humeaup(at)hotmail.com, bertrand.geay(at)u-picardie.fr, emilie.spruyt(at)u-picardie.fr

This paper will investigate the construction of parenting during the first year of a child's life and its variations according to social groups, from the more deprived families to the well off and educated ones. The conceptions of family, care practices and early education practices can be related to parents' regard for institutions, social justice and gender relations. This period of life is critical for couples, involving a series of implicit norms, particularly for couples with different social backgrounds, according to their school trajectory and the social position they take up in the labor market. An important division appears thus within working classes, between very precarious classes, which are far off the institutions, and the more integrated ones, more considerate of middle class standards. Inside upper classes parents are distinguished by their consideration of awakening, obedience and fulfillment of the child. This paper will be based on the first results of ELFE (Etude Longitudinale Française depuis l'Enfance) as well as on a quantitative inquiry conducted during 5 years with 50 families coming from different social backgrounds. Experience and displaying of early parenthood in narratives of young mothers and fathers

Smiljka Tomanovic
Faculty of Philosophy University of Belgrade, Serbia
smiljkat(at)hotmail.com

The paper deals with interpretation of narratives of young parents related to their experience of early parenthood with a newborn child. It is based on the analyses of narratives from in-depth interviews with twelve mothers and twelve fathers age 30 from Serbia done in 2012. It aims to explore to what extent the experience of early parenthood is related to normatives from dominant discourses of motherhood and fatherhood, as well gender differences in its

displaying. I also explore satisfaction with early parenthood experience related to features such as: objective conditions (of pregnancy and delivery, mother's and child's postnatal health, etc.), expectations and received amount and type of support (from partner, from female relatives), fulfilling of gender parental role expectations etc. The analysis of narratives reveals significant gender differences that could be associated with primary and secondary experience of early parenthood: the mothers displayed experience and satisfaction that are more distinctive, differentiated and personalized as compared to the fathers. Displaying early motherhood as positive experience and displaying satisfaction are more related to mother's expectations of support and their fulfillment regardless of objective conditions (e.g. health issues). Fathers' narratives reveal that their early parenthood experience is partly secondary and not personalized, for instance realized through expected undifferentiated help and support from their parental families for young family as a whole that is perceived as satisfactory. Their narratives display mostly their individualization - acceptance of a new role as increasing responsibility and new personal challenges, and thereby they are reflecting heteronormative discourse of masculinity.

The Impact of Youth Delinquency on Parenting: Towards a Bi-Directional Framework of 'Child' and 'Parent' Effects

Daniel McCarthy
University of Surrey, United Kingdom
d.mccarthy(at)surrey.ac.uk

A considerable volume of studies assessing multiple harms which parents inflict on children. Child delinquency is one such area which has commonly been explained through factors including neglectful, hostile or abusive parenting practices. This 'deficit model' of parenting research, whilst compelling, largely neglects investigation of the broader array of structural factors, family processes and bi-directional effects which shape family lives. We operationalise a model which takes account of the effects which parents have on children (parent effects), and children have on parents (child effects). This draws on a large mixed methods study of parents/main caregivers with children involved in serious delinquency comprising survey data (n=184) and in-depth interviews (n=60). Our data highlight considerable harms which delinquency has on family processes and parenting capacities, with some evidence of recourse toward more punitive parenting within these circumstances. The broader impacts of these adversities on parents' social disadvantage are further examined.

The Influence of Children's Number on Mental and Physical Health of Parent in Germany

Xiaoman Hu, You Li
Heidelberg University, Germany; Heidelberg University, Germany
bessie0831(at)hotmail.com, fiona.heidelberg(at)gmail.com

While there are many studies concentrating on how exercises the parent's behavior great influence on children's health, few attention has been paid to the significant effect from children to their parent. However, being a parent means both good and bad for adults. According to the Life-Course Perspective, because the relationship between living situations of parent and of children is extraordinary tight, the negative relation with children and the problematic life of children will cause obvious parent's depression and bring about passive influence on their mental health. Besides, having children means financial burden and time consumption in some ways. So children have also negative effects on the physical health of parent. This empirical study seeks to provide a correlation between the number of children in family and the mental as well as physical health of parent in Germany. By analyzing data in The German Socio-Economic Panel with OLS-Regression and Fix-Effect-Regression and taking effects from income, gender and age into account, we arrive at a conclusion that the number of children has significant passive influence on both the mental and physical health of parent in German society.

RN13 | Session 02d Intergenerational Relationships and Kinship Networks II

Linked Lives Across Borders: Forms of Romanian Family Solidarity in the Context of International Migration

Ionut Foldes

Babes-Bolyai University, Romania

ionut.foldes(at)gmail.com

[theme RN13_m]

Opening the national borders across Europe along with facilitating work permits for foreigners in Western Europe has an enormous impact amongst Romanians as well. In a struggling economic context – with increasing unemployment and high risk of poverty – determined by the transition to market liberalism (neoliberalism), a considerable number of Romanians seek financial security in western societies (i.e. Italy and Spain). Besides self-evident structural effects of international migration, considering the mezzo level, families and households, the present paper aims to understand how geographic distance influence adult-child – parent relationships. Comparing functional intergenerational solidarity between the time prior to migration and the current period, while at least one adult child lives in a different country, different patterns of family solidarities are to be expected. Descriptive results for parents with one migrated child showed that upward help transfers for household tasks and upward material support continues to exist across time. Even if national borders separate parents from their offspring, the last ones continue to offer support during visits. Moreover, high numbers of migrated adult-children were not involved in functional solidarity practices neither in the past nor currently. In reversion, it was observed that for a number of

parents, upward money transfers started only after migration, while material support (household items, food etc.) from children stopped after they left the country. Against this background that defines the potential for intergenerational solidarity, cases of support transfers with more than one adult-child living abroad remains a subject for further investigation.

Exchange of practical intergenerational support. The perspective of elderly Romanians with migrant children

Mihaela Haragus

Babes-Bolyai University, Romania

mihaela.haragus(at)ubbcluj.ro

RN13_m: Intergenerational relationships and kinship network

The large extent of work-related migration from Romania challenges the intergenerational relations through the geographical distance between adult children and their parents. We investigate how practical support (or assistance in form of time, a form of functional solidarity) flows between elderly parents living in Romania and their migrant adult children.

We capture the different ways of provision of support (direct provision with physical co-presence, direct provision at a distance, coordination, and delegation of support to a third person), and investigate the factors that lead to a more or less intense exchange of support, adopting a theoretical model that accounts for four conditional factors for solidarity: opportunities, needs, family and contextual-cultural structures. The data we work on come from a national survey of 1,500 elderly persons who have children who live abroad.

We have found that elderly in poor health, residing in rural areas are most likely to benefit from practical support in situations of co-presence, during children's visits at home. Direct provision of practical support to migrant children in the destination countries (mainly grandchild care), in situations of co-presence, depends on the elderly opportunities to travel. Solidarity in the form of coordination and delegation of support exists when the elderly parents left behind are rather in poor health but not critical and when there are other family members around them, with whom the migrant children communicate and organize care from a distance.

Mature adults and the intergenerational solidarity within the family. The Spanish case

Rita Cavallotti, Francesco Marcaletti

Universitat Internacional de Catalunya, Spain;

Universitat Internacional de Catalunya, Spain

rcavallotti(at)uic.es, fmarcaletti(at)uic.es

The paper presents the preliminary results of a survey on intergenerational solidarity within the family carried out in Spain at the end of 2016, and based on a national quota-sample of the 65-74 years old residents with children still alive. The questionnaire has been administered with CAPI technique and led to collect 608 valid cases. Random sampling techniques have been adopted for each strata of the sample.

Following previous studies, the survey's final goal is to provide evidence based data for reinterpreting both the sociological relational perspective applied to the study of the intergenerational solidarity within the family, and the classic Bengtson-Roberts theory. The data analysis is based on the calculation of indexes, the use of multi-variate techniques, and the analysis of familial and social networks.

The survey specifically focused the dimensions of – and the relations between –: the structure of the family and the intergenerational relationships; the familiar and friendship solidarity networks; the mutual orientation between generations; the memory and the feelings of gratefulness and equity; the health conditions and the leisure habits; the ICT use; the being in paid job; the participation in volunteering and social-political activities; the social capital; the values and the attitudes; the representations of the elderly condition; the financial condition.

The results of the analysis allow exploring the relevance of the structural solidarity dimensions (number, type, proximity of the family members, and so forth) in shaping the intergenerational solidarity within family, in relation with all the other solidarity dimensions already explored by the literature: associational, affectual, consensual, functional, and normative. Moreover, the results provide further evidence for the analysis of intergenerational solidarity according to the relational sociology paradigm.

Single mothers and intergenerational support patterns in Lithuania

Deimante Kuconyte-Budeliene
State scientific research institute Lithuanian Social Research Centre, Lithuania
kuconyte.deimante(at)gmail.com

Around 45 percent of single mothers with dependent children lives at-risk of poverty and according to this indicator country is among the leaders in EU countries. Research show, that for substantial part of single mothers the state support in cash is the main source of living. This proves that welfare state providing formal support is not fully corresponding to the needs of single mother families thus, the informal intergenerational support is especially significant. Thus this paper addresses several question: what models of intergenerational support to single mothers families could be distinguished? How they are perceived by women?

Existing research shows that intergenerational support helps to mitigate consequences of divorce to single mothers. Extend family members mostly provide financial, practical, information, childcare, nature support (Mudry, Kushner, Neufeld, 2010). Intergenerational support on macro level is influenced by the social policy, demographic and cultural determinants. On the meso level intergenerational support determine by the social class, the structure and type of family. On the micro level factors, such as - identity, reflexivity, role of the primary and secondary socialization.

The paper is based on the qualitative methodology.

We conducted 20 biographic interview with divorced or separated single mothers, raising dependent children.

Primary research results revealed that intergenerational support models is oriented to childcare, provision of the material resources, practical support, social capital transfer from the mother's parental generation to the single mother. Our preliminary results show that four intergenerational support "top-down" could be distinguished. In the further analysis we will examine how these models are linked with the meso and micro levels determinants of the intergenerational support.

RN13 | Session 03a Couple Formation and Marriage Markets I

Measuring and explaining the marriage boom in the developed world

Jesús J. Sánchez-Barricarte
Carlos III University of Madrid, Spain
jesusjavier.sanchez(at)uc3m.es

Using aggregated data from 25 developed countries over a lengthy period of time, this article presents a measure of the marriage boom observed in the twentieth century and an explanation for its causes. One of our main conclusions is that even though it basically developed after the Second World War, its origins are to be found before it. We found that, contrary to the views of some scholars, this boom was not a short-lived phenomenon, but actually lasted for 90 years on average. Using panel data analysis techniques, we are able to show that the rise in women's education, state spending on social benefits, and larger percentages of people employed in the primary sector tended to discourage marriage. We also found a quadratic relationship between the nuptiality index and the per capita income and mortality rates.

Men's Singleness and Well-Being

Anu Kinnunen, Osmo Kontula
University of Tampere, Finland; The Family Federation of Finland
anukkinnunen(at)yahoo.com,
osmo.kontula(at)vaestoliitto.fi

This study investigates in what extend men strive for a couple relationships and how singleness relates to wellbeing. Three dimensions: happiness, loneliness and psychosomatic symptoms, were used as the indicators of wellbeing. Data is collected in The National Study of Human Relations, Sexual Attitudes and Lifestyles in Finland years 1992, 1999, 2007 and 2015 (FINSEX). Quantitative methods were used for the analysis. The research results are based on the data of 2797 men aged 25-64. Out of them one in six lives without an intimate relationship and most strive for a couple relationship. Singleness is more prevalent in big cities, small towns and countryside. In the quantitative analysis, we compared singles striving for a couple relationship, singles without an acute wish for

a relationship and men in relationship. The single men striving for a couple relationship reported higher levels of loneliness than other singles. They also had more nightmares, general tiredness and anxiety than the other two groups. The results show that wellbeing is not only connected with the relationship status but also with the possible contradiction between the actual and the wished relationship status.

Partner Preferences and the Income Cliff in Households: Insights from Agent-Based Modelling

André Grow, Jan Van Bavel
KU Leuven, Belgium; KU Leuven, Belgium
Andre.Grow(at)kuleuven.be,
jan.vanbavel(at)kuleuven.be

Women's economic role in Western societies has changed dramatically over the last decades. Since the 1960s, female participation in tertiary education and in the labor force increased, and women increasingly entered previously male dominated occupations. Furthermore, a decline in men's income has increased the importance of women's income for the wellbeing of their families. Against this backdrop, it is surprising that marked inequalities in spouses' relative income persist. The distribution of relative income within households tends to be highly skewed. The husband usually earns more than the wife and there is a striking discontinuity in their relative contributions to household income at the 50/50 demarcation line: many wives earn almost as much as their husbands, but few wives earn more. Earlier research has assumed that this 'cliff' is the result of gender norms that hold that the man should be the main provider for the family. We explore the alternative possibility that this cliff might result from the gender wage gap that still exists in the overall population, and suggest that because of this inequality, the cliff might even occur if people are indifferent about whether it is the husband or the wife who earns more. We assess the logical consistency of our argument with an agent-based computational model that we submit to computational experiments. Preliminary results suggest that the gender wage gap might contribute to the observed income cliff in households, and that this cliff can occur even if spouses do not care about which partner earns more.

RN13 | Session 03b Family Planning and Fertility III

Do family policies have a natalist impact and how this can be measured? An analysis of GGS-data

Beat Fux
University of Salzburg, Austria
beat.fux(at)sbg.ac.at

Measuring the pronatalist impact of family policies is difficult. Experts argue that family policies might cause an increase of fertility by at most 5-10%. Based on Generations and Gender Survey data (GGS), this thesis will be examined. We apply piecewise constant exponential models which allow to measure the

distinct normative and structural covariates of first motherhood separately for early mothers, norm followers and late mothers. Preliminary survival analyses show that particularly within the lower classes it is self-evident and unquestioned to get a child rather early. Therefore the assumed policy impact is small. By contrast, high skilled couples who outbalance their multiple interests are characterized by frequent ambivalences in their reproductive intentions and they frequently postpone procreation. This makes them more responsive to family policy incentives.

Research design: In a first step, couples with uncertain and ambivalent reproductive intentions will be selected. GGS allows to determine these group rather precisely (e.g. biologically able to procreate, living in a partnership). In a second step, we control for major factors that might hamper the conversion of intentions into behavior (e.g. unstable partnership, health, work and income). In a third step, the policy evaluations among the distinct target groups will be discussed. The data allow analyzing whether policies motivate couples either to reconsider their intentions or to modify the timing of planned behaviors.

The research design distinguishes between age-specific reproductive norms which are closely related to social status and by focusing on couples with ambivalent reproductive intentions. This might contribute to further elaborate the theory of planned behavior. The paper is providing an approach to quantify the impact of family policies.

Where do Large Families Come From? Determinants of Large Families' formation in Russian cities

Ivan Pavlyutkin, Mariia Goleva
NRU Higher School of Economics, Russian Federation; Saint-Tikhon's Orthodox Humanitarian University, Russian Federation
euhominid(at)gmail.com, m.goleva(at)mail.ru

Today, large family (family with three or more children) is not only an empirical but also a theoretical exception. It means that it is hard to find an adequate social theory (or a middle-range theory) which could explain - where do large families come from in a contemporary rationalized risk or post-materialist society? This paper is aimed at reflecting on this question and providing answers relying on the results of qualitative research.

The research is based on the analysis of 53 in-depth interviews taken from Russian parents living in urban large families in Moscow, Arkhangelsk, Vladimir (2015-2016). Interviews were analyzed according to the Grounded theory methodology and techniques of coding (open and axial) (Glaser, Strauss 1967; Glazer 1978).

As the result of the research, we identified several types of pathways to large families, which vary by meanings of three categories: value of childbirth; parental responsibility; family loyalty and adherence to chosen life course. These types also differ in parental religiosity and the degree of family embeddedness in

weak and strong social ties. We show, that the transition to life in large family is hard to realize being socially independent from the community. Family embeddedness in social relations with others facilitates transition through such mechanisms as social contagion, social learning and social support in gift-giving circles. In conclusions, we provide a critical discussion on the dominant theories of fertility decline.

Large Families in Europe: What are the mechanisms behind the birth of a 3rd+ child in nine European countries?

Ralina Panova, Isabella Buber-Ennser
Federal Institute for Population Research, Germany;
Wittgenstein Centre for Demography and Global
Human Capital (IIASA, VID/ÖAW, WU)
panovaralina(at)gmail.com, Isabella.Buber-
Ennser(at)oeaw.ac.at

The decline of fertility in the course of the Second Demographic Transition is mainly attributed to the increase in childlessness and the decline of large families (three or more births). Based on the 1st and 2nd wave of the Generations and Gender Survey (GGS) data, this paper provides longitudinal comparative analysis of higher order fertility transitions and individual attitudes towards children and social norms in nine European countries - France, Western Germany, Austria, Bulgaria, Czech Republic, Georgia, Hungary, Lithuania and Russia. The purpose of this study is to identify the driving mechanisms behind the birth of a 3rd+ child and explain how they differ in the above mentioned countries. Our aim is to find out which the universal and country specific determinants of the birth of 3rd or more children are by focusing on sociocultural factors. We consider 10,813 men and women between 18 and 45 years who have at least two children. The dependent variable is the birth of a 3rd+ child between two survey waves. The main explaining variables are the anticipated costs and utilities of children as well as social norms. The multivariate analysis is carried out using logistic regression. In addition to the gender specific models with the country variable as proxy for the societal context, analyses are carried out separately for each country. The study provides new insights into the link between sociocultural factors and formation of large family. It reveals cross-national differences in the relationship between attitudes and norms and higher order fertility transitions.

New Marital Strategies in Metropolitan Cities of Turkey

Aylin Akpınar
Marmara University, Turkey
aylinakpin(at)gmail.com

Traditionally, male breadwinner ideology has been dominant in Turkey. In 1980s families in metropolitan cities were captured into neoliberal economic change. New marital strategies, such as searching for gainfully employed women by men who want to climb up the social ladder was an instance of this change. This

presentation is based on the narratives of four middle class, university educated, gainfully employed women and draws in part from data of a larger study on marital lives & divorces of women of different ages and social classes who lived in three metropolitan cities of Turkey, namely, Istanbul, Ankara and Izmir. The research aimed to understand the reasons for women's divorces. The data was generated through in-depth interviews with 43 divorcées from September 2014 to February 2015. The data partly revealed how some men married middle-class women with stable incomes to fulfill their dreams of upward mobility and how they also gained privileges due to material transfers from women's parents into their own marriages. Men who married women who stood on their two feet represented the neoliberal masculinity of our times, in the sense that, they tried to maximize the material advantages of their marriages to be able to make investments to start up their own businesses or to accumulate capital for themselves. These marriages ended in divorce when women understood their husbands' instrumental rationality and regretted the fact that they were the chosen ones instead of being able to choose whom to marry.

RN13 | Session 03c Motherhood and Mothering Practices

Long-term Breastfeeding in Finland - Practice and Experience

Jenny Säilävaara
University of Jyväskylä, Finland
jenny.w.sailavaara(at)jyu.fi

My ongoing gender studies' PhD research focuses on Finnish women who have been breastfeeding over a one year and on cultural aspects they encounter. This paper introduces some of my research findings so far. The presentation focuses on the question of how long-term breastfeeding is affecting these mothers' lives: How do they use space while breastfeeding? Is it possible to breastfeed openly and if so, what kind of practices do these mothers use to make it possible? What about the practice of breastfeeding itself; what does it mean to be a long-term breastfeeding mother in Finland?

This presentation is based on written data collected from 39 mothers (collected in 2012). The mothers reflect on their experience and tell about their view on extended breastfeeding in context of Finnish culture. My method is content analysis. The results so far show that breastfeeding long-term can be challenging especially in public spaces. Breastfeeding in public is frowned upon in Finland, but according to my findings, some mothers still do choose to breastfeed openly, while others feel that they need do it in secret, or "in the closet".

By approaching the subject of long-term breastfeeding through feminist conceptualizations of normativity and space, sociological relationality as well as queer theoretical understandings of the metaphor of the closet, the presentation examines experiential knowledge on this previously little researched subject.

Opposing dominant discourses on breastfeeding

Sunna Símonardóttir
University of Iceland, Iceland
sks23(at)hi.is

The World Health Organization recommends exclusive breastfeeding for the first six months of life, with continued breastfeeding up to two years of age or beyond. This policy has been adopted by the Nordic countries, including Iceland, where there has been an upward trend towards higher breastfeeding rates and duration. As breastfeeding has increasingly become a subject of moral concern, the research that has been done on breastfeeding from a socio-cultural point of view remains rooted in an Anglo-American context and has mostly been conducted in countries where breastfeeding rates remain relatively low and the cultural context of breastfeeding similar. This study addresses that knowledge gap by collecting narratives from 77 Icelandic mothers who have struggled with breastfeeding in a country where the cultural and societal expectations for women to successfully breastfeed are high and breastfeeding represents a strong moral and social norm. This study employs discourse analysis to gain an understanding of the identity work that mothers perform in order to construct themselves as 'good' responsible mothers despite their 'failures' in breastfeeding. The study also extends theorizing about rhetorical agency and resistance by analyzing how Icelandic mothers who have struggled with breastfeeding oppose and challenge the dominant medical hegemony of breastfeeding discourse. The mothers contest certain aspects of professionals' infant feeding advice by constructing counter discourses of their own where they present themselves and their infant feeding experiences as legitimate in a context that proclaims simultaneously that parenting should be shared equally and that mothers should ultimately be held responsible.

From nipples to powder. Examining anthropometric characteristics as determinants of infant feeding patterns

Karen Vanderlinden
Department of Sociology, Ghent University, Belgium
karen.vanderlinden(at)ugent.be

Rate of growth in infancy is an important indicator of infant mortality and morbidity, since reduced growth is a risk factor for disease susceptibility. Even though a mostly linear growth path is discerned for all infants, growth patterns between breastfed and formula-fed infants are different, with breastfed infants displaying a downward trajectory in growth development beginning at 2 to 3 months until 1 year of life. There is the possibility for reverse causality, where slow-growing infants falling off their growth curve trajectories may be deliberately supplemented or weaned in an effort to reverse those trends. We first intent to examine how feeding patterns evolve over time and the way this varies between maternal educational levels. Then, focus on the way these infant feeding evolutions can

be explained by infant anthropometrics alone. Finally, we investigate the extent to which the impact of infant anthropometrics on feeding choices is influenced by maternal education. We employ Foucault's notions of power and authority and the theory on learned effectiveness and health to frame the way in which mothers are influenced when doctors, literally, indicate their child's development on these growth curves. IKAROS data (2006-2009, population data), collected by Kind en Gezin (Child and Family), a Flemish (the northern part of Belgium) public institution which focuses on the welfare of young children and their families, is used to conduct several multivariate growth curve analyses. Preliminary results show that mothers of babies with a lowered growth, indicated by lower SD scores for their respective age and sex on the growth charts, tend to change infant feeding patterns over time. Possible explanations, policy implications and directions for further research are discussed.

Motherhood in the context of economic crisis: co-responsibility or reinforcement of intensive mothering?

Matxalen Legarreta, Marina Sagastizabal
University of the Basque Country UPV/EHU, Spain;
University of the Basque Country UPV/EHU, Spain
matxalen.legarreta(at)ehu.es,
marina.sagastizabal(at)ehu.eus

Specialist literature examining the impact of the current economic crisis on gender inequalities indicates that the crisis initially affects mainly men in Spain. This is due to its influence on masculinized economic sectors, such as construction (Larrañaga and Jubeto 2009; Pérez Orozco 2010; Larrañaga, Jubeto and De la Cal 2011; Agenjo, 2011). It affects women to a greater extent by the cutbacks in public services, as they are the main users and employees (Larrañaga, Jubeto and De la Cal, 2011). However, its effect is thought to be more negative for women than for men and, in general, the crisis is believed to intensify gender inequalities (Galvez and Rodríguez, 2011; Orozco, 2010). Considering this background, the paper presents some of the tensions produced in the new crisis scenario in relation to the meanings of motherhood. Data come from ongoing research conducted in The Basque Country (region in northern Spain) and have been produced through the combination of quantitative (Time Budgets) and qualitative (deep interviews) techniques. The conclusions suggest that the significance and practice of mothering in this context is ambivalent. On the one hand, it gives rise to new situations of shared and co-responsible childcare, mainly related to what time availability theories point out concerning the effects of labor market schedules on the availability of time dedicated to care. On the other hand, following the contributions of doing gender view, a reinforcement of traditional models is noted, influenced by the discourses on domesticity and intensive mothering.

RN13 | Session 03d Intergenerational Relationships and Kinship Networks III**Multigenerational cohousing communities as elective affinity networks?**

Susan Schröder, David Scheller
University of applied sciences Potsdam, Germany;
University of applied sciences Potsdam, Germany
susan.schroeder(at)fh-potsdam.de, d.scheller(at)fh-potsdam.de

Social and demographic shifts towards an increasingly aging society accompanied by individualization and shifting family structures have been associated with social isolation and a 'caring crisis'. Multigenerational cohousing has lately been discussed as solutions to these forms of social disintegration.

Our paper will present preliminary findings from a participatory action research project: 'Multigenerational cohousing in high-rise buildings'. Conducted in Potsdam and Frankfurt (Oder), Germany, the project began in May 2016 and will conclude in April 2019. We will draw on qualitative research, involving interviews data and focus groups with self-organized cohousing projects, to examine multigenerational communities as elective affinity networks.

From a subject-theoretical perspective, we are looking at processes of community building and new forms of kinship. The questions addressed are: Which forms of intergenerational relationships can be found in cohousing projects? To what extent do residents remain in (traditional?) family structures? And, which new forms of kinship are emerging in cohousing settings?

Our analysis highlights three key findings. First, motivations for cohousing – regardless of social backgrounds – are focused on creating a safe and reliable neighborhood with trustworthy social networks. Second, relations in cohouses are driven by personal needs, ideas and resources, i.e. individual 'me-time' and 'community-time'. Third, in moments of conflict age becomes visible as a strategic argument for the residents in the projects., i.e. 'knowledge-based experience' for seniors. In conclusion, we argue that residents prefer optional, voluntary relationships on the basis of individual choices with other housemates. However, in situations of conflict intergenerational kinships beyond family are potentially challenged.

Multigenerational households in Italy. How ageing and economic crises are affecting individual trajectories and family forms

patrizio lodetti
University of Milan, Italy
patrizio.lodetti(at)unimi.it

This work aim to understand how significant demographic changes and the economic crisis have affected generational interdependence, family structures and solidarity networks in Italy. My work takes in consideration changes in family living

arrangements, focusing on the multi-generational household types, both from a structural and a relational perspective.

Avoiding a straight Bourdesian positioning, I'm using some of this author key concept to frame a methodological approach. What I propose is a sequential mixed-method designs, where quantitative methods are used to understand the objective factors that contextualize the increase of multigenerational households and qualitative methods to understand the subjective processes involved in the management of this kind of living arrangement.

In the practice, my analyses are intended to take a longitudinal perspective, to grasp change over time. I'm using three waves (two gathered before 2008 and one later) of a repeated cross-sectional survey: the Multipurpose survey on households (ISTAT). I'm going to present results elaborated from descriptive analysis and logarithmic regression models. I'm showing also results of a cluster analysis performed to detect the recurrent biographical events (job losses, insufficient income, divorces, illnesses) and individual features (mainly gender and age), which rise the risk to drive individual trajectories toward multigenerational living arrangement. On this taxonomy are defined the criteria to set up a reasoned sampling for the qualitative analysis. Results of the qualitative will not be included in the eventual discussion

Family Relations and the Intergenerational Transmission of Poverty

Marion Fischer-Neumann, Petra Böhnke
University of Hamburg, Germany; University of Hamburg, Germany
marion.fischer-neumann(at)wiso.uni-hamburg.de,
petra.boehnke(at)wiso.uni-hamburg.de

After a long period of neglect of social reproduction issues since the middle of the last century, socialization research is currently increasingly readdressing the meaning of socialization and its conditions within the family for social selection and reproduction processes.

We want to contribute to the existing and at present emerging strand of literature by explicitly referring to the quality of family relations (i.e. intergenerational bonds) as socialization conditions that may affect the reproduction of income poverty. To define intergenerational relationships and their impacts, we draw on the broad body of research on intergenerational solidarity. According to the solidarity-conflict-model, intergenerational relations involve positive elements (i.e. solidarity) and negative elements (i.e. conflict).

In order to analyse the effects of intergenerational conflict and solidarity empirically, we use data from the German Socio-Economic Panel Study (GSOEP; 2000-2015). It is a large-scale annual household panel survey which has been conducted in Germany since 1984. We measure the dependent variable of income poverty (yes/no) by using the modified OECD equivalence scale of whether the respondents' self-reported household equivalent income after public and

private transfers in the current month is below 60% of the median monthly household income. Further, SOEP contains information addressing structural and functional solidarity as well as conflict. While structural solidarity is defined by measures of family size, composition and distal proximity, functional solidarity is measured by how far parents supported the respondents' achievements while attending school. Intergenerational conflict in turn is assessed by how often the respondent had disputes with their respective parents during adolescence. Due to the panel data available, we assess random effects logistic regression models.

Applying complete social network methods on kinship networks of divorced and intact families

Vera de Bel, Marijtje van Duijn, Tom Snijders
University of Groningen, Netherlands, The;

In this paper we make a first attempt to apply complete social network analyses (SNA) methods on kinship networks. This enables us to study relational structures in kinship networks of divorced families and kinship networks of intact families. During the last 40 years, divorce rates in Europe have doubled. Despite the extensive amount of research on how parental divorce affects the relationships and well-being of children and their divorcing parents, little is known on the consequences of parental divorce for extended kin. Argued from family systems theory, extended family members can be affected by the divorce of their children, while, reasoned from a solidarity perspective, they simultaneously can become important sources of support to the nuclear family. In this paper we compare contact and relationship quality in complete directed kinship networks consisting of one resident child, two parents and up to four grandparents of 60 divorced families and 80 intact families. The data come from the Divorce in Flanders study. The kinship networks will be analyzed using Bayesian Exponential Random Graph Models for small networks.

RN13 | Session 04a Labour Markets and Welfare States in Transition: Barriers and Opportunities for Work-Family Reconciliation and Gender Equality

How do Changes in Family Policies Influence the Life Course of Men and Women?

Gesche Brandt
German Centre for Higher Education Research and Science Studies, Germany
g.brandt(at)dzhw.eu

In 2007, the Parental Allowance and Parental Leave Act was introduced in Germany. The aim of this

reform was (amongst others) to shorten the time span of parental leave taken by mothers and to increase the share of fathers taking parental leave. Apparently, highly educated women benefit to great extends from the new political regulation and the share of highly educated men taking parental leave is higher than before. Does therefore the new political regulation lead to converging life course patterns among highly qualified men and women?

To answer these questions, life course patterns of higher education graduates are analysed using sequence analysis. The empirical analysis is based on the 1997, 2001 and 2005 graduation cohorts of the graduate panel studies conducted by the German Centre for Higher Education Research and Science Studies (DZHW). The sample consists of approximately 14,000 persons. For each cohort, the period of investigation covers the first ten years after graduation. This period represents the so-called rush hour of life which is characterized by the start and establishment of the working career and family formation. The family formations of the older cohort took place before 2007 and of the youngest after 2007.

The results confirm that men with higher education degrees usually are full-time employed even if they become fathers. However, the proportion of fathers with parental leave experiences increases significantly after the reform. The live courses of mothers are still diverse. Although first tendencies of approximation are evident, the traditional patterns still dominate.

Gender mainstreaming and work-family balance: an overview at Eurobarometer data

Isabella Crespi, Vera Lomazzi
University of Macerata, Italy; Gesis – Leibniz Institute for the Social Sciences, Germany
isabella.crespi(at)unimc.it, vera.lomazzi(at)gesis.org

Social policies aiming to promote gender equality have evolved substantially in the last decades. Over the past years, the European Union has developed an actual strategy to promote equal opportunities between men and women. Mainly looking at the European Commission's Eurobarometer Surveys, the study aims to understand the connection between the normative level and this specific realm of the European Commission's activity with a specific focus on the development of the questions asking opinion on work-family balance and evaluating the EU gender equality policies. A huge and valuable set of variables and questions has been developed to improve the knowledge on the gender mainstreaming implementation in the agenda looking at further challenges for work-family balance in the future. Could we identify any changes in the EC public opinion surveys in the gender mainstreaming perspectives about work-family balance? The focus will be on Eurobarometer to detect any change related to the legislative development of the gender mainstreaming perspective, evolution of political agenda, and directives (the last agenda is the Horizon 2020 program and this will be also evaluate) with a specific

focus on work-family balance issue. Contents under investigations are related to the gender inequality, working women, and gender policies. We will start exploring the Eurobarometer. To answer to the project's research questions, content analysis will be employed to deeply study the development of the questionnaires. Descriptive statistics and models based on regressions will be used to describe the trends in attitudes towards gender roles and work-family balance and to test item validity.

Genderising Consequences of Gender-Blind Family Policies in Poland in 2010s

Katarzyna Suwada

Nicolaus Copernicus University, Poland

k.suwada(at)umk.pl

In 2010s Polish family policy has undergone a series of reforms. These reforms included: an introduction of paternity leave, a 6-month parental leave, a programme extending institutional care for children under 3 years, and finally, a programme 500+ in which every parent who has more than two children acquires a right to child allowance. All of these reforms tried to address the problems of extremely low fertility rates. The aim of the paper is to examine what effects of all these reforms have on gender inequalities.

Even though some of the reforms might be analysed in terms of their degenderizing effects, I claim that in fact none of them tried to address an issue of gender inequalities. These reforms that had a potential to actually help in achieving gender equality were introduced in such a way that this potential was wasted. Polish politicians are not interested in gender equality issues. What is more, some of them openly talk about the restoration of the traditional model of family.

My paper is based on an analysis of legal documents, political programmes and politicians' declarations regarding the aims of particular reforms. It is complemented by experiences of Polish parents gathered in in-depth interviews conducted in 2012 and 2017.

The analysis of interviews shows that the politicians' ideas of how to handle family policy do not always respond to people's needs and expectations. What is more, the introduced instruments do not work in a way politicians planned. Additionally low fertility rates in Polish society can only be partially explained by inadequate instruments of family policy. It is also necessary to notice the general lack of effective gender equality policies.

Men's and women's needs and expectations towards corporate welfare

rosantonietta scramaglia

IULM University, Milan, Italy

r.scramaglia(at)gmail.com

The paper presents the preliminary results of a research project aiming at investigate men's and women's needs and expectations towards corporate welfare. Specifically, the research inquired about

gender relations, task distribution concerning children and eldest care, and male and female sense of responsibility towards household and community.

From November 2016 to January 2017 we distributed an online questionnaire through the web application Lime survey to a convenience sample of 14.000 Italians, from 18 to 89 years (3082 permanent employees, 1319 independent workers, 649 occasional workers, 574 unemployed/looking for a job).

We asked about respondents' values, life satisfaction, economic crisis consequences on their families, and fears and dreams about the future. Moreover, they had to indicate the importance of 25 corporate welfare policies that could improve the life quality of workers, of their families, and of their communities. Through 29 items, we also explored the conditions, which, according to respondents, foster the balance between work and family life.

The gendered perspective concerning needs and expectations towards corporate welfare allows researchers to cast a light on the still existing differences between male and female roles both within families and in the community.

RN13 | Session 04b Infertility and Reproductive Technologies

The meaning of childlessness along the infertility treatment pathway

Zsafia Bauer

Corvinus University of Budapest, Hungary

zso.bauer(at)gmail.com

Exploratory qualitative netnography of Hungarian public social media data serves the empirical background for proposed paper (funded by OTKA-K108981) submitted to theme RN13_e: Infertility and reproductive technologies. The study investigates the myriad of conflicting emotions and social stigmas participants come to face throughout their patient journeys. Analysis aims to deepen understanding of how patients dealing with infertility diagnosis and subsequent treatment perceive their own childlessness.

Present paper explores how longing for conception and childbirth influences their decision to employ medically assisted reproductive technologies which bear the potential of helping them, simultaneously carrying financial, physical, psychological and other costs. These questions are engaged through the analysis of expectations and frustrations expressed on online discussion groups and other open-web sources adopting the methodological approach of qualitative netnography. The research design allows examining the discourse of the participants in a natural, non-controlled environment. The presence of the researcher had no influence on the results, bypassing problems regarding biases experienced during individual or couple interviews. Results show that having children becomes the ultimate and all-encompassing goal for the participants who transform and re-organize their entire lives to achieve this aim.

Social stigmatization is leveraged by the strong support they receive from their partners and family.

Fertile Markets: Governing Cross-Border Reproductive Care

Eleni Tsingou

Copenhagen Business School, Denmark
et.dbp(at)cbs.dk

This paper explores how market governance develops in an institutional vacuum. It does so by focusing on cross-border reproductive care, a recent but growing phenomenon enabled by developments in assisted reproductive technology (ART) services. This care raises questions of who regulatory environments recognise as a potential parent, and what risks patients are willing to endure to their rights, and their bodies, to receive treatment. The paper proposes a political economy approach to understand this emerging market, and the regulatory and governance dimensions of cross-border reproductive care. It first outlines demand and supply side factors, such as national welfare provision (including public funding for ART), and cross-border regulatory variation on reproductive rights and ART methods. It proceeds to explore (i) how for-profit and not-for-profit actors create and govern this market; and (ii) the institutional challenge posed by cross-border services and how professional, market and regulatory governance mechanisms are involved in providing structures and legitimacy to such care provision. These markets have emerged in an institutional vacuum where regulatory authorities have ignored developments because of lack of capacity or due to the services in question tackling local religious and cultural taboos, or are still in the process of seeking information on what is happening. In this vacuum, specialist clinics and patient care organisations emerge as providers and facilitators, while communities, virtual and personal, enable the market, with formal governance mechanisms playing regulatory catch-up.

Nationalizing eggs and ethics in Finland: Enacting kin and biologizing race in the Nordic context of transnational egg donation

Riikka Homanen

University of Tampere, Finland
riikka.homanen(at)uta.fi

Within the Nordic countries Denmark is arguable the most well know "fertility hub" for the so called cross-border reproductive travellers - when talking about donor sperm. My ethnographic research on fertility treatments in Finland has shown that in the case of travel for donor eggs, Finland is the Nordic destination. In fact, most of the Finnish donor eggs go to cross-border travelers, mostly to other Nordic nationals. Drawing on my ethnographic material from IVF clinics in Finland, I will discuss the pull factors for these particular travellers by analyzing how kinship is enacted in the everyday practices and organization of care.

The analysis shows that there are pull factors quite

common to fertility destinations in general, such as permissive legislation on IVF, availability of treatments, geographical and cultural proximity and relatively reasonable costs. However, more specific to the Nordic context are the imaginaries of both the healthcare staff and the travellers on national (and racial) resemblance and "good Nordic care". Finns are seen as Nordic kin, and the inheritability of this "Nordicness" is reinforced at the clinics. Even the state donor register originally built on the arguments of children's rights is, in practice, taken as a guarantee of ethnic origin of the donors. In the past the cross-border travelers were concerned particularly that the donors might be Russians.

Enacting Nordic kin-ness in these ways can be interpreted as reconstituting the dominant biopolitics of race and nation, and as part of intra-European histories of racism and postcolonialism. In the case of Finland/Nordic region it is more precisely about postsocialist orders and racism.

Transformation of Family and Demographic Policy Caused by Assisted Reproductive Technologies in Russia

Elena Bogomiagkova, Marina Lomonosova

St.-Petersburg State University, Russian Federation;
St.-Petersburg State University, Russian Federation
elfrolova(at)yandex.ru, lomonosovamv(at)mail.ru

The paper deals with social consequences of assisted reproductive technologies (ART) on the example of Russia. According to official data of Russian Association of Human Reproduction, in 2014 the total amount of ART executed cycles in Russia was 95628; the country was in the top five of European countries. The birth of a child is such a field of overlapping and competing interests of the state, separate families and individuals, and the state is interested in expanded reproduction of population and birth of healthy children. Nowadays social and demographical policy in Russia uses ART as a tool for regulating reproductive behavior of both women and men.

Using such conceptions as bioeconomics, biopolitics, biomedical citizenship and such empirical methods as analysis of statistics, discourse analysis of mass media, expert interviews we studied the process of ART implementation in Russia. We focus on such topics as how traditional understanding of functions of family is transformed today and parents' and gender roles are changed. Two opposite trends can be observed. On the one hand, the accessibility of ART contributes to the realization of individual reproductive rights. In conditions of technical progress, the birth of a baby is not only and not so much a need but individual project which may not be associated with sexual behaviour, family formation and less limited by health and age of parents. On the other hand, the access to ART may be the basis for the production of new social differences and strengthening traditional family values. Access to ART do not simply reflect the structure of the socio-economic differentiation, but produce new forms of social inequality.

RN13 | Session 04c Fatherhood and Fathering Practices I**Post-divorce fathering in Lithuania: between “caring for” and “caring about”**

Ausra Maslauskaite

Vytautas Magnus University, Lithuania

ausra.maslauskaite(at)vdu.lt

In this paper, we analyze the quality of the nonresident father and under-aged child relationships after parental union dissolution in Lithuania. The country represents the context where the gender-neutral custody legislation was introduced more than a decade ago and the normative expectations towards the more involving role of the father after union dissolution are on the rise. Theoretically, our study is grounded on the conceptual framework dividing the care into the “care about” and the “care for” (Smart 1991). “Caring about” marks the more abstract notion of feelings of care and “caring for” grasps the everyday activity of meeting children’s needs.

The analysis is based on the representative survey with the non-resident fathers with under-aged children in Lithuania (N=1500). We measure the quality of the relationships using the adapted Network of Relationships Inventory (Furman, Buhrmester 1985). We also consider the self-reported everyday activities fathers do with their children. Using the multivariate analysis, we identify the factors determining the quality of the relationships. We control for the father’s and the child’s individual socio-demographic factors, characteristics of the divorce process, father’s involvement in child maintenance, parents’ relationships and father’s post-separation partnership trajectory.

Our preliminary descriptive analysis proves that the nonresident father-child relations could be characterized through low conflict, high admiration of the child from the father’s side, but also through the low intimacy, reciprocity and companionship and high relative power of the child in the relationships. There is indeed a substantial variation of the relationship quality across the socio-economic status groups.

Hazy Transition to Fatherhood: Is the Czech Case Exceptional?

Olga Nesporova

Research Institute for Labour and Social Affairs,
Czech Republic

olga.nesporova(at)vupsv.cz

The paper focuses on the transition to fatherhood and the life changes which fatherhood effects in the everyday lives of men. It is based on longitudinal qualitative research conducted with 16 dual-earner parental couples in the Czech Republic from 2011 to 2014. The first wave of interviews took place during pregnancy and the second upon the child reaching 18 months. The expectant fathers evinced vague plans concerning approaching fatherhood; some stressed involvement in childcare while others emphasized the provider role. The concept of a “hazy” transition to

fatherhood evolved based on the narratives of first-time fathers and is used to describe the indistinct character of the transition to fatherhood as opposed to the “distinct” transition to motherhood described by first-time mothers. Identity theory is used as the explanatory framework. I suggest that the hazy transition to fatherhood involves patriarchy, the breadwinner role and the central worker identity, while the distinct transition to fatherhood entails equality, involved fatherhood and the central father identity. Since the Czech sample uncovered only narratives suggesting a hazy transition to fatherhood, the question arises as to whether the Czech case is exceptional.

Interchangeable Parents? Fathers as Primary or Equal Carers for Young Children in the UK

Paul Hodkinson, Rachel Brooks

University of Surrey, United Kingdom; University of Surrey, United Kingdom

p.hodkinson(at)surrey.ac.uk, r.brooks(at)surrey.ac.uk

Against the context of persistent gender divisions with respect to early years parenting, this paper explores the perspectives and experiences of UK fathers who have gone ‘against the grain’ (Ranson 2010) by taking on either primary or equal care-giving responsibility for children aged three or under. Informed by in depth interviews with 24 fathers in heterosexual households, the paper particularly focuses on a discourse of parental interchangeability that pervaded the accounts of many respondents and, in particular, those who were sharing care (more or less) equally with their partner.

The paper sets out how this discourse manifested itself, in relation to ideals about gender equality and/or the pragmatic benefits of a scenario in which parents are deemed equally able to take on childcare tasks, depending on availability. We also explore the extent to which such discourse was borne out in practice, identifying various ways in which, through choice or circumstance, parents were operating in such a manner, while also focusing on the limits of interchangeability. Here, we explore a tendency even in the context of extensive fatherly involvement for some aspects of child-care still to be deferred to mothers – and a propensity for mothers in some cases still to be regarded as default carer.

In spite of such limitations, we argue the substantial aspects of interchangeability these fathers demonstrated represents a significant challenge to gender divisions in early-years care that connects closely to ideal models of shared care outlined by the likes of Fraser (1997) and Crompton (1999).

Can Fathers Mother? Single Fathers and the Transforming Meanings of Fatherhood

Mohamad Chour, Marie-Hélène Fosse Gomez

SKEMA Business School, France; Lille 2 University

chour.mohamad(at)gmail.com, marie-helene.fosse-gomez(at)univ-lille2.fr

Nowadays, a record number of households are

runned by single fathers in most of the European societies. In France, 23% of minor children are living with their fathers in permanent residence or shared custody according to the French ministry of justice (2015). Our research aims to explore how single fathers experience the domestic sphere, a traditionally feminized field, while accomplishing their role of fathers. We adopt a gender role and a parenting role construction theoretical perspectives. Long interviews have been conducted with twenty French single fathers in order to investigate how the absence of the mother affects the practices of fatherhood. Based on the analysis of 427 pages of data, we identify three main categories of single fathers depending on their strategies to copy and/or delegate the role of the mother. Moreover, interviewees seem to experience the domestic sphere differently. Household duties such as cooking and housekeeping in addition to the nurturing role are experienced by many of the respondents as constructing elements of their fatherhood. The domestic sphere is managed by those fathers with a strong dimension of abnegation. We identify as well the role of the marketplace in building new relationships between single fathers and their children. Thus, our study contributes to illustrating the evolution of fatherhood and the transformation of its meaning in a French and European cultural context.

RN13 | Session 05a Older People and Elder Care

Whither Next? Family Carers' Experiences of Role and Identity Transition on Cessation of the Caring Role

Carol Kelleher, Eleanor Bantry White, Deirdre O' Loughlin
University College Cork, Ireland; University College Cork, Ireland; University of Limerick, Ireland
carol.kelleher(at)ucc.ie, E.BantryWhite(at)ucc.ie, Deirdre.OLoughlin(at)ul.ie

The purpose of this paper is to explore how family carers experience role and identity transition over the caregiving lifecourse as they progress from 'family member' to 'family carer', to 'post-carer'. Such transitions approximate cumulative rites of passage (Van Gennep 1960, Turner 1969) comprising ongoing identity rebuilding and present practical and emotional challenges for family carers.

Using a participatory action qualitative research approach involving collaborations with three national carer associations, depth interviews were conducted with twenty three family carers, comprising thirteen females and ten males in urban and rural Ireland, who had experienced loss in their family caregiving role. Our findings reveal three phases of role and identity transition precipitated by multiple losses across the care giving life course, which we term reconfiguring, distancing and reconstituting.

Our first contribution is the extension of sociological perspectives of care and family. Specifically, we characterize the consumption and provision of care within the family as a private-public interfacing group

phenomenon comprising family members, health care providers, policy makers, friends and neighbors. Second, we empirically illustrate how family carers' experiences of role and identity transition frame relational identities within family caring ensembles. Lastly, we illuminate family carers' experiences of cumulative, multifaceted and overlapping role and identity transitions which may remain open-ended on cessation of the caring role. We conclude with a discussion of policy and societal implications in order to better support family carers during and upon cessation of the caregiving role.

Determinants of loneliness among older adults with at least one child working abroad

Veronica Savu
Babes-Bolyai University, Romania
veronica.somesan(at)yahoo.com

RN13_n

Studies have shown repeatedly that older adults who are in poor health and who live alone are subject to high levels of loneliness. Moreover, the size of the social network and the support exchanges within it are strongly associated with levels of loneliness among older adults. Therefore, I intend to highlight the determinants of loneliness which are experienced by Romanian elderly with at least one child who is currently working abroad. It is expected to find differences between social and emotional loneliness. Data was used from the ongoing research Intergenerational Solidarity in the Context of Work Migration Abroad. The Situation of Elderly Left at Home. The major component of the project is a national survey which was carried out among elderly parents aged 60 and above with at least one adult child who is currently working abroad. The sample size reached 1500 respondents.

The results of logistic regression show that, comparing to the young old, being oldest old, is more likely to experience emotional loneliness. Responds with poor health are five times more likely to experience emotional and social loneliness, as opposed to those with no health problems. With regards to respondents who have all their children living abroad, they express more social loneliness than parents who have other children living in the country. Those who are visited frequently are less likely to experience social loneliness. No significant differences were found when testing for emotional loneliness

From maharajah to butler: elderly men taking on care functions

Ana Cristina Romea Martínez, María del Mar Del Rincón Ruiz
Universidad de Zaragoza, Spain; Universidad de Zaragoza, Spain
anacrisromea(at)gmail.com, mdrincon(at)unizar.es

The growing incidence of ageing in Spain, together with the crisis of traditional care work prevalent in our country, means that, in tandem with an increase in demand for care, there is also a significant drop in the

supply of potential care-givers. The context described above, together with the poor public provision of services for people in situations of dependency, is forcibly leading to the diversification of the profile of a care-giver in Spain.

This study focuses on elderly men acting as carers for people in situations of dependency, with the aim of identifying the main characteristics of the care being offered. To this end, twelve semi-structured interviews were conducted with male carers – from 61 to 83 years of age – and six interviews with social service and healthcare professionals working with such carers.

The main conclusions of this study reflect the fact that these carers carry out all types of care duties, particularly those falling under the umbrella of supervision. For many people, this is the first time they are performing this type of activity, and represents a change of role, which they have taken on late in life. Male carers tend to have greater external support than female carers to carry out their duties as they often resort to public services, to female immigrant care-workers or to other carers within the family itself.

Greater recognition of their work, both on a social and institutional scale, or adapting programmes that target family carers to their specific needs, would be some of the priorities envisaged for improving the quality of life for such carers.

Relationship patterns of elderly persons in risk of poverty – the importance of intergenerational and kinship relations

Gerhard Jost

Vienna University of Economics and Business;
Institute for Sociology and Social Research, Austria
Gerhard.Jost(at)wu.ac.at

In this empirical research project, which took place in Vienna (Austria), the relationship structures of elderly people – most of them retired and living in risk of poverty - were examined. In this contribution findings, which are based on the analysis of 25 qualitative (problem-centered) interviews, will be presented. Methods in context of an interpretative methodology have proved suitable for questions about the characteristics of relationship structures. The qualitative way of research opens the perspective to everyday life and biographical experiences. It enables a detailed knowledge about social relationships, their development, structure and change.

As the family is a source of social interaction and integration, it can be assumed, that intergenerational and kinship relations are fundamentally significant. The study shows this strong influence of relatives for the relationship patterns and the intensity of the social network (as well as the opportunity for support), but shows furthermore other factors which determine the relationship structures of the elderly: f.i. the loss of a partner/the family status, the state of health, biographical structuring and (past) employment relationships. In the empirical study the cases are reconstructed, which show different structures of social relationships which depend not only from

children and other relatives, but also from relations to friends, acquaintances and neighbours. In context of the case analyses social policy measures have been derived which can contribute to a (stronger) inclusion of single or childless elderly persons/pensioners.

RN13 | Session 05b Methodologies in Family Research

Multiple-Perspective Qualitative Longitudinal Analysis: Couples' transition to parenthood

Susanne Vogl, Ulrike Zartler, Eva-Maria Schmidt
University of Vienna, Austria; University of Vienna, Austria; University of Vienna, Austria
susanne.vogl(at)univie.ac.at,
ulrike.zartler(at)univie.ac.at, eva-
maria.schmidt(at)univie.ac.at

Transition to parenthood affects both partners. To understand dynamics and sense-making within this time of change, the perspective of both partners should be taken into account. The integration of both perspectives allows for a richer understanding of family dynamics. In addition to individual accounts, dynamics and negotiation processes within the couple can be reconstructed.

However, the integration of both perspectives is a challenging endeavor, particularly when multiple time-points are considered. Partners can offer complementary, converging or diverging views and this can change over time and with regard to the topic. Our research question addresses these issues: How and when do perceptions of partners diverge or converge? How can discrepancies be conceptualized? Can they be ascribed to gender differences? We will discuss methodological implications of these findings for the challenges and benefits of researching both partners.

Our study is based on 66 problem-centered interviews from eleven Austrian couples at three time points: during the last trimester of pregnancy; six months after birth; and two years after birth. The interviews were conducted with both partners separately and covered a wide range of topics, e.g. pregnancy and preparations for birth, daily routine and time management, parental leave and childcare arrangements, work-family-balance, expectations and perceptions of parenthood, quality of partnership, relation to the child, characteristics and development of the child.

In our analysis, we focus on three levels of comparisons: (1) cross-sectional within-couple comparison, (2) longitudinal within-couple comparison; (3) between-couple comparison. With these comparisons, we focus on (a) similarities, inconsistencies and dissonances in couples' accounts, (b) the dynamics within and between different accounts, and (c) patterns of and explanations for discrepancy in accounts.

Developing a measure of paternal involvement in childcare

Mark Elliot, Helen Norman

University of Manchester, United Kingdom; University of Manchester, United Kingdom
 mark.elliott(at)manchester.ac.uk,
 helen.norman(at)manchester.ac.uk

How to measure 'paternal involvement in childcare' is a contentious issue. Not only is 'involvement' a subjective concept, deriving a conceptually invariant measure is difficult given the childcare activities that constitute it change as a child grows older (e.g. see Norman and Elliot 2015, Dermott 2008; Lamb 1986). Yet deriving a measure is pivotal for understanding what influences paternal involvement in childcare - a key concern for policy, organisational and academic debates on gender equality, fathers and their children (e.g. see Norman et al. 2014; Fagan and Norman 2017; Eurofound 2015).

In this paper, we address this shortfall by deriving five measures of paternal involvement in childcare that span a ten year period post-birth using confirmatory factor analysis on the UK's Millennium Cohort Study (MCS). To further develop and validate these statistical measures, we conducted thirty qualitative 'experiments' with fathers, which involved a practical 'card-sorting' activity and a cognitive interview. This helped us to assess whether the measures we produced from our statistical analysis were clear and conceptually invariant across time.

This triangulation of methods improves the validity and reliability of our 'involvement' measures, helping to confirm that the selected MCS variables could be appropriately organised into particular and discrete dimensions of paternal involvement for use in subsequent analysis.

Breaking up the qualitative/quantitative binary in research on socially vulnerable families: A designedly large-scale qualitative approach

Marie Flinkfeldt, Elisabet Näsman
 Uppsala University, Sweden; Uppsala University, Sweden
 marie.flinkfeldt(at)soc.uu.se,
 elisabet.nasman(at)soc.uu.se

Drawing on a large-scale qualitative study of 1500 audio-recorded encounters between social insurance representatives and parents inquiring about family-oriented benefits in Sweden, this paper illustrates the gains of using naturally occurring interaction for observation-driven analysis of families in vulnerable situations. As vulnerabilities are expressed in families' interactions with others, their meaning is shaped in and for that particular encounter. By examining how naturally occurring situations unfold in real-time, the situated meaning of different vulnerabilities that families experience can thus be documented. The paper discusses how access and ethics may be dealt with in such studies and how developing large databases of recorded interaction could contribute to breaking up the qualitative/quantitative binary and facilitate increased sharing of data and more effective use of resources. We argue that this approach may be especially fruitful for research on sensitive or

stigmatized issues (e.g. limited ability to provide for children), since first-hand access to situated meaning-making captures variations that may be difficult to describe in e.g. interviews. In addition, families' encounters with authorities that provide service, aid or benefits are particularly important to access directly rather than via accounts produced solely for research. This is because close examination of the interactional details of such encounters, e.g. using conversation analytic methods, can pinpoint how state officials treat expressions of social vulnerability, thus offering a window into the conditions under which families in socially vulnerable situations seek and receive service and help. By such means, it is possible to make tangible recommendations to improve practice in this respect.

Critical Analysis of Telegram Messenger Impact on the Relationships of Iranian Couples

Abbas Faghih Khorasani, Elham Habibi
 ◌University of Tehran, Iran, Islamic Republic of;
 ◌University of Tehran, Iran, Islamic Republic of
 abbas.faghih(at)gmail.com,
 Elhamhabibi2006(at)yahoo.com

The growing use of Telegram messenger has affected the traditional relationships of couples in Iran. Due to the lack of filtering, easy access and specific technological attraction, Telegram has turned into the destination of virtual wave of immigration for Iranian social networks users. In this research we have studied the impact of Telegram on traditional relationships of Iranian couples by doing a survey on 150 married users in Tehran including 73 men and 77 women between 25 to 40 years old beside a control group of 101 married men and women who didn't join to Telegram. According to this research, we found the relevance between using Telegram and outbreak of tension in couples interactions ($p < .05$). The rate of reliability of our questionnaire was $\alpha = 0.83$.

Eventually, our descriptive findings indicated that from our respondents 67 percent believed that they had a more satisfaction from their marital relationship before joining to Telegram while 24 percent disagree with our hypothesis and 9 percent chose indifference option in the questionnaire. Moreover, with the analysis of other questions we found how absence of verbal interaction, competition for gaining virtual capital to have more influence on family members and others in Telegram and frequent reconstruction of virtual identities for different situations in groups besides the differences of real world and the fantasy of virtual world in Iran, addiction to permanent presence in network and finally changing the construction of power through reduction of real situations in family's structure into avatars lead to tension in couple relationships.

Fathers on Leave Alone: a comparative perspective

Margaret O'Brien, Karin Wall
 University College London, United Kingdom; Instituto de Ciências Sociais Universidade de Lisboa Portugal
 m.obrien(at)ucl.ac.uk, karin.wall(at)ics.ulisboa.pt

This paper presents findings from a comparative study exploring the experiences of fathers taking "home alone leave" across 11 countries in Europe, North America and Japan. Each national research team adopted a similar qualitative approach drawing on a symbolic interactionist model that prioritized the agency and subjective perspectives of social actors. In-depth interviews were carried out with fathers who had taken leave alone for at least one month or, in some national contexts, with fathers who had taken leave alone part-time. All fathers belonged to dual earner couples in which fathers had taken recent (within last three years) leave for a newborn child.

Throughout most of the post-war 20th Century, entitlement to leave was only for mothers, seen as the primary and natural caregivers even when they took up full-time jobs. Our evidence suggests that across all national contexts fathers taking parental leave alone are seen as agents of social change. However, their lived experiences are diverse and complex, contingent on policy, family, life course, and individual factors. The comparison across different national contexts illuminates how different policy provisions affect the social meaning of fathers' leave. The findings show that where a father spends weeks or months in solo care of young children, his long-term relationship with the children is closer and the experience tips him from being a helper to taking more responsibility for caregiving, housework and care of the home. This period of solo caring from the father seems to provide a tipping point, offering considerable potential for greater gender equality in the home. However, work-placed factors and maternalist parental leave design remain barriers to fathers taking significant parental leave.

Work organizations as mediators for fathers' take-up of parental leave in Germany

Thordis Reimer

University of Hamburg, Germany

thordis.reimer(at)wis0.uni-hamburg.de

The paper examines the role of work organizations for German fathers' use of parental leave. It aims at revealing the mechanisms that foster or hinder fathers' take up of paid parental leave and how these mechanisms interact, resulting in distinct patterns of fathers' leave behaviour by work organization.

The following questions are analysed: (1) What are the reasons behind fathers' parental leave use? (2) How do work organizations mediate fathers' decisions to take parental leave? The data basis of this study consists of 47 qualitative interviews with employed fathers in three different organizations (from the CRC 882 - B5 project 'Work organizations and life conduct of fathers').

The analysis consists of two steps: First the fathers' stated reasons for leave taking are described and summarized to different types of single mechanisms that mediate fathers' leave-taking; then, using these types, Qualitative Comparative Analysis (QCA) is conducted. This is a configurational approach that

rests on the assumption that no single factors in isolation but rather the interplay between single conditions explain an outcome. The aim of this research strategy is to reveal different mechanisms of fathers' leave use, differentiated by their workplace.

The results underline the relevance to understand fathers' decisions to use parental leave as an interplay of different factors. Besides the individual or family level, particularly work organizations mediate fathers' leave take-up. Altogether, the comparison of mechanisms of fathers' leave use in three different work organizations points to the importance of the organizational structures and work cultures for fathers' decisions to take parental leave.

When and how do fathers become fathers? A qualitative sociological study on self-acknowledgment in first time fatherhood in Italy

Eugenia Mercuri

University of Milan/ University of Torino, Italy

eugenia.mercuri(at)unimi.it

Fatherhood has drawn the attention of social scientists a few decades ago as a topic of research in itself, and it has now been explored from many different perspectives and with different aims and methods. "Father" as a sociological term refers to the connection between a particular child and a particular man, and the process by which the term becomes attached to an individual. But in exploring the changes occurred overtime in this relevant social phenomenon, an issue has been so far overlooked: how does that process take place in a man's life? The aim of this paper is to explore the processes that lead a man to recognize his own identity as a father, in an original attempt at considering at the same time the relevance of cultural and social meanings attached to fatherhood and the recounted perception of the emergence of a connection with a first child, be it before or after its birth, in reconstructing the mechanisms underlying the biographical and social phenomenon of becoming a father. Drawing upon 30 discursive interviews with first time fathers of children aged 0 to 3 years old living in north-western Italy, and digging in men's narratives travelling retrospectively from pregnancy and childbirth to contemporary practices and reflections upon fathering, the beginning of the experience of fatherhood will be explored, trying to disentangle what processes and changes in self-perception take place during such a relevant life transition, and what cultural and symbolic meanings are attached to the taking of the father's role.

Caring father in relation to public sphere. Reflections on (un)favourable factors that influence this model in contemporary Poland

Marta Bierca

University of Social Sciences and Humanities (SWPS), Poland

marta.bierca(at)gmail.com

There have been significant changes in family roles in Poland over a last decade, with especially strong

focus on alterations in the father's role. In the new model, the father is supposed to willingly engage in childcare which should be expressed in active participation in daily chores and also building emotionally rich father-child relation. The model of engaged father is supposed to be deep-rooted in individual needs and preferences of men who redefine their role and aim at remodelling relations within family.

The author analyses the modern father's journey from the patriarchal to the engaged model in the context of Polish public sphere. The assumption that lays in the heart of this analysis is that remodelling family relations is dependent not only on individually but also publically-shaped conditions. In this context, are the specifics of public sphere supportive or demotivating for modern men? How do the rules of economy, labour market, work environment or public institutions result in development or stagnation of the new fatherhood model? How do men tackle with these outer phenomena? Is the 'backlash' observed or is the re-traditionalisation of gender roles overcome?

The aim of the paper is to analyse the challenges of modern fathers in Poland as regards active following of the engaged fatherhood model. The empirical material will be provided by qualitative interviews inspired by biographical method conducted with young fathers representing the 'new' paradigm and also quantitative data from author's research project on family roles in the context of public sphere specifics.

RN13 | Session 06a Cultural Understandings of Family

Changing Meanings of Family in Personal Relationships: A Cross-National Comparative Perspective

Karin Wall, Rita Gouveia, Gaëlle Aeby, Vida Cesnuiyte

Instituto de Ciências Sociais da Universidade de Lisboa; Université de Genève, Switzerland; Université de Lausanne; Mykolas Romeris University, Lithuania.
karin.wall(at)ics.ul.pt, rittadocarmo(at)gmail.com, gaelle.aeby(at)unil.ch, v.cesnuiyte(at)mruni.eu

Research on family meanings and practices in late modernity underlines the continued importance of the bonds of affection and support in families, but it also reveals changing sets of significant family ties and a blurring between kin, ex-kin and non-kin, with commitments going beyond the nuclear family to include a wider array of affinities. Drawing on a configurational approach, the aim of this paper is to examine the plural meanings of family bonds in cross-national comparative perspective, by exploring the changing boundaries between family ties and personal ties in three European countries with specific socio-economic and historical pathways (Portugal, Switzerland, Lithuania). Three national surveys on the Lifecourse and Personal Networks of individuals belonging to two different birth-cohorts (1950-55 and 1970-75) were carried out in 2010-12. After examining the ties which individuals consider as "family" within

their personal configurations, the paper analyses the types of "as family" networks and tests for the main shaping factors. Findings reveal commonalities as well as differences between countries. The salience of nuclear kinship ties emerges in all countries, as well as greater fluidity in the social construction of family bonds, in particular through friendship; but there are country-specific aspects with regard to the salience of kin and non-kin in family bonds, the categories of ties imbued with family meaning and the main types of family network. National context and birth-cohort are of major significance, confirming the influence of contextual factors and the need to consider such variables in future theoretical models of personal configurations.

Evolvement of marital networks

Anna-Maija Castrén

University of Eastern Finland, Finland
anna-maija.castrén(at)uef.fi

The paper presents preliminary results of a longitudinal analysis of young couples' social networks in the early years of marriage. The interest is two-fold: first, to investigate the evolvement of a marital network and the intertwining of two partners' circles of family and friends into a shared configuration of relationships, and, second, attention is paid to the persons husbands and wives individually consider as emotionally closest to them at two time points, at the time of wedding and after three to eight years of marriage. The analysis draws from a figurational perspective that combines insider and outsider perspectives to relational dynamics and highlights both the subjective view of research participants expressed in qualitative interviews and the relational setting delineated with network analytic tools as important. Data consists of information on the networks of 13 Finnish opposite sex couples in their first marriage. Longitudinal data is collected at the time of couple's wedding (T1) and after three to eight years of marriage (T2). Different kinds of data are used: personal narratives on significant relationships, structured information on alters and ego-alter - relationships, and structural information on interconnectedness. The paper focuses thematically on changing interdependencies in marital networks. Structural changes in networks are reflected to the ways in which significant relationships are narrated in two time points. The paper aims to further a more in-depth understanding about the intimacy structures evolving during the first years of family life.

A New Form of a Relationship: Distance Marriage Experiences of Academic Couples

Günnur Ertong Attar

Mersin University, Turkey
gunnurertong(at)mersin.edu.tr

Marriage experiences have both diversified and differentiated but it still requires a public commitment. In Turkey, strict traditional gender roles are common and "alternative" marriage types are rarely

encountered. Academic couples in Turkey, can fall apart because of difficulties in finding positions at universities and due to compulsory service after PhD. This autoethnographic research was conducted in order to study more closely the marriage experience of the academician couples living in different cities which also I am experiencing. In-depth interviews were conducted with wives experiencing this. Although the academic women seem to be a symbol of freedom in the public space, it is worth studying if they feel the same at also private space. I wondered the costs that the ones who broke the norm of living together are bearing. In a controlled and restricted way, marriage gives woman a certain status but this status is threatened by living away from her husband. As the main result I've found that husbands who are seen "in charge of" these women are not with them and this rises marginalization of these women for public. In this research I asked participants how they see this type of marriage, whether they see social pressure because of this different experience, and I asked their coping strategies.

The impact of the partner market on union formation and dissolution

Johannes Stauder, Jan Eckhard, Tom Kossow, Laura Unsöld

University of Heidelberg, Germany; University of Heidelberg, Germany; University of Heidelberg, Germany; University of Heidelberg, Germany
 johannes.stauder(at)soziologie.uni-heidelberg.de,
 jan.eckhard(at)soziologie.uni-heidelberg.de,
 tom.kossow(at)soziologie.uni-heidelberg.de,
 laura.unsoeld(at)soziologie.uni-heidelberg.de

The composition of the social environment has an important impact on an individual's way of life. An example of this is the partner market which influences relationship transitions – like union formation, mate selection and relationship stability – in many ways. Usually, studies about the partner market use simple sex ratios with spatial units based on large regions or whole countries. This is in contrast to empirical evidence showing that the choice of a partner is predominantly restricted to much smaller contexts, like the daily rounds of an individual. Therefore our project "Macro-structural conditions of the partner market in longitudinal perspective" applies more elaborated partner market measures to detect variations, influencing factors and consequences of partner market conditions in Germany between 1984 and 2013. Our presentation will give a more detailed introduction into a) the project's theoretical approach and b) the applied concept for measuring the partner market. The presentation will also contain main results of the project concerning issues like c) the variation of partner market opportunities over the male and female life course, d) differences in partner market conditions between cohorts, e) influence of demographic changes, like the decline in birth rate, on the partner market, f) the impact of the partner market on relationship transitions, like union formation, mate selection and relationship stability.

RN13 | Session 06b Families in the Context of Economic Crisis and Poverty

(In) Dependence from Family? Experiences of Young Greek Women during the Financial Crisis

Ioulia Kazana

University of Surrey, United Kingdom

i.kazana(at)surrey.ac.uk

Since the economic crisis in Greece in 2008, a vast array of structural changes have impacted on a host of social institutions and practices. One such feature of Greek society which has been impacted significantly has been young people's transition to adulthood, held back as a result of dwindling welfare support, and high unemployment/low wage work. A crucial manifestation of these challenging times has been the impact on parents and families more generally to support their children, many of which are aged in their 20s and 30s. This poses a number of challenges for young adults to develop a sense of independence both material and emotional. Drawing upon qualitative research conducted with Greek women in Athens and Thessaloniki, this paper will assess the extent to which family life alters their everyday interactions with their families. Four particular areas will be focused upon: strain at home, financial and emotional support/dependence, leaving the parental home, and relational comparisons with different countries and generations.

German family structures and practices revised: trying to get by in times of crisis

Kristin Neumann, Marie Boost

Institute for Employment Research of the Federal Employment Agency, Germany; Institute for Employment Research of the Federal Employment Agency, Germany

kristin.neumann(at)jab.de, marie.boost(at)jab.de

All over Europe, the economic crisis has had a harsh impact on the employment and living conditions of many families. Families are forced to adapt to aggravating living circumstances by using new practices and strategies to deal with their limited resources. This was the starting point for the EU-funded project 'RESCuE': investigating the potential of resilient household practices in nine different European countries. In this qualitative research project, we used a combination of extensive biographical narrative and participatory photo interviews to gain an insight into the everyday life of vulnerable families. In this presentation, we focus on German families by following a broad definition of this sociological concept. Despite the apparently well-functioning German labour market and welfare system, many households are highly exposed to poverty and social exclusion. In order to compare different family strategies, we conducted interviews in rural and urban areas. Therefore, the specific characteristics of the labour market conditions and the welfare state system are analysed. Additionally, the data interpretation focuses on two different

perspectives: (1) A distinction between the actual occupied and the attributed gender roles becomes obvious, especially when the division of work was subject to re-negotiation. (2) A broad variety of poverty reducing strategies becomes visible. Hence, case specific heuristics of different family strategies, such as reliance on welfare state benefits, return to pre-modern family structures or new forms of cohabitation, including its ambivalences will be expressed. The importance of the allocation of various social, cultural and economic resources becomes as obvious as the necessity to re-examine the dominant representation of the family, as new patterns of kinship emerge along with their ambivalences, ruptures and discontinuities.

Family Futures: Italy, Spain and the UK

Lynn Jamieson, Adele Lebano
Centre for Research on Families and Relationships;
University of Edinburgh, United Kingdom
L.Jamieson(at)ed.ac.uk, adele.lebano(at)ed.ac.uk

How do experiences of recession, more or less 'family friendly' environments and competing discourses about local, national and global futures play out as people imagine their future family and personal life? This paper reports on a study that explores how different circumstances and uncertainties in the present impact on how people see their 'family' futures. In-depth interviews with young men and women aged 30-35 in Italy, Spain and the UK document their views of their possible futures, including quality of life, partnership and childbearing. The research participants are men and women without children or with one child in established couple-relationships, whether married, living-together or living apart. The focus is on established couples aged 30-35 because they are likely to have already given consideration to future parenting and their views and experiences are likely to provide insight into the timing of a child and childlessness. We have focused on heterosexual couples as their route to parenting is less complex than that of same-sex couples. Research participants are in two groups of employment circumstances: those in secure employment, those who either have insecure jobs or are unemployed. In each country, the starting point for recruitment is two localities with contrasting regional trends in rates of fertility and economic performance. The study is part of a bigger programme of work <http://www.cpc.ac.uk/> looking at fertility change in the context of economic recession, especially the timing and circumstances of having and not having children.

Deprivation and Support Between Three Generations

Martina Brandt, Christian Deindl
TU Dortmund University; University of Cologne,
Germany
martina.brandt(at)tu-dortmund.de, deindl(at)wiso.uni-koeln.de

Economic crises put pressure on families as the "natural" safety net concerning support, especially

when state or market fail and irrespective of the welfare state regime and culture. However, economic crises also negatively affect resources of the family enabling this informal support. Astonishingly there is little research on how economic crises and poverty affect family support relations.

We thus explore the links between transfers between respondents aged 50 and over in Europe and their parents and children, and social and material deprivation across 116 regions in 16 European countries and Israel based on the Survey of Health, Ageing and Retirement in Europe. Multilevel models were used to analyze transfers of time and money in a three-generational setting depending on the socio-economic background of households within different regional contexts. We found that middle aged respondents were less likely involved in transfers with their adult children and their older parents when they were socially or materially deprived. The more deprived, the less they gave in both intergenerational directions, and the more they received from their children. Moreover, intergenerational transfers were generally diminished in regions with higher inequality. Middle aged respondents who are at this family stage often the main givers in a three-generational setting turn to receivers of intergenerational transfers when deprived. They may then even become a burden, especially for their offspring. Moreover, intergenerational exchange is lower in regions with higher social inequality. Families in more unequal regions are thus especially vulnerable in terms of social exclusion and support.

RN13 | Session 06c Fatherhood and Fathering Practices III

Studying care, doing care: Does type of education affect men's involvement in unpaid work? A comparison between Norway, Austria and Poland

Teresa Martín-García, Cristina Solera
Spanish National Research Council (CSIC), Spain;
University of Turin
teresa.martin(at)cchs.csic.es, cristina.solera(at)unito.it

Among the vast literature on the gender division of unpaid work and the so-called "new fathers", it is a consolidated evidence that not only her but also his level of education matter. However, although shown relevant for other behaviors such as first union or first child, to the best of our knowledge no study has so far examined the role of type of education for men's share of domestic and care work. By drawing from the Generation and Gender Survey and by comparing three countries (Norway, Austria and Poland) with distinctive cultural and institutional settings, in this paper we focus on couples with young children and we explore whether, controlling for his and her level of education and labor market position, there is a higher time involvement in unpaid work among men trained in fields in which a large majority of students are women and where traditional stereotypical female qualities prevail (eg. teaching and healthcare), compared to those in male-dominated technical fields.

We expect these men to have different involvement in unpaid work, especially in fathering, due to already-existing attitudes and values when choosing type of education; more or less family-oriented socialization during the formative years; and cost-benefit calculations concerning their occupations and career paths. Moreover, we expect these effects to be more pronounced in Norway where less traditional gender norms and more institutional support for a “dual earner-dual carer” model may allow men (and women) to follow their preferences, as captured by type of education.

Fatherhood and childcare in times of crisis: towards a new masculinity model?

Marina Sagastizabal, Matxalen Legarreta
University of the Basque Country UPV/EHU, Spain;
University of the Basque Country UPV/EHU, Spain
marina.sagastizabal(at)ehu.es,
matxalen.legarreta(at)ehu.es

Some studies indicate that the current economic crisis, which is characterized by the loss of centrality of employment in men's identity, may produce advances towards their greater involvement in childcare and, therefore, towards parent co-responsibility (Abril et al., 2015). Others show the reinforcement of traditional gender roles in couples where women have higher incomes than men, in order to compensate the deviation of their behavior from the “male breadwinner” model (Greenstein, 2000). Yet, recently, literature on new fatherhood reveals childcare as being part of the redefinition of hegemonic masculinity (Cohen, 1993; Dermott, 2005). Considering this framework, the paper presents a reflection on fatherhood and masculinity focusing on the meanings that parents give to care in the economic crisis context. Data come from ongoing research conducted in The Basque Country (a region in northern Spain) and has been produced through the combination of quantitative (Time Budgets) and qualitative (deep interviews) techniques. The main conclusions highlight ambivalent situations. On one hand, meanings given to childcare by fathers in precarious situations show a re-signification of their daily life, based on the centrality of care, as the most meaningful aspect of their existence. On the other hand, the “breadwinner” model does not completely disappear, but rather is reinforced through men refusing to consider their exclusive dedication to care as a possibility while unemployed. Nevertheless, in both cases, women's main role in the domestic-familiar domain is not questioned, which raises doubts concerning the progress being made towards co-responsible parenting experiences.

