several distinct processes explaining a variety of experience of childlessness when the postponement of childbearing is identified at the level of demographic indicators. It also shows how structures and values are intertwined in individual experience, and allows for theorising the difference in the postponement of childbearing between those who grew up before and after 1989 in the Czech Republic.

RN13 | Session 01c Parenting and Parent Child Relations I

Understanding of the concepts of "good" parents and "good" children

Vida Cesnuiyte

Mykolas Romeris University, Lithuania
v.cesnuiyte(at)mruni.eu

The research aims to find why parents and children sometimes obviate each other's emotional support even they need it. What are the causes or consequences related to such processes?

The theoretical approaches state that within parents-children ties the interpersonal support is distinguished type. Normatively, it is natural that parents expect support from children and children – from parents.

Such practices coherent with affectual solidarity covering interpersonal feelings and emotional ties like love, empathy, closeness, attachment, caring, trust. Its strengthen ties among family members and create family. The research hypothesis is that respect and concern about well-being of closest relative prevent from looking for emotional support among, respectively, children and parents. The analysis is based on quantitative representative data collected in Lithuania between November, 2011 and January, 2012, and in-depth qualitative interviews carried out between June-August, 2012.

The research results reveal importance of emotional support of parents to children and of children to parents. They intend to give such support to each other. Such practices can be assigned to practices that are doing family. Meanwhile, qualitative data highlight some aspects that create obstacles for sharing of emotional support. Children, usually, look for it beyond the family in order to protect parents from the information about failures in their personal life. Similarly, parents prefer emotional support from other relatives or non-relatives but not from children in order not to burden children with their worries. Such behaviour is expression of inner understanding of "good" parent and "good" child who care about each other's well-being.

„Empathetic but looking out only for oneself” - on the parents expectations regarding their children and on parenting practices in contemporary Polish families

Malgorzata Sikorska

University of Warsaw, Poland
malgorzata_sikorska(at)wp.pl

The main aim of my presentation is to discuss the first results of the research project: „Family and parenting practices in traditional and postmodern families - reconstruction of daily routines”.

I will focus on the parents expectations regarding their children as well as on the parent-child relation described on two following levels: 1) the reconstruction of the social patterns of a 'good' parent, a 'good' child and a socially accepted model of raising process (based on the discourse analyses and on the outcome from the depth interviews with respondents) and 2) the reconstruction of parenting practice, the routines appearing in parents-child relations (based on the outcome from the depth interviews with respondents and the results of the diaries filled by respondents).

The main aim of my research is to confront the social patterns of a 'good' mother, a 'good' father and a socialization process with the reality of parenting practices. The first analysis entitled to frame the initial findings on the parents' inconsistency visible in the following issues: 1) the inconsistency relating to parental expectations regarding their children (for example: the respondents expect that their children will be at the same time empathetic and looking out only for themselves); 2) the inconsistency between the social ideal patterns and the parenting practices. The

mentioned inconsistency create a feeling of insecurity in the role of 'good' parent. I propose the preliminary thesis that the social pattern of parenting as well as the parental practices in Polish families are influenced at least by two conflicting perspectives: 1) liberal and subjective treatment of children and 2) very traditional treatment based among others on catholic norms.
Theme RN13_h

Social investment versus parental investment: a French public problem?

Claude Martin
CNRS, France
claude.martin(at)ehesp.fr

Since more than 30 years the Health Behaviour in School-aged Children – HBCS inquiry documents the children well-being at the international level. In the 3 last editions of this inquiry which explores the situation of thousands of 11, 13 and 15 year olds in almost 40 countries, the French situation looks very problematic on the “parent-child relations” issue, as France is at the last position in the ranking of the countries. In our presentation we propose to explore hypothesis to understand this situation. We suggest to explain the problem in terms of balance between social investment (public) and parental investment (private) and to look at the way this balance is build up as a public problem in the French parenting support policy. Since the early 1990s, an explicit parenting support policy effectively made its way onto the French political agenda. This policy responds to a growing political demand to avoid the failure of the parental educational mission and “new social risks” for children. To educate parents to their own role, to improve their “competence”, to control their practices, correspond to the construction of parenting as a public problem and the defense of a “parental determinism”, mobilizing many different knowledge and empirical results. We argue that the slow policy process that led to current French parenting support policy is the outcome of an ideological, professional and scientific battle. In this battle, public actors (politicians, experts, media) could miss a main point concerning the parent-child relations and parental investment and its quality. To present the field of positions and arguments, we look at official and experts' reports in the last decade.

Parenting Practices ,interrelated': Conceptualizing Parental Involvement at the Transition to Parenthood

Eva-Maria Schmidt, Ulrike Zartler, Irene Rieder
University of Vienna, Austria; University of Vienna, Austria; University of Vienna, Austria
eva-maria.schmidt(at)univie.ac.at,
ulrike.zartler(at)univie.ac.at,
irene.rieder(at)univie.ac.at

Numerous studies have explored parents' unequal involvement in care work, emphasizing the formative power of the first period of parenthood. However, detailed knowledge of the ways in which care work is interlinked between parents in everyday practice

during the transition to parenthood is limited. An Austrian qualitative longitudinal study with first-time 22 parents (66 individual interviews during pregnancy, six and 24 months postpartum) provides in-depth insights into the variety and complexity of everyday parental relations in doing care work at the transition to parenthood. By exploring parents' practices longitudinally, we developed a typology of parental care that is grounded on relationality and a gender-neutral conception of how pre-pregnancy-, pregnancy- or child-related needs are identified and fulfilled by both parents. The typology embraces six types of interrelated parenting practices, namely equal caring, managing–conducting, main caring–co-recognizing, key caring–helping, exclusive caring–absent, and being absent. We show how parental involvement in care is constituted by a complex interplay of parenting practices performed by both parents over time. We demonstrate that parents are situated on a continuum between equality, dichotomy, ambiguity and inequality when practicing care work. Overall, the results systematize the tremendous variety of parents' interrelated involvement in care work.

RN13 | Session 01d Intergenerational Relationships and Kinship Networks I

Analysing family from the perspective of Pierre Bourdieu's social class theory. Closeness and distances within families non-homogenous in terms of social class

Katarzyna Dębska
Warsaw University, Poland
katdebska(at)gmail.com

[theme RN13_m][short abstract]

Family is often described as a 'basic cell of society' which unites people. I would like to discuss family as a much more complicated occurrence existence in a broader social context. A family does not have to be a homogeneous in terms of class, and owned capital of individual members may together greatly vary. My research is inspired by Pierre Bourdieu's theory. In my presentation I would like to question the popular thesis that members of one social class do not have contacts with representatives of other social class. On the contrary, family becomes a sphere in which there is a chance to gather members of one family who belong to different classes. Family ties, objective institutionalized relationships of kinship and affinity, create a situation of specific closeness between people whose class positions may be diverse. Moreover, experiences of advance or declassing affect a family as a whole and alienate relatives or complicate their relations. Family obligations may veil the reality of difficulties in being together as a family in such a situation.

I would like to discuss preliminary results of my study which allow me to answer following research questions:

How does family environment respond to advance/declassing? How do family members manage situations which reveal the fact of

inconsistencies in their habituses? Can family solidarity be built despite such differences?

Data for my analysis was gathered using the method of autobiographic narrative interviews and observations. Interviewees were members of the same families; owing to such a way of constructing particular case studies I gained access to various perspectives of individual family members.

Family ambivalence and grandparental care. Longitudinal evidence of mothers' and fathers' accounts

Ulrike Zartler, Eva-Maria Schmidt, Irene Rieder, Cornelia Schadler, Rudolf Richter
University of Vienna, Austria; University of Vienna, Austria; University of Vienna, Austria; University of Vienna, Austria; University of Vienna, Austria
ulrike.zartler(at)univie.ac.at, eva-maria.schmidt(at)univie.ac.at, irene.rieder(at)univie.ac.at, cornelia.schadler(at)univie.ac.at, rudolf.richter(at)univie.ac.at

Care work in families often relies on grandparents providing support for their children by caring for their grandchildren. The study presented here indicates that this inclusion of grandparents into care work may be a source of family ambivalence for the middle generation. Relying theoretically on the family ambivalence concept and including aspects of a configurational approach, this study concentrates on the transition to (grand-)parenthood.