Fathers and care discourse

Ingólfur V. Gíslason
University of Iceland, Iceland
ivg(at)hi.is

Iceland enjoys an international reputation for being a fairly gender equal country and for an innovative

approach to get fathers more involved in care taking of their babies, through a partial individualization of parental leave. This has met with a fair amount of success as the proportion of fathers using parental leave rose from 0.3% in 1999 to 86% in 2003. This may seem like a remarkable change since one of the central areas of Western gendered division of labour is the care-taking of young children. But even though the social situation has changed radically there is the question if discourses have followed suit or if they in any way preceded the change. In this paper I present the results of a study of books and periodicals published in Iceland between 1846 and 2010 that focused on instructing (potential) parents on how best to care for their new-born babies and raise them the first years. Regarding the role of the father, three periods can be detected. Right up to the sixties, the father is almost completely absent, he is hardly mentioned. Starting in the sixties and seventies he enters the scene as a (clumsy) helper to the mother. In the nineties we enter a new period where the father becomes more of an independent actor and the tendency is to portray the parents as equal. Still, even though most of the books try to address “parents” it is fairly obvious that parent really means “mother”.

Fatherhood Models in the Middle Class of Contemporary Russia

Alexandra Lipasova
National Research University Higher School of
Economics, Russian Federation
alexandra.lipasova(at)gmail.com

Drawing on in-depth interviews with married Russian fathers, this paper focuses on the gender contracts and fatherhood models of the middle class of contemporary Russia. It shows that while the ideal of fathers heavily involved in day-to-day parenting is widespread, the reality is somewhat different despite the active participation of Russian mothers in the labor market. Still, for most Russian men, fathering as a set of everyday practices of engaging with their children has more value than for the generation of their fathers. The research shows that modern Russian society can be characterized by the co-existence of egalitarian and traditional tendencies in gender relations. On the one hand, the practices of involved fathering are evolving, and on the other hand, the traditional patterns of masculinity are enforced, excluding fathers from the sphere of parenthood. Economic factors and rigid notions about the family gender contract are the main obstacles which prevent Russian men from “doing” involved fatherhood. The liberal phenomenon of “new fatherhood” which appeared in Western countries turned out to be much more conservative in Russia. The modern family is still the “space of struggle”, and this struggle is counter-directed: it can be a fight for survival, or for power, or for an egalitarian gender order, against the discrimination of men as secondary parents, against old-fashioned traditional views on the father's and the mother's roles in the family, or for the preservation of those views.

While many men still consider caring for children “sissy stuff” which should be done by women, we can not speak about egalitarian relations in family life.

RN13 | Session 07a Families from Children's Perspective

Mapping children's and parents' lived experiences of families-in-transition

Lesley Murray, Liz McDonnell, Tamsin Hinton-Smith
University of Brighton, United Kingdom; University of Sussex, United Kingdom; University of Sussex, United Kingdom

L.Murray(at)brighton.ac.uk,
E.J.Mcdonnell(at)sussex.ac.uk, j.t.hinton-smith(at)sussex.ac.uk

This paper reports on the first stage of a cross national, longitudinal study that considers children's and parent's lived experiences of family life moving (materially, conceptually and emotionally) from one iteration of 'family' to another. Focusing initially on stories told by parents of ended/ing intimate relationships and the accounts given to their children of this, the research explores parental perspectives of families who are fundamentally changing their everyday practices and identities. The social and cultural resources available (and constrained) in different contexts will be compared. The second and larger phase of the project will explore children's experiences of their changing families, and how children re-make and re-tell those stories to the people around them. Using innovative and engaging research approaches (including multi-sensory and co-designed), children's voices over time (so often absent but often imagined) will be documented, providing valuable input into policy and practice contexts. Framed in sociological theories of mobilities, intimate relationships and childhood, this research reveals the tensions that emerge between childhood and adultist agendas.

Power and children's agency in children's family conflict accounts

Eija Mirjami Sevon, Marianne Notko
University of Jyväskylä, Finland; University of Jyväskylä, Finland
eija.sevon(at)jyu.fi, marianne.notko(at)jyu.fi

Family is a crucial context in which interpersonal power is honed and exercised both between and within generations. It is often stated that there are more clear power arrangements in child-parent relations than in sibling relations. In the presentation we view family conflicts from the theoretical perspectives of power and children's agency.

The participants were 53 Finnish children, aged from 4 to 13 years, reached via two collaborative multimethod research projects. All the methods applied with the children shared the general aim of focusing on family relationships and daily family life, and enabling a participatory approach to be used with the children. We coded all conflict situations, defined as any

episodes where the child described an open conflict, argument or resistance, or talked about incompatible goals between themselves and parents or siblings descriptions, from the data sets.

Content analysis of the children's data sets revealed that while conflicts often concern daily actions and routines, they also relate to family rules, decision-making and fairness. Our analysis found also diverse forms of power, for example, domination, legitimate authority, resource power and power negotiations or struggles. We found that children talked most often about power in child-parent relationships, but also power negotiations between themselves and their siblings especially among the older group of children. Children's degree of agency was varying: they could describe themselves as active, resisting agents in the struggles between siblings or against parental requests, but at times also as more adapting or negotiating towards sibling or parental demands or domination.

A family-based intervention targeted childhood obesity. A qualitative study applying P. Bourdieu and M. Foucault to stigma in the family

Didde Høeg, Dan Grabowski
Steno Diabetes Center Copenhagen, Denmark; Steno Diabetes Center Copenhagen, Denmark
didde.hoeg(at)regionh.dk,
dan.grabowski(at)regionh.dk

Introduction:

To treat childhood obesity and to prevent lifestyle diseases in adulthood several lifestyle interventions targeting the family are offered to families with an obese child. To tailor family-based interventions to the individual families and thereby to increase weight loss there is a need for more knowledge about how family-based interventions are experienced and managed by the families.

Methods:

Data consist of 10 in-depth semi-structured family interviews with 25 family members (10 children, 15 parents), who were enrolled in a family-based lifestyle intervention targeted families with an obese child. The theoretical framework consisted of P. Bourdieu and M. Foucault focusing on habitus, self-discipline and familial power.

Results:

Parents and children felt that their self-determination and autonomy were respected in the intervention. However, some families experienced that the empowerment based approach left them with too many decisions regarding health choices that they did not feel competent to navigate in. These families more or less handed over the responsibility for healthy living to the overweight child. Often they set up special rules, that only the obese child should adhere to, which meant that several of the children experienced being stigmatized in their own families because of the intervention.

Conclusion:

The results emphasize that health professionals working with family-based interventions, should be

aware of the fact that the whole family needs to be equally involved and committed to the lifestyle intervention – in order to minimize the risk of intra-familial conflicts and stigmatization of the obese children.

Between the familiar and the strange: how children understand and negotiate their relationship to their imprisoned fathers

Helene Oldrup
SFI, Denmark
heo(at)sfi.dk

In Denmark appr. 6-7% of children experience father's imprisonment during childhood and youth. Existing research shows how imprisonment typically leads to divorce and less contact between children and their incarcerated fathers, as well as such children having greater risk of behavioural problems, mental health problems and of committing criminal acts themselves (Murray, Farrington). Thus, imprisonment place large challenges on the relationship between the parents as well as between the imprisoned father and the child. However, while these outcomes of parental imprisonment are well-documented, less is known about children's own perspective on imprisonment. The aim of this paper is to explore how children understand and negotiate their relationship to their father, and how this relationship change over time, following the imprisonment.

In doing so, the paper draws on the themes of fatherhood and imprisoned/stigmatized fatherhood, care/relationality and sociology of childhood. The paper analyses narratives of three children, who had different degrees of intimacy with their fathers before imprisonment. The analysis of narratives explores how the young people understand and negotiate themes such as closeness/distance, autonomy and parental responsibility. The paper draws on a mixed methods study of children with a father in prison, where 36 children and their mothers were interviewed. In addition, a survey were carried out, including over 1000 children with a father in prison and their mothers.

RN13 | Session 07b Family Dissolution and Post-Divorce Families I

Family map and Life line: new perspectives in qualitative children of divorce research

Felicia Annamaria Robles
Università Cattolica del Sacro Cuore, Italy
FeliciaAnnamaria.Robles(at)unicatt.it

["theme RN 13_1"]

Many changes are affecting the family today, transforming the foundations of self-identity, which are the core models for everyday personal life. The situation of family disruption raises a number of human and social issues/transitions which deserve to be better understood. This survey being carried out on a sample of young Italian adults, shows in the form of qualitative research the main features of these methods, the Family map and Life line. They define

the structure, the positions of family members, the relationships between them and conceptualize who belongs to a family that has changed, with crucial events related. The interviewee can actively identify and describe graphically (within the four sections and the concentric circles of the map and along the line) which relations and facts are more or less relevant. The interviewer can ask questions in order to get some processes of change and the actors' own perception of such change, e.g. with reference to current state or past events. Along a specific visual development of the graphs -while providing a helpful framework- this throws some light on what family relationships, events and representations are on the perception of the person involved. The challenge posed for this visual methods is to continue to conceive of individuals in terms of relational approach, through the interdependence with self, others, and the world during the course of life. A great contribution of this tool sui generis is that it opens the door to numerous additional questions that need answers and further research.

The marital instability in Italy: analysis of an emerging phenomenon

Gabriella D'Ambrosio
Sapienza - University of Rome, Italy
gabriella.dambrosio(at)uniroma1.it

Over the last twenty years, the intimate sphere and the conjugal behaviour of italians is radically changed. Together with the increase of the number of mixed marriages and cohabitations we note, in fact, the increase in the divorce rate too (for example, in the early Nineties the total number of divorces was 27.682 and at the beginning of year 2010 this number was 54.160, almost double).

The growing number of legal separations and divorces, therefore, appears as a clear statistical indicator of a new and emerging phenomenon in our national context: precisely, the conflict within the couple and the resulting marital instability.

For this reason, the aim of this research is to study this topic with particular attention to what has happened in Italy from 1990. The number of legal separations (we prefer study this indicator because it's the first step to apply for annulment of marriage in the italian civil legislation) is going to be analyzed through the use of secondary data by ISTAT - National Institute of Statistics with reference to contextual and individual properties. Among the firsts: the type of divorce and regional distribution; among the latter: the age of spouses at marriage, the age of spouses at separation, educational level of spouses and their employment status.

Divorce within Turkish and Moroccan communities in Belgium

Emilien Dupont
Ghent University, Belgium
emilien.dupont(at)ugent.be

This paper focuses on the divorce of Turkish and

Moroccan migrants in Belgium and relates it to three marriage types: a marriage established through marriage migration, a local intra-ethnic marriage, and a mixed marriage.

This paper uses data from the Belgian National Census and examines the aforementioned marriage types established between 2001 and 2005. These marriages were followed until 2011 the latest. Log-rate event history analyses were performed to discern the divorce risks of each marriage type within the Turkish and Moroccan group, distinguishing between men (N Turkish group = 4.613; N Moroccan group = 9.9171) and women (N Turkish group = 4.755; N Moroccan group = 7.785). The overall divorce risks as well as the divorce risks associated with each marriage type were also compared to those risks 15 years ago.

Our results show that divorce rates have doubled for the Turkish and Moroccan groups within the course of 15 years. This rise in divorce rates applies to every marriage type and is especially notable among mixed marriages probably because of cultural differences and weak social support. Divorces are more prevalent among the Moroccan group, which is probably caused by already higher divorce risks in Morocco coupled to looser social control mechanisms. Furthermore, divorce risks of the different marriage types have converged.

Overall, processes unrelated to the marriage type have changed divorce among Turkish and Moroccan migrants in Belgium remarkably. Modernization, individualization and emancipation are probably among the most important ones.

A Comparative Perspective on Working Couples: The Impact of Non-standard Employment on Partnership Stability in Germany and Australia

Inga Lass

The University of Melbourne, Australia, Bielefeld University, Germany

i.lass(at)unimelb.edu.au

During the past decades, many OECD countries have seen a rising importance of non-standard forms of employment – among them fixed-term contracts, temporary agency work, part-time, marginal and casual work. On this background, the paper investigates how non-standard employment affects partnership stability in Germany and Australia.

Non-standard employment often involves specific strains like job insecurity and low earnings. These strains can reduce partnership quality, which – according to Social Exchange Theory – in turn lowers partnership stability. Otherwise, part-time and marginal work provide more time for housework and joint activities with the partner, which should increase partnership quality. Furthermore, they often designate a partially specialised division of labour, which – following the New Home Economics – increases the mutual dependency of the partners and the gains from the partnership. The research question is explored using discrete-time event history analysis of cohabiting and married couples. The data for the analysis stem from the German Socio-Economic

Panel (SOEP) Study and the Household, Income and Labour Dynamics in Australia (HILDA) Survey (2001-2014).

The results stress the diversity of effects of non-standard employment on the risk of partnership dissolution: The effect not only varies by the specific employment form, country and gender but also depends on the question of whether we look at cohabiting unions or marriages. Moreover, it turns out that the effect of the employment form differs with regard to the employment situation of the partner, suggesting a closer look at employment constellations in future dissolution research.

RN13 | Session 07c Gender Differences and Gender Relations I

The Changing Gender Balance in Education, Patterns of Union Formation and Fertility Behaviour: Comparing Mid-Twentieth Century and Contemporary Belgium

Eli Nomes, Jan Van Bavel

University of Leuven, Belgium; University of Leuven, Belgium

eli.nomes(at)kuleuven.be,

jan.vanbavel(at)kuleuven.be

Over the course of the 20th century, the expansion of female participation in education and the gradual re-entrance of women into the labour market changed the dynamics of union formation and fertility. In this paper we investigate the relation between the changing gender balance in education, the resulting patterns of educational assortative mating and fertility behaviour. We study fertility patterns in Belgium during the Baby Boom era, when women were at the start of their catch-up with men in terms of education, even though the traditional gender division of labour still stood strong. Using this period as a sort of baseline situation, we then focus on the situation at the beginning of the 21st century, when women had overtaken men in level of schooling. We investigate how changes in the timing and quantum of fertility are related to the changing combinations of his and her educational attainment. Our hypothesis is that changing conditions and expectations on the marriage market influence the combinations most conducive to childbearing and –rearing. That is, while hypergamy (husband more educated than the wife) was associated with higher fertility during the Baby Boom era, this positive association shifted to homogamy (both partners equally high educated) and hypogamy (husband less educated than the wife) as the importance of female education grew. We adopt a couple-oriented approach and use retrospective Belgian census data with rich information on educational attainment and marriage and childbearing histories, which allows us to use event history analysis to analyse fertility of the relevant birth cohorts. Preliminary results show that hypogamy is clearly associated with lower fertility, both among the older and younger cohorts.

Women's Relative Resources and the Subjective Balance of Decision-Making in European Couples

Martin Klesment, Jan Van Bavel

University of Leuven, Belgium; University of Leuven, Belgium

[martin.klesment\(at\)kuleuven.be](mailto:martin.klesment@kuleuven.be),

[jan.vanbavel\(at\)kuleuven.be](mailto:jan.vanbavel@kuleuven.be)

Studies of family and fertility are increasingly more interested in gender equality in the domestic sphere, which is often seen as lagging behind the equalization in the public domain. Further equalization in the private domain is to be expected, however, due to the reversal of the gender gap in education that increases the number of unions where the woman is more educated than the man. Relatively higher education, combined with increased female labor market participation, leads to many women nowadays out-earning their partner. This new pattern is likely to change the way how decision-making in couples is distributed, which in turn shapes gender equality in the couple. In this study, we investigate how decision-making about money-related questions in the couple is reported by women and how it associates with their educational pairing and relative earnings. Using European Union Statistics on Income and Living Conditions 2010 data for 27 European countries ($n=82,254$), we find that women with relatively higher education compared to the partner, or who out-earn their partner, are more likely to report that they alone make major decisions about money in the family. The association between relative earnings and decision-making seems to be strongest in couples where the woman is more educated than the man. We also find that the association with relative earnings is not linear and may be affected by attempts to reduce deviance from traditional gender roles.

Intrinsic Value of Decision Making: Evidence from a Charitable Giving Experiment in Egypt

Ghida Karbala, Gerhard Riener, Marcela Ibanez
Göttingen University, Germany; Göttingen University, Germany; Göttingen University, Germany
[ghida.karbala\(at\)zentr.uni-goettingen.de](mailto:ghida.karbala@zentr.uni-goettingen.de),
[ghida.karbala\(at\)zentr.uni-goettingen.de](mailto:ghida.karbala@zentr.uni-goettingen.de),
[ghida.karbala\(at\)zentr.uni-goettingen.de](mailto:ghida.karbala@zentr.uni-goettingen.de)

Using an experimental approach we provide causal evidence on the willingness to implement own pro-social decisions of joint-income with a partner, shedding light into the gray box of joint decision making over moral outcomes. We conducted a lab in the field experiment with a representative sample of 640 couples and singles residing in Cairo, Egypt. We elicited donation behavior over joint and own income that was generated within the experiment. In a second step we paired subjects in a between subject design either with their (a) spouses (b) a randomly chosen woman (c) a randomly chosen man. Subjects were asked to anonymously vote on how strongly they would like their decision to be implemented on a scale from 1 (not strongly) to 5 (very strongly). A vote that exceeds that of the matched partner was

implemented. Our experiment controls for subjects general unwillingness to take moral decisions in addition to elicited beliefs regarding the donation behavior and the willingness to implement decisions of the matched partner. We find that overall subjects report an average of 4.38 to implement their own decision. However, married women when paired with their spouse only report a willingness of 3.74, while the married men when paired with their spouses report a willingness of 4.58 (Wilcoxon rank sum test, $p\text{-value} < .0001$). We do not find this difference, when subjects decide against a randomly chosen subject (man or woman). This leads us to conclude that women show low willingness to bargain within the household even when provided with own personal income and anonymity. These results suggest that existing bargaining household models and policies are incomplete without taking into account the willingness to bargain within the household and the way in which this willingness interacts with social identity norms.

A qualitative study of trajectories of maternal gatekeeping towards the stepmother

Charlotte Maene, Bart Van de Putte

Ghent University, Belgium; Ghent University, Belgium

[charlotte.maene\(at\)ugent.be](mailto:charlotte.maene@ugent.be),

[bart.vandeputte\(at\)ugent.be](mailto:bart.vandeputte@ugent.be)

[Theme RN13_i] This study explores the trajectory of maternal gatekeeping towards the stepmother. This theoretical setting tries to actualize the classic theory of maternal gatekeeping by developing a framework that answers to the current societal context of which the post divorce/ new formed family is an integral part. On the one hand the emphasis is on the perception of mothers about step motherhood. There is an ambiguity when ideas about motherhood and gender roles are not coordinated. On the other hand this study focuses on how the subjective standard about step motherhood is used by mothers to evaluate their presence. It is being investigated which factors give rise to certain strategies of maternal gatekeeping (partnership, manager, unknown, enmity), but also how these strategies can change within the family. These motivations and interventions are mapped on the basis of eighteen in depth interviews with mothers. The families involved have different post divorce accommodation arrangements, but in most cases the children spent as much time with their father as with their mother. These families found themselves in different phases of the divorce procedure. The interviews were conducted in three different data collection rounds wherein the method of the Grounded Theory was followed.

RN13 | Session 08a Family problems and Family Interventions

Leave policies in 29 countries: Confronting policies with public opinion

Isabel Valarino

Autonomous University of Lausanne, Switzerland

[Isabel.Valarino\(at\)unil.ch](mailto:Isabel.Valarino@unil.ch)

There is considerable heterogeneity regarding the length of paid leave entitlements for parents and the extent to which mothers and fathers are encouraged to share them. To this day only little research has studied public opinion toward leave policies. This paper addresses the following research questions: What leave policy do individuals consider legitimate? How does this compare to existing leave schemes? How (dis-)satisfied are individuals? What are the predictors of (dis-)satisfaction? The study draws on welfare attitudinal theories that consider the influence of institutional and cultural factors, as well as self-interest and ideational factors. The data stems from the 2012 International social survey program. 29 industrialized countries that have different leave schemes and represent distinct welfare regimes are selected (N= 39'306). Methods for the analysis include descriptive statistics, logistic regressions and multilevel models.

Preliminary results indicate that distinct social norms exist regarding the length of leave, which reflect roughly the existing leave schemes in place in these countries. The study shows that it is in liberal as well as hybrid and residual welfare states that individuals are most dissatisfied. On the one hand it is where the social legitimacy of leave policies is most contested and on the other hand it is also there that the largest proportion of individuals who would like a longer paid leave than what currently exists are identified. The paper will then move on to analyze the influence of socio-economic factors such as sex, age, education, parenthood, as well as of gender ideology and political values on individuals' (dis-)satisfaction regarding leave policies.

Promoting a positive relationship between families and early childcare services: a survey in Italy

Maria Letizia Bosoni
Catholic University of Milan, Italy
marialetizia.bosoni(at)unicatt.it

In a context of low fertility rates and difficulties in reconciling family and work, European policies encourage strategies for increasing female employment and childcare provision. Thus childcare services play a crucial role in order to support families in balancing work and family.

Italy is characterized by childcare provision rate under European average and still below Lisbon target for 0-3 years children (European Commission 2014), with high costs and low quality: thus the family is still the main provider of early childcare.

This contribution will present results from an online survey conducted in 2014 on families using Pan Consortium childcare in Italy, aimed at understanding families characteristics - structure, cultural orientation toward childcare services and social capital - and their relationship with the service.

It will also draw a picture of a national non-profit organization - the PAN Consortium - aimed at promoting high quality early childcare services (0-3 years), all over Italy, with 191 nurseries and 5.400

children cared in 2014. The PAN Consortium is based on a partnership between a bank and different non-profit networks providing early childcare services.

Research questions addressed:

- Which families use PAN childcare services?
- Are families satisfied for the childcare service?
- Which relationship between families and the childcare service? (have families an active and positive relationship with the service?).

Through an online questionnaire, 1676 families has been assessed.

Cluster analysis reported 3 groups of families, different for structure (number of children, employment) and cultural orientations: families with 1 children starting nursery and open to collaborate; families with 2 children with at least 6 months attendance, very satisfied and active; families with 1 child, 6 months to 2 years attendance, with low satisfaction and non-collaborative.

What are the differences and similarities between neonaticidal mothers and infanticidal parents?

Natacha Marie Vellut, Jon M. Cook, Anne Tursz
CNRS, France; Cermes3, France; Cermes3, France;
Cermes3, France; INSERM, France
natacha.vellut(at)parisdescartes.fr,
joncooke(at)gmail.com, tursz(at)vjf.cnrs.fr

Population

A retrospective study (1996-2000) in three regions in France. Ninety-two cases of suspicious deaths of under-one infants. Thirty-seven cases of infants dying after one or more shaking events. Thirty-two cases of neonaticides. In the end, cases of 23 fathers and 26 mothers as perpetrators were analyzed.

Method

An examination of the judicial files of these cases provided multiple information sources.

These sources yielded several descriptive variables entered into Modalisa©.

Aim of the analysis: To identify profiles of parent perpetrators, analyze characteristics of their offenses, describe how police and the judiciary handled cases and examine differences between mothers and fathers.

Results

Neonaticide is a story of mothers. For the mother perpetrators, there were no specific socio-demographic characteristics in evidence. They did not differ significantly from women in the general population as concerns occupation. However, when psychiatric and psychological assessments were carried out, they showed a relatively homogenous psychological profile.

Aside from one case (a mother who had killed 4 of her newborns), the justice system was often lenient. We will analyze this in detail.

Killing by abusive head trauma is a story of families. We define three family profiles. Young parents were a uniform group of families, with couples formed at < 24 years of age. Overwhelmed parents formed a fairly heterogeneous group of families. These parents were neither young nor violent. Violent parents were an

unremarkable group since they were socially integrated and thus did not attract attention.

We will show that the Justice system proceeds differently according to these profiles of families: it is more severe with fathers than with mothers, but also with the younger and lower social categories.

Predictors of Child-to-Parent Violence Among German Adolescents

Laura Beckmann

Criminological Research Institute of Lower Saxony,
Germany

[laura.beckmann\(at\)kfn.de](mailto:laura.beckmann(at)kfn.de)

Abuse of parents, or child-to-parent violence (CPV) is a common but highly under-researched form of family violence compared to other types of family aggression, such as intimate partner violence or parental abuse. The primary objective of this study was to assess the predictive role of some individual and family characteristics of adolescents who perpetrate physical aggression against parents. Aggressive acts include pushing, grabbing or shoving parents, hitting them with a fist or kicking them, as well as hitting them with an object. Predictors include exposure to parental physical violence during childhood, parental warmth and monitoring, as well as respondents' behavioral and emotional characteristics. Data were examined from a representative cross-sectional sample of about 6,700 9th graders from Lower Saxony, Germany. Respondents were surveyed on several determinants of problematic and risk-taking behavior, including socioemotional functioning, attitudes towards violence and family characteristics. To answer the research question, binary-logistic regression models were conducted. First results show that childhood exposure to parental violence, depressive symptoms, and problematic alcohol use were significant risk factors for CPV, while parental warmth and monitoring were not significantly associated with CPV. No gender differences concerning the frequency of parent-directed aggression were found. Implications of these findings are discussed.

RN13 | Session 08b Family Dissolution and Post-Divorce Families II

Intimate relationship breakdowns: between personal experiences and social expectations

Gaëlle Aeby

University of Manchester, United Kingdom

[gaëlle.aeby\(at\)manchester.ac.uk](mailto:gaëlle.aeby(at)manchester.ac.uk)

Across Europe, in spite of the increase in divorce rate, being in a relationship remains a valued social status, and readiness to date again is often considered as the final step of the break-up or divorce process. Studying how individuals enter and exit relationships, how they make sense of their experiences (subjectivities), and how their family and friends accompany those transitions (solidarities), tells us about the social values and norms framing today personal life.

Drawing on data from a qualitative interview study of

the post-break-up relationships of 30 adults living in England, this paper focuses on how individuals experience this transition. Breaking-up has two main components, one personal related to feelings and emotions, and one social related to the change of status and its consequences in terms of social expectations and sociability practices.

On the one hand, we document what people concretely do in order to overcome a break-up and with what meanings. Results show different practices around taking care of oneself; new social activities; rituals of separation. On the other hand, we document how people deal with social expectations dictating how to have a "successful" break-up and their own struggles. Results show different strategies around communication; sources of support; social withdrawal. This paper shows that breaking-up is a multi-stages process happening at the personal and social levels and that social values and norms often do not correspond with the individuals' realities and temporalities. Un-making relationships simultaneously impact different life domains and shape the contents and meanings of personal life.

Objectifying child support decisions

Elke Claessens, Dimitri Mortelmans

University of Antwerp, Belgium; University of Antwerp,
Belgium

[elke.claessens\(at\)uantwerpen.be](mailto:elke.claessens(at)uantwerpen.be),

[dimitri.mortelmans\(at\)uantwerpen.be](mailto:dimitri.mortelmans(at)uantwerpen.be)

Child support research increasingly acknowledges the importance of clear-cut policies concerning the determination and transfer of child support following a union dissolution (Aizer & McLanahan, 2006; McMullen, 2011). Not only does insufficient child support put the caring parent and the child at risk of poverty; an inconsistent mode of determination can fuel hostile relations between ex-partners (Natalier & Hewitt, 2014), induce uncertainty and stress as well as adversely affect the relationship between the paying parent and child (Cancian, Meyer & Han, 2011). Most European countries therefore have legally mandatory standards or recommended methods in place with the aim of ensuring a fair and objective determination of child support.

Belgium lags behind in this respect, having several calculation methods rather than a uniform standard. In this research, we use fiscal data to investigate how this results in a lack of objectivity in the determination of child support. Our results reveal a lot of variation in the results provided by these methods. This raises serious concerns in terms of equity and justness, as it implies that different amounts are paid in similar family situations. Further, we relate these results to the determination methods in Denmark and France and consider the potential benefits and adversities of these systems. This comparison reveals that objectivity is not only gained through uniform calculation: flexibility and accessibility of a method is equally important to ensure an equitable outcome for both partners in a union dissolution.

Gender equality, child well-being and shared residence in Spain

Lluís Flaquer, Anna Escobedo, Anna Garriga, Carmen Moreno

Universitat Autònoma de Barcelona, Spain; Universitat de Barcelona, Spain; Universitat Pompeu Fabra, Spain; Universidad de Sevilla, Spain

lluis.flaquer(at)uab.cat, anna.escobedo(at)ub.edu, anna_garriga_alsina(at)yahoo.es, mcmoreno(at)us.es

In the last few years there has been a significant growth of divorce cases involving shared residence in Spain where they have shifted from 9.6 percent of divorces with children in 2007 to 24.6 percent in 2015. Recent developments show that the debate on shared residence is shifting from benefits gained by parents from the perspective of gender equality to the questions related to the quality of care and to the consequent outcomes for children in terms of their well-being. The development of shared residence reveals an increasing centrality of children's well-being, rights and interests. Furthermore, it is in line with the growth of family diversity and closely corresponds with the movement in favor of father involvement with the care of children. One of the unsettled issues of research agenda is to investigate the extent to which and under which conditions the growth of shared residence makes a positive contribution to the well-being of children.

This paper has a two-fold objective: (1) to explore the factors that are contributing to the growth of shared residence in Spain and (2) to examine child well-being levels in different types of postdivorce families with a particular focus on shared residence. Our analyses draw on two different databases, i.e. the Spanish Statistics of Annulments, Separations and Divorces (2007-2015) and Health Behavior in School-aged Children (HBSC) for Spain 2014. Preliminary results suggest that adolescents have better well-being levels in two-homes than in single-parent households but lower outcomes than those living in intact families.

High-conflict divorces from a child's perspective

Kim Bastaits, Inge Pasteels

PXL University College, Belgium; PXL University College, Belgium

kim.bastaits(at)pxl.be, inge.pasteels(at)pxl.be

Many studies have concentrated on the link between a parental divorce and children's well-being. Whereas the early research on this topic claimed that a parental divorce ipso facto had negative consequences for children's well-being, in recent decades it became clear that especially a high-conflict parental divorce has a negative impact on children's well-being, according to the parental conflict theory (Fisher, 2004). Most studies rely on parental insights concerning their conflict, leaving the perspective of the child out of the picture. Moreover, most studies compare high-conflict divorces with low-conflict divorces and do not distinguish between different types of high-conflict divorces that children can experience. Consequently, this study aims to (1) gain

insight in different types of high-conflict divorces according to children and (2) investigate how these different types of high-conflict divorces affect children's well-being.

Therefore, we use a dyadic subsample ($n = 451$) of the DiF-dataset, which contains information on divorced parents and their children. First, a latent class analysis is performed to identify different types of high conflict divorces according to children. Second, a possible relation between those types of parental divorces and children's well-being is examined using multiple regression models. Preliminary results indicate that children distinguish four types of parental divorces: low conflict divorces (47,3%), resolved verbal conflict divorces (36,6%), resolved physical conflict divorces (7,4%) and ongoing high conflict divorces (8,7%). Especially the ongoing parental conflict can affect children's well-being negatively, with a lower life satisfaction for boys and higher externalizing problem behavior for girls.

RN13 | Session 08c Gender Differences and Gender Relations II

Family Trajectories and Life Satisfaction: The Swiss Case

Boris Wernli, Sara Zella

FORS, Switzerland; University of Lausanne, Switzerland; FORS, Switzerland; University of Oxford, Oxford Institute of Population Ageing, UK

boris.wernli(at)unil.ch, sara.zella(at)gmail.com

Focusing on the last 14 waves of Swiss Household Panel (2001 – 2014), a multithematic annual household panel based on a random sample from the Swiss resident population, we examine the impact of five family events (formation of the union, transition from cohabitation to marriage, birth of child/ren, deconstruction of the union and departure of children from the family nest) on life satisfaction. Analyses are performed separately for women and men, and controlling for demographics (age), economics (household income, education level, satisfaction with financial situation), health (impediment, satisfaction with health) and social interaction parameters (participation in clubs or other groups, satisfaction of free time, leisure activities and personal relationships). We adopt a life course perspective and use a multilevel approach (mixed linear model) to study individual trajectories on the mid-term (5 years), aiming at understanding not only the immediate impact of several events on well-being, but also at capturing its duration through time. Results show that most of the considered steps of the family construction and deconstruction have an impact, which is different across time and between females and men.

Explaining gender differences in willingness to commute long distances: A test of the household responsibility hypothesis

Simon Pfaff, Heiko Rueger

Federal Institute for Population Research, Germany; Federal Institute for Population Research, Germany

simon.pfaff(at)bib.bund.de,
Heiko.Rueger(at)bib.bund.de

Session: RN13_g: Gender differences and gender relations

It is now well established in social science literature that women commute shorter distances to and from work than men. According to the household responsibility hypothesis (HRH) this is due to gender differences in the household division of labour, i.e. women's greater share of household and child care tasks. Using data of the EU-funded research project „Job Mobilities und Family Lives in Europe“ (N=4,370) the aim of the paper is to test the HRH. While most previous research has focused on actual mobility behaviour, this paper adds to the literature by analysing the willingness to commute long distances to and from work (i.e. at least 60 minutes one way). Measuring mobility intentions has advantages over measuring mobility behaviour since the latter is highly selective. Controlling for several relevant factors the regression models confirm gender differences in willingness to commute long distances. Moreover, the results show that the presence of children significantly reduces willingness to commute among women, but not among men. The results thus seem to confirm the HRH. Interestingly, however, the (gender-specific) division of household and child care tasks within the partnership is only moderately associated with the willingness to commute long distances among mothers. Thus, it seems to be the role as a mother, per se, that reduces the willingness. Spending a great deal of time travelling to and for work seems to be more socially accepted for fathers than for mothers. The findings are discussed with regard to gender relations in the labour market.

Separation and Singlehood as Moments of Reconfiguration of Gender Norms

Marie Bergström, Géraldine Vivier
The French Institute for Demographic Studies (INED), France; The French Institute for Demographic Studies (INED), France
marie.bergstrom(at)ined.fr, vivier(at)ined.fr

[Theme RN13_G] Couple life and trajectories have become more diverse in Europe over the past decades. Due to growing rates of separation and repartnering, numerous individuals today experience several romantic relationships over their lifetime. Whereas older generations often had only one partner in life, younger generations more often declare to have had different spouses. This is the case in France where more than half of the population, aged 30-50 years in 2013, declared to have had two relationships or more. In this presentation, we look at how past relations as well as the experience of separation and periods of singlehood influence people's attitudes toward couple life and repartnering. In doing so, we focus on gender differences. We know that gender roles are strong in heterosexual relationships: the way women and men engage in romantic relationships and the "work" they do within the couple (domestic, social

and emotional labor) are different. When single, do women and men reassess their expectations with regard to couple life? Do their behaviors change with regard to former (and gendered) experiences? To answer these questions, we use both qualitative and quantitative data from France. The results push for an alternative approach to the transformation of intimate lives. Whereas sociologists often explain new patterns of conjugal behavior by referring to a shift in norms and attitudes, we would like to stress the importance of an inverted reasoning: new norms and attitudes regarding intimate life also spring from changes in life course patterns.

Job loss and its detrimental consequences for spouses' life satisfaction

Frederike Esche
University of Hamburg, Germany
frederike.esche(at)wis.uni-hamburg.de

Although numerous studies have documented the detrimental effects of unemployment onto the individual's subjective well-being, almost nothing is known about its impact onto the partner's subjective well-being. This is very surprising given that individuals are always integrated into different social contexts and different mutually related and mutually influencing life domains. Hence, the consequences of unemployment may spill over to the partnership and/or cross over between both partners.

This paper asks whether and in which way the loss of one's job entails collateral effects onto the life satisfaction and domain satisfactions (e.g. satisfaction with income, leisure, household labour and family life) of both partners. Regarding the underlying mechanism, the paper focusses on the material costs of unemployment as well as possible consequences of shifting time use patterns. To investigate whether the consequences of unemployment vary with the predominant gender roles, analyses are conducted separately between couples with unemployed men and women in East and West Germany.

Using the longitudinal data of the SOEP (1984-2015) and applying fixed effects panel regression models, results show that unemployment is a harmful experience for both partners. Moreover, results reveal the expected gender-specific differences, showing significant higher consequences (in West Germany) if the male partner becomes unemployed. Regarding the underlying mechanism, findings highlight the importance of the material consequences for both partners' dissatisfaction. Furthermore, the division of labour plays a crucial role when it comes to women's dissatisfaction with family life as well as with life in general in consequence of husbands' job loss.

RN13 | Session 09b Migrant, Multicultural and Transnational Families I

Transnational families through the lens of 'imaginary' and 'relationality'

Irena Juozeliuniene, Irma Budginaite, Indre Bieleviciute

Vilnius university, Lithuania; Vilnius university, Lithuania; Vilnius university, Lithuania
 irena.juozeliuniene(at)gmail.com,
 irma.budginaite(at)fsf.stud.vu.lt, indrebie(at)gmail.com

Life across borders has become one of the consequences of 'making Europe'; since Lithuania's accession to the EU transnational families (parents/children living separately) have come to constitute a significant category in the newly emerging typology. Building on two out of five concepts developed by Smart to analyse personal life – 'imaginary' and 'relationality' – the authors examine the ways in which the experience of migration re-defines and re-organizes the relationships in transnational families. The authors demonstrate how these analytical tools could be operationalised by employing the ideas of 'rekeying' (Goffman), 'role-person merger' (Turner), dyadic family configurations (Trost) and renegotiation of family commitments (Finch, Mason). The primary source is a mixed method research study carried out between 2012-2015, financed by the Research Council of Lithuania. The authors established the discursive way that transnational family relations exist in one's imagination. 'Local', 'multi-local' and 'relational' family discourses highlight how the relations between different agents - parents, relatives, friends, and institutions – contribute to the definitions of transnational family networks. Moreover, when relations are placed at the centre of the transnational family image, the changing attitudes to gender roles, especially towards mothers as being the primary child caretakers, and conceptualization of expanded networks (kin and non-kin) as families, became quite evident. The authors reveal that transnational life alters the relational dynamics between family members. Newly emerging identities such as a 'guest-like-father', a 'mother-like sister', and a 'family keeping' grandmother, all highlight how role specific commitments are renegotiated when family members live across borders, and how commitments stemming from multiple family roles intertwine.

Native Albanians and Albanian Immigrants Perceptions on Family Values: The role of acculturation

Ledia Kashahu Xhelilaj, Stela Karaj, Theodhori Karaj
 A.Moisiu University, Durrës, Albania, Faculty of Education,; Tirana University, Albania, Faculty of Social Sciences,; Tirana University, Albania, Faculty of Social Sciences,
 kashahuledia(at)yahoo.com, stelaka(at)yahoo.com,
 dhorikaraj75(at)gmail.com

The aim of this study is to compare the data regarding to family values (traditional role of father, family relations), and commitment among 230 native Albanians and 102 Albanian immigrants living in Greece. All participants completed the Family Value Scale (Georgas, 1999). Immigrants' acculturation was measured using the Vancouver Index of Acculturation (Ryder et al., 2000). Native Albanians indicated more

than Albanian immigrants living in Greece the obligations of children toward parents and family. The interaction of gender and group (native Albanians and Albanian immigrants living in Greece) showed that immigrant females believe more than immigrant males in obligation of children toward parents. Two dimensions of acculturation–heritage culture identification and involvement in the host culture – make different contributions to immigrants' perception of obligations of children toward family. Heritage identification of immigrants is correlated positively with two dimensions of family values: the role of father and mother in the family and the obligations of children toward parents. There was no correlation between involvement of immigrants in the host country and family values.

Boundary-making within an immigrant social space: Albanian-Italian/Romanian intermarriages in Italy

Rachele Bezzini
 University of Sussex, United Kingdom
 rachele.bezzini(at)gmail.com

This paper explores how boundaries are reconstructed within an immigrant social space by focusing on Albanian-Italian and Albanian-Romanian partnerships/marriages in Italy. Research on the nexus between intermarriage and integration generally considers minority-majority marriages within a one-way understanding of integration. This study instead examines both minority-majority and minority-minority marriages within a multi-way understanding of integration. In particular, it analyses the intermarriage-integration nexus from the perspective of mixedness and through the boundary-making framework – along which are systematically organised the categories that social actors use to redraw demarcation lines and/or search for a common ground. Drawing from in-depth interviews to 61 Albanian-Italian/Romanian couples, mainly in the area of Florence, the paper shows how operations of redefinition, repositioning, and resemantisation articulate the ways in which Albanian, Italian, and Romanian partners interact, questioning established boundaries, their location and meaning, on the basis of the experience of migration in itself. Firstly, a background of migration makes it possible to transcend previous divisions and subvert/reverse mutual distances, putting together yesterday's and today's migrants. Secondly, the acknowledgment of integration processes may move foreign partners from the domain of the other to the domain of the self, for minority and majority partners alike. Thirdly, when identificational categories are revalued, intermarriage could also create – from a cluster of return projects, escapist fantasies, and self-realisation dreams – the migrants of tomorrow.

Social remittances into family life

Marta Buler
 SWPS University of Social Sciences and Humanities,
 Poland
 mbuler(at)swps.edu.pl

The research question: What is the impact of migration on the non-material aspects of family life?

Theoretical approach: The conceptual framework of this paper relies on combining several perspectives at the junction of family research and migration studies: social remittances, “doing family”, transnational families, life-course approach.

Data: Three qualitative components comprise this study: (1) secondary data analysis of historical sources found in classic migration studies; (2) secondary data analysis of the findings from the Cultural diffusion through social remittances between Poland and UK conducted in 2011-2014 in Poland and the United Kingdom; (3) primary research entails qualitative research of the selected migrant families via case study approach.

Methodology: In the project the interpretative paradigm is being followed and the Layder’s (1998) approach is being implemented. The theoretical approach (see: theoretical approach) is combined with the qualitative mix method study based on the three research projects (see: data).

Research findings: The paper will be focused on two aspects concerning social remittances into family life: (1) findings on familial solidarity understood as a norm and as a part of social capital; (2) attitude towards familial celebrations and special events on the field of practices and norms.

Interpretation: Social remittances in the transnational family life plays important role. Migrants enter the new environment and are exposed to different practices, norms and attitude towards social capital. They may choose the new attitude towards almost every element of family life as more convenient for them.

RN13 | Session 09c Work-Family Balance and Work-Family Conflicts I

Power structures and traditional division of household tasks within couples: A comparison of European countries

Ruth Abramowski

University of Salzburg, Austria

ruth.abramowski(at)sbg.ac.at

In the last decades, we observe a rapid modernization in most European countries. In particular, equal rights in the private sphere were implemented and supported by family policies. Gender equality as a political goal is highly valued among couples. Nevertheless, if comparing the division of household tasks in European countries, we observe a striking discrepancy between egalitarian attitudes and traditional domestic behaviors. Considering the behavioral traditionalism, the primary research question is: How do power structures and empowerment determine the division of household tasks within couples in different European countries?

The goals of this PhD project are to create a theoretical meta-analysis of central studies, to develop a typology of power dimensions, to carry out a multilevel analysis that integrates the dimensions

societal empowerment and the power division within couples and to explain the division of household tasks. The theoretical approach is that the division of household tasks could be explained by structural conditions, institutions, participation, cultural values, attitudes and individual differences.

In the analysis of the division of household tasks all European countries will be integrated for which the first and second wave of GGS data are available in order to develop an appropriate multilevel model for longitudinal, nested data. Up to now, only 14 countries from the first wave are analyzed. Comparing these countries, the ‘Task-Participation-Index’ indicate small country-specific differences, however, in all countries women do more housework than men. According to the first results, especially non-traditional division of household tasks is more accepted in countries with higher political empowerment for women. Due to the small sample size at level 2 analysis, we designed an analysis of regional level.

Practices in Egalitarian Partnerships: New Findings from German Families

Magdalena Gerum, Claudia Zerle-Elsäßer

German Youth Institute, Munich, Germany; German

Youth Institute, Munich, Germany

gerum(at)dji.de, zerle(at)dji.de

In Germany a new norm arises: Mothers and fathers should share responsibilities in the family as well as in paid work to equal parts. Although this norm of a more egalitarian partnership is pushed forward by modernized German family policies, everyday practices still are much less egalitarian than desired.

Therefore our research focuses on identifying and analyzing “really egalitarian partnerships” where occupation and family work are shared equally following the main research questions 1) how egalitarian Germany’s egalitarian partnerships actually are and 2) which influencing factors can promote or inhibit the extent of egalitarianism.

The analyses are based on the dataset “AID:A II” (Growing up in Germany II), a large survey conducted by the German Youth Institute (Munich), which includes around 12,000 families with a child under 18 years of age. The data allows identifying “really egalitarian partnerships” by comparing their actual working hours and division of family work. Our results show that “really egalitarian partnerships” still are a very rare phenomenon in Germany: Only a few couples do work the same hours and even if, they mostly do not share the family work equally.

Findings suggest that corresponding to our assumptions the number and age of children, the education level of mothers and fathers as well as personal attitudes like gender concepts are closely related to the level of egalitarianism in families. Further important influencing factors for the level of egalitarianism are the social prestige of the parents, mainly the fathers' occupation, the mothers' striving of autonomy as part of their concepts of partnership and the mother's satisfaction with their partnership.

Having it all or doing it all? Successful femininity in a neoliberal age

Kristina Saunders

University of Glasgow, United Kingdom
k.saunders.1(at)research.gla.ac.uk

In an age of neoliberalism and individualization, the apparent decline of traditional categories such as gender, class and the family implies greater potential for choice, exploration, and self-creation (Giddens:1991, Beck and Beck-Gernsheim:2002). For women in particular, these conditions are said to create a shift from being defined by domesticity, to becoming freely choosing subjects who can equally participate in education and paid employment, where they can 'have it all' (Harris:2004). Giddens also (1992) claims that declining tradition allows for the democratization of intimate life; which is presumed to lead to greater gender equality in relationships, and a move from the male bread-winner, to dual-earner family.

In this context, freedom and choice are claimed to define women's lives, yet they are expected to demonstrate productivity in the labour market, whilst also being expected to engage with a form of motherhood focused upon investing in children (Faircloth:2013). Presented as freely chosen, it is contradictory expectations such as these that come to re-traditionalize traditional gender relations as 'having it all' appears more akin to 'doing it all' (McRobbie:2013).

Drawing on qualitative data from my PhD research, this paper will discuss how the contradictory and discursive elements of neoliberalism and individualization come to affect women's experiences of paid and unpaid work. Findings from in-depth interviews with women from a range of social backgrounds in Scotland, aged 21-60, will be used to explore the ways in which the notion of doing it all aids in the construction of a 'successful' female trajectory that women are expected to follow; which is defined by ideals of hyper-productivity and responsibility in relation to paid, unpaid, and emotional labour.

Beyond 'work-family conflict'. New metaphors and vocabularies for women empowerment

Laura Grunberg, Stefania Matei

University of Bucharest, Romania; University of Bucharest, Romania
lauragrunberg(at)yahoo.com,
stefania.matei(at)gmail.com

RN13_f (short abstract)

In many scientific and policy contexts, femininity is discussed through a vocabulary of family-work 'conflict'. This practice acts as a self-fulfilling prophecy, with unintended consequences on women's agency. The dominant discourse defines the terms in which the reality of work-family conflict appears to women, thus introducing an understanding of family and professional life as antagonist domains of existence. Through a phenomenological interpretation

of the metaphors and vocabularies used by women nurses to make sense of their life, we illustrate the performativity of language and the role of communicative action in raising a type of self-awareness that might be used to overcome gender inequalities. We claim that a repertoire of autonomy is more suitable than a vocabulary of family-work reconciliation in designing adequate gender sensitive policies and strategies of women empowerment. In this context, we propose and document a playful methodology to explore the interaction between family and work by relying on non-intrusive techniques of data gathering.

RN13 | Session 10b Migrant, Multicultural and Transnational Families II

Gender and intergenerational differences in the "hybridization" process of Muslim migrants. A case study from Milano (Italy)

Donatella Bramanti, Stefania Giada Meda
Catholic University of Milan, Italy; Catholic University of Milan, Italy
donatella.bramanti(at)unicatt.it,
stefania.meda(at)unicatt.it

The research intends to explore the characteristics and positioning of the migrant Muslim population in Milano (Northern Italy) regarding the intercultural encounter and possible forms of exchange and "hybridization" with the receiving society. The general aim is to explore the basis of and the possibility of a reciprocal "hybridization" with the Italian culture and values.

The key concept orienting the research is "hybridization", a metaphorical notion usable for understanding the cultural exchange between persons and communities with different backgrounds.

The analyses are carried out in the light of gender and intergenerational differences, as these are the two main axes able to identify and define the family.

The research is based on quantitative data, collected by means individual questionnaires. Two hundred eleven participants were recruited amongst the Muslim communities in Milano in 2014 (52% males, 48% females; 60% first-generation immigrants aged 35-72, 40% second-generation immigrants aged 18-34).

Data analysis is based on indexes, cluster analysis, and logistic regression.

The findings show considerable differences between men and women, and between first-generation and second-generation immigrants. The second generation is less identified religiously, less observant of practices, less convinced of the political role of Islam, with more frequent exchanges with non-Muslims, and a higher level of "hybridization". Women (from both first and second generation) are more likely to interact with non-Muslims and more open to "hybridization". Finally, the analysis identified a group of men aged 30-50 of recent immigration that are marginalized, discouraged, with a low attitude to "hybridization".

Patriarchal Racialization: Marriage Immigrants and Multicultural Families in South Korea

Seonok Lee

University of British Columbia, Canada
seonok.lee(at)alumni.ubc.ca

This research project examines the everyday life experiences of two categories of marriage immigrants in South Korea: foreign brides and foreign husbands from South and Southeast Asian countries. Drawing upon ethnographic research on marriage immigrants, their family (so called multicultural family) and Koreans, this paper argues that the racialization of immigrants plays a central role in reproducing patriarchal family structures, which contemporary Korean women are increasingly resisting. This article offers a theorization of the intersectionality of racialization and patriarchy - not typically analyzed in its co-formation - through what the author calls 'patriarchal racialization'. Patriarchal racialization is a gendered racialization process whereby for foreign brides, patriarchal gender roles are emphasized in order to minimize racial differences, while for foreign husbands, racial differences are emphasized to exclude them from the national community. Thus, children of a Korean father and a foreign mother are seen as racially closer to Koreans than the children of a foreign father and a Korean mother. Patriarchal racialization creates a link between the belief in paternal blood lineage and the idea of race. Patriarchal racialization creates an opportunity for working class and rural Korean men and their family members to exercise their power by re-entrenching patriarchy in the micro-sphere of the family. It offers them a way to maintain their dignity despite their socially disadvantaged class position. While patriarchal family relations are gradually eroding in Korea, the Korean state attempts to define Korean culture as conservative and patriarchal by constructing women marriage immigrants as patriarchal frontiers.

Migration and Intergenerational Cash Flows in Europe

Bettina Isengard, Ronny König, Marc Szydlik
University of Zurich, Switzerland; University of Zurich, Switzerland; University of Zurich, Switzerland
isengard(at)soziologie.uzh.ch,
koenig(at)soziologie.uzh.ch,
szydlik(at)soziologie.uzh.ch

Intergenerational transfers are important manifestations of functional solidarity in contemporary societies. Especially in times of societal crises and the withdrawal of the welfare state, intergenerational support is an important characteristic of (grand)parent-child relationships. Research on intergenerational solidarity patterns has revealed considerable cohesion and support in Europe. However, previous studies have mainly addressed the causes and consequences of intergenerational solidarity patterns of natives, whereas the population of foreign origin has often been neglected.

Therefore, the paper investigates in a joint view and in

a multigenerational perspective an especially relevant form of functional solidarity. The paper addresses (a) differences and similarities in intergenerational cash flows between migrant, interethnic and native families, (b) differences within migrant families, as well as (c) variations across Europe. The empirical analyses are based on the fifth wave of the Survey of Health, Ageing and Retirement in Europe (SHARE), including 14 European countries. The analyses employ a multigenerational and multi-ethnic perspective by investigating the relevance of intergenerational cash flows of at least 5,000 euros from (a) the respondents aged 50 years and older to their own adult children and b) from elderly parents to the SHARE-participants.

Overall, our analyses prove that European family generations are connected by considerable financial transfers. Furthermore, migration matters for receiving cash from parents and for giving high monetary transfers to offspring. Here, clear differences in the extent of intergenerational cash flows become apparent when considering the complexity of migration according to household composition, duration of stay and country of origin.

Germany's Integration Politics in Practice: The Early Experience of Chinese-Speaking Highly Skilled Female Family Migrants

Chieh Hsu

University of Heidelberg, Germany
chieh.hsu(at)stud.uni-heidelberg.de

Germany does not officially recognize itself as an immigration country and imposes integration-oriented regulations before and after entry on family migrants, its dominant and "accepted" mode of immigration. This paper examines how the concept of integration, a state-anticipated and -stipulated goal, is connected to the migration trajectory of skilled female family migrants married to German husbands. Based on participant observation and semi-structured interviews with 21 Chinese-speaking women across Germany, I focus on how these women mobilize resources to overcome "hurdles" of entry requirements, how they define and interpret their tasks and obligation of integration upon arrival, and the dynamics of their intercultural marriage and household, as well as its impact on their integration. Drawing from symbolic interactionism and interactional role theory, this paper proposes to view these women as occupants of the "wife" and the "migrant" roles, and to conceive their early acculturation as a rivalry between preestablished self-conceptions and new circumstances in the host society. This research unveils, with a small and ethnic-specific sample, how acculturation unfolds in the context of Germany's integration politics and how this experience alters the self-conceptions of skilled female family migrants, a population hitherto scarcely explored. This paper's findings also complement theories of immigrant integration and assimilation.

The effect of children's residence arrangements on the work-family balance among divorced families

Annelies Van den Eynde, Dimitri Mortelmans
University of Antwerp, Belgium; University of Antwerp,
Belgium

annelies.vandeneynde(at)uantwerpen.be,
dimitri.mortelmans(at)uantwerpen.be

Abstract

Balancing work and family is a challenge for many men and women nowadays. It is the rising number of dual-earner families and higher job demands that suggests that the pressure on the private organization of work and family has increased (del Carmen Huerta et al., 2011; Keene & Quadagno, 2004).

This paper contributes to the literature of work-family balance by focusing on different family constellations than the dual-earner couples which dominate this study field (Gatrell, Burnett, Cooper, & Sparrow, 2013). The current study examines the effect of children's residence arrangements on the work-family balance of divorced parents. In divorced families, the children's residence is formally divided between two separate households (Willekens, Vanderheyden, & Mortelmans, 2011). The classic model entailed a dominant stay with the mother, while now a shift is recognized towards more shared residence between the two parents (Sodermans, Vanassche, & Matthijs, 2011). Children's presence or absence in the household of a divorced parent determines the available time and energy they can devote to either family or work.

The study uses survey data collected in 2008 in Flanders, Belgium. The multi-actor study "Divorce in Flanders" enables us to compare different family constellations after the divorce such as single parents, parents who cohabiting with a new partner, remarried parents, and parents in a LAT relation. Also the form of residence arrangement of the child is available in the questionnaire and can take different forms such as living full-time with one parent, shared residence, and week mother/weekend father or week father/weekend mother.

Covariates of family meals in the UK. Evidence of social differentiation in eating patterns

Ewa Jarosz

University of Oxford, United Kingdom
ewa.jarosz(at)sociology.ox.ac.uk

This paper examines social differentiation in eating patterns in Britain, focusing on family meals among respondents with under-age children. Eating with family members brings multiple benefits to individuals, such as improved wellbeing, nutritional status, or school performance of the children. Modern lifestyles might pose a challenge to commensal eating, but not all social groups are at the same risk of skipping or shortening meals they have with others. Eating patterns are differentiated by individual's social class. How people eat has also been associated with education, work schedules, and family characteristics.

Qualitative studies, though very insightful, do not allow disaggregating the effect of these variables hence the need for quantitative exploration. This study uses 2014/2015 UK Time Use Survey data in a quantitative analysis of eating patterns. Statistical models show the net effects of social class, education, work characteristics and family-related covariates on the frequency and duration of family meals. Respondents in highest class dedicate overall more time to family meals, while those with tertiary education eat more often. Working hours, both in case of paid and domestic work, do not affect the frequency or duration family meals, but people working in shifts have fewer meals. Single parents, a notoriously time-poor category, spend least time eating with their families. Finally, some universal traits emerge – older people spend more time eating and eat more frequently, and weekends are characterized by more frequent meals and longer eating also when other social characteristics are accounted for.

Work-family reconciliation policies in Baltic states

Snieguolė Grigužauskaitė, Daiva Skučienė
Lithuanian social research centre, Lithuania;
Lithuanian social research centre, Lithuania
snieguole.griguzauskaite(at)gmail.com,
daiva.skuciene(at)lsc.lt

Work - family reconciliation policies are the main axis of the welfare state. It is the main reason why it takes a large place in every country which is interested in their population living quality. The biggest problem is that some of European countries still haven't found the best method how to balance work - family reconciliation in order to solve the fundamental problems and to adapt the context of globalization. The Baltic states (Estonia, Latvia and Lithuania) aren't an exception. Due to their historical, economic and political development features, they suffered a lot of changes and encountered the same or very similar family policy problems like: low birth rate, the decreased number of marriages, the growing elderly population, still extant inequality between men and women and particularly employment and family policy implementation questions.

According to this, the goal of the study is to show how work - family reconciliation policies balance is sustained in Baltic states. The research is based on the methodology of Fenger et al. (2014), who stated that institutional logic, public preferences and socio-economic and societal conditions are related to each other.

Two research methods were used for the implementation of the purpose of research: for social policy arrangements and measures the qualitative analyses of data of MISSOC and ILO database were used; for the public opinion analyses the data of ESS 5 and ESS 7 and Eurobarometer were used. For the data analyses the descriptive and regression analyses were used.

Gender, Race, and Nationality in Cross-Border Marriage Brokerage Business

Mi-Jeong Jo

Goethe-University of Frankfurt, Germany
jo(at)em.uni-frankfurt.de

This research explores relatively small but consistently existing marriage brokerage business in South Korea (hereafter Korea) that match Korean men with women from eastern Europe, mainly Russia, Ukraine, and Kazakhstan. The phenomenon of female marriage migration to Korea, which emerged in the mid-1990s, began to diversify with more countries mostly after the state permitted international marriage brokerage agencies to become a free enterprise with almost no regulation (Marriage Brokers Business Management Act 1999). Drawing from the dominant narratives of female marriage migrants from China and Southeast Asian countries, many scholars of marriage migration have pointed out the resurgence of traditional gender roles in the rise of cross-border marriage, especially those who marry rural old bachelors.

Then a question arises, why is there such demand from Korean bachelors to seek their brides from Russia, Ukraine, and Kazakhstan where women are characterized as more independent? Based on ethnographic data during the fieldwork conducted in 2016 as well as Korean media coverage of women from respective countries, this paper attempts to explore the following questions: 1) How has the international marriage brokerage business begun and continued or changed, and what are legal and socioeconomic factors for it? 2) What are the images of these women in Korea, and especially how did the media coverage play role in the process? 3) Why and what is the mechanism of the brokerage fee that is presumably more expensive for matching with women from Russia, Ukraine, and Kazakhstan than those from other Asian countries?

RN13 | Session 11a Families in the Context of Disability and Ill-Health

Aging in Place with Intellectual Disability: Care Transitions among Older Two-Generation Families

Yueh-Ching Chou, Teppo Kröger, Wen-Chuan Wang, Wan-Ping Lee

National Yang-Ming University, Taiwan; University of Jyväskylä, Finland; Tzu Chi University, Taiwan; National Chi-Nan University, Taiwan
choucyc(at)ym.edu.tw, teppo.kroger(at)jyu.fi, wang(at)mail.tcu.edu.tw, wei6801(at)gmail.com

Little is known of transitions in care and housing of old two-generation families that include aging (≥ 40) adults with intellectual disability (ID) and their older (≥ 65) parents. This study employed the "housing pathways" theory in order to explore the experiences of these families of such transitions. All potential old two-generation families from two local authorities in Taiwan were recruited; 237 families completed our survey and 61 our in-depth interviews between May 2015 and July 2016. Different models and types of

transitions in care and housing of these families were identified and found to be connected with changes in their care responsibilities and living arrangements. Old parents are concerned with transferring their care responsibility to others, often to their other children. The lifecycles and social/financial contexts of older parents and aging adults with ID, and those of the siblings of adults with ID, are linked together and need to be considered in the process of making moving decisions. Concerning the transitions in care and housing, kin relations, living geography and ethnic culture seem to be more important factors than social/health care needs/use of older parents and aging adults with ID. Aging in place was more popular than moving in old age among these families; hiring a migrant care worker strengthened families' choice of ageing in the old place. Care transitions, aging with disability and kin relations are linked together for these families and should be taken into account and addressed by aging, housing and disability policies.

Women with disabilities and reproductive autonomy in Poland

Agnieszka Król

Jagiellonian University, Poland
a.krol(at)uj.edu.pl

[Theme RN13_o]

I will discuss how women with disabilities navigate their reproductive autonomy and parenting practices within the social, cultural and legal context that construct exclusive norms on who can become a "good" mother in Poland. The project is located in the studies on Reproductive Justice that highlight how the ability of women to determine her own reproductive autonomy is related to the conditions in the community she lives in. Presented study aims at analyzing the emic perspective of women with physical disabilities in order to understand negotiations related to the construction of reproductive dilemmas (connected with the right to have a child, right not to have a child and right to parent own child (Luna i Luker 2015)) within ableist social contexts. The preliminary results of empirical research based on qualitative methods (IDs) on reproductive autonomy and motherhood practices will be presented. The interviews were conducted both with mothers and childless/childfree women with physical disabilities who create diverse family forms in Poland. The analysis tackles challenges in experiencing reproductive autonomy and doing motherhood as well as ways of dealing with challenges in the context of current restrictive reproductive rights policies, inadequate support and public discussions on reproductive justice in Poland that tackle women and people with disabilities.

The presents results of "Disability, motherhood, care. Reproductive autonomy and experiences of motherhood of women with disabilities in Poland" project funded by National Science Center, Poland (2015/19/N/HS6/00789).

The Role of Authenticity in Healthcare Communication with Families Living with Type 2 Diabetes: A qualitative study applying Charles Taylor's theories to healthcare practice

Dan Grabowski

Steno Diabetes Center Copenhagen, Denmark
dan.grabowski(at)regionh.dk

In family-focused healthcare communication, concepts of authenticity are unexplored. This study analyzes if and how authenticity can be used to approach challenges associated with communicating with families living with Type 2 diabetes (T2D).

Data were collected in 7 workshops with people with T2D and their relatives (n=25/31) and 6 workshops with healthcare professionals (HCP) (n=45). The workshops focused on T2D-related family issues. The theoretical framework consisted of Taylor's theories on horizons of significance and social imaginaries.

The analysis disclosed four categories of authenticity:

1) Authentic HCP: Families often refer to HCPs with respect because of the position they represent or because they possess important skills or knowledge. It is equally important, that the HCP appears as a real human being with everyday experiences.

2) Authentic relation: Families find it easier to relate to a healthcare situation when they experience that the relationship is based on genuine caring, as opposed to rule-bound caring. They need to feel, that the HCP is genuinely interested in communicating about the given problem-issue.

3) Authentic thematic contents: Families listen to information when the themes communicated conform to their sense of who they are and what they know.

4) Authentic activities: Families' level of participation is heightened when they feel that they partake in practices of value. Contextual factors greatly affect if and how the families feel that the healthcare communication makes sense in their lives.

These categories provide us with new ways of creating a sense of authenticity when communicating with families living with type 2 diabetes.

RN13 | Session 11b Migrant, Multicultural and Transnational Families III

Work-life reconciliation strategies of non-EU migrant families in a specific institutional and structural context of the Czech Republic

Lenka Formánková

Institute of Sociology, Czech Academy of Sciences, Czech Republic

lenka.formankova(at)soc.cas.cz

What are the care arrangements of the non-EU migrant families and its impact on the family relations? We are focusing on care arrangements of migrant families in the context of a specific post-state socialist country - the Czech Republic - and apply it to map strategies of this families in combining childcare and paid work. In the analysis, we focus on the largest non-EU migrant communities in the Czech Republic - those of Vietnamese and Ukrainian. Third country

nationals often face strong work pressures, economic difficulties, racial and social discrimination, and contrasting cultural and religious values; thus, the reconciliation of work and family life is likely to be a sensitive issue, revealing tensions and vulnerabilities specific of migrant families. By focusing on a very specific but crucial problem of work-life reconciliation strategies in migrant families with children under ten, we will be able to understand the opportunities and barriers that group of migrants face and in the same time to gain insight into the integration processes. We are seeking to answer the following question: What are the care arrangements of the Vietnamese and Ukrainian migrant families and its impact on the family relations in the Czech Republic? The analysis builds on an institutional analysis of migration policies and welfare state programmes and statistical analysis of the migrant populations.

How do Polish and Icelandic parents decide how to divide parental leave?

Asdis Adalbjorg Arnalds, Gudny Björk Eydal

University of Iceland, Iceland; University of Iceland, Iceland

aaa1(at)hi.is, ge(at)hi.is

In 2000 a new law on paid parental leave was introduced in Iceland that provided fathers with three months of father's quota, which at the time was the longest non-transferable period of parental leave for fathers in the world (Moss & O'Brian, 2006). Since the law was enacted, the majority of fathers have made use of their non-transferable right to leave. Although research has focused on variations in leave use (Eydal, 2008), none has addressed the question of how immigrant parents make use of their right to parental leave. Poles constitute the largest group of migrants in Iceland, and the presented study addresses the question of how parental leave is used by Polish migrating parents who had their first child in 2009 compared to parents that are born and raised in Iceland.

A web-survey and qualitative interviews were used to compare patterns of leave use for the two groups of parents. The study uses the concept of family practices, introduced by Morgan (1996) to investigate how parents negotiate work and family life arrangements within the same framework of family policies. The study also draws on the theoretical perspective of transnationalism (McCarthy and Edwards, 2011), which provides an understanding of how kinship networks across borders shape the way parental leave is used. The findings show how parent's decisions on how to divide parental leave are shaped by past experiences, relationships and social networks, work orientation and their views towards the role of men and women in the upbringing of children.

Mapping the role of 'transnational family habitus' in the lives of young people and children

Elisabetta Zontini, Tracey Reynolds

University of Nottingham, United Kingdom; University of Greenwich, United Kingdom

elisabetta.zontini(at)nottingham.ac.uk,
T.A.Reynolds(at)greenwich.ac.uk

In this paper we develop the concept of 'transnational family habitus' as a theoretical tool for making sense of the ways in which children and young people of migrant background are 'doing families' transnationally. Drawing on over a decade long cumulative research on Caribbean and Italian families in the UK, as well as on a new joint research project, the paper firstly investigates the opportunities and consequences of a transnational family habitus on family arrangements, kinship relationships and identity within a transnational context. Secondly, it analyses the role of these young people's structural location in Britain in shaping the boundaries of their transnational family habitus. We argue that a transnational family habitus should be seen as asset, which can potentially disrupt conventional understandings of belonging and processes of inclusion and exclusion. However, we also detail how social divisions of class, race, and increasingly migration status, shape such habitus.

RN13 | Session 11c Work-Family Balance and Work-Family Conflicts III

With or Without You

Dries Van Gasse, Dimitri Mortelmans
University of Antwerp, Belgium; University of Antwerp, Belgium
dries.vangasse(at)uantwerpen.be,
Dimitri.Mortelmans(at)uantwerpen.be

Single parenthood is often approached as a problematic situation. People become single parents by divorce, separation or bereavement and have to cope with this situation (Fisher & Low, 2015; Pai & Ha, 2012). These transitions to single parenthood provoke unforeseen struggles in reconciling work and family responsibilities. In order to maintain the household, single parents have to both work and take up all the household roles (Bakker & Karsten, 2013). Nevertheless, there are also single parents for whom single parenthood is a positive story. These people are single parent by choice (Hertz, 2006). As it is no longer necessary to have a partner to start a family, people are able to choose to become single parent by sperm donation (Zadeh, Freeman, & Golombok, 2013) or adoption (Pasch & Holley, 2015). Hertz (2006) states that single parents by choice remain single due to circumstances but bear a strong desire to become parent. Nevertheless, single parents by choice have the same task to combine their work responsibilities and their parental roles. In this paper, we explore how single parents by choice made their decision with regard to a single parent work-family situation and how they adapted their life to facilitate their single parenthood. The central research question in this study is: "How do single parents by choice reorganize their lives to facilitate single parenthood". We used qualitative in depth interviews with 20 single parents by choice to explore how they organized their work-family life before and after giving birth.

Leave policy in the context of economic crisis and cuts in public spending. The Spanish experience

Gerardo Meil, Pedro Romero-Balsas, Jesus Rogero-Garcia
Universidad Autonoma de Madrid, Spain; Universidad Autonoma de Madrid, Spain; Universidad Autonoma de Madrid, Spain
gerardo.meil(at)uam.es, pedro.romero(at)uam.es, jesus.rogero(at)uam.es

In 2007 a substantial change was introduced in Leave policy when a quite ambitious new law to foster Gender Equality was introduced. The implementation of this law was hampered by the impact of the economic crisis, as big social spending cuts and deep reforms in Social Security law had to be taken. Government's policy instead of improving costly legal provisions of leave rights, has shifted the accent into co-responsibility among partners (greater involvement of men) and employers. One instrument used by the Government to foster co-responsibility by employers has been the creation of an official label "companies for (gender) equality" for those private companies who have developed an ambitious gender equality plan going beyond the law requirements.

The aims of the paper to be presented are twofold. First, analyze the politics of the new measures improving parental leave policy paying attention to the discourses since the beginning of the economic crises of the different governments, the political parties and the main social actors. And secondly, analyze the Gender Equality Plans of the "companies for equality" and the one of the Public Administration in order to identify and discuss what kind of improvements have been made on parental leave regulation, so that it can be evaluated the effectiveness of promoting Gender Equality Plans at company level in terms of improving the parental leave provisions.

Provisional results show that nearly all Companies Gender Equality Plans only improve in minor details the national legislation, and no incentives are introduced to foster father's use of parental leave provisions.

Work-Family Profiles and Mental Health: The Moderating Effect of Gender Ideology among Men and Women

Deniz Yuçel
William Paterson University of New Jersey, United States of America
denizyuçel18(at)yahoo.com

Research Question: This study tests a typology of work-family balance to examine whether work-family profiles differ in mental health. It also evaluates how gender ideology moderates this effect, and whether the moderation differs between men and women. Theoretical framework: This study uses family stress theory, specifically Hill's ABC-X theory of family crisis. Methodology: This study uses survey data on married professionals and managers from the 2008 National Study of the Changing Workforce (N=927). Latent

profile analysis is used to identify three groups of work-family balance, then the study uses ordinary least squares (OLS) regression to test whether these groups differ in mental health. Research Findings: Three types of work-family balance emerged: Beneficial, Active, and Contradictory. Results from multivariate analyses suggest that the Beneficial type showed better mental health than the Active and Contradictory types. Moreover, the negative effect of an imbalance between work and family (i.e., being in either the Active or Contradictory group) on mental health is stronger for those who have more egalitarian gender ideology. Finally, this moderating effect of gender ideology is found to be more significant among women. Interpretation: Overall, this study makes a significant contribution by classifying three work-family profiles among professionals and managers, and testing whether these different profiles differ in mental health. Finally, this study highlights the moderating roles of gender ideology and gender.

RN13 & RN34 | Session 09a JOINT SESSION: Families, Gender Roles and Religions in Times of Neo-Liberalism: Different Traditions and New Challenges

Combining spirituality and environmental activism: a feminist or gendered turn?

Irene Becci

Lausanne University, Switzerland

irene.becci(at)graffiti.net

Neo-liberalism has clearly been identified as one of the main causes of the current global environmental crisis. At the core of this critique is the philosophical attitude that this system implies in terms of individualism, profit-orientation, exploitation of resources, short-term views. Since at least a couple of decades, environmentalist activism, both at a global and a local scale point to the fact that ecological issues need to be framed in connection with discourses about inner change and spiritual experience. A series of practices, such as the ritual (re)construction of a lost link to nature through the celebrations of the full moon, references to cosmological themes such as mother earth, or the promotion of natural contraception, all seem to point to at least two new processes: ecological activism seems to be, first increasingly integrating references to a spiritual dimension and, second this spiritualization of ecology seems to also imply essentialized ideas about gender. This presentation aims at discussing some empirical evidence from an ongoing research project in Europe's alpine regions in order to offer a reflection about the intersections between gender, spirituality and nature that challenge a secular view of ecology in mainly technical terms. It will question the differentiated participation of men and women in these discourses and practices and the rather timid connections to historical feminism.

Religious denominations and gender role attitudes: the influence of welfare regime

Amy Erbe Healy

Mary Immaculate College, UL, Ireland

Amy.Healy(at)mic.ul.ie

Theme RN13 & RN34: Traditional gender role attitudes regarding work and family are often associated with particular religious denominations such as Islam, (Norris and Inglehart, 2011). However, while religions are often presented as unifying forces, crossing national boundaries, religions do not operate in a vacuum. Members of religious denominations are impacted by other institutions in society which vary across countries and regions within Europe, (Esping-Andersen, 1990; Fenger, 2007) and which also impact attitudes, (Lück, 2006; Orloff, 1996).

This research analyses the impact of religious denomination, welfare regime and their interaction on traditional gender attitudes using three rounds of the European Social Survey (ESS): rounds 2, 4 and 5. Two variables -- "women should be prepared to cut down on paid work for the sake of their family" and "men should have more right to a job than woman when jobs are scarce" -- were analysed using ordered logistic regression and these explanatory variables: age, immigrant status, gender, educational attainment, religiosity, household composition, feelings about income, religious denomination and welfare regime. Countries included were: Belgium, Germany, France, the United Kingdom, Ireland, Denmark, Finland, the Netherlands, Czech Republic, Estonia, Hungary, Poland, Slovenia, Slovakia, Spain, Greece, and Portugal.

In Western Europe, members of religious denominations (including Islam and Eastern Orthodox) within welfare regimes which encourage women working outside of the home are significantly less conservative than members of the same denominations in other countries. Conversely, in countries with regimes which promote traditional gender roles, members of conservative religious denominations have the most conservative attitudes in Europe. Traditional gender role attitudes are especially pronounced in Eastern Europe. Multi-level modelling will be used to analyse the impact of macro-level variables.

An Ancient Gender-Based Tradition Against Muslim Laws in the Mediterranean Space: The Case of Kabyle Women's Disinheritance

Carmen Garratón-Mateu

University of Cadiz, Spain

carmen.garraton(at)uca.es

Discrimination against women in inheritance matters is a fact in those countries, such as Algeria, where Sharia regulates these affairs. However, the case of Kabyle women is even more paradoxical. In Kabylie land has been transmitted through the male line for generations. Land ownership means belonging to a tribe or to a certain village. Any intrusion that could menace the cohesion of the group was avoided. In

doing so, not only women were prevented from accessing land, but also foreigners. Women could not access to land in the basis of intertribal pacts which were contrary to Quran. After independence, the creation of a new Estate, with the consequent derogation of Berber customary laws, failed to consider social, legal and linguistic diversity which led de facto to a current overlapping of legal systems.

Over the last years Kabyle social reality has changed thanks to the incorporation of women to workforce. Nevertheless male dominance is still so strong that if a woman dares to claim her part of the inheritance she risks being rejected by her family. Furthermore she will have the only option to benefit from the Algerian Family Code, based in the Islamic inheritance that fosters a discriminatory treatment of women.