We concentrate on the following research questions: How do first-time parents' accounts about grandparental care develop over time? Which aspects of ambivalence are inherent in these accounts? Which strategies do parents develop in dealing with ambivalence?

The study was conducted in Austria and comprises multiperspective longitudinal accounts from both parents, collected by means of qualitative in-depth individual interviews with first-time mothers and fathers at three points in time: pre-birth (last trimester of the pregnancy), six months and two years after the birth (n=66 interviews). Detailed case reconstructions and comparative analyses were carried out.

Results showed that mothers' and fathers' expectations with regard to grandparental care were unclear, idealized and contradictory. We identified several distinct types of ambivalence with regard to grandparental care and a variety of strategies in dealing with ambivalences. These strategies varied over time and were not necessarily consistent among both parents. Overall, results indicated that ideals of ('appropriate') care and ideals of family relationships played a major role in parents' constructions of their intergenerational relationships with grandparents and their handling of grandparental care.

The effect of economic wellbeing on the exchange of intergenerational support

Paul Teodor Haragus, Mihaela Haragus

tpharagus(at)gmail.com, mihaela_c2(at)yahoo.com

RN13_m: Intergenerational relationships and kinship networks

Family solidarity has distinct motivations and manifestations in different social strata and the socioeconomic status influences the intensity of intergenerational solidarity. We can approach downward intergenerational solidarity from the perspective of status reproduction: parents invest in their children through intergenerational transfers to avoid their downward social mobility. Most approaches (altruism, reciprocity, or status reproduction) suggest intense instrumental support in families with lower socioeconomic status.

Our intention was to investigate how social mobility is supported through intergenerational relations. For this we used data from Generations and Gender Programme (GGP) Wave1, for Bulgaria and Romania, focusing on three forms of support provided to family members: financial, emotional and instrumental. We used a synthetic index of material wellbeing, combining income and expenditure approach: total household income, two indicators of the ability of household to make its ends meet, the evaluation of the household ability to overcome financial difficulties and the satisfaction with the housing.

Analysis of data for Romania and Bulgaria shows that intergenerational solidarity seems to function distinctly in different social strata. We showed that in higher status families there is more financial support to an adult child (in both countries), but for the emotional support the effect was found only in Romania. In Bulgaria, higher status families are less likely to offer instrumental support to their descendants. Regarding upward intergenerational transfers, we showed that higher status families provide more financial and emotional support to their parents and less instrumental support.

Family social capital during the labour market transition: Inequalities and Mechanisms

Mattia Vacchiano, Joel Martí, Lidia Yepes Cayuela
Universitat Autònoma de Barcelona, Spain; Universitat Autònoma de Barcelona, Spain; Universitat Autònoma de Barcelona, Spain
mattiavch971(at)gmail.com, Joel.marti(at)uab.cat, Lidia.Yepes(at)uab.cat

Abstract (theme RN13_m]”):

In the past decades, several scholars have shown how contacts help job seekers to find a job, particularly focusing on two mechanisms: the transmission of information about job opportunities (information flow) and the contacts intermediation during the process of recruitment (influence flow). Although the “strength of weak ties thesis” associates family ties to worse occupational attainment, these ties are still an important source of resources for labour market transitions of youth, especially in a Southern European context. Consequently, we

analyse the complex and variegated support provided by kinships in this process, in order to understand through which mechanisms the family, as social capital, generates economic inequalities among social groups. Drawing on social capital theory, in this presentation we use quantitative and qualitative data from a study of 250 young adults aged 20–34 in the Barcelona metropolitan area, in order to explore the role played by family resources in the labour market. The results show that these resources are mobilised in all social groups, but relevant differences among them regarding the extent and type of mobilised resources can be identified; differences that contribute to the intergenerational reproduction of occupational inequalities.

This research is part of a project financed by the Spanish Ministry of Economy and Innovation through grant CSO2012-36055 conducted by the Centre d'Estudis Sociològics sobre la Vida Quotidiana i el Treball - Universitat Autònoma de Barcelona. We also elaborate this research in the context of INCASI Network, a European project (Horizon 2020; Marie Skłodowska-Curie, 691004) coordinated by Dr. Pedro López-Roldán.

Parenting Outside Marriage in Spain: The Changing Profile of Cohabiting and Unpartnered Mothers

Teresa Castro-Martin, Clara Cortina, Benoit Laplante
CSIC, Spain; Universitat Pompeu Fabra, Spain;
Institut national de la recherche scientifique, Canada
teresa.castro(at)csic.es, clara.cortina(at)upf.edu,
Benoit.Laplante(at)UCS.INRS.Ca

Fertility research is increasingly centered on the role that family change, new union formation patterns and partnership instability might play on fertility trends. In the case of Spain, very low fertility levels (less than 1.4 since 1989) have been reached in a context of increasing childbearing within cohabiting unions (31% of total births in 2014) but also outside co-residential partnerships (12% of total births in 2014). In this paper, we examine nonmarital childbearing patterns and trends in Spain, distinguishing between births to cohabiting parents and births to unpartnered mothers. We use all birth records between 2007 and 2015 (about 4 million births), 2001 and 2011 Census, the Population Register and the Continuous Household Survey. We estimate age-specific fertility rates by women's union status (married, cohabiting, unpartnered) and their contribution to total fertility. We also compare the socio-demographic profile of married, cohabiting and unpartnered mothers, in order to assess whether the traditionally negative educational gradient in nonmarital childbearing has waned or reversed. Finally, we examine to what extent mothers' union status is associated with newborns'

health disadvantage –measured through low birth weight–, employing multinomial regression models. We distinguish whether or not unpartnered mothers declare father's information in the birth registration. The declaration of paternal information can be used as a proxy for father's legal recognition of the child and as an indication that the newborn's parents maintain some kind of relationship, even if they do not live together.

Are Children a reason to marry? A comparative study of France, Germany and Hungary

Nicolai Patrick Groepler, Johannes Huinink, Timo Peter

Chemnitz University of Technology, Germany;
University of Bremen, Germany; University of Bremen,
Germany

nicolai.groepler(at)soziologie.tu-chemnitz.de,
huinink(at)empas.uni-bremen.de, tpeter(at)empas.uni-
bremen.de

Our paper aims at describing and explaining differences in marriage patterns among cohabiting couples in three European societies with a conservative welfare regime, yet diverging institutional and structural features: France, Germany and Hungary [themes RN13_a, RN13_b, RN13_c]. In particular, we investigate to what extent fertility increases cohabiting couples' propensity to marry in each country and whether couples get married primarily during pregnancy or after childbirth. Based on a discussion of relevant cross-national differences regarding the legal status of unmarried and married couples, family policy, cultural norms and labor market characteristics, we develop hypotheses linking these societal differences to marital behavior.

To test our hypotheses, we use longitudinal data from the Generations and Gender Survey (GGS) for France and Hungary and from the German Family Panel (pairfam) for Germany. To ensure comparability, a number of relevant covariates were harmonized in order to control for potential confounders which may affect the fertility process as well as marriage formation. Using discrete-time event history analysis, we observe robust differences in the effects of fertility on the marriage rate between the three countries. Pregnancy increases the incidence of marriage in Germany and Hungary, whereas no significant effect of fertility is found for France. After childbirth, the transition rate drops to its original level in Germany or in the case of Hungary even below that. These findings point to the critical role of the societal context, which couples take into consideration when making decisions in their private lives. Especially the extensive provision of public childcare in France appears to provide mothers with a high degree of economic autonomy allowing couples to choose their preferred family form with fewer constraints.

Love and Money - The Distribution of Power in Intimate Relationships

Anna Stenpaß

University of Hamburg, Germany

Anna.Stenpass(at)wis0.uni-hamburg.de

Over the last decades, there has been a change in intimate relationships. There are higher divorce rates and new forms of relationships, such as cohabiting or living apart together-relationships. Nevertheless intimate relationships are one of the most important social relationships in people's life.

The study examines the distribution of power within heterosexual relationships in Germany. Based on data from the German Socio-Economic Panel (GSOEP), covering the years 2005, 2008, 2010 and 2012, a secondary analysis was conducted. To identify the influence of personal income on power distributions, the data is examined in light of cooperative-bargaining-models as well as gender-role-attitudes.