Additionally the application of this Code, inspired by Sharia creates problems for others sectors of Algerian society such as foreigners, non Muslims, converts and lay people.

Field work, consisting of questionnaires and interviews, has been done in order to make a portrait as accurate as possible of the inadequacy between official law and modern plural society.

Sibling Configuration and Dietary “Re-islamization” among Second-Generation Muslim Youth in Europe

Hiroshi Kojima
Waseda University, Japan
kojima(at)waseda.jp

This study analyzes the effects of birth order and sibship size on Islamic dietary practices among second-generation Muslim youth in Europe, applying comparable ordered logit models to TIES data from Belgium, Germany and the Netherlands. The analysis reveals that being the second or higher order child has a positive effect on halal food consumption among German females but a negative effect among Belgian males. However, being the second or higher order child has no significant effects on fasting during Ramadan in the three societies.

A comparable model applied to French TeO data shows that being the second or younger child has no significant effects on religious food restriction, while having one sibling has a negative effect among males and females and having two siblings has a negative effect among females. Having two siblings is also found to have a negative effect on halal food consumption among females in Belgium and a negative effect on fasting during Ramadan among German males.

In France being the eldest child has a positive effect on religious food restriction among females, while being the elder of two children has negative effects among males and females and being the eldest of three children also has a negative effect among females. In other countries having one or two siblings tends to have negative effects and being the eldest child tends to have a positive effect. Therefore, the combined effects of birth order and sibship size on dietary “re-islamization” differs across genders and

societies among second-generation Muslim youth.

RN14 - Gender Relations in the Labour Market and the Welfare State

RN14 | Session 01a Gender and Professions

A smooth sea never made a skilful sailor: Gender and nautical science.

Runa Brandal Myklebust
Oslo and Akershus University College of Applied Sciences, Norway
runamy(at)hioa.no

Research into choices of higher education and its consequences for social inequality has been extensive. Much of the research aims to explain the stabilizing factors, that is, explain why and how social structures like social class and gender continue to influence individual choices. This article wishes also to contribute to the understanding of how change can come about, by exploring the motivation and considerations of students entering an extremely male dominated profession. Previous research shows that it is students of higher social background that are most likely to choose gender untraditional. Also, it's been described how this mainly occurs in middle-class jobs. This study focuses in stead on students with working class parents, choosing an area of occupation much characterized by vocational training and skills. The article aims to explore how young males and females experience the entry into a bachelor degree in nautical science, educating them to become deck officers and captains of ships. From being an extremely male-dominated line of study, nautical science has experienced a growth in female students the last few years. My findings demonstrate how maritime knowledge and experience is used as an asset and as demarcation both by female and male students—this in contrast to previous studies. This gender neutrality in the use of professional knowledge is analytically understood as inclusion and equality, and thereby to represent change and gender desegregation. At the same time, I demonstrate how the female students experience gender constraints both when making the choice of education, and in exercising the professional role. These findings support the claim that there are also strong stabilizing factors at work, which contributes to perpetuation and segregation.

Labour Market and Gendering of Professions in Contemporary Czech Film Production

Jan Hanzlik

University of Economics in Prague, Czech Republic
jan.hanzlik(at)vse.cz

The first part of the paper focuses on the question how people get jobs in the domain of film production in the context of contemporary Czech film industry. Prominent theories of “flexible specialization” (Storper and Christopherson) and “semi-permanent work groups” (Blair) are introduced and applied to the Czech context, which has been shaped by the transition from nationalized film studios with permanent employees to the post-1989 project-based system managed by private film producers. One feature of the labour market that immediately comes to focus is the fact that many professions in film production are gendered and there is considerable inequality in the access to various professions, a fact that has been referred to as the “celluloid ceiling” in literature on the subject (e.g. Kelly, Robson). The second part of the paper focuses on this particular issue in detail. Based on the analysis of Czech industrial publications and qualitative interviews with selected film professionals working in gendered professions (such as script supervisors and set designers), the paper seeks to explain how gendering of professions in film production is constructed by industrial discourse and how it is interpreted by people working in such professions. In conclusion, the paper identifies various stereotypes (women are better at multitasking, women are more empathetic, etc.) that circulate in various discourses and form the basis for differences and inequalities on the labour market and in labour process.

Gendered leadership in SET: Care does not have to Disturb Research!

Felizitas Sagebiel
Bergische Universitaet Wuppertal, Germany
sagebiel(at)uni-wuppertal.de

In this paper care will be an implicit issue under the focus of output orientation, commitment and availability of female professors in science and technology which have been influenced by new economy. The background of the paper is a German research project, lasting from 2009 to 2012, financed by the Ministry of Education and Research and the European Social Funds (Sagebiel 2013). Results will be taken from one governmental research organisation and one university based on qualitative guided interviews with professors.

For research in SET acquisition of paid projects has become the first priority and professors in leadership positions are responsible for this. In this situation top scientists have to become entrepreneurs. This means a cultural change to output oriented research. Professors not only expect longer working times from themselves, but, they expect intrinsic motivation and more hours work than in the contract also from the scientific researchers. Integration of staff with family responsibilities becomes a new task for professors as leading persons, accepting partly constraints for family people, for example that they leave the work place at

special times, but, at the same time expect high scientific productivity and output in time. But, there is a belief in research that offering possibilities to organize working time and home responsibilities is enough. Most interviewees do not reflect that the expectation of prolongation of work time and qualified output can be contradictory to a family engagement.

The results will be confronted with gendered organisational studies, feminist studies and critical labour studies.

Women in science. Research collaboration in Italian Academia from a gender perspective.

Elisa Bellotti, Luigi Guadalupi
University of Manchester, United Kingdom; IRISS
elisa.bellotti(at)manchester.ac.uk,
l.guadalupi(at)iriss.cnr.it

The paper analyses the position and outcome of female scientists in the local system of public funding to academic disciplines in Italy. In specific, we look at 10 years (2001 – 2010) of the Italian Ministry of University and Research funding of Projects of National Interest (Prin) in all the disciplinary areas: in this dataset we observe the percentage of women funded in each discipline, their role in the grants and in the academia, their tendency to collaborate across gender compared to their male counterpart, and the total amount of funding they receive in the ten years under analysis. While results presented here are preliminary, they suggest that women are still under-represented in Italian academia, they occupy less prestigious roles and overall receive less money than male scientists. Differences across disciplinary areas are discussed, and used to inform a future research agenda on the role of gender in scientific research.

RN14 | Session 01b Gender and the State

Public procurement as a form of responsive or reflexive regulation to advance gender equality

Tessa Wright
Queen Mary University of London, United Kingdom
t.wright(at)qmul.ac.uk

In the context of a shrinking public sector, and reduced regulatory and enforcement powers of states in many European countries, the use of public procurement policy may be a means for local and national states to extend their influence to the private sector in order to address social objectives, such as employment inequality. Social procurement – or ‘buying social justice’ (MCrudden, 2007) – has been subject to political and legal advances and setbacks, including questions over its permissibility under EU legislation, although the 2014 EU Procurement Directive allows public authorities to promote social, economic and environmental development, and good quality employment and services through public spending. This paper seeks to situate social procurement within a conceptual framework of new forms of regulation that move beyond traditional forms of ‘hard’ legislation and instead seek to engage wider

groups of stakeholders in the implementation of regulatory standards. The paper will consider the extent to which public procurement policy can be considered as a form of regulatory new governance (RNG), responsive or reflexive regulation, drawing on concepts developed by Ayres and Braithwaite (1992) and Nonet and Selznick (1978, 2001). While offering primarily a conceptual discussion, the paper will examine the application of public procurement policy and contract compliance in the context of advancing gender equality in employment in the construction sectors, drawing on evidence from the UK – the procurement strategy adopted during the construction of the London 2012 Olympic Park – and the US – affirmative action measures in federal contracting to increase women’s participation in the construction trades.

Local Councils’ Strategies for the Implementation of Gender Equality Sensitive Public Procurement: A comparative Perspective.

E. Katharina Sarter
Glasgow Caledonian University, United Kingdom,
University of South Wales
sarter(at)gmx.de

With roughly one third of general government expenses and about 13% of Gross Domestic Product (GDP) spent for the purchase of goods and services by public sector bodies (OECD, 2015), public procurement is an important market. It has been highlighted as “one of state and local governments’ most important jobs” (Potoski, 2008: S58) and credited “a great potential to promote gender equality” (European Institute for Gender Equality, 2017).

The proposed presentation examines strategies to implement gender equality sensitive public procurement at local level. Focusing on local strategies to implement legal requirements to have due regard to equality in public procurement, it examines how local councils in two countries, Wales and Scotland, seek to implement (gender) equality sensitive public procurement.

It, first, presents a brief conceptual outline of how public procurement can be used as a lever to promote gender equality as well in the workforce as in a wider societal contest. Based thereon, the presentation critically examines local councils’ strategies of implementing equality sensitive public procurement in Scotland and Wales.

Welfare State and Women's Access to Shelters in Turkey: A Study from Social Rights Perspective

Altın Aslı Şimşek Öner
Atılım University, Turkey
aaslisimsek(at)gmail.com

Today the prevention of violence against women has an essential role in providing women's participation in socio-economic life by promoting women's rights. Elimination of violence against women has been a public policy since 2006 in Turkey. There are 137 women's shelters run both by public bodies and local authorities according to 2016 data. Nevertheless, women have difficulties in accessing to these shelters, and benefiting from socio-economic opportunities while staying there.

The aim of this study is to analyse the legislature and social policy about the women's access to shelters and participation in labour market after leaving the shelters. I am going to make this analysis through examining the relationship between Turkish welfare state model and women's rights. While examining this relationship, i am going to use a social rights-based approach. According to this approach, poverty and social exclusion of women cannot be solved without providing or protecting socio-economic rights.

I am going to describe women's access to the shelters and socio-economic rights from the perspective of socio-legal studies including feminist legal theory. The difference between the equality principle in text-based legislature and problems about gender equality in real life is going to be understood by using socio-legal methodology. The scope of this study is the relationship between the legal status of the shelters and social law in Turkey, because of the difficulties in explaining all kinds and dimensions of the prevention of violence against women. The focus is on strengthening the socio-economic rights of women who are exposed to violence.

The State as the Provider and Financer of Childcare: Perceptions of the Public

Özgün Ünver, Tuba Bircan, Ides Nicaise
KU Leuven - University of Leuven, Belgium; HIVA - Research Institute for Work and Society; KU Leuven - University of Leuven, Belgium; HIVA - Research Institute for Work and Society; KU Leuven - University of Leuven, Belgium; HIVA - Research Institute for Work and Society
ozgun.unver(at)kuleuven.be,
tuba.bircan(at)kuleuven.be,
ides.nicaise(at)kuleuven.be

Research suggest that when people are asked to describe an ideal situation, the ideals they express are based on the current situation they live in and the options that are currently available to them. This study contributes to the existing perception research from the aspect of a crucial social policy area: childcare. Besides having a key role in regulating childcare provision and financing, the welfare state provides (i.e. public or publicly subsidised facilities) and finances (via public expenditure schemes) childcare to varying degrees. Although the need (or lack thereof) for public

facilities and resources for childcare have been discussed for several decades at the policy-level, we still do not know much about the perspective of users of these services regarding the role of the government as the primary provider or financer.

To address this gap in the literature, we conduct multilevel analysis on the relationship between current policies and the attitudes of public toward public provision and financing of childcare across 40 countries around the globe. At the respondent-level, we control for various demographic and socio-economic variables that have an impact on the perception of people. At the country-level, we test the effect of several welfare characteristics of the country with regard to the financing of childcare, use of childcare, general wealth, economic and intercultural inequalities, as well as gender and family policies. We use the fourth round of ISSP data on Family and Changing Gender Roles from 2012 at the individual-level and retrieve country-level variables from the OECD Family Database.

RN14 | Session 02a Gender and Age

Comparing experiences and outcomes for older workers in low-paid precarious employment and well-paid secure employment in Ireland and the United States.

Aine Ni Leime
National University of Ireland, Galway, Ireland
aine.nileime(at)nuigalway.ie

This paper compares employment and pensions policy in the US and Ireland at a time when governments and employers are being strongly encouraged to extend working life in response to population ageing. The US has a longer history of extended working life policies and has a greater proportion of older workers than does Ireland. It has fewer family friendly policies than Ireland to help reconcile work with caring and has for a long time pursued a neoliberal policy agenda privatising and individualising pensions.

This paper discusses the impact of extended working life policies for home health aides and janitors in the US neoliberal policy context as compared to Irish home health aides and cleaners who are in a more hybrid policy regime with some protective European Union employment measures. It also compares the experiences of teachers – a more sedentary, secure occupation in each country.

The paper uses a gendered political economy of ageing and a lifecourse approach to analyse the differences and similarities between workers in different occupations and subject to different welfare state regimes. It draws upon interviews tracing the work-life trajectories with ten female home health aides in Ireland and ten in the United States; with ten male cleaners in Ireland and ten janitors in the United States and with ten male and ten female teachers in each country.

In both countries men and women in physically demanding low-paid occupations are not in favour of

working past traditional state retirement age, while the evidence for teachers is more mixed. Health considerations and gendered caring histories are influential. Policy implications are discussed, as are potential future research directions.

Marketization and Managerialization of services for female school dropouts and young women in Israel

Orly Benjamin
Bar Ilan University, Israel
orly.benjamin(at)biu.ac.il

In contemporary public administrations throughout Europe, Israel included, Principles of marketization and managerialization are held applicable throughout the social services: education, welfare and healthcare. The applications of the marketization and managerialization toolkit was recently compared for its various European formations in Germany, Denmark, Italy and the UK. Based on this comparison Klenk and Pavolini concluded that the applied practices of quasi-marketization reduce levels of professionalization and knowledge preservation across various services. With trends of de-centralization and the increased importance of non-governmental providers of services the comparison indicated also an increased dialogue between public regulators, service users and other citizens. But, have feminist activists and organizations used the increased opportunities for dialogue? Because of the historical interest of the women's movement in services for female school dropouts and young women, focusing on these services, seem a good focal point for examining feminist involvement in the dialogue over the budgeting and the management of such services. Analyzing texts produced by an Israeli forum of providers of these services, as well as working papers produced by governmental bodies, 20 interviews with those involved in the operation of such services and those in feminist organizations, I set forth to shed light of the following: the ways in which services targeting female school dropouts and young women are budgeted; the employment quality experienced by employees operating the services; and, the level of participation of feminist activists and organizations in reinforcing the voices of services providers in their dialogue with government administrators involved in budgeting decisions.

The role of the state in feminisation and quality of employment: A comparison of teaching profession in the UK and Pakistan

Mahwish Khan
Univeristy of the West of England, United Kingdom
mahwish.khan(at)uwe.ac.uk

Teaching is considered one of the 'female' occupations in most countries around the world (Gaskell & Mullen, 2006). Feminization does pave the way to increase the presence of women in work but it does not imply women's access to power in the labour market. On the contrary feminisation is often related to the lowering of the status of an occupation and raises

issues related to the gender wage gap, occupational segregation, glass ceilings and work life balance (Bruegel, 2000; Wylie, 2000). The aim of this paper is to compare and contrast the employment trends of women in the labour market of the UK and Pakistan while giving particular attention to the teaching profession. The paper will analyse differing reasons and processes of feminisation of teaching and evaluates the role of the state during the process in the UK and Pakistan. The paper will also analyse the quality of employment of teaching in terms of knowledge, rewards, and career advancement opportunities in the two countries.

In the UK, there is a vast literature on feminisation of teaching tracing it back to the expansion of the public education in the nineteenth century (Miller, 1992). Whereas, feminisation of education in South Asian countries particularly in Pakistan, initiated in early 2000s in the backdrop of promotion of neo-liberal privatisation policies (Kelleher, 2011). This paper has used interpretivist approach to analyse the employment trends and quality in teaching profession. Both secondary and primary research has been done to analyse the changing labour market trends and quality of teaching employment in the UK and Pakistan.

Precarisation of Work in the Home-Based Elder Care in postsocialist context

Majda Hrženjak
Peace Institute, Slovenia
majda.hrzenjak(at)guest.arnes.si

Based on the policy analysis and 45 individual semi-structured interviews with care workers we analyse working conditions in home-based elder care in Slovenia, a 25 years old post-socialist country with a fast ageing population. Diverse employment positions with different degrees of precarisation co-exist and compete in the home-based care. They can be sorted in two continuum: 1. between public and market service; 2. between formal and informal work. Though in scarce public provision standard working arrangements predominate, care is being economically devaluated making employees working poor despite enormous workload. Because existing policies set market providers working as individualized self-employees as noncompetitive to the subsidized public services, they create only insecure occasional employments and are often pushed into informal economy where they are excluded from social citizenship. Migrants, long term unemployed, poor pensioners and working poor are actors in informal care market. A family assistant appears as a semi-employment status which pays a minimum wage for 24/7 care without being eligible to all rights from work. On the edge of the precarious informal home-based care are situated family carers, who perform care without financial compensation and social rights from work. Based on the analysis we argue that transformation of care from unpaid women's work in the family to social care is in threat to be unmade in the context of aging population and neoliberal

retrenchment of the welfare state, which can have serious consequences for women's economic (in)equality.

RN14 | Session 02b Gender, Agriculture and Food Production

Gendered Labor Regime, Wage Labor and Resistance: The Women of the Greenhouse

Zeynep Ceren Eren Benlisoy
Middle East Technical University, Turkey
zeynepcereneren(at)gmail.com

This study focuses on women's position in the rural labor markets and its radical change under the rural transformation process. As the small commodity producer households have great difficulty in maintaining their agricultural production and husbandry, the category of worker-peasant has become more visible in the rural areas. Yet the ways women experience such a drastic change seems to be different than men.

In this context, 'the greenhouse work' appears to be stereotyped in the Bakırçay Basin, Aegean Region, Turkey as 'women's work', even though the large-scale greenhouse production based on export has a short history in the region. The workers are predominantly composed of rural women, who until recently used to be tobacco, cotton or olive producers in the plain and mountain villages of the basin.

According to the preliminary findings of the fieldwork conducted in one of the largest greenhouse, the labor regime has gendered characteristics. The gendered division of labor organizes the working day in which 'greenhouse work' is seen as an 'extension of women work in agriculture'. The working conditions are precarious and the wages are low.

Given these, this study also looks for the possibilities for resistance practices in such a gendered labor regime. It tries to understand not only how they handle with the heavy work burden under the systematic mobbing of the greenhouse managers but also how they find alternatives and 'use' working in the greenhouse to liberate their private lives.

The Role of Cooperatives in Rural Women's Ability to Resist Global Markets: Analysis of Women's Cooperatives in Turkey

Bulent Gulcubuk, Gulce Olgun Susta
Ankara University Faculty of Agriculture Department of Agricultural Economics, Turkey; Ankara University Faculty of Agriculture Department of Agricultural Economics, Turkey
bgulcubuk(at)gmail.com, gulceolgun(at)gmail.com

Global food companies are becoming more and more influential all over the world. It is getting nearly impossible to be able to resist these companies and to take place in the market. In overcoming this problem, cooperatives are important tools and objects for rural women in agriculture. Cooperatives on a volunteer basis, with the function of solidarity, cooperation and collective social service have an important role in

economic, social and democratic development of individuals and society. Less than 4 % of all entrepreneurs in Turkey are women and it is not possible even to give any ratio in rural areas in this regard. So, strengthening of the woman cooperative system in any field, increasing the presence of women in cooperatives and their effects in decision-making processes will be a milestone to meet economic, social and cultural needs of women and to make them be able to resist global markets. Women's cooperatives in rural areas will have a positive impact on making economic, social and cultural opportunities especially for women, who work informally, who can't participate in working life in rural areas freely and who can't participate in social relationship system. Cooperatives may play a key role in solving women's problems due to gender inequalities in economic power sharing, obstacles that women meet with related to participating in workforce. In this paper firstly, data about the role of women in agriculture will be presented then, how cooperatives can play a role in women's participation in social and economic life, how cooperatives can function in resisting the global food companies will be discussed. Besides, the issue about women's cooperatives in rural areas of Turkey will be reviewed.

Handover of Jobs in a Local Agricultural Labor Market

Elif Sabahat Mura
Çanakkale Onsekiz Mart University, Turkey
esmura(at)comu.edu.tr

This paper is based on a case study documenting the patterns of wage-labor processes of agricultural workers among the inhabitants of Adapazarı, an industrialized city in northwestern Turkey. Agriculture in the hinterland of the city is based on small-sized commercialized farms, which have long been regarded as the typical Turkish case. A significant part of agricultural tasks, such as hoeing, picking, and packaging, have been associated with women's labor and established as women's work in the region. Agricultural jobs around the city have historically been one of the important employment options for urban women although the number of available agricultural jobs has shrunk lately due to industrialization process, enlargement of residential areas in 1990s and mechanization of some agricultural tasks. The case study is conducted in the harvest seasons of the years 2011, 2012, and 2015 through participant observation and semi-structured interviews with workers and employers. The fieldwork provides hints indicating a handover of agricultural jobs from women living in central neighborhoods to peripheral settlements where mainly new migrants and minorities (Kurd, Roma) are settled. The research indicates that the recently increased employment opportunities within the city (in service sector and industries) have been utilized unevenly among the inhabitants of the city, regarding the ongoing vitality of precarious agricultural jobs for women living in the settlements which are associated with minority identities. Therefore, this analysis of the

hitherto undocumented peoples' struggle for income signals the structural inequalities of the wider society confining women, particularly minority women to precarious agricultural jobs, without legally defined responsibility of employers, secure contracts, fringe benefits, retirement rights, safety precautions for work and transportation.

RN14 | Session 03a Parents

Managers' views on parental leave and work/family balance - problems and solutions within different institutional logics.

Tanja Haraldsdottir Nordberg
Oslo and Akershus University College of Applied Sciences, Norway
tano(at)hioa.no

This paper contributes to recent years' debate on effects of family policies such as the right to parental leave. Whereas some researchers have highlighted the positive effects for gender equality, others have pointed at utilising such policies having negative consequences for women's careers. This debate contains implicit assumptions about how managers perceive of employees' use of parental leave, but few studies have examined managers' views directly.

This paper examines how managers within the Norwegian police and legal profession view employees' use of parental leave. Data comprises qualitative interviews with 34 managers.

The paper adopts an institutional logics approach. The managers' problematisations of employees' parental leave, as well as proposed solutions, are analysed as signalling cues of the logics the managers' views are grounded in. The paper also discusses the relevance of assumptions about managers' perspectives that are implicit in two central explanations for women's lack of career progression following childbirth; the theory of human capital depreciation and parental leave's signalling effect. What does this look like within different institutional logics?

The paper finds that whereas the managers in private law firms and in the police problematise parental leave, the managers in public sector legal offices view parental leave as unproblematic. Importantly, profession and sector cannot solely explain the differences in the managers' views. The paper locates these different views in the different institutional logics the managers draw on. The role the employees have in the organisation, the nature of the work tasks and the employee's gender are central for whether the managers view parental leave as problematic or not.

The impact of flexibilization of work on caring masculinities

Živa Humer
Peace Institute, Institute for Contemporary Social and Political Studies, Slovenia
ziva.humer(at)mirovni-institut.si

Slovenia has dual-earner model from the Second World War on with full time employment of women

and men supported by the family policy of gender neutral parental leave and accessible, subsidized public child care services for more. The state upgraded the parental leave scheme with paternity leave in 2003 aiming to foster caring role of fathers. However, the precarisation, the intensification and flexibilisation of work in Slovenia result in that almost three thirds of first jobs for young people are atypical, precarious forms of employment. The neoliberal market based on the concept of »ideal worker« unburdened with care and family obligations, deriving from traditional gender role division represent one of the key factors affecting the involvement of fathers in care for children. Based on qualitative empirical evidence we analyze how work arrangements and working positions influence fatherhood and the possibilities of work – family reconciliation. In particularly the focus is on the impact of paid work on two groups of fathers: in precarious forms of employment and in leading and managerial positions. The analysis shows the greater shifts toward caring fatherhood and variations of relations between paid work and fathering can be observed in the group of fathers in precarious employments. Fathers in leading and managerial positions with full power to development of work – family reconciliation mechanisms, express prevailing hegemonic masculinity with limited participation in care for children fulfilled in »weekend fatherhood«.

How do fathers adapt their work to become involved in childcare? Gender differences for Work-life balance in workplaces in Spain

Teresa Jurado-Guerrero, Carmen Botia-Morillas, Paco Abril, Jordi Monferrer
Universidad Nacional de Educación a Distancia, Spain; Universidad Pablo de Olavide, Spain; Universitat de Girona, Spain; Universidad a Distancia de Madrid, Spain
tjurado(at)poli.uned.es, cbotmor(at)upo.es, francisco.abril(at)udg.edu, jordimanel.monferrer(at)udima.es

Based on three discussion groups conducted in Barcelona, Madrid and Seville in 2016 and on recent statistical data, this paper explores the barriers and possibilities that involved fathers encounter at their workplaces when they enter parenthood. Involved fathers are defined as those who adapt their working time, work schedule or workplace to parenting, or those who have a job that allows for work-life balance. In addition, they form dual-earner couples with a full-time working partner and spend at least two hours at weekdays caring for their children. Fathers from public sector enterprises, medium to large private companies and small businesses participated in one discussion group respectively.

This qualitative and quantitative analysis shows that working in tight shifts (mornings mainly), as well as schedule flexibility, telework and paid paternity leaves are the measures mostly used by the interviewed fathers, and by Spanish fathers in general. In addition, the use of schedule flexibility and telework display

very low gender gaps in contrast to opting for unpaid and transferable leaves or the use of statutory entitlement to reduced workhours. Under certain circumstances supervisors and coworkers attitudes are described as hostile to the adoption of support measures. Some clear policy recommendations arise from this study, should the aim be to foster work-life balance for fathers and mothers but without having unintended consequences on gender inequality.

The impact of parental leave policy on the labour-market engagement of mothers. Do the number of children and pre-birth work engagement matter?

Marie Valentova

LISER, Luxembourg

marie.valentova(at)liser.lu

In this paper, we examine the impact of the introduction of parental leave policy in 1999 on the labour-market engagement of mothers with one and two children in Luxembourg. Labour-market engagement is measured by the number of hours worked monthly, one, two and three years following the birth of the last child. Analyses are conducted using longitudinal social security records data from 1995 to 2002. The difference-in-differences (DiD) method is used to establish a causal relationship between the introduction of the policy and its outcomes. The results of the analyses reveal that among mothers with one child, the introduction of the policy had a significant and positive impact on the working hours during the first three years after childbirth. Among mothers of two children, the impact of the policy was significant for one year after childbirth. Heterogeneity effect analysis shows that single-child mothers who worked part time before childbirth were substantially more responsive to the policy than their full-time working counterparts.

RN14 | Session 03b Mainstreaming and EU Policy

Gender Equality and Political Change in Northern Ireland

Stella Warren, Hazel Conley

University of the West of England, Bristol, United Kingdom; University of the West of England, Bristol, United Kingdom

stella.warren(at)uwe.ac.uk, hazel.conley(at)uwe.ac.uk

Most examples of political change in recent times have had negative connotations for equality. By comparison equality has been at the centre of positive political change in Northern Ireland (NI). Stemming from the Belfast Agreement in 1998, non-discrimination in public service employment and the delivery of public services are key planks in promoting equality of opportunity and good relations in NI. The mechanism for achieving these aims is contained in s.75 of the Northern Ireland Act, considered a particularly successful aspect of the legislation. The legislation requires public authorities to produce an equality scheme and report annually on the progress made towards the objectives laid out in the scheme.

The legislation was heavily influenced by European Union policy, particularly the concept of gender equality mainstreaming. Women's groups in NI played an important role in brokering the agreement and shaping the legislation, but there is some doubt as to how far women in NI have benefited from the legislation. This paper examines how gender equality and mainstreaming is reflected in equality schemes and documentation in 18 case study public authorities in NI, including the setting of gender equality goals and clear timetables and plans to achieve the goals. The case studies involved documentary analysis of equality schemes, action plans and annual progress reports coupled with semi-structured interviews with the key equality officer in each authority. The results so far indicate mixed results, with some schemes developing effective measures for gender equality but to a much lesser extent in others.

Gender mainstreaming done behind closed doors – an unintentional catalyst for anti-gender mobilization?

Marta Rawłuszko

University of Warsaw, Poland

rawluszko(at)gmail.com

Gender mainstreaming (GM) is regarded as a feminist strategy aiming at influencing public policies and thus improving women's lives. In current battles against neoliberalism and state dismantling, successful GM, understood as the stronger presence of feminists within state structures, is considered a significant challenge to contemporary feminism. The strategy is risky and its ultimate positive impact remains highly problematic. The picture is even more complex in the case of local manifestations of GM. In Poland's case, GM became a part of local administrative practices as a result of Europeanization, i.e. the process of subjecting domestic policies to European law. Thus, the strategy eluded parliamentary control and public debate.

The aim of the presentation is twofold. Firstly, it will contribute to existing scholarship on effectiveness of GM in shaping social policies. I will show that the strategy brings positive results but that they are limited to the state administration's internal organizational gender regimes. Secondly, I will show that GM, if implemented in a non-democratic, expert/bureaucratic manner, may produce new tensions around gender policies and constitute an unintentional catalyst for conservative backlash. I will argue that the local specifics of GM implementation in Poland have fuelled popular fears of a state slipping away from people's control and being overtaken by the external forces of international feminism.

The presentation is data-driven and based on two qualitative analyses: 1) 29 in-depth interviews with feminists and state administrators, both involved in GM implementation; 2) critical discourse analysis of the narratives of opponents of "gender ideology".

Rethinking New Economic Governance from Feminist Political Economy approaches

Astrid Agenjo
 Universidad Pablo de Olavide de Sevilla, Spain
 cmagecal(at)upo.es

The objective of this work is to incorporate the Feminist Political Economics perspectives to the analysis of the challenges of the EU, transcending the conventional economic look to locate people and their living conditions in the centre. In particular, analyzing the challenges of the European model of social cohesion, solidarity and equal opportunities after the economical recession and, specifically, in the current context of New Economic Governance. The hypothesis held is that, in this context, there is a fundamental contradiction regarding the maintenance of the European social model and the objectives of the “inclusive, sustainable and intelligent growth” stated in the Europe 2020 strategy, since, at the same time, it exists a strict fiscal discipline demanded by the Stability and Growth Pact that has resulted in a deflationary adjustment moved to labour markets and to the core components of social policy (mainly in the peripheral economies). This has a crucial gender impact as the structural adjustment causes directly an intensification of the unpaid work in the households and, within them, specific subjects who embody the ultimate responsibility over the daily well-being. Households are the basic unit of welfare, but they are not harmonious units because they are organized according to a “family debt” and a “mandate of gender” that delegate such responsibility to women, both material and symbolically. Gender is a cornerstone for the creation and allocation of resources for the maintenance of the well-being in the European context.

RN14 | Session 04a Feminist Politics

Feminist democracy in a Brexit environment - a political dynamic more than hegemony: When you do things with others, you hold that inside you - a glimpse of the world we are trying to create.

Margaret Page, Sue Cohen
 University of the West of England, United Kingdom;
 University of Bristol, United Kingdom
 margaret.page(at)uwe.ac.uk, suecohen0(at)gmail.com

In the last 20 years there has been growing commitment by EU institutions to furthering gender equality. Enmeshed in social initiatives designed to sustain political and economic cohesion within a capitalist system, they nevertheless demonstrate that a political dynamic exists that is more than hegemony, hard fought and led by women's movements across the EU and in the Women's Rights Committee of the European Parliament.

If the UK is to hold onto gains made towards gender equality in legislation and public policy there needs to be political commitment in Brexit negotiations to adopt comparable regulatory measures. Yet social infrastructure and gender have been all but cleansed from political and media Brexit discourse; where the “public”, economics and the market have little or no

synthesis with the “private” - social infrastructure, social care, childcare, reproductive rights, domestic relations, or community inclusion.

Brexit threatens to remove vital resources for promoting gender mainstreaming, and the tools for compliance and monitoring. This will be particularly damaging in the context of austerity, and the potential fragmentation of EU. With the weakening of equality legislation and neo liberal marketisation of public services, new mechanisms and strategies are needed to protect and advance gender equality and feminist social democracy.

This paper will examine the challenges and opportunities encountered by feminist grassroots organisations' working to protect and promote gender mainstreaming in the SW region of England in the context of Brexit negotiations and neo liberal austerity measures on social infrastructure services for women in the region.

Romanian Women in and out of Communism: Work, Solidarity, Empowerment

Petruta Madalina Teampau
 Babes-Bolyai University, Romania
 teampau(at)fspac.ro

Part of the politics of “promoting women”, in communist Romania women were massively absorbed into labor force and became subjects of an orchestrated “emancipation” that gave them equal rights to men. However, beyond the strong propaganda, women were carrying a “triple burden” as workers, mothers and activists. While most of the literature argues about a “failed emancipation”, others contend that many women experienced a genuine form of empowerment through work: they felt strong and gratified for having a job and a profession, working side by side with men. At the same time, most of them did not even think about disrupting the patriarchal order that required them to be good mothers and wives; in fact, they took pride in managing to fulfill all these challenging duties.

How did women themselves lived out their emancipation? Was there space for a genuine empowerment? How was solidarity created in workplaces with hundreds of women and was it based on class or gender? Did women actually experience autonomy during communism? If so, how was it possible to have left the private patriarchy untouched? Finally, how are all these developments inherited by the next generations of women, socialized after the fall of communism, in a radically altered socio-political setting? My research, based on narrative interviews conducted on the two age-groups, “mothers” and “daughters”, both working class and white-collar, examines differences, congruence and nodal points in the discourse and lived experience of women, with a focus on work, solidarity and empowerment.

Women's Quiet Encroachment as an Experience of Empowerment

İrem Yılmaz
 Ankara University, Turkey

iremyilmazyi(at)gmail.com

The labour force participation rate was higher for males than females across all Turkey. Women face different challenges in terms of supply and demand with their labour. Private patriarchy, which is located in their home, is one of the obstacles they face in the terms of supply. Men, as a representative of the patriarchal gender relations at home, have right to speak about women's labour forces.

In this study, in-depth interview have conducted with twenty two women who are not allowed to work in paid job by their husband yet they are working or have been worked. When women decide to work, first of all, they need to convince "the men" who is inside the house. Persuasion is not a one-time action, is an ongoing process throughout their working life. At first, the whereabouts of the business, who will be working with and working hours are important variables. And then, there are tactics that women need to follow in order to maintain the men's gains achieved. Although diversity of tactics as well as the number of women, the common goal is keeping low profile. They encroach on relation between their husbands and themselves quietly. Thanks to this tactics, they can keep stay outside.

Although women reproduce patriarchy in this way, on the otherside they harm it yet they do not have such a purpose. Even though, it looks like an individual struggle, women have invisible networks between themselves. They becoming strong after this process. Their position in the house getting better.

Creating Change Through Feminist Solidarities: critical actors building critical mass

Susan Durbin, Ana Lopes, Stella Warren
University of the West of England, United Kingdom;
Newcastle University; University of the West of
England, United Kingdom
sue.durbin(at)uwe.ac.uk,
ana.lopes(at)newcastle.ac.uk,
stella.warren(at)uwe.ac.uk

Europe has an increasingly ageing workforce and is experiencing an on-going reduction in its working age population (ILO, 2016). In parallel, there is a shortage of skills in some economically critical industries, especially engineering, which could be addressed through the recruitment and retention of more women (Munn, 2014). Women comprise just over 8% of engineers in the UK, which compares poorly to other EU countries, such as Latvia (30%) and Sweden (26%). The aviation and aerospace industry in the UK is male dominated; women make up just under 10% of engineers and 4% of pilots. One issue women face in this industry and male dominated industries generally, is a lack of support and progression.

To address this, the alta mentoring scheme was developed 'for women/by women' for business and social justice reasons. This involved a number of 'critical actors' (Childs and Krook, 2009) from public and private sector organisations in the aviation and aerospace industry and a team from the University of

the West of England. The aim of this collaboration was to bring about positive change by promoting gender equality, through mentoring, and to build a critical mass of women (Kanter, 1977; Torchia et al. 2011) who could support one another. The paper will consider 'critical actors' and 'critical mass' theory and through data analysis, argue that these concepts can be usefully integrated to achieve gender equality through the formation of feminist activist solidarities (Cockburn, 1991; Walby, 2011).

RN14 | Session 05a Quotas and Women on Boards

Gender Imbalance at the Top of the Business Sector in the Gender Equal Welfare States Iceland and Norway

Laufey Axelsdóttir
University of Iceland, Iceland
laa2(at)hi.is

The under-representation of women in top positions is receiving increasing attention in Europe and the United States. It stands in contrast to the educational attainment among women, in areas such as finance, law and management, as well as the labour market participation among women. Gender imbalance among key decision makers is widespread, and strongest in the business sector (Davidson & Burke 2011). Supply and demand theory is often used to explain the persistent male dominance at the top levels (Teigen 2002). Demand-side explanations emphasize employers' actions, along with discriminations, and supply-side explanations most often stress occupational choices of men and women (Reskin, 1993).

While Iceland is ranked as number 1 and Norway number 3 in the world on general gender equality, Iceland is number 29 and Norway number 39 on the ranking of gender equality among legislators, senior officials and managers (World Economic Forum, 2016). The paper examines how top-managers in these two most gender equal welfare countries value given supply and demand-side explanations of the under-representation of female top-managers, and what measures for a better gender balance they believe in. It draws on combined quantitative data-sets of 1388 male and female managers serving on the executive committees in the 250 largest companies. The results show that managers question those given supply and demand-side explanations, and have relatively strong beliefs in recruitment policies and better gender balance of family responsibility to change the opportunity structure, and to contribute to a better representation of female executives in the business sector.

On recruiting executives in Iceland: A gender perspective

Ólöf Júlíusdóttir
University of Iceland, Iceland
olj2(at)hi.is

The Nordic countries are known for its welfare society; dual breadwinner model, generous parental leave and in pursuing gender equality in all spheres. According to World Economic Forum Iceland takes the top score the eighth year in a row when measuring gender equality in the world. Women in leadership positions, however, remains low. The purpose of this study is to analyse the underrepresentation of women with economic power by looking further into the recruitment process within different companies.

Qualitative method is applied by analysing twenty semi structured interviews with female and male CEOs. The interviews were conducted in the end of 2016. Those selected were randomly chosen from a previously survey sent to 250 largest companies in Iceland.

The preliminary findings show that headhunting and networking are the main means of recruitment for executive positions. In general both women and men interviewed did not give much for their own involvement in networking although they mentioned the importance of it. Nevertheless, male business leaders have a broader network and greater opportunities to strengthen it. The discourse around gender balance in executive committees was different among women and men. For the men interviewed the best candidate was usually someone who "fits within the team," independently of gender. However, men were most likely be the perfect match. For the greater part of women CEOs interviewed found it necessary to have other women in the executive positions, they preferred not to be there on their own.

Despite the good intention of the welfare society in promoting gender equality the complexity of the recruitment process part takes in maintaining women's underrepresentation in leadership positions.

Gender balance on boards: the policy framework and the role of key actors

Sara Falcão Casaca
ISEG, University of Lisbon, Portugal
sarafc(at)iseg.ulisboa.pt

Despite the investment in education and human capital in general made by European women, their representation in business and economic decision-making bodies is still very low. In this regards, the picture in Portugal is particularly critical. The paper is intended to provide an overview of the slow progress made in the country, over the last decade, regarding the policy and normative framework geared towards a greater gender balance on boards and in economic decision-making. It further explores the legal-binding measures recently announced by the Government and critically discusses the low involvement of relevant social actors in policy proposals and policy advancement.

New directors, old boards. The implementation of gender quotas in Italian listed companies.

domenico carbone, joselle dagnes
University of Eastern Piedmont, Italy; University of Turin
domenico.carbone(at)uniupo.it, j.dagnes(at)unito.it

In Italy the existing gap between men and women in terms of access to the labor market, wage levels, and career opportunities is very relevant. The female labour participation rate is lower than 50%. Moreover, the 2014 Global Gender Gap Report ranks Italy in the 69st place out of 142 countries worldwide (21nd out of 28 European countries). Within this scenario, the legislator has recently introduced an important affirmative action in order to reduce the gender gap on job positions of responsibility, in which women are systematically underrepresented. In fact, with the Golfo-Mosca law, in 2011, gender quotas have been adopted for listed company boards in Italy. The law, providing for reaching a one third representation of women in business leadership, is changing the structure of Italian corporation boards by breaking the existing power balance.

The paper aims to investigate the effects of the quota law focusing on the recruitment process of new female directors and on their characteristics. The goal is to define the profile of women that through this law have reached a position within a corporate board, their career paths and their opinion about the effectiveness of the law in order to substantively, and not only formally, reduce the gender gap in this strategic segment of Italian's labour market.

The empirical findings are based on the results of a national web-survey conducted among all the Italian women members of listed corporate boards.

RN14 | Session 06a RN KEYNOTE SESSION: The Gendered Future of Europe

The future of gender equality in the re-making of Europe - RN14 Keynote Speaker

Sylvia Walby
Lancaster University, United Kingdom
s.walby(at)lancaster.ac.uk

Recent feminist mobilisations offer renewed solidarity in the face of crisis. Europe is being re-made in the face of contradictory pressures towards both fragmentation (Brexit) and also for ever closer union of the parts that remain (the Five Presidents report). This un-making and re-making of Europe is gendered at its core. The change in the level of governance of the fiscal (involving spending on the welfare state) from Member State to the EU level, as experienced by Greece under the '6-pack', may be extended to the rest of the EU under the 5 Presidents Plan. This is a gendered change since spending on the welfare state is so important for gender relations. The analysis of this re-gendering requires the development of concepts of gender regimes (Walby), not only of concepts of gendered institutions (Waylen). Explaining

the restructuring of gender relations in labour markets and welfare states requires an understanding of the gender regimes of which they are part as well as of the restructuring of capitalism and the intersection of multiple regimes of inequality. The theorisation of the cascade of the crisis from finance to the real economy to the fiscal to politics and violence requires rethinking the concept of social system using complexity theory. This paper offers a new theoretical framework within which to rethink the crisis in Europe.

RN14 | Session 07a Gender and Austerity

Single mothers and personal agency: opportunities and strategies for resistance and survival in times of austerity

Kate Julie Clayton-Hathway
Oxford Brookes University, United Kingdom
kclayton-hathway(at)brookes.ac.uk

The discourse surrounding lone mothers has long been highly politicised, entrenched in a paradigm of dependency and notions of an underclass. This doctoral research used an alternative perspective of gender equality, looking at the positive legal rights of single mothers, focussing on them as service users.

Reflexive equalities law introduced in the UK during 2010 was intended to allow local stakeholders some agency in the distribution of resources. This has provided increased opportunities for those who rely heavily on state services - particularly the socially and economically marginalised – and those who seek to help them. However, a prevailing environment of austerity and cuts to funding in social care, education and health services means that accessing resources presents a growing challenge.

Using an approach influenced by feminist thought, with a standpoint grounded in these women's unique interests and experiences, this study encouraged women to 'speak for themselves' and explore the issues from the ground up. Through interviews with stakeholders and lone mothers themselves, a rich picture has emerged of these women's lived experiences and the agency they exercise in challenging and resisting their material and structural constraints. In contrast to stereotypes of poor choices and a culture of reliance, the findings show how these women operate as social actors to improve their own and their children's situations.

Long Term Care, Gender and the Crisis in Greece: Comparing pre and post-crisis microdata

Antigone Lyberaki, Platon Tinios, Zafiris Valvis,
Thomas Georgiadis
Panteion University of Political and Social Sciences,
Greece; University of Piraeus, Greece; University of
Piraeus, Greece; Panteion University of Political and
Social Sciences, Greece
antiglib(at)gmail.com, ptinios(at)gmail.com,
zvalvis(at)gmail.com, th.georgiadis(at)gmail.com

The Greek crisis was exceptionally deep and implied major realignments in income roles and retrenchment

in public welfare services. These realignments are likely to have been felt especially in the field of Long Term Care (LTC) and more especially in gender roles in its provision. This is supplied in Greece by a hybrid welfare state, comprised of a 'formal' state-based system and an 'informal' family-based system, centred on women. Thus, both aspects -gender and retrenchment – are likely to be highlighted through examining the changes in LTC provision and finance through the crisis.

The proposed paper compares microdata from SHARE (Survey of Health, Ageing, and Retirement in Europe) wave 2 (2006/7) with data of the same survey for wave 6 (2015). Though Greece did not participate in SHARE w4 and w5, there nevertheless exists substantial longitudinal information in SHARE w6 (3000+ individuals) who had participated in pre-crisis waves and are now included.

The empirical investigation lies in three directions: First, how LTC needs altered during the crisis. Second, whether the crisis changed the pattern of response to these needs, as a reaction to retirement patterns or household incomes. Third whether the crisis led to a change in gender roles in LTC as a reaction to formal sector retrenchment.

More occupied more unequal: the crisis effects on women's work in Italy

Fatima Farina, Alessandra Vincenti
University of Urbino, Italy; University of Urbino, Italy
fatima.farina(at)uniurb.it,
alessandra.vincenti(at)uniurb.it

This paper looks at the effects of the crisis on women's participation in the Italian labour market by considering policies, numbers and quality of work. Given the widespread belief that the crisis has hit mainly the male labour force, the analysis presented shows the 'corrosive effect' on the traditional weak female participation of women in the national labour market, even in a comparative European frame. The paper is focused on how the recent growth in female offer is, paradoxically, a symptom of a more serious trouble than a virtuous pushing factors. In fact, the increasing of female working participation in the "Crisis Eve" goes with a negative qualitative trend in working conditions, salary, gender pay gap, working time, etc. Also the policies adopted over the last years, regarding labour market and reconciliation, helped to increased inequalities, intergenerational and territorial gap, keeping Italy a "peculiar case" where the policies adopted over the last year are far from being gender (equality) oriented and the breadwinner model is not yet overcome. Being Italy one of the most industrialised countries with the highest gender inequality, the old structural problems overlap the new crisis through a regressive tendency both in terms of socio-economic participation and of gender equality.

Women in Greece during the crisis: A social investment programme evaluation

Alexandra Koronaïou, Georgios Alexias, Georgios Vagias, Alexandros Sakellariou
Panteion University of Social and Political Sciences of Athens; Panteion University of Social and Political Sciences of Athens; Panteion University of Social and Political Sciences of Athens; Panteion University of Social and Political Sciences of Athens
alexkoron(at)gmail.com,
galexias(at)yahoo.gr, george.vagias(at)gmail.com,
sociology.panteion(at)gmail.com

Despite the fact that the economic crisis that runs its seventh year in Greece had a severe impact on men and women respectively, the truth is that women's place in the labour market is still worse compared to their male counterparts. Female unemployment is still very high and women are less paid compared to men. Within such an environment the implementation of social investment projects on women is of crucial importance. The purpose of this paper is to present the findings of an evaluation of a social investment programme called "Promotion and strengthening of women's participation in trade unions and their representation bodies" designed and implemented in Greece (2011-2014). This programme aimed at promoting and ensuring the active participation of women workers in positions of responsibility at all levels and types of trade unions. Through the in-depth qualitative analysis of documents, focus groups and semi-structured interviews with women who took part in the programme and staff employed during its implementation the following questions raised: Did women participate in the programme? Were women interested in such an intervention? Which were the advantages and disadvantages of the programme? Were there any side effects and/or unexpected outcomes? Which were the outcomes of the evaluation of the programme? How such programmes of social investment could help in confronting the economic crisis? The paper is based on the findings of Innosi (Innovative Social Investment: Strengthening Communities in Europe) a Horizon 2020 research project (2015-2017) on social investment and social innovation.

RN14 | Session 08a Gender and Pay

Flexicurity, Wage Structures, and Gender Gaps: Sources of Earnings Inequality in 19 Countries

Szu Ying Ho
City University of New York, United States of America
innerdark(at)gmail.com

"Flexicurity", the balance between flexibility and security, is a flagship labor market policy promoted by the European Commission since the middle of 2000s. While the EU Commission staffs firmly asserted the idea of flexicurity will enhance gender equality, numerous feminist scholars have rejected the relationship between gender equality and flexicurity. Furthermore, a number of research pointed out

women were typically overrepresented in flexible work, but still few research focus on the influence of flexicurity on gender earning gaps. To fill this gap, this study addresses hierarchical linear models, the analysis combines individual-level data (obtained from the Luxembourg Income Study) with country-level data (obtained from secondary sources) to evaluate the effects of flexicurity policy factors (Employment Protection Legislation (EPL) and Active Labor Market Policy (ALMP)) on gender earnings inequality across 19 countries. The findings show that gender earnings disparities are more pronounced in countries with higher level of EPL and ALMP, which suggests higher level of flexicurity is more inclined to result in higher gender earnings inequality. However, the findings also show that if cross-country differences in the wage structure are controlled, EPL and ALMP didn't show significant effect on the gender earning gaps. Consequently, the author therefore concludes that in countries with more developed flexicurity policies may result in higher gender earnings disparities, but egalitarian wage structures may reduce the impacts of flexicurity policies.

Pay transparency and the Gender Pay Gap in Europe: Using reflexive legislation to change employer behaviour

Hazel Conley, Ursula Torbus
University of the West of England, United Kingdom;
University of Silesia, Poland
hazel.conley(at)uwe.ac.uk, urszula.ludian(at)wp.pl

After more than 40 years of equal pay legislation all European countries continue to have a gender pay gap that favours men. It is widely argued that traditional, reactive equal pay legislation in which women have rights to compensation after they have been discriminated against, has reached the limits of effectiveness in closing the gap between male and female pay. A key criticism is that the lack of transparency on gender pay discrepancies in most organisations means that reactive approaches to equal pay legislation cannot help women to claim their rights to equal pay. These arguments seem to have had resonance and some European states have started to adopt new proactive approaches to legislation aimed at closing gender pay gaps. Modelled on the concept of reflexive legislation, these new forms of legislation attempt to change employer behaviour by requiring them to introduce organisational transparency on the gender pay gap in their organisations. This paper examines legislation in three European countries, Italy, UK and Germany that have adopted new forms of legislation in relation to gender pay gap reporting. The findings suggest that, whilst these new forms of legislation are well intended and have some merit, they are largely weakened by the timidity of national governments who are reluctant to add 'burdens to business' or impede profitability, particularly in times of economic and political crises. The paper situates the research in socio-legal theories on reflexive legislation and feminist theories of the welfare state under capitalism.

The gender pay gap. An analysis of sectorial dynamics

Núria Sánchez-Mira, Pilar Carrasquer Oto, Martí López-Andreu, Albert Trinidad Jiménez
 Universitat Autònoma de Barcelona, Spain; Universitat Autònoma de Barcelona, Spain; University of Huddersfield; Universitat Autònoma de Barcelona, Spain
 nuria.sanchez.mira(at)uab.cat,
 pilar.carrasquer(at)uab.cat,
 M.LopezAndreu(at)hud.ac.uk,
 albert.trinidad(at)uab.cat

Studies on the gender pay gap have often focused on measuring the differences in the individual characteristics of men and women in order to quantify the explained and unexplained part of such discrepancy, in a way that relegates gender to a sort of 'residual'. In contrast, the paper advocates an approach to the gender pay gap as an indicator of gender inequalities in the labour market, considering the impact of reproductive factors as well.

Whereas the main factors contributing to shape the gender pay gap have been identified extensively in the literature, less attention has been paid to its translation into specific sectorial and organizational contexts. The paper advocates, thus, the need to analyse to what extent the (under)valuation of women's work and its translation into professional categories, follows different logics depending on the activity sector; in what sense that is related to different contexts of production and work organization as well as strategies of workforce management; in what way certain organizational structures and cultures foster different mechanisms of occupational segregation and thus pay hierarchies; and how these issues are perceived and addressed by social agents in collective bargaining.

With this aim, we conduct an in-depth analysis of selected activity sectors, taken as critical cases representing diverse productive and organizational contexts. The analysis includes a revision of processes and contents of collective bargaining, interviews with social agents, as well as focus groups with employees.

The Time Squeeze: Working Time and the Temporal Organization of Daily Life

Sofía Pérez de Guzmán, Marcela Iglesias, Ester Ulloa
 University of Cadiz, Spain; University of Cadiz, Spain; University of Cadiz, Spain
 sofia.perez(at)uca.es,
 marcela.iglesias(at)uca.es, ester.ulloa(at)uca.es

Numerous recent research reveals an increasingly widespread belief among the people of Western developed countries regarding the rapidly growing acceleration in the pace of life and a loss of control over the organization of time allotments in their daily lives. One of the most widespread explanations of this phenomenon points to the massive incorporation of women into the labor market, which, by reducing their availability for care and domestic work, has placed a

great amount of strain on the articulation of the different spheres of everyday life and is forcing an incipient redefinition of gender relations within the family. As a result, both men and women are experiencing an ever-increasing time squeeze.

Providing the results of qualitative research carried out in Spain with an innovative methodological approach that takes as base and object of observation the world of daily life, we will argue that this feeling of time squeeze is deeply related, and contingent upon, the sense and value that people assign to each of the different areas of activity that make up daily life and to the extent to which the exercise of a particular activity favors or hinders the development of other highly valued activities. In this context, working time appears as the central variable - and the most problematic - when trying to articulate work, care and free time.

RN14 | Session 09a Gender and Labour Markets

Can we measure gender inequality by comparing man to women?

Gorana Djoric
 Faculty of Philosophy, University of Nis Serbia, Serbia
 gorana.djoric(at)gmail.com

The distinction between sex and gender seems to be well established in theory. In the literature on the gender content of different welfare states there is a broad consensus that men and women have differential access to economic resources, not because of their natural differences but because of the sexual division of work and family labour and their differential valuation, all other things being equal. In theory, gender inequality is about the location and the treatment of caring work, resulting in a particular economic status of carers vs. non-carers (regardless of their biological sex).

However, in overwhelming majority of empirical research theoretically well established concept of gender (as distinct from sex) is approximated by sex and measured by comparing men to women. More attention has been paid to how to measure social phenomena presumably determined by gender, such as resources, capabilities, income, health, education. Much less attention has been devoted to the issue of how to measure the concept of gender (as an independent variable) in an empirical research.

In this paper we apply a three dimensional classification scheme indicating six different gender positions to measure gender inequality in economic wellbeing using SILC database for country and time comparison. We compare the findings with the results obtained by measuring gender inequality as inequality between men and women (as is most common approach). We demonstrate that gender inequality (as measured by carer/noncarer divide) may increase, while sex inequality (between men and women) decreases.

The Cohorts of Convergence? Danish Women and the Changing Paradigm of Women's Labour Market Participation.

Luize Ratniece
 Universitat Pompeu Fabra, Spain
 luize.ratniece(at)upf.edu

As the pioneering cohorts are ending their labour market careers, now is the time to map out the advancement that women have made towards convergence with men in labour market achievements. I explore the extent of convergence of the labour market trajectories and closure of the gender gap in Danish labour market for 1941-1980 birth cohorts using Danish register data.

The novelty of this article lies in a longitudinal approach and use of sequence analysis that includes the intensity of labour market attachment as a key aspect of analysis. I follow the population for 26 consecutive years between 1986 and 2011, and apply sequence analysis to create two longitudinal trajectories, one of labour market related activity and the other of household composition. I cluster the sequences, explore these sets of clusters descriptively and apply regression analysis to examine how household composition is related to labour market activity.

I find that labour market trajectories for both men and women have been dominated by full-time work. Private sector jobs dominate the trajectories of men while public sector jobs dominate those of women, especially in the older age groups. The division between full-time and part-time work has a negligible long-term impact as a defining characteristic of the labour market trajectories. While the strong labour-market attachment of Danish women is very clear, so is the fact that at least so far they have tended to build their careers in the more sheltered public sector. While even the youngest age group does not reach complete gender convergence, the 1971-1980 birth cohorts is the one with the most similar results for men and women.

Occupational Segregation in Europe - Dissentangling the Role of Paid and Unpaid Work

Erling Barth, Inés Hardoy, Liza Reisel, Pål Schøne, Kjersti Misje Østbakken

Institute for Social Research, Norway; Institute for Social Research, Norway; Institute for Social Research, Norway; Institute for Social Research, Norway; Institute for Social Research, Norway
 erling.barth(at)samfunnsforskning.no,
 ines.hardoy(at)samfunnsforskning.no,
 liza.reisel(at)samfunnsforskning.no,
 pal.schone(at)samfunnsforskning.no,
 k.m.ostbakken(at)samfunnsforskning.no

International comparisons of gender segregation in the labour market shows a relatively high level of gender segregation in countries that are considered to be advanced in other areas of gender equality. The Nordic countries, for example, are characterized by a dual earner – dual career model that facilitates and stimulates high labour force participation for both men and women, including mothers with small children. However, the welfare state policies facilitating female

labor market participation are also criticized for contributing to consolidate women in weaker labour market positions, with lower lifetime earnings and fewer career opportunities, and in general reinforcing occupational segregation. In this paper we investigate how the levels of gender segregation across European countries compare when we include both paid labour and unpaid domestic work. We argue that in order to properly compare gender segregation across countries with different labour force participation rates and different work-family policies, we need to model gender segregation in “tasks” (including e.g. child care and elderly care) rather than just gender segregation in the paid labour market. Using a variety of indices for measuring gender segregation, we find that when including home making as a (unpaid) profession, the relationship between general levels of gender equality and gender segregation in the labour market is much more logical and linear than what theories of the “welfare state paradox” seem to imply.

Gendered jobs and the (re-)negotiation of gender equality on the Romanian labour market

Oana-Elena Negrea

University of Bucharest, Faculty of Sociology and Social Work, Romania

oana.elena.negrea(at)gmail.com

As the new framing of the European arena takes shape, inequalities present themselves as a Rubik's Cube that social scientists and policy makers have to solve as efficiently as they can. As in all European countries, the Romanian society is currently facing the ubiquity of inequality and gender inequality is no exception. One of the pillars of inequalities is gender, a social classifier that, combined with several others such as race and/or class, generates the inequalities regimes described by Joan Acker (2009). Thus, structural imbalances can present themselves in a wide variety of domains, including the labour market. A particular by-product of the labour market is the gendered structure of occupations and jobs, which can cause disparities on several levels. Hence, a gendered classification of Romanian labour may be a good starting point when discussing how cataloguing social life is brought about and (re-)negotiated in the current economic and social context of the unified European market. The case of Romania provides useful insights into understanding the specificities of gender within a labour market that has a communist path dependency. Considering all these issues, the aim of the present paper is two-fold: outlining how gender inequalities are mapped on the Romanian labour market and uncovering how these inequalities are structured at both an individual and household level. Simply put, how is a European country such as Romania dealing with gender inequalities? More so, how is it re-shaping them so as to have a more inclusive structure of the labour market, given its EU membership?

RN14 | Session 10a Gendered Careers and Job

Quality

“Women’s Issues”: The Notion of Motherhood and its impact on Women’s Career Planning

Eve Ewington

Liverpool John Moores University, United Kingdom
e.ewington(at)newcastle.ac.uk

The notion of motherhood is a persistent constituent of feminine gender identity, linked to essentialist concepts of gender, defining women’s social role (Gillespie, 2003) and often leading to negative consequences both for those who conform to such definitions, and for those who defy them. Organisations have sought to address this imbalance through the introduction of equality initiatives but these can be seen as ‘coercive gendering’ (Czarniawska 2013) where issues such as childcare are removed from male workers and considered “women’s issues”. Finally, internal regulation in the form of compliance with gender stereotypes (c.f. Ely and Padavic, 2007) and external pressures may lead to significantly constrained choices for women planning their career development.

Using data from 41 in-depth interviews with professional women in the UK Civil Service, this paper explores how the notion of motherhood informs women’s identity work (c.f. Brown, 2015) and consequently their career decisions and ambitions throughout their life stages.

The findings suggest that women, irrespective of whether they have children or not, are heavily impacted by the association between motherhood and femininity. Firstly, early career professionals appear to limit their ambition early into their career due to the possibility of motherhood; secondly, coercive gendering – in the form of ‘family-friendly’ offerings such as part-time working – recasts issues relating to family and children as “women’s issues”, thereby limiting career prospects for all women; and finally, women who do not have children continue to suffer negative effects but have little representation from trade unions, which also practice coercive gendering.

Occupational change and its relationship to job quality - blessing or curse for women's occupations?

Anita Tisch, Silke Tophoven

Federal Institute for Occupational Safety and Health (BAuA); Institute for Employment Research
tisch.anita(at)baua.bund.de, silke.tophoven(at)iab.de

In Europe, women not only work in other occupations than men (horizontal segregation), but also are less often found in leadership positions (vertical segregation) and achieve lower income for similar occupational tasks (gender pay gap). Moreover, men and women often face different risks in terms of occupational safety and health. And “women do jobs that are often wrongly assumed to be safe and easy”(<https://osha.europa.eu/en/themes/women-and-health-work>)

It is often discussed that occupational chance in terms

of digitalisation creates an increasing number of professions with low job demands and abolishes (physically) demanding tasks. It has been argued that many demanding tasks performed by employees today, will be conducted by computers in the nearest future. We question and test this hypothesis and thereby ask, whether differences between typical female and male jobs can be found. Since most recent studies already show that women on average have lower potential for substitution than men, we ask whether high demanding male occupations are more likely to be substituted while high demanding female occupations remain of importance.

We make use of substitution potentials of occupations calculated based on German occupational data from an expert data base of the Federal Employment Agency (Dengler/Mattes 2015) and combine the data at hand with the General Index for Job Demands in Occupations calculated and adjusted bases on the German BIBB/BAuA-workforce survey (Kroll 2011) as well as with an index of horizontal gender segregation calculated on administrative data of the German Federal Employment Agency (Tophoven et al. 2015).

An exploration of the relationship between gender and education on job quality: a comparison of Germany, Sweden and United Kingdom

Yi-jung Wu

University of Wisconsin-Madison, United States of America
wu363(at)wisc.edu

The research aims to explore the relationship of gender and education on job quality, including work autonomy and work intensity in terms of different country regimes across Germany, Sweden and UK. It also attempts to take other factors, including sector and part-time/full-time into consideration to provide additional information in the analysis. Secondary data analysis was used as a major research method to achieve research objectives. Thus, the fifth European Working Condition Survey 2010 was used for the statistical analysis. Analysis including descriptive statistics and regression analysis were used to find out how gender and education interact on work autonomy and work intensity. The findings show that there is a high percentage of Swedish women working in the public sector whose job quality is not as high as most people might believe. Although the state provides childcare through direct public provision in Sweden, for women, maintaining their career path is more challenging than for men. In addition, the findings also show that having post-secondary school qualifications has the biggest effect on work intensity, where such women have more similar levels of job intensity as men across three countries, especially, in the UK, where having post-secondary school qualifications has the largest effect in terms of reducing the gender gap in respect to autonomy. These findings challenge our common belief that having higher level of education has a positive relationship with job quality. In fact, gender, sector and country regime also play important roles in this

relationship.

Mobility and entrepreneurship: Dodging the ceiling glass?

Celia Díaz-Catalán, Laura Díaz-Chorne, Lorenzo Navarrete Moreno, Victor Sanz Suárez-Lledó
Colegio de Ciencias Políticas y Sociología, Spain; Universidad Complutense de Madrid; Colegio de Ciencias Políticas y Sociología, Spain; Universidad Complutense de Madrid; Universidad Complutense de Madrid; Colegio de Ciencias Políticas y Sociología, Spain
celia.diaz(at)colpolsoc.org, laura.diaz(at)colpolsoc.org, Inavarre(at)ucm.es, Victor.sanz(at)colpolsoc.org

Mobility and entrepreneurship are social practices linked to the construction of identity set from complex decision-making processes, which bring into play a set of repertoires of resources and perceived opportunities on an ongoing basis. As Bruni, Gherardi, & Poggio (2004) showed, there are different forms of entrepreneurship as well as different forms of gender. Besides, when mobility comes into play, future expectations show how gender stereotyping is embedded in the entrepreneurs' narratives. Family issues are strongly intertwined with women's professional careers, to a greater extent than men's professional careers (González & Vergés, 2013; Kou and Bailey, 2014; Xie&Shauman, 2003). Women may be affected by social constraints and gender roles, where both factors are impetuses in their international mobility (González & Malpica, 2013), and modify both their expectations and opportunities along their life course. Even if entrepreneurship is sometimes assumed as a way to dodge the ceiling glass, we found that women entrepreneurs delimited in time expectations more than men their business projects. Narrative analysis is used to promote an approach to the phenomenon under study to analyze the 19 in-depth interviews of young women and men moving to or from Spain. By the narrative perspective, the stories are situated in the center of the analysis, tracing the order of the events, at the same time that is perceived how different arguments produce performative effects (Czarniawska, 2004; Brown & al. 2009; Gherardi & Perrotta, 2014).

This work is produced in the frame of the research project Horizon2020 MOVE (Grant Agreement No649263), in which the mobility of the young in EU in a typology that attends to the main motive by which is established: labor, by studies and entrepreneurship.

RN14 | Session 11a Gender and Migration

Finding the Keys to Autonomy: Educated Palestinian Single Women in Israel Migrating South in Search of Work

Tal Meler
Zefat Academic College, Israel
talmeler12(at)gmail.com

The tendency for internal migration is limited among Palestinians who are citizens of Israel, due to internal

and external barriers. However, in recent years many educated Palestinian single women in Israel have migrated south in search of work. This paper is based on qualitative research I conducted among them. This migration originates in economic and occupational hardship but may lead to mobility and autonomy for these women and shapes gender relations in their communities. Using the terminology coined by Walby (1989) "dual systems theories" and by Kandiyoti (1988) "bargaining with patriarchy", I will examine how these women bargain with capitalism, deconstruct patriarchal regimes, and challenge accepted gender relations.

In the current article, I wish to combine these two fields of knowledge and suggest an analysis of the "migration in search of work" of these women, who, as I will argue, operate in a social setting made possible by the alliances that exist between patriarchy and capitalism. I will present a situation in which women "bargain with capitalism" and receive, in exchange, legitimacy for realizing an alternative gender order. Women bargain with the "accepted" capitalist rules of the game, when they fulfill its expectations to gain a higher education and thereby find employment. Meaning, they are seemingly acting within the demands of the capitalist social order that defines an ethos of education and employment. However, in practice, they expand the accepted options in their society and create alternative modes of behavior, when they choose relocation. Thus it emerges that employing this strategy allows them to stretch the limits of family and gender patriarchy, delay marriage, and live far from familial supervision.

Reconciling in a Familialistic Welfare Regime: The Case of Migrant Mothers

Cristina Solera, Arianna Santero
Turin, Italy; Turin, Italy
cristina.solera(at)unito.it, arianna.santero(at)unito.it

Italian welfare state has been classified as 'familialism by default', assuming not only traditional gender roles but also strong intergenerational and kinship obligations. Italy has also been described as corporatist, with social protection following labour market divisions, further deepened since the late 1990s by a Mediterranean path of "partial and selective deregulation". In this context, migrants in precarious jobs, especially in the domestic/care sector, may not have access to reconciliation policies. Moreover, increasingly restrictive migration policies may reduce the support from relatives living nearby.

Yet, empirical studies on work-family balance of migrants with pre-school children in Italy, as in other (recent) immigration country, are still lacking. By means of a mix-method, in this paper we explore migrant women's behaviours and narratives around the birth of a child, their labour market participation, their reliance on leaves and on formal or informal care arrangements. More precisely, by drawing from Istat 2012 "Indagine campionaria sulle nascite e le madri", we analyse how women's employment interruptions and/or use of childcare services vary by their

education and occupation, migration story, area of origin, and partner's labour market position. Then, by drawing from 44 qualitative interviews with parents from different origin countries and (gendered) migration circuits, we analyse how mothers account for reconciliation and care practices.

What emerges is a complex mix of instrumental and moral rationalities, mediating between mothers' (and their partners') material conditions and beliefs on the "good mother", the "good father" and "the best for the child", with crucial implications for gender inequalities.

Labor market integration of migrants: Does marital status at the time of migration matter?

Hanna Brenzel

Institute for Employment Research, Germany

Hanna.Brenzel(at)iab.de

From a theoretical point of view, the labor market integration of female migrants and especially female migrants within relationship is not clear cut. Two main theories exist which predict quite opposing labor market behavior of female migrants: The Family-Investment-Theory and the Tied-Mover Theory. Due to these contradicting theories, a great empirical debate is going on, how well female migrants are integrated into the foreign labor market. And, since both hypotheses only predict labor market participation of female migrants within a relationship, single female migrants are more or less neglected within this debate. Following the logic of the investment and tied-mover theory, differences among family migrants and single migrants should occur when analyzing the integration process.

Therefore, the main contribution of this work to the research on labor market adjustments of immigrants is to examine differences between family and single migrants in terms of their labor market integration and post migration employment trajectories. According to preliminary results, based on the IAB-SOEP Migration Sample linked to administrative data of the Federal Employment Agency, one can conclude that migrating as a family migrant does not worsen the labor market performance for female migrants – measured as the transition to first employment. Moreover, this result apply irrespective of the timing of migration compared to the spouse. As a consequence, this questions both theories – the investment and the tied mover assumptions. However, male family migrants show faster transition rates to first employment than single male migrants.

Paid Labor of Female Migrant Domestic Workers in Russia: the Intersectionality of Labor, Ethnicity and Migration

Dzhoys Kuaovi

National Research University Higher School of Economics, Russian Federation

dkuaovi(at)hse.ru

Starting from the early 1990s labor migration predominantly from the post-Soviet countries of Central Asia has become an essential element of the

Russian economy. As worldwide, Russia has recently experienced vast feminization of migration flows. The presenter looks at the impact that such trends might have had on these female migrant domestic workers in Russia.

On the one hand, with the rapid development of the service sector, in the recent years much more job opportunities have become available to these women. At the same time, the ongoing global economic crisis has led to the decline of the Russian real estate sector and the decrease of number of job places that it would traditionally provide to the majority of male Central Asian migrants. Thus, quite often these women become 'breadwinners', which affects the traditional household formation.

Furthermore, these women may face discrimination or oppression in their everyday life. In their case, it is not only nationality, ethnicity, religion or the status of migrant, quite often illegal, that should be examined - it is also their gender.

Based on the concept of intersectionality (Kimberlé Crenshaw, 1991), the presenter claims that in the case of female Central Asian workers, there is a certain intersection of the status of migrants and foreigners, and language barriers (structural intersectionality), the 'whiteness' of Russian feminist movements and the patriarchal character of Muslim communities (political) and the specificity of the representation of these women in media (quite often, a negative one).

The latter aspects may bring more limitations in terms of the female migrants' integration into the host society and require deep analysis.

RN15 - Global, transnational and cosmopolitan sociology

RN15 | Session 01a Citizenship, Social Boundaries and Cosmopolitanism

Exploring experienced citizenship in Tanzania

Ajali Nguyahambi, Rehema Kilonzo, Tiina Kontinen
University of Jyväskylä, Finland; University of
Dodoma, Tanzania; University of Jyväskylä, Finland
ajalimu(at)yahoo.co.uk,
kilonzo_rehema(at)yahoo.com, tiina.t.kontinen(at)jyu.fi

Citizenship is a continuously contested concept in the context of sub-Saharan Africa. For example, the colonial legacy is evident in the location of state borders, architecture of governance structures and ethnic identities. The idea of citizenship gained new currency in the nation-building of postcolonial states, and took novel forms as a result of the introduction of multiparty democracies. Recently, the international development aid has also emphasized strengthening citizenship as an avenue to inclusive development and good governance. As a sociological concept, citizenship tends to capture juridical, political, and cultural practices which define membership of a society. T.H. Marshall's (1950) definition of citizenship as a status of a full member in a community is a standard reference in the sociological literature. However, conceptualizations that capture processes, take into account different politics of belonging, and scrutinize lived experience of citizenship are increasingly suggested. This paper focuses on exploring lived experiences of citizenship the understanding of which is significant both in conceptualizing the dynamics of African societies and in designing interventions for fostering citizenship. We present tentative results of a Tanzanian case study which is a part of a larger project "Growth into citizenship in civil society encounters" (2015-2019) implemented in collaboration with Finnish, Tanzanian and Ugandan universities. On the basis of qualitative interviews collected in January 2017, we analyze citizenship conceptualizations and experiences from the perspectives of an NGO engaged in supporting active citizenship and its beneficiaries in a rural community.

Going cosmopolitan. The valorization of "the international" in Swedish elite upper secondary education

Mikael Palme

Uppsala University, Sweden
mikael.palme(at)edu.uu.se

While international schools in some countries represent a highway to elite positions, this is less so in others, where the challenges of globalization to a large extent is at stake within the national education systems (Wagner 2017). This study explores how "the international" is valorized in the sub-field of elite upper-secondary education in the Stockholm region. The positions of elite schools and study programmes in the space of upper-secondary education is mapped out using simple correspondence analysis on information on all individual students' inherited and acquired capital. Further, by means of a questionnaire addressed to 360 pupils in five selected schools representing polarities in the space, the relations between capital resources, cultural practices and beliefs related to globalization are explored. Finally, the study builds on life history-oriented interviews with 110 pupils from the same schools as well as ethnographic observations from classroom teaching, pupils' associations and European youth parliament activities. The analysis indicates that the relation that pupils at upper secondary elite schools uphold with "the international" is largely determined by the volume and structure of their inherited and acquired resources in combination with the influence provided by the school they attend, its position in the space, history, institutional assets and strategies. While pupils at the traditional elite "lycéées" in the center of Stockholm confide primarily in the solidness of a nationally defined cultural capital, albeit with strong international components, pupils at the IB-programme and at elite schools with economic orientation more often celebrate the arrival of a global and cosmopolitan culture with weaker national roots in terms of language and history (Weenink 2008, Dugonjic 2014).

Marginal cosmopolitans in the metropolis? Media gratifications of a disregarded press in the outskirts of the city

Christian Lamour
Luxembourg Institute of Socio-Economic Research,
Luxembourg
christian.lamour(at)liser.lu

Media can play a key role in the development of a cosmopolitan society in the city by proposing a reflexive representation of the cultural diversity in the urban environment. Their contents are also used to shape the routinized interactions of different social worlds more or less opened to that diversity. Over the past 20 years, a free daily press targeting the urban masses on the move from peripheral residential areas to central occupational locations, have been flourishing in the increasing diversified metropolises of Europe. It is commonly thought that the elite and paid media are more important than the popular and commercial one to represent and recognize the added value of the cultural "Other" in the city. However, can the free daily press be the tool of a mass cosmopolitan society coming daily from the outskirts

of the city? It is argued that this newspaper can be used by plural readers selecting its content to reproduce their cosmopolitan working environment. Based on a qualitative reception studies of 23 foreign workers reading the free daily *L'essentiel* in Luxembourg and located in two different professional environments (retailing/academic research), the purpose of the research is to explore the public gratification of a disregarded/marginal segment of journalism in a cosmopolitan Grand-Duchy.

RN15 | Session 02a Questioning the Power of State in a Global Context

Power as authority

Pertti Alasuutari

University of Tampere, Finland

pertti.alasuutari(at)gmail.com

This paper argues that to understand authority in governance the modern world system, instead of starting from its allegedly “real” or “material” bases, we must treat compliance and its various groundings as the primary and real footing of authority. From this perspective, the potential structural position behind an actor's -- for instance an individual's, state's or international organization's -- authority is just one strategy by which the actor in question attempts to ground their authority. In other words, authority must be considered as built on belief and trust, which those intending to affect the comportment of others use to manipulate others' conception of the situation at hand. Altogether, it is suggested that we can identify four types of authority: ontological, moral, capacity-based and charismatic. Ontological authority refers to respect for a person or organization as an actor that presents a credible picture of reality; moral authority depicts deference based on the belief that a person, organization, text or principle tells us what is right or wrong; capacity-based authority alludes to an actor's perceived ability to change the conditions for others' moves (for instance, by imposing sanctions); and finally charismatic authority refers to actors' unique characteristics and fame. The paper illustrates this typology by taking examples from the role of international organizations in global governance.

Studying global policy transfers in the governance of Large Scale Agricultural Investments in Mozambique:

Magalie Bourblanc

GovInn, University of Pretoria, South Africa

magalie.bourblanc(at)cirad.fr

It is a well-known fact that Large-scale agricultural investments (LSAI) are driven by diverse global market forces (demands for food, feed, biofuels etc). One of the commonly held hypotheses is to claim that the global market forces have had a major (mainly detrimental) impact on developing countries, especially with regard food security and natural resources management, because governance frameworks have largely failed/been nonexistent at

both global, national and local levels to ensure sustainable and equitable development through these LSAIs. Against this backdrop, global governance instruments have been designed in a bid to regulate a phenomenon of so-called “land grabbing” following the world food prices crisis of 2007/2008. The most renown ones are the Principles for Responsible Agricultural Investment that Respects Livelihoods, and Resources (PRAI) and the Voluntary Guidelines on the Responsible Governance of Tenure of Land, Fisheries and Forests in the Context of National Food Security. If an extended amount of academic work has been dedicated to the study of these global policy instruments' adoption at the international level, the impact of these initiatives on the ground and at the national level is an empirical question that remains to be answered (Borras et al. 2013). The Afgroland research project (Belmont forum call, 2015-2018) objective is to provide an in-depth analysis of the multi-level dynamic in the governance of large-scale agricultural investments between the local, the national and the global levels. We study in particular potential policy transfers around these two global policy instruments but also around other emerging policy norms. We use process-tracing methods for a case study located in Mozambique.

The Discursive Power of International Rankings and Turkey

Yetkin Baskavak

Yildiz Technical University, Turkey; Istanbul Bilgi

University, Turkey

baskavak(at)yahoo.com

The proliferation of global rankings, which measure the performance of states in various areas of politics, constitute a significant part of the architecture of global governance. The increasing popularity of these rankings gives them both a discursive power and a disciplinary function. By “discursive power”, I refer to their role in defining the “normative horizons” of politics. They do not just measure or monitor, but they also define the ideal, the good, the legitimate and the acceptable. By providing benchmarks and describing “best practices”, they constitute an integral part in the processes of international diffusion of ideas, institutions or policies. To the extent that they practically influence the decisions and actions of states or international bodies, moreover, these indexes also execute a disciplinary function, compelling their targets to comply with the norms they propagate. These functions are realised, however, in the way they are received and reacted upon by the states and publics they measure. This paper analyzes this interactive dimension in the case of Turkey, through the examples of credit ratings, the OECD's PISA scores and the freedom of the press rankings, covering three areas of economics, education and civil liberties.

The moral authority of science in the modern world polity: Cross-national evidence from parliamentary discourse

Ali Qadir, Jukka Syväterä
University of Tampere, Finland; University of
Tampere, Finland
ali.qadir(at)uta.fi, jukka.syvatera(at)uta.fi

Sociological institutionalist research has quantitatively mapped the spread of science to ever-more domains of public life fed by national integration in the modern world polity. However, it remains unclear why or how political actors themselves rely on science in their discourse. This paper offers a “thick,” qualitatively derived, bottom-up account of how the authority of science is built in national policymaking and what that results in. We ask what precisely policymakers talk about when they talk about science, what use individual actors put the authority of science to, under what conditions, and with what conflicts. Relying on a framework of epistemic governance, the paper examines parliamentary debates on new laws to describe the role of “objective” science in a quintessentially moral activity, namely lawmaking. Making a comparative, qualitative analysis of parliamentary discourse over 20 years in seven countries, we confirm the institutionalist argument that there is growing reliance on science around the world, and that this usage does not correlate with functional requirements. Furthermore, we find ample references not just to particular sciences, but also to science in the abstract, undefined sense, and find hardly any contests around the use of science. That is, science enjoys a largely uncontested authority in parliaments around the world in making new laws. Moreover, the nature of parliaments means that our findings reflect broad socio-cultural premises considered valid in modern society. We therefore argue that science has assumed what Durkheim referred to as a sweeping “moral authority,” and discuss that role in detail.

RN15 | Session 03a Cosmopolitanism, Consumption and Communication

From ignorance to celebrityization: Vietnamese food in a post-socialist city

Karel Cada
Charles University, Czech Republic
kcada1(at)gmail.com

Through the case study of the spread of Vietnamese bistros in Prague, the capital of the Czech Republic, this paper is focused on changes in the forms of everyday Vietnamese presence and how these different forms can be transformed into cosmopolitan practices and identities. Numbering approximately 65,000, Vietnamese make up the largest non-European minority in the Czech Republic, with most of them living in Prague.

Food and its consumption are very often invoked in discussions of the exchange of cosmopolitanism and superdiversity. The paper follows the 'convivial turn' by focussing on how ethnic differences are negotiated and managed in everyday lives and places. However, despite the rich literature on ethnic identities in everyday lives, little work has thoroughly examined

the situation in post-communist countries.

The paper makes use of media texts, biographical interviews and the researcher's own observation in order to map the relationships between transnational networks, material objects and the recognition of migrants by the majority society. The history of markets and bistros creates a map of mutual relationships between the Czechs and the Vietnamese: from ignorance, through hazard to fascination and celebrityization.

Through ethnic cuisine a positive presence of the Vietnamese in public space has been established in two ways. First, the Vietnamese started to be portrayed as acting subjects with their own agency. Secondly, these entrepreneurs in gastronomy have been seen by Czech middle class consumers as a welcome addition to the construction of Prague as a modern and cosmopolitan city

Power Geometry of Global Parenting

Pei-Chia Lan
National Taiwan University, Taiwan
pplan(at)ntu.edu.tw

The existing studies of parenting and class reproduction mostly suffer from the pitfall of “methodological nationalism,” analyzing the operation of class distinction in a relatively closed social system. Drawing on in-depth interviews with ethnic Chinese parents from over one hundred families in Taiwan and the US, I employ Doreen Massey's concept “power geometry” to illuminate how social inequalities mediate the profound effects of global forces by enabling or constraining people's access to rights, resources, and mobilities.

I develop the term the power geometry of global parenting to describe how a politics of differential mobility shapes class-specific childrearing practices and reinforces social inequality on both global and local scales. While the newly rich Taiwanese consume childrearing and educational styles they perceive as fitting a Western ideal, the decline of the US economy has shattered Taiwanese immigrants' confidence in the American dream and they attempt to mobilize cultural resources and social networks in the home country to prepare their children for the rise of Asia. The hypermobility of upper-middle-class families in both Taiwan and the US comes at the expense of limiting the life opportunities of other families who are trapped locally. Moreover, some transnational mobilities and connections generate cultural capital while others are considered far less productive in the power geometry, such as cross-border marriages in Taiwan and the practice of sending children back home for a period of time (so-called “satellite children”) among working-class immigrant families in the US.

RN15 | Session 04a Cosmopolitanism and Minorities

What's wrong with migration? Confronting sociology's methodological nationalism in an

effort to understand migrancy beyond binaries of difference.

Peter Holley

University of Helsinki, Finland

peter.holley(at)helsinki.fi

The sociological study of migration conceives of its object of study – (im)migrants – as essentially different to ‘native’ and presumably sedentary populations. This constructs a native-immigrant dichotomy in which ‘natives’ are viewed as autochthonous, enduring in the face of social changes imposed upon them by globalisation or threatened by ‘newcomers’ whose presence undermines a population that is perceived to be historically rooted and homogenous. Linked to this understanding, sociological understandings of ‘the migrant’ are premised upon common-sense groupism. Indeed, this reproduces alterity and fails to account for the multiplicity of communitarian subject positions available to those with migrant backgrounds who reside in increasingly diverse settings. Based upon data collected during biographic narrative interview with persons that have migrated both to and from Finland, this paper argues for a study of ‘identity’ that resists the imposition of enforced narratives through which such individuals are compelled to recount their experiences as socially marginal ‘others’. Rather, it envisions an active sociological listening that questions traditional binaries (i.e. insider-outsider, native-immigrant), highlighting instead the discursive resources employed by actors when navigating different constellations of belonging and making sense of often ambiguous collective categories.

Key terms: Methodological nationalism, migration, narrative, identity work, common-sense groupism.

Blackness in 21st Century France: The Construction of a Racial Minority

Abdoulaye Gueye

University of Ottawa, Canada

agueye(at)uottawa.ca

This paper examines the conundrum of the construction of a racial minority in a color-blind society that rejects any differentialist politics. It focuses on the emergence of a black citizenry in the French public space as shows the institutionalization of the Representative Council of Black Organization (CRAN) founded in 2005. The paper builds on two arguments. First, the existence of a racial minority requires a public volition for recognition and equality. This consists in challenging the supremacy of a majority whose legitimacy is suspected to be unfounded. Such idea departs from any essentialization of minority and instead foregrounds its relational dimension. The Latin etymology of the concept of minority constitutes an opportune ground to elaborate further on this insight. *Minuere* [minority] means: “to lessen”. Minority is therefore a disadvantaged and prejudiced group whose condition is legitimized on the basis of natural(ized) characteristics including sex, skin color, race, etc. The second argument is that the aforementioned volition is conveyed through

propaganda. One can borrow from Eley and Suny’s analysis of the formation of the nation to fine-tune this argument. They posit that the making of the nation requires communication. Yet, communication is also a component of propaganda. Propaganda goes further though. It is a direct intervention in Other’s autonomy of decision and thought in order to act upon Other according to Ego’s goal. The black minority stems basically from a discourse of recognition framed by black organizations. Taking stock of both the volition for equality/recognition, and the development of a propaganda action, I will demonstrate that blackness operates at the intersection of three realms of meanings: discourse, belief, and material production.

Brazilian women in Paris: female labour and transnational displacement in a comparative perspective

Laura Graziela Gomes, Solange Riva Mezabarba

Universidade Federal Fluminense, Brazil;

Universidade Federal Fluminense, Brazil

lauragraziela(at)gmail.com,

solange_riva(at)hotmail.com

In this paper, we intend to give an approach considering two surveys carried out in Paris with Brazilian women who live in the city. The first group is formed by women from popular segments of Brazil’s interior (Goiás, Minas Gerais), whose motivations for migration include the evangelical religious option (neopentecostal). Working as a support point and forming a network of contacts, the church works for many of them (even the undocumented) as a catalyst in their professional settings, predominantly focused on the economy of care (Zelizer, Guimarães, Hirata). The second group, originated from the Brazilian middle classes (from several Brazilian cities), use executive and corporate work as a declared motivation for commuting. With high qualification, they are expatriate executives (Boltanski, Wagner) or have built their professional career from family support to realize the “dream” of living in Paris. The romanticized idea of the city is a point of contact between the groups. Their stories, however, place us before two different realities. Regarding the relationship with their families, the ones from the first group are providers that finance their families in Brazil, while the other group is dependent financially and emotionally; regarding their work, the first group is involved in the economy of care and religious empowerment; the second is immersed in the complex female relationship with the executive career world. The construction of support networks characterizes the first group, whilst the second, on the other hand, moves away from their fellow countrywomen, getting closer to the French society.

Heritagization by Dispossession. Meanings and socio-territorial implications of local patrimonial activation initiatives in Neoliberal Chile

Rosa Maria Guerrero Valdebenito

Universidad de Concepción, Chile

rosaguerrero(at)udec.cl

The concept of cultural heritage has changed significantly in the last decades, being configured in a polysemic concept that applies to diverse social uses. Today there is a strong ownership of the local communities regarding to this concept, which articulates itself with various issues and social demands, such as local development and territorial rights, among others. The talk exposes and argues for the important role that the installation and consolidation of the neoliberal model has played in the configuration of initiatives for the rescue, preservation and activation of local heritages in Chile. This relationship is expressed in three trends of heritagization: 1. Neoliberal heritage; 2. Heritage as resistance and social protest, and 3. Heritagization as reterritorialization. The presentation describes each of these trends and focuses in particular on heritagization actions as resistance, which are generating important changes in the territories. The background and arguments presented here are the result of a study that aimed to describe and analyze the social uses and meanings of the local cultural heritage, taking the southern regions of Chile as research area. We believe that the results presented here are an important contribution to understand the contemporary sociocultural frameworks of heritage discourse and their impact on the transformations of the territories.

RN15 | Session 05a Transnational Actors and Diasporas

An Actor Based Explanation of Migrant Transnationalism

Julia H. Schroedter, Jörg Rössel, Ilona Pap
University of Zurich, Switzerland; University of Zurich, Switzerland; University of Zurich, Switzerland
schroedter(at)soziologie.uzh.ch,
roessel(at)soziologie.uzh.ch, ilona.pap(at)uzh.ch

Contemporary societies exhibit an increasing level of transnational transactions in different areas of social life, i.e. migration, social relations, economic and cultural exchanges. Especially in migration research it has been argued that classic forms of migration have been replaced by transnational forms of migration, where firstly, migration itself is not a one-way process of relocation, but characterized by forms of commuting and return migration. Secondly, integration is not perceived anymore as a linear process of assimilation into the autochthonous population, but strongly shaped by transnational links between migrants and their countries of origin. Up to now empirical research has mainly focused on the prevalence and extent of such transnational relations of migrants.

In our contribution we focus on an actor based explanation of migrants' transnational relations and experiences. It provides several straightforward and testable assumptions. Within this framework we assume that the prevalence and extent of transnational relations and experience of migrants depend on the cost-benefit ratio of transactions

directed to the host country and the country of origin. Based on rather simple assumptions it is possible to explain changes in the degree of transnational transactions over time and differences between groups and individuals in their degree of transnationalism.

We empirically test the suggested rational choice explanation of migrant transnationalism with respect to migrant's political interest and participation. Is it mainly directed to the host society or the society of origin? Our empirical study is based on a recent sample of migrants from six different countries in Switzerland and on an added sample of Swiss people. Based on this data we can test if the explanation applies both to migrants and the autochthonous population.

Coping with hard times. Filipino labour migrants' use of support networks and support resources.

Sanna Saksela-Bergholm
University of Helsinki, Finland
sanna.saksela(at)helsinki.fi

This paper discusses Filipino labour migrants' strategies to cope with difficulties they have faced during their recruitment process to Finland, access to their working environment and in their making of future plans. Data shows the significance of migrants' social support networks and forms of support consisting both of ethnic co-workers and friends beyond family members. Social support received from congregations, co-mates and family members help migrants to overcome hard times in their access to the Finnish working life. The transnational community play an important role for the migrants as provider of emotional support, whereas co-workers offer significant subjective understanding, information and guidance. Migrants' previous working experiences and support received both in local and transnational context guide the migrants' future plans. In the future, the majority of the twenty-eight informants would like to stay in Finland until their retirement. However, several of the informants pointed out their wish of family reunification. Since last year, the criteria for family reunification has been made stricter, which in its turn may motivate the labour migrants to return or to move to another country.

Networking diaspora for African development. Example: Rwanda Diaspora Global Network (RDGN)

Elzbieta Budakowska
University of Warsaw, Poland
ebudakowska(at)uw.edu.pl

The increasing number of Rwandans appeared in the world as a result of the genocide in 1994. European countries were also on the route of Rwandan transnational space. The process of maintaining transnational linkages by the established diasporic communities helped not only to support each other in difficult situations but also to represent and promote contacts between immigration countries and Rwanda. Migrants keep the ties between Rwandans at home

and those in the Diaspora. They also keep the Rwandan culture alive by organizing cultural events for both Rwandans and their foreign friends.

Rwandan Diaspora is composed of big number of young migrant students residing and/or studying in different countries. It is a great potential who can play substantial role in the development of the Mother-Land as well as can involve the countries of their stay into the cooperation with Rwanda. So African Diaspora is mostly defined in connection of migration with development and transnational linkages.

Engaging Diasporas as Development Partners for Home and Destination Countries RWANDA DIASPORA GLOBAL NETWORK – RDGN was founded in 2008. It is an independent, non-profit umbrella organization, under which Rwanda Diaspora associations from 23 countries are coordinated in 5 continents: Africa, Asia, Australia, Europe, North America.

In my presentation I will outline the idea of RDGN from the Rwandan diasporic community perspective and the Rwandan governmental narration.

RN15 | Session 06a European Identity and Mobility

Towards An Ever Closer Union among the Peoples of Europe? A Longitudinal Network Analysis of the European Social Space

Emanuel Deutschmann, Jan Delhey, Monika Verbalyte, Auke Aplowski

Otto von Guericke University Magdeburg; Bremen International Graduate School of Social Sciences; Otto von Guericke University Magdeburg; Freie Universität Berlin; Otto von Guericke University Magdeburg; Otto von Guericke University Magdeburg
emanuel.deutschmann(at)ovgu.de,
jan.delhey(at)ovgu.de, monika.verbalyte(at)fu-berlin.de, auke.aplowski(at)ovgu.de

Following relational sociology (Emirbayer 1997) and transactionalist theory (Deutsch 1953), we suggest to conceptualize the European social space as a multiplex network of people's transnational mobility and communication. To enhance our understanding of how this social space has evolved over time, we comparatively analyse the development of five types of cross-border interaction (migration, student exchange, tourist flows, phone calls, online friendships) over periods of up to five decades (1960–2010). In specific, we examine: (1) how the density of interaction has changed over time, (2) how the degree of closure towards the outside world has changed over time, (3) whether the networks have become more centralized or more equally distributed over time, and (4) what the mechanisms behind these trends are, e.g., whether historically and culturally bound regional clusters are dissolving and political and economic ties are becoming more relevant. Social network analyses of process-generated dyadic data from a variety of sources (UN, World Bank, World Tourism Organization, International Telecommunication Union, Facebook) reveal, inter-

alia, that (a) the density of in-teraction has consistently increased in Europe and (b) trends in closure are type-dependent, with in-creasing closure in migration and student exchange and decreasing closure in tourism and phone calls. Thus, our findings provide new insights into the changing structure of Europe as a social space and highlight the necessity to take the multiplex nature of human interaction into account when examining processes of transnational integration.

Assessing transnational behavior of Europe's second generation through linking research on migrant transnationalism and intra-European mobility

Christine Barwick
Centre Marc Bloch, Germany
barwick(at)cmb.hu-berlin.de

In Europe, the study of second generation transnationalism is still in its infancy. While there are important studies on second generation's transnational ways of being and belonging (e.g. Fokkema et al. 2012; Wessendorf 2013), these studies usually focus solely on transnational practices that connect the Country of Residence to the ancestral home country. The conclusion is usually that the second generation exhibits less transnational behavior than their parents – first generation immigrants. This limitation is inadequate as the second generation is likely to show other forms of mobility with different destination countries, just as other mobile Europeans. To fully capture second generation's transnational ways of being and belonging, we therefore need to connect the migrant transnationalism literature to the literature on intra-EU mobility and European identification. So far, these two research traditions have existed rather next to each other, even though they address similar theoretical questions. In this theoretical paper, I will demonstrate how linking the two research traditions advance our understanding of second generation transnationalism. It enables us to focus on the link between ways of being and belonging, which has been a central question in studies on intra-EU mobility and European identification. Understanding the link between behavior and identification, in turn, is crucial for figuring out the ways that transnationalism and integration interact for the second generation. In addition to theoretical advances, linking the two research traditions also leads us to think about new methodological ways of researching transnationalism and mobilities.

"European Identity and Mobility" Is it the taking part that counts? Youth transnational political participation in the EU

Laura Diaz-Chorne, Javier Lorenzo, Lorenzo Navarrete Moreno, Victor Sanz Suárez-Lledó
Colegio Nacional de Ciencias Políticas y Sociología, Spain; Universidad Complutense de Madrid; Universidad Carlos III; Universidad Complutense de Madrid; Colegio Nacional de Ciencias Políticas y

Sociología, Spain

[laura.diaz\(at\)colpolsoc.org](mailto:laura.diaz@colpolsoc.org), [javier.lorenzo\(at\)ucm.es](mailto:javier.lorenzo@ucm.es),
[Inavarre\(at\)ucm.es](mailto:Inavarre@ucm.es), [victor.suarez\(at\)colpolsoc.org](mailto:victor.suarez@colpolsoc.org)

The study of transnational migration has been developed in Europe in a prolific way during the last two decades (Pries 2002; Vertovec, 2003; Bauböck, 2003; Faist, 2013) and the main concept of transnationality extended through the work of multiple scholars. Nevertheless while transnational economic, social, or cultural activities are performed through political boundaries without directly questioning them, political transnationalism defy exclusive loyalties of citizens towards a single state and acts as if the political community had been de facto extended beyond the territory of the State (Bauböck, 2007).

Existing literature focuses mainly on receiving countries and how the political opportunity structure (POS) determines transnational political participation (Morales, Pilati, 2014). In relation to the "sending-country gap" (De Haas, 2011) we question whether the high rate (57%) of young people who feel excluded from economic and social life because of the economic crisis (Eurobarometer, 2016), and the substantial variance of citizens willingness to migrate on countries more affected (Spain, Portugal, Greece), do echo on participation positively or negatively.

Using data extracted from two surveys (n5750, n3200) conducted within the H2020-MOVE project (GA.No 643263) that examines youth mobility in the EU, we introduce a new variable (mobility/non-mobility) in the study of youth political participation and civic engagement building on previous works on online political activities (Anduiza, 2007), migrant political participation (Morales, Pilati, 2014) and directionality of this participation (Ostergaard-Nielsen, 2009) and address the issue of participation from countries more affected by the economic crisis (Spain, Romania) versus less affected (Germany, Norway).

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 649263.

Modern Space of Experience: a global history of intellectuals in displacement

Aurea Mota

Universitat de Barcelona, Spain
[aureamota\(at\)ub.edu](mailto:aureamota@ub.edu)

Contemporary global history has greatly improved our understanding of what could be understood as the relation between 'the modern' and 'the global' - a connection that is not obvious at it appears in some contemporary approaches. Opening new historical archives and revising previous ones, historians and social scientists have demonstrated the role of European and non-Western-Europeans intellectuals in the creation of a global modern order and in doing so have challenged by different means the idea of universal history, of the possibility of a cosmopolitan order, and an of the modern development. Current post-colonial and 'Southern' critiques have been a source of these revisions, and at the same time the

findings from the new global history have been used to rethink the formation of the modern world. This paper draws on some empirical sources that the 'global turn' has brought about, but strongly rejects and criticises proposals that are based on crystallised geographical images that aim to explain 'how places think' – as these appear for instance in the work of Michael Burawoy, Walter Mignolo, Raewyn Connell and Boaventura Sousa Santos. And by doing so it creates an image of Europe as historical unproblematic rational actor. The paper will analyse intellectuals in displacement. It will be shown that the global dimension of modernity is based on the experience of displacement and the knowledge generated through this movement. By this it is meant that to experience a different way of seeing the unknown, or to approach what is already known through different eyes, is a way for human beings to situate themselves in a world that has become transformed because of their own action.

RN15 | Session 07a Global Socialization and Citizenship

International Students' Narratives: Cosmopolitan Rites without a Story

Pierluca Birindelli

University of Helsinki, Finland
[pierluca.birindelli\(at\)helsinki.fi](mailto:pierluca.birindelli@helsinki.fi)

Studying abroad is a growing and institutionalized practice. To find out what young people are really getting out of it we need to hear their stories and explore the implications of the educational travel within the broader context of their lives. This paper presents preliminary findings about the significance attributed by international master students in Helsinki and in Florence to their educational, cultural and overall life experience abroad. Analysis of 50 autobiographical-autoethnographical essays reveals that most of the subjects had no previous familiarisation with or exposure to clear-cut narratives about the destination country and city. We can indeed find a series of related images, but not sufficient to constitute a leading narrative for their life experiences in North or South Europe. The trace of a well-defined script derived from a structured story, such as a book or a movie, is absent. It is instead possible to catch a glimpse of a vague cosmopolitan narrative. This story, constructed on a global scale by different actors and institutions, is partially disconnected from the society and culture of the countries of destination or provenance. The story upholds the validity of studying abroad for both instrumental and expressive reasons. And the practice seems to constitute a liminal and transitional space-time: an institutionalized rite of passage towards adulthood and global citizenship. It's an undefined story without exemplary characters, so it's up to the individual student to find heroes and villains along the way to construct his or her idea of who is a good citizen of the world.

Bye-bye Europe – young European professionals living the ‘global’ in Singapore and Tokyo

Helena Brigitte Hof

Waseda University, Germany

hof.helena(at)gmail.com

Entering the labor market in Europe has become increasingly challenging, even for middle-class EU citizens with tertiary degrees. Having accumulated ‘global skills’ like foreign language proficiency and intercultural competence, a growing part of Europe’s young educational elite is leaving the continent.

The paper is based on a qualitative study of 70 young, mainly Caucasian Europeans. It investigates how those who grew up with cosmopolitan values and a positive notion of mobility become mobile beyond European borders. These young Europeans forge their ways to Singapore and Tokyo, two global cities which seem to promise more than familiar and crisis-ridden Europe. Lured by job and lifestyle opportunities, they hope to encounter the ‘cultural and racial other’. Yet, they soon find themselves to be ‘othered’. Having limited work experience and moderate incomes, and being neither Chinese nor Japanese native speakers, these young professionals have emerged as a growing migrant community on both city scenes. Yet, very few return to their home countries. Having followed them for several years allows to not only reveal their drivers and motivations to leave Europe as well as to depict their daily life in Asia, but also, to explore how their perception of Europe has been changing over time.

The study traces these Europeans’ bonds to ‘home’ and how instead of returning many plan to move on. It asks if the Erasmus culture and positive notion of overseas experience on the CV is pushing Europe’s youth out – and how their cosmopolitanism manifests in culturally and racially different Asia.

Changing meaning of citizenship in the narratives of denizens living in Poland

Katarzyna Andrejuk

Polish Academy of Sciences, Poland

kandrejuk(at)ifispan.waw.pl

The presentation will explore the changing meaning of the citizenship status for third country nationals residing in an EU member state. It will focus on the group of long-term immigrants in Poland who intentionally do not apply for naturalisation even though they fulfill the legal conditions. Examined will be the causes and personal motivations of the decision to not apply for the host country’s citizenship. The most important reasons include: privileges associated with the current legal status (permanent residence permit, EU long-term residence permit); lack of acceptance of dual citizenship in the country of origin; advantages associated with the citizenship of the sending state. The presentation will be based on the original empirical material (in-depth interviews) collected during the fieldwork in Poland between 2014 and 2017.

Globalisation, differentiation of cities, and the ‘weight’ of the built environment

Andrea Glauser

University of Lucerne, Switzerland

andrea.glauser(at)unilu.ch

In urban sociology, it is a widely shared assumption that globalisation in the sense of translocalisation ‘has not ironed out differences’ but rather has led to a diversification of urban forms (Herzog 2015: 9; Soja/Kanai 2007). Furthermore, it is stressed that the dynamics of homogenisation and heterogenisation do coexist, as globalised patterns are adopted and reconfigured in specific local constellations (Czarniawska 2010; Schmid 2015). This contribution focuses on architecture, more specifically on the globalised high-rise building type, and explores the role of the built environment in such processes of local adaptation and ‘translation’. I will argue that the role of the built environment is widely ignored yet crucial to understanding path dependencies regarding urbanisation. Its ‘weight’ is certainly not an immediate effect of the ‘materiality’ of architecture but rather the outcome of how built forms are involved in social practices. The discussion is based on case studies about Paris, London, and Vienna and sheds light on the reproduction and reinterpretation of the zone of former city walls.

RN15 | Session 08a Part I Belonging and Online Participation; Part II Distributed Papers

Connected Sahrawi migrants in Spain: New technologies, migratory experiences and social relations.

Silvia Almenara Niebla, Carmen Ascanio Sánchez
Universidad de La Laguna, Spain; Universidad de La Laguna, Spain

silvia.almenara(at)ull.edu.es, cascanio(at)ull.es

The Sahrawi conflict is one of the most prolonged refugee crises, the result of the unfinished colonization of Western Sahara by Spain and the subsequent invasion of Western Sahara by Morocco. Since 1975 the Sahrawi community live in the refugee camps in Tinduf due to the invasion and the ensuing war. Through the years, Sahrawi people have started their own migratory displacement to their previous colonial power, Spain, in order to achieve a better future and improve life conditions for their families in the camps. The migratory experience in Spain and the importance of keeping in touch with their relatives and friends inside the camps have created a new subject, “the connected migrant” (Diminescu, 2004) who maintains his/her relations with their home-camp due to the possibilities that new technologies offer. This reflection proposes the importance of examining the impact of new technologies on migratory processes. In this sense, I argue that the Internet reduces the anxiety of separation that Sahrawi migrants experience in Spain due to the instant communications services, such as WhatsApp, Messenger or Imo. It explores how Sahrawi people, living in Spain, have generated their

own virtual activity related to their home-camp and the Sahrawi cause in order to maintain their family tie and their collective identity as Sahrawi. To conclude, this reflection addresses the social implication of online spaces to generate a constellation of agencies to reduce the impact of migratory experience and generate their own life plans.

“One 'leader' to rule them all”? Social, political and psychological reflections on leadership and hegemony in cyberspace

Georgios Vagias, Konstantinos Koskinas
Panteion University of Social and Political Sciences,
Greece; Panteion University of Social and Political
Sciences, Greece
george.vagias(at)gmail.com, kkoski(at)panteion.gr

The ways we talk about the internet, the web and especially cyberspace, the ways we behave in these “areas” are mostly characterized and driven by a direct or indirect inference to a notion of singularity. Theoretical and empirical research usually approaches and perceives these areas as a “single” space, e.g. “one” internet, “one” web, “one” cyberspace. On the one hand, this makes presentation and analysis of research findings much more accessible and conceivable. Yet, on the other hand, it seems to complicate our attempt to fully understand what is truly virtual about cyberspace: the textures, the interconnections, the form and the content of all kinds of online social relations. And also, the source, the pathways and the procedures through which relations of power, of control, and of authority emerge, unfold, and are enforced. One possible way to resolve this is to approach cyberspace on a global level as a multi-layered, multi-dimensional and multi-fragmented space, which is formulated as a dynamic terrain of ongoing contest. Building on the theoretical grounds of virtual reality as a philosophy of culture, cyberspace and online networks, allows us to think about the potential and the actual realities. Moreover, to reflect on them and to raise questions over leadership and hegemony in cyberspace: who is in control of the multiple cyberspaces? where do the virtually numerous cyberspaces intersect and how do they intertwine with each other? which groups (government agencies, corporations, hackers, etc.) prevail each time and what are the social, political and psychological processes that define sovereignty as legal and legitimate respectively?

Diaspora engagement online: communication technologies, governments, and their skilled emigrants

Tingyu Kang
National Chengchi University, Taiwan
tingyu.kang(at)gmail.com

This paper examines the ways in which governments manage its skilled emigrants using communication technologies. A growing literature on diaspora engagement has demonstrated that the management of diasporas increasingly serves as a development

strategy for many governments around the globe. Skilled emigrants are among the main targets in diaspora engagement policies as they are often portrayed as key actors for development in the policy discourse of brain drain. However, current studies on diaspora engagement rarely examine the role of communication technologies in forming state-diaspora relationships. Diaspora engagement policies are embodied through a series of social-material processes, such as transnational visits, monetary exchange, and cross-border flows of knowledge, where various new communication technologies function as a key material environment due to the transnational nature of these exchanges. Based on documentary analysis of both print and online government publications of mainland China, Singapore, Taiwan, the UK, and the US, this paper demonstrates and compares the different rationales and techniques with which governments engage its extraterritorial talent using communication technologies. The findings identify various models of online diaspora engagement. While Web 1.0 technologies are adopted to publicize policy information for skilled diasporic individuals, Web 2.0 technologies are utilized to personalize and privatize transnational exchanges among skilled emigrants, government officials, and business figures in the homeland. Algorithms function as a central governing technology which develops policy categories and priorities based on digitally collected human capital information of skilled emigrant while this process of digital categorization is largely masked to the emigrants.

A sociological comparison of decisions related to diversity by the Federal Constitutional Court of Germany and the South African Constitutional Court.

Johan Zaaiman
North-West University, South Africa
johan.zaaiman(at)nwu.ac.za

Germany and South Africa are both societies experiencing diversity challenges. The dimensions of diversity are quite different between the two societies and make comparisons a complex matter. However both societies have highly regarded constitutional courts that determine the interpretation of the constitutions of those societies. The German Court (established 1951) has a long standing tradition of decisions whilst the South African Court (established 1994) is still viewed in South Africa as a novel institution and its role in society debated. Both the courts have been confronted with cases related to diversity issues. This paper compares specific decisions of these courts that relates to aspects of diversity – especially decisions that focus on social and economic views. From this comparison it is clear that the grounds for decisions between the two courts overlap but also differ. The analysis thereof presents concepts and theoretical inputs that talk to the discourse on diversity in sociology. This can assist sociology in its comparative theorising on diversity

issues among different societies.

The Global Public Space

Svetlana Hristoforova Hristova
South-West University, Bulgaria
sv.hristova(at)abv.bg

The global crisis in 2008 just exhibited the fact that the world hegemony reached this point when it brought about global counter-hegemonic responds by a newly born majority of the impoverished middle class. The development of global discontent and resistance is exemplified in the proliferation of transnational social and political networks and informal movements, but also in various largely unnoticeable everyday local practices of disagreement looking for cosmopolitan re-imagination and validation (Theodossopoulos 2013). The reclaimed and regained (even temporarily) public spaces as a product of 'power-filled social relations' (Massey 1999, 21) give evidence of these trends connected with globalization of protest. While Kevin Cox drew attention to the interplay between different local interests in globalizing environment, and the emerging broader social networks with porous boundaries through which 'spaces of resistance' occur even in the most totalitarian states (Cox 1998, 3), Saskia Sassen was the first to conceptualize the emergence of the Global Street, employing 'fragments of various national and global territories': a new spatial way of protesting and addressing political issues in search for social justice (2012). Now these spaces multiply and 'move' throughout the continents: Tahrir and Taxim Squares, Puerta del Sol, Wall Street and Sintagma – they all became landmarks of radicalisation of public space and dissemination of new spatial approach of contestation throughout the globe. At the beginning of the 21st century, the transnational public space was born – with transnational actors, globally disseminated practices and self-organized networks. But the trend of transnationalisation of public space can be thought also through the lens of touristification and terroristification, acquiring different forms, instruments of expression and intensity.

This work analyzes some social changes derivatives on globalization process, their interdependence and global consequences.

More in details, the focus of this paper is the concept of citizenship and its evolution. The processes of definition of citizens are always more dependent from models, relationships and situations that occur in distant places with respect to the physical space within which their biography is materially lived.

The privileged audience of our citizenship narratives is

not necessarily placed in the contexts of our material life and it nor constitute part of networks of our direct relations. Instead, it can be reached in mediated ways and can be part of a virtual or a spatially imaginative context of reference.

The growing interdependence and the contemporary erosion and multiplication of boundaries make it possible to think of oneself as freed from local ties, in constant motion, immersed in global flows that enable remote relationships, the rapid transition from one context to another and the ability to overcome and establish distinctions. They allow individuals to recognize themselves within a cosmopolitan outlook, which could mean: "Global sense, a sense of boundarylessness. An everyday, historically alert, reflexive awareness of ambivalence in a milieu of blurring differentiations and cultural contradictions. It reveals not just the 'anguish' but also the possibility of shaping one's life and social relations under conditions of cultural mixture. It is simultaneously a skeptical, disillusioned, self-critical outlook" (Beck U., 2000).

RN15 | Session 09a International Organizations

The World Social Forum: Democratizing Global Civil Society?

Micha Fiedlschuster
Leipzig University, Germany
fiedlschuster(at)uni-leipzig.de

One of the key debates in global sociology concerns the questions about whether or not international NGOs and transnational social movements stand for an emergent global civil society and if so, does that signify a democratization of globalization? The World Social Forum, which is a bi-annual gathering of civil society actors, is an exemplary case to test answers to these questions. The participants deliberate in the Forum about people-driven strategies to tackle economic, social and political problems from a transnational perspective. The cosmopolitan and the neo-Gramscian position are two important contrasting approaches to assess the role of the WSF in globalization and global civil society. Seen from the cosmopolitan perspective, the Forum could be part of the checks and balances in global governance and it might contribute to democratizing globalization. The neo-Gramscian approach casts the Forum as a potential site for building a counter-hegemonic movement to the existing global system of power. Based on my fieldwork at two Forums, I critically engage with these two interpretations and champion a third one: I argue that the Forum's potential contribution to 'democratizing globalization' consists in its focus on democracy within the cooperation of (global) civil society. The organizers of the Forum are aware of the power imbalances among the participants and sought to create a format in which they can meet on equal footing irregardless their financial capacity or preferred mode of action and organization. I will show the potentials and deficits of this experiment in transnational organizing.

Formalizing Funding from West to East: Civil Society to Social Entrepreneurship in Post-Socialist Serbia

Anna Matthiesen

New School for Social Research, United States of America

matta644(at)newschool.edu

This paper draws on a nine-month period of ethnographic research in domestic non-governmental grantmaking organizations in Belgrade, Serbia. Specifically, it analyzes how these organizations, acting as brokers between international aid organizations and smaller Serbian advocacy and service groups, respond to changing transnational funding imperatives and institutional logics, including shifting ideals of collective action. Drawing on analysis of previous scholarly work, funding patterns and dozens of semi-structured interviews with current and former NGO employees, the first section of the paper 1) explores how American ideals of political culture have organized NGO funding in post socialist spaces, to 2) contextualize the present shift in international funding rhetoric from civil society to social entrepreneurship and private philanthropy. The second section illustrates how these groups reckon with a socialist legacy in Serbia while trying to implement this new grantmaking language, with strategies to confront specific ideals of civic participation and the state's role in social welfare. Here I argue that these organizations, and their funders, are playing an active role in reshaping these values according to a new logic of individualism and the market. As the NGO becomes the institutional form of choice or necessity for those who want to engage in either service or advocacy projects, the paper concludes that this reordering has significant implications for the possibilities and forms of political and social action.

Development and heritage: UNESCO in search of a new paradigm

Dobrosława Wiktor-Mach

Cracow University of Economics, Poland

wiktord(at)uek.krakow.pl

The main goal of the paper is to examine the evolution of ideas and concepts linking 'development' and 'heritage' forged at the forum of the UN inter-governmental specialized agency – UNESCO and the determinants of that change of paradigms. Although UNESCO's primary preoccupation was education in the developing world, already in the 1960s UNESCO extended its programs into the field of heritage. At first, those two concepts were regarded as separate or opposed ideas. The milestone 1972 Convention proposed means to protect the material cultural and natural heritage. UNESCO positioned itself as a key actor in the debate on development when in 1968 it organized the first intergovernmental conference on sustainable development and, afterwards, established the "Man and the Biosphere" programme. The next decades witnessed increasing engagement of

countries from the Global South, endeavouring to push the organization's activities into new directions, and to refocus its commitment to both cultural and natural heritage and to development. The criticism of UNESCO's Europocentrism led to the new conceptualization of heritage, which now encompasses the underwater human legacy (2001 Convention) as well as intangible heritage (2003 Convention). Numerous charters, recommendations, guidelines, strategies and action plans followed, and they reflect debates on various aspects of heritage, which gradually was linked to the issue of development. In this process of interactions of representatives of various countries and increasing multilateralism UNESCO has eventually become the main actor in promoting culture as the fourth pillar of sustainable development.

The Authority of International Meta-organizations

Valtteri Vähä-Savo, Jukka Syväteri, Leena Tervonen-Gonçalves

University of Tampere, Finland; University of

Tampere, Finland; University of Tampere, Finland

valtteri.vaha-savo(at)uta.fi, jukka.syvateri(at)uta.fi,

leena.tervonen-goncalves(at)uta.fi

The world has seen a dramatic increase in the number of international organizations during the last hundred years. Among them there is a constantly growing group of so-called meta-organizations, whose members are themselves organizations. Especially in the case of national policy-related organizations, it has largely remained a mystery, why they are so eager to join international meta-organizations, even when their activities are mostly tied to national policy objectives. Drawing on the theoretical framework of epistemic governance, our paper suggests that from the member's viewpoint meta-organizations appear as accumulations of epistemic capital, which they can tap into when pursuing their interests on the national field. To understand why potential members decide to join meta-organizations, it is necessary to analyze how meta-organizations build themselves and present themselves as accumulations of authority, which can be utilized by the members. This paper focuses on a case study concerning the International Association of National Public Health Institutes (IANPHI), which was established in 2006 and quickly gained a membership of 100 National Public Health Institutes (NPHIs) from 88 countries. Our case study examines the activities of the meta-organization and the rationales it offers for prospective members to join the IANPHI. We identify six distinct mechanisms, through which the IANPHI accumulates epistemic capital, making itself an attractive body for NPHIs throughout the world. The paper also looks at the more general implications these mechanisms have for the construction and spread of global models and for the dynamics between local and international organizations.

RN15 | Session 10a Rethinking the Role of the State**The contradiction between the increasing interdependence at the global and regional levels, and rising isolationism at the national.**

Larisa Vdovichenko

Russian State University for Humanities, Russian Federation

vdlarissa45(at)yandex.ru

In recent years the process of integration and strengthening of supranational mechanisms of regulation of international relations are exposed to serious challenges. On the one hand, this is due to the inability of existing mechanisms of international organizations to cope with the growing threats of illegal migration, terrorism, drug trafficking and aggravation of interstate conflicts resulting from the unsolved economic, political, social and other important issues. This is causing some government politicians to protect the national government from these negative processes. In parallel, the strengthening of isolationist sentiment on the part of the population of some countries. On the other hand, these changes in dominant trends in the relationship between global, regional and local processes requires the increased attention of sociologists not only on theoretical but also practical levels. The aim of this paper is to analyze people's views on the strengthening of the barriers of the state in relation to the external among, the slowing of the global processes. It seems to us interesting to compare views on this topic of political figures in different countries, as well as public opinion there. This report continues the study of the author on the subject, which is necessary for a better understanding of new aspects of the contradictions between the trends of people's consciousness in relation to global and local processes. The results are based on the materials of the personal case study of this theme and some surveys conducted by poll centers.

Rethinking the role of the State: coercion and ideology in global context

Laura Fernández de Mosteyrín

Universidad a distancia de Madrid, Spain
lauramaria.fernandez(at)udima.es

The state is a central concept of the social science's tool. It's nature has been widely debated in the last decades. While it is affected by global and local tensions and by the erosive power of neoliberal forces, one of the most outstanding characteristics of western states in the last decade is its highly regulative capacity. If examined in terms of coercion, policing and control, essentially -but not only- related to counterterrorism, state power appears to be stronger than it seems.

Borrowing from historical sociology and recent theorizations of the sociology of war, this paper examines the concentration of coercion in Spanish State, relate this transformation to counter terrorist

efforts in the context of the 'war on terror' and discusses the extent to which this state power amounts for the category of 'securitarian state'.

"Doing "deliberative mini-publics": How shall we study translocal knowledge spaces of politics?"

Jan-Peter Voß

Technische Universität Berlin, Germany

jan-peter.voss(at)tu-berlin.de

The paper starts with a broader question: What is the relevance of 'knowledge spaces' for late modern politics? We suggest that the circulation of certain models that describe what politics is and how it can be done are equally important as spaces which are constituted by the reach of violence or the validity of laws. If they are, how can we study them? We focus on "deliberative mini-publics", a model of democracy which builds on professionally organized deliberations among representatively sampled groups of citizens. The model has spread across the globe since the 1970s. We argue that the network of sites in which the model is practiced constitutes a new space of democratic culture cutting across various regional political cultures. It comprises sites where the model is applied for the production of "public views" on particular issues, and sites where it is scientifically studied or where it is developed as a professional standard or marketed as a service. Conceptually, we start from studies of "policy mobilities" and "policy assemblages", but we are not content with observing "translations" and "fluidity" as we follow models through different contexts. We have a closer look at what it is that connects the various practices in different places. How are they connected, what is it that holds them together, materially and discursively? What we find here, we argue, is a space to be studied with concepts like Knorr Cetina's "global microstructures" or John Law's "situated globalities".

Crowding in and crowding out: An example for Africa's opportunities to clarify theoretical controversies in Europe (and elsewhere)

Harald Künemund, Paskas Wagana, Marvin Blum

University of Vechta, Germany; St. Augustine

University of Tanzania; University of Vechta, Germany

harald.kuenemund(at)uni-vechta.de,

wagana(at)hotmail.com, marvin.blum(at)uni-vechta.de

One of the oldest theories in the field of ageing is that modernization is accompanied by a loss of social and economic functions of older people and a shift in responsibility from the family to a public solidarity system. It is often assumed that a strong welfare state reduces the willingness of families to provide financial support and services to their aged parents because it substitutes public resources for those previously provided by the family. This relationship has been called the "crowding out" hypothesis – the state crowds out family obligations and erodes private intergenerational solidarity. Both theoretical arguments and available empirical evidence also support the reverse hypothesis, namely that the

relationship between the state and the family can be described as a process of “crowding in”: Generous welfare systems provide resources that help to increase rather than undermine family solidarity.

The same argumentation can be identified for example with reference to charity donations, voluntary activities and civil society in general. Empirical evidence, however, has been extremely limited in most of these cases. We argue that such interactions are perfect examples where we can expect sub-Saharan Africa to contribute to the international sociological discussion. As examples we present results from studies on intergenerational relations within the family in Tanzania and provide an outlook on further research activities.

RN15 | Session 11a Local and Transnational Issues in a Global World

(Non)Political Work – An ethnography of everyday democracy assistance and rule of law reform in Lebanon

Sina Birkholz
Freie Universität Berlin, Germany
sina.birkholz(at)fu-berlin.de

My PhD project is an interpretive political ethnography of international Democracy Assistance (DA) and Rule of Law Reform (RoL) in Lebanon, based on 10 months of field research, that aims to contribute to a decentering of intervention research and sociology (Go 2013; Beck 2005). I combine two conceptual perspectives in my research: on the one hand, I frame DA and RoL as instances of routine intervention and Political Aid (Carapico 2014). This approach highlights the continuity of colonial interventionist practices and thinking, and the similarities in the projectification and professionalization of conventional development assistance and DA/RoL. It thus allows for a critical discussion of the role of global power relations in shaping people’s lived experiences. For understanding the everyday realities of people involved in Political Aid, however, I conceptualise it as a “complex set of evolving social practices and struggles” (Long 2001: 33), and as shaped by organizations and institutions, which are “inhabited and embodied by individuals who go to work” (Ybema et al. 2009: 1). In my paper, I will focus on showing how Lebanese involved with Political Aid perceive their struggle to reconcile “activism” with “work”, how they reflect on their choice of organizational forms for their engagement, how they strive to be “professional” in their interaction with political authorities and donors, how they make sense of and use standardised formats and techniques for producing accountability, and what role (auto)critique and explicit knowledge production play in their everyday work and activism that takes place in a transnational field shaped by global power disparities.

Citizen co-production in the development of Uganda’s emerging urban centres: exploring the translation of an international urban development

programme into local administrative practices

Eva Schindler
University Potsdam, Germany
eva.schindler(at)uni-potsdam.de

Sub-Saharan Africa’s emerging urban centres are grappling with informality and the international development community promotes participation and multi-stakeholder partnerships to address this challenge. These types of interventions have, however, been notoriously difficult to implement. Czarniawska and Sevón’s theory of translation (Czarniawska and Sevón, 1996, 2005) and Bierschenk and Olivier de Sardan’s concept of practical norms (Bierschenk and Olivier de Sardan, 2014) provide an analytical framework to understand how the globally coined concept of co-production travels to the countries of the global south and becomes translated by local bureaucrats to fit the context. The proposed paper will take the Cities Alliance programme “Transforming the Settlements of the Urban Poor in Uganda (TSUPU)” as a case study. TSUPU aims at collaboratively managing urban growth and formulating inclusive urban development policies that benefit the poor. Among the programme’s instruments to ensure the participation of citizens in programme implementation are local platforms – called Municipal Development Forums (MDFs) – where urban poor organisations, local government, and other stakeholders meet regularly to exchange views, debate priorities and agree on common actions. The paper will seek to understand the context-specific meanings attached to slum dweller participation and co-production in urban development and to explore the translation of these ideas from programme theory into everyday practice. Taking a constructivist-interpretive perspective and drawing on the methodological toolkit of organisational ethnography, the paper will present a first analysis of empirical data collected in three months of fieldwork, conducted from January to April 2017.

Transnational Advocacy Networks, Epistemic Communities, and Corporate Liability for International Crimes

Raluca Grosescu
University of Exeter, United Kingdom
ralucagrosescu(at)gmail.com

This paper explores the activity of two transnational collaborative networks concerned with holding corporations and their representatives accountable for international crimes committed during the Argentinean dictatorship and the Colombian conflict. The first one comprises the German NGO The European Center for Constitutional and Human Rights, the Argentinean Centre for Legal and Social Studies (CELS) and the Colombian trade union Sinaltrainal. This cooperation resulted in criminal complaints lodged against managers of Mercedes Benz Argentina (Germany 1999 & Argentina 2002) and against the company Nestlé Colombia (Switzerland 2012). The second network was established in 2012 and includes the

University of Oxford, the Argentinean NGOs CELS and ANDHES, and the Colombian NGO Dejusticia. The collaboration resulted in the development of a truth commission model on corporate complicity in human rights violations and the publication of various articles and books on this topic.

The paper argues that although these transnational collaborations played an important role in pressuring for corporate liability, the political and professional agendas of the actors involved in these networks were often different and even mismatched. The paper takes a critical stance towards constructivist approaches to norm formation and their circulation across border, by emphasizing the professional competition between various groups of experts and the potential conflicts between actors militating at local, national, and international level. These diverse interests led actors to build only provisional anti-impunity coalitions and to abandon collective actions when they became too costly for their wider agendas and strategies of legitimation in their own professional field.

Looking at Others in National Policymaking: The Case of Portugal and Spain in the Recent Economic Crisis

Laia Pi Ferrer

University of Tampere, Finland

laia.pi.ferrer(at)uta.fi

Previous research has shown that policymaking is interdependent, which means that nation-states take into account previous considerations in other countries. This is manifest in the fact that nation-states are surprisingly isomorphic. Therefore, it is contended that instead of talking about separate national societies, we can talk about a single world society driven by values and concepts embedded in what has been called world culture. However, there is a lack of knowledge on how national policies become synchronized with each other. Some research has pointed out that there are cross-national differences in the frequency whereby actors in national policymaking appeal to the international community. Nevertheless, there are no studies analysing the countries that nation-states allude to in their debates. In this study, I focus on how other countries are referred to in Portuguese and Spanish parliaments when debating reforms during the recent economic crisis (2008–2013). Therefore, I limit the research to the Iberian Peninsula in a critical moment in which both countries confront adversities. Although these two countries are considered siblings, with historical and geographical ties, my first results show that there are differences in how other countries are mentioned. In Spain, better-off countries are often referred to, whereas in Portugal there are more references to countries seriously affected by the economic crisis. These results lead to some questions for the upcoming analyses: Why are certain countries mentioned? Are these references predominant in the economic crisis period? Have speakers used the same group of countries as references in other periods?

RN16 - Sociology of Health and Illness

RN16 | Session 01a General Call - Subjectivities and Dilemmas

Early diagnosis and the re-making of patient subjectivity: the case of multiple sclerosis

Micol Bronzini, Maria Giovanna Vicarelli
Polytechnic University of Marche, Italy; Polytechnic University of Marche, Italy
m.bronzini(at)univpm.it, m.g.vicarelli(at)univpm.it

The diagnostic improvement is enabling earlier diagnosis for many diseases like multiple sclerosis (MS). This allows initiating appropriate medication at early stages, managing the symptoms, preventing exacerbations and, in some cases, improving outcomes. However, early diagnosis is also deeply changing the social construction of patient subjectivity, the relationship between health professionals and citizens, as well as the social and cultural representation of health and illness. In particular, patients and health professionals are forced to negotiate the treatment and the very subjectivity of newly diagnosed MS in a somehow different way from the past. In this regard, the tension between the 'experienced illness' and the 'semantic illness', as well as between the 'institutional sickness' and the 'sickscape' (Maturò, Conrad, 2009) may become more evident. Moreover, drawing on Corbin and Strauss' work (1985; 1988) the point in time when the diagnosis occurs differently affects the three lines of work -the biographical work, the everyday life work and the illness work – their trajectory and their intersection (Robinson, 1990).

In this theoretical framework, the paper presents the main results of a qualitative research on multiple sclerosis carried out in the Marche Region (Italy), between February 2015 and April 2016. We collected 20 illness narratives of patients with multiple sclerosis and their caregivers and carried out in-depth interviews with the healthcare team in charge of the special unit for MS in the main Regional Hospital. Special emphasis was placed on a relational perspective, investigating: how the diagnosis influences the three lines of work, the subjective perception of being ill, the relationship with health professionals, significant others and friends.

'Sharing social labour': humanization in hospital treatments between organisational and subjective needs

Anna Rosa Favretto, Francesca Zaltron
University of Eastern Piedmont, Italy; University of Eastern Piedmont, Italy
favretto(at)asie.it, francesca.zaltron(at)asie.it

The humanization of healthcare and the attention paid to patients, as person and not only as individuals needing medical intervention, is considered one of the basic principles guiding the organization and actions of European welfare system. In order to implement this principle, suitable organization forms and sufficiently trained professionals are required, as well as a constant 'labour' carried out by patients, who are very active subjects in their therapeutic relationships. This 'labour' is often disregarded, although it is indispensable to give form to respectful therapeutic relationships involving patients, medical personnel, and caregivers.

This paper will present some results of a research project including 80 stories of illness by hospitalized patients (suffering from heart failure or colorectal cancer). It aims at exploring some social processes which realize humanization in medical fields and 'shared social labour' between patients and healthcare professionals necessary to implement such principle. Special attention will be given to patients' effort to adapt their diagnostic path and treatment to their needs (personalisation process) and to adjust themselves to different care contexts (familiarisation process). For this purpose, we will analyse and discuss a few forms of negotiation detectable in therapeutic relationships, resistance and compliance processes which come to light in the stories of illness we gathered, as well as the management processes of the power differential existing between patients, caregivers and health workers in order to humanise treatments and therapies.

Humanism in medicine - practical dimension: analysis of the documents (complaints and requests of patients) - problems and dilemmas

Alicja Laska-Formejster
University of Lodz Faculty of Economics and Sociology, Poland
aformejster(at)o2.pl

Although "about the patient" much has been written, however, due to the complexity and changing nature of the problems, we can still feel the insufficiency and desire to deepen and broaden the framework of reflection in this area. Especially in the case of "analysis of the patient's actions" functioning in contemporary medicalized reality. Reality, in which the typical becomes a crossing borders of intervention in nature, the biological dimension of the human being; which says about transcendence; about the potential biomedical research - the opportunities and threats created by new technologies; which is raising issues of importance to discover new methods and tools for effective diagnosis and treatment. All actions are guided by the most important goal: the good of mankind and man. However, is the reality keeping pace with the ideas? Is the pursuit of the noble

objectives of the medicine not losing so important for it humanistic element? Complaints and requests made to the authorities upholding respect for the rights of the patient suggest a positive answer to this question. In the speech are presented selected results of a larger research project. The results of the analysis of complaints and requests submitted to the Professional Liability Officer of Regional Medical Chamber in Lodz (1990-2010). The time frame and the problem of the analyzed material can be considered reliable exemplification of “disappearance” of the humanistic element in the “patient - medical staff” relationship and indicates the nature of the problems faced by patients over 20 years. Selecting the indicated data also allows to bring up the conclusions of a broader nature.

The field of kidney transplantation in Turkey: familial care, ethical dilemmas and biomedical practice

Basak Can

Koc University, Turkey
basakcan(at)ku.edu.tr

Turkey has an advanced medical infrastructure and qualified medical staff in organ transplantation that is also financially supported by the government. Yet, the transplant practice in the country suffers from organ shortage. The number of patients in the national organ waiting list exceeds the number of deceased donors. This creates a unique donation pattern in which the majority of transplants are from living, mostly blood-related donors. That is, donors and recipients know and relate to each other in very intimate ways. This paper thus asks: How does the biomedical practice of organ transplantation interact with the intimate, familial and personal dimensions of care and sacrifice? Against the backdrop of Turkey's experience with organ donation since the late 1960s and the neoliberalization of health care since the early 2000s, this paper ethnographically examines the experiences of kidney transplant candidates and donors, their families, caregivers and clinical professionals in a clinical setting in Turkey. This paper not only provides an empirically grounded understanding of how people decide to donate or sell their organs within a complex network of gendered familial obligations and expectations, but also shows the ways in which transplant processes as the icon of medical accomplishment are dependent on and mediated through local, gendered forms and practices of care, kinship and intimacy. This research aims to reveal the hidden risks and dangers of normalization and routinization of live donor kidney transplant especially for the younger populations and women.

Social conditions and smoke behaviours during the recent crisis in Italy

Simone Sarti, Marco Terraneo

Università degli Studi di Milano, Italy; Università degli Studi di Milano-Bicocca, Italy
simone.sarti(at)unimi.it, marco.terraneo(at)unimib.it

The aim of this study is to describe the trend of the

relationship between socioeconomic position and tobacco consumption in Italy during the years of the recent crisis (from 2005 until 2013).

Socio-epidemiological literature presents mixed results about the impact of economic crisis on smoke behaviours (Asgerisdottir et al. 2014; Ruhm 2005; Gallus et al. 2015; Charles e DeCicca 2008). Some scholars find a positive effect in terms of a general reduction of the propensity to smoke but others show that this diminution doesn't concern vulnerable people (for example unemployed persons). In Italy descriptive reports suggest a substantial overall stability during the period considered (Costa et al. 2012). Smoke has well-known consequences on psycho-physical wellbeing and it's related to social inequalities in health, therefore in this framework it's important to investigate the relation between vulnerable social conditions and tobacco habits.

Data used stem from the two annual Istat's surveys: the household “Family Expenditure Survey” (from 2005 to 2013) and the individual multi-purpose survey “Aspects of daily life” (from 2005 to 2013). We apply multilevel regression models to estimate the diachronic variation over time and structural equation models (SEM) to estimate associations between individual socio-economic indicators and tobacco consumption. In particular, we analyse the relations between indicators of life and economic satisfaction and the propensity to smoke and the number of cigarettes smoked.

First findings suggest a substantial role of the economic crisis in tobacco behaviours both at household and individual level. Our analyses seem to show higher effects of the crisis on tobacco consumption on individuals in disadvantaged socio-economic positions living in Southern Italy.

RN16 | Session 01b Capitalism, Subjectivities, Solidarities: Theorizing Mental Illness in Times of Crisis

‘Capitalism, Subjectivities, Solidarities: Theorizing Mental Illness in Times of Crisis’: The Urgency for Marxist Theory

Bruce Macfarlane Cohen

University of Auckland, New Zealand
b.cohen(at)auckland.ac.nz

This presentation offers a critical reflection on the current global ‘crisis’ in mental health, and with that, the proliferation of psy-professionals and their accompanying claims to better knowledge on mental disease. Fundamentally, I ask and seek to answer how sociologists can accurately explain such large scale expansion without any known improvement in the ‘science’ of mental illness or associated treatments. As I outline in my book *Psychiatric Hegemony: A Marxist Theory of Mental Illness* (2016) previous attempts by labelling, social constructivist and Foucauldian scholars to theorise this fundamental contradiction in contemporary institutional power has failed to fully contextualise the political project of the mental health system within a framework of

fundamental material inequalities. In contrast, the utilisation of structural Marxist scholarship allows us to make sense of the emergence and development of the psy-professions within industrial society, their changing practices and priorities, points of internal and external competition and conflict, as well as their expansion in neoliberal society. This current period of what I refer to as 'psychiatric hegemony' will be demonstrated with some examples from the fifth edition of the American Psychiatric Association's Diagnostic and Statistical Manual Mental Disorders (DSM-5) – a diagnostic matrix which legitimates and promotes capitalist values and norms including individualism, consumerism, cooperative labour, the nuclear family and women's reproductive responsibilities, and the maintenance of socio-economic inequalities.

'Capitalism, Subjectivities, Solidarities: Theorizing Mental Illness in Times of Crisis': The View From the Clinic

Michael John Hazelton

The University of Newcastle, Australia

Michael.Hazelton(at)newcastle.edu.au

In this presentation I comment on the current state of mental health globally from the perspective of a psy-professional (mental health nurse) who has also trained as a sociologist. If it can be argued that the mental health system led by psychiatry continues to operate as a kind of political project supporting capitalism, that project would seem to be contingent, fragile and constantly under challenge, by dissenting voices such as those of the survivors of psychiatry – a new social movement. It might be argued that psychiatry and the biomedical model have not previously been exposed to the degree of critical scrutiny and opposition that currently exists. If the psy-system is in crisis it may be that this is more a crisis of human rights associated with iatrogenic damage resulting from psycho-pharmacological mega-dosing and polypharmacy and other forms of poor practice. There are also, of course, ongoing human rights concerns surrounding mental health law and coercion as 'care'. Moreover, the 'psy-system' comprises various competing interests that are played out daily at the policy, governance and clinical practice levels. The various professions assert their 'unique' occupational contributions to the mental health division of labour, workforce improvement targets typically fail to be met and service users continue to express dissatisfaction with the outcomes of 'care'. Given this context it is difficult to view the 'psy-system' as working in any organised and coherent way to support capitalist ideals and practices.

Madness: Ideas about Insanity

Peter Morrall

University of Leeds, United Kingdom

p.a.morrall(at)leeds.ac.uk

This paper addresses the uncertainties and incongruities about madness. It analyses critically how

madness was historically and is today understood. There is no adherence to any prior perspective by the author (and no 'instinctive' sociological condemnation of psychiatry).

Contrasting past and present case-studies of people who have been perceived as mad and/or perceive themselves as mad, core ideas about madness are critiqued for their theoretical and empirical robustness. The case studies cover the topics of: madness and murder (Pierre Rivière and Anders Breivik); 'asylumdom' (John Perceval and Howard Dully); the sanity of insanity (Mary Barnes and Gwyneth Lewis); the insanity of society (Stephen Fry and 'Swift Runner'); science and psychiatry (the Susannah Cahalan and 'WL').

Madness as a category of human performance consisting of behaviours, thoughts, and emotions, troublesome to an individual, to those Goffman terms the 'normals', or society overall, is also critiqued.

Ideas covered include: post-structuralism/social constructionism; existential-phenomenology; social control; Marxism; social realism; radical libertarianism; critical/radical/evolutionary psychologies; medical anthropology; and the biological sciences of 'scientific-psychiatry'.

What is proposed is that madness has always been and continues to be misunderstood and may not be understandable. All ideas (so far) applied to madness are theoretically and/or empirically inadequate. Moreover, the very application of a particular idea, because this is conducted in and on its own terms, can only render a presumptive, partial, and preconceived understanding of madness.

Morrall P (2017) *Madness: Ideas about Insanity*. London: Routledge.

RN16 | Session 01c Neoliberalism and Challenges to Medical Professionals I

Economic Crisis and International Mobility of European and non-European health workers in the South-East of France: Citizenship and Gender

Francesca Sirna

CNRS, Université de Nice Sophia Antipolis, France

francesca.sirna(at)gmail.com

The present contribution aims to analyze the geographical and social mobility of European and extra-European nurses in the South-East of France (PACA) in the context of the global social and economic crisis.

If, on the one hand, the economic crisis that affects Europe has led to the strengthening of control over Europe's borders, to limit "irregular" migration, on the other hand we also observe increasing "elite" migration trends. In order to better reveal the process and the dynamics shaping these latter mobilities, I propose a comparative analysis of professional and geographical mobility of intra- and extra-European migrants (men and women) in the health sector, characterized by an increasing shortage, a strong feminization and an increasing international and

geographical mobility since the beginning of the 2000s. Besides, as a matter of fact, the integration into the European Union area of new Eastern European countries (with the automatic recognition of qualifications and degrees) has produced a competition between Europeans and non-Europeans in the French health labor market. This has happened despite the historic links that France maintains with African countries – the Maghreb and the former colonies of sub-Saharan Africa. Thus, there would be a new hierarchy of health professionals and a reconfiguration of the access to this employment sector according to citizenship, but also gender. Furthermore, analyzing the international mobility of these professionals means also to understand the balance between northern and southern countries in a context of globalization and economic crisis and the international process of health inequalities reproduction.

Doctors and midwives between market, profession and personalized care (commercial childbirth care in Russia)

Anna A. Temkina

European University at St.Petersburg, Russian Federation

atemkina(at)gmail.com

Different research shows the lack of trust to medical institutions and social roles of obstetricians in Russia. Some urban educated women as responsible mothers and consumers choose to pay for the childbirth care. The market in Russian health care has been developing since the 1990s, and expanded in the 2010es. Based on 14 in-depth interviews with medical professionals who work in hozraschetnye (paid) departments in state maternity hospitals I argue that medical workers redefine themselves as professionals in relation to market. Doctors and midwives are motivated to work with paid patients by material benefits, though they make efforts to create boundaries between market and profession. They negatively evaluate market rhetoric of the patients and profit oriented colleagues, try to reduce financial issues to the brackets of interactions, which change the conditions of work and care, but should not colonize the professional world. They stress that medical treatment does not depend on payment (though somehow it does). Doctors and midwives do not consider the commercial system as just one, but they should adapt themselves to it.

Doctors report that in commercial care they work more autonomously and take more responsibility to compare with regular department's work. They work in more stable and reliable teams. They report about more "human relations" and personalized care, and they appreciate personalization of women as making process more satisfactory for both sides. Consumer's choice is bracketing the interaction of women as patients and professionals in their social roles, and also slightly change professional conditions of obstetricians' work towards more autonomous and satisfactory.

Freezing time: the hybrid strategy of promoting oocyte vitrification in Bulgaria

Ina Dimitrova Dimitrova

Plovdiv University Paisii Hilendarski, Bulgaria

ina.d.dimitrova(at)gmail.com

The aim of the paper is to illuminate and explore the set of frames, constructed and mobilized around the so-called "social" egg freezing in Bulgaria. It argues that these frames combine in a curious way two opposing ideologies – a neoliberal and a conservative set of values, messages and images – which together form a heterogeneous discourse, which could be called "reactionary techno-progressivism". Relying on a hybrid cultural texture, combining the still typical Bulgarian high valorization of parenthood (and especially motherhood), the demographic gloom haunting the country, and the ever popular postsocialist transitional neoliberal rhetoric, focusing on the need to praise the productive citizens, a contentious interpretative work is unfolding. It constructs women (and more generally draws the line between the "feminine" and the "masculine") as active, productive, aspiring employees and leaders. This image, however, is obviously considered as incomplete in order to resonate with the specificities of the local context: it is stressed that something is lurking behind – the age old feminine nature, predestined to bear children and give birth. The "responsible" woman should recognize her "authentic" way of being, which the modern lifestyle has veiled, and reunite with it with the help of the most progressive means available – the new biotechnologies.

Introducing 'natural' childbirth in Russian hospitals: midwives' institutional work

Ekaterina Borozdina

European University at St.Petersburg, Russian Federation

eborozdina(at)eu.spb.ru

Since 1990's Russian maternity care is undergoing a series of reforms associated with introduction of the neoliberal logic in work of the post-Soviet health system. While causing public debates, these reforms also become the subject of sociological research. However, there remain certain gaps in our understanding of these changes. First, the emphasis in studies is usually put on doctors, as if it is the only professional group that exists in healthcare and is affected by the transformations. Second, health care professionals are usually described as 'victims' of the reforms. New opportunities for agency that professionals acquire in the context of marketization and liberalization of Russian healthcare are rarely considered.

In this paper I intend to fill these gaps. I employ a concept of institutional work to investigate the experiences of Russian midwives as they engage in developing their professional project and changing maternity healthcare in the country. Using qualitative

interviews collected at one of Russian centers for midwifery care, I consider midwives as agents, who struggle for professional autonomy and market niche in the volatile circumstances of healthcare commercialization. I concentrate on the two main points: 1) how midwives create new institutional space for 'natural' childbirth in Russian maternity care and provide new identities for those involved in this practice, 2) how the peculiarities of organization of Russian maternity care and state politics in the sphere determine the very form that 'natural' childbirth takes in the country.

RN16 | Session 02a General Call - Cross National Perspectives

The Interrelationships between Morbidity, Functional Limitation and Self-Rated Health in Europe

Aija Duntava, Liubov Borisova, Ilkka Henrik Mäkinen
Uppsala University, Sweden; Uppsala University, Sweden; Uppsala University, Sweden
ajja.duntava(at)soc.uu.se,
liubov.borisova(at)soc.uu.se,
Ilkka.Makinen(at)soc.uu.se

In the medical sociology literature, most commonly used health proxies are self-rated health, morbidity and functional limitation. The interest in different aspects of health led to the investigation of the relationships between those, mostly, focusing on two aspects of health rather than three or more. There are only a few studies exploring relationships between three or more proxies of health that date back to 1980s and 1990s testing different models for the structure of health. Studies, unfortunately, have not been continued and, moreover, were performed mainly in the U.S. and limited to the elderly population. Thus, the main objective of the current research is to explore interrelationships between the three aspects of health: morbidity, functional limitation and self-rated health. The study proposes a modification of the previous models of health structure and tests it on the entire population (all ages) across 20 European countries.

The study utilizes the European Social Survey (ESS) from 2014 that provides the data on self-rated health, functional limitation and various health problems. Structural equation modeling is employed in order to estimate causal pathways for the morbidity, functional limitation and self-rated health as well as direct and indirect effects.

The preliminary results support the predictions from the proposed model. Specifically, morbidity and functional limitation all have direct effect on self-rated health. Furthermore, morbidity has indirect effect on self-rated health through functional limitation. Yet a few exceptions among European countries are revealed.

The results of this European cross-country comparative study allows us to increase the generalizability of the health structure. Furthermore, the study opens new research avenues in terms of

adding socio-economic factors and health related behavior to the model.

Ideology and resistance in young people's experiences of health under 'the imperative of enjoyment'

Kathrine Vitus

Aalborg University, Copenhagen Denmark, Denmark
vitus(at)socsci.aau.dk

This article explores upper secondary school students' understandings and experiences of health in Denmark, where public health promotion makes appeals to pleasure. Health promotion hereby taps into capitalist society's 'imperative of enjoyment' (cf. Žižek 1999; 2006; Declercq 2006; McGowan 2004), which reproduces ideological fantasies about the fulfilment of desires through consumption of health. Based on qualitative empirical material produced through participatory and visual methods during fieldwork in 2012, the analysis shows that relations between healthiness and pleasure are conflated and paradoxical: the students try to fit into society not only by being healthy, but also by enjoying it, but if they fail pleasure, they fail healthiness, and experience a loss of individual social value. However, despite the 'enjoyment society' potentially produces marginalisation, individualisation, de-politicisation and fragmentation, the students of this study actively attempt to subvert its double binds and become subjects not totally absorbed in ideology. Nevertheless, public health promotion that reproduces enjoyment as imperative even in pursuing health, risk reinforcing young people's resistance towards 'health'.

The education gradient in cancer prevention use, a consistent phenomenon across Europe?

Barbara Willems, Piet Bracke

University Ghent, Belgium; University Ghent, Belgium
Barbara.Willems(at)ugent.be, Piet.Bracke(at)ugent.be

Objectives: To extend the literature on educational inequalities in cancer prevention use by (1) simultaneously studying different preventive cancer measures (e.g. cervical smear test (PAP), colorectal cancer test (FOBT), prostate-specific antigen test (PSA), and mammography screening) across different European countries, and (2) evaluating both absolute and relative inequalities. Diffusion of innovation theory and country differences in the organisation and financing of health services are considered as frameworks to guide interpretation of the findings.

Methods: Analyses are based on Eurobarometer data. Depending on the preventive outcome and the specific target population at risk, final sample sizes ranges from 4,511 (PSA) to 10,313 (FOBT) respondents. Overall and country-specific logistic regressions are applied

Results: Educational inequalities in cancer prevention use exist, but vary considerably between countries and preventive outcomes. Overall pro-high educational inequalities are only observed in PAP and PSA test use. In terms of both absolute and relative

measures of inequality, the most problematic countries seem to be Denmark, Greece, Spain, and Austria for respectively cervical smear testing, mammography screening, PSA testing, and colorectal cancer testing.

Conclusion: Two explanations for this large variation in educational inequalities in cancer prevention use across and within countries popped out the results. (1) In line with DOI theory, colorectal cancer testing seems to be in an early stage of diffusion with low or non-existing inequalities, PSA and PAP smear testing in a further stage with emerging and high inequalities, and mammography screening in an advanced stage with decreasing or low inequalities. (2) Also differences in the organisation and financing of health services seem to matter, as in countries with universal coverage and/or publicly funded health services educational inequalities are absent.

The effect of intergenerational social mobility on psychological well-being: a cross-national comparison in Europe.

Jasper Dhoore
Ghent University, Belgium
jasper.dhoore(at)ugent.be

In this paper I empirically investigate if and to what extent intergenerational social mobility affects individual psychological well-being across EU countries. By incorporating country level characteristics within the study of the psychological consequences of social mobility, I analyze how the impact of moving between different social classes on psychological well-being varies between welfare state regimes in EU countries. Using diagonal reference models on data from the fifth wave (2013) of the SHARE-data, I find that for the majority of the countries individual psychological well-being is chiefly a function of the social class someone has moved to, indicating processes of acculturation. However, in Switzerland and Belgium, social mobility has an asymmetric effect on well-being, with upward mobility positively and downward mobility negatively affecting psychological well-being. Although these preliminary results indicate cross-country variations of the psychological consequences of social mobility, they do not support the notion of mobility consequences that are dependent upon the welfare state regimes present in EU countries.

Material deprivation and health care services in Europe

Marco Terraneo, Mara Tognetti Bordogna
Università di Milano-Bicocca, Italy; Università di Milano-Bicocca, Italy
marco.terraneo(at)unimib.it, mara.tognetti(at)unimib.it

A large number of studies documenting an influence on access and utilization of health care of traditional social stratification variables. Socio-economic status (SES) is related to health because individuals deploy resources (such as knowledge, money, power) to avoid risks and to adopt protective strategies.

Therefore, people with greater resources are better able to use health care services in order to improve their health than people with lower SES. In this perspective, a key dimension are economic resources that we know to be an excellent predictor of health conditions. An extensive literature defines relative and absolute poverty based on monetary income or consumption. However, income-based measures may be particularly poor proxies of material conditions among older people. Additionally, these measures are problematic in the context of international comparisons. For these reasons, in this work the economic situation of individuals can be approximate by material deprivation measure.

The aim of this study is to describe the relationship between material deprivation and health care system among individuals aged 50 and over in 14 European countries. Data derived from the wave 5 of SHARE (Survey of Health, Ageing and Retirement in Europe) project. In particular, we are interested to analyze the association between economic conditions and three health care outcomes: a) access and use of services; b) health care satisfaction; and c) out-of-pocket expenditure.

First results prove that for elderly people, who are becoming an increasingly important group in our societies, material deprivation may represent a serious problem with regards to health care access and use. This means that there is a large space for European social policies to remove obstacles for healthy aging and for increasing individual well-being.

RN16 | Session 02b Discussing Mental Health and Illness: Negotiating Stigma and Power

Empowered against stigma of mental illness – a case of mothers of individuals with schizophrenia in Poland

Anna Prokop-Dorner
Jagiellonian University, Poland
a.e.prokop(at)gmail.com

Severe mental illnesses pose a pervasive threat of stigmatization on the afflicted individuals and their close ones. The presentation demonstrates findings from a qualitative study aimed at describing the experience of coping with courtesy stigma among parents accompanying their adult children with schizophrenia in Poland. While most of the family members of afflicted individuals anticipate exclusion and experience overarching shame leading to life in secrecy and isolation, some of them decide to face numerous barriers, including stereotypical convictions, attitudes of reluctance as well as excluding and discriminating practices in their communities. Basing on the cases of mothers engaged in shaping local discourses on mental health as well as creating facilities for individuals with mental health problems, the social factors empowering relatives endangered with social exclusion will be discussed.