According to the cooperative-bargaining-model, power is influenced by individual resources, especially the personal income. Gender role theories, most notably assumptions of socialization, assume that individual behavior depends on norms and attitudes which were internalized during childhood.

Two dimensions of power will be measured: implementing power, defined as the control over income and orchestration power, defined as decision-making. It can be assumed that the increase in women's employment status led to a change in inter-household-relationships. It is hypothesized that factors like the employment level, marital status, the duration of the relationship, as well as children have an influence on power distributions as well.

Hybrid logistic regression models (N=11.540) are used to empirically test for evidence of various determinants. The results show differences between the power bases. Especially the personal income does not influence the distribution of power as strong as supposed. Instead, household income, gender stereotypes as well as role attitudes, seem to affect power distributions in intimate relationships.

The impact of personal networks on conjugal and psychological vulnerability of heterosexual couples in a long-term relationship: a longitudinal perspective

Rita Gouveia

Université de Genève, Switzerland

rittadocarmo(at)gmail.com

Personal networks and social support are paramount for the well-being of individuals, couples and their families as they provide emotional and material resources to cope with critical events and transitions over the life course. Several features of personal networks have been empirically proved to have an impact on conjugal quality, such as the density of support, the level of ties' overlap between partners, and the level of family interference on conjugal interactions. However, little is known about the longitudinal effects of those indicators on partners'

psychological and conjugal adjustment. Therefore, the main aim of this paper is to investigate the role of personal networks on both psychological and conjugal vulnerability of couples, by taking a longitudinal approach. For this purpose, we draw on data from the Swiss longitudinal survey "Social Stratification, Cohesion and Conflict in Contemporary Families", which has been following an initial sample of 1534 heterosexual couples residing in Switzerland over three waves (1998, 2004 and 2011). In this paper, we focus on couples who remained together between wave 1 and wave 3 (N=721). In order to explore the network effects, we focus on both functional indicators (perception of emotional and financial support available, level of family interference) and structural indicators (level of friendship overlap, frequency of contact, and the level of transitivity between friends, siblings and parents). Psychological vulnerability was measured through a 6-item scale of depressive symptoms. In order to assess conjugal vulnerability, we rely on three indicators: conjugal satisfaction, separation thoughts, and frequency of conjugal conflict. Findings show that networks have a significant impact on both individual and conjugal vulnerability, although with different effects on men and women.

RN13 | Session 02b Family Planning and Fertility II

Work-related spatial mobility over the life course and fertility: a comparison between four European countries

Heiko Rüger, Gil Viry

Federal Institute for Population Reserach, Germany;

University of Edinburgh, UK

heiko.rueger(at)bib.bund.de, gil.viry(at)ed.ac.uk

In contemporary societies travelling intensively to and for work has become an important part in many people's lives. Spatial mobility may, however, conflict with other life domains like fertility, especially for women. Using a life course approach, our study provides novel evidence that the interrelation between fertility and work-related spatial mobility is largely shaped by national contexts. We investigate various forms of mobility, including labour migrants, daily and weekly long-distance commuters, and workers regularly absent from home. We apply innovative techniques of sequence analysis to grasp these mobility experiences holistically as mobility histories. We analyse longitudinal data from the 'Job Mobilities and Family Lives in Europe' survey of 1,064 women and men aged 40 or older which were randomly selected from the residential population in France, Germany, Spain and Switzerland. We examine whether the association between fertility and mobility histories varies cross-nationally. Our results indicate that long-term experiences of daily long-distance commuting and overnight work travel are associated with lower fertility mainly among women in Germany and Switzerland while this association is largely absent among women living in France and Spain.

Interestingly, there are similar tendencies among male overnight travellers in Germany and Switzerland, although the differences are less pronounced than among highly mobile women. Our findings suggest that social norms, family policies and labour market structure play an important role in shaping people's lives by either reinforcing or mitigating the conflict between fertility and work-related spatial mobility.