Targeting or pushing away pupils with a neuropsychiatric diagnosis School strategies on the educational market in Stockholm

Emma Christina Laurin, Emil Bertilsson
Uppsala University, Sweden; Uppsala University,
Sweden
emma.laurin(at)edu.uu.se,
emil.bertilsson(at)edu.uu.se

In the long standing sociological critique of neuropsychiatric diagnoses, such as ADHD, educational systems have been depicted as oppressive agents of state control and medicalization (Singh 2008). While neuropsychiatric diagnoses are still pronounced features in educational settings medicalization is in fact negotiated by numerous actors and market interests (Conrad 2005). Drawing on Bourdieu's concepts capital, strategy and field (Bourdieu 1996) and Hacking's theory on transient mental illness (Hacking 2002) this study analyzes the social uses and meaning of ADHD- and ASD-diagnoses, specifically focusing on schools strategies. The results are based on interviews with 15 principals, 30 parents to children with an ADHD- or ASD-diagnosis in Stockholm and a statistical correspondence analyzes mapping schools and their resources in relation to each other on what may be labeled as a school field.

The study shows that children with neuropsychiatric diagnoses play an important role in the competition among schools over pupils, resources and reputation on the educational market in Stockholm. Some schools pushed away children with diagnoses perceiving them as a risk for the schools while other schools specifically targeted children with neuropsychiatric diagnoses. The result indicates that the schools varying strategies may be understood in relation to the positions they upheld on the school field.

Maintaining the ordinary

Trude Gjernes, Per Måseide
Nord university, Norway; Nord university, Norway
trude.k.gjernes(at)nord.no, per.maseide(at)nord.no

The paper focuses on staff members' work to make involvement in activities by persons with dementia appear as ordinary. This means to help making these persons' subjectivity appear as ordinary as possible. The analytical approach is inspired by Harvey Sacks article, "On doing being ordinary". Data are from a

caring institution for people with dementia. Data consist of interviews with staff members and observations.

When people with dementia behave in extraordinary ways, the staff tries to make them behave in manners they consider to be or resemble normal or ordinary behavior. Appropriate guidance is described by staff members as "quiet and invisible to others". Attempts are made to make the disease as invisible or unremarkable as possible. The hiding or making interactional consequences of dementia as invisible as possible is considered vital, because it will protect the patient from being stigmatized by others, it may reduce their experiences of loss and thereby make them less depressed. The main idea among the staff is that "a person with dementia should be able to go to the grocery store together with staff members and be seen by others as if he were you or me". "You do not take someone who has been principal and go bowling together with students from the school where he worked, to let them watch him and make him experience that he is not managing the game and loose face in front of them. You will rather take him for a walk".

Diagnosing Autism and the Politics of Childhood in Turkey: What is Lost in Translation?

Emine Yayalar
Bilkent University, Turkey
emineonculer(at)bilkent.edu.tr

Historically, in Turkey children's well-being was politicised and embedded within the nationalist discourses of the Turkish state. Furthermore, with the increasing penetration of neoliberalism in Turkey, the middle class has embraced selective education as a means to sustain class reproduction. This emphasis on education fuels anxieties of parents and educators creating a demand for private mental health services for children. The proposed paper builds on fieldwork conducted in Turkey to analyse the changing politics of childhood through a study of autism. Through observations and interviews with parents and professionals, I show that middle class parents have formed alliances with Western-educated experts to "disassemble" the autism spectrum and opt out of the world of autism altogether. They do this by keeping their children in a liminal space, a no-man's land without a diagnosis and push for intense early intervention with the hopes that their children will be "cured" without having become part of what they deem the stigmatizing world of autism. I will discuss in detail the contestation over biomedical treatments, the changing nature of special education and "valorization of childhood" in an environment increasingly governed by the principles of neoliberalism.

RN16 | Session 02c Health and Disability: Health Policy for Autism

Sick in a New Way - From Asperger Syndrome to Autism Spectrum Disorder

Niklas Mats Westberg

Halmstad University, Sweden
niklas.westberg(at)hh.se

"We Aspies has found our identity in our diagnosis and now it's taken away" one could read in a Swedish newspaper in 2011. This was a response to the decision to eliminate Asperger Syndrome (AS) from the leading diagnostic classifications of mental illnesses and let the condition be included in the category of Autism Spectrum Disorder (ASD). For people with AS this alteration in diagnostic classification had a strong impact on their everyday life, as subjectivities, solidarities within the aspies-community and relations to various agencies and collectives are now subjects for renegotiating.

Grounded in an on-going study, involving interviews with 20 people with AS and analysis of an online community, the paper will focus on three questions: What symptoms, problems and sufferings are AS used to decipher in everyday life and how can these experiences be analysed from a sociological point of view? How does AS as a cultural category, embedded in psychiatric discourse, structure the feelings and explanations of mental suffering and what happens with this interpretative practice when the diagnosis is incorporated in ASD? In what ways does this change transform the conditions for AS as a resource for subjectivity, collectivisation of suffering, and management of feelings of social deviance?

A goal with the research is also to contribute to the field of "sociology of diagnosis" in relation to an understanding of how psychiatry increasingly makes social interaction a subject for medicalization of human behaviour

Students with Autism Spectrum Disorder and University. Analysis of media discourse about autism policy in Poland.

Maria Świątkiewicz-Mośny, Maja Drzazga-Lech, Marta Ir

Institute of Sociology, Jagiellonian University, Poland;
Institute of Sociology, University of Silesia, Poland;
Wyższej Szkole Biznesu w Dąbrowie Górniczej,
Poland

maria.swiatkiewicz-mosny(at)uj.edu.pl, maja.drzazga-lech(at)us.edu.pl, mir(at)wsb.edu.pl

In Poland, we talk quite a lot about Autism Spectrum Disorder (ASD) in the context of children. Problems adults with ASD are hardly present in the public discourse. It was stressed in the latest National Database of Autism (2016) that explore situation of people with ASD in Poland.

The inspiration for the sociological research was the article in one of the biggest polish newspaper. The author, professor of one of the polish university wrote about his student with Asperger's Syndrome and problems he had with him. He used terms such as retarded, insane, limited. This article aroused extreme emotions, from very negative to understand and support. Moreover it helped to launch a debate on the presence of people with ASD at the universities. On the one hand organizations that support people with

autism strongly protested against expressions used by those professor. On the other hand article shows the frustration, confusion and lack of preparation for the contact (teaching) with ASDs students.

Social changes in the Poland, also in the education system leads to the fact that more and more people with developmental disorders including ASD will undertake studies. Universities should prepare to work with such students.

Basing on Goffman conception about stigma we are going to present analysis media discourse about students with ASD, the legal provisions that regulate the status of such students, programs lead by universities to help disabled students, as well as policy for adults with autism spectrum disorder in case of Poland.

Narratives of pain, narratives of struggle: The formation of autistic identities in the Greek context and the impact on health and education policies.

Theodosia Marinoudi

Panteion University of Social and Political Sciences,
Greece

soula_marin(at)hotmail.com

In recent years autism has emerged as an agonistic field of negotiations between agents, subjectivities and collectivities, which form social identities and communities on the basis of common experience. Different conceptualizations of autism manifest in the wide range of performed social trauma and disability in the Greek context. On one hand, narratives and practices of dramatization bring forth vulnerability and pain as a strategy of integration in the existing social structures. On the other hand, radical narratives of resistance emerge as social structures are considered to produce exclusion and pain.

In this paper I explore the performative force of these discourses and counter-discourses regarding autism in Greece. How have certain (bio) social dynamics affected the dominant representations of autism? Which was the impact of their perception of autism on health and education policies? Based on discourse analysis performed on the interviews of members and advocates of two groups, this paper focuses on the ruptures, continuities and discontinuities which emerge as the signifier "autism" is claimed by collectivities, social groups and individuals either in terms of pain or in terms of struggle. Although these different and multiple aspects of autistic forms of life are predominantly presented as contradictory, in this paper I argue that continuities and relations between pain, vulnerability, power and struggle are silenced. Drawing on the experiences of autistic people, I will investigate how the interactions and interrelations between these approaches can contribute to their empowerment and the consequent relief of their social suffering.

Italian policy for autistic people: austerity in welfare services and innovation in local governance experiences.

Angela Genova
University of Urbino, Italy
angela.genova(at)uniurb.it

The implementation process of UN convention on the rights of persons with disabilities is facing several barriers in the context of austerity welfare policy in Italy. The process is investigated considering the welfare services for autistic people calling for specific integrated health and social care interventions as well as inclusive labour policy. The reduction of qualified professionals in public health services and the lack of a strategic healthcare workforce policy, in terms of new professionals, have strongly affected the offer of local public health services in the context of increasing demand for qualified support for autistic people. The Italian workforce policies concerning health and social care services in the last decades have erected new institutional barriers and pushed for regional innovative governance experiences. The study highlights the regional differences in the regulative context as well as in the offer of services and in governance experiences. Innovation concerning the relationship between public, private and third sector organisations are emerging, outlining innovative experiences also in the area of social farms.

RN16 | Session 03a General Call: Gender Perspective on Public Health

Violence against women between reproduction and social change. Research and action in four Italian municipalities

Lia Lombardi
ISMU Foundation, University of Milan
l.lombardi(at)ismu.org

This proposal intends to discuss the issue of violence against women under two perspectives: by analysing the forms of domination and subjugation that reproduce the violent dynamics of men against women; highlighting the social change, analysed through the narratives of the interviewees involved in a quanti-qualitative research and also through the test of a governance model to contrast gender violence.

The research was carried out in 2012-2013 in four municipalities of Milan province to investigate the socio-cultural factors of violence against women (knowledge, perception, stereotypes, prejudices, representations). It consisted in: a survey of 300 interviews with women aged 20-59; three focus groups with 20 women involved in the previous survey; 10 in-depth interviews with sex-offenders prisoners (men) who were attending an "Intensified program of the offence elaboration", under the project "Parla con lui".

Research and actions taken on the four Municipalities, provide tools for understanding the social construction of gender violence phenomenon; the next step is to learn how to break the circle of violence. With

reference to this last point, we bring the example of a governance model deployed by one of the municipal administration involved in the research project. They started in 2009 with a comprehensive work to combat violence against women, by providing before a reception service to women (Sportello Donna) up to the establishment, in 2014, of a local and operational network on: a) training for educational, social and healthcare operators; b) educational awareness courses for students; c) coaching and support to women victims of violence.

French standards and resistance to the implementation of breastfeeding policies

Géraldine Comoretto, Aurélie Maurice, Claire Kersuzan
ALISS INRA; LEPS Université Paris 13;
COMTRASEC Université de Bordeaux
geraldine.comoretto(at)inra.fr, aurelie.maurice(at)univ-paris13.fr, clairekersuzan(at)yahoo.fr

France holds one of the lowest breastfeeding rates in Europe, despite official adherence to international standards and social policies promoting birth and child well-being. Compared to other European countries, the promotion of breastfeeding appears later in France and in a more flexible way. This paper investigates French resistance to the implementation of policies to promote breastfeeding although it has become a public health concern in the last decade and there is growing emphasis on breastfeeding recommendations in child's health and nutrition programs.

This presentation focuses on the specificity of the French case in the European context: 1) a specific historical heritage unfavorable to breastfeeding compared to the Anglo-Saxon pattern (Rollet, 1989); 2) the social acceptability of mothers returning to work soon after birth, strengthened by social policies (16 weeks of maternity leave), when mixed feeding is already less widespread than elsewhere; 3) a singular normative context against lengthy breastfeeding, competing with international standards promoting breastfeeding for six month or more, up to two years. The paper will specifically highlight the maternal experience of lengthy breastfeeding in France. Who are the mothers involved and how do they reconcile their breastfeeding choices with the societal standards that see them as "nonstandard"?

This work combines qualitative and quantitative approaches based on semi-directive interviews conducted with 25 mothers from various social backgrounds and statistical data from the French Longitudinal Study of Children (Elfe), following a cohort of more than 18,000 children born in 2011 via a multidisciplinary approach.

Sexual and reproductive health of migrant women and impact on the health system: the role of culture and family traditions

Giovanni Delli Zotti, Ornella Urpis
University of Trieste, Italy; University of Trieste, Italy
giovanni.dellizotti(at)dispes.units.it,
ornella.urpis(at)gmail.com

The patriarchal structure of the family seems to be still the foundation of human relationships and of the organization of society in many countries with strong emigration. In migratory processes, loyalty to traditional patriarchal family systems often remain unchanged, and relations between sexes crystallize. Difficult relationship with the new society, cultural distance and lack of integration often produce the withdrawal of the migrants in their cultural groups. This way, many foreign communities remain impermeable to the social world that surrounds them. An ethnic group thus defines through the maintenance or the strengthening of distinctive traditional practice like Female Genital Mutilation (FGM) that in migrant communities becomes pivotal in collective identity. FGM is a taboo not to be revealed and becomes the boundary of identity and of community pride.

Female genital mutilation, one of the most brutal human rights violations of our times in many places in Africa, in some countries in Asia and now also in Europe, because of migration, is deeply rooted in gender inequalities, as well as an expression of deliberate physical and psychological dominance over girls and women.

The data presented will be collected through an analysis of the accesses to the Maternal Child Health Hospital Burlo Garofalo of Trieste and by means of a series of in-depth interviews with migrant women and cultural mediators. The goal of the research is to identify the presence of the phenomenon of forced marriages and FGM in the territory of Friuli Venezia Giulia and to observe the effects of patriarchal patterns of behavior on sexual and reproductive health of migrant women, as well as on the social costs that these behaviors produce on healthcare facilities.

Perceptions of use of complementary and alternative medicine in women with breast cancer

Kavi Sharma, Joana Almeida, Jonathan Gabe, John Anderson

Brighton & Sussex Medical School, University of Brighton, UK; Royal Holloway, University of London, UK; Royal Holloway, University of London, UK; Brighton & Sussex Medical School, University of Brighton, UK

K.Sharma2(at)uni.brighton.ac.uk,
joana.almeida.2007(at)live.rhul.ac.uk,
J.Gabe(at)rhul.ac.uk, J.Anderson(at)BSMS.AC.UK

Breast cancer is the most prevalent cancer in the United Kingdom, and the majority of people with this cancer, mainly women, have been treated with chemotherapy. Chemotherapy, in turn, has caused severe side-effects, yet relatively little UK research has been carried out into the use of Complementary and Alternative Medicine (CAM) to tackle these side-effects or simply to improve the quality of life of breast cancer survivors. Sociological literature further highlights a disturbing lack of communication between cancer patients and mainstream healthcare professionals in regards to CAM use. The pilot-study presented here thus aims to understand the

perceptions of use of CAM in women with breast cancer; it addresses three main research questions: (1) Why women with breast cancer have used CAM; (2) What women with breast cancer have thought are the benefits of using CAM; (3) What women with breast cancer have felt are the reasons for nondisclosure of CAM use. Qualitative semi-structured interviews will be conducted to 12 female breast cancer patients during March and April 2017 at Brighton and Sussex University Hospitals Trust. The interviews will be analysed using a general thematic analysis guided by a grounded theory. This qualitative pilot-study will present preliminary findings on the perceptions of CAM use in female breast cancer patients. This will enhance our understanding of CAM use by cancer survivors and will potentially form the basis for a major impact case study, where healthcare professionals will be considered.

RN16 | Session 03b Discussing Mental Health and Illness: Evaluating MI care: Between Interpretation and Coercion

Acute Psychiatric interventions: An ethnography on mechanical restraint

Luigi Gariglio, Mario Cardano
Università degli Studi di Torino, Italy; Università degli Studi di Torino, Italy
luigi.gariglio(at)unito.it, mario.cardano(at)unito.it

Millions of people experience mental problems in Italy each year. In Piedmont region, more than 800 admissions occur per month (N=817 in 2015), either voluntarily or compulsorily, into one of the 23 acute psychiatric wards. About 560 patients are involved and will receive psychiatric care. Involuntary admissions and treatments usually involve a minority group of inpatients (about 15%), and physical restraint can be used for a smaller group of patients.

There has long been a scientific debate focussing on both involuntary admission and physical restraint due to their multiple contested functions of care and control. Scholars have showed contrasting opinions about such psychiatric practices. In particular, among others interpretations, the use of mechanical restraint is seen as: i) a barometer of psychiatric treatment; ii) a part of the psychiatric setting; iii) and, a sub-optimal yet pragmatic organizational solution for managing acute crises.

All in all, both involuntary admission and mechanical restraint are considered, by both researchers and practitioners, as measures that, if possible, should be avoided, without ignoring the necessity to protect the patient who is a danger for himself, herself or others. In Italy, mechanical restraint is frequently adopted in acute psychiatric wards; yet, no in-depth study is available so far.

This ongoing pilot research will investigate tackle the ward organization and the staff cultures, which may facilitate or reduce the adoption of mechanical restraint. In this presentation we will only provide a description of the different ways in which mechanical restraint is performed by psychiatric staff and

facilitated or resisted by patients in one psychiatric wards.

“Taking care of patients. Fixing people or reducing symptoms ?”. Cognitive behavioral therapy and the concept of recovery.

Elsa Forner-Ordioni
EHESS, France
elsa.forner(at)gmail.com

Cognitive and behavioral therapy (CBT) is a psychotherapeutic innovation that has been reported by many scientific reports to be more efficient than psychoanalysis in most mental disorders treatments. In France, situation has been rather controversial between CBT pros and cons since INSERM (French national institute for medical research) recognized the superiority of CBT for most of mental disorders in 2005.

CBT matches well with the French healthcare system, progressively designed by evidence-based medicine and psychosocial rehabilitation policies. On the other hand, CBT is also satisfying new public management drifted by economical constraints, as improving and quantified self and also based on the concept of self-reliance of patients.

Still, for CBT therapists (psychiatrists and psychologists) practice seems to pop some questions through valuation process: how to quantify and value efficiency of CBT? How to give account for the singularity of therapeutic alliance between patient and therapist ?

Using ethnographic method, my inquiry focused on a top-range university French hospital, well-known for its CBT practice. What kind of tools do CBT therapists use through the healthcare process to judge the patient condition? Doing things together, how do they argue for some definition of recovery, illness or improving patient's life? Analyzing interviews gives perspective to understand various conceptions of recovery brought by these practitioners using cognitive and behavioral therapy in their everyday practice.

Mental health care and coercion – the Control Commission's efforts to balance jurisdiction and ethical dilemmas

Bente Vibecke Lunde
Nord University, Norway
bente.v.lunde(at)nord.no

Use of coercion concerns many patients and services in mental health care in Norway. This paper will examine how pros and cons to coercion in mental health care are expressed in Norwegian government documents, and the framework that guides the Control Commission's efforts to safeguard control of coercion in Norwegian psychiatric hospitals.

Coercion is a controversial phenomenon in mental health care. Many associate use of coercion with exercise of power and traumatic experiences, which evokes strong emotions. Coercion challenges basic values in health care like voluntarism and informed

consent. The ethical principle of autonomy, human rights and patient rights are basic guidelines in health care. Coercion is to be in use only in exceptions, and is to be authorized by law. Use of coercion to adults in psychiatric wards, can be divided into three categories: establishment of coercion in mental health care, medical treatment without consent of the patient, and use of coercive measures. Control functions of the Control Commission can divide into appeals and control (document control, welfare checks). In Norway, decisions concerning the establishment / termination of coerced observation and coerced mental health care may appeal to the Control Commission. So may also decisions about shielding, contact restrictions, search, urine test, coercion measures and transfer between institutions. Control Commission handles complaints about the use of these measures.

Private crises, public concerns: experiences of assessment under the Mental Health Act

Rosie Buckland
University of Bath, United Kingdom
R.C.Buckland(at)bath.ac.uk

This paper draws on current PhD research into people's experiences of assessment under the Mental Health Act (MHA). The research will involve interviewing who have been assessed, Approved Mental Health Professionals (AMHPs), assessing Doctors, family, friends and crisis team workers. It will then use discourse analysis to understand these interviews and associated documents outlining decision making and agreed plans. The numbers of people detained under the MHA is rising year on year as its scope reaches the gaps left by service restructures, service absences and changes to people's benefits. An assessment under the MHA has thus never been more political and public and yet it is still a private event, responding to an intensely personal crisis. Each actor in the assessment process will define the nature of the crisis differently however and I am interested in how these understandings are shaped by their social positioning. My research also considers the ways in which these positions were negotiated publically in the bitter debates that surrounded the 2007 amendments to the Mental Health Act 1983. I currently work as an AMHP, in what is an increasingly uncomfortable role, where practicing ethically is a hypothetical desire rather than a practice reality. In presenting my research so far I engage with these wider debates and my own unique position as an AMHP/researcher.

RN16 | Session 03c Neoliberalism and Challenges to Medical Professionals II

Medical Doctors Savaged to Death in China: Whose Fault?

Cheris Shun-ching Chan
University of Hong Kong, Hong Kong S.A.R. (China)
cherisch(at)hku.hk

On March 23, 2012, a medical resident in Harbin,

north China, was stabbed to death by an angry young patient. More recently on May 5, 2016, a stomatologist in Guangdong, south China, was stabbed to death by a middle-aged patient. These were, unfortunately, not isolated incidents. Physical violence against doctors in mainland China has been happening every year throughout the past decade. A study published as early as 2008 found that more than half of the surveyed medical professionals reported having been verbally abused, and 3.9 percent physically assaulted, by patients in the past year. How can we explain patients' violence against medical professionals? In this paper, I analyze the institutional factors that have led to the increasing tension between doctors and patients. Changes in the health care system in post-Mao China drove public hospitals to operate according to commercialized economic principles while maintaining their socialist appearance. The pressure to raise revenues and the low basic salaries of medical doctors lured hospitals to associate doctors' incomes with the economic benefits they brought to the hospitals. This resulted in a blatant conflict of interests between doctors and patients. At the same time, while patients are increasingly aware of their rights and lifting their expectations on medical professionals, the Chinese health insurance system imposes a number of constraints on the professional autonomy of doctors, forcing them to select profitable patients and treat patients unequally. These institutional problems have made doctors the scapegoat for patients' frustrations and anger.

Trust in the doctor in a changing society

Jorid Anderssen

UiT The Arctic University of Norway, Norway
jorid.anderssen(at)uit.no

Trust in the doctor in a changing society.

Jorid Anderssen, UiT, The Arctic University of Norway
This paper present result from a study on trust in doctors/general practitioner over time. The paper is based on four separate fieldworks over a period of almost 35 years (1981-2015) in a small coastal community in Norway. The village was traditionally an isolated fishery community. Some years before my first fieldwork, they got a road that connected the village to the municipal center. The village is located in an area where doctors work for a short period before they move on to more urban parts of the country.

In 35 years, there has been a tremendous change in what kind health problems people present for the doctor. There has also been a big change in how they perceive the doctor. During my first fieldwork, they felt safe that they had access to a doctor in the municipal center. In the last fieldwork, most of them say that they trust the current doctor. They think that health is an individual responsibility, and say they would not trust an incompetent doctor. However, they often add, "A doctor is a doctor." They do not travel to another doctor to get a second opinion, and they do not think that internet can compete with a doctor's knowledge.

Their trust in the doctor in all four fieldworks is discussed in relation to individualization, and the role

of the doctor in a modern society.

Healthcare providers' perspective on the new Family Medicine Model in Turkey.

Pinar Oktem, Ayca Gelgec Bakacak

Visiting Lecturer at Ankara University, Member of Board Positive Living Association, Istanbul, Turkey; Hacettepe University, Turkey

pinaroktem(at)gmail.com, abakacak(at)gmail.com

The 'Family Medicine Model' (FMM), referred to as General/Family Practice in Europe, was implemented across Turkey in late 2010, as part of the recent major revision of the healthcare system. While aimed at strengthening primary healthcare services and harmonising Turkey's health system with the EU, its legislative framework and practical implementation have been subjected to important criticism, including the commoditisation of healthcare and de-prioritisation of preventive healthcare. The Model is still considered as 'new'; and its implications are not thoroughly comprehended by the general public or by decision makers.

This paper aims to understand the healthcare providers perspective, through authors' observations in the field and review of related legislation and evaluation reports.

Results indicated:

- 1) Structural problems causing disruption in healthcare delivery -such as longer working hours, increased financial burdens on physicians, perceived 'dual' authority regime in healthcare organisation and related professional conflicts-
- 2) Socio-cultural aspects of healthcare delivery - particularly affecting sexual and reproductive healthcare and increased violence against healthcare providers as a persistent issue in Turkey-
- 3) Perceived transformation in the 'professional identity' -learning new skills in management, technologies, law and so forth, causing change in the meaning and definition of primary healthcare and decrease in professional 'satisfaction'-

Subjectivities in ER: analysis of conflictual interactions between patients and caregivers in the emergency room of a local hospital in northern France

Déborah Ridet

Université d'Artois, France ; LEM UMR 9221
deborah.ridet(at)univ-artois.fr

Emergency departments in public hospitals in France are open 24/7. During the night, the emergency room (ER) becomes the main point of admission to the hospital. Each patient arriving in the ER must be examined. The ER staff typically deal with organizational constraints and a variety of patients, whose conditions range from "life or death emergencies" to "routine consultations". In performing their duties, the ER staffs are constantly confronted with individual patients' subjective perceptions of their own health. Analyzing professional practices and caregivers' victimization, this proposal, based on

ethnographic fieldwork (combining observations and interviews) conducted over six months in the ER of a local hospital in northern France, will discuss the conflictual interactions caregivers face in their daily practice. Three situations experienced as potentially violent will be highlighted:

- Patients leaving against medical advice or refusing to take treatment despite medical advice can be experienced by healthcare professionals as a negation of their professional identity.
 - Applying medical restraints during certain medical procedures to restrain patients and prevent them from injuring themselves is often considered by caregivers as a “dirty work”, raising the question of individual rights and freedom.
 - The use of patient flow management systems by nurses involves monitoring patients, who are asked to comply with the role of the “good patient”.
- These three examples underline how subjectivities of health professionals in an ER can be in conflict with patients’ personal subjectivities, and that both parties experience forms of stress and discomfort in ER.

RN16 | Session 04a Analysing the Relationship Between Migration, Health Conditions, Health Care Access and Utilization in a Time of Crisis

Analysis of preterm births in an ethnically diverse maternal population in the UK and the linkage to ethnicity and socio- economic deprivation

Shuby Puthussery, Pei-Ching Tseng, Nathan Shaw, Thomas Puthussery
University of Bedfordshire, United Kingdom; University of Bedfordshire, United Kingdom; Independent Consultant; Independent Consultant
shuby.puthussery(at)beds.ac.uk, pei-ching.tseng(at)study.beds.ac.uk, nkshaw23(at)gmail.com, thomas.puthussery(at)gmail.com

Background: Despite significant overall improvements in maternal and infant health over the past decades, ethnic minority mothers in the UK and their babies are at higher risk of adverse health outcomes and experiences compared to the White population. Preterm birth, defined as birth at less than 37 weeks of gestation, is a significant cause of ill health and mortality among babies in the UK as well as worldwide.

Aim: This study explored geospatial patterns of preterm birth and investigated links between preterm birth, ethnicity and area deprivation using the Social Determinants of Health Framework.

Methods: Statistical and geospatial analyses were conducted using routinely collected anonymous data of all live births over a 9 year period from 2007-2016 in a maternity unit catering to an ethnically diverse population. Geographical Information Systems (GIS) and logistic regression were used as analytical techniques.

Findings: Among 46307 births analysed, great majority (85.6%) of the mothers lived in neighbourhoods that were in the three most deprived

areas. Two fifths (40.38%) of mothers belonged to an ethnic minority group. Maternal country of birth was recorded for 20557 births with 41.9% of mothers born abroad. There were a total of 3835 (8.3%) preterm births with 39.4% occurrences among ethnic minority mothers. Black Caribbean mothers had the highest proportions of preterm births. Compared to White British mothers, Pakistani and Bangladeshi mothers had significantly lower proportions of preterm births ($p = .05$). We did not find any significantly different pattern in preterm birth rates with respect to the combined effect of ethnicity and area deprivation.

Conclusions: We found little evidence of the link between preterm births and ethnicity and social deprivation in this population.

Changes in access to health services among native and immigrant populations in Spain in a context of economic crisis and legal changes

Yolanda González-Rábago, Unai Martín, Amaia Bacigalupe
University of the Basque Country, Spain; University of the Basque Country, Spain; University of the Basque Country, Spain
yolanda.gonzalezr(at)ehu.eus, unai.martin(at)ehu.eus, amaia.bacigalupe(at)ehu.eus

Since 2008 Spain, as other European countries, has experienced a profound economic crisis the implementation of strong policies of fiscal consolidation and austerity. Thus, there has been relevant changes in social policies, among them in health care, such as the Royal Decree-Law 16/2012. This regulation restricts the health rights of irregular immigrants to care for those younger than age 18 and to emergency and maternal health care. The aim of this study is to analyse the changes in access to health care among native and immigrant populations in Spain between 2006 and 2014. Using data from the Spanish National Health Survey (editions 2006/07 and 2011/12) and the European Health Interview Survey for Spain (editions 2009 and 2014), we calculated adjusted prevalences of utilization of different levels of health care (primary care, specialized care, hospitalization and emergency services visits) among population aged 18-50, and prevalence ratios to analyse differences between native and immigrant populations in each year and to examine the change between years in native and immigrant populations. Results show no significant changes in the use of any of the health care services, neither in the comparison of the situation before/after the beginning of the economic crisis, nor when comparing before/after the implementation of the Royal Decree-Law 16/2012. Unexpectedly, the access to health care seems to be unaffected by the economic and legal changes, even among immigrant population, despite the restriction of access of the irregular immigrants. Therefore, it remains necessary to identify which mechanisms have mitigated the impact of crisis and austerity measures on the use of health care services.

Syrian Refugees and Challenges for Health

System: Case of Istanbul

Seda Güven, Tuba Bircan
 University of Istanbul, Turkey; University of Leuven,
 Belgium
 sbilan(at)istanbul.edu.tr, tuba.bircan(at)kuleuven.be

In political, social and economical terms, Turkey is the most affected country of the Syrian crisis. More importantly, Turkey as a host country of Syrian refugees has been living a dramatic demographic change. Consequently, the massive influx of people into the health care system presents an enormous challenge. Providing access for refugees to health care services has been one of the priorities for Turkish government with support of several international institutes and NGO's. Besides suffering the same health problems as the Turkey's population, Syrian refugees are at risk populations for the traumatic war-related injuries, mental disorders, and infectious diseases, which may be more common in Syria. Turkey is reported to have expended almost \$5 billion in aid, through its Disaster and Emergency Management Presidency (AFAD). More than \$150 million was spent on health care for 2.8 million Syrians. Syrian refugees in Turkish healthcare system and how Syrian families get the care that is needed to build new lives is the main question this study addresses. The aim of our research is to investigate the refugee influx and its impacts on health system in Turkey and its implications on health practices in Turkey's largest city, Istanbul. Changes in health policies and newly emerging health practices will be evaluated and analysed. In addition to the main statistics of refugee influx, financial and policy reviews, and institutional perspectives on healthcare provision to Syrian refugees will be scrutinised. The results will contribute to local and European health policies and recommendations on good practices in healthcare provision to (Syrian) refugees.

The Dilemmas of Immigrant Families In Interaction with Health- and Social Care Professionals in Finland

Annika Lillrank
 University of Helsinki, Finland
 annika.lillrank(at)helsinki.fi

The ethos of a universal welfare state has developed uniform services through the public sector. The public system focuses on citizens within the country but has omitted transnational solidarity and consequently has less understanding for otherness. Immigration challenges the health and social care professionals to develop new ways of working with culturally diverse ethnic minorities. Finland has received an increasing number of immigrant families whose children may have disabilities, and whose experiences of public service we do not know about. Even international studies on how cultural diversity affect families of children with disabilities are fairly rare.

In this study I ask; how do immigrant families, which have a child with developmental delays and/or various disabilities, experience interactions with Finnish child

health- and social care professionals? The data I use draw on qualitative interviews with immigrant parents of disabled children. These parents have lived for about ten years in Finland and many were well educated and fluent in English.

The preliminary findings highlight that parents have communication problems with professionals, because of lack of knowledge of how the health- and social care system function. Parents experienced that professionals did not facilitate them to overcome the lack of system knowledge and, language problems increased their sense of bewilderment. Secondly, parents experienced that professionals tended to downplay their concerns of developmental delays that slowed down access to investigations and rehabilitation. Thirdly, parents experienced that professionals often behaved in an authoritative way and did not make efforts to develop reciprocal dialogues with them. Thus they felt ambivalent, or lacked trust in relation to public professionals. Some parents successfully consulted private professionals and service providers.

Vaccination for Refugees in Greece: The creation of "aliens" in the interface of Public Health Concerns, Humanitarian Aid and Racist Reactions to Austerity Policies

Sevasti Trubeta
 Free University, Germany
 sev.trubeta(at)gmx.de

This paper deals with vaccination campaigns directed toward refugees in Greece subsequent to the summer of 2015 and is based on ethnographic fieldwork. The analysis draws on sociological approaches to public health that consider the implementation of preventive measures, especially vaccination, as an indicator of the relationship between community and individual. The starting argument of the paper is that the vaccination actions for refugees are officially justified by the dual goal of humanitarian aid and the intention to include refugees in general public health systems. But the inclusion occurs with different conditions than those for ordinary citizens as soon as refugees are thought to pose an additional risk for the European societies because of their origins in world regions burdened with high risks of contagion. Thus, they become subjects to what Andrew Lakoff has described as two regimes of global health: global health security, in the western world and humanitarian biomedicine in the developing countries. What renders the Greek case profoundly different than other European cases are the austerity policies which are affecting large parts of the population and also public (health) services. In this context, vaccination for refugees has emerged as a controversial issue in Greek public sphere, revealing the troubled relationship between citizens and the state authority in this period of austerity with a part of citizens claiming vaccination as a public good that is being withheld from the "nationals" but provided to "foreigners". In view of the racist outbreaks, local public institutions, medical professionals and the part of the local

societies committed to solidarity use vaccination as a means of countervailing racism and advancing the inclusion of refugees in the local societies.

RN16 | Session 04b Discussing Mental Health and Illness: Determinants

Gender differences in psychological health of undocumented and forced African migrants in France

Julie Pannetier
CEPED, France
julie.pannetier(at)ceped.org

In the actual context of increasing forced migration and barriers to immigration in Europe, migrants reduced mental health is a central issue because it may have long-term consequences on their social inclusion. Little is known about the social determinants of migrants' mental health, particularly the roles played by forced migration and illegality in destination countries, which may manifest differently for men and for women. The goal of this paper was to understand the gendered roles of forced migration and illegality on mental health among sub-Saharan African migrants living in the Paris, France metropolitan area. This study used data from the Parcours study conducted in 2012-2013 among a representative sample of migrants consulting in healthcare facilities ($n=2,468$). Anxiety and depressive symptoms were measured with the Patient Health Questionnaire-4 (PHQ-4). Escaping one's own country because of threats and living illegally in a host country are experiences that impair mental health. Among women, anxiety and depressive symptoms are strongly related to having left their own country because of life threats after controlling for confounders. Specific forms of gender based violence faced by women refugees in societies of origin and destination may have lasting mental health consequences. Among men, residing illegally in the host country was the primary cause of impaired mental health after controlling for confounders. Men are more subject to police controls than women in public space. Undocumented male migrants may fear of being arrested by the police, resulting in deportation and failure of their migration effort.

The Mental Health of the Internal Migrants' Offspring. The Turin Case, After the Economic Miracle

Mario Cardano, Angelo d'Errico, Cecilia Scarinzi, Giuseppe Costa
University of Turin, Italy; Epidemiology Unit ASL TO3 Piedmont Region; Epidemiology Unit ASL TO3 Piedmont Region; University of Turin, Italy; Epidemiology Unit ASL TO3 Piedmont Region
mario.cardano(at)unito.it,
angelo.derrico(at)epi.piemonte.it,
cecilia.scarinzi(at)gmail.com,
giuseppe.costa(at)unito.it

Until the mid-1950s, Italy was still an underdeveloped country. Between the Fifties and the Seventies, Italy

was involved in an industrialization process that collocated this country among the more developed ones. This process was possible thanks to contribution of an army of poor, uneducated migrants who moved from the South toward the North of Italy. In that time, Turin was one of the preferred destinations of this process of modernization. Similar on this point (and not only on this) to the migrants who, today, reach the Italian beaches, the Southern migrants were illegal, due a fascist law in force at that time. They lived in garrets, cellars, hovels. The social situation was not better: southern migrants and their children were discriminated in all the places of living. This study wants to analyze the impact on mental health of these shocking experiences on the offspring of southern migrants, focusing on the most severe mental distress: psychosis. The data used to this purpose combine the results of a qualitative meta-analysis and a large longitudinal archive. We analyzed some studies carried out during the Turin Economic Miracle, and others performed more recently. These studies give us information about the subjective meaning of these experiences. To measure the impact of it, we analyzed a large data set of 191,062 children characterized by their geographical origins, and their mental health, expressed by hospital admission for psychosis. The main result of the study is the higher relative risk of psychosis (RR 1,56) for the offspring of southern migrants, compared to native population. The relevance of this study rests on striking resemblance of the process analyzed with the more recent international migrations.

Affective work – affective disorders?

Lauri Kokkinen, Ari Väänänen
Finnish Institute of Occupational Health, Finland;
Finnish Institute of Occupational Health, Finland
lauri.kokkinen(at)tth.fi, ari.vaananen(at)tth.fi

During the last four decades, affective disorders have increased among working-age population in many Western countries. This long-term trend has secularly followed the increase in human service jobs such as those of service clerks, teachers, social workers and health professionals, and the decrease in traditional male work associated with non-emotional physical labor. As descriptive studies on mental health risks in human service work have demonstrated extreme emotional demands, job complexity, high responsibility and exposure to threats and violence, we began to study more closely the association between human service jobs and affective disorders.

In this study, we compare the risk of long-term sick leave for affective disorders in human service work to those of employees in other occupations between 1990 and 2015 in Finland. Participants were randomly selected from the Statistics Finland population database of seven independent consecutive national cohorts (1990–1994, 1995–1999 etc.), each representing a 33% sample of the 18–65 years population. These data were linked with diagnosis-specific records on sick leaves, drawn from the Social Insurance Institution of Finland Registry, using

personal identification numbers.

Armed with knowledge from descriptive studies on mental health risks in human service work we hypothesize that the relative risks should be highest among social workers. Furthermore, we predict that men employed in social services may be even more exposed to these hazards due to their work tasks and because they may have fewer resources for coping with these hazards in jobs traditionally seen as female work.

Making use of critical theories for the sociological study of depression

Domonkos Sik

Eötvös Loránd University, Hungary

sikdom(at)gmail.com

Critical theories have an ambiguous relation to psychopathologies. There seems to be a parallelism between notions normatively grounding critical theories like “alienation”, “anomie”, “loss of meaning”, “ontological insecurity” or “identity crisis” and notions describing symptoms of mental illnesses such as “generalized anxiety”, “depression” or “schizophrenia”. However this parallelism has never been utilized by the sociology of mental illness. The presentation aims at reinterpreting the psychological insights on the formation of depression from the perspective of critical theories and testing the resulting model. In the first part of the presentation, based on Bourdieu’s, Giddens’, Habermas’, Honneth’s and Lash’s concepts of social integration, a theoretical attempt is made to identify those social constellations, which may contribute to the emergence of depression. In the second part, the database of European Social Survey 2012

(<http://www.europeansocialsurvey.org/data/download.html?r=6>) is used in order to analyze the correspondence between variables representing such social constellations and a scale measuring depression (Radloff 1977). According to the results of the linear regression, the lack of ontological security caused by incompatible routines (Giddens), a defeatist pattern of habitus (Bourdieu), unpredictable patterns of recognition (Honneth), an indifferent pattern of communication (Habermas) and the over-canonization of aesthetic reflexivity (Lash) both increase the level of depression. These results may enable a sociologically deepened understanding of depression, while providing new insight for further research and social praxis alike.

RN16 | Session 04c Citizen Participation, Genomics and Bio-Banking: Process I

Translating genomic risk information to personal understanding

Karoliina Snell

University of Helsinki, Finland

karoliina.snell(at)helsinki.fi

Finland is aiming to be a model country in utilizing genomic information. It is expected that with the help

of genome knowledge and data bases health care costs can be cut, new innovations and business opportunities will be created and people can make preventive life style changes. A large-scale pilot project called GeneRISK was launched to further these goals. The aim of GeneRISK was to develop methods to gather, analyse and interpret genome knowledge related to cardiovascular diseases, and utilize the information in public and private health care as well as to provide some information directly to research participants.

The participants of the GeneRISK project received through an internet portal a personal genomic risk score that estimates their risk to have a cardiovascular event during the next ten years. The paper presents results from a focus group research made among these research participants. The analysis focuses on how research participants discuss and translate the information they have received to manageable and understandable knowledge. Translation is a process that involves interpretation, questioning, and sharing of the data. The results are also incorporated to participants’ personal experiences and their previous understandings of heritage, lifestyle, family and personal health history. The paper analyses through the reasoning of the focus group participants, the forms of subjectivities and subjectifications that a genomic risk score and its personal translation create as well as critically reflects the possibilities of these kinds of projects to promote life style changes.

What constitutes public trust in biomedical and genomics research in England?

Felix Gille, Elizabeth Holdsworth, Sarah Smith, Nicholas Mays

London School of Hygiene and Tropical Medicine, United Kingdom; London School of Hygiene and Tropical Medicine, United Kingdom; London School of Hygiene and Tropical Medicine, United Kingdom; London School of Hygiene and Tropical Medicine, United Kingdom

felix.gille(at)lshtm.ac.uk,

elizabeth.holdsworth(at)lshtm.ac.uk,

sarah.smith(at)lshtm.ac.uk,

nicholas.mays(at)lshtm.ac.uk

The success of biomedical research and subsequently the health care system depends on public trust. A paucity of research describes what public trust actually is. Therefore this study engages with participants’ and public perceptions and experiences of biobank and genomics research to conceptualise public trust. The research findings potentially contribute to health policy.

A secondary analysis of 21 face-to-face interviews with biobank participants and two public focus group interviews about the perception of genomics research was conducted. Data were thematically analysed following inductive coding. Open coding focused on the proximity of the search terms: trust, confidence, hope, believe, belief, faith, and love. The terms similar to trust are used in colloquial speech and were searched to broaden the scope of the search strategy.

In an iterative process, conceptualising themes were identified.

This study identifies 15 key themes of public trust. Public trust is conceptualised by an anticipated net-benefit for the public and system, ethical use of data, autonomy and data security in official hands. The government, NHS and leading politicians are all viewed as mutually responsible to build public trust. Further, theory is developed where public trust is a consensus of public discourse in the public sphere. Policy makers need to take into account the multiple themes identified. If biomedical and genomics research is to work it has to gain public trust. Threats of commercialisation of personal data in combination with a lack of an anticipated public benefit are the main drivers for low public trust in this context.

Giving a meaning to health through biobanks

Brigida Riso

University Institute of Lisbon (CIES-IUL), Portugal
brigida.riso(at)gmail.com

Biobanks for clinical research purposes are increasingly common for supporting biomedical and basic research worldwide.

This research is focused in understanding how a biobank structure can be changing the concepts of health and illness, in an era of great technological innovation.

In the course of harvesting, collecting, and storing samples, many health professionals, lab technicians, researchers, and healthy and ill donors cross their paths around health and illness experiences.

When a biobank aims to collect samples from both healthy and ill donors, when doctors decide which samples to collect, when data is selected to be associated with the sample, when patients' associations are asked to actively participate, when samples are released to one investigation instead of the others, what are the embedded meanings of health and illness? How are these conceptions defined in a context where using a large number of samples is becoming a validity and objectivity criteria for clinical investigation?

This research followed the samples' trajectories, from harvesting to storing, using ethnography as research method, in a Portuguese biobank.

Fieldwork shows that the biobank works both as a centre of samples storage, and a mediator of many social practices. Connecting the world of basic researchers, doctors, patients and health and research organisations, the biobank reveals itself as a complex mixture of interests and paradigms. The complex dynamics around samples suggest that subjectivity plays an important role, not only in the so-called objective making of science, but also in giving diverse meanings to health and illness experiences.

Relations in biomedical research participation: Building a cross-cohort platform in the context of a national health system

Sally Ann Atkinson, Richard Milne, Shirlene Badger
University of Cambridge, United Kingdom; University

of Cambridge, United Kingdom; University of Cambridge, United Kingdom
saa65(at)medschl.cam.ac.uk,
rjm231(at)medschl.cam.ac.uk,
sb491(at)medschl.cam.ac.uk

This paper examines how participation is re-conceptualised in the landscape of preventative, precision and personalised medicine in the UK. Tailored approaches to experimental medicine are increasingly presented as time and cost effective ways of developing new treatments for clinical care, proactively identifying and targeting the earliest causes of ill-health before long-term damage has accumulated. This is particularly pertinent in a financially constrained national health service. Such research requires a new kind of research participant and recruitment process. Rather than relying on volunteers and clinical recruitment, it requires access to large and sustainable groups of primarily healthy, 'data rich' participants. This approach has led to the rise of collaborative initiatives such as Dementias Platform UK (DPUK), which brings together over thirty longitudinal cohort studies with informatics, genomics, and imaging resources. Developing, linking and extending research networks in this way has the potential to change how research participation is conceptualised, managed and experienced.

Based on interviews and focus groups with cohort study participants linked to DPUK, I explore how a variety of relations are evoked to express understanding, experience and expectations of research participation. I specifically focus on how participants draw on personal and familial experiences of health and health care systems in the NHS to explain their engagement with research. Their accounts of health care demonstrate how participants' understanding of research participation is embedded within the wider national health care system. These findings have important implications for how we understand willingness and motivation to participate in these evolving research networks.

RN16 | Session 05a Chronic Diseases and New Health Policies in the Capitalist Era I

I am celiac, How sick am I?

Cleto Corposanto, Beba Molinari

The Magna Græcia University of Catanzaro, Italy; The Magna Græcia University of Catanzaro, Italy
cleto.corposanto(at)unicz.it, beba.molinari(at)unicz.it

Celiac disease is a chronic condition which is complicated by a series of factors ranging from difficulties in the diagnosis, which is often delayed, to the implications for interpersonal relationships in social contexts which involve food.

The only available curative response to the disease, with no known effective pharmacological regime, is a diet completely free of gluten. It is therefore of particular interest to know the extent to which a celiac person considers themselves to be ill.

The focus of this paper is the construction of a scale

to measure levels of illness not from the point of view of a medical expert and based on a clinical analysis (Evidence Based Medicine) but rather how it is perceived by the person who must live with the disease. In order to arrive at a value, 6 macro areas were analysed: Disease, Illness semantics, Institutional sickness, Sonetness, Sickscape, Illness experienced (Corposanto, 2011). Each macro area is the subject of a series of affirmations to which the respondent was asked to express a degree of consent. The statements were made available to respondents in an online questionnaire.

The aim was to experiment with a questionnaire which could aid, on one hand, in testing which dimensions may be more appropriate for inclusion in a final version of the scale, and on the other hand, in the determination of the levels within the measurement range which a person would find relevant in describing their individual approach to their illness.

Vulnerabilities and ambivalences in care

María Teresa Martín Palomo, Inmaculada Zambrano Alvarez, Evangelina Olid González, José María Muñoz Terrón

mtmartinpalomo(at)ugr.es, izamalv(at)upo.es, eolid(at)us.es, jmterron(at)ual.es

This paper presents the results of the project "Geographies of care work". Based on the qualitative research conducted in Andalusia (Spain). The paper aims to delve into the challenges care work professionalization encounters in practice and into the vulnerability this very work entails for the care workers and for people looked after, because of the emotional and bodily aspects that the aforementioned care implies. In addition the ambivalences derived from the set of interrelations and moral aspects that care implies are analyzed.

Starting off from the national long-term care regime, this paper pays particular attention to the implementation of the Personal Autonomy and Care for Dependent Persons Law (2006), which aimed to professionalize and turn care work into a decent job. Our paper argues that the intrinsic physical (bodily) and emotional aspects of care work pose specific barriers to professionalization.

It also states that care work carries with it numerous forms of vulnerability; on one hand, because it is a relational kind of work, with a strong emotional and corporal involvement; on the other hand, because the care receiving has a lot to say regarding the assistance he/ she needs and how he/she wants to be looked after (there is a strong subjective component, that even the law recognizes), but still, this is not always taken into account.

The fact that care work has become more precarious in the last decade, in a context of strong public regulation of elderly care, multiplies the vulnerabilities of care workers and of people who needs care. The resulting incomplete process of

professionalization has important consequences for the quality of the care provided and for gender equality.

Family and Community Nursing in Italy

Alessia Bertolazzi, Silvia Marcadelli
University of Macerata, Italy; University of Rome Tor Vergata, Italy
alessia.bertolazzi(at)unimc.it, silvia.marcadelli(at)gmail.com

Introduction: Ongoing socio-economical and epidemiological changes emphasizes the need to introduce figures such as the Family and Community Nurse (FCN) into the healthcare system. However, formal recognition of the figure is currently lacking in Italy and there are few studies in this field. An exploratory study, funded by the Italian Ministry of Health, has been carried out in 8 Italian regions.

Methods: A set of local experiences in which the role of the nurses expresses functions and competencies related to the family and community nursing was examined. 138 stakeholders, with different backgrounds (GPs, nurses, nurse managers, service users), were questioned using semi-structured interviews.

Results: Two distinct models have been classified. In the first model, family and community nursing is applied to defined social contexts (a target population living in a defined area), characterized by a comprehensive view of care and a creation of a bond of trust between nurses and patients. The second model refers to nursing applied to the Chronic Care Model, whose objective is to improve health conditions in the population with chronic disease, through early diagnosis of possible complications, slowing down the deterioration of disease and, consequently, reducing unnecessary hospitalizations.

Discussion: The authors outlined the characteristics, meanings, and challenges that the Italian NHS is experiencing in trying to introduce the FCN, to guarantee coordination of care for patients in chronic conditions and a better sustainability of the system. The research produced a theoretical model for family and community nursing by centering primary care services through district agencies.

Social networking and diabetes management: the impact on the relationship between health professionals and patients, in the capitalist era.

Gea Ducci, Lella Mazzoli
University of Urbino Carlo Bo, Italy; University of Urbino Carlo Bo, Italy
gea.ducci(at)uniurb.it, lella.mazzoli(at)uniurb.it

In the network society of the capitalist era, the increasing digitization and the pervasive use of social and participative web by individuals, groups, organizations in daily life, is producing momentous changes in the field of health and healthcare, at micro level, at macro level and in micro-macro relation (citizens-health institutions). It's therefore necessary that this dimension and, in particular, the activity of

social networking, is more and more taken into account in the health policies. Citizens, institutions and health professionals, are now immersed in a new medial ecosystem, with repercussions on the relationship management and the patient's taking charge, that assume specific characteristics in the case of chronic diseases, such as diabetes.

In this regard, we offer a reflection on the implications that the use of digital media (such as App and social media) entails in the relationship between diabetic patient and health practitioner / care center: what are the strengths and weaknesses related to the use of these media? What are the risks? We will consider some Italian cases in which the social platform "WhatsApp" is used daily by health professionals and diabetic patients, impacting on their relationship; we will reflect on the eventual possibility of adopting rules (policy) at the organizational level, concerning the use of social media in order to avoid generating new forms of inequality.

RN16 | Session 05b Discussing Mental Health and Illness: Making Sense of Mental Illness Diagnoses

Diagnosing Psychosexual Abnormality in Taiwan Military

Ting-She Chang

National Taiwan University/Tri-Service General

Hospital Beitou Branch, Taiwan

andrewchang0515(at)gmail.com

Gender dysphoria is substituted for gender identity disorder in DSM-5, and homosexuality has been removed from DSM since 1973. However, as for military services, according to military regulations for standing soldier service category in Taiwan, it is obliged that a soldier would be suspended or separated if he/she is diagnosed as "psychosexual abnormality" in Taiwan.

What is psychosexual abnormality? It is not clearly defined in the regulations. But as a psychiatrist working in a Taiwanese military hospital, I find it implies homosexuality and transgender, which is already depathologized in DSM. This research will be focused on what psychosexual abnormality is and how the diagnoses are made in Taiwan. By interviewing "patients" and psychiatric professionals such as psychiatrists, psychologists, social workers, occupational therapists and nurses in Taiwanese military hospitals, I argue that although "psychosexual abnormality" is out-of-fashioned and contestable, the vagueness and uncertainty of the definition ironically give strategic space for both professionals and "patients". By analyzing the negotiation process of making diagnosis of psychosexual abnormality between professionals and "patients", I want to investigate firstly why "psychosexual abnormality" is still a standard to suspend or separate soldiers; secondly, how it is made in the military diagnostic practice; and thirdly, what gender/power structure it reflects in the military. I propose that a military mental health policy with all-gender-friendly perspectives

must be further discussed and planned instead of "kicking-all-the-deviances-out" policy nowadays.

The general physician and mental illness in times of neoliberalism in Chile

Claudio Maino

University Paris Descartes (Paris 5) Cermes3

Laboratory, France

claudiomaino(at)gmail.com

In Chile, the explosion of depression arrives paradoxically in the spring of the "Chilean golden decade", characterized by the restoration of democracy in 1990 and a spectacular growth of the economy.

This paradox has been analysed like the fruit of the launch of the neoliberal laboratory in the 70s during the dictatorship and its subsequent success in democracy. I would like to analyse this paradox from a particular scene: the social success of the general physician to treat mental illness.

At an international level, this process is articulated to the discovery of new drugs of the spirit, causing a new medical offer and a new demand for treatments that is not only concentrated on the illness but also on the welfare and on the daily discomfort. In Chile, the general physician is called to deal with mental illness in the dawn of a new democracy, specifically with the revindication of human rights and the promotion of universal access to health. Nevertheless, the medical literature describes a new complaint among primary care patients: they must face more alone than ever before the demands of life. Epidemiological studies, in turn, show the explosion of depression and sociologists, meanwhile, talk about the loss of the common imagination in Chile, the blur of an "Us".

In relation to this, I propose some notes about the changes of the language of mental health when general practitioners start to deal with mental illness, to problematise how the relationship that is established between pathological expressions, economic transformation and the way of "making society" in Chile, can bring up a truth contrast about these crossroads in northern countries, particularly in Europe

Work-Related Suffering and Its Psychotherapeutic Re/Interpretation

Sabine Flick

Goethe-University Frankfurt, Germany

s.flick(at)em.uni-frankfurt.de

This paper examines how psychotherapists deal with suffering in its work-related forms. Based on the results of a qualitative empirical study in psychosomatic hospitals in Germany, I show how psychotherapy can lead to a normalization of overburdening demands at the workplace, and ultimately a de-articulation of social factors. I argue that psychotherapists transform social suffering into suffering related to the self by re/interpreting the links to society that figure in the patients' subjective theories of illness. The reason for this transformation

lies in the logic of the profession necessary to legitimize the claim that the patients' suffering falls under the competence of psychotherapy. Therapists have to disregard 'the social' in this manner since there are no medical diagnostic tools that would explicitly refer to work. The result of this professional re/interpretation is a form of therapy that medicalizes and personalizes social suffering, thereby intensifying, rather than mitigating, a self-referentiality on the side of patients that is forgetful of society and already weighs on the individuals seeking treatment. To develop my argument, I first consider the dimension of work and its significance for psychotherapeutic etiology and diagnosis. I then present the study used and explicate its results in terms of three strategies of re/interpretation. Finally, I discuss the social-theoretical implications of this re/interpretation

The shifting role of employees' mental health in the medical encounter – The problematization of work capacity in Finland, 1970-2015

Ari Väänänen, Noora Lindroos, Jussi Turtiainen, Anna Kuokkanen, Anne Kouvonen
Finnish Institute of Occupational Health, Finland;
University of Helsinki, Finland; Finnish Institute of Occupational Health, Finland; Finnish Institute of Occupational Health, Finland; University of Helsinki, Finland
ari.vaananen(at)tll.fi, noora.lindroos(at)helsinki.fi,
jussi.turtiainen(at)tll.fi, anna.kuokkanen(at)tll.fi,
anne.kouvonen(at)helsinki.fi

Over the past few decades, mental health problems have become key drivers of work disability in Western countries. This study examined occupational health professionals' perceptions of the underlying reasons for the rise of mental health-related work disability between the early 1970s and the mid-2010s in Finland. Using the concept of work capacity, we analyzed the changing role of mental health in a society that underwent a drastic transition in work life and culture during these decades. Our data included 41 in-depth expert interviews of Finnish occupational health professionals. The interviews were conducted in 2015. Our findings indicated that the rise in employees' mental health problems was increasingly associated with the problematization of work capacity during the period under examination. The occupational health professionals identified crucial transitions in the historical understanding of work capacity, which contributed to the increase in mental health problems among their patients. They were often related to the structural changes in work life that influenced the core requirements placed on employees. However, the explanations also pointed out long-term changes in employees' subjectivity, which made it possible to express psychological and social problems in the medical domain. Our analyses show that previously incompatible theoretical approaches can be useful in understanding the rise of mental health problems and concerns in 1970-2015 in Western countries.

RN16 | Session 05c Migrations and Health Inequalities in Europe I

Inequalities in Access to Health Care and Long Term Care in Europe for older migrants

Jochen Baumann, Tatjana Mika
TU Braunschweig, Germany; German Federal Pension Insurance, Berlin
Jochen.Baumann(at)tu-bs.de, Tatjana.Mika(at)drv-bund.de

Older migrants in Europe are especially sensitive for questions concerning health care and long-term care. EU law draws a decisive legal distinction between immediate need or support and access to insurance coverage. It differentiates between benefits in cash and in kind. Health care is considered to be a benefit in kind, granted in the case of medical need. However, access to comprehensive health care including prevention, treatment of chronic diseases and care provisions are spanning over longer periods of time and take place in older age. Those cases are most often not covered by EU law. Access to local medical treatment is not available for many of the older migrants in the EU because the coordination of social security does not cover these cases. The difference is potentially stark for people with chronic illnesses and long-term care need.

Emigration and remigration in later working life or after retirement is influenced strongly hereby. Remigration to countries with a largely private health care insurance is often unaffordable. Immigration or remigration to countries with a statutory health insurance scheme like Germany is hindered by binding insurance on long contributive records. NHS hinders access for migrants also directly. These inequalities in the politics of access to health care and long term care in Europe for older migrants can explain migration behaviour in higher working age and in old age. We will explain this with statistics of the German Federal Pension Insurance concerning the major migration movements of persons to and from Germany in later working life and old age and additionally with data from Eurostat.

Neglected Relationships of Health Inequality among Immigrants in Europe: An Example of Intersectionality Informed Comparative Research

Anna Gkiouleka
York University, United Kingdom
a.gkiouleka(at)york.ac.uk

The suggested paper moves beyond comparisons between immigrant and native groups and focuses on the way that relationships of health inequality are shaped among specific immigrant groups as those emerge from the different combinations of the dimensions of gender, ethnic origin, immigration, and socio-economic status. Integrating intersectionality theory with approaches on social determinants of health, the paper considers patterns of health inequality as the outcome of multiple and simultaneous effects of privilege and disadvantage as

those are experienced by individuals depending on their social positioning. In terms of analytic strategy, the study adopts an inter-categorical approach and compares relationships of health inequalities across different immigrant groups and countries. Logistic regression analysis is conducted using pooled data deriving from the European Social Survey. Measures include self-rated health data, ethnic origin as excluded from the respondents' and their parents' country of birth, generation and citizenship, gender and occupational status. The paper explores different operationalisations of immigrant groups and of socio-economic status for the documentation of multiple relationships among groups and examines the impact of two and three way interactions. The findings illustrate a refined depiction of health inequalities among different immigrant groups, and they highlight the constructed character of health inequality and the complex ways that combinations of privilege and/or disadvantage translate into increased burden of poor health and hampering conditions. Also, they have important implications about the ways that dimensions of individual social positioning interact with structural factors at the macro-level.

The State of Health of Eastern European Immigrants and Indigenous Population in Western European Countries

Agnes Rozsa Santha
Sapientia University, Faculty of Tirgu Mures,
Department of Applied Social Sciences, Romania
santhaagnes(at)yahoo.de

Introduction

There is contradictory evidence to the effect of migration upon health. The healthy migrant hypothesis suggests that migrants are healthier upon arrival into their new home country than the locals. Nevertheless, studies indicate that this initial health advantage fades in time and it may even turn into its opposite.

Methods

The paper compares the subjective health of first generational Eastern European immigrants with that of the native population of Western European countries. The comparative analysis is based upon a representative sample of the working age population, the data source being the European Social Survey round 7, years 2014-2015.

Regression analysis is carried out in order to identify the social determinants of health and to assess the magnitude of their impact. The determinants of mental and general health are being searched for among demographic characteristics (gender, migration status, partnership status), socioeconomic status (income), social integration (number of intimate social relations, religiosity), and labour market features (number of working hours, flexibility of work, employment status).

Results

The migrants' health is worse than that of the indigenous population with regard to both mental and physical health. Immigrant women's mental health is significantly worse than native women's. Results show that even if other variables are being controlled for,

the migration status still matters, and natives have better chances for health than immigrants. Evidence supports the negative impact of migration upon health.

Health-related deservingness: irregularity as a deserving factor? A study of healthcare access for undocumented migrants in France

Céline Gabarro
Urmis, Université Paris Diderot, France
celinegabarro(at)yahoo.fr

Until 1993, undocumented migrants could benefit from equal rights with French workers: as long as they showed proof of employment, they received health insurance ("assurance maladie"). Their irregularity did prevent them from being treated differently. Starting 1999, with the Pasqua laws, undocumented migrants could no longer benefit from health insurance through their job, whether the latter was declared or not. They could only benefit from State Medical Aid – "Aide médicale d'Etat" (AME): a free healthcare coverage only poor people can access. From that moment on, undocumented people were perceived as poor people by healthcare instructors. Poverty allowed them to be protected by the healthcare system. Nonetheless AME recipients don't have as much rights as the others. They depend on a specific system which is more difficult to obtain. Moreover, as poor people, they are seen as a financial burden for the French healthcare system and as less deserving than others, because they have not paid for it. As foreigners, they cannot claim for solidarity. Therefore AME is seen as charity by healthcare instructors. The latter act as the healthcare system's gatekeepers by organizing a selection of who deserve AME and who does not. According to them, the deserving are the ones who are really poor, and who act as poors: meaning they do not ask for anything but charity. The undeserving are the ones who are seen as coming to France to take advantage of the French welfare system. To conclude, the intersectionality of poverty and foreign status matters more than irregularity in how healthcare instructors distinguish between deservingness and undeservingness, and ultimately grant healthcare coverage or not.

RN16 | Session 06a General Call - Old and New Objects

Mental wellbeing, the environment and the ecological state

Paola Signoretta, Veerle Buffel, Piet Bracke
Department of Social Sciences, Loughborough
University, United Kingdom; Department of Sociology,
Ghent University, Belgium; Department of Sociology,
Ghent University, Belgium
p.e.signoretta(at)lboro.ac.uk,
Veerle.Buffel(at)UGent.be, Piet.Bracke(at)UGent.be

The association between physical environmental conditions and mental wellbeing is widely documented in terms of both positive and negative effects. Though there is some indication that the better a country

performs in environmental terms the better its levels of mental wellbeing are, the role of the state in this association is unclear. More specifically, this paper investigates the role of the 'ecological state', "a state that places ecological considerations at the core of its activities". With this background in mind, this British Academy-funded presentation examines whether the ecological state is a moderator in the association between physical environmental conditions and mental wellbeing. The presentation starts by identifying the existing typologies of ecological states and by defining a conceptual framework of the pathways through which physical environmental conditions and the ecological state impact on mental wellbeing; it continues by presenting the analytical approach used to explore these pathways combining multilevel modelling and spatial data analyses and the findings. The geographical focus is on regions and countries of the European Union. The study employs secondary survey data sets and other secondary regional and country level data. The paper aims to make a contribution to sociological cross-country health inequality research in terms of both substantive and methodological innovations.

In the Land of Pharma: a thematic analysis of the corporate communication of the pharmaceutical industry

Sarah Van den Bogaert, Jana Declercq, Thierry Christiaens, Piet Bracke, Jacobs Geert
 Department of Sociology, Ghent University, Belgium;
 Department of Linguistics, Ghent University, Belgium;
 Department of Pharmacology, Ghent University, Belgium;
 Department of Sociology, Ghent University, Belgium;
 Department of Sociology, Ghent University, Belgium
 Sarah.VandenBogaert(at)UGent.be,
 Jana.Declercq(at)UGent.be,
 Thierry.Christiaens(at)UGent.be,
 Piet.Bracke(at)UGent.be, Geert.Jacobs(at)UGent.be

Over the past decade, the pharmaceutical industry has been battling a negative reputation and has been confronted with accusations, such as putting profits for patients and manipulating clinical trial results. In this study, we focus on how pharmaceutical companies use corporate communication as a strategic tool to battle, what we define as, "the Bad Pharma discourse". Drawing on interviews, press releases, corporate documentation, and ethnographic fieldwork, we analyse the main themes that are used by the industry to construct its corporate reputation discourse and focus on how this discourse interacts with other discourses. Our results illustrate that on the one hand the industry contests the Bad Pharma discourse by generating an alternative discourse. On the other hand, they also partly embrace and reframe this Bad Pharma discourse. Therefore, we argue that corporate communication can be perceived as a never-ending struggle over meaning with other discourses.

Social networks of persons with neurological diseases.

Eleni Koutsogeorgou, Antonio Maria Chiesi, Matilde Leonardi
 University of Milan; University of Turin; University of Milan; Fondazione IRCCS Istituto Neurologico Carlo Besta
 e_koutsogeorgou(at)hotmail.com,
 antonio.chiesi(at)unimi.it, Matilde.Leonardi(at)istituto-besta.it

Background: In scientific literature is gradually recognised that persons with neurological diseases face social barriers in their everyday life, which have detrimental consequences on their health and wellbeing. Also, components of social capital, such as social networks and trust, have been found to be positively associated with good health status and psychological well-being. Given the current economic crisis, the enhancement of social networks could be an inexpensive, yet highly effective solution, together with the increase of social support for the improvement of health and wellbeing of persons with neurological diseases, too.

Aim: To identify recent studies focusing on the role of social networks for persons with one of the following types of neurological diseases: epilepsy, multiple sclerosis, and Parkinson's disease.

Methods: A systematic literature review was conducted of peer-reviewed studies published from 2000 to 2016, focusing on social networks – according to the definition of social capital – of persons with one of the abovementioned neurological diseases. The databases searched were: PubMed, Scopus, Web of Science, ProQuest, and PsycINFO. Specific inclusion and exclusion criteria were set.

Preliminary results: From 1,896 abstracts, 44 studies were considered eligible for analysis. Preliminary results indicate that the majority of the studies relates to the perceived support and/or the impact of the neurological disease on patients' social relationships or social functioning. Further research exploring structural or cognitive aspects of social networks in a larger variety of neurological diseases could contribute to the identification of the characteristics of social networks which improve social functioning of persons with neurological diseases.

Online health communities as a new object for sociology of health

Victoria Dudina
 St. Petersburg State University, Russian Federation
 viktoria_dudina(at)mail.ru

Digital health policy encourages people to take more responsibility for their own health through the use of information technologies, in particular through the creation of online-communities of people with various illnesses. Involving people on the basis of peer-to-peer consultation and exchange of information in a self-management of disease requires an understanding of social consequences in terms of the impact on health behavior. Results of the research of

online health communities will be presented. The tasks were to identify the everyday classifications of diseases affecting health behavior; to identify potential risks of participation in online health communities; to identify advantages of participation in online health communities.

The main advantage of participation in online health communities is improving of psychological well-being due to emotional support from people with similar problems, information support, inclusion, overcoming stigma and reduction of the digital divide. Online health communities have particular value to people with reduced mobility, with stigmatized illnesses or for those who, for some reasons cannot receive adequate medical care and emotional support face-to-face. At the same time, a common practice of peer-to-peer consultation in online health communities leads to the fact that people often get tips that can harm their health. Contributing factors include stress and negative emotions such as fear, anxiety experienced by patients and their families, which prevents rational assessment of information. In addition, the same information is perceived differently by different people, depending on their personal characteristics, such as gender, age, education, cultural capital, Internet literacy.

RN16 | Session 06b Health, Body-Weight and Everyday Life: Studying Subjectivities Through Time I

Exploring the Relation between Food, Health and Contemporary Living in an Obesogenic Environment

Rachael H Sibson, Giovanna Bermano, Arthur Stewart, Iain Broom, Chris Yuill
Robert Gordon University, United Kingdom; Robert Gordon University, United Kingdom; Robert Gordon University, United Kingdom; Robert Gordon University, United Kingdom; Robert Gordon University, United Kingdom
r.h.sibson(at)rgu.ac.uk, g.bermano(at)rgu.ac.uk, a.d.stewart(at)rgu.ac.uk, j.broom(at)rgu.ac.uk, c.yuill(at)rgu.ac.uk

As part of a wider research project which explores the obesogenic environment incorporating social, cultural, biological and psychological aspects; this paper draws on the findings from 17 semi-structured interviews. The research indicated that there were three thematic social practices relating to food, i.e., instrumental, aesthetic and disciplined eaters. Each theme was quite different and identified in function of how individuals related to food in their everyday practices, how they saw themselves in relation to health, socio-cultural functioning, economic conditions and embodiment. Individuals in each theme had a distinct moral imperative approach to food. Instrumental eaters were more likely to be picky eaters and food served as a function in quenching a biological need to eat rather than something done for pleasure. In contrast, aesthetic eaters found enjoyment and pleasure in food and exploring new food. Disciplined

eaters laid somewhere in between: food was functional and nutritional fuel, and typically, they had more of an awareness of sugar and fat content of food.

After inductive analysis of the interviews, each of the identified eating behaviours related to the accepted, albeit problematic, classifications of weight based on body mass index: instrumental eaters represented the obese category whereas disciplined ones, the normal weight category. These preliminary findings may challenge the traditional medicalised understandings that being overweight is on a pathway of 'disease progression' to obesity: the healthier attitude and approach towards food and life, shown by overweight individuals, may avert weight gain and the path to obesity.

Money for Your Fat!: Health, Morals and Capitalism

Hannele Harjunen
University of Jyväskylä, Finland
hannele.harjunen(at)jyu.fi

In 2009, an anonymous Finnish private sponsor donated ten million euros for a nation-wide weight loss rally that was titled "Literacy with the Flab" (Läskillä lukutaitoa). The idea of the rally was simple: people were encouraged to join a competitive weight loss campaign and try to lose as much weight or "flab" as possible in eight weeks' time. For every lost kilogram, the sponsor would pay 15 euros towards improving teacher education in Nepal. On the surface, this campaign looks like any of the hundreds of other campaigns that have rallied against "obesity". It builds on a host of stereotypical and false assumptions about fatness, fat people and weight loss. However, in this paper, I will take a closer look of the discourses employed in this on particular campaign. I will argue that it actively constructs a connection between fatness, lack of morals and economy. I will illustrate this argument by analyzing press releases and newspaper articles written on the "Literacy with the Flab" rally and two similar campaigns that took place in Finland during the first decade of the 21st century. I will argue that by constructing fat people as the wasteful, over-consuming and immoral subjects, these campaigns reinforce the status of fatness, and fat people, as a global problem. I will show that the anti-fat sentiment employed in these rallies draw from mainstream health-, moral-, and economic discourses respectively, and are, in the end, very little about promoting health and all about neoliberal capitalist economy and moral judgment of fatness.

Obesity, Stigma and Reflexive Embodiment: Feeling the 'Weight' of Expectation

Oli Williams
University of Bath and NIHR CLAHRC West
osw21(at)bath.ac.uk

The dominant obesity discourse emphasises moral responsibility and lifestyle modification. This particular framing of obesity promotes weight-based stigma.

Obesity stigma has consequently become a significant research inquiry. Findings overwhelmingly demonstrate that obesity stigma: is an ineffective means by which to reduce the incidence of obesity; exacerbates weight-gain and; has additional detrimental consequences. However, the sensate experiences associated with the subjective experience of obesity stigma as a reflexively embodied phenomenon have been largely unexamined. This paper addresses this knowledge gap by providing a phenomenological analysis.

Data derive from eleven months of ethnographic participant observation and semi-structured interviews with three single-sex weight-loss groups. Group members were predominantly overweight/obese and had low-socioeconomic status. This analysis triangulates these two data sources in order to investigate what/how obesity stigma made group members feel.

Obesity stigma is shown to have confused participant's objective and subjective experiences of their bodies. This was primarily evident in the finding of group members feeling heavier after engaging in behaviours associated with weight-gain but this 'weight' not registering on the scales. This is conceptualised as the weight of expectation and is illustrative of the perpetual uncertainty that characterised participants' weight-management. Additionally, the sensate experiences of physiological responses to physical activity are shown to have been ascribed moral and social significance. These carnal cues provided group members with a sense of certainty, that was otherwise largely absent, and played an important role in their attempts to negotiate the lived experience of obesity stigma. These findings deepen understanding of obesity stigma as a set of reflexively embodied sensations and provide further evidence of weight-based stigma being an inappropriate and ineffective means of promoting health.

Technologies of being-in-time: situating early childhood health care practices in time.

Mutsumi Karasaki, Gerben Moerman
University of Amsterdam, Netherlands, The; University of Amsterdam, Netherlands, The
m.karasaki(at)uva.nl, G.Moerman(at)uva.nl

The "first 1000 days" of a child's life - from pregnancy through the child's second birthday - are now treated in research and policy as a critical period for the child's cognitive, emotional, neural and physical development that shapes the health trajectory into adulthood. So too, new parents often experience this period as a unique and not-wholly-unproblematic phase of their lives. Their experiences may be marked by uncertainty, risk, and hecticness, although they can also be accompanied by senses of pleasure and intimacy. In the face of rapid changes, parents develop embodied ways of knowing how to care for their child.

In this paper, we draw upon data from a multi-method study (multiple time-point interviews and observations

with new parents and infants, and video analysis of children's health clinic consultations) to show how parents and professionals mobilised what we call 'technologies of time-ing'. These technologies included various tools and objects used in clinics and at home, and everyday, cultural, and professional knowledges and practices. They were used by both professionals and parents to ameliorate the sense of uncertainty surrounding early childhood eating and sleeping, and to address the risk of current and future undesirable weight and health status in children. In so doing, these technologies allowed for situated ways of knowing, by connecting and/or disrupting the link between the past, present and a desired future. Observing how parents and professionals mobilised these technologies revealed multiple temporalities, diverging and converging in the relations of power.

RN16 | Session 06c Migrations and Health Inequalities in Europe II

Cross-border patient mobility, consumer citizenship and the uneven European healthcare space

Sabina Stan
Dublin City University, Ireland
sabina.stan(at)dcu.ie

Cross-border patient mobility (CBPM) has become a significant component of care experiences across Europe. This has also been acknowledged in EU legislation, which defines CBPM as a citizen and patient right in the European single market. As Brexit debates have shown, CBPM between 'old Europe' and Central and Eastern European (CEE) New Member States has, however, become increasingly contentious. The paper seeks to contribute to these debates by seeking to assess the overall scope of patient and resource flows between eastern and western Europe. It focuses on CBPM based on EU legislation and acknowledges that east-west CBPM takes place in an uneven European healthcare space whereby healthcare expenditure and service levels in richer EU15 countries contrast with those available in poorer EU11 states. The article argues that the articulation between EU social citizenship rights and the creation of the European single market contributes, among other factors, to making east-west CBPM a fuel rather than a deterrent of larger east-west healthcare inequalities in Europe. Furthermore, by adopting a transnational perspective, the article inquires whether these inequalities are solely territorial, i.e. between eastern and western parts of the continent, or are also cutting across territorial borders.

"Is this food?" A qualitative study on food security among refugees living at Norwegian asylum reception centers.

Laura Terragni
Oslo and Akershus University College, Norway
laura.terragni(at)hioa.no

Food security is a basic need and a human right. Food

security exists when all people, at all times, have physical, social and economic access to sufficient, safe and nutritious food that meets their dietary needs and food preferences. Food security is a critical component for assuring adequate nutrition and is listed among the social determinates of health. Inadequate nutrition has been observed among asylum seekers resettled in developed countries. There are however few studies investigating food security among this vulnerable group. The aim of this study is to investigate health challenges and barriers to food security among asylum seekers living at Norwegian reception centers.

The study took place in three Norwegian reception centers. Data were collected through participant observation and qualitative interviews. The study indicated that the food provided at asylum reception center did not meet the food culture of refugees and that there was little variation. New eating habits were based on the strategy to survive on as little money as possible. Aspects related to acculturation such as lack of knowledge on the new food environment, communication difficulties, lack of availability of food complying with religious rules restricted food consumption to a limited number of food items. Also structural aspects as distance from grocery shops and lack of kitchen facilities hindered the preparation of food. The study provides indication that asylum seekers living at the reception centers are not entitled to food security. This can have relevant health consequences. It is important to know more about challenges to food security and entitlement to food for this vulnerable group is in welfare state societies.

New Migrations, New Inequalities? Health Professionals on the Move in an Age of Turbulence

Joana Isabel Teixeira Sousa Ribeiro
University Coimbra, CES, FEUC, Portugal
joanasribeiro(at)ces.uc.pt

The study of skilled migration in the health sector is an opportunity to question the processes of global inequalities. In this vein, the implementation of austerity measures, particularly in an increasingly female social area, such as the National Health Services, proves the role of transnational actors in labour segmentation, cognitive injustice and regional unbalances. Moreover, the rhetoric discourses of mobility tends to replace the migrat labour practices, associated with insecure labour and educational paths, precarization and economic cost-effectiveness in the health sector.

In an age when there are several challenges, among others, the increase of population in need of care (refugees, asylum seekers, elderly, chronic patients); the migration of health professionals could be an opportunity to discuss the (re)framing of structural inequalities accordingly to socio-geo-historical positioning (global South/ global North; center/ periphery; `emigrant country`/ `immigrant country`; `origin country`/ `host country`). This paper seeks to be a contribution for that debate. It results from a

longitudinal qualitative study made in a semi-periphery European country, like Portugal, with a colonial past and an e-/immigration experience.

The (re)production of mobility and migratory discourses, practices and actors along time are tacking into account, considering the world system theory, the `international migratory system` and postcolonial studies; and its effects on global healthcare (re)distribution.

Setting limits in uneasy times - early overweight in migrant families

Kia Ditlevsen, Annemette Nielsen
University of Copenhagen, Denmark; University of Copenhagen, Denmark
kmd(at)ifro.ku.dk, anmn(at)ifro.ku.dk

The aim of this paper is to provide knowledge on barriers to preventive action on early childhood overweight in non-Western migrant families. It investigates the underlying understandings of the parental role in relation to weight control present in health-care professionals and in families.

The study is based on qualitative interviews with parents who are engaged in interventions aimed at helping them and their children to adopt a healthier life style, and on interviews with health-care professionals.

The paper shows that the participating parents, most of them migrants, all low-SES and living under different forms of insecurity, perceived their parental task for the present as creating wellbeing for their children, and they were, therefore, reluctant to enforce dietary changes. The health-care professionals, in contrast, considered the need for change through a perspective on future risks, and perceived early childhood obesity as a result of parental inability to restrict their children from unhealthy foodstuff.

The contrasting understandings, the paper argues, question the suitability of the universal model of parental feeding styles, which most health care professionals rely on, and it illuminates the implications of implicitly applying this model in health interventions which involve vulnerable categories of parents such as refugees to Western societies. The paper makes the point, that health care professionals preoccupied with what they see as inadequate parental assertiveness in ethnic minority families with unhealthy and overweight young children might fail to see the whole story of parental capability, and do not fully understand the rationale behind the parental practices they are trying to change. This can result in misrecognition of already stigmatized families and decrease the likelihood of successful intervention.

RN16 | Session 07a Unemployment, precarious work, and health (care) from a comparative perspective: Contributions to the development of an institutional approach.

Governing the unenterprising self in enterprising societies

Christian Maravelias
Stockholm University, Sweden
chm(at)sbs.su.se

Sociologists studying the political economy have made the case that the turn to neoliberalism has resulted in a transformation, not only of the principles of governing individuals and populations, but also of the general understanding of what it means to be an able, useful, and healthy individual. Rather than docile individuals, government is alleged of striving for making up enterprising selves who are able to make use of their desires and individuality as parts of their human capital.

Given this it is surprising that so little attention has been devoted to the regulation of those groups of individuals who are marginalized because they are judged to have little potential to qualify as human capital. This paper seeks to bring light on this issue by accounting for a study of the largest Social Integrative Enterprise in Sweden, Samhall. A Social Integrative Enterprise seeks to integrate marginalized jobseekers who are diagnosed as functionally impaired on the labour market.

With the turn to neoliberalism Social Integrative Enterprises such as Samhall have undergone a transformation, from providers of sheltered employment for the functionally impaired to providers of temporary labourers to business firms, labourers who are alleged to display a bio-medically defined fit for simple, monotonous service and factory labour precisely because they are functionally impaired. Drawing on Foucault's studies of neoliberalism I will suggest that Social Integrative Enterprises hereby illustrate a general tendency in contemporary western societies, the tendency of supplanting the classical liberal distinction between 'the economy' and 'the social', between efficiency and solidarity, with an economization of life itself.

Precarious employment and health in Europe: prevalence, evolution over time and country distribution.

Karen Van Aerden, Kim Bosmans, Christophe Vanroelen
Vrije Universiteit Brussel, Belgium; Vrije Universiteit Brussel, Belgium; Vrije Universiteit Brussel, Belgium
kvaerden(at)vub.ac.be, kibosman(at)vub.ac.be, cvroelen(at)vub.ac.be

In recent decades, socio-economic inequalities in health have increased in many European countries. This paper focuses on one important determinant of adverse health: precarious employment. Recent research indicates that precarious work experiences cause serious harm to people's health. Therefore, the main goal of this paper is to provide a thorough overview of precarious employment and its relation with adverse health outcomes in European employees. This paper uses data from three successive waves of the European Working

Conditions Survey (2005, 2010 and 2015) in order to shed light on 1) the prevalence of precarious employment in Europe over time and across countries and 2) the relationship between precarious employment and the health of employees. First, seven different aspects of employment conditions and relations are combined in an overall indicator for precarious employment: employment instability, lack of material rewards, lack of workers' rights and social protection, de-standardised working time arrangements, lack of training opportunities, lack of collective organisation and unbalanced interpersonal power relations. Then, descriptive analytical techniques are applied to show the evolution of precarious employment over time and its distribution across Europe. Finally, regression analyses are performed in order to examine the relationship of the precarious employment indicator with different health and well-being outcomes. Combining information from multiple employment features in order to define precarious employment provides innovative insights considering its occurrence and its consequences in Europe. The results of this study will raise awareness to the detrimental consequences of precarious employment situations for the health and well-being of individuals.

EU PATHWAYS Project: An effort in combating unemployment and increasing (re)integration in the workforce for persons with chronic diseases

Anastasia Vlachou, Olga Roka, Panayiota Stavroussi, Beata Tobiasz-Adamczyk, Barbara Wozniak, Aleksandra Pilat
University of Thessaly, Greece; University of Thessaly, Greece; Jagiellonian University Medical College, Poland; Jagiellonian University Medical College, Poland; Jagiellonian University Medical College, Poland
anavlachou(at)uth.gr, rokaolga(at)gmail.com, stavrousi(at)uth.gr, mytobias(at)cyf-kr.edu.pl, barbara.wozniak(at)uj.edu.pl, aleksandra.pilat(at)uj.edu.pl

Persons with chronic health conditions often encounter challenges in finding and maintaining employment as well as returning to work after long-term sick leaves. The rising prevalence of chronic diseases in the European working age population increases the risk of labour market exclusion and has negative consequences at individual, national and European level. This threat becomes more visible in the context of the current European economic crisis.

In response, PATHWAYS (Participation to Healthy Workplaces and Inclusive Strategies in the Work Sector), a three-year EC-funding research project, aims at developing innovative approaches for professional (re)integration of persons with chronic diseases and support their participation in the workforce. PATHWAYS Consortium consists of 12 partners from 10 European countries with expertise in employment and health issues.

A specific objective of the PATHWAYS project is to determine the effectiveness of employment

(re)integration strategies within the European context. This presentation aims to disseminate preliminary findings from a systematic review of scientific publications evaluating employment (re)integration strategies for persons with chronic diseases in European countries. Particular emphasis is given to the strategies emerged as affecting positively the workforce participation.

The search strategy identified a total of 101 scientific articles published between 2011 and 2016; almost half of these targeted primarily to a quantitative evaluation of the strategies' effectiveness to improve employment outcomes. Positive change has been reported in 23 scientific publications for 12 strategies, including mostly services rather than policies or systems. The findings are discussed in order to support the implementation of innovating and effective employment (re)integration strategies.

Higher education & contemporary working conditions: a comparative approach

Pieter Dudal, Veerle Buffel, Piet Bracke
Ghent University, Belgium; Ghent University, Belgium;
Ghent University, Belgium
pieter.dudal(at)ugent.be, veerle.buffel(at)ugent.be,
piet.bracke(at)ugent.be

Social epidemiological research is dominated by a rather optimistic view on the mental health status of the higher educated. Despite the consistency of this observation, recent empirical research points to some counteracting evidence as elevated forms of mental health complaints have been found for several higher educational professions and these are often directly linked to their working conditions. This issue is mainly studied from a micro perspective with a strong focus on working conditions as such but little attention has been paid to the potential influence of macro-processes. This research tries to fill this gap by focusing on how labor market competition among the higher educated influences their working conditions and hence their mental health status. Analysis are based on a subsample (N = 8848), aged between 18 and 65, of the European Working Condition Survey (5th edition, 2015). Results, from 30 European countries, indicate that increasing labor market competition among the higher educated is related to an amelioration of the mental health status for the employed higher educated. Furthermore, we see that labor market competition moderates the relationship between certain working conditions and mental health. It has been shown, for example, that managerial quality or support becomes more important the more a country's labor market is characterized by competition among the higher educated. The results are discussed in the light of literature on the expansion of tertiary education.

Work-family demands, health and lower status occupations: Europe in a Comparative Perspective

Hannah Volk
University Graz, Austria

hannah.volk(at)uni-graz.at

The matching of personal and working life as a social determinant of health and well-being has been extensively discussed during the last years. Workers managing multiple roles may be at added risk of stress due to competing responsibilities of work and home. Although many studies in this field have focused on high-skilled workers, little is known about the situation of workers in lower status occupations. Lower status workers are more likely to work at lower hourly rates, with fewer benefits, and inflexible part-time schedules- conditions which create work-life challenges for families and single-parents. Further workers from lower status groups have fewer social and economic resources in order to cope with diverse stressors, causing stronger health impacts. (e.g. Folkmann 2011; Richter 2009; Hoven&Siegrist 2013; Richman et al. 2006)

In this study, data of the ISSP 2012 and 2015 is used and hierarchical multilevel regression models encompassing 18 OECD-countries are calculated. One hypothesis of this study is that the negative health effects of work-life stressors is stronger among low status workers than among higher status workers. Further the negative health effects are expected to be lower in countries of the Nordic welfare state (dual-earner support model) than in continental or southern European countries (general family support model), due to stronger social mediators on the macro level of society. The results indicate that the negative health effects of work-life stressors differ by occupational status and welfare state regime. The results are explained by using the sociological stress model of Leonhard Pearlin as a theoretical framework for the associations between work-life stressors and health outcomes and the impact of personal and social mediators on the micro and macro level.

RN16 | Session 07b Health, Body-Weight and Everyday Life: Studying Subjectivities Through Time II

The pervasive nature of moral discourse within GPs' accounts of obesity communication

Maxine Blackburn
University of Edinburgh, United Kingdom
m.blackburn(at)ed.ac.uk

Despite increasing pressure on general practitioners (GPs) to use every opportunity to talk to their overweight patients about weight loss, evidence demonstrates that weight is rarely discussed in general practice. Taking the stance that anti-obesity discourse is harmful and disempowering for individuals living with obesity, this study explores how medical and moral discourse surrounding body weight similarly constrain and inhibit GPs from discussing weight loss with patients. Underpinned by a discourse analytic approach, I demonstrate the ways in which subjectivities of doctors and patients are governed by wider socio-cultural and political structures. 'Trigger films' depicting simulated doctor-patient interactions in

which a doctor either acknowledged or ignored their patient's body weight, were used as a reflective device in interviews with twenty GPs. The paper focuses on the moral and ethical discourses running throughout GPs' accounts, demonstrating that patients are positioned as both individually responsible for, yet simultaneously powerless to lose weight. I highlight the ambivalence and tension within GPs' accounts, outlining the ways in which they construct obesity as a significant health risk yet also recognise, and in some cases seek to block patients from revealing an embodied and complex narrative around eating and fatness. Findings reinforce the limited vocabulary available through which 'fatness can be discussed and accounted for' (Throsby 2007), contributing to a sociological understanding of the modern obesity 'crisis'.

The understanding of mothers' perspective on their children food practices.

Cristina Pereira Vieira, Luísa Ferreira da Silva, Dália Costa
 UAb/ CIEG; CAPP; ISCSP/CIEG
 cieg(at)iscsp.ulisboa.pt, luisafs(at)iscsp.ulisboa.pt,
 daliacosta(at)iscsp.utl.pt

This paper focuses the lay rationalities on 'healthy food'. Previous knowledge shows that lay choices are primarily subjective and referring to the symbolic values of family and tradition more than to 'the healthy'. 'The healthy' is a concept of health built inside the scientific rationality where well-being is merely biological. In day-to-day life the concept of 'healthy practices' is implicated in cultural systems and associated with living conditions. Research shows that people adapt the dominant concept of healthy with their traditional values and norms (Silva, 2008).

The paper presents data from a qualitative study using group interviews, in Portugal, and aimed to the understanding of mothers' perspective on their children food practices. The aim is to deep the comprehension of the levels of reflexivity as well as the reflexive processes involved in children food choices.

The ages of the children go from 4 to 14. Method refers to focus group but practical constraints made it impossible to follow all the technique principles. Data analysis takes into account social position and gender. Paper presents first results and discusses the viability of focus group to this type of research.

Silva, L. F. (2008) *O Saber Prático de Saúde – Lógicas do Quotidiano*, Porto: Afrontamento - The publication, silva 2008, *O Saber Prático de Saúde – Lógicas do Quotidiano* ("Practical Knowledge of Health, The Logics of Healthy in Everyday Life") refers to a research project with participation in the entire research of Cristina Pereira Vieira - author of this abstract.

A Sociological Observational Study on Nutrition in Italians Children and Their Parents

Brunella Fiore, Alessandra Decataldo, Carla Facchini
 University of Milan-Bicocca, Italy; University of Milan-

Bicocca, Italy; University of Milan-Bicocca, Italy
 brunella.fiore(at)unimib.it,
 alessandra.decataldo(at)unimib.it,
 carla.facchini(at)unimib.it

Nutrition plays a pivotal role in the health status of children. Furthermore, in developed countries child and adolescent obesity runs and affects later health, educational attainment and quality of life. Therefore, it represents an important social and political issue.

The eating habits of the Italian children and their parents have not however been extensively investigated. We know that obesity runs in families, with children of obese parents at greater risk of developing obesity than children of thin parents. However, we do not know the relationship among parents' socio-cultural characteristics and their children's nutrition style.

The aims of this study are to: 1) describe the eating habits of Italian children and compare them with those of their parents; 2) explore whether and how children's dietary intake are affected by the cultural and socio-economic status of their parents; 3) focus on the relationship between children dietary intake and places where the main meal is usually consumed (home, school canteen, fast food, restaurant, etc.).

The design and methods imply a retrospective population study with data from the 2010 face-to-face multi-purpose survey by ISTAT (Italian National Statistics Institute). This survey focused on collecting data about eating habits and nutritional aspects, and was conducted through face-to-face guided interviews with a pre-defined questionnaire. The survey aimed at Italian families; each family was extracted with random criterion by the municipal registry lists, according to a statistically representative sample of the population residing in Italy. All members of the family were interviewed. Among 48,336 interviewees (21,091 families) of all ages, we will focus on participants with 4-13 years old children (4,491 interviewees) and their parents.

Healthy food makes healthy bodies? How individuals deal with health-norms and their social demands on the body.

Tanja Robnik
 LMU München, Germany
 tanja.robnik(at)soziologie.uni-muenchen.de

Analysing current health discourses on food and eating practices, the fact that bodies are taken as physical expression of the success or failure in the efforts of self-management, has never been more obvious. Being skinny is no longer the primary goal. Bodies are supposed to be healthier, fitter, and more productive, and they are supposed to look like that. Nutrition in this discourse is meant to make people feel more energetic, prevent or even cure skin-problems and even diseases like cancer. Reports, life-style magazines, nutritionists and exchange forums create the vision of people regaining control over their own bodies by choosing the right food and eating practices. If these choices are presented as living up

to the demands of body-shape, health and productivity, it gets difficult to question these standards and their normative effects in general. Despite several movements questioning health ideals like fat-acceptance for example, I want to show, that individuals aren't aware on most normative effects and their instability. Instead of criticising the possibility to live up these norms, empirical data shows various strategies to handle with failure. The analysis of subject formations in health-food- debates, shows the difficulties with these normative standards. There are plenty diets and scientific papers on health food however there is no cure for the so called "obesity-crisis" and other conditions connected to food. Yet subjects are supposed to eat "right". I would like to show how these decisions are made based on scientific knowledge, the body and the idea of a self-reliant and autonomous consumer.

RN16 | Session 07c Migrations and Health Inequalities in Europe III

Goffman meets Butler: identifying frames of mental health in interactions of mental health care professionals with diasporic Muslims

Elise Rondelez, Sarah Bracke, Griet Roets, Caroline Vandekinderen, Piet Bracke
 Departement of Sociology Ghent University Belgium; Department of Sociology University of Amsterdam The Netherlands; Department of Social Work and Social Pedagogy Ghent University Belgium; Department of Social Work and Social Pedagogy Ghent University Belgium; Departement of Sociology Ghent University Belgium
 elise.rondelez(at)ugent.be, s.a.e.bracke(at)uva.nl, griet.roets(at)ugent.be, caroline.vandekinderen(at)ugent.be, piet.bracke(at)ugent.be

Although diasporic Muslims seem to have a mental health that is precarious, the evidence of their underrepresentation in established mental health care services is increasing. This issue has been identified, conceptualized and approached in a number of epistemological and methodological approaches in the existing body of international research. However, it can be argued that we lack an in-depth and dynamic understanding of this social problem, in theoretical as well as in empirical terms. In this contribution, we discuss the findings that are part of a current research project that examines this issue of underrepresentation in Flanders (the Dutch-speaking part of Belgium), in which we take the perspective of professionals in mental health care services to explore these questions. Inspired by the work of Goffman and Butler, we attempt to disentangle the frames professionals use in their contacts with diasporic Muslims with 'mental health problems' and discuss the three identified frames that are intrinsically interrelated: a biomedical frame, a resocialization frame and a cultural difference frame.

Explaining the Disability Pension Gap between

non-Western Immigrants and Natives in Denmark

Jeevitha Yogachandiran Qvist, Hans-Peter Y. Qvist
 Department of Political Science, Aalborg University, Denmark; Department of Sociology and Social Work, Aalborg University, Denmark
 jy(at)dps.aau.dk, hpq(at)socsci.aau.dk

In Denmark, like in the other European Societies, it is well-documented that the risk of being granted disability pension is much higher among non-Western immigrants compared to natives. However, little previous work has been carried out in order to explain the disability pension gap between non-Western immigrants and natives. In this paper, we examine whether and to what extent differences in socio-economic status (measured as education, occupation and labor market status) and health between non-western immigrants and natives can explain the disability pension gap. Towards this end, we use high-quality register data from Denmark that includes information about disability pensions granted from 2010 to 2013 as well as information about socio-economic status and health on the individual level. In our statistical analysis we use logistic regression analysis based on the Karlson-Holm-Breen method, which allows us to decompose the effect of being a non-Western immigrant into total, direct and indirect effects without mixing confounding and scaling bias. Corroborating previous studies, we find a large total effect of being a non-Western immigrant, indicating that non-western immigrants have a much higher risk of being granted disability compared to natives, but we find that over half of the disability pension gap is explained by indirect effects via socio-economic status and health. In sum, our results indicate that the disability pension gap between non-Western immigrants and natives in Denmark would be less than half the size had non-Western immigrants been equally privileged in terms of socio-economic status and health.

RN16 | Session 08a General Call: Health Determinants

Differences in Determinants of Individual-level Health Between Western and Eastern Europe

Liubov V. Borisova
 Uppsala University, Sweden
 liubov.borisova(at)soc.uu.se

The East-West health divide in Europe is well documented, in both objective and subjective health. Ever since the Cold War, West European countries have fared better in terms of health than their Eastern neighbours. However, the question still remains whether this divide is determined simply by differing socio-economic conditions or whether determination of individual health is qualitatively different and cannot be generalised between East and West. Therefore, this paper analyses the determinants of both objective and subjective health in Eastern and Western Europe. Multi-level analysis on the dataset of the European Social Survey (ESS) is performed. The data covers 30

countries and almost 300 thousand individuals over seven rounds, and provides proxies for the main socio-economic determinants and two measures of health: self-reported health and functional ability. Health determinants are measured at both the individual- and country-levels, and are divided into economic, political, and social determinants, lifestyles and health care. The standard demographics – age, gender, education and marital status – are also controlled for.

The analysis reveals that determinants of health are not the same in Eastern and Western Europe. Furthermore, overall country-level context influences health in the West, but not in the East. These results might signify that different health determination processes occur in East and West Europe. All the findings once more reinforce the anomaly of the Eastern European region, and recommend that researchers treat comparisons of different health indicators, as well as their determinants, between these two regions with a high degree of caution.

Educational inequalities in general and mental health: does the curricular tracking system matter?

Katrijn Delaruelle
Ghent University, Belgium
katrijn.delaruelle(at)ugent.be

There is a common view in literature that educational tracking amplifies social inequalities in a wide range of outcomes. The current study aims to examine whether this belief holds true for educational disparities in health. Taking an institutional perspective, it specifically explores the extent to which differences in national tracking systems matter for the relationship between education on the one hand, and general and mental health on the other. To shed light on this, we use information of the European Social Survey (round 6 and 7: 2012-2014) for individuals 25 to 40 years of age (N = 17,175) in 25 European countries. The national tracking system is defined by a factor that captures the age of selection, the number of different school tracks, and the length of differentiated curriculum at the country-level. Moreover, general health is assessed by self-rated health scores, whereas mental health is measured using the shortened Center for Epidemiologic Studies Depression Scale (CES-D 8). The estimated two-level hierarchical models show that tracking is indeed associated with larger educational inequalities in both health outcomes. Lower-educated individuals fare worse in terms of general and mental health than their higher-educated counterparts in all countries, however the strength of association is much higher in countries with a highly-tracked system (e.g. Germany, The Netherlands, and Belgium) than in countries with a more comprehensive one (e.g. United Kingdom, Denmark, and Norway). These results underscore the counter-effective background of curricular tracking in tackling social inequalities in health.

Inequalities and Inequity in utilisation of health

care among the older people in Greece during the pre-crisis period from 2004 till 2009

Ismini Drakou
London School of Economics and Political Science,
UK
isminidrakou(at)gmail.com

The objective of the study is to employ quantitative empirical methods (Horizontal Index and Odds Ratios) to explore key aspects of equity in the receipt of health care in Greece among the older population 50+, via two nationwide (SHARE, Greek HIS) and one urban setting (PatraHIS) datasets and shed light on the equity issue in the use of health care before and after Greek NHS major reforms of 2001-4 and 2005-7.

The findings suggest that inequalities in health care exist mainly for the probability of specialist and dentist private visits. Income-related inequalities are less apparent in inpatient admissions and outpatient visits, favoring the less advantaged. Moreover, intra and interregional inequalities exist in most of health care services use except for probability of GP visits, favoring residents of thinly-populated areas. They are not apparent for inpatient care, as well. Furthermore even though we signify territorial disparities in the probability of specialist visit favoring the better off, once the positive contacts of specialist visits are included, the elderly have equal probability to make a specialist private visit, irrespective of their income and their region of residence. In addition, there is a regressive trend in OOP amount for inpatient admission in terms of ability to pay and region of residence favoring residents of thinly-populated areas and Central Greece region- who tend to be less advantaged. For outpatient care, there is a progressive trend in OOP amount in terms of ability to pay, SHIF coverage and region of residence.

Social Origins, Socio-Economic Status and Intergenerational Transmission of Smoking in Hungary

Alexi Gugushvili
University of Oxford, United Kingdom; University of
Cambridge, United Kingdom
alexi.gugushvili(at)spi.ox.ac.uk

Most studies of the determinants of smoking are based on cross-sectional surveys of individuals. However, individuals are influenced by experiences over their life courses, including parental exposures. While contemporary influences, such as price and marketing, are key factors, the very high rates of smoking among men and the rapid changes among women in the post-communist countries mean that this region offers an opportunity to understand better the intergenerational role of parental influences on smoking. In this study, we exploit a unique dataset, the PrivMort cohort study conducted in 52 Hungarian towns in 2014-2015, which collects information on behaviours of middle-aged and older individuals and their parents, including smoking. We explored the associations between smoking by parents and their offspring using odds ratios and predicted probabilities

from multilevel logistic regressions. The prevalence of smoking in our sample comes close to the latest available data from nationally representative surveys. Adjusting for a wide array of social origin, socio-demographic and socio-economic variables, our multivariate analysis suggests that although sons of regularly smoking fathers have higher likelihood of smoking, the association between daughters' and their smoking mothers is significantly stronger.

RN16 | Session 08b Loneliness, social relations and health

Is self-rated health stable assessment ? - Role of social characteristics of respondents.

Beata Tobiasz-Adamczyk, Katarzyna Zawisza, Aleksander Galas, Tomasz Grodzicki
Department of Medical Sociology, Chair of Epidemiology and Preventive Medicine, Jagiellonian University Medical College, Krakow, Poland.;
Department of Medical Sociology, Chair of Epidemiology and Preventive Medicine, Jagiellonian University Medical College, Krakow, Poland.;
Department of Epidemiology, Chair of Epidemiology and Preventive Medicine, Jagiellonian University Medical College, Krakow, Poland.;
Chair of Internal Medicine and Gerontology, Jagiellonian University Medical College, Krakow, Poland.
mytobias(at)cyf-kr.edu.pl,
katarzyna.zawisza(at)uj.edu.pl,
aleksander.galas(at)uj.edu.pl,
tomasz.grodzicki(at)uj.edu.pl

Several psychological and sociological concepts have been developed to explain the "nature" of self-rated health and showing the role of self-rated health in functional status, social activity and coping strategies with several serious diseases.

The aim of the study was to assess the stability of self-rated health and explain the role of such demographic and social determinants as age, gender, level of education, saturation of social networks, trust, loneliness and participation as predictors of changes in self-assessment health.

Survey was performed in two waves (2011; 2015-2016) covered 1850 community-dwelling Polish citizens (18+). Face-to-face interviews based on structured questionnaire were performed at homes of respondents by specially trained interviewers.

Self-rated health was assessed by single-item question, besides the Courage Social Network Index, 3-item UCLA Loneliness Scale and question focused on trust and social participation were used.

Comparison between I and II waves showed that 46 % of respondents reported no changes in self-rated health, 26,2% indicated better self-assessment and 27,9% noticed negative changes.

Results showed that among considered predictors (age, gender, level of education, the level of social network index, trust, loneliness and participation) of changes in self-rated health, the level of social participation was found as significant (the highest values of social participation was found for those who

indicated no changes (mean=23.4 , SD=14.9) or assessed their health as better (mean=22.8 , SD=14.7), the lowest values were observed for those who assessed their health as worse (mean =20.4, SD=14.4) (p=0.001)).

The results of the GLM Repeated Measures procedure confirmed social participation as significant predictor of changes in self-rated health controlling for other considered variables.

Results of performed analysis confirmed higher level of stability of self-rated health.

Loneliness, weak ties, and the ambivalence of culture

Christopher S. Swader
Lund University, Sweden
cswader(at)gmail.com

This research uses objective and subjective factors to explain perceived loneliness among people in Europe. Objectively, it looks at the effects of living alone, emotional integration, and general social integration. Subjectively, it measures the impact of personal and country-level individualism-collectivism. Using a European sample (European Social Survey 2014) comprising 36760 individuals in 21 countries, the study predicts loneliness using multi-level ordinal regression using both maximum likelihood and Bayesian estimation procedures.

Results indicate that personal individualism enhances acute loneliness while the society's level of individualism reduces it. Moreover, these factors are smaller than the powerful impacts of social isolation on loneliness. In addition, no interaction effects are found between individualism and social isolation; individualists and collectivists are equally impacted by social isolation in terms of its loneliness outcomes. These findings suggest that weak social relationships strongly enhance loneliness, despite that social integration may be differently valued between individuals and across societies. Based on this data, the best case for reduced loneliness is when people have strong face-to-face social ties and are personally collectivist in orientation but living in a tolerant individualist society.

Social capital, gender and depression in Belarus.

Sara Ferlander
Södertörn University, Sweden
sara.ferlander(at)sh.se

Depression is a major and increasing health problem worldwide, especially among women. The condition has been related to various factors, such as alcohol consumption, economic situation and, more recently, to social capital. However, there have been relatively few studies about the social capital-depression association in Eastern Europe, and especially in Belarus. This paper aims to fill this gap by examining different forms of social capital and depression in Belarus, focusing on gender differences.

Data was obtained from the Belarus National Health Survey, which was conducted in 2011. 2107

respondents were interviewed with a response rate of 71.6%. For depression, two measures were used: self-rated and medically diagnosed depression. Social capital was operationalized through questions about different social relations. In order to examine the quality of those relations, respondents were asked to rate them on a 1-10 scale from burdening to energizing. Logistic regression analysis were used to estimate the association between social capital and depression, separately for men and women.

The preliminary findings show that significantly more women than men reported depression. Membership in voluntary associations was very low. Nevertheless, many Belarusians had informal connections with relatives and friends. These were also the forms of relations that were rated as most energizing. Regarding the link between social capital and depression, those who had regular contact with relatives and friends reported less depression than those with less regular contact. It was also found that good relations with friends and relatives were associated with less depression. A significant gender difference was found in these associations. The mental wellbeing of men was mainly related to the quantity of social relations, whereas women benefit more from quality relations.

Understanding human wellbeing: A balance between solitude and sociality

Sunwoo Lee, Jan Halák
Palacký University in Olomouc, Czech Republic;
Palacký University in Olomouc, Czech Republic
sunwoo.lee(at)upol.cz, jan.halak(at)centrum.cz

This study develops a conceptual framework to better understand human wellbeing as related to needs for solitude and sociality. In our conceptual model, we view sociality and solitude as opposing features, but two positive phenomena, and so further explore how to balance them. Three research thrusts were addressed: 1) a development of clear conceptualization and operationalization of solitude and sociality with regard to their underlying cognitive, emotional, physical, and environmental factors; 2) a development and specification of the psychometric instruments to assess solitude and sociality; and 3) a formal theory construction of solitude-sociality balance linked to human wellbeing. To do so, we differentiate solitude from loneliness, which is a lack of social integration. We redefine solitude as one's predominant affinity for or interest in being alone over being with others—a volitional state of being alone. As such, solitude is a motivational force that leads one to engage in constructive practices, including effective self-regulation, creative insights, and a restorative period between social encounters. Building on this idea, we investigate how people coordinate their specific need for solitude and sociality in their social and digital environment, and what negotiation strategies are made to fulfill their social well-being and life satisfaction. Proposed conceptual models and implementation challenges will be discussed from an interdisciplinary perspective, including psychology,

sociology, philosophy, and leisure studies. Findings will expand our understanding of the socio-psychological underpinnings of human wellbeing, and will serve as a basis of new-ecological paradigm in health studies and any related field of studies.

RN16 | Session 08c Health, Body-Weight and Everyday Life: Studying Subjectivities Through Time III

The case of Bariatric surgery: rethinking one's own body and a new style of life.

Giuseppina Cersosimo, Paola Iovino
Department of Medicine, Surgery and Dentistry - University of Salerno, Italy; Department of Medicine, Surgery and Dentistry - University of Salerno, Italy
gcersosi(at)unisa.it, piovino(at)unisa.it

The paper analyses, through interdisciplinary approaches, the perception of one's own body image in subject treated with bariatric surgery. This research clearly emphasizes the increase in adult obesity for biological causes as well as for factors inextricably bound up with a range of social and cultural elements, such as dietary habits, social and local backgrounds, family and gender customs.

The work presents the results an investigation on a sample of people treated with bariatric surgery and realized through both qualitative and quantitative methodologies. The results of the research have shown the need for adoption of a more comprehensive and holistic perspective to further extend the discussion, connecting a social epidemiological framework for obesity together with an analysis of the transformations in the process of socialisation of the people. Such an approach highlights too the pivotal role of the individual in the (re)definition of cultural patterns and lifestyles.

The research showed also that for each patient is important the bariatric surgery because s/he prefers the perspective of the body as a 'project': from this standpoint, and for each respondent, the body represents a presupposition which provides the basis for defining oneself as a subject in good shape and presentable, anyway linked to one's own physical and social well-being. For people such a project casts into a total adherence to the indications received by their respective doctors (ranging from healthy food to risky behaviours).

The power of thinness. Stating moral supremacy through the body

Gisella Orsini
University of Malta, Malta
gisella.orsini(at)um.edu.mt

The data presented is based on a qualitative and comparative research conducted in Malta and Italy between 2012 and 2014, aiming to understand the socio-cultural factors leading to the onset of eating disorders. The study involved participant observation, semi-structured interviews, structured questionnaires and focus groups with 37 women with an eating

disorder and 22 health professionals

The label of 'eating disorders', appeared for the first time in the Diagnostic and Statistical Manual of Mental Disorders, only in 1980. It classifies a number of illnesses characterized by gross disturbances in eating behavior due to a strong fear of gaining weight or becoming fat.

In contrast to the biomedical perception of the phenomenon I consider eating disorders as the result of moral self-transformative processes that reflect the social expectations of women in Malta and Italy.

The drastic changes in personal attitudes towards both food and the body characterising eating disorders are the result of a complete dedication to the moral values embodied in thinness, namely the control of bodily needs and pleasure.

The self-transformative process of people with eating disorders can be understood as a form of moral conversion along a continuum of increasing control over hunger: the higher the control, the higher the level of satisfaction and the degree of moral conversion achieved.

In this sense, while thinness is a symbolic and powerful statement of the triumph of the mind-self, the annihilation of all physical threats to the idealised mind-self, fat bodies are perceived as symbols of moral failure.

Within and against each other: Comparative poetic vignettes as an analytic and educative tool in school health education

Rosie Welch

Monash University, Australia

rosie.welch(at)monash.edu

One of the major challenges for school health education and teacher education in Australia is developing students' critical thinking skills in relation to health and the body. Because of a history of behaviour change and health promotion models, there continues to be a narrative of risk and anxiety, often individualised, around illness and disease as a consequence of individual lifestyle 'choices'. A 'child saving' agenda as others have named it (Evans, Davies & Rich, 2008) is deployed through individualised pedagogies, prescriptive of exercise and diet. In this paper, pre-service graduating teachers' subjectivities in relation to health and the body and their biographical lines of flight (Honan, 2007) are examined. The methodology is revealed as a resource to understand the nuances of how health manifests in different geo-political, economic and social contexts. A set of arguments are put forward for the utility of biographical narrative poetry, especially when used comparatively, and informed empirically by discourse analysis from a larger data set. The methodological process of constructing three representative poetic vignettes of discursive positions from interviews with 23 pre-service primary school teachers is outlined. Foucauldian discourse analysis (Jager and Maier, 2009) informs the steps taken to represent the positionality of the selected pre-service teachers' lived experience. A case is made for this

methodology as a powerful resource for theoretically and pedagogically exploring within and against normative dimensions of health and the body in school health and teacher education.

RN16 | Session 09a Citizen Participation, Genomics and Bio-Banking: Subjectivities

Storing and using the Guthrie Card collection for research purposes: a role for citizens in shaping policy

Carol Porteous, Sarah Cunningham-Burley, David Porteous, Mhairi Quiroz-Aitken

University of Edinburgh, United Kingdom; University of Edinburgh, United Kingdom; University of Edinburgh, United Kingdom; University of Edinburgh, United Kingdom

carol.porteous(at)ed.ac.uk,

Sarah.C.Burley(at)ed.ac.uk,

David.Porteous(at)ed.ac.uk, mhairi.aitken(at)ed.ac.uk

In the wake of recent high profile public controversies relating to the collection and use of health data for research purposes, increasing attention is being directed at public attitudes and preferences in this area. This has led to calls for greater public engagement and to the changing relationships between research professionals and publics, where science is, in many respects, becoming increasingly accountable, not least to demonstrate public benefit. Public engagement has taken a focal role as a means of creating both transparency and accountability, particularly with unfamiliar or cutting edge scientific techniques that may seem controversial. One such provocative example is the possible use Guthrie Cards (heel prick blood spot), which have been stored since the 1980s, for genomic research relevant to medicine. At present, this potential resource is not available for research use. As one way of moving beyond a legal, political and cultural impasse, we conducted a citizens' jury with the overarching question 'Should the Guthrie card collection be preserved and made available for health research? Citizens' juries provide a dialogic approach combining the presentation of scientific evidence with discussion towards a resolute position. Participants have a degree of control over the process with the support of facilitators. We will present an analysis of the views expressed in these deliberations and an account of the process itself along with a consideration of the impact of the jury on participants and the wider policy landscape in Scotland.

"Citizens and "their" samples: The value of bio-material and data in biobanking

Melanie Goisau

University of Vienna, Austria

melanie.goisau(at)univie.ac.at

Collecting, storing, and distributing biological samples and health related data by biobanks, and the potentials and risks connected to these activities, have been subject of many debates regarding ethical, legal,

and societal implications. Thus, questions such as how to improve the involvement of publics and patients in health care policy-making and how health innovation is translated in practices have been raised. Against this background, the paper examines the specific ways in which citizens discuss and imagine the processing of data and human body material in the context of the Austrian biobanking infrastructure BBMRI.at. It builds on the in-depth analysis of nine group-discussions where 114 citizens and patient representatives, together with professionals from the field debated about biobanking. Based on these data, the paper explores how citizens built a connection to the biological material in participatory settings. Based on the assumption, that samples contain genetic information about the donors, citizens imagined the samples as still belonging to the subject. Drawing on sociological theories and concepts in the interpretation of these constructions, the paper elaborates the entanglement of samples, data, and subjectivity. The analysis focusses on the practices in which this entanglement is enacted in ascribing the biological material value and, not least, worth during the participatory process. In connecting these findings to understandings of consent and ownership of (genomic) data, the paper concludes with a discussion of new models for engaging individuals and publics in biobanking.

Negotiating the position of lay expertise in healthcare development and service production

Marjaana Jones

University of Tampere, Finland

marjaana.jones(at)staff.uta.fi

Patient centred care, joint decision making and service user involvement have become some of the guiding principles of the process of reforming public health services in a number of western countries. Patients are no longer described as passive recipients of care. On the contrary they are hailed as the active participants, demanding for individualized care and choice. Particularly in relation to chronic illnesses, patients are also referred as experts, suggesting that they can possess skills and expertise which can also be referred to as experiential knowledge. Although empowering on the surface, these developments can also be viewed as means through which responsibility is shifted on to individuals, who are expected to utilize their expertise by managing their own conditions. However, increased emphasis on involvement and patient centeredness has also meant that people with illness experiences are included into the development and coproduction of services alongside health professionals. Despite these developments, the scope of their role remains vague and they are required to negotiate their own positions in relation to established professionals groups within healthcare. Furthermore, the position of experiential knowledge and its potential contribution to healthcare is often questioned. This study focuses on the perspectives of the healthcare service users who are actively involved in service development and co-production activities in Finland.

In-depth interviews conducted with involved service users are analysed in order to explore how they negotiate their own position and the position of experiential knowledge in varied healthcare service settings and in relation to healthcare professionals.

Solidarity and donor subjectivities: the Finnish case of blood donation and biobanks

Vera Milja Johanna Raivola

University of Eastern Finland, Finland

verar(at)student.uef.fi

In his classic piece, Richard Titmuss (1970) argued that a system of voluntary blood donation - 'a gift for a stranger' free to give and to receive –works more effectively than commercial blood markets when it comes to blood supply. His explanation was that voluntary institutions were able to appeal and construct donors as moral subjects 'gifting' blood for their community which in turn provides for their needs by public goods. Titmuss pictured voluntary blood donation as a reciprocal system that runs on peoples' inherent altruism, instead of personal interests or money.

Today the Finnish Red Cross Blood Service is planning to set up a blood donor biobank. The vision is to provide volunteers 'another way of helping'. Based on blood donor interviews in Finland, I argue that blood donation for research is not the same 'gift relationship' that Titmuss described and the differences need to be acknowledged when these two institutions are integrated. Participation to biobanks is motivated through a narrative of technical innovation rather than social innovation and empathy. From the donor's perspective the 'strangers' in this picture are many and abstract and there is a long, risky wait before anything comes back to the community. Against this context it is more challenging to build on mutual solidarity and moral subjectivities, causing biobanks to rely more on institutional trust. However, capitalism is well rooted in biomedical innovation process and genomic data is specifically framed as 'personalised health'. This puts blood donor biobanks in a rather difficult place as intermediaries between private interests and public's altruism.

RN16 | Session 09b Chronic Siseases and New Health Policies in the Capitalist Era II

The contribution of new technologies to long-term care for Parkinson's patients and their caregivers

Linda Lombi, Michele Marzulli

Università Cattolica del Sacro Cuore, Italy; Università

Cattolica del Sacro Cuore, Italy

linda.lombi(at)unicatt.it, michele.marzulli(at)unicatt.it

Background

Parkinson's disease (PD) is a serious chronic-degenerative disease affecting the human central nervous system. Research has confirmed that PD is associated with a reduction in quality of life, not only for the afflicted, but also for their caregivers (Martinez et al., 2008; Kam Mei et al., 2011; Kudlicka et al.,

2014). Despite the wide occurrence of the disease, its social aspects have not yet been investigated in depth by researchers. In particular, little attention has been paid to non-pharmacological therapies which aim to improve the quality of life of those affected directly and indirectly. Our research investigates the contribution new technologies may make to guaranteeing better life conditions for PD patients and their caregivers.

Methods

We adopt a mixed method approach based on data collected from focus groups (No. 2), face-to-face interviews (No. 18) and web surveys (No. 554) administered to patients, their caregivers and clinical experts.

Results

Patients use online technologies for three main reasons: 1. to communicate with physicians (71.8% of patients interviewed communicate with their neurologist via email); 2. to find information about Parkinson's (over the previous 12 months, 85.5% of patients sought information about their illness on the net); 3. (less common, but important) to maintain contacts with other patients (over the previous 12 months, 34.2% consulted social networks dedicated to Parkinson's). Their caregivers also use social media and the Internet to obtain information about PD and to gain emotional support.

App use is still not common among persons afflicted with Parkinson's (only 15.8% consulted relevant apps), although the clinical experts interviewed predict a growth in technological tools and ensuing benefits for Parkinson's patients.

Difficult return to the labor market: professional re/integration of people with chronic health conditions in Greece and Poland (results from the PATHWAYS research project)

Aleksandra Pilat, Barbara Wozniak, Beata Tobiasz-Adamczyk, Anastasia Vlachou, Panayiota Stavroussi, Olga Roka

Department of Medical Sociology, Jagiellonian University Medical College, Poland; Department of Medical Sociology, Jagiellonian University Medical College, Poland; Department of Medical Sociology, Jagiellonian University Medical College, Poland; Department of Special Education, University of Thessaly, Greece; Department of Special Education, University of Thessaly, Greece; Department of Special Education, University of Thessaly, Greece
 aleksandra.pilat(at)uj.edu.pl,
 barbara.wozniak(at)uj.edu.pl, mytobias(at)cyf-kr.edu.pl, anavlachou(at)uth.gr, stavrusi(at)uth.gr, olgaroc1(at)yahoo.gr

In European countries the situation of people with disabilities at the labor market is regulated, unlike the situation of people with specific health conditions, but not having the "certificate of disability". Among these conditions there are depression, chronic headaches, diabetes, musculoskeletal disorders, COPD and cardiovascular disease. Specific solutions to improve work ability and employability of these groups of patients are needed, like policies, systems and

services tailored to their needs and abilities restricted by health problems.

PATHWAYS project contributes to the development of innovative approaches to promote the professional re/integration of persons with chronic health problems. The main aim of the project is to increase participation of chronically ill individuals in the labor markets through increasing their work ability. Work ability is a result of a combination of different factors, including individual-level and workplace-related factors (Ilmarinen 2009). Identification of systemic solutions and work-related conditions that are favorable to professional activity of persons with chronic conditions is among main objectives of the project.

The first stage of the PATHWAYS project research was aimed to investigate the policies, systems and services addressed to the people with restricted ability to work, existing in ten European countries. Mixed-methods approach was employed, including literature review, expert in-depth interviews with representatives of public, private and NGOs agencies providing support in professional re/integration to people with specific health conditions and internet survey with experts representing organizations working in the field of professional activation and re/integration of chronically ill individuals.

Aim of the presentation is to analyze results of the research conducted in Poland and Greece and to discuss them against the background of the situation in other European countries.

Promoting Telemedicine Implementation in Europe: Between Public Policies and Private Interests

Carlo Botrugno

Università di Firenze, Italy

carlo.botrugno(at)gmail.com

Contemporary health systems are facing challenging transformations due to increasing ageing population and mounting incidence of chronic-degenerative diseases. To address these challenges, a growing part of the literature call on to the implementation of 'telemedicine', which comes from the intersection of telematics and medicine, and has been firstly conceived in the 60's as a fundamental means to provide medical assistance in natural disasters or space missions. Nonetheless, starting from the 90's, the increased reliability of transmission devices has overturned this 'residual ratio' of telemedicine. Nowadays, thanks to the widespread availability of wireless networks and portable devices, telemedicine offers patients a huge range of care services accessible from home, which is meant to avoid unduly transfers to the specialist centres and reduce length of the hospitalizations. In parallel to this development, a public discourse has begun to sustain the implementation of telemedicine into the EU health systems. According to their proponents, telemedicine would improve quality and wide access to healthcare, allowing public health systems to save financial resources. Nonetheless, though telemedicine services are often presented as ready-to-use and without risks,

available evidences on cost-effectiveness and clinical acceptability are scarce and inconsistent, and many questions still need to be addressed for a coherent spread of these services in daily practice. In such a scenario, it is fundamental to assess whether the innovative models are intended to cover real needs of chronic patients, or to induce new ones matching the economic interests of private stakeholders and telemedicine vendors.

RN16 | Session 09c Forced Migration, Health, Policy: Challenges for Europe

Inclusion society, health and asylum seekers: sociological perspective

Alessandra Sannella
University of Cassino, Italy
alessandra.sannella(at)unicas.it

According to the Unhcr over 362.376 people have crossed the Mediterranean last year. 3.771 victims have been recorded . 181.438 arrived in Italy, and 173.450 in Greece. In the first month of 2017, 11.154 arrivals by sea in Europe have been recorded . A research, funded by the University of Cassino, entitled "Project S.E.R.A.: The Health Analysis of Asylum Seekers" was conducted in Centres for Asylum Seekers of Castelnuovo di Porto, near Rome, in the period 2012 – 2013, to investigate health conditions at arrival of Asylum Seekers in Italy. The research focused on the detection of the incidence of 'culture' of origin on people's health in the asylum seekers by redefining their own identity kit (Goffman: 1961). Because of the complexity of the given contest, the survey had to be carried on with mixed methods research. Three focus groups and two seminars were conducted in the Camp. Health data regarding access to the Centre were collected. Overall, data on 792 people (mean age 27 years, 80% males, 58% from Africa) were assessed, and the association between socio-demographics characteristics and screening test results were analyzed. The research aims to suggest that, the promotion of health for asylum seekers, should be taken into account by the Europe policies, as one of the main goals to be followed. The aim is the reduction of health inequalities, and the protection of vulnerable people. A very important point is to ensure protection measures for unaccompanied refugee children.

Mediterranean mortality study: an exploration of the contextual factors associated with the increase of migrant mortality in the Mediterranean Sea from 2014 to 2016

Ludovica Ghilardi, Karl Blanchet, Calum Davey, Diane Duclos, Lucio Malvisi, Aurelie Ponthieu
London School of Hygiene and Tropical Medicine, United Kingdom; London School of Hygiene and Tropical Medicine, United Kingdom; London School of Hygiene and Tropical Medicine, United Kingdom; London School of Hygiene and Tropical Medicine, United Kingdom; Medicins sans Frontieres (MSF);

Medicins sans Frontieres (MSF)
ludovica.ghilardi(at)lshtm.ac.uk,
karl.blanchet(at)lshtm.ac.uk,
Calum.Davey(at)LSHTM.ac.uk,
Diane.Duclos(at)lshtm.ac.uk,
lucio.malvisi(at)rome.msf.org,
Aurelie.Ponthieu(at)brussels.msf.org

Purpose

The crude number of death and "missing" migrants across the Mediterranean migratory roads has increased from 2014 to 2016. Considering the limited available data, is it possible to contextualize the factors associated with this increase?

Methods

Using public available data, we will generate an estimate of the monthly and annual mortality of migrants in the Mediterranean from 2010 to 2016. The estimates will be disaggregate by "death" and "missing" migrants as well as by geographical route. Yet, using geocoded data, we will develop a spatial analysis of the shipwreck to identify the areas at higher risk of shipwreck.

MSF interviews with shipwreck survivors and rescue operators will be utilized to understand the voyage's conditions. Finally, an analysis of the border policies will be developed to contextualize the phenomenon.

Preliminary results

From a preliminary analysis, some trends can be observed: mortality rate has increased dramatically from 2010 to 2011-2012, during the period of the disaggregation of the Libya state. Then, from 2013 to 2014, the mortality rate stayed steady. Recently, from 2014 to 2016 the mortality rate has increase again from 1.93 to 2.46 to 2.80. The change is mostly attributable to the increase of "missing" migrants and to the increase of mortality across the Central Mediterranean route. From a preliminary spatial analysis, areas closed to the Libyan coasts are clusters of significantly higher risk of death compared with areas around.

Looking forward

Variation in mortality should be interpreted in light of the context and modalities of migration. Qualitative and policies analysis will help to understand the risk behaviors taken by the smugglers and the impact of national, regional and international policies on migration.

Networks of Care in EU Borderlands: Humanitarianism, Rights, and the State in Migrants' Maternity Care

Vanessa Elisa Grotti, Cynthia Helen Malakasis, Chiara Quagliariello, Nina Sahraoui
European University Institute, Italy; European University Institute, Italy; European University Institute, Italy; European University Institute, Italy
vanessa.grotti(at)eui.eu, cynthia.malakasis(at)eui.eu, chiara.quagliariello(at)eui.eu, nina.sahraoui(at)eui.eu

Through the study of refugee, asylum-seeker, and undocumented migrant pregnant women's access to healthcare in European borderlands, this paper

analyses the political economy of the provision of prenatal, perinatal, and postnatal care in three sites: Greece (Athens), southern Italy (Lampedusa), and an autonomous Spanish city in northern Africa (Melilla). National legislations in these three countries provide women with access to maternity care regardless of their migration status. If and how this access is granted, however, varies significantly between countries. The combined effects of neoliberal cuts in social services and the burgeoning – particularly in Greece and Italy – of the humanitarian sector in response to the advent of refugees have spawned new structures, networks, and dynamics in the countries' healthcare systems. The paper offers comparative insights into the changing roles of public healthcare structures and humanitarian actors and organizations, and interrogates the implications of emerging divisions of labour in the field: Is the humanitarian sector filling a temporary gap, or slowly establishing a more permanent niche? Conversely, how do national health services negotiate the growing entrenchment of their terrain of action? This inquiry generates a related and crucial one: Is healthcare provided to this category of political subjects as a social right or rather on a humanitarian basis? The paper's theoretical conclusions rely on the empirical findings of long-term ethnographic fieldwork conducted in these three sites by researchers of the ERC-funded project EU Border Care.

Violence indicators and health of refugees/asylum seekers: the first five days

Ignazia Maria Bartholini
Università di Palermo, Italy
ignazia.bartholini(at)unipa.it

Hotspots are the first reception centers where refugees / asylum seekers make entry and remain up to a maximum of 5 days.

It is in this short period of time that the physical violences suffered by refugees / asylum seekers are discovered by medical personnel. However, indicators of physical violence does not constitute a prerequisite to an even psychological treatment program for the victims. They often have unmistakable signs (burns, injuries, physical fractures and so on) in their body. Physical and sexual violences have as target not only women but also young people and men.

Furthermore, some of them declare to be members of "families fake" and phenomenon of "fake family" is another violence after all those suffered.

The research describes the common experiences to 30 witnesses (doctors, nurses, social workers and educators), who work at the Hotspot Trapani-Milo (Sicily).

It describes an "reasonable map" of physical (concrete signs and related codes of interpretation) and psychological violence indicators (mapping of the emotional scripts) suffered by the victims.

It presents an integrated model of "first response" of victim health support and other essential services (accessible alternative accommodation, legal advice, medical and psychological counseling).

HIV and access to rights for Sub-Saharan immigrants in France: results from the ANRS Parcours survey

Anne Gosselin, Study Group for the Parcours CEPED (Université Paris Descartes - IRD), France; CEPED (Université Paris Descartes - IRD), France
anne.gosselin(at)ceped.org,
anne.gosselin.a(at)gmail.com

Background In France, HIV-positive foreigners can obtain a residence permit for medical reasons (RPHR) (a 1-year renewable permit). However, associations for immigrants' rights have claimed that if RPHR holders are entitled to long-term permit, they had more difficulty to access them. In this study we assess whether HIV-positive persons are discriminated because of their holding RPHR.

Methods We use data from the ANRS Parcours quantitative survey which was led in 2012-2013 among 1705 randomly-sampled Sub-Saharan immigrants living with HIV/Aids or Hepatitis B in Paris area. This biographical survey allows us to reconstitute the entire history of residence permits. With discrete-time logistic models, we study the determinants of the access to long-term permits and the effect of RPHR on this access. Control variables are included to take the instruction level, the reason of migration, the period of arrival and length of stay into account.

Results The RPHR has a negative impact on the access to long-term residence permits (aOR between 0.15 and 0.27 according to the group, $p < 0.01$), thus RPHR holders are discriminated in their access to long-term permits in France. Additionally, our results reveal an increasing difficulty to access long-term permits since 2005, reflecting the hardening of migratory policy in the last decade.

Conclusions For the first time these results quantitatively measure the discrimination towards HIV-positive Sub-Saharan immigrants in their access to long-term residence permit and they claim for a sustainable legal status for ill foreigners in Europe.

RN16 | Session 10b Ethical Implications of a Sociological Approach to Health and Illness

He said, she said, we said: What are the ethical issues in conducting joint interviews in qualitative health research?

Karen Lowton
University of Sussex, United Kingdom
k.lowton(at)sussex.ac.uk

Until relatively recently it had been supposed by most qualitative researchers that the individual was the natural unit of investigation for interviews, able to speak both about and on behalf of their partner and other family members, and in doing so convey the more relational aspects of their lives. However, recent work involving dyadic interviews (interviewing couples separately and/or together) has led to increased understanding of how couples experience and manage health and illness. Benefits of this method

include: involving those with health conditions that may otherwise exclude them from research participation; enabling a fuller understanding of how family life is experienced with health conditions; and understanding how men and women present themselves differently in a joint as opposed to individual interview. However, understanding of the ethical issues that arise from this method is not as developed as that for individual interviews and focus groups; this paper focuses on these ethical issues. These include: the topic of research, its sensitivity, and how this might affect interviewees and data collected; recruiting couples, the pressure to participate, and to what extent researchers can prepare participants; managing power imbalances, tension, and social response bias throughout the couple's participation; disclosure of new or contested information within the interview setting, and to what extent confidentiality can be maintained in disseminating research findings. No ethical approach can completely protect participants, yet it is clear that risks to participants from insiders as well as those external to the research can be reduced through attention to these issues.

GPs confronted with social gradients in their practices: looking for the ethical and clinical implications of a study on social inequalities in preventive care

Géraldine Bloy, Laurent Rigal
University of Burgundy - LEDi; Departement of Family Medicine - University Paris Sud - CESP INSERM U 1018
geraldine.bloy(at)u-bourgogne.fr,
laurent.rigal(at)free.fr

Our proposal questions the ethical and clinical implication of a quantitative survey (n=3600) looking for professional, educational and economic gradients in patient "health-related behaviours", on the one side, and in preventive care dispensed by French General Practitioners (GPs), on the other side. We found important gradients among the patients on both sides and almost for each type of care, either in favour or in disfavour of the bottom of the social ladder.

These findings were discussed with the GPs in a qualitative survey linked to the former one, in focus groups and in-depth individual interviews. Their reactions to the social gradients existing among the patients and in the practices were variable. Not every GP admitted the situation. Those admitting it diverged in how patient basic social characteristics could/should be taken into account in the doctor-patient interaction and the care. Ethical issues, especially related to equality, equity, and individual freedom, were embedded, and somehow performed, in GPs' views of their role. Our analysis contrasts 1) those considering the social environment effect as given, vs those intending to challenge it 2) those referring to an individual management of the care vs a more collective approach.

Wondering what could be an ethical clinical use of our findings, we would like to link (rather than to oppose)

the ways GPs think about social inequalities to an epistemological reflection about the meaning of social categorization among sociologists. This means revisiting and maybe updating some fundamental debates on the very nature of social categories or classes, trends or determinations, reification and stereotypes.

Needs versus rights: moral understandings of health workers in Belgium regarding access to healthcare for individuals with precarious immigration status

Dirk Lafaut
Free University of Brussels (VUB), Belgium
dirk.lafaut(at)vub.ac.be

Similar to other European countries, Belgium's increasingly restrictive asylum policies have engendered a growing population of inhabitants lacking citizenship, residence permits or any formal certification of 'belonging'. These individuals and communities live a complex and subterranean reality, in an ambiguous relation with the surrounding society. This ambiguity becomes especially tangible in the domain of healthcare. Belgium has a legal framework about who should pay for medical services provided to individuals with a precarious immigration status. However, empirical findings show this legislation is poorly implemented. Perceptions of 'illegality' somehow seem to conflict with solidarities and notions of 'universality' of access to care.

In this paper we explore what healthcare workers in Belgium consider to be the criteria to help individuals with a precarious immigration status, as well as the concepts and frameworks they use to negotiate dilemma's regarding access to healthcare. Based on multisite ethnographic research and in-depth interviews we identify different subject positions that are taken by healthcare workers.

Starting from an ethics of care perspective we analyse how these subjectivities are linked to broader normative theories and ideological conceptualizations of care in a context of global power imbalances. The normative framework that is currently used regarding access to healthcare, is mainly guided by deontological, utilitarian and human rights perspectives. Our findings suggest that there is a gap between these theoretical models and the lived realities in clinical practice. Starting from needs rather than rights, a care-ethics approach can furnish us with a more comprehensive understanding of how practices on allowing access to healthcare are related to specific ethical characteristics of care, as well as to broader moral values and norms.

RN16 | Session 10c The Pharmaceuticalisation of Performance: Consumption Practices Across Generations

Film representations of performance enhancement: the role of cinema in the shaping of social imaginaries and discourse

Telmo Costa Clamote
ISCTE-IUL, Portugal
telmocostaclamote(at)gmail.com

This presentation discusses the nature and role of film representations of performance enhancement in the reframing of social imaginaries and discourse regarding traditionally bounded visions of the body and of the legitimate scope of its technical manipulation. Film constitutes a cultural product particularly embedded in society, both in terms of its production – usually involving complex networks of social actors – and of its, potentially global, reception. Therefore, it can work as a powerful mediator in the establishment of shared cultural definitions and views of social issues and problems gaining visibility in certain contexts. On the one hand, cinema can take away from social debate thematic material, securing a certain capital of social interest; but on the other, framing it in narrative form, it can contribute to settle the terms of subsequent social discussion, producing an exemplary vision of it. Therefore, cinema can, simultaneously, socially expand and culturally contract public debate. We will address that dynamic looking at representations of performance enhancement in film, and discussing them at three levels. First, that of narrative conventions in film, through which moral discourse on a subject can coexist with its cultural naturalization. Second, that of the place of cinema in contemporary infoscapes, which can further that naturalization by allowing for a growing circularity of representations across different media, which heightens films' mediation role in social discourse. Third, that of the relation between film representations and individuals' actual social representations and practices, concerning the use of performance enhancers, particularly medications.

Managing cognitive performance with medication: comparing youths and elders experiences

Elsa Pegado, Joana Zózimo, Noémia Lopes
Centro de Investigação Interdisciplinar (CiiEM), Instituto Superior de Ciências da Saúde Egas Moniz; Centro de Investigação e Estudos de Sociologia (CIES-IUL), Instituto Universitário de Lisboa (ISCTE-IUL); Centro de Investigação Interdisciplinar (CiiEM), Instituto Superior de Ciências da Saúde Egas Moniz; Centro de Estudos Sociais (CES), Universidade de Coimbra (UC); Centro de Investigação Interdisciplinar (CiiEM), Instituto Superior de Ciências da Saúde Egas Moniz; Centro de Investigação e Estudos de Sociologia (CIES-IUL), Instituto Universitário de Lisboa (ISCTE-IUL)
elsa.pegado(at)iscte.pt, joanazozimo(at)ces.uc.pt, nlopes(at)egasmoniz.edu.pt

One of the expanding strands of pharmaceuticalization is the reconfiguring of the social uses of medicines. If, once, these were confined to the realm of health and illness, empirical research has shown their usage beyond therapeutic goals, namely for the daily management of cognitive performance. Hence, medication consumption (or the dispositions to consume it), oriented to this feature, reflects not only the growing social pressure to enhance performance – which is one of the cultural traces of modern societies –, but also the possibility and desirability of managing performance with pharmaceutical resources, on a drive in which pharmaceuticalisation exceeds medicalisation. These social pressures assume different meanings for different generations and in the different daily contexts individuals live in. Starting from this outlook, this presentation aims to discuss the uses of medication to manage cognitive performance from a transgenerational and comparative perspective, illustrated with empirical data on the consumption, and dispositions to consume, of two segments of the population: youngsters (18-29 yo) and elders (65+ yo). These data were drawn from two sociological studies carried out in Portugal: the first, finished in 2014, on therapeutic consumptions for performance among youths; the latter, finished in 2015, on the psychopharmaceuticalisation of old age. In both studies, a mixed methods approach was used to collect the data, including a questionnaire (n=1483 and n=414, respectively), followed by semi-directive interviews (n=43 and n=30, respectively).

Performance-enhancement investments in urban Mozambique

Carla F. Rodrigues
University of Amsterdam, AISSR, The Netherlands;
Eduardo Mondlane University, Department of Sociology, Mozambique
carla.af.rodrigues(at)gmail.com

Within the increasingly diverse offer of products in the global (and local) market(s), more and more options are available for individuals to enhance their image and their (cognitive, social and physical) performance. These new consumption tendencies are connected with the idea of well-being and improvement, and are based on constructed desires, expectations and needs that go beyond the (often blurred) dichotomy of health and illness. While this seems to be a widespread trend, sociological studies on the pharmaceuticalisation of performance have mainly focused on 'western' contexts. This presentation aims to discuss how the circulation of such 'global' technologies (especially pharmaceuticals), ideals (of well-being, performance, improvement) and images (performative, aesthetical) is having expression in local consumption practices and aspirations in urban Mozambique. What are the individuals' main concerns regarding their performance? Which areas or activities are more permeable to investments through the use of substances (whether herbal medicines or manufactured pharmaceuticals)? What are the main differences in terms of gender and age? Based on a

total of ten months of ethnographic fieldwork in Maputo, including formal and informal interviews and conversations, focus group discussions, observations in pharmacies, and a household survey, this paper aims to address these and other questions. Data shows how the emergence of new areas of investment goes hand in hand with the reconfiguration of old consumption practices.

Risk and performance consumptions among young people: between conceptions and practices

Hélder António Raposo

Lisbon School of Health Technology, Portugal

helder.raposo(at)gmail.com

The main purpose of this presentation is to discuss the emerging reality of the new practices and logics related to therapeutic investments through medications and/or natural products for purposes of mental/cognitive and/or physical/body performance management (performance consumptions) among the Portuguese youth (aged 18-29), through the analytical prism of perceptions of risk and efficacy.

Grounded on the empirical data that results from the application of a questionnaire to a national survey (n = 1483) with non-proportional quota sampling, the sociological analysis that is undertaken is focused in specific indicators, like the perceptions of risk associated with these consumptions; the grading of risk given to different therapeutic resources for performance purposes; and the experience (and management) of risk and efficacy of actual consumption practices.

In terms of the main results, it is possible to underlie the idea that although the positions regarding the risk of performance consumptions do point out a negative perspective and the appreciation of safety, there are specific variations and differentiations that not only indicate permeabilities and predispositions towards consumption, but also conceptions that are redefined due to the actual practices, circumstances and purposes of the consumptions, as well as to the contexts in which those consumptions occur.

RN16 | Session 11a General Call - Health Determinants: Hot Topics

A Discourse Analysis Approach of Vaccine Hesitancy in Romania

Cosmin Toth

University of Bucharest, Romania

paulcosmin(at)yahoo.com

Currently there is major concern on multiple levels for the immunization issues both globally and in Romania related to: vaccine coverage rates, public trust in vaccines and pharmaceutical companies. I intend to approach the vaccine hesitancy subject from a Discourse Analysis perspective.

I analyze discourses and repertoires as commodities using a metaphorical frame of competitive market that will provide a dynamic perspective on how and why certain repertoires are picked up. According to this

metaphor, “sellers” are those who have firm pro- and respectively anti- vaccination convictions while the “buyers” are the parents who are trying to make a decision. My aim here is to analyze some of the most prevalent pro- and anti- vaccine repertoires that are displayed on the Romanian online discursive market. My starting assumption is that the parents that want to make an informed decision will soon have to deal with an enormous quantity of available information that is way too expensive to critically review. This brings them inevitably on a market of repertoires that provides ready-made discursive constructions displaying taken for granted: empirical data, scientific conclusions, analogies, categorizations and metaphors. Thus, a discourse that is accessible, rhetorically well augmented with selected moral and scientific assumptions, containing vivid metaphors easy to invoke and master, is tempting. Analyzing the interpretative repertoires, rhetorical construction, categorizations and metaphors used as weapons on a market of discourses, that is at war on the matter of child immunization, provide an insight on vaccination hesitancy intending to show why certain repertoires are more probable to be picked up, assimilated and used for decision making.

Discursive processes of de-legitimation: The construction of institutional distrust towards national vaccination programs online

Niina Erkama, Johanna Moisander, Kirsi Eräranta

Aalto University, Finland; Aalto University, Finland;

Aalto University, Finland

niina.erkama(at)aalto.fi, johanna.moisander(at)aalto.fi,

kirsi.eraranta(at)aalto.fi

Since their start, the national vaccination programs of industrialized countries have been widely supported institutions with firm legitimacy. In recent years, however, these programs have been increasingly problematized and questioned by the general public as a result of the international swine flu crisis (2009-2010) in particular. In this paper, we examine the discursive processes through which the legitimacy of national healthcare institutions has been problematized, undermined, and defended in online public discussion. More specifically, we analyze the ways in which the national swine flu vaccination campaign was discursively legitimated and de-legitimated in print and online media news in Finland in 2009-2012. Our empirical material consists of 536 newspaper articles published in a leading national newspaper and 345 on-line articles published on the website ‘Vaccination info’, a Finnish non-profit, pro-choice, pro-information citizen association focusing on vaccines. All in all, our paper highlights the process through which institutional distrust against national health authorities was discursively constructed online during this period, and how this contributed to the assemblage of new critical online citizen groups and communities.

Education, job position or income? The importance of selecting the right SES indicator for the prediction of back pain

Michael Fliesser, Jessie De Witt Huberts, Pia-Maria Wippert

University of Potsdam, Germany; University of Potsdam, Germany; University of Potsdam, Germany
fliesser(at)uni-potsdam.de, witthub(at)uni-potsdam.de, wippert(at)uni-potsdam.de

Background: In health research the choice for specific indicators of socioeconomic status (SES) are rarely justified and different indicators are often used interchangeably. This is problematic since the predicted influence of SES on specific health outputs varies depending on the used indicator(s), making it difficult to gain insight into the influence of SES on health outcomes. In this contribution the relative influence of three common SES indicators (education, job position and income) on back pain is investigated, a health domain where this have not been investigated yet.

Methods: A longitudinal study was conducted with 502 healthy adults. Three different SES indicators, education by ISCED, job position by ISCO-08 and income were assessed at the first measurement point. Six months later back pain intensity and disability were evaluated by the chronic pain questionnaire (CPG). Separate regression models for each SES indicator were calculated and standardized regression coefficients were compared.

Results: For back pain intensity job position had the highest impact, followed by education. Income had no significant influence. For back pain disability job position had the highest influence. Education and income had equally strong impacts.

Discussion: Commonly used SES indicators had different predictive powers for the development of back pain, with job position being the strongest predictor for both dependent variables. Education also plays an important role, whereas income only had an influence on pain disability. Reasons for this will be discussed and the importance of SES indicator selection emphasized.

'Neither healthy nor ill': High cholesterol and the experience of risk

Mikko Jauho

Consumer Society Research Centre, University of Helsinki, Finland
mikko.jauho(at)helsinki.fi

Contemporary health care revolves around the concept of risk. Extensive epidemiological studies have connected individual aspects of lifestyle (e.g. fat consumption, smoking) and various personal vital characteristics (e.g. blood pressure, cholesterol) to the probability of developing an illness in the future. Consequently, significant parts of both public and individual health care aim at managing various health risks. Conceptually (elevated) health risk ranks somewhere in the middle ground between health and disease. Risk denotes only the possibility of illness,

yet risk imputations can have real consequences. These consequences are the subject of this presentation. I examine risk perceptions and experiences in persons who have elevated cholesterol, an asymptomatic risk factor for cardiovascular disease, or are otherwise concerned about their cholesterol levels. The material consists of semi-structured interviews with healthy adult individuals conducted in 2015. The analysis is guided by questions related to the demarcation of the boundaries between health, illness and risk: how does 'the experience of risk' relate to the experience of illness and in what way they differ from each other?

RN16 | Session 11b Making Publics and Building Solidarities in 21st Century Public Health

Between reflexive patients and reflected health care systems: the case of patient and public involvement

Dino Numerato

Faculty of Social Sciences, Charles University, Prague, Czech Republic
dino.numerato(at)fsv.cuni.cz

This paper analyses the role of patient and public involvement (PPI) in the politics of health care in the Czech Republic. By understanding PPI both as a bottom-up civic engagement and top-down initiative stimulated by public policies, the analysis is focused on the dynamics between engaged citizens and health care system. In this regard, the capacity of PPI to transform, redirect and reorient health care is critically examined. In order to understand the PPI's impact, the paper discusses the internal heterogeneity of PPI. Furthermore, the paper identifies different scenarios that emerge due to the impact of PPI on the Czech health care system. Different health care (re-)configurations caused by the PPI are situated on the scale between the transformation and reproduction of the health care system. The analysis is theoretically framed by the concept of reflexivity; the focus is given to the dynamics between reflexive patients on the one hand and critically reflected and potentially reflexive representatives of the health care system on the other hand. A particular attention is given to the role of digital media in these processes. The data that underpin the analysis are drawn on the qualitative study carried out both online and offline of the patient and public involvement in the Czech Republic as part of the project "Civic engagement and the politics of health care". More specifically, a critical discursive analysis of primary and secondary documents is complemented with semi-structured interviews with citizens and policy-makers.

Europe and transplant tourism

David Matas

Canadian Bar Association, Canada
dmatas(at)mts.net

The focus of the presentation would be transplant tourism from Europe, using travel to China as a case

study. The rise of transplant tourism into China coincided with a shift in China from socialism to capitalism. The Government of China, as part of this shift, withdrew funds from the health system. This funding gap was filled in large measure by the sale of organs, often to transplant tourists, sourced from prisoners sentenced to death and prisoners of conscience.

Globally, humanity was not defended against this abuse. Outside of China, organ trafficking prohibitions were largely territorial nature, and did not apply to transplant tourism. The Council of Europe Convention against Trafficking in Human Organs opened for signature in March 2015, the European Parliament 2013 resolution on organ harvesting in China and its 2015 declaration on investigating organ transplant practices in China address the abuse.

The inclination of health professionals to focus on the health of their patients has come up against the need for concern about organ sources. The question of compulsory reporting by health professionals to health authorities of international transplant tourism is a particular area of tension. As well, the issue of organ transplant abuse in China gets tangled up with larger questions of China European relationships.

The presentation would consider the answers of pan-European institutions to these questions and the response of a sampling of European countries. The conclusion would be that subjectivities make resolution of the conflict between capitalism and solidarity in this area difficult to achieve.

Solidarity and cost management: Swiss citizens' reasons for priorities regarding health insurance coverage

Mélinée Schindler, Marion Danis, Samia Hurst
Département de Sociologie, Université de Genève, Switzerland; National Institutes of Health, United States; Institut éthique histoire et humanités, Université de Genève, Switzerland
melinee.schindler(at)unige.ch, MDanis(at)cc.nih.gov, samia.hurst(at)unige.ch

Approaches to priority setting for scarce resources have shifted to public deliberation as trade-offs become more difficult. We report qualitative results of public deliberation in Switzerland, a country with high health care costs, an individual health insurance mandate, and a strong tradition of direct democracy with frequent votes related to health care.

We adapted the Choosing Healthplans All Together (CHAT) tool, an exercise developed to transform complex health care allocation decisions into easily understandable choices, for use in Switzerland. We conducted focus groups in twelve Swiss cities, recruiting from a range of socio-economic backgrounds in the three language regions.

Participants developed strategic arguments based on the importance of basic coverage for all, and of cost-benefit evaluation. They also expressed arguments relying on a principle of solidarity, in particular the importance of protection for vulnerable groups, and on the importance of medical care. They struggled with

the place of personal responsibility in coverage decisions. In commenting on the exercise, participants found the degree of consensus despite differing opinions surprising and valuable.

The Swiss population is particularly attentive to the costs of health care and means of reducing these costs. Swiss citizens are capable of making trade-offs and setting priorities for complex health issues.

The impact of social networks on the level of health literacy among Polish elderly, in the context of their area of residence (urban/rural). The SKSPOL study.

Zofia Antonina Slonska, Agnieszka Borowiec, Anita Ewa Aranowska
the Cardinal Wyszyński Institute of Cardiology, Poland; the Cardinal Wyszyński Institute of Cardiology, Poland; the Cardinal Wyszyński Institute of Cardiology, Poland
slonska(at)post.pl, a.borowiec(at)ikard.pl, a.aranowska(at)ikard.pl

In accordance with the statistical prognosis the process of Polish population aging will be constantly accompanied by a dynamic growth of the old-age dependency ratio. It means, that along with the aging process, we can expect, both at the individual and the societal level, the intensification of the problemmes related to coping with worsening health and social dependency. One of the threats, which can contribute to the prevention of the threats is the empowerment of the elderly through activation and education of their social networks in supporting them in rising their health literacy . To perform this task a deepen knowledge on relationships between social networks and health literacy in different contexts is needed. The aim of the presentation is to show the newly identified categories of social networks and then to assess them in terms of their impact on the health literacy of older people in urban and rural area in Poland. The analyzed data come from the study, which at the turn of 2016 and 2017 was carried out by the Institute of Cardiology, Warsaw in the representative sample of 750 elders aged 65-84 years. Data were collected by the standardized questionnaire, using PAPI.

RN16 | Session 11c Precarity and Health in the Wake of the Crisis

RN16 & RN19 | Session 09a JOINT SESSION: Valuable Health Care? Curing and Caring in the Shadow of the Social and Economic Crisis

Changing frontline care roles to reduce bed blocking in the UK NHS

Kathy Hartley
University of Salford, United Kingdom
k.a.hartley(at)salford.ac.uk

The need for greater integration of health and social care services is headline policy in the UK (Social Care Act, 2014) in a bid to improve patient flow from

hospital to community and reduce bed blocking. One impact of this is that professional groups from differently managed and funded sectors need to work more closely and in new ways, as solutions are sought and implemented. The professions and change literature highlights some of the challenges associated with this, owing to status differences that exist between such professional groups (Huby et al., 2014) and the salience of such occupational identities (McNeil et al., 2013) One site has plans to alter the way by which discharge of patients from hospital occurs, transferring responsibility from a senior nurse to local nurses, care workers and physiotherapists, with an ambitious timetable by which this must occur. How such a change of roles might be approached, perceived and achieved is therefore of interest from both a theoretical and practice perspective.