Childbearing behavior after a job loss

Maik Hamjediers

Humboldt-University of Berlin, Germany
maik.hamjediers(at)hu-berlin.de

Economic and sociological scholars have proposed contradicting hypotheses for the association between women's unemployment and subsequent fertility. On the one hand, a notion of substitution predicts higher childbearing for women experiencing a loss of employment; either due to lower opportunity costs of staying out of the labor market or because of a diminution of the prospect of having a successful career. Both mechanisms attribute an increase of fertility to the substitution of labor market participation with engaging in motherhood. Studies conducted in Germany support such link, revealing a positive association between unemployment and childbearing. However, studies from Finland and Austria displayed a negative impact of job losses on the likelihood of a pregnancy when exploiting business closings as exogenous variation and thereby aiming at causal effects. These findings are in line with an economic and sociological notion of a stable career as a prerequisite for family formation.

This analysis aims to evaluate the previous findings for Germany by investigating different reasons of job terminations and their impact for a sample of women in the age of childbearing. Data of the period 1984-2014 from the German Socio-Economic displays a short-term association between unemployment due to dismissal and increased likelihood of births. This observed pattern however could be attributed to reversed causality. At the same time, neither closing of workplaces nor voluntary quitting do women reveal higher fertility. These findings take into question previously results of unemployment increasing birth rates.

Masculinity, Sexuality and Contraceptive Practices: The Case of Young Lithuanian Men

Vaida Tretjakova

Lithuanian Social Research Centre, Lithuania
vaida.tretjakova(at)gmail.com

The aim of this paper is to reveal the underlying mechanisms behind childbearing decisions and the choice of contraceptive methods to meet them by bringing in the men's perspective. Contraceptive behavior is usually the focus of demographic studies and they have almost exclusively concentrated on women. This is mostly because of the assumption that women possess the most accurate information on the subject. At the same time, however, understanding of

the importance of men's roles and their influence on childbearing decisions and, consequently, on contraceptive behavior has been growing in the scientific literature. The prevailing explanations of contraceptive behavior rely on the framework of rational behavior and assume progressive linear transition from the use of the so called "traditional" methods (withdrawal, calendar method) to "modern" ones (hormonal contraception). Lithuania in that respect serves as an interesting case study, since even though family transformation processes associated with the second demographic transition are clearly visible, the "modern mode" of contraceptive behavior has not (yet?) been established. Based on 30 in-depth semi-structured interviews with 18-34 years old childless Lithuanian men the interconnections between gender relations, discourses of masculinity and sexuality and contraceptive practices are analyzed. Results of the study indicate the need to reconsider the dominant explanations of contraceptive behavior and their adaptability to specific social settings.

The shift towards a medical contraceptive model in Europe: Where are we now?

Rozemarijn Dereuddre

Ghent University, Belgium
rozemarijn.dereuddre(at)ugent.be

CONTEXT: The introduction of highly effective contraceptives in the 1960s fundamentally changed couples' reproductive behavior. To a different pace and extent, European countries witness(ed) a shift from a contraceptive model based on natural family planning and condom use ('cooperative methods') towards a model dominated by pills, IUDs and other medical methods. The current study aims to look at how this transition further ran/runs its course by (1) comparing the trends in contraception in the 1990s and the 2000s in different European countries, and (2) determining whether changes between the two time periods can be attributed to changes in the composition of the population or to changes in men's and women's behavior.

METHODS: We combine data from the Fertility and Family Surveys (1988-1998) and the Generations and Gender Surveys (2004-2011) for ten European countries. Country and period specific logistic regression analyses, and decomposition analyses are used to examine our research questions.

RESULTS: The growing dominance of the medical contraceptive model is confirmed; all countries show an increase in the use of medical contraceptives between the 1990s and the 2000s. At the same time, most countries also witness a rise in cooperative methods which suggests that the former does not merely substitute the latter. Both the change in cooperative and medical methods are attributable to a combination of changing population compositions and altering behavior. Large variations between countries are however present.

CONCLUSIONS: The results underline that sociodemographic inequalities in contraception vary

over time and across contexts.

RN13 | Session 02c Parenting and Parent Child Relations II

Regard for institutions and construction of parenting

Pierig Humeau, Bertrand Geay, Emilie Spruyt