**Does state care of those, who care about us?
Some challenges for health care practitioners in
the context of social and economic reforms**

Anastasiia Novkunskaia
European University at Saint-Petersburg, Russian
Federation
a.novkunskaia(at)gmail.com

Neoliberal reforms appear to be one of the key factors, changing healthcare institutions nowadays. Applying both, market and managerial logics of regulation, such measures often cause some additional challenges for the work of health care practitioners and lead to unpredictable and unexpected transformations of the institutional field.

This paper addresses several levels of social change occurring in the field of obstetric care in Russian small towns. In particular, it describes some recent state reforms, which apply neoliberal logic, and reveals its innate contradictions. It also analyses the consequences of regulatory alterations for healthcare institutions' performance, medical professionals' work, and their clients' opportunities. Application of the neo-Weberian approach allows investigating the particular challenges for professionals' regulation, set by other parties, like state, insurance companies, managers and patients, violating the very ideals of professional commitment for doctors and other healthcare practitioners.

Moreover, I aim to show, that current institutional transformations unequally affect different areas and lines of health care. There are some important heterogeneities between formally similar institutions, working in different regions (like, for example, remote provincial areas). Further, the specificity of obstetric care itself predetermines some additional challenges due to unpredictability of the process of labor and symbolical meanings, related to the field of childbirth. The gender-sensitive analytical optics allows recovering such problems, as increasing demands emerging from the patients and some other social agents (the Orthodox church, state), imposing extra tasks and difficulties for the medical professionals' work.

**Health insurance and disability insurance:
solidarity development and deservingness
perceptions**

Maartje van der Aa
Maastricht University, The Netherlands
m.vanderaa(at)maastrichtuniversity.nl

Solidarity is the 'moral infrastructure' of social insurance arrangements that protect citizens against financial risks of illness. However, many European countries have set up different insurance arrangements for either risk: costs of treatment are covered through health insurance, while illness-related loss-of-income is arranged through disability insurance. This paper compares the development of these policies and the perceptions towards claimants in a case study of the Netherlands.

First, we conducted an analysis of the development of solidarity in health insurance and disability insurance since the 1980s. We conclude that restrictions in solidarity in disability insurance were broader, more thorough and implemented more quickly than in health insurance. Furthermore, there were differences in the development of their public-private mix. Whereas health insurance remained a public structure, private arrangements were introduced in disability insurance. Second, we examined a sociological explanation of the difference between health insurance and disability insurance by looking into the perceptions of citizens towards claimants. Do citizens support absolute allocation or do they think that benefits should be conditioned? If so, based on which criteria? We conducted a discrete choice experiment (n=345), which demonstrates that cooperation of claimants – with the treatment and/or reintegration into employment – was significantly more important (p<0.01) to be considered deserving for disability insurance (30% influencing choice) than to be considered deserving for health insurance (19%). These different perceptions of claimants in of health insurance and disability insurance may have contributed to the deeper impact of reform on solidarity in the latter.

**Between Caring and Killing – Ambivalences in the
Profession of Farm Animal Veterinary Medicine**

Julia Gutjahr
University of Hamburg, Germany, Institute of
Sociology
julia_gutjahr(at)yahoo.de

Although animal farming is embedded in an (increasingly problematized) ambivalent human-animal relationship, and veterinarians play an important role in animal agriculture, livestock veterinary medicine as a specific healthcare profession has received little attention from sociology so far.

Sociological research about people working with livestock animals has shown the ambiguous nature of these relationships (Wilkie 2010). Professional work in animal healthcare also is, as in human medicine (Merton 1976), framed by ambivalences. However,

these differ from other health professions: The specific constellation of actors and professional values, which aim to serve both people and animals, lead to particularly complex moral issues in daily work (Atwood-Harvey 2005, Swabe 2000), which include, for example, euthanasia (e.g., Sanders 1995, Rohlff/Bennett 2005).

Farm animal medicine specifically holds conflicting demands. Animals are functionalized as commodities, and economical constraints determine the value of healthcare, but veterinarians also work with sentient beings and have a curative mandate (c.f. "Caring-Killing Paradox", Arluke/Sanders 1996: 85).

This paper aims to answer the question: How do farm animal veterinarians make sense of job-related ambivalences? The paper introduces a theoretical classification of 'ambivalence management' about the ways veterinarians cope with conflicting requirements of their professional work. The basis is an empirical study with qualitative, semi-structured interviews with 16 cattle veterinarians in Germany. The results show, that vets form complex perceptions about ambivalences and develop a professional identity with strategies to deal with them, such as normalization and distancing techniques.

RN16 & RN35 | Session 11a JOINT SESSION: Migrations and Health Inequalities in Europe

"...and what ends up happening is that we end up lying" Palliative Care Workers talk about Cross-cultural Interaction

Pernilla Ågård, Sandra Torres
Uppsala University, Sweden; Uppsala University, Sweden
pernilla.agard(at)soc.uu.se, sandra.torres(at)soc.uu.se

The social-constructionist perspective argues that language sets the framework for how we perceive the world around us. In interacting with others we negotiate the characteristics that we ascribe to different categories. This presentation departs from research showing that 'Othering' processes to could lead up to inequalities in health care. It is namely through these processes that people are reduced to a few stereotypic characteristics. This presentation aims focuses therefore on how end-of-life care workers discuss cross-cultural care interactions with patients categorized as migrants and the ways in which stereotypes about them are formulated.

Through focus group interviews with end-of-life care workers in Sweden (n=60) this presentation explores how end-of-life care workers negotiate, refute and compromise their understandings of cross-cultural interaction in talk and how assumptions about ethnic 'Others' are the backdrop against which they formulate their views on this type of interaction. Findings show that the end-of-life care workers interviewed often regard cross-cultural interaction as challenging since these patients are assumed not only to have needs that differ from 'ordinary patients' but needs that could collide with some of the core values of the Swedish health care legislation. As such, the study contributes

to research on cross-cultural care interactions and brings attention to the 'Othering' processes that take place amongst co-workers in care settings.

From expats to precarity. Migrant women and health care in the context of pregnancy and birth.

Alena Parizkova
University of West Bohemia in Pilsen, Czech Republic
parizkov(at)kss.zcu.cz

Pregnancy and birth are important situation influencing maternal health and simultaneously are influenced by women's context and circumstances. Our research focuses on maternal health of migrant women in the Czech Republic. We are interested in women's expectations, experiences and in the context of their pregnancy and birth stories. We conducted interviews with migrant mothers and workers from helping professions, namely social workers, midwives and psychologist, who have worked with migrant women. In the presentation we will show how the intersection of legal statuses, conditions of employment and protective policies shape the position of migrant women when dealing with the need of health care during pregnancy and birth. Precarious status influence access to the health care and brings various challenges for migrant women, such as higher expenses, bureaucratic obstacles, uncertainty and stress. A significant topic is the health insurance system, which affects the access to the health care not only for the mother but also for a child.

"We are obliged to provide UAMs with special care" – Negotiating between Vulnerability, Autonomy and Identity in Malta

Laura Kristina Otto
University of Bremen, Germany
laurakristina.otto(at)gmail.com

25% of arriving refugees in Malta are classified as UAMs following age assessment. Consequently, they are placed under the Refugee Act and a Care Order, receiving general refugee and specialized services for UAMs, the latter being perceived as particularly vulnerable and thus housed in special homes. My research, based on ethnographic fieldwork conducted between 2013-2016 includes interviews with refugee and non-refugee actors. The research relationship with the young refugees can be described as long-term and collaborative. By analysing the situation within these homes —where age disputes occur beyond the formal age assessment procedure between refugees and institutional staff— from a postcolonial and intersectional point of view, Western notions of childhood can be made visible and investigated. The young refugees feel pressured, insecure and under surveillance. Thus, the home, formally established to protect vulnerable people, becomes a place of new insecurities, distrust and exclusion for UAMs. In this setting, help and vulnerability are negotiated, extending supportive practices beyond the mere legal frameworks in place. Both refugee and non-refugee actors developed

support practices there, but unmake them at the same time. The focus on the practices developed by young refugees in these homes illuminates the extent to which they can be understood as subjects acting with agency. I argue that borders are not merely locatable and fixed on a map, but rather unfixed, non-permanent and malleable. These can be described as (social) boundaries that exist in dividing between the in- and outside. The perpetuated age disputes thus contribute to producing these social boundaries.

Effects of ethnic group density on young migrants' health and health behaviour

Matthias Robert Kern

University of Luxembourg, Luxembourg

matthiasrobert.kern(at)uni.lu

Throughout the 20th century and the beginning of the current one there has been a drastic increase in ethnic diversity in many European societies.

From a sociology of health perspective these developments pose the question of how processes of acculturation, and with it levels of acculturative stress, often seen as responsible for many of the adverse health effects of migration, are altered if the standard assumption of an allochthonous ethnic minority acculturating to the ways of an autochthonous ethnic majority is violated. The ethnic density hypothesis suggests that an increase in own ethnic group density or overall ethnic minority density, through facilitating social support networks among co-ethnics, decreasing the rates and altering the perception of incidences of interpersonal racism and lowering the gap between acculturation and ecology can have a buffering effect on the adverse health effects of migrant status. This contribution, relying on data from the 2013-14 wave of the Luxembourgish Health Behaviour in School-Aged Children (HBSC) study, investigates the relationship between young migrants' health and health behaviour and ethnic density in school classes. School classes, as an essential part of school-students' immediate social environment, constitute an important acculturation context. At the same time, Luxembourg, as one of the most diverse countries in Europe, where almost two thirds of school-aged children have a migration background and only roughly 17% of first- and second-generation migrants attend classes with a native majority, presents itself as the ideal national context to explore the implications of increasing levels of ethnic diversity for migrant health and, due to its high variance in ethnic density between classes, offers enough statistical power to detect the sketched potential moderating effects.

RN17 - Work, Employment and Industrial Relations

RN17 | Session 01a European Industrial Relations: Representation, Representativeness and Social Dialogue

Effectiveness and Engagement in European Sectoral Social Dialogue

Barbara Bechter, Bengt Larsson, Gizem Bozdemir, Manuela Galetto, Thomas Prosser, Sabrina Weber
 University of Durham; University of Gothenburg;
 University of Durham; University of Warwick;
 University of Cardiff; Pforzheim University
 barbara.bechter(at)durham.ac.uk,
 bengt.larsson(at)socav.gu.se,
 gizem.bozdemir(at)durham.ac.uk,
 Manuela.Galetto(at)wbs.ac.uk,
 ProsserTJ(at)cardiff.ac.uk,
 sabrina.weber(at)hs-pforzheim.de

Research on the mechanisms and outcomes of Sectoral Social Dialogue Committees (SSDCs) point towards diverging directions. Some focus on good examples or cases that produced concrete outcomes and therefore see a genuine contribution of SSDCs to the multilevel governance of employment relations in the EU. Others, by contrast, emphasise how the massive output in number of SSDC-texts mainly includes legally non-binding agreements or procedural documents. Such literature focus on the obstacles that hinder both the commitment of social partners and the implementation of the documents jointly produced. The aim of this paper is to theoretically elaborate and try out different empirical measures of "effectiveness" and "engagement" in SSDCs.

As regards effectiveness we attempt to unpack the concept both by asking "for whom?", and "in achieving what?" Also the issue of engagement needs to be conceptually elaborated in order to be understood and measured adequately. The social partners' engagement may vary in relation to:

- topic and issue tackled at European level,
- different instruments (e.g. agreements, guidelines, recommendations, tools, statements),
- the direction of influence seeking (addressor),
- the process of communication (top-down, bottom up), and
- consensus building and collaboration (vertical and horizontal).

The paper is based on ongoing research in the SPEED-project (Social Partner Engagement and Effectiveness in European Dialogue). The projects

combines both quantitative material covering all 43 SSDCs, and in-depth qualitative interview studies of two SSDCs (metal and hospital) covering the social partner organizations in five countries (DE, IT, PL, SE, UK).

Representativeness and outcome of European Sector Social Dialogue - a comparison of 4 sectors

Peter Kerckhofs, Georg Adam
 Eurofound, Ireland; Forba, Austria
 peter.kerckhofs(at)eurofound.europa.eu,
 adam(at)forba.at

Sector social dialogue has been established at European level within a legal framework from 1998. This resulted in 43 European sector social dialogue committees (ESSDC). Industrial relations research has shown great interest on understanding processes and dynamics of this form of multi-level sectoral social dialogue. To ensure that the right actors are involved in these ESSDCs, Eurofound is conducting representiveness studies on the request of the European Commission. In doing so, a longstanding cooperation over 10 years with Forba offers expertise that will form the basis of this paper.

Some research suggests the existence of a link between the organisational strength of the European associations involved in European sectoral social dialogue (ESSD) and their capacity to produce any outcome in terms of jointly agreed texts and implement these agreements. The hypothesis is that features such as low actor fragmentation, high organisation density, high levels of collective bargaining and formal European level mandating procedures, are generally found in the sectors where ESSD appears, at least formally, to have been most productive.

While representiveness studies compile data on those factors, they allow us to assess whether those hypotheses can be confirmed or countered. For this purpose, a comparative analysis of the representiveness of European Social Partner organisations in 4 different sectors will be conducted: Agriculture, Inland waterway, Footwear and Tanning & Leather.

"The Political Theory of European Works Councils; Transnational Trade Unions, Networks and Europeanization

Vasileios Koniaris
 University of Macedonia, Thessaloniki Greece,
 Greece
 koniar(at)uom.edu.gr

The aim of this article is to take the current analysis concerning European Works Councils one step further by examining the new political theory behind this form of employees' information and consultation structure. It is suggested that in those successful cases, which are the minority of the current ones, elements of transnationality, networks and identities may constitute a new form of industrial relations based on

collaboration between management and employees in the European multinational company. In those cases, attitudes of the representatives differ from traditional industrial relations approach when they are examined in the transnational framework. Also, European Works Councils may act as asymmetric “risk absorbents” concerning globalization, thus offering to the EU the capacity to re-balance her economic and social integration. Evidence for the article is being based on a set of semi-structured interviews that are conducted since the adoption of the Recast Directive 38/2009 and on literature concerning post-industrialism in the EU.

Activation policies : institutional standardization and lived forms of expected work

Didier Demazière, Marc Zune
CSO - Sciences Po Paris; University of Louvain, Belgium
d.demaziere(at)cs0.cnrs.fr, marc.zune(at)uclouvain.be

The activation of job search behaviour is a key characteristic of the so-called Active Labour Market Policies in many European countries. Based on an incentive paradigm, these policies tend to intensify conditionality to unemployment insurance benefits (UIB) by a greater control of the effectiveness of job search. Numerous critical studies have highlighted the forms of standardization of job search induced by the control agencies, and the underlying pressure for behavioural change and increased responsibility. Our paper seeks to better understand the experience the unemployed under this activation regime, through the original point of view of the one who fail to cope and are sanctioned. Our empirical data is based on a corpus of some 30 in-depth interviews conducted with unemployed who have been definitely excluded from UIB in Belgium in 2015. We firstly describe the gaps between institutional requirements, based on a standard employment reference and an normative conception of job-search, and the subjective interpretations of the unemployed based on heterogeneous experiences of past employment and their present situation combining unemployment and exclusion. Post-exclusion effects are then analysed, highlighting the variety of what we call « the forms of expected work », drawing a large panorama of projections into work activities, often conceived at distance from standard employment, and more or less attainable depending on the relational and biographical resources. Our development helps us, in turn, to contribute to the understanding of the experience of employment after unemployment, and the contemporary transformation of the boundaries between inactivity and employment.

RN17 | Session 01b Recognition and Inclusion at the Labour Market - on the Matter of Gender and Age

Individual perspective on the occupational prestige and gender discrimination on the labour market

Olga Anna Czeranowska
University of Warsaw, Poland
o.czeranowska(at)gmail.com

Occupational prestige is one of the classic research topics in the sociology of work and labour. However, there are some methodological problems still unsolved. The most important of them is defining the concept of prestige. Other important issue is the “invisibility of gender” in the research on occupational prestige – questionnaires relate to the occupational group as a whole, without differentiating prestige of male and female incumbents.

In the research for my PhD thesis I decided to focus on the individual perspective and describe experiences of members of high prestige occupational groups. My second goal was to elaborate social definition of occupational prestige. Differences between men and women on the labour market and gender discrimination were included in my research plan as a horizontal problem.

In order to obtain complex answers for my research questions I used triangulation of data, sources and methods. I chose explanatory research design: qualitative research was used to explain and deepen initial findings obtained by using quantitative methods. First stage of my research included quantitative media analysis, auditory questionnaire and desk research. Results enabled me to elaborate methodology of the second, quantitative stage – individual in-depth interviews with members of high prestige occupational groups. Interviews were analyzed with the use of methodology inspired by systematic text condensation, which enabled me to discover different meanings of occupational prestige in biographies of men and women. I was also able to elaborate a social definition of prestige which is based on binary oppositions.

Gender Imbalance in IT Sector: The Case of Taiwan

Yung-Han Chang
University of Kang Ning, Taiwan
yhchang(at)ukn.edu.tw

Since the early 20th century, the labor participation rate of women in many developed countries has increased. However, many scholars have found that women often face gender segregation in a way that women are less likely to take jobs requiring high professional competence. As information technology (IT) industry blooms in recent decades, the relatively lower percentage of female employees in this industry has been particularly intriguing given that the first computer programmer was a woman, the mathematician and writer—Ada Lovelace. Although Taiwan, one of the economic entities that invests heavily in IT sector, has emphasized on the technology development and talents cultivation in this field, there has been a lack of research into women's

under representation. Previous studies examining gender imbalance in IT industry have mostly either adopted essentialist or social constructionist theories, and attributed the imbalance to female characteristics or work environment and culture. Whereas the essentialist approach simplified the gender imbalance problem and seen it as the result of gender differences, the social constructionist approach failed to take women's different reactions to the environment into account. Accordingly, this study adopted Trauth's "individual differences theory of gender and IT" and a mixed-methods approach by using both quantitative data from Taiwan's Manpower Survey and in-depth interviews with 22 female and 8 male employees in IT sector. The research findings showed that women were underrepresented in Taiwan's IT sector, especially in management jobs. The gender imbalance started from education and was associated with patriarchal culture and work-family conflicts. Unless these issues are addressed, gender inequality in pay and the promotion opportunities found in the analysis suggests a persistence of gender imbalance in future.

Split consciousness: Workers' representatives and social justice

Gadi Nissim

Ruppin Academic Center, Israel
gadinissim(at)gmail.com

Unions' stewards at the workplace level are characterized by a split political consciousness rather than comprehensive one. They express egalitarian motivations and class solidarity, but this tendency remains local and limited in scope.

This paper is part of a larger study of the activity of unions' stewards in twenty different corporations in Israel. Based on a qualitative research, I demonstrate that while stewards make their organizational decisions at the workplace, these are often not consistent with their broader political views. For example, Jewish stewards have sought the political support of their Palestinian co-workers in the organization while disregarding the wider political implications of this endeavor in light of the general Israeli-Palestinian conflict. Similarly, stewards may express anti-neoliberal views, but at the same time they maintain their political support of the Israeli right because of its hard policy towards the Arab.

The findings imply that political consciousness and sense of social justice tend to be diverse among unions' stewards. The egalitarian motivation and class solidarity are often confined to face-to-face interaction at the workplace. Moreover, class egalitarianism and solidarity are repeatedly overshadowed by contradictory stronger commitment to separatist views regarding nationality, religion and more. Similar tendency may occur in other countries while the internal organizational dynamics are subjected to other external forces (such as mass immigration and economic turbulence).

The opportunity to be outsiders: minimum income scheme beneficiaries engaged in public works

Silvia Girardi, Roland Maas, Valeria Pulignano

LISER, Luxembourg; KU Leuven - Centre for Sociological Research Employment (Industrial) and Labour Market Studies, Belgium; LISER, Luxembourg; KU Leuven - Centre for Sociological Research Employment (Industrial) and Labour Market Studies, Belgium

silvia.girardi(at)liser.lu, roland.maas(at)liser.lu, valeria.pulignano(at)kuleuven.be

Following the literature on labour market insiders/outside, we challenge the view that labour market integration inevitably leads to social inclusion. We argue that labour market integration does not imply necessary a subjective experience of social inclusion.

We ground this claim on in-depth qualitative interviews with people on a minimum income scheme who are engaged in public works in return for their welfare benefit. The interviews focus on the perception of their occupation and we analyse them looking at how work insecurity manifests in their lives. These are a group of peculiarly vulnerable people which have been assigned to work experience programmes by the social assistance service provider (e.g. case workers), usually in the public or non-profit sector, as they are considered unable to participate to the labour market unless provided with a sheltered occupation. This specific group of workers is very little studied in the debate on insiders/outside and, therefore, we shed light on their job insecurity and investigate their outsidersness condition with regards to their participation both to the labour market and society.

Although the main narrative of policy makers and social workers on these kind of jobs rhetorically stresses their role as an opportunity for beneficiaries, our research outlines that 1) those work programmes display a whole range of characteristics associated to precarious jobs such as the temporary duration and low level of protection and employment rights; 2) subjectively, some workers experience both an high level of insecurity and forms of disrespect from co-workers.

RN17 | Session 01c Trade Union Formation and Organisation

On The Outside Looking In? A Micro-level Analysis of the Perceptions of Trade Union Representation and Membership in the Netherlands

Giedo Jansen, Alex Lehr

University of Twente, Netherlands, The; Radboud University, Netherlands, The
giedo.jansen(at)utwente.nl, a.lehr(at)fm.ru.nl

It is often held that trade unions predominantly represent "standard" workers, with permanent and full-time employment contracts. "Non-standard" workers, for example employees with temporary contracts, agency workers or freelancers, are believed to be

poorly accommodated by trade unions. To explain the representation gap, insider/outsider-theories postulate that non-standard workers would refrain from membership because they believe that unions protect the secure jobs of insiders rather than the insecure jobs of outsiders. This simple assumption, however, that links employment type and job insecurity to perceptions of trade union inclusiveness (or rather feelings of “outsiderness”) has rarely been empirically tested. Hence, the questions addressed here are: (a) To what extent have standard and non-standard workers different perceptions of trade union inclusiveness, and (b) to what extent are perceptions of a representation deficit related to a lower willingness to join a trade union?

To answer this question hypotheses are derived from insider-outsider theories and theories on union revitalization. It is hypothesized that outsiders (i.e., non-standard workers, unemployed) perceive trade unions as both less inclusive as well as less responsive to their needs than insiders. Moreover, it is expected that these perceptions of a representation deficit are related to a lower willingness to join a trade union. Empirically, this article focusses on the Netherlands, a country with a relatively flexible labor market and a typical gap in union membership between standard and non-standard workers. Data in used from the 2015 “Work and Politics”-wave fielded through the LISS Panel (Longitudinal Internet Studies for the Social Sciences).

The position of trade unions and the discourse: a case of Poland

Piotr Ostrowski
University of Warsaw, Poland
ostrowskip(at)is.uw.edu.pl

Over the past 27 years, Poland has undergone a socio-economic transformation, which had a profound impact on labour relations, including the position of trade unions. These changes were reflected in the discourse on industrial relations. However, this question has received scant attention from sociologists. This is particularly unfortunate since there are efficient analytical tools that allow us for acknowledging those factors. The aim of this paper is to bridge the above-mentioned gap by demonstrating that Critical Discourse Analysis (CDA) is a relevant tool in the context of research in industrial relations. It helps to study the asymmetry between the forces of Labour and Capital. For CDA, language is the most important factor behind the creation and reproduction in the society; the nature of power and (symbolic) domination. These two are hidden and covered by the “official” discourse. The creation of “commonly-shared” consensus, acceptance and legitimation for the domination are the main functions of the hegemonic discourse. Moreover, CDA requires that the “uncovering” researcher not only “externally” describes and explains the studied phenomena, but also actively addresses the voice of the dominated and defends those who, by means of symbolic violence, are subject to the tyranny of the power

relations. The paper presents an application of CDA to industrial relations in Poland, and the position of Polish trade unions, by using the examples taken from several studies which I conducted in the past years.

Narration of Workers from Turkish Steel Town: From Old to New Generations

Mustafa Berkay Aydın
Uludağ University, Turkey
berkayaydin(at)gmail.com

This paper examines the formation processes of the working class in Karabük on the basis of Karabük Iron-Steel Factories. The workers who have been working in the factory since the foundation of the corporation are chosen as the sample group of the study. The working class identity and the general formation of the working class are examined through three different 'generations'. Focus group and a field research based upon survey are applied in addition to in depth interviews. The aim of this study, in accordance with the historical development, to discuss each period separately, from the perspectives of their continuity and distinctiveness. By laying emphasis on trade union history and political field particularly, the study also tries to define the roles of these variables in the process of formation of the working class in different periods. It seems that the significant distinctiveness of the last generation of these three generations is remarkable.

This paper focuses on historical process of working class formation. Karabük is the oldest heavy industry investment of Turkey. In its 75 years history, it can be seen Turkish social and economic history with workers' perspective. Karabük is a one of the 'steel town'. In generally, from a historical perspective politics come before industrial workplace relations. On the other hand, the study tries to focus on last generation working class, and the results are signed that the last generation of steel workers as 'precariat'. Last generation workers quest new politics, old type of trade unionism and old type political positions are not operational for new workers.

Lonely in a crowd: do young precarious workers need trade unions, do trade unions need young precarious workers?

Jan Czarzasty
Warsaw School of Economics (SGH), Poland
jczarz(at)sgh.waw.pl

Precarisation of labour follows various paths, depending on the institutional surrounding, socio-cultural underpinning, political framework and role of the state in a particular country. Trade unions seem unsure on how to deal with the consequences of the process, which has recently come to interfere with the longer and more persistent one, that is, of deunionisation. Empirical evidence (e.g. Kuene 2013; Martínez Lucio, Marino, Connolly 2017) suggests that the challenge of precarious work has not only been recognized but also addressed by European trade unions, yet their responses have produced moderate

effects, especially in terms of attracting people representing youngest brackets of economic activity age (up to 30) to trade unions. Bringing young people to unions has long been a tough challenge, and with those who are not only young but also in a precarious position in the labour market being a target for organizing activities, the objective becomes only more difficult to achieve.

The paper's main analytical focus is on the relationship between young precarious workers and trade unions in today's Poland from both perspectives. The key questions addressed are: 1) do young precarious workers want to be recruited into trade unions (if they see trade unions as viable vehicle for formulating, articulating and representing their collective interests, provided they are able define their interest in any other way than individual) and 2) do trade unions want to bring in young precarious workers (is there a genuine commitment and action behind the façade of declarations)?

The data employed come from primary (the preliminary results from the DFG-NCN funded PREWORK project) and secondary (existing empirical data, literature) sources.

RN17 | Session 02a European Governance and Social Effects

Industrial Relations in the European Union – A Race to the Bottom?

Sebastian Schief

University of Fribourg, Switzerland

sebastian.schief(at)unifr.ch

Crouch divided the industrial relations systems of the then EU 15 into four types (Crouch 1996). Great Britain is representative of a type characterised by loosely organised and decentralised collective bargaining, the type of which Italy is the representative can be described as rudimentary, essentially unregulated, and employer-dominated. Sweden (centralised) and Germany (decentralised) represent corporatist types characterised by high labour standards.

It was shown that within the process of enlarging the European Union the industrial relations systems of the member states came under pressure (Kohl et al.2006, Schief 2006). We argued that with the enlargement new nation-states became members who seemed to enforce or renovate a tendency towards a growing importance of the company in industrial relations. There was reason to believe that a massive change in the balance of the two forecasted groups in favour of a loose and decentralized industrial relations system may have led to different consequences in the countries under investigation. The result could be a revised diversity or a single European model which more or less corresponds to the loose and decentralized type.

It is time to do a detailed re-analysis of the industrial relations systems of the old and new member states. We hope to gain insight to the possible changes in the balance between corporatist and loose and

decentralized countries. Based on several indicators we analyse the development of industrial relations of the member states of the European Union. According to our analysis, the development towards the loose and decentralized type has continued.

With a little help from my courts? Assessing the impact of the new European economic governance on the Irish reforms of wage setting mechanisms.

Vincenzo Maccarrone

University College Dublin, Ireland

vincenzo.maccarrone90(at)gmail.com

In 2010, caught in the middle of a financial storm, Ireland was forced to resort to a 85 billion loan from the Troika. In exchange, the country representatives signed a series of Memoranda of Understanding which contained specific reforms to be implemented. At the onset of the crisis, Ireland had one of the most flexible labour markets among OECD countries. In addition, the long tradition of engagement of the social partners in centralized neo-corporatist agreements terminated quite abruptly in 2009. Hence, one might expect to find few references to labour market reforms in the agreements with the Troika. This was mostly true, but with an exception: the particular attention that the technocrats had for the only institutions producing legally binding wage setting agreements. These institutions, named Employment Regulation Orders and Registered Employment Agreements, were struck out by two sentences of the High court and the Supreme Court in 2011 and 2013 respectively. They were later reintroduced with significant changes by the government in 2012 and 2015. What role did the Troika play in the reform process? Are the Irish reforms of wage setting mechanisms solely explained by autonomous national developments? In order to answer these questions, I will make use of a two-level game theoretical framework, where both EU and domestic actors interact. My work will be based on the analysis of official documentation as well as relevant media sources. Through the use of process-tracing, I will try to assess the impact over time of both external and intervening variables.

Forms and content in European trade union cooperation: The importance of resource-, sectoral- and industrial regime differences

Patrik Vulkan, Bengt Larsson

University of Gothenburg, Sweden; University of Gothenburg, Sweden

patrik.vulkan(at)socav.gu.se,

bengt.larsson(at)socav.gu.se

Even though there are well-established structures for transnational cooperation in Europe, trade unions are currently facing challenges relating to transnational market and policy integration as well as a weakened position on the national level in many countries. In this situation there is a need to further develop both the vertical and horizontal transnational trade union cooperation. To understand the preconditions for trade

union to face up to this challenge, this paper studies the forms and contents of existing transnational trade union cooperation in five sectors in Europe: metal, construction, transportation, healthcare and banking and finance. The theoretical point of departure for the analysis is that the forms of cooperation, the issues focused and the intensity of cooperation is expected to be dependent on what sectors and what regions (or industrial relations regime) the trade unions belong to, and what resources they have. The aim of the paper is to test whether differences between sectors or regimes are of most importance for what forms and content transnational union cooperation take, when controlling for resources of unions. Empirically the paper is based on a European-wide survey to trade unions in these sectors (n 221). The main result is that sector-differences are more important than regime-differences in explaining the overall engagement in different forms of cooperation, when controlling for resources, whereas both sectors and regimes have some independent effects on what issues trade unions cooperate on.

Unmaking of employment regulation across the EU: what consequences for unemployment and labour market segmentation?

Agnieszka Piasna
ETUI, Belgium
apiasna(at)etui.org

Unemployment rates in the EU rose to record levels after the economic crisis of 2008, yet the experience varied substantially across member states. To remedy the effects of the recession and overcome the unemployment crisis, a powerful trend in EU policy making has focused on the functioning of the labour market and policies of labour market deregulation have been pressed on member states by the European Commission. The dominant analysis, especially from the EU institutions, diagnosed employment regulation as the root cause of unemployment in Europe and driver of labour market segmentation.

This paper engages with this policy stance and aims at stipulating alternative policy narrative. It summarizes findings from a collaborative research project that set out to investigate why unemployment has risen more in some countries than in others since 2008, how far this relates to the policies pursued and what have been the effects of employment protection reforms on employment (levels and structure). On the basis of experience in a large sample of EU Member States, we found that reducing employment protection does not bring economic benefits but also that post-crisis changes have led to increases in precarious employment and hence more pronounced, rather than reduced, labour market segmentation.

RN17 | Session 02b Recognition of Education and Skills at the Labour Market

Mismatch among graduates from the dual system of vocational training: a task-based approach

Nancy Kracke, Margarida Rodrigues
Institute for Employment Research (IAB), Germany;
Joint Research Centre, European Commission, Spain
Nancy.Kracke(at)iab.de,
Margarida.Rodrigues(at)ec.europa.eu

The phenomenon of labour market mismatch, defined as a discrepancy between the skills and competencies of an employee and the ones required to perform that person's job, is widespread and has relevant negative effects at the individual and societal levels.

There has always been a debate about the best way to measure the mismatch phenomenon but none of the recent approaches takes into account the actual and occupation-specific tasks performed at work. We argue that comparing the tasks performed during the apprenticeship and the tasks performed in future jobs is a more detailed and accurate way of measuring mismatch.

Apart from developing a new task-based measurement of mismatch, we aim at studying in-depth the mismatch phenomenon among recent graduates from the dual system of vocational training in Germany and investigate the consequences for the career transitions in their first few years in the labour market. This is a relevant issue because this educational track has been appointed as one of the main reasons for a better performance of youth labour markets witnessed in some European countries.

We use rich administrative data from the German Sample of Integrated Labour Market Biographies (SIAB). Our first results point to the importance of the way in which mismatch is measured and support the use of the task-based indicator. Given this, we focus on this mismatch measure and use it in multivariate regression models to analyse its determinants (at individual and occupational level) and in a sequence analysis to examine the development of the graduates' careers.

Disability, education, and labour market participation: What is the effect of education inside the labour market?

Trond Bliksvær, Ingrid Fylling
Nord University, Norway; Nord University, Norway
trond.bliksvaer(at)nord.no, ingrid.fylling(at)nord.no

Participation in the labour market is regarded as a corner stone of active citizenship (Sainsbury and Coleman-Fountain 2013) in the Western world. Research has established that educational level is one of the most important predictors of employment for persons with disabilities (Kittelsaa, Wik, and Tøssebro 2015; Wik 2010; Molden, Wendelborg, and Tøssebro 2009; Grue and Finnvoll 2014; Bø and Håland 2015), and education seems to have a larger effect for employment among disabled than among non-disabled (Kittelsaa et al. 2015, Tøssebro and Wik 2015). Hence, educational level is regarded as an important means for social mobility for disabled people. However, so far we know less about the work situation that is achieved on the background of a given educational level or type among persons with

disabilities, and whether this is different for employed persons with and without disability.

In this paper we explore the question: What is the relationship between educational level or type of education and attained work situation among employed persons, and is the relationship between education and employment different among disabled and non-disabled? We will present data analyses from a Norwegian level of living survey from 2014 (EU-SILC Norway 2014), comparing the situation for employed disabled and non-disabled regarding factors like type of occupation, type of contract, and salary. We will use crosstabulations and correspondence analysis, and we will in particular focus on the relationship between type and level of education on one hand, and type of occupation on the other. The results of the analyses will be relevant for discussions about education and social mobility among disadvantaged groups in the labour market within an universalistic welfare state.

Formal, and informal, recognition of skilled migrant's professional qualifications in the European Union and its influence in labour market outcomes: the case of Portuguese nurses

Paula Reis

New University of Lisbon - Faculty of Social Sciences and Humanities, IPRI-UNL, CICS.NOVA-UNL, Portugal
paula.reis(at)fcsh.unl.pt

In the last decades the European Union has been very active in creating legal apparatus and mechanisms to enhance intra-european labour mobility, to further establish a single labour market and to achieve the EU2020 goals of smart and inclusive growth. However, several constraints of political, legal, administrative and practical nature continue to hinder the mobility of workers and the recognition of their professional qualifications. Professional qualifications are an element of economic empowerment and distinction. Recognition is a mechanism of regulating, and ordering the access to the labour market. Therefore, formal and informal recognition of professional qualifications, or their non-recognition, influences migrants' access to the labour market, but also the migrants' position within the market itself. Numerous observations on the European Union context, that included third country nationals and Eastern Europeans, continue to show the underutilization of skilled migrant workers and the existence of wage differentials. Similarly, recently conducted studies about Portuguese skilled emigrants, particularly on nursing professionals, suggest disparities in status and earnings when compared to natives. These results challenge the principle of nondiscriminatory treatment of workers and disclose the phenomenon of labour market segmentation. To cope with this issue it's relevant not only to identify the degree of influence of institutional, organizational and social contexts in the formal, and informal, recognition processes of professional qualifications, but also to understand its underlying

factors and mechanisms. In this research, we focus on the case of Portuguese nursing professionals. In this research we adopt a multilevel approach, thus contributing to highlight the articulations of the various factors and mechanisms that produce inequality, between migrants and natives, in the labour market.

Insecure transitions: how differences in education lead to different employment security pathways

Mireia Bolívar, Paco Belvis, Joan Benach
GREDS-EMCONET, Public Policy Center (UPF - JHU), Department of Political and Social Sciences, Universitat Pompeu Fabra, Spain; GREDS-EMCONET, Public Policy Center (UPF - JHU), Department of Political and Social Sciences, Universitat Pompeu Fabra, Spain; GREDS-EMCONET, Public Policy Center (UPF - JHU), Department of Political and Social Sciences, Universitat Pompeu Fabra, Spain
mireia.bolivar(at)upf.edu, paco.belvis(at)upf.edu, joan.benach(at)upf.edu

Austerity and flexibilisation policies in Europe have eroded employment conditions, enhancing inequalities and fostering career paths marked by job insecurity and labour exclusion. In this context, the paper aims to study the extent to which labour trajectories have experienced an entrapment within circuits of insecurity during the period 2002-2012 in Catalonia (Spain), and to identify the factors associated with such exclusionary circles of insecurity. A particular emphasis is given to the effect of education and its interplay with other individual and structural elements such as gender, social class of origin and industry that enhance or prevent the protective effect of education. The paper analyses the mobility of individuals between three states in relation to paid work, which are characterized by their different degrees of employment security: not occupied, unstable employment, and stable employment. To this end, data from the Catalan Inequalities Panel (PaD; Jaume Bofill Foundation) were adjusted through various dynamic multinomial logit random effects models that handle the unknown initial conditions problem. The results present evidence of a strong state dependence in employment transitions as well as an intense flow of transitions between non-occupation and temporary occupation. The results also show that higher education does not prevent workers from transitioning into unstable occupations, but contributes to define whether the individual further moves into a secure employment or remains locked in the exclusionary circle around temporary employment and unemployment. Finally, results on the structural factors that contribute to explain these inclusionary and exclusionary transitions are presented in relation to the dynamics of segmentation of the Spanish labour market.

RN17 | Session 02c Global Challenges in the for Work and Society**Basic Income as Transformation?**

Hanna Ketterer

Kolleg Postwachstumsgesellschaften, Jena University, Germany

hanna.ketterer(at)uni-jena.de

Basic income or universal basic income (UBI) is widely debated. Renewed interest in UBI spans from Silicon valley actors and big businesses, national governments e.g. in Finland to (post-Capitalist, e.g. Paul Mason) social movements. UBI is considered a response to myriads of contemporary societal challenges: unemployment, poverty and heteronomy inherent to Capitalism (Claus Offe), the prolonged crisis of the welfare state and assumed technological unemployment due to new potentials within robotics and AI (Osborne and Frey 2014). There is a wide range of hypotheses on how a UBI would transform contemporary Western society ranging from pragmatic to utopian. On the basis of both foundational and latest basic income studies, this paper compares competing justifications (Forst 2015) for UBI and hypothesized transformations of contemporary work society in each line of justification. The analysis shows five principal justifications for UBI: a moral, ethical, functional, anti-growth and feminist justification. Each justification is distinct in its outlook on and degree of the envisioned transformation defined as change in a) modern society's self-understanding as employment and work-centred social formation and in b) the division of necessary paid and unpaid labour beyond the present status quo. Moreover, the paper scrutinises the social conditions under which transformation is delineated within each justification. I argue that the study of the UBI as a real-utopian project should be subject to a contemporary sociology of work aimed not only at analysing present faultlines integral to contemporary work society, but also at prefiguring alternatives.

Logistics Workers as a Social Group?

Cécile Cuny, David Gaborieau, Clément Barbier
University Paris Est, France; University Paris Est, France; University Paris Est, France
cecile.cuny(at)u-pem.fr, david.gab(at)wanadoo.fr, clement.barbier02(at)gmail.com

The following contribution presents the preliminary results of a collective Franco-German research project, which deals with retail logistics workers, who occupy an intermediate position between industry and services and represent 13 % of total worker's employment in France, 17% in Germany. Their work consists in getting the goods into cities, which is a core function for urban lifestyle. Having identified this group, the aim of our project is to understand what its social practices outside warehouses are. The research is based on an ethnographic survey conducted in logistics parks located at the peripheries of four cities: Paris and Orleans (France),

Frankfurt/Main and Kassel (Germany).

Our contribution will focus on the processes of labour market fragmentation in Paris and Frankfurt/Main, in order to analyse them in a transnational perspective. Indeed, observing a labour market at this scale and in the context of "world cities" enlightens the internal divisions of the working class and the ways these divisions differ from one context to another. Depending on the types of goods, the urban contexts and the ways industrial relations are regulated at different levels (from the local to the European one), the difficulty of working conditions in the warehouses, the salaries and the social recognition of these positions are quite different. Permanent employment on positions that aren't seen as "true occupations" is considered in the light of what it can offer: relative wage increases in Frankfurt and an access to mortgage loan in Paris.

Youth Revolts and New Union Movement in the Public Sector in Taiwan

Yubin Chiu

National Pingtung University, Taiwan

wobblies(at)gmail.com

Under the legacy of authoritarian industrial relations, the unionism in public sector only exists in state-owned enterprises while the Trade Union Law prohibits the public servants from unionization. Shortly after the democratic transition in the mid-1980s, SOE unions used to play a leading role in national labour movement. On the other side, despite the fact that civil servants can only organise "association" which has no bargaining rights to represent themselves, the better working conditions and stable employment have largely kept civil servants quiescent. Recent development related to neo-liberal managerial strategies and pension reform, however, has been building up new momentum of unionism among young employees in the two sectors. In SOE sector, several new unions have been built by young employees since 2012. They have criticized the old unions and launched several strikes and protests which won strong public support. In government sector, the ongoing pension reform agitates the docile Civil Servant Association which mostly represents seniors and retirees who have been entitled the generous pension. A bunch of young civil servants, who are forming an alliance, have openly challenge the leaders of the Civil Servant Association and ask for a new pension scheme more fitting in generation justice. This research aims to explore the momentum of new organising trend and its impact on the public sector unionism. Three cases of new organising efforts will be reviewed and followed by the discussion on the possible change in the industrial relations in the public sector.

Examining management technologies as a site of conflict: political interests and class composition in distribution warehouses.

Craig Gent

University of Warwick, United Kingdom

c.gent(at)warwick.ac.uk

Distribution warehouses - or 'fulfilment centres' - and their labour conditions have been a regular fixture in media investigations over the last few years, causing widespread concern (especially in the UK) about 'zero-hours' contracts and the physical pressures put onto workers. What remains underexamined is the technological infrastructure used to manage these employees and undermine the likelihood of them organising. Although we are witnessing a resurgence of debates around the dangers/possibilities of the labour-saving devices deployed in some high-end warehouses (e.g. robots such as Kiva), less is being said about the development and use of technologies which exist for the sole purpose of ensuring the effective - and sometimes relentless - actualisation of labour power from workers, to the detriment of the understanding required to develop new struggles on the terrain of work and technology.

This paper will present empirical findings from interviews I have conducted with workers in the British distribution sector, using Italian autonomism's conceptual framing of 'class composition' to develop an understanding of how management technologies such as dashboards, wearables and tracking devices exist within workplaces as sites of class conflict and contestation. In doing so I will explain how these technological innovations come to represent the collective interests of management while variously responding to, subverting and/or stimulating the political forms and expressions available for furthering workers' individual and collective interests.

The change of working time regime and the role of the trade union: some evidences from China's manufacture industry

Wei Zhao

Beijing Normal University, China, People's Republic of
zhaowei(at)bnu.edu.cn

As a concept of sociology, time sociology is an important dimension and method of contemporary social science research. The time's sociality or the social time is a kind of expression of social relations and rights. The arrangement and convention of time are different in the different social field and life, as well as in specific social relationships and social organizations. They embody the different nature and condition of social rights and social welfare. The analyses and critical thinking of the social arrangement and regulation will result in the deeply understanding of social system and institutions from the perspective of sociology. Work and time have always been conflated and their relationship always socially constructed.

The research on time and also working time has not been paid much attention by China's academy, especially in sociology field. Refer to the issue of working time, a few researches could be found in industrial relations and labour economy, and few studies investigate the dimensions of working time flexibility in recent years.

It is reported that Chinese workers have to work longest hours in the world. This article reviews the forming of the work time regime since the 1950s, especially after the 1990s. It analyses that although the perfect labor legislations about the work time, certain number of Chinese workers in manufacture industry have to work longer, harder and according to the management demand. Drawing the fieldwork in 4 manufacture sectors, it is argued that there is evidence of a move towards a 'temporality' model of working time, the limited role of the union and also the traditional and "new" culture of work time worse the "employer/management-led" the work time regime.

RN17 | Session 03a The Role of Actors and Sectors

The Cement of Social Dialogue: The Pivotal Role of Trust for the Efficacy of Collective Bargaining

Bernd Brandl

University of Durham, United Kingdom
bernd.brandl(at)durham.ac.uk

Previous debates on the functioning of social dialogue concentrated on the analysis of the effects of different institutional and organisational structures. In this functionalistic approach of different structures little attention has been given on what accounts for the efficacy of these structures. In this paper the role of trust between the actors' involved in industrial relations for the efficacy of different social dialogue structures is investigated. It is hypothesized that for voluntaristic, coordinated and governed institutional systems mutual trust is the key factor for its efficacy. The hypotheses are tested and confirmed on the basis of recent and representative data on social dialogue for all European Union member states. As the question on the role of trust in institutions (re-) entered the political debate in many European countries the article finishes with highlighting the relevance of the results for current attempts to reform industrial relations institutions.

Legitimation, Power and Institutional Change – Sectoral-Level Collective Bargaining in Israel's Private Sector

assaf shlomo bondy

Tel-Aviv University, Israel
foldya(at)gmail.com

A lot of research tried to evaluate the importance and effects of sectoral, multi-employer, collective bargaining on economic performance and labor-market governance. While many (neo-classic) economists regard sector-level bargaining as an inefficient and non-representative form of industrial relations, other social scientists find its affiliation with wage moderation, low inequality and strong democratic institutions. As empirical evidence supporting both arguments continued to rise, new analytical frameworks suggested the importance of market characteristics or coordination mechanisms as accounting of researchers' different conclusions.

Traces of this debate can be seen through the ongoing political and academic controversy around recent policies promoted by Troika in some European states. Although important elements in this debate, the underlying (institutional) mechanisms of sector-level bargaining were rarely addressed as a focal point of research.

In order to assess the feasibility, influence, resilience and contributions of sector-level bargaining in a given industrial relations system, this paper will present different forms and mechanisms of power underlying sector-level institutional structure. Using data from the Israeli industrial relations system and through a sectoral point of view, I will present the patterns of power underlying processes of sector-level collective bargaining – its change and preservation. Through analysis of different industrial relations sub-systems in Israel, I will demonstrate different approaches for sectoral bargaining, their feasibility and prospect. By applying power-oriented terminology the paper will suggest a resolution for ongoing empirical and theoretic debate on the practicability of intermediary, sectoral institutions in industrial relations and will conclude with some remarks for future industrial relations policy and research.

EO's in the EU: A cross-national micro-level analysis of employer's organization membership in European Countries

Alex Lehr, Giedo Jansen, Bernd Brandl
Radboud University Nijmegen, Netherlands, The; University of Twente; University of Durham
a.lehr(at)fm.ru.nl, giedo.jansen(at)utwente.nl, bernd.brandl(at)durham.ac.uk

Employer's organizations (EO's) are of considerable importance in socio-economic decision making and industrial relations. Yet in contrast to their counterparts on the labor market, trade unions, scientific studies on the representativeness of EO's as measured by companies' EO membership have been few and far between. Moreover, empirically, existing studies relied on aggregated data, prohibiting adequate tests of the micro-level mechanisms implied by most theories on EO representativeness and membership. This paper redresses this lacunae by analyzing the major theoretical explanations for EO membership using cross-national micro-level data on 19.786 companies across 28 countries from the European Company Survey. Theoretically, the paper contributes to the debate by setting out a unified, multi-leveled theoretical framework, and by further developing extant theories by detailing the conditions under which various mechanisms operate. The (preliminary) results suggest that EO membership is more likely a) as firm size increases, b) as the organizational power of employees increases, c) for companies in the industry sector, d) as the skill-level of employees decreases. EO membership is also found to be more likely for companies in countries a) with strong trade unions, b) where the EO system is highly fragmented, c) where extensions of collective agreements are more common. The effect of the

organizational power of employees at the workplace furthermore increases with national trade union strength.

The convergence of Industrial relations traditions in Greece and Ireland in the European crisis (2008-2016).

Barry P Colfer, Christos Ioannou
University of Cambridge, United Kingdom; The Office of the Greek Ombudsman, Athens, Greece.
bc348(at)cam.ac.uk, cioannou(at)hol.gr

This paper investigates crisis-induced changes to industrial relations practices in Europe with a focus on Greece and Ireland over the course of the economic and social crisis since 2008.

The theoretical and analytical framework of the paper and the justification of the selection of these case studies are informed by Visser (2008; 2012)'s comprehensive classification of European industrial relations traditions, which places Greece in the state-centred tradition, and Ireland in the liberal-pluralist group.

In the state-centred group, involvement of the social partners with the state is traditionally low, and collective bargaining is decentralized. Policies are designed without systematic input from the social partners, with actors subsequently accommodated via flexible implementation processes often based on derogation from the law. The liberal-pluralist group traditionally displays higher organisational density, high collective bargaining coverage at a very decentralised level, and limited interaction between social partners and state authorities. Greece and Ireland conform to some of these conditions, but not to all.

This paper contends that crisis-induced EU-backed structural reforms have brought about a convergence between the industrial relations traditions in these countries, where the Greek model is being recast to resemble the Irish one. The role of EU and national authorities in this convergence, and in the general reordering of European industrial relations through the introduction of new economic governance measures, is also analysed.

The paper finally reviews trade union responses to these changes, including through the formation of new coalitions, through changing relationships with political parties, and through involvement with EU-level actors including ETUC.

RN17 | Session 03b Natives and Foreigners on the Labour Market

The invisible proletarians of Ostrava: Ethnographic observations on racialised labour in a post-socialist city

Barbora Cernusakova
The University of Manchester, United Kingdom
barbora.cernusakova(at)postgrad.manchester.ac.uk

This paper will focus on intermitted and informal labour of Roma residing in a neighbourhood of

Ostrava, a city in the Czech Republic. Work accessible to Roma was at the core of my 11-month ethnographic research. Working alongside the street-cleaners and recycling labourers, I embarked on the process of learning about other aspects of their lives, including the local conditions for material reproduction of labour. The 'features of work' that have emerged from the data so far include Roma workers' contractual insecurity and dependency on welfare; informality of their employment arrangements and related 'invisibility' of Roma work in the eyes of the public.

In the second part of the paper I theorize on the relationship between racialisation of Roma labour and capital's demand for the 'industrial reserve army' in the local context of Ostrava. My aim was to explore what role has the race been playing in formation of hierarchies and fractions of working class and whether it has been (and continues to be) a factor that maintains the local industrial reserve army. Albeit significant, discriminatory racism in employment, isn't the only factor of racialisation of Roma workers. Their access to formal, regular and better-paid employment complicate also debts, often incurred as a result of intermitted employment or low wages. Taking a contract-based job by a person with formal debts results in a cut of their wage by compulsory repayments. I ponder an argument that debts reproduce informal work as a specific form of unfree labour among Roma workers in Ostrava. Debt adds a specific vulnerability of workers who become tied to a certain types of employers.

Bosses and 'new' strangers: Syrian workers' positions in craft-based furniture industry

Feray Artar, Akin Bakioğlu

Ankara University, Turkey; Sociology Association, Turkey; Ankara University, Turkey

ferayartar(at)gmail.com, akin.bakioğlu(at)gmail.com

In this study, the Syrians, who escaped from the war and sought asylum Turkey from 2011, will be evaluated through their 'native' and 'foreign' positions within their everyday and working lives in Sıtele Furniture Industrial Zone. The study will focus on the formation of native-foreign identities in the relations between Turkish citizens living in the Ankara Sıtele's coming from in various parts of Turkey and, living and working around the Industrial Zone and refugees coming from Syria.

Although Turkish citizens themselves migrated to reside in Sıtele region, they have become native as they came into contact with the Syrians since they settled to the region before the Syrians. Syrians are attracted to the industrial districts of the provinces since they are able to get ahead in the labor area surrounded with low wages and double insecurity, these districts provide a cheap housing complex that is included in the scope of urban transformation. Thus, local small producers, crafts and landlords have a new income source.

The Syrians have made a strengthening effect on the furniture industry, which is being built on the basis of

artisanal craftsmanship and has almost come to an end. Syrian workers who were previously engaged in craftsmanship have integrated quite easily and they became a cheap and qualified labour force within the region.

In-depth interviews were conducted with both local residents and Syrians in a qualitative research design, and native-foreign positions in the region were tried to be read through the employee-employee-employer relationship. The striking data obtained reveals the hierarchical competition of Turkish workers with Syrian refugees and its reflection on everyday life.

Structural weaknesses, economic downturn and the competition between immigrants and natives in the Italian labour market

Maurizio Avola

University of Catania, Italy

mavola(at)unict.it

The Italian labour market is historically characterized by some structural weaknesses. First, compared to other Western European countries, Italy has a much lower level of employment. Secondly, the Italian labour market is characterized by a structural "reluctance" to create highly skilled jobs. Finally, in Italy there is a very strong occupational penalization of young people and women and a marked territorial dualism. Nevertheless, in the last two decades Italy has become one of the foremost countries in the world for the consistency of migration in-flows. Differently to other Western European countries, in Italy immigrants (compared to natives) experience a trade-off between lower levels of penalization in terms of employment entry chance (and risk of unemployment) and higher levels of occupational segregation in the area of bad jobs (Reyneri, Fullin, 2011).

In this scenario, the economic downturn starting in 2008 has strengthened the structural weaknesses of the Italian labour market. In fact, differently from the international dynamics (Gallie, 2013), in Italy we have observed a deep decline of the employment rate combined with a clear trend to a downgrading in the quality of labour demand.

It considered that, the main research question is the following: what have been the effects of the economic downturn on the traditional dimensions of inequality characterizing the Italian labour market? In particular, the paper will focus on the evolution of the competitive relationship between native and immigrant labour force, considering also the internal differences among the Italian macro-areas. The analysis will be addressed using the Italian LFS 2005-2015 and focalizing the attention on different dimension of inequality in the labour market (employment/unemployment, job quality, employment conditions).

The earnings of immigrants: actual versus potential country-specific human capital

Andrey Tibajev
Linköping University, Sweden
andrey.tibajev(at)liu.se

This paper uses the theoretical framework of country-specific human capital in order to study earnings of immigrants and natives. The objective is to ascertain the difference in earnings return to labour market experience between specifications that use potential and actual experience. Theoretically, labour market experience acquired prior to migration should have a positive effect on earnings but with lower return than domestic experience; this is because some, but not all, skills are transferable across national contexts. But using potential experience measures, as is most common in previous research, will negatively bias the estimate for experience before migration, and bias the estimate for experience in the host country towards zero for the group with more instances of unemployment, i.e. immigrants.

By utilizing a combination of the Level-of-Living Survey 2010 and the Level-of-Living Survey for Foreign-Born, I estimate the return to experience for immigrants and natives. Models with actual experience show that the return to domestic experience is about the same for immigrants and natives, and that experience before migration has a return significantly below domestic experience, but significantly above zero. Models with potential measures show instead a coefficient for domestic experience that is biased towards zero for immigrants, and that potential experience for work before migration has no economic return at all. The results for models with actual experience are more in line with theoretical predictions, because some skills are indeed transferable across borders. And the difference between models points to the importance of good measurement when comparing groups.

RN17 | Session 03c The Changing World of Work

Möbius Management: The Internal Dynamics of Business Ethics Programmes

David Redmalm, Annika Skoglund, Karin Berglund
Department of Industrial Engineering and Management, Uppsala University; Department of Industrial Engineering and Management, Uppsala University; Stockholm Business School, Stockholm University
david.redmalm(at)soc.uu.se,
annika.skoglund(at)angstrom.uu.se,
karin.berglund(at)sbs.su.se

The present study draws on the theoretical framework of Giorgio Agamben to conceptualize the dynamic that business ethics programmes create within companies—an area of study that is underexplored in organization and management research. We suggest that the “ethical” corporation can be regarded as a machine that dissolves the boundaries of the firm and conflates the goals and values of management,

employees and the corporation—a process we call Möbius Management. Using ethnographic methods, we have studied the American-Hungarian IT company Prezi’s engagement in the Budapest Pride Parade, in a Roma settlement, and in a mission to help Syrian refugees. These different situations can be regarded as what Agamben calls “zones of indistinction”: places where seemingly contradictory values and categories are merged, and where the value of life is momentarily challenged. Entering these zones, employees’ personal engagement is encouraged and developed, which in turn strengthens bonds between employees and sustains an atmosphere of openness at the office. To make the interventions into company events that are also individually rewarding, management and employees downplay the political specificity of the situations in favor of emotional aspects and general references to humanist universalism. In this way, corporations with social visions can themselves also be regarded as “zones of indistinction” where idealism and economic gain, as well as individual and employee identities, are merged. In conclusion, the contrast between Prezi and the present political situation in Hungary, characterized by a rhetoric of inside and outside, accentuates the process and effect of Möbius management.

Changes in the Newsroom: Technology, Improvisation and Multitasking

Silvia Popa
University of Bucharest, Romania
silvia.popa(at)sas.unibuc.ro

My research touches upon issues of work, technology and institutional organization in the context of television. Using sociology of work literature and social studies of infrastructures and drawing on ethnographic research in two small size TV companies from Romania carried out since 2014, I argue that continuous technological innovation and transformation of technological standards and protocols have produced significant transformations of this profession. These include high and often unrealistic technology-related expectation, frequent errors, improvisation and unexpected technological events, additional time pressure for learning the new technologies, and new opportunities for workforce downsizing through multitasking.

Self-disciplined entrepreneurs in the new economy: A case study of white-collar engineers in China’s high-tech industry

Xia Yan
The University of Hong Kong, Hong Kong S.A.R. (China)
yanxia(at)hku.hk

Knowledge workers’ working conditions and labor rights have not kept up in step in China, despite an improvement in workers’ autonomy and bargaining power. Unlike manual workers, knowledge workers’ poor working conditions and violations of legal rights are a consequence of choices made by workers

themselves, rather than being the result of employer's direct and coercive control. Based on the case study in a large Chinese enterprise in the ICT industry, I will examine the formation of the self-discipline mechanism in China's high-tech workplace. The self-discipline mechanism is shaped with the synergy of state's social and economic institution, capitalists' management and workers' subjectivity. The joint interest between capitalist and workers is built as a result of the internal labor market and performance-vested reward system. The conflict of interests between capitalist and workers is transferred into a conflict between the interest of workers as economic actors in the production and the interest of workers as social actors embedded in society. Workers are always faced with the dilemma when they have the impulse to resolve the conflict in interests. China's uneven regional development policies, along with the marketization of resources for livelihoods and marketization of social insurance, have a greater role in the transformation of workers into self-disciplined entrepreneurs who regard their labor power as a kind of capital (human capital) that can be invested in the labor market and from which they can earn a profit. The economic and social structure force knowledge workers to prioritize financial rewards and to give up other rights and benefits. Poor working conditions and violations of rights are regarded as inevitable sacrifices for mobility from underdeveloped regions to developed cities.

Like there`s no tomorrow: Work(ing) in a start-up organization.

João Vasco Coelho
ISCTE-IUL, Portugal
vasco.jcoelho(at)gmail.com

In the last two years, Portugal has been increasingly presented as an emergent "start-up nation". During this period, public grant programs have been stimulating startup "hubs" across the country, positioning the so-called Portuguese innovation ecosystem as a "success story", as one of the "best-performing startup communities in Europe".

Critical, dissonant perspectives of this phenomenon are rather scarce. In this paper, we consider that it's necessary to go beyond dominant discourses of (public) glorification, in order to study how business is concretely managed in a start-up context, or if organizational practices, work cultures and individual, immediate, work experiences are somehow specific in start-up organizations.

Conceiving a start-up primarily as a temporary organization is suggested to represent an analytical lens that can help uncover some of its less "visible" dimensions.

Analytical work is anchored in qualitative interview and direct observation data, gathered during a 12 months longitudinal research, held in one the most successful start-ups created in Portugal, in the last four years. One narrative – "Like there`s no tomorrow" – is presented and discussed. Organizational and management practices are described to be primarily

based on relentless experimentation, a focus on action (on "getting things done"), an alluring need to be always "on the move". The continuous need to promote organizational differentiation and singularity is highlighted, as it constitutes, in a start-up context, a relevant proof of (institutional) existence. Due to this need, managerial visions tend to emphasize, in a neo-schumpeterian vein, the virtues of disruption and discontinuity.

An overall sense of uncertainty, volatility and normative impermanence, and the defuturization of individual work experience(s), are suggested to be two concrete implications of these organizational and managerial orientations.

RN17 | Session 04a Can Labour Voice be Oppressed?

The Oppressive Boss and Employees' Authoritarianism: Exploring the Relation between Suppression of Voice by Employers and Employees' Preferences for Authoritarian Political Leadership

Antonia Stanojević, Agnes Akkerman
Radboud University; Radboud University
a.stanojevic(at)fm.ru.nl, a.akkerman(at)fm.ru.nl

In contemporary society, economically active people typically spend most of their waking hours doing their job. Having that in mind, this research examines how socialization at the workplace shapes political preferences. Innovatively, it examines in particular the possible relationship between employees' voice suppression by the employer and the formation of their political preferences. Since the employer is perceived as an authority figure, their behavior might induce spillovers to attitudes about political authorities and authoritarian governance. Therefore, a positive effect of suppression of voice by employers on employees' preference for authoritarian governance is expected.

The hypothesis will be tested on the data gathered within the first wave of Dutch Work & Politics Data set 2017 (N=6000), which allows for a wide range of demographic and psychological control variables. Although a cross sectional analysis to be used at this point does not allow for causal inferences, the confirmation of expected relationships would encourage and justify further longitudinal research on the same panel data-set, in order to get a clearer image of causal relationship between employers' suppression of voice and workers' political preferences.

Suppression of voice in the workplace and its effect on the political efficacy of the worker

Guido Dijkstra, Agnes Akkerman, Roderick Sluiter
Radboud University, Netherlands, The; Radboud University, Netherlands, The; Radboud University, Netherlands, The
g.dijkstra(at)fm.ru.nl, a.akkerman(at)fm.ru.nl, r.sluiter(at)fm.ru.nl

The workplace is one of the agents of political socialization. Through participation at work civic skills can be developed. These skills are also useful outside the workplace, e.g. in the political domain. Therefore, worker participation can foster political efficacy. Research also suggests that negative work experiences can create a negative spillover from the workplace into the political domain. However, empirical proof is still limited and focuses mainly on positive work experiences. This paper contributes to this debate by testing the effect of a clear example of a negative work experience: suppression of voice by the employer. We will answer the following research question: to what extent does suppression of voice by the employer affect internal and external political efficacy of the worker? When a worker's voice is suppressed, it can damage the development of civic skills and create the feeling one is incompetent to bring about change, inside and outside the workplace. Therefore, we expect that suppression of voice has a negative effect on both political internal and external efficacy. For the empirical test, we use the first wave of Dutch Work & Politics Data set 2017 (N=6,000). We apply regression analyses to test the model.

Which voices get suppressed and why? Studying antecedents of voice suppression and burdens to employee voice in The Netherlands

Katerina Manevska, Agnes Akkerman, Roderick Sluiter

Radboud University Nijmegen, Netherlands, The;
Radboud University Nijmegen, Netherlands, The;
Radboud University Nijmegen, Netherlands, The
k.manevska(at)fm.ru.nl, a.akkerman(at)fm.ru.nl,
r.sluiter(at)fm.ru.nl

Flexibilization of the work force as well as a rise in migrant workers in European societies has led to an increase in the share of employees with an insecure position at work. For this group of employees, the burden to speak up in situations where they experience problems or conflicts at work may be especially high because their insecure position makes them more vulnerable to retaliation. While institutional conditions shape the space for employee voice, suppression of voice takes place in social interactions between the employer, the employees and their co-workers. Currently, no explanation exists for variations in the prevalence, intensity and types of suppression tactics deployed. Furthermore, data on suppression of employee voice is scarce and notoriously difficult to obtain because of its sensitivity. In this paper, we develop a theory on the suppression of employee voice. In addition, we develop a survey instrument that enables us to measure employee voice suppression. These data, collected among a representative sample of Dutch employees (N=5000), enable us to study under which conditions and in what ways employers and co-workers attempt to suppress what types of voices of employees. This paper contributes to our understanding of current burdens to employee voice. Hence, the insights obtained from our study can offer valuable contributions to both scholarly and public

debates on employment relations in the post-industrial era, in particular on the voice of precarious workers.

Labour movement in a context of state repression in Turkey: Wildcat strikes and the internationalization of trade union action under the AKP rule

Isil Erdinc

Université Paris Dauphine, France
isilerdinc2(at)gmail.com

Since its arrival to power in 2002, the AKP government holds the parliamentary majority, allowing it since then to transform the state, to apply neoliberal public policies that undermine and damage labour unions' action. The cost of trade union affiliation and workers protests rise, strikes are annulled and restricted by the government under the pretext of "being dangerous for national security". Some trade unions, close with nationalist, rightwing political groups collaborate with the state and support the restrictions. Glass manufacturing industry, aviation, mining, petroleum industry and public sector are faced with suspension of strikes. Metal sector is another example of the restriction of strikes. However, the case of the mobilization of metal workers in Bursa (a city in the west of Turkey) against union discrimination and violation of union rights allows to examine how workers can still protest in workplace and to what extent strikes can still be a useful way of obtaining rights during collective bargaining processes. Thus, this paper will firstly make a brief analysis of legal and political obstacles against strikes. Secondly, it will focus on the case of metal sector and metal workers mobilization strategies mainly in the companies of Renault, Ford and Bosch between 2012 and 2015 in Bursa. It aims to discuss the limits and the opportunities of two main strategies in a context of state repression: wildcat strikes on workplace level and the internationalization of trade union activities in order to create leverage and support on national level.

RN17 | Session 04b Employer Perceptions and Practices – Discrimination and Discourse

New cleavages in the low-wage labour market of the Central European region? Employment practices in the Austrian border region

Laura Wiesboeck

University of Vienna, Austria
laura.wiesboeck(at)univie.ac.at

This paper deals with employment practices in the context of East–West cross-border commuting in the Central European Region (CENTROPE). Since 1 May 2011, citizens of the Czech Republic, Slovakia and Hungary have had full access to the Austrian labour market. The geographical proximity and the higher wage levels in the Austrian border region make it appealing for commuters residing in these areas. In order to understand the current structure of the transnational labour market, the introduction of a common legal framework is only one part of a broader

picture. Therefore the aim of this paper is to shed light on the role of employers and the recruitment process in CENTROPE.

The guiding research questions are: What are the employers' attitudes towards hiring cross-border commuters? How do the employers justify these attitudes? Have new social hierarchies developed due to the placement of low-wage workers in the Austrian border region?

Methodologically, 20 expert interviews were conducted with mayors, business owners, European Employment Services (EURES) employees and trade unionists operating in the region between 2011 and 2013. The analysis provides comprehensive information about the practice of employers, their preference towards commuters as a flexible workforce and their patterns of rationalization of this preference, e. g. by referring to the commuters' specific work behaviour or differences in their local resident labour market. The analysis reveals norms of decision-making that lead to a new social hierarchy between potential employees in the hiring process.

The data was gained in the course of the research project TRANSLAB, funded by the Vienna Science and Technology Fund (2012-2015) at the Department of Sociology, University of Vienna.

Discourses on work and entrepreneurship.

Defining reality in (post)transformational Poland

Konrad Kubala
University of Lodz, Poland
suspensio(at)o2.pl

As a result of a series of historical events in the twentieth and twenty-first centuries, contemporary capitalism celebrates the emergence of a human whose ontological self-definition is that of an independent entrepreneur (Beck 2005). In the "Life-World" order, the status of humanity is no longer determined by a mere transfer of emphasis from freedom to coercion, but a shift towards an individual, intentional and planned self-employment. Most of the concerns of private life and problems of social life have their source in this "operationalization" of the concept of work. The knowledge of it, while becoming part of the "uncontested obviousness", creates "common beliefs" of today's individualized societies. This knowledge is also called rational.

The material I would like to discuss is based on ten focus group interviews. Their primary goal was to determine to what extent the content and discourse strategies presented in the media influence and modify the language used by the respondents to describe their social reality (including the economic one). The selection of the respondents (all of them Lodz residents) and the criteria set can be regarded as legitimate for both substantive and practical reasons. Those questioned included the owners or senior managers of small and medium-sized enterprises, blue-collar and white-collar workers, self-employed and unemployed. Respondents belonging to particular groups have different interests in real terms, which can affect their perception of the

economic reality. Crucially, the respondents were also grouped by age.

My intention is to reconstruct the linguistic description of the issues of work and entrepreneurship among people differently positioned in the labour market.

A field experiment testing for discrimination against ethnic minorities in the Austrian labour market

Julia Schuster
Johannes Kepler University Linz, Austria
julia.schuster(at)jku.at

Internationally, it is unusual or even illegal to attach photographs to job applications. In the German-speaking world, however, it is a common and expected practice across all sectors of the labour market to send a portrait photo when applying for a job. This provides those employers and human resource developers who hold racial stereotypes with an opportunity to discriminate not only based on foreign names but also based on skin colour and other visual clues of ethnicity. This paper investigates whether such discrimination occurs in Austria and if so, to what extent. I present results of a correspondence testing experiment in which applications of a number of fictional characters were sent in response to job advertisements in the tourism sector across Austria. The applicants had comparable resumes and qualifications but differed in their names (native, Nigerian, Chinese) and in their enclosed portraits that depicted Caucasian, African or Asian models. The number of invitations to job interviews (callbacks) per fictional character tells, whether some ethnic groups are more popular on the labour market than others. Results show that both clues - names and photographs - affect the callback rates of the applicants, however, to differing extent depending on the applicants' ethnic backgrounds. Callback rates are always highest for native applicants, suggesting discriminating behaviour by employees. Differences between Chinese and Nigerian applicants exist as well and may be explained by varying sets of stereotypes associated with both groups.

Discrimination based on phenotype in the German Labor Market

Ruta Yemane, Ruud Koopmans, Susanne Veit, Bram Lancee
WZB Berlin, Germany; WZB Berlin, Germany; WZB Berlin, Germany; University of Amsterdam
ruta.yemane(at)wzb.eu, ruud.koopmans(at)wzb.eu, susanne.veit(at)wzb.eu, b.lancee(at)uu.nl

Results from numerous field experiments unequivocally show that employers discriminate against ethnic minorities in the labour market. In these studies researchers have signaled ethnic origin, usually for only one or two ethnic groups, by the name on the resume. However, a name-based operationalization of ethnic origin conflates with other characteristics that are associated with ethnic origin such as e.g. phenotype. This paper presents first

analyses of a correspondence study on discrimination in the German labor market based on applicant's phenotype for a range of 35 ethnicities (N=6.832). German exceptionalism allows testing this hypothesis, as photos on resumes are still the norm in applications. In this study, we therefore varied profile pictures on the resume using a range of up to seven pictures representing very light to very dark phenotypes, while keeping the ethnic origin of the applicant constant. We suggest that if individual tastes are behind discrimination, phenotypes that deviate from the common norm in a country will lead to reduced callback rates. As a robustness check we do not only vary pictures for ethnic minorities, but also for the German natives using the whole range of pictures. Results show that callback rates for both, applicants with a migration background and applicants with a German sounding name, are highest for stereotypical North or Central European phenotypes. Callback rates are lowest for stereotypical South European or East and West African phenotypes. We predict this as evidence for taste based discrimination, as phenotype in itself is an irrelevant trait for productivity.

RN17 | Session 04c Changing Environments and the Implications for Labour Relations

Individual wage setting in the public sector – Fulfillments of a “one company approach”?

Ylva Ulfsdotter Eriksson, Bengt Larsson, Petra Adolfsson

Bengt.Larsson(at)socav.gu.se,
Petra.Adolfsson(at)handels.gu.se

An ambition within MNCs is to establish and transfer company-wide HR policies and practices across borders. Common HR policies and practices is a way to create a unified company. Yet, national institutional frameworks, with distinct norms, rules and common assumptions, exert forces on implementation and transference and thus conditions HR practices and actions.

Against the background of international companies' quest for a “one company approach” it is interesting to explore how large national public sector organizations manage and succeed in this matter. Such organizations do not face institutional and cultural hindrances as they actually act within and share political and economic structures.

Wage setting policies and practices are particularly delicate within organizations as it aims to communicate what attitudes, behaviors, and performances that are evaluated and assessed within the organization. Wages and wage setting practices are also often discussed with reference to organizational justice theory as it is important that these procedures and practices are conducted transparent, equal and fair.

This paper explores how informational and procedural

justice is perceived by employees and managers in a middle-sized municipality in Sweden. Drawing on the results from a survey study conducted in 2016, the paper discuss the possibilities for “a one company approach” in a national settings. Preliminary results show that access to and knowledge about the municipalities wage policy differs to a high degree. The paper explores whether this can be explained by field of operations within the municipally (care, education, technical etc), district, occupation, gender, age etc.

Seizing the Hybrid Areas of work by Re-presenting self-Employment

Annalisa Murgia

Leeds University Business School, United Kingdom
annalisa.murgia(at)gmail.com

The contribution will present the ERC Starting Grant 2016 research project SHARE - Seizing the Hybrid Areas of work by Re-presenting self-Employment. The project is a transdisciplinary and multi-method study of the work arrangements which destabilize the dichotomies between standard and non-standard work, and between self-employment and dependent employment. More specifically, it will research solo self-employment, namely self-employment without employees. This is a growing category in Europe which comprises very different subjects, often disguised by official statistics and difficult to represent by unions: from highly skilled independent professionals to ‘fake self-employed’ workers, legally self-employed but in fact wholly dependent on the company.

SHARE will study the emergence of hybrid areas of work through a comparative research in six European countries: Germany, France, the Netherlands, Italy, UK and Slovakia. Despite the overall large increase of solo self-employment, path-dependency connected to welfare state traditions has induced national legislators to adopt distinct strategies of labour-market (de)regulation and adjustment of social security systems, producing different consequences on both social protection and collective bargaining.

In the presentation the strategies to combine the comparative analysis of labour laws and labour force surveys with a cross-national ethnography will be discussed. Particular attention will be paid to the new forms of collective representation of solo self-employed workers in Europe, to be explored by adopting the comparative ethnography as an on-the-ground approach, able to inform both macro and legal perspectives. By researching the practices used to classify, measure and represent the solo self-employed workers, the project aims to furnish societally relevant findings, thus providing both theoretical and applied advancements.

Declining Demographics, Growing Worker Demands: Insights from Eastern Germany

Daniel Meyer, Stefan Schmalz, Anne Göttert

Max Planck Institute for the Study of Societies, Cologne, Germany; Friedrich Schiller University Jena,

Germany; Friedrich Schiller University Jena, Germany
 meyer(at)mpifg.de, s.schmalz(at)uni-jena.de,
 anne.goertert(at)uni-jena.de

As with many other European regions, large parts of Eastern Germany are confronted with an increasingly aging and declining population. It is well established that shrinking demographics cause shortages of skilled workers and bring challenges for recruiters and companies. Largely unexplored, however, remains the impact of demographic change on the subjective perceptions and attitudes of workers. To address this, we focus on worker attitudes toward labor and employment relations using the example of East Thuringia, a structurally weak region in Eastern Germany. Conceptually, we understand demographic change as a “game changer” that sets a structural limit on wage dumping and poor working conditions, thereby affording workers a better position in the labor market. Empirically, we take a multi-level approach: on the macro level, we use official statistics to track demographic developments in seven districts over the past two decades. On the micro level, we draw upon survey data from a large regional study (n = 2,188) conducted in spring 2016 and perform cluster analyses of worker attitudes. Our findings indicate that recent demographic changes – in conjunction with other favorable socio-economic trends – have significantly increased workers’ self-confidence and demands, as measured by a shrinking fear of dismissal and a stronger orientation toward participative work arrangements, learning, health, and work-life balance initiatives. However, attitudes and demands still vary strongly by socio-economic strata and spatial factors (e.g., attractiveness, urbanization). In conclusion, employers would be well advised to consider the growing demands for better working conditions in order to attract employees and remain competitive.

Occupational Sex Segregation vis-à-vis Differences in Education, Skills and Employers’ Preferences

Szymon Czarnik, Marcin Kocór
 Jagiellonian University, Poland; Jagiellonian University, Poland
 szymon.czarnik(at)uj.edu.pl, marcin.kocor(at)uj.edu.pl

In societies all over the world we observe substantial amount of occupational sex segregation. This state of affairs may be brought about by a variety of factors, including stereotypical beliefs, differences between sexes in terms of personal predilections, level and type of completed education, skills required for particular kinds of job, as well as employers’ hiring preferences. Five rounds of Human Capital Study in Poland (2010-2014) provide us with unique data to investigate the interdependencies between these factors. The situation in the Polish labor market has been diagnosed via random samples of working-age population (17,600 persons each year) and employers (16,000 firms each year). We employ both sections of the study to reveal the links between the actual

occupational segregation and job-holders’ and job-seekers’ characteristics, as well as job-providers’ hiring preferences. In particular, the unified framework of the study allows us to analyze the extent to which skill requirements of particular occupations coincide with skill self-evaluations of men and women in the labor market. At each level of the analysis we observe differences between sexes, and those differences tend to be intercorrelated. In our presentation we show how employers’ proclivity to hire males or females is contingent both on the type of firm, and the characteristics of the vacancy to be filled.

RN17 | Session 05a Crisis, Post-Crisis and Employment Relations (special session 1)

Between a Rock and a Hard Place: Social Partners and Labour Market Reforms in Greece under Austerity

Andreas Kornelakis, Horen Voskeritsian, Michail Veliziotis, Panos Kapotas
 King’s College London, United Kingdom; University of the West of England, Bristol, United Kingdom; University of Southampton, United Kingdom; University of Portsmouth, United Kingdom
 andreas.kornelakis(at)kcl.ac.uk,
 Horen.Voskeritsian(at)uwe.ac.uk,
 M.Veliziotis(at)soton.ac.uk,
 panos.kapotas(at)port.ac.uk

Existing literature that sought to examine the recent developments on employment relations in Greece in the context of austerity and the Eurozone crisis (Kretsos, 2012; Wood et al, 2015; Ioannou, 2012; Koukiadaki & Kokkinou, 2016) has not managed so far to provide a convincing account of the social partners’ responses to the far-reaching reforms and institutional changes in the labour market during the Greek crisis. While several works broadly agree on the general direction of travel towards ‘deregulation’ (Ioannou, 2012) or ‘deconstruction’ (Koukiadaki & Kokkinou, 2016), they do not unveil the fault lines and the hidden fractures between and within peak-level trade unions, employers and policy-makers on the unprecedented agenda of labour market deregulation.

The present article will fill this gap exploiting rich data sources comprising primary documents (position papers, announcements, etc.) as well as in-depth face-to-face interviews with key actors representing labour, business and the state. The fieldwork was carried out in the period June-August 2016 and involved interviews with key representatives of GSEE, SEV, SMEs associations, and the Ministry of Labour. The thematic analysis will focus on three areas: collective bargaining and minimum wages; employment protection legislation; and policies towards undeclared work. The preliminary analysis suggests that the resistance to deregulation perspective is a simplistic account of this story. Instead, the fault lines between and within social partners have been more nuanced than expected and different actors conceded to the need for institutional recalibration, albeit in different directions.

Did the chickens come home to roost? Public pay settlement and industrial conflict in post-crisis Ireland

John Geary
University College Dublin, Ireland
john.geary(at)ucd.ie

The scale and magnitude of the fiscal and budgetary adjustments in Ireland in the years following the Great Recession were among the most drastic and largest ever witnessed in an advanced economy. Yet in contrast to countries in southern Europe, which were also under the grip of the Troika, there was little union protest. Geary (2016) explains this by the absence of a tradition of ideological unionism; the dominance of a normative orientation to pursue agreement through dialogue; as well as a perception among union leaders that the external constraints arrayed against them were too powerful. Resistance risked provoking political mobilization against public sector unionism in particular, which would probably have gained traction with a public that had grown rapidly distrustful of unions.

However, the context was not entirely hostile. Public sector employers were willing to seek an accommodation in order that union leaders might be enlisted to sell unpalatable cuts to their members and gain their support in implementing public service reforms. Thus, there remained the scope, however circumscribed, for unions to shape the process of adjustment, and to retain the (albeit contingent) protections offered by the collectively negotiated agreements.

This paper considers the period from when Geary's analysis ceases (2014) by which time the Troika had departed Irish shores and the Irish state had regained elements of its former economic sovereignty, and by which time, too, the shoots of economic recovery had begun to bear fruit. It addresses the question of whether unions retained their approach of 'reasonable' accommodation in the improving economic context or rather did they seek to press advantage, and be more confrontational in an effort to recover lost ground?

Public service employment relations in the EU countries after the crisis: a fundamental change or business as usual?

Lorenzo Bordogna, Stephen Bach
University of Milano, Italy; King's College London
lorenzo.bordogna(at)unimi.it,
stephen.bach(at)kcl.ac.uk

In almost all EU countries, public administrations and public service employment have been one of the main targets of governments' responses to the economic and sovereign debt crisis. The stricter constraints of the new EU economic governance have made containing or cutting public expenditure, of which wage and salaries of public employees are a key component, a prominent concern that has not been confined to countries covered by an assistance program from the Troika. Employment levels, working

conditions, wage and salary dynamics and pension benefits of public employees have often been at the centre of governments' measures to contain or cut the total public sector wage bill. Alongside these measures, also employment relations institutions and practices have been significantly affected.

The relevant question that the paper wants to explore is therefore whether post-crisis public service employment relations present discontinuities deep enough to configure a fundamental transformation of previous patterns, to some extent resembling the transformation that occurred in the US private sector employment relations in the 1980s, according to the well-known book by Kochan, McKersie and Katz (1986).

This issue will be addressed updating the empirical evidence and the analysis of a recently published collection of national case studies on 12 EU countries, with a special focus on the growing, albeit indirect, role of the EU economic governance on national public service employment relations.

Industrial relations through the crisis in Italy: Which way forward?

Roberto Pedersini
Università degli Studi di Milano, Italy
roberto.pedersini(at)unimi.it

Industrial relations in Italy have experienced important developments during the Great Recession. At the beginning of this period, in January 2009, the framework set by the 1993 tripartite agreement was reformed, without the support of Cgil, the major trade union confederation.

Two of the most important changes introduced by the 2009 cross-industry deal concerned the termination of the income policy scheme, which had determined a long phase of wage restraint, and the introduction of a broader scope for decentralisation, within an 'organised' system of opening clauses to be determined at sectoral level. The latter element became a matter of contention, especially because of the split on the union side about the balance to be found between sectoral and decentralised bargaining and the divisions in the metalworking sector on sectoral renewals and the reorganisation plan at Fiat.

A series of intersectoral agreements on representation and representativeness, as well on the rules for decentralised bargaining and opening clauses, established a new shared regulatory framework between 2011 and 2014, with the participation of Cgil. At the same time, the economic difficulties persisted (and are still there) and a number of reforms on the labour market and social security system were introduced (without social concertation).

The paper provides an assessment of this period in the light of the most recent renewals of industry-wide agreement as well as on the analysis of recent survey data on collective bargaining and industrial relations at company level.

RN17 | Session 05b Job Satisfaction and Workplace Representation

Workplace employee representation in a voluntaristic context: the Swiss case in comparison

Heinz Gabathuler, Patrick Ziltener
University of Zurich, Switzerland; University of Zurich, Switzerland
gabathuler(at)soziologie.uzh.ch,
ziltener(at)soziologie.uzh.ch

In most continental European countries, employee representation bodies elected by the workforce (works councils / Betriebsräte / délégations du personnel / ondernemingsraden) play an important role in social dialogue. They are, either alongside with trade union representatives, or alone, the primary dialogue partners for management when it comes to regulate certain issues at the workplace, establishment or firm level, such as working time and conditions, remuneration, health and safety, consequences of restructuring etc in medium and large size businesses. Their formal constitution as well as their roles and competencies are usually regulated by law.

The case of Switzerland in this international context is quite particular: On the one hand, such institutions enjoy a long tradition, especially in the manufacturing industry and in the financial sector. On the other hand, a law on workplace-level employee representation was only introduced in 1994, whereas a number of collective agreements – on branch and on firm level – provide regulations on “works councils” for a long time already, and in a much more detailed way than the law. Furthermore, terms are also defined on firm or establishment level – which is relevant, as only around half of the private sector workforce are covered by collective agreements. The role of “works councils” in Switzerland can thus only be understood by taking into account the voluntaristic character of Swiss industrial relations.

We will present preliminary findings from a research project on “works councils” in Switzerland, based on an analysis of dominant patterns of collective bargaining within different industries of the private sector in relation with incidence, forms and functions of “works councils”, as well as on a number of case studies in selected industries.

The effects of individual motivation and contextual factors on job satisfaction. A cross-sector analysis.

Rosita Garzi, Nereo Zamaro, Sonja Cappello, Gabriella Fazzi
Università degli Studi di Perugia, Italy; ISTAT - Istituto Nazionale di Statistica, Italy; Università degli Studi di Perugia, Italy; ISTAT - Istituto Nazionale di Statistica, Italy
rosita.garzi(at)unipg.it, zamaro(at)istat.it,
sonja.cappello(at)unipg.it, fazzi(at)istat.it

The implementation of welfare policies at local level heavily rely upon public and private (mostly non profit)

organizations' cooperation. The quality of service delivery is influenced by the quality of working life in these organizations.

The paper presents the results of a multi-sector survey on Public Service Motivation (Perry-Wise, 1990; Pandey et al, 2017) and organizational well-being carried out in the area of Terni, Italy, in 2016. The interviews involved the staff of 2 Municipalities, and the employees of 2 social cooperatives, for a total population of over 1.500 workers. The paper describes the main determinants of job satisfaction, comparing two different organizational settings, and furthermore evaluating to what extent organizational well-being and perceived workplace safety influence the level of perceived job satisfaction.

The paper investigates on the connection between individual motivation, relational and contextual factors, organizational well-being and work satisfaction, leveraging on a multi-sectoral approach to compare the pro-social attitudes of workers employed either in a public, in a non profit both front-end organizations.

The survey was based on mixed mode research techniques. The following tools were used: focus groups; on-line questionnaire; in-depth interviews to key informants.

The findings show significant connections among the dimensions under analysis –i.e. between PSM, job satisfaction, perceived performance, and other contextual factors like leadership style, “red tape” and workplace deviance. Meanwhile, various differences seem to emerge in each kind of organization, suggesting the influence of some “institutional specific effects” at work when trying to explain what facilitates or inhibits employees participation to work.

Stuck on similarities and differences? The practice of comparative workplace employment relations research

Patrick McGovern
LSE, United Kingdom
p.mcgovern(at)lse.ac.uk

Despite their growing prominence within industrial relations and the sociology of work, there has been a surprising lack of discussion on the design and execution of cross-nationally comparative workplace case studies. A frequent criticism of such is that it lacks in representativeness or typicality and so its capacity for making country-level generalizations is limited to noting cross-national similarities and differences. Further problems arise when the cases are taken to be typical of particular industries or of MNC companies operating in those countries. Accordingly, the selection of cases is the central choice available to the qualitative comparativist. How then does this emerging workplace literature address this problem?

To capture the current ‘state-of-the-art’ I focus on a random sample of papers published in the leading American, Australian, British, Canadian and European journals on work and employment relations between 2000 and 2014. The articles were analyzed through a form of directed content analysis that combined

qualitative and quantitative methods.

In examining the way this research address the problems of national generalization and cross-national comparisons, I focus on problems of case selection, analysis and types of generalization. Current case selection strategies raise a number of questions about the nature and level of comparison. In terms of analysis, a key issue is the division between within-case and cross-case forms of research and their resulting interpretation of the different roles attributed to national differences. The paper concludes by arguing that if this research is to overcome problems of representativeness and demonstrate that differences in national institutions matter then the challenge is one of understanding how such differences matter for theoretical purposes rather than for specific, historical or idiosyncratic reasons.

RN17 | Session 06a Crisis, Post-Crisis and Employment Relations (special session 2)

Concertation during and after the crisis: is governmental unilateralism the only game left in town in the Eurozone periphery?

Arianna Tassinari

University of Warwick, United Kingdom

a.tassinari(at)warwick.ac.uk

The impact of the crisis on dynamics of social dialogue and concertation across European countries has not been uniform. Some authors (cf. Bieling and Lux, 2014) have hypothesised an emerging divergence between 'core' Eurozone countries, where the institutions of concertation and joint governance are said to have been relatively resilient during the crisis; and 'peripheral' Eurozone countries, where the crisis is said to have marked a shift towards governmental unilateralism as the dominant mode of policy-making.

This paper aims to problematise this account by investigating empirically how have the relationships between governments, trade unions and employers' organisations in the formulation of economic and social policies changed in the crisis' aftermath in four peripheral Eurozone countries: Italy, Ireland, Spain and Portugal. Is governmental unilateralism actually 'the only game left in town' in the post-crisis landscape?

The paper analyses developments from 2008 to 2016, combining documentary analysis and findings from semi-structured interviews. It assesses how have social partners' organisations been involved in policy-making processes in labour market, welfare state and collective bargaining reforms during the Eurozone crisis and in its immediate aftermath, and whether there are differences in the nature of their relationship with governments between the 'peak' of the crisis phase and the emergent post-crisis 'recovery'.

The argument put forward is that rather than a homogenous drift towards governmental unilateralism, we are witnessing different country-specific trajectories in the reconfiguration of governments-social partners' relationships and of the institutional

forms through which these are articulated. The complex interplay between macroeconomic conditions, institutional legacies, power resources and governmental partisanship must be analysed to account for different trajectories of development in these circumstances.

Talking about the same but different? Alliances and cooperation in social movement and industrial relations theory. An integrative approach

Sabrina Zajak, Giulia Gortanutti, Johanna Lauber, Ana-Maria Nikolas

Ruhr-University Bochum, Germany; Ruhr-University Bochum, Germany; Ruhr-University Bochum, Germany;

Ruhr-University Bochum, Germany
sabrina.zajak(at)rub.de, Giulia.gortanutti(at)rub.de, johanna.lauber(at)ruhr-uni-bochum.de, ana-maria.nikolas(at)ruhr-uni-bochum.de

Social movements and labour have been key forces contributing to building and strengthening democracies and creating institutions that democratically govern capitalism. Against the background of the ongoing economic crisis in Europe, the shrinking of democratic space, and multiple institutional failures, a joint claim of social movement and industrial relation research is that cross-movement alliances should help to construct and maintain solidarity within and among societies in Europe. Understanding reasons for cooperation and their failures is thus an important task. Social movement and industrial relation theories both embarked to theorize and empirically research such alliance formation, yet mainly from their own theoretical background. This paper starts by comparing different but similar theories of both research fields, calling for a further integration of resources, identity, cleavage or political-economic opportunity approaches both theories use albeit in different ways. The paper suggests that using such an integrative approach to study what we call transnational cooperation events - European wide events which are jointly organized between trade unions and social movement organization - is an important step towards explaining the relationship between social movements and trade unions and their joint potential to recreate democratic ways for governing work and capitalism in general.

Recovering from the crisis. Organizational adjustment practices in South Europe.

Margarida Martins Barroso

Lisbon University Institute (ISCTE-IUL), Portugal

margarida.barroso(at)iscte.pt

In this paper, we analyze how companies are tackling the challenges brought by the economic crisis regarding human resources' management and organizational functioning.

In an economic and social context shaped by increasing pressures to the reduction of labour costs, many organizations have adjusted their structure,

policies or strategies in face of external restrictions, aiming to assure high levels of performance while simultaneously trying to maintain previously accumulated human capital.

Developed under the project Organizational strategies of adjustment to the economic crisis. A comparative analysis of HRM practices in South Europe (FCT, 2014-2017), this paper presents a comparative analysis of the most frequent types of measures put in place since the beginning of the crisis by Portuguese, Spanish and Greek companies. Based in data from the European Company Survey (Eurofound 2013) and in organizational case studies in small and medium sized companies in the three countries, we discuss how the responses to the crisis are influenced by the interaction between organizational practice and national institutional functioning.

This study focuses companies in countries with similar institutional configurations and strongly affected by the crisis, and intends to reinforce the organizational dimension in the analyses of labour market adjustments.

Why flexible working arrangements did not protect the Greek labour market during the recession? A dual labour market perspectiv

Ioulia Bessa, Danat Valizade, Mark Stuart
University of Leeds, United Kingdom; University of Leeds, United Kingdom; University of Leeds, United Kingdom

I.Bessa(at)leeds.ac.uk, D.Valizade(at)leeds.ac.uk, M.A.Stuart(at)lubs.leeds.ac.uk

Our paper examines potential reasons for the failure of FWAs to protect the Greek labour market during the crisis. The study seeks to provide fresh insights into the role of FWAs as an instrument for recessionary adjustment mechanism, by considering the case of Greece, a country that has been taken aback by the recent economic crisis with regard to both its overall economic performance and more specific labour market outcomes.

Drawing on dual labour market theory, we define and look at employer-centred FWAs, used at the margins of secondary labour markets, and in parallel employee-centred FWAs, predominantly found in primary labour markets.

Analysis suggests that as an adjustment mechanism employee-centred FWAs do not support the primary labour market in Greece, which is a vital condition for avoiding excessive job losses. We demonstrate the failure of FWAs to support the Greek labour market during the recession is rooted in often overlooked institutional determinants. In particular, the deeply ingrained gender division of the Greek labour market deprived dual labour markets of flexibility necessary to insulate primary jobs from unemployment. It is not merely Greek organisations that defy FWAs as a means of protecting primary labour markets from imminent recessionary shocks, but predominantly core male employees, who, empowered by culturally embedded masculine stereotypes, reject at face value any mechanisms that may hamper their privileged

position in the labour market.

RN17 | Session 06b Regulatory Mechanisms and Changing Patterns of Labour Mobility

Transnational Capital/Labour Flows - Managing Cross-Border Collaborative Projects. Adapting Labour Market Policy to a Transformed Employment Structure

Mei-Ling Lin
National Open University, Taiwan, Taiwan
paulina(at)kcg.gov.tw

The shift towards recognition of a capital-labour flows have occurred within the broader context of a globalized knowledge economy and a global race for skills. Change in a country's employment structure is shaped by the evolution of skill supplies, implies that educational expansion and migration flows are crucial to understand occupational change. The local communities, Taiwan is in competition for its share of the intellectual capital and for the best skilled migrants. Taiwan has announced the opening of a new office for blockchain coders for financial technology, and expands its expertise in the blockchain industry. We aim to disentangle the strategy applied by Taiwan to adapt its national labour markets to increasing globalization and flexibility demands. The paper is presented as follows. First, we compare national patterns of job growth in Taiwan, extending the discussion of the reach of job polarization. Second, we examine differential patterns, building on the analysis of educational patterns of employment growth. Third, we go about understanding the relationship between capital flows, labour flows and em/migrant resettlement patterns. We assess the impact economic globalization has on the flows of the highly educated, and documents incentive programs put into place by the government to tap highly educated talent abroad. A final summary reflects on the key finding of this paper, its contribution to the research arena, as well as open questions for future research. The paper delivers both quantitative and qualitative data as well as an account of the relevant labour market reforms in Taiwan.

Key Terms skilled migration, employment policy, intellectual capital, entrepreneurial excellence, youth livelihoods

Towards 'fair control' over movement of labour: Labour market regulations and immigration at the EU margins

Guglielmo Meardi
University of Warwick, United Kingdom
guglielmo.meardi(at)wbs.ac.uk

Recent migrants, whether from inside or outside the EU have tended to concentrate in insecure forms of employment, unlike previous waves that were finding work in relatively secure jobs mostly in manufacturing, raising the issue of a complex link between migration, flexibility and poor employment conditions. Social concerns over employment have become central in

particular around free movement of workers, as exemplified by the Swiss referendum of 2014 and the British one of 2016. The paper reviews, through social survey data, labour market data, documentary and media information as well as interviews with key stakeholders, the experience of the three countries at the margins of the EU that have tried or are trying ways to regulate free movement of workers while maintaining as much free trade as possible with the EU, ie Norway, Switzerland and the UK. It identifies the extent to which labour market regulations can address social concerns over free movement while being perceived as 'fair' by local and migrant groups, and the role of industrial relations actors in 'embedding' free movement of workers into local employment regimes. The paper concludes with implications for the EU and for Brexit.

Brexit and the future of EU labour mobility to the UK: the analysis of institutional actors' responses to changing regulatory mechanisms of migration

Zinovijus Ciupijus, Gabriella Alberti, Oliver Liz, Stuart Mark, Forde Chris, Cutter Jo

University of Leeds, United Kingdom; University of Leeds, United Kingdom; University of Leeds, United Kingdom; University of Leeds, United Kingdom; University of Leeds, United Kingdom; University of Leeds, United Kingdom

zc(at)lubs.leeds.ac.uk, g.alberti(at)leeds.ac.uk,

e.a.oliver(at)lubs.leeds.ac.uk,

M.A.Stuart(at)lubs.leeds.ac.uk, cjf(at)lubs.leeds.ac.uk,

J.Cutter(at)leeds.ac.uk

The paper aims to explore the implications and tensions of Brexit for patterns of labour mobility from the European Union to Britain. The paper investigates how different interest groups view the challenges of Brexit for labour mobility and how they seek to respond to the post-Brexit employment landscape. Brexit affects EU labour migrants, creating uncertainties for the position of EU workers in Britain, in terms of labour market rights and social protection. At the same time, this changing landscape also affects a variety of other stakeholders (Rolfe, 2016). For example, employer bodies have expressed concern over the implications of changing migration policy for skills supply, while union organisations have highlighted the consequences for working conditions and the regulation of migration. 'New' industrial relations actors such as labour lawyers, state agencies and migrant groups also seek to influence policy formulation around labour mobility. With the fault lines of Brexit still emerging (O'Reilly, 2016), the paper examines emerging and potential areas of agreement and tension among stakeholders. The paper draws on literatures in migration studies and employment relations, and offers an analysis of ongoing, shifting stakeholder positions using publicly available sources. The analysis looks at the putative post-Brexit migration regime in the UK and its implications for the rights of EU workers in the UK labour market, to explore the nature of ongoing social dialogue among these groups. This dialogue has

important policy implications for the developing UK social model and the changing relationship with the European social model.

Europeanization of work and the implications for labour inspectorates

Almut Bachinger, Jimy Perumadan

International Centre for Migration Policy Development (ICMPD), Austria; International Centre for Migration Policy Development (ICMPD), Austria

Almut.Bachinger(at)icmpd.org,

jimy.perumadan(at)icmpd.org

Europeanization of work and employment has caused fragmented and complex labour markets and sectors and occupations regulated by regulations that tend to serve employers' demand for cheap labour by eroding labour standards. At the same time, the most extreme forms of labour and criminal law breaches are attaining increasing attention and labour inspectorates are expected to contribute to efforts to fulfil international obligations, e.g. in tackling "trafficking in human beings for the purpose of labour exploitation" (THB-LE). Labour inspectorates and other national inspecting and enforcement bodies have difficulties in overseeing and sanctioning standards in the view of this growing complexity and the multiplication of their tasks, and are acting in a climate of negative attitude of economic and political actors against their routine activities.

The paper will use the concept of the regulatory state (Majone, 1994) to analyse different regulatory approaches of labour inspecting authorities in five European countries (Austria, Czech Republic, Germany, Netherlands and UK). Particularly it will investigate whether and to what extent 1) inspectorates are required to address severe crimes such as THB-LE (ideology), and 2) the means are provided to implement these tasks (practices). We assume that debates and practices on THB-LE should be analysed as an expression and function of an ideology that draws 1) the state as defender of the vulnerable (instead of the worker and his rights) and opponent of evil traffickers to 2) legitimize the institution building of a repressive top-down enforcement of migration, tax and social security law and 3) as a specification of a meta-environment that veils capitalist logics.

Majone, G. (1994). The Rise of the Regulatory State in Europe. *West European Politics* 17(3), 77–101.

RN17 | Session 07a Crisis, Post-Crisis and Employment Relations (special session 3)

Unemployment and precarious employment experiences in Greece in times of crisis

Christina Karakioulafi

University of Crete, Greece

chkarakioulafi(at)gmail.com

The Greek debt crisis combined with austerity measures have led to soaring unemployment rates to unprecedented for the Greek labor market levels and

to the formation of a workplace landscape marked by increasing employment precariousness and deregulation of labor relations. In this context and in view of their intensity, the concepts of unemployment and of precariousness seem to acquire a different content and scope. However, in Greece the scientific analysis of unemployment and precariousness is mainly of statistical character. Although statistical analysis allows us to register households or individuals affected by situations such as unemployment, they do not however allow us to see how these households and the unemployed experience their unemployment situation and how they manage to cope with unemployment. In the same way, it is difficult for statistical analysis to take account of and to register the various forms of employment precariousness and insecurity which are present in the Greek labor market. The aim our paper is to investigate how men and women experience and cope with unemployment and/or employment precariousness (and insecurity) as well as how they perceive their present and future general working (or non-working) situation. Our work is based on in-depth qualitative interviews examining both subjective experiences and significations of unemployment and and/or employment precariousness, as well as how the broader situation of economic crisis and rising unemployment impacts on these experiences and significations. It seems that in this context unemployed people demonstrate a certain pessimism with respect to their ability to escape their unemployment situation. Finally, we also examine the role of traditional supporting networks such as the family protecting unemployed (and their families) from extreme deprivation.

New middle classes facing crisis: old and new precariousness

The crisis exploded in 2007 did not affect only the most vulnerable employees. It took a multifaceted range of factors: investment restraints, legislative changes, crisis accentuated in some professional sectors and branches of activity. These factors also affected high qualified working groups. In particular, many white-collar professions altered their activity. The aim of this paper is to show the first results of an ongoing research (GVA2015-055) that analyses the situation of these occupational groups in the context of the crisis. In this case, their social expectations have been soaked by insecurity.

In this project, we selected three case studies that represent well this crisis of the new middle classes: the first is the lawyers, who have suffered public cuts and legislative changes that have altered the functioning of their profession; the second are the

architects, affected by a drastic reduction of construction and, thirdly, journalists involved in structural and technological changes, and specially, in the case of Valencian Region affected by the closure of the radio and TV public service (RTVV).

The research has a qualitative methodology based on in-depth interviews at working professionals, focusing on intermediate age groups (35-50 years). The interviewees show us that job security -considered a success already achieved- has been questioned by the crisis. The first results give us a picture of life and job insecurity significantly over a much greater perception of the crisis as their job prospects were built in times of strong expansion of employment and economic activity.

The revival of the household economy -- Social Land Program in Hungary

Flórián Sipos, Judit Csoba
University of Debrecen, Hungary; University of Debrecen, Hungary
sipos.florian(at)arts.unideb.hu, csoba.judit(at)arts.unideb.hu

The concept of social land programs was initiated at the beginning of the 90s by the Crisis Management Program Office of the Ministry of Social Welfare in Hungary. The rationale behind the government support was tackling deep poverty in disadvantaged regions. After the crisis in 2008, the social land program gained more and more importance among the social group with precarious life situations. With the reduction of the welfare benefits and expansion of the workfare model, the main objective of the program is to strengthen self-sufficiency and to support people dropped out from the social aid system. Self-sufficient 'family farming' was a widespread form of economic activity under the state socialist period. The social land program sought to revive the tradition of self-sufficiency in small villages among the most disadvantaged groups in order to empower them to satisfy their basic needs. However, the conditions in the last 2-3 years have been missing; neither the expertise nor the tangible assets (land, tools) have been available, albeit the number of people in need continued to grow. The Hungarian government also made efforts to connect the originally volunteer activities of the social land program with the compulsory public work programs. Thus, the program became one of the well known 'test' tools of the conditional social transfer. Instead of independent family farms, a quasi-feudal form of collective work started to develop with the new model. The present paper is based on an extensive empirical fieldwork on 10 research sites.

Vocational habitus in liminal contexts: the case of a Greek training voucher in Tourism sector

Giorgos Bithymitris, Orestis Papadopoulos
Panteion University of Social & Political Science, Greece; Keele University
geobith(at)kpe-panteion.gr, o.papadopoulos(at)keele.ac.uk

The paper addresses the issue of precarisation in the making, as manifested in traineeships in the Greek tourism sector. The research explores recent experiences of 20 young trainees (up to 29 years old) who received 80 hours of theoretical training in 7 tourism-related professions and gained 420 hours working experience as interns (June 2016 - March 2017). Our findings suggest that the trainees –mostly those with working-class backgrounds and lower levels of social capital- instead of identifying and enriching their career prospects, they endorse precarity as a general rule, preparing themselves for an endless and sometimes purposeless drifting into a vaguely conceived post-crisis labour market. The concept of liminality is coined here for this existential condition, which describes both the “between and betwixt” position of the young trainees and the vocational habitus of the “protean” multi-tasking service employee. The paradox that we seek to address with our analysis could be described as follows: the dominant national and EU policy paradigm considers the individualized learning on how to cope with precarity, as a strategy to overcome this condition and enter labour market, first as an intern and then (hopefully) as an employee. In reality, the unintended consequences of this approach, points to the opposite direction: a spiral of precarity with service economy and tourism sector being at the epicentre with multiple political and social implications.

RN17 | Session 07b Institutional Responses to the Vulnerabilities of Migrant Workforce

Imagined independence among Swedish highly skilled labour migrants

Ylva Wallinder

University of Gothenburg, Sweden

ylva.wallinder(at)gu.se

Transnational labour mobility among the highly skilled is often described as a result of the individual's free will to move, thus excluding structural motives for migration. This paper examines how Swedish labour migrants reason about their decision to seek qualified employment abroad, exploring their motives as well as the preconditions for their labour mobility. Even if it is a well-known that the intra-European mobility is facilitated through legislative changes during the last decades, there is still a rather poor understanding of the assumptions and experiences of these individuals who de facto chose to search for work abroad for improved career prospects.

The paper is based on an interview-study of Swedish highly skilled migrants employed either in London (UK) or Munich (Germany). The collected interviews examine the migrants' motives to seek qualified employment abroad, as well as their experiences. A clear pattern that occurred in the data was a struggle to manage one's life independently. Despite their strive for independency, all of the interviewees acknowledge a certain vulnerability and dependency on a social security system that they comprehend.

This tension, between a desired independency and a perceived vulnerability and dependency, is herein framed as an imagined independence. The migrants' imagined independence allows them to gain a perceived social security by knowing that ‘they can always return’, and via their imagined community of highly skilled Swedes living abroad they can gain trust and comfort when needed. Such descriptions reflect both the highly skilled migrants' (potential) problems as well as their privileges.

Between national and global: Challenges to Trade Union Solidarity by Migration, Europeanization and the Rise of the Populist Right.

Saskja Schindler, Julia Hofmann

University of Vienna, Austria; University of Vienna, Austria

saskja.schindler(at)univie.ac.at,

julia.hofmann(at)akwien.at

Since the first workers' movements, solidarity between workers is the fundamental norm of trade unions. It aims at breaking the competitive thinking between workers within a nation state but also on a global level. Nevertheless since unions in Europe mainly act on a national level, their concepts on solidarity are currently challenged by the Europeanization of work as well as by the so-called “migration crises” in 2015/2016. Vast socio-economic and regulatory differences between the EU member states combined with the opening of the labour market reinforced the competition between workers. The arrival of a large number of refugees in 2015/2016 brought a very vulnerable social group to the national labour markets and thus produced a further intensification of workers' competition. Unions found themselves in a tension between a form of solidarity based on the interests of national workers and the demands of transnational solidarity.

The current rise of the populist right in Europe further challenged trade union solidarity as they propose a competing - ethnic/nation-based - version. Trade union solidarity thus is challenged twofold: on the one side by national/global contradictions and on the other side by the “nationalization of the social question” through the populist right.

In our paper we illustrate these challenges to trade union solidarity by taking the empirical example of the debate on the labour market access for refugees in Austria. Therefore, we will examine the following questions: How did unions react to the debate on the labour market access for refugees? How did they refer to workers' solidarity in this debate? How was their position influenced by the Austrian populist right (FPÖ)?

Extending the typification of temporary organization: the case of a trade union

Joanna Karmowska, John Child

Oxford Brookes University, United Kingdom;

University of Birmingham, United Kingdom

jkarmowska(at)brookes.ac.uk, j.child(at)bham.ac.uk

The great majority of studies of temporary organizations have been conducted in business organizations. Taken together, they suggest that a temporary organization normally has certain characteristics such as the task of accomplishing a specified project to a given completion date. The configuration of these characteristics can be regarded as a prevailing 'ideal type', in the Weberian sense. The investigation we report reveals divergence from a central feature of this ideal type, namely 'planned temporariness'. Our empirical evidence is drawn from an in-depth case study of a temporary branch initiated by a British trade union for the recruitment of East European migrant workers.

The temporary trade union branch differs from the typification of a temporary organization in the existing literature. The contrasts that emerge serve to identify comparative dimensions of organizational temporariness as well as factors likely to give rise to different positions along those dimensions. They suggest that there may be different types of temporary organization, conditioned by the nature and context of trade unions as occupational interest organizations, which also exhibit differences in their development over time. The paper offers a critical examination of both the results and the method, and builds on this to indicate fruitful avenues for further research.

Union and migrant advisory offices approaches towards posted workers in Germany

Maria Alexandra Voivozeanu
University of Bucharest, Romania
alexandra.voivozeanu(at)gmail.com

Posted workers are hired in one of the EU countries and carry out their work on another Members' State territory. Studies show that they have high chances of getting stuck in precarious jobs (Brentsen, 2015, Molitor, 2015).

On the other hand, limited bargaining power when it comes to posted workers (see Laval, Viking, Ruffert vs ECJ law cases) and other institutional limits reduce the capacity unions have to represent them. Against this background, to address labour related problems of posted workers (and highly mobile migrants) German unions support advisory offices which council migrants in their native language.

My research focuses on the construction sector and meat industry sector, two economic sectors with high numbers prevalence of posted workers. The paper is based on interviews with national representatives of IG-BAU Industrial Trade Union Building, Agriculture Environment, NGG (Catering Trade Union) and of DBG (Umbrella Organization of the German Trade Unions) and on interviews with employees of migrant advisory offices. Data have also been collected using participatory research when translating for a local branch of the construction union at their interactions with Romanian workers and by interviewing Romanian posted workers in Germany.

In order to get a better understanding on the position and strategies of German unions towards posted workers my research brings answers to the following

questions: What is the approach German unions have towards posted workers? Where do advisory offices stand in the picture? What is the extent of collaboration between unions and advisory offices?

RN17 | Session 08a Crisis, Post-Crisis and Employment Relations (special session 4)

Returns of Education. Labour Market Inequalities in times of crisis.

Olga Papadopoulou
University of the Aegean, Greece
olpapadop(at)gmail.com

The study of the labour market and of the triptych "labour market, human capital and earnings" is an extremely important issue for the competitiveness of the economy. Dealing with labour market and the formation of individuals' earnings through human capital are the main objects of the paper, which aims to contribute to the current scientific debate.

This paper focuses on the Greek labour market, within the framework of national economy that characterised by a great transformation, because of the crisis that began in 2010.

The main research question, which connects economic inequality and educational inequality in the context of the labour market, is formulated as follows:

"Do differences in human capital or education lead in inequality on individuals' earnings and consequently in inequality on the labour market of Greece?"

The main research question is summarised to the following subquestions:

- "In which extent workers' human capital-characteristics (such as education and experience) explain possible variations in individuals' earnings in the Greek labour market?"

- "Are individuals' earnings determined by a series of other personal characteristics (such as gender or marital status)?"

In order to answer the above questions, human capital theory will be used as the main theoretical framework, together with application of Mincer equations. Specifically, the relationship between earnings and a number of explanatory variables will be investigated using a microdata set from Household Budget Surveys 2011, by Hellenic Statistical Authority. Results showed that education and professional experience positively associated with individual earnings, with university education showed the highest performance.

The young people in the labor market: employment issues

Nina Arsentyeva, Sergei Busygin
Institute of Economics and Industrial Engineering,
Russian Federation; Novosibirsk State University,
Russian Federation
ars(at)ieie.nsc.ru, sergei257(at)gmail.com

Data: sociological survey of 4365 graduates of the professional education system conducted in 2015-2016 in the Novosibirsk region.

Theoretical basis of this study relies on the works of the founders of the human capital theory T.Shultz's, G.Becker's and others.

The economic crisis of 2008 and the post-crisis period negatively reflected on the state of the labor market. The fraction of full-time employment with sufficient compensation is reducing and the fraction of part-time and temporary employment is increasing. There is an increase of jobs that require low or medium qualification. These characteristics are peculiar to the labor market of the Novosibirsk Region and majority of other Russian regions.

Labor market is a place of conversion of human capital into capital. In this context it is important to study the behavior of the population that looking for a work, adapting to new opportunities, organizing priorities in the labor market and demonstrating work motivation. The results show us that young people are "sacrificing" a received profession (63%) for employment in any job. The current situation contradicts a national goal of building-up of a human capital and innovative potential of the economy.

The paper analyzes the amount of losses in professional and qualificational potential of the economy and human society as a result of the degradation of the socio-economic characteristics of the sector. It also describes those segments of the labor market, where deprofessionalization risks of workers are especially great.

Negative attitudes towards unemployment in European countries, in relation to the activation shift & macroeconomic changes

Veerle Buffel, Sarah Van de Velde
Ghent University, Belgium; University of Antwerp, Belgium
Veerle.Buffel(at)Ugent.be,
Sarah.VandeVelde(at)uantwerpen.be

This study investigates public attitudes towards unemployment within the context of the recent economic crisis and the activation shift in Europe. We use two waves –1999-2000 and 2008-2009– of the European Value Survey (EVS). By using the information of a high number of countries (25) and combining two waves of the EVS (50 country-years), we are able to relate the macroeconomic and institutional context as well as changes therein to individual's attitudes towards unemployment. A negative social image about people who don't work seems to predominate in all European countries, and has strengthened in several countries from 1999 to 2008. Our results have revealed that the public attitude towards unemployed individuals becomes more negative in countries with a strong increase in unemployment levels. In countries with on average a high level of expenditures on Active Labor Market Programs as well as in countries with an increase in efforts in activation, people are less eager to agree that 'not working turns into laziness and that 'receiving benefits without working for it is humiliating'. In sum, a strong economic downturn may reinforce the negative social image of people without work, while efforts in

activation rather weaken this negative image. These findings highlight the importance of studying macroeconomic and institutional characteristics in cross national and dynamic nature on attitudes towards unemployment.

RN17 | Session 08b Ethnic Workers and Entrepreneurs

New Actors and New Conflict: Labour Conflict among Workers in Construction Industry in Turkey

Sidar Çınar
Mardin Artuklu University, Turkey
cinar.sidar(at)gmail.com

Recent years, Syrian refugee flows have influenced Turkish construction sector. It is estimated that a lot of Syrian refugees are working as construction worker informally because they do not have working permission. This situation has created an environment for interaction among workers with different ethnic identities in construction sector. Then, any construction site is a confronted space for different identities especially between Turkish and Kurdish people in Turkey. At the same time there are competition for job opportunity among ethnic identities. Especially resulting from Syrian migration, the composition of construction workforce has changed and then the competition among construction workers has risen sharply. Bargaining powers of workers in Turkey have decreased because of Syrian workers. This paper explains the confrontations between workers with different ethnic identities and Syrian workers in construction sector in Turkey. This paper based on an ethnographic research project on construction workers. Fieldwork was conducted in Diyarbakır; a city that has been less studied in comparison to other big cities in Turkey. As the research focuses on workers' experiences; qualitative methodology has been employed. In-depth interviews have been conducted with (N=32) construction workers in Diyarbakır city centre.

The bargaining power of outsiders: the experience of temporary workers in Italy and the UK

Alessio Bertolini
University of Edinburgh, United Kingdom
s1250360(at)sms.ed.ac.uk

In recent years, driven by the increased number of people employed in atypical contracts during and after the Great Recession, literature in social policy and political science has brought attention to issues of individual and collective bargaining related to temporary employment, focusing the analysis towards power relations within the employment system and between categories of workers with different employment statuses. However, this literature has mainly investigated the objective structure of power relations in the employment system. It has hitherto failed to explore the actual experience of the temporary workers embedded in this power relations

structure. To fill this gap in the literature, this paper compares the experience of individual and collective bargaining among temporary workers in two countries with extremely different industrial relations systems. While the UK epitomises a fragmented system of industrial relations with bargaining happening mostly at the workplace level, Italy is characterised by national sectoral collective bargaining that is legally binding for all firms in the country, complemented by workplace bargaining in medium-large firms. The methodology entails semi-structured interviews with temporary workers in the service sector, trade union staff members and other relevant stakeholders. I argue that the industrial relations system does indeed play a relevant role in shaping power relations between different groups in the employment system, but that the relative bargaining power of temporary workers does not necessarily follow our expectations from the analysis of the objective structure of power relations, and that the characteristics of the industrial relations system shape their actual experience of bargaining power in unexpected ways.

Serbian immigration entrepreneurship in the USA: Case Study

Nemanja S. Trbojević, Vladan D. Vidicki
University of Novi Sad - Faculty of Philosophy, Serbia;
University of Novi Sad - Faculty of Philosophy, Serbia
tnemanjat(at)yahoo.com, vladan.vidicki(at)gmail.com

The most important sociological contribution in the field of entrepreneurship relates to concept of ethnicity and ethnic groups. In contrast to majority of papers that deal with the ethnic entrepreneurship as a whole, this paper analyses its early phase – immigration entrepreneurship. This term refers to entrepreneurial activity of an ethnic group in the process of adjustment to a novel socio-economic context, during which all of the members of that ethnic group are still considered to be immigrants.

The paper will present research results of entrepreneurial activities of the Serbian citizens who migrated to the USA from Europe. The aim of this research is to find the relation between the Serbian community's social capital in the USA and the success of new members in the area of entrepreneurship. The research will be conducted using case study methodology, and the data will be gathered using scientific interview. Using in-depth analysis of ethnic entrepreneurship, authors are going to make a contribution to this interdisciplinary problem.

Small Shops Big Tragedies: Doner/Kebap Ethnic Workers in Berlin

Besime Şen
Mimar Sinan Fine Arts University, Turkey
besimesen(at)yahoo.com

This paper aims to discuss the how Turkish immigrant has become entrepreneurship in Western European metropolises like Berlin throughout "ethnic business." These businesses based on small entrepreneurship have gained ethnic character in major European

metropolises. The ethnic economy has intensified in certain cities (Langlois and Razin, 1989). In addition to this, it seems that the ethnic economy gained a gender-based dimension in terms of both entrepreneurial and labor power (Jones, 1992, Lewin-Epstein, and Semyonov, 1992, Weinkopf, 2009; Wilpert, 2007; Mushabena, 2006; Caglar, 1993: 2013). This research shows how Turkish immigrant has become ethnic business entrepreneurship and workers regarding the political economy and Berlin metropolitan policies and seek how changed of immigrant labor policy of Germany within declined of secured jobs and; to seek how important of being qualified or unqualified workers in Doner Work? What are the effects of working under low wages, long working hours, limited mobilizing throughout the space circumstances to integration process to German society?

I did 20 interviews with workers, five businessmen, two managers of Turkish business journal, two members of the business and social organization of Turkish immigrant. Oral history method was conducted to get the story of workers and their immigrant experiences in Berlin. I have contacted specific person depending on the information, and I gathered some data about the specific institution from various brochures, advertisements, catalogs, reports. I have contacted with background Turkish, Kurdish/Sunni/Alevi, German/Turkish/Kurdish and contact limited new Syrian refugees.

RN17 | Session 08c New and Old Forms of Industrial Conflicts and Collective Representation

Dynamics of labour struggles against austerity: a case study on the total strike in Madrid underground in 2010

Nicholas Pohl
University of Lausanne, Switzerland
nicholas.pohl(at)unil.ch

In the aftermath of the great recession, numerous austerity measures were implemented in Spain. The first to apply to the publicly financed Madrid underground was a 5% wage-cut adopted by the Assembly of Madrid in June 2010. The underground workers responded immediately and vigorously: for the first time since 1991, they went on a total strike, causing a standstill of the underground during 48 hours and a traffic gridlock in the city centre. The strike did surprise because of its magnitude but also because of the risks taken by the workers, since they could be held liable – even dismissed – for non-compliance with the compulsory minimum services. The question rises how these workers came about to risk their jobs to counteract this wage-cut, a fortiori in times of general economic uncertainty.

In order to provide responses to this question, I adopt a processual perspective and retrace the genesis of the strike and the course of the event itself. The analysis includes subjective experiences, with moments of uncertainty and doubt, avoiding thereby a too linear reconstruction ex-post. In this regard,

particular focus lies on the production, the expression and the reception of emotions and how these processes contributed to the dynamics of the event.

The research is based on primary and secondary sources gathered during 8 months of ethnographic fieldwork among Madrid underground workers and their union sections. They include written materials produced by different union sections before, during and after the strike (e.g. circular letters, periodicals, press releases), interviews with members of the strike committee and with ordinary workers, as well as written and audio-visual materials gathered from online news portals and social media.

Alternative forms of the workers resistance in Poland's Japanese Foreign Direct Investment

Maciej Bancarzewski

University of Hertfordshire, United Kingdom
m.bancarzewski(at)herts.ac.uk

The paper empirically examines workers response towards specific managerial practices in Japanese electronics factories located in peripheral Poland (Toruń). The research was conducted in the years 2010-2014. Working conditions at the site were harsh. The subordination of labour was brought about by the precarious status of employment, rather than the implementation of Japanese quality policies. Workers did not remain passive actors in this process. The evidence gathered from the interviews, and online discussion boards is explicit. The resistance is mainly disorganised. Although the role of formal trade unions was limited, the data pointed to other forms of resistance, both conventional and novel, from sabotage, absenteeism, humour to insubordination and the use of blogging sites. In the context of the researched labour process, the empirical findings point to markers of collectivism in all forms of worker resistance and hence identified that the presence of the collective worker not only has persisted in both the labour process debate and the workplace itself, but, even if not evidently, through the resistance to management practices and control. This research demonstrates that capital-labour conflict has not disappeared in Poland and workers can still resist capital, albeit through unconventional methods. This paper augments critical discourses and voices about the experience of workers, particularly in the context of the intense competition that has led to flexibility and precarious employment.

Beyond strikes: shape of workers' collective actions in Poland

Piotr P. Plucienniczak

Fundacja Socjometr, Poland
pplucienniczak(at)gmail.com

Political opportunity structure theory identifies structural factors that influence actors' ability and will to mobilize and also the repertoire of such mobilization. We discuss the possible convergence between political economy and POS theory in a framework of "political economic opportunity structure"

(opportunities for the labour mobilization). It is used to enhance our understanding of labour organization as a varied, often extra-institutional response to structural characteristics of its environment, beyond counting strikes or union density.

The paper uses protest event analysis of collective action of the labour in Poland since 2004, the year of the EU accession, until today. We have gathered all acts of workers' non-routine collective resistance or disobedience in that period that were reported in the nationwide press: from strikes through picket lines and slowdowns to social campaigns. Attention was also paid to threats of protest as an important indicator of labour's organizational capacity.

Analysis of protest data in terms of sectors of economy and forms of organization of labour process shows where the labour can and does organize beyond relying on institutional data. The analysis also shows the opposite, the spaces where there is no collective resistance or it is not visible. This, in consequence, allows us to track and compare characteristics of certain workplaces or sectors that shape the chances for the labour mobilization. Our major intention is to show new possibilities of sociology of industrial relations that incorporates social movements theories – the possibility to follow workers' in their struggle beyond institutionalized forms of contention and of studying them. This is especially important in a political environment that is hostile to institutionalized representation of interest, such as Poland.

RN17 | Session 09a Transforming Labour (Market) Structures and Expectations

Job-rotation between companies in regional networks as a tool to maintain employability

Alexander Bendel

Federal Institute for Occupational Safety and Health (BAuA), Germany

bendel.alexander(at)baua.bund.de

In the face of the demographic change and the increasing digitalization of workplaces, innovative age management concepts become more important. The decrease of the performance of older employees is related to a health-threatening work environment and to a lack of opportunities that could help to develop professional and personal skills.

There are a lot of jobs with a „limited period of work activity“ (due to monotonous tasks, high stress, a lot of routine etc.) that provoke physical and mental wear and lead to demotivation, deskilling and the loss of the ability to learn. To maintain employability, preventive concepts are necessary. These concepts should counteract deficits of health, motivation and qualification. It takes a long-term view on the whole working life to prevent age-related mental and/or physical disabilities.

Here job-rotation between companies could be an effective tool to maintain employability. It can help to reduce physical/mental stress and is linked with new professional and personal demands (which foster the

cognitive performance and the ability to learn). The research project „Job-rotation between companies in regional networks as a tool to maintain employability“ (TErrA) identifies chances and limits of this tool.

In our project we focus on small and medium-sized enterprises (SME) because they do not have the resources to perform job-rotations (in contrast to large enterprises). SMEs are not able to provide a wide range of workplaces and work. In addition they have neither a full-time human resources department nor a personnel development program.

The role of employer, job and employee characteristics for flexible working time

Ines Zapf, Enzo Weber

Institute for Employment Research, Germany; Institute for Employment Research, Germany
ines.zapf(at)iab.de, enzo.weber(at)iab.de

Modern working societies face the challenge to combine the establishments' with the employees' needs for working-time flexibility. However, conflicts between the employers and employees' needs for working-time flexibility can arise. The purpose of our study is to examine the employer-, job- and employee-sided driving factors of working-time flexibility using Germany as a role model. For this purpose, we consider overtime and four different working hours' arrangements as two measures for working-time flexibility. We investigate the determinants of overtime and different working hours' arrangements using the German Linked Employer-Employee Study of the Socio-Economic Panel (SOEP-LEE) and logistic regression models. The results show that employer and job characteristics are most important for determining overtime and the different working hours' arrangements (fixed daily working hours, working hours fixed by employer which may vary, self-determined working hours, flexitime within a working hours account), underlining the power of employers with regard to working-time flexibility. Employee characteristics play the least important role, although employees can flexibly organize their working times and can benefit from certain arrangements, such as self-determined working hours and flexitime within a working hours account. The study provides evidence that working-time flexibility in Germany is mainly employer-oriented. However, through demographic changes and a possible lack of qualified personnel, employee-friendly arrangements are likely to gain importance.

The trajectories of job seekers with activity : exit to permanent contract or locking-in effects ?

Moulin Léonard, Sabina Issehnane, Oumeddour Leila
INED; Rennes 2 University, France and Center for employment studies; Center for employment studies CEET; Center for employment studies CEET
leonard.moulin(at)ined.fr,
sabina.issehnane(at)gmail.com,
Leila.OUMEDDOUR(at)cee-recherche.fr

The development of atypical forms of employment

makes increasingly blurred the boundaries between employment and unemployment, and questions the French system of job seeker allowance, based primarily on a model of long term contract and full-time job. The proportion of job seekers with activity has tripled since the mid-1990s, and has grown by over 80% since the crisis opened in 2008. The French employment agency has called job seekers with activity : job seekers in "Reduced Activity" (RA). The RA refers not only to an activity – part time jobs or temporary jobs - carried out by the job seeker while being registered on the list of job center, but also the possibility for job seekers compensated to cumulate their income from activity with their allowance. It is therefore in line with employment policies that respond to an activation logic. This research presents a quantitative and qualitative analysis to highlight the effects of the different characteristics of jobseekers on their path. For this, we have built a typology of job seekers' trajectories from a method of "optimal matching". We mobilize a panel data from the FH-D3 from the French Job Center and the DPAE (declaration prior to hiring which is mandatory for employers). This longitudinal analysis allows to highlight the types of trajectory groups in terms of using more or less sustainable RA and exit to a job also more or less sustainable. This analysis is coupled with our field survey that sheds light on the different trajectories with the biographical path of jobseekers according to their characteristics.

RN17 | Session 09b Employment Arrangements in Times of Globalization

Internalising the experience of restructuring: steelworkers and occupational identity

Chris McLachlan

University of Hertfordshire, United Kingdom
c.mclachlan3(at)herts.ac.uk

The impact of redundancy on affected employees following employment restructuring includes issues such as poor health, financial hardship, emotional and psychological distress and feelings of helplessness towards future employment. Addressing the impact on individuals in industries that generate a powerful sense of occupational identity, such as steel, is especially important in understanding the different ways in which employees respond to restructuring. In order to try and ameliorate the impact on employees, responsible restructuring has been proposed in the academic and policy literature, from the European Commission and the International Labour Organisation, as way for organisations to address the concerns of those affected.

Thus, this paper presents the findings from a case study of UK based steel plant (SteelCo) that claimed to have conducted its restructuring process in a responsible fashion. In particular, the impact of the restructuring, and the supposed responsible approach, on affected steelworkers is discussed, highlighting a range of social, cultural, material and experiential factors most pertinent to the response of

employees to SteelCo's restructuring process. The findings presented point to the notion that, for steelworkers, the experience of restructuring had become internalised as part of what it meant to work at SteelCo, generating an indifference to SteelCo's description of its process as 'responsible'. Understanding the extent to which a restructuring process is responsible, or not, must therefore be understood in relation to the social and historical factors that constitute particular occupational identities, and thus the subsequent disposition of employees to the onset of restructuring processes.

Precarity of work and employment in Slovenia: Forgotten flexicurity?

Mirosljub Ignjatović, Aleksandra Kanjuo-Mrčela
University of Ljubljana, Slovenia; University of Ljubljana, Slovenia
mirosljub.ignjatovic(at)fdv.uni-lj.si, aleksandra.kanjuo-mrcela(at)fdv.uni-lj.si

In the past two decades the situation on the Slovenian labour market has changed towards increasing flexibility of work and employment with weak demands for the implementation of the flexicurity concept in practice. More recent analysis (Kanjuo Mrčela and Ignjatović, 2014), found that those changes are in line with typical trends present in the developed world (US and many European countries) and that increasing part of the workforce is at risk of unwanted flexibility without security which the literature identifies as the concept of precarity (Kalleberg 2009, 2012; Standing, 2011 and 2014).

The purpose of this analysis is to analyse the changes on the organizational level of Slovenian companies, which are crucial for the understanding of precarization trends. The conceptual – theoretical framework of analysis represents a literature that contributes to the understanding of the concepts of flexibility and precarity as analytical instruments with which we analyse the current changes in the sphere of work.

The central part of our analysis will be the latest data from the CRANET survey and empirical data obtained from other European and Slovenian surveys and analyses, offering insights into the situation in the Slovenian organizations. The special attention will be given to the organizational level information on the use of flexible employment and work, remuneration arrangements, the situation in the field of health and safety at work and employee satisfaction in Slovenian organizations. In conclusion, we will reflect on and assess whether the trends confirm the precarization of work that we have seen in previous analyses.

Working on it at Home: Work and Family Conflicts experienced by Self-employed and Hired workers working from home

Liron Baharav, Asaf Darr
Ben-Gurion University of the Negev, Israel; University of Haifa
lironbah(at)post.bgu.ac.il, adarr(at)univ.haifa.ac.il

Throughout recent decades, economical, organizational, and technological changes, have led to a silent revolution of office location in Europe and other Western economies, reflected also in the growing rate of home-based teleworkers. The challenge of home-based teleworkers in managing the interface of home and work and the conflicts between work and family have provoked research attention. Some researchers suggest that home-based telework contributes to the balance between work and family, while others indicate that the home-office has a negative effect on work-family balance. However, this scholarship ignored the important distinction between 'hired workers' and 'self-employed'. Each such group encounters dissimilar control systems and career development characteristics and therefore may experience and manage their conflicts differently. Based on twenty semi-structured in-depth interviews with hired and self-employed workers working from home, this research indicates that some similarities are found in relation to these two groups' perceptions on the nature of homeworking. However, essential differences are noticed regarding their experience: hired-workers experience a stronger work-family conflict than self-employed workers, who demonstrate a more intense family-work conflict. In order to cope with their conflicts, the two groups adopt bureaucratic mechanisms, using different strategies of integration/separation regarding time, space and tasks management. While hired-workers make reference to bureaucratic mechanisms when they blur the boundaries between work and family, self-employed workers seek to construct bureaucratic boundaries and a formal work schedule and space to help them to separate work from family. This study illustrates how in an autonomous work space such as home-based telework, bureaucracy still plays a significant role.

Winner Takes All: Bidding and Contesting for highly skilled work on Internet Platforms

Pamela Meil
Institute for Social Science Research, Munich, Germany
pamela.meil(at)isf-muenchen.de

Currently we are witnessing developments in the use of digital media which represent a fusion of processes, combining aspects of user-generated content, global value chains and crowdsourcing which have a number of ramifications for working conditions, employment security, work content and work flows within and between companies. Although the trends in externalizing work through crowdsourcing initially were seen as affecting occupations or profiles requiring less skill or levels of formal qualification, the types of work affected have expanded to encompass a growing range of occupations: from creative professions to highly skilled technical professions.

User generated content is largely perceived as a form of peer production or cooperative work. Crowdsourcing, however, carried out in the framework of crowdsourcing through the use of platform intermediaries, has been seen as an extreme version

of outsourcing and offshoring across global value chains. As such, it has been linked to processes of standardization and codification.

This paper tackles the issue of crowdworking highly skilled work in three ways: looking at jobs being offered through 2 internet platform sites in Germany and Austria for skilled professions both in terms of the target group, the type of work, the means of applying, the remuneration, and the contract form. The paper also utilizes data from interviews conducted with crowdworkers in Austria and Germany. Finally, it reviews the secondary literature on crowdworking studies focusing on highly skilled occupations. The analysis examines processes of fragmentation of work, implications for careers and reputations of the workers, as well as impacts on existing employment regulation resulting from the shifting configuration of value chains between individual workers, intermediate employers and companies.

RN17 | Session 10a Voice Opportunities and Alternative Forms of Representation and Cooperation

Formalization or disrespect of labor? A survey on voucher based occasional employment in Italy

Gianluca De Angelis, Marco Marrone
University of Bologna, Italy; University of Bologna, Italy
gianluca.deangelis(at)gmail.com,
marco.marrone3(at)unibo.it

This paper wants to focus on the reasons behind the paradox of the use of voucher based occasional employment in the Italian context: on one hand it is supposed to be a tool to improve conditions of informal workers, and on the other hand it creates a new frontier of informalization for everyone. The use of voucher in Italy was introduced in 2003 to legalize the wages paid without an employment contract, but since then this mode of payment has exploded involving more than one million of workers on the national level. In the first section, statistical evidences will be presented to focus the relevance of the explosion. Interviews collected in the city of Bologna, capital of Emilia-Romagna region, one of the Italian regions where voucher based occasional employment is spread the most, will be reported in the second section. They will be analyzed to answer three research questions: What kind of formalization the use of voucher based occasional employment have produced? What are the effects of the use of voucher that can be seen in the workplace? What are its effects on the Italian labor market? Main results are: on one hand, vouchers have produced a formalization which has only benefitted the employer, who can avoid their responsibility since voucher workers are not considered to be in a formal employment relationship. On the other hand, voucher based occasional employment seems to have stressed asymmetries both between workers and employers in the workplace and between different workers in the labor market. Thus, the formalization produced by

voucher work seems to consist a new and more efficient frontier of disrespect of labor in network capitalism.

„Please accept your new order“ - On-demand food delivery services and the social sustainability of platform-based work

Benjamin Herr
University of Vienna, Austria
benjamin.herr(at)univie.ac.at

Online on-demand food delivery is a growing market: an increase in smartphone use, middle class spending and mobile payment allow firms such as Deliveroo, UberEATS or Foodora to provide a link between restaurants and customers at home or the office. During labor disputes at these companies, such as in UK (Delieveroo; UberEats) or Italy (Foodora), bad working conditions, low payment or a lack in workers' representation have been addressed and caught public attention.

Since the on-demand food delivery companies, which are structuring a new market and industry, are relatively new, labor research hitherto did not gain deeper insights in the actual labor process of these. Thus this contribution aims to shed more light on that distinct organization of platform-based work.

By using participatory observation the author worked several months at an online on-demand food deliverer. Based on that, an interview guideline has been constructed which was used for qualitative semi-structured interviews with riders of the company.

Workers tend to be doubled integrated, not only as labor-power in a standardized labor-process, but as subjective being who, by forced friendliness, are encouraged to identify with the overall undertaking.

Some of the question this contribution deals with are: How do workers in that new industry describe the labor process? How do they see themselves with regard to the firm? And what can we derive from this very labor process with regard to future challenges for social sustainability?

Between institutions and movements: Comparing union strategies in fashion retail in Italy and US

Stefano Gasparri, Giovanna Fullin, Peter Ikeler
University of Warwick, United Kingdom; Università di Milano Bicocca, Italy; SUNY Old Westbury, US
stefano.gasparri(at)wbs.ac.uk,
giovanna.fullin(at)unimib.it, ikelerp(at)oldwestbury.edu

This paper investigates union strategies for organizing workers in 'fast fashion' retail, a sector with endemic low-wages and high precarity (Grugulis and Bozkurt 2011). We focus on two very different national contexts where union revitalization has long been pursued in opposite directions: social partnership in Italy and organizing in the US (Frege and Kelly 2004). At the same time, while many scholars acknowledge the use of multiple strategies, others affirm that if revitalization is to be effective, unions need to 'learn from each other' — that is, move towards institution-building for social movement unionism and grass-

roots mobilization for social partnership unionism (Heery 2001). To better understand this strategic crossroad, we examine the initiatives targeting the same multinational companies (Abercrombie & Fitch) in two large cities, Milan and New York. On the basis of interviews with union activists and retail workers, our results report unions in Italy able to organize 'zero-hour contract' workers and unions in the US able to create an innovative channel of representation through a new 'institutional actor' (the Retail Action Project, a workers' center supported by the union). In both cases, our analysis demonstrates that what moved unions there were not just available institutional opportunities (Turner 2009), but especially a broader working class orientation (Hyman 2001). In line with a 'constructivist institutionalism' (Morgan and Hauptmeier 2014), this work explores union strategies as resulting from the interplay of institutions and ideas.

Dialogic leadership in the worker co-operatives

Gisela Redondo, Ana Burgués
Universitat de Barcelona, Spain; Universitat de Barcelona, Spain
gisela.redondo.sama(at)gmail.com,
ana.burgues(at)ub.edu

Leadership demonstrates to have an important role in the development of working environments in which leadership practices of employees may grow, improving the quality of organizations (Waldman, et al, 1998; Srinivasan & Kurey 2014). The theoretical advancements on distributed, shared or transformational leadership contribute to analyse the relationship between leadership and participation in diverse business organizations. This work deepens in the concept of dialogic leadership (Padrós & Flecha, 2014), in which leadership is not reduced to a particular role assigned to a person and not to others. Instead of this, leadership becomes a dimension of any human being, enabling diverse people to contribute to the improvement and effectiveness of organisations.

In the worker co-operatives, the members participate in the management of the organisation and promote leadership practices. As a result, some workers show relevant implication in the cooperatives if compared to non-cooperative organizations. Through a bibliographic analysis, some cooperatives have been explored to identify leadership principles among workers that are contributing to improve the work environment through dialogue and participation. The results show how leadership is developed and how principles as "one person, one vote" in the organization allow more effective participation of workers, beyond their position in the organization's structure.

RN17 | Session 10b The Impact of Globalization on Working Conditions and Working Contexts

Coworking - innovative form of work

Katarzyna Rabiej-Sienicka
Jagiellonian University, Poland

katarzyna.rabiej.sienicka(at)gmail.com

Modern society is struggling with transformation on the labor market caused by individualization expressed by among others: increasing number of freelancers, start-ups and micro-entrepreneurs, the accelerated dynamics of changing job or profession, a new model of living and growing uncertainties and risks related for example with flexibility, mobility, instability, temporary work. The era of globalization is a time of unfair social contract in which employees accepted flexible working in return for a promise to preserve jobs, it is also a time of commodification, which has spread to all aspects of life.

In response to these changes, we observe the emergence of alternative, often innovative forms of work. The aim of this paper is to analyze one of these forms - coworking understood as a response to changing conditions on labor market. Coworking is a new phenomenon; it attracts attention because it has been recognized as having the potential of the "third way", located between the conventional experience in corporate work and individual work, performed in the isolation of space (office).

The main topic discussed in the paper is therefore a paid work, understood both as a space of organization, as well as the institution that is the source of the identity of individuals. Transformations of the labor market are considered in the context of the process of individualization and a growing sense of risk and insecurity.

This paper will introduce the conception of the individual, which is suspended between the desire of individualization and need of community.

The author indicate the development trends of coworking based on first results of the 2017 Global Coworking Survey carried out by Deskmag The Coworking Magazine.

"The impact of globalization on changes in maritime transport - globalization and the "global seafarer"

Arkadiusz Kołodziej, Agnieszka Kołodziej-Durnaś
Szczecin University, Poland; Szczecin University, Poland
kolodziej.socjologia(at)gmail.com,
kolodziej.durnas(at)gmail.com

Maritime transport has a bilateral relationship with the process of globalization. The possibility of transport on a large scale and the reduction of transport costs provides a basis for the development of the international economy. In this sense, transport is one of the most significant cornerstones of globalization. On the other hand, globalization has a tremendous impact on the maritime industries; it is no exaggeration to say that this sector is currently one of the most globalized.

The globalization of maritime business can not be reduced to the relationship between economic operators. Changes in maritime transport includes the developments in work organization and transformation of the social structure of the ship's crew. These

changes lead to the emergence of a “global seafarer”. In the presentation we intend to describe the social context of changes in the maritime sector and their importance for Polish and European seafarers. The presentation will include own investigations (survey research) and review of the current literature.

RN17 | Session 11a Industrial Relations and the Welfare State

Job insecurity and the devaluation of social inclusion: a new social cohesion model in Spain

Salvador Manzanera Román
University of Murcia, Spain
smanzanera(at)um.es

The main goal of this paper is to analyze the relationship between job insecurity and both social exclusion and vulnerability in Spain. This aim was tackled by means of quantitative and qualitative techniques. Secondary sources of statistical information were used together with interviews to experts of the institutional sphere and to individuals currently undergoing processes of job insecurity, vulnerability and social exclusion.

Last years, job insecurity has experimented a process of extension and intensification resulting in a displacement of an increasing number of social groups from the central segment of the labour market to the periphery. Work, although still keeping its main role over the rest of social exclusion dimensions, has lost its social inclusive capacity. On the contrary, it has emerged as a triggering factor for the vulnerability and social exclusion processes.

The social speeches linked to the social facts shape individual's lives, redefining the new social and labour spaces of the social exclusion. The research has identified four new spaces in the labour market that define the situation of workers in terms of job insecurity and social exclusion.

The changes have generated a new social cohesion model characterized by larger and deeper vulnerability and social exclusion spaces which have undergone changes in their social valuation; even social inclusion has been devalued after considering as inclusive situations that in the former model would have been considered as typical situations of vulnerability or social exclusion.

The Making and Breaking of Solidarity: The Struggle of Unemployed Workers in the UK.

Vera Wegmann
University of Nottingham, United Kingdom
ldxvw(at)nottingham.ac.uk

This paper is concerned with the solidarity relations that underpin the resistance and commoning processes of unemployed and disabled workers groups in the UK. The purpose of this paper is to explore in what way solidarity relationships are (un)made between unemployed and employed workers and with other activist groups. Thereby, a distinction between solidarity concepts based on

sameness and understandings of solidarity based on interdependence and difference will be made. The paper is based on an extensive period of participatory action research from 2012-2016 with 18 activists groups. This paper thereby feeds into broader discussions on the decline and future of trade unionism and new ways of organising around work, which go beyond the workplace and might demand new workers institutions as well as a greater engagement with other actors in the community. Conceptually the paper is informed by Cleaver's concept of the “social factory”, which conceptualises work taking place in productive and reproductive spaces and includes the unemployed. As such, Cleaver sees opportunities for links between different struggles, as all workers struggle for more wealth and less work, on the basis of mutual interest. Yet, Cleaver understands work as a social relation, which is not only key but also unique to capitalism and his subsequent understanding of class struggle as limited to the resistance against work (hence capitalism). The term resistance thus refers to reactionary practices but it cannot capture the proactive creation of alternative social relations of production. I thus draw Federici who pointed out that commoning practices for alternative modes of production and ways of being are intrinsically interlinked with resistances against capitalism.

Work of the Unemployed? Working Conditions of the Marginalized Workers in Poland.

Jacek Zych, Justyna Zielińska
University of Warsaw, Poland; University of Warsaw, Poland
zychjacek1(at)wp.pl, justynakingaz(at)gmail.com

The aim of this paper is to present working conditions of the marginalized workers in Poland. Although, the unemployed persons officially do not work, it turns out they often perform work offered by public institutions (Public Employment Services and social assistance organizations), like internships, trainings etc. Moreover, due to lack or very low financial support (benefits) they often enough are forced to work on the black market.

After the collapse of communist regime in Poland mass reduction in employment associated with dismantling of huge industry typical for socialist era have created large segment of society which permanently oscillate between short-term or informal jobs and unemployment (the formal level of unemployment during 25 years after transformation has been higher than 10%). During research conducted among the unemployed and beneficiaries of social assistance (2013-2014) in two post-industrial cities in Poland we found out that they usually were engaged in informal or short-term work. Conditions of that work are hard, level of exploitation seems to be very high and aforementioned workers seem to be the most vulnerable group on the labour market. Norms of labour code are not obeyed and the power of employers over workers is overwhelming: long working hours, no safety standards, cases of non

payment for work. Despite of the fact that these workers are in touch with public institutions they are not protected from aforementioned abuses. Moreover, employers who breaks labour code are among these who receive support from public institutions.

Effectiveness of the Tripartite Commission for Social and Economic Affairs (2001-2013) in Poland as an institution of social dialogue: conclusions and perspectives for the Social Dialogue Council as the new, systemic social dialogue body.

Dariusz Szklarczyk
Jagiellonian University, Poland
dariusz.szklarczyk(at)uj.edu.pl

In 2015 with the initiation of the new national social dialogue institution – the Social Dialogue Council (SDC), some new expectations have emerged about the shape and real effects of peak (national) level social dialogue policy in Poland. Some of these expectations are about a greater impact of the SDC on social and economic issues, because this new institution has been granted more power than its predecessor – the Tripartite Commission (TC). Nevertheless, no theory or sociological analysis has been created to enable researchers to formulate hypotheses about the expected effectiveness of the new settings from a historical perspective, which would take into account evidence and in-depth assessment of TC's effectiveness, especially in successful mediation of employers' and employees' interests (agreements, resolutions, compromises etc.). In such circumstances, the author will present the results from analysis of dynamics of effects achieved by the TC in 2001-2013 (the so-called „second Commission” [Gardawski, 2009]). These results were achieved using a qualitative content analysis [Mayring, 2000] of over 100 documents elaborated in the course of TC operation (43 resolutions, 74 announcements) and analysis of media reports available in EurWORK database. To gain some in-depth insights, several IDIs with TC stakeholders and other social dialogue investigators have been performed. Conclusions of the study foster an assessment of the (rather disappointing) effectiveness of TC in 2001-2013 and enrich the discussion on the expected role of the SDC as an institutional solution to the issues of organizing employers' and employees' interests.

RN17 | Session 11b Occupations and Jobs

Inter-Occupations Inequality and Linguistic Work

Josep Ubalde, Amado Alarcón
Universitat Rovira i Virgili, Spain; Universitat Rovira i Virgili, Spain
josep.ubalde(at)urv.cat, amado.alarcon(at)urv.cat

Sociological theory and research has stressed the relevance of occupations as a source of social inequality in post-industrial societies. Pay-off to skills has been proposed as one of the main aspects to account for between-occupations inequality. Literacy, cognitive skills among other abilities and knowledge

exert an important role on this processes. However, few works on skills and wages has specifically focused on analyse the role played by language work and the communicative and linguistic skills associated. Considering that internationalization and informationalism are producing a greater need for language-related work, in this paper we analyse how are rewarded these skills across occupations (taking into account different compositional, institutional and skill demand variables). We address empirically this question measuring language work in its multidimensional nature from ONET database and linking the measurements to the CPS earnings data. This research contributes to enhance sociological comprehension on postindustrial skills and income inequalities. The research is part of a project supported from the Ministry of Education and Science of the Spanish Government (CS02015-64247-P).

Becoming on-the-job trainers: the impact of changes in the world of work

Roberta Besozzi
SFIVET, Switzerland
roberta.besozzi(at)iffp-suisse.ch

The Swiss dual VET system is the pathway followed by most young people after compulsory education. While on-the-job trainers play a key role in the training process, there have been very few studies about them.

From a perspective of the sociology of work, and in particular from theories about changes in work, professional identity and commitment to work, this contribution aims to shed light on the impact of changes in the world of work on the endorsement of on-the-job trainers' positions.

This paper draws on a PhD thesis focused on on-the-job trainers' trajectories in the French-speaking part of Switzerland, and is being carried out within a broader study on this theme (Projet FNS100017_153323).

Based on qualitative methods and data, this contribution relies on the analysis of semi-structured interviews conducted with on-the-job trainers (N=80) and focus groups (N=4) organized with future on-the-job trainers (N=28) working in companies of different sizes from a variety of sectors.

Our preliminary analysis has produced some unexpected results. Some on-the-job trainers show a strong professional identity and commitment to work that they want to transmit to their apprentices. Others also have a strong professional identity and their training duties offer them some room for manoeuvre to withstand their difficult working conditions. Finally, some, while committed to work, do not necessarily show a strong occupational identity. It appears that their position is a way of finding a new sense of meaning in their job.

This contribution will discuss the meanings of this position and the impact of changes in the world of work on this issue.

Destinated to become a restaurant worker?

Jack Lainpelto
Lund University, Sweden
jack.lainpelto(at)ism.lu.se

A significant part of the labour market debate is devoted to issues concerning the problematic youth. Expressions like “the lost generation” is coined to address the very core of the matter: the current challenge for especially low educated young people is to gain a sustainable work life. In a strategy to increase employment opportunities specifically suited for the latter group, the Swedish government lowered the VAT for restaurant and catering services from 25 % to 12 % in 2012. The purpose was to make ground for an increase in demand for restaurant and catering services and by that also make ground for an increase in suitable employment opportunities. In this study I interview young men and women, who a few years after the implementation of the new VAT participates in a publicly funded training program in restaurant work. In the study I view the tie between the interviewees and the government strategy as a power relation, which frames the analysis of how personal experiences of both previous employment and unemployment contributes to form conceptions about restaurant work and a future as restaurant workers. The young men and women tell their personal stories at an intersection where the ambition to transform into an improved Self and the labour market strategy meet. At this intersection a space also emerges that becomes possible to relate to power, not through the political view point, but through the interviewees own perception of who they have been, who they are now, and who they want to become.

Survey of Career Plans of Sociology Senior Students After Graduation in Turkey

Aysen Satiroglu, Melike Akbiyik
İstanbul University, Turkey; İstanbul University, Turkey
satiroglu.aysen(at)gmail.com,
melike.akbiyik(at)istanbul.edu.tr

According to the statistics of Statistical Institute of Turkey, unemployment rate for life sciences, social & behavioral sciences and humanities is ranged from 10% to 15% in Turkey. Sociology has high number of students because of having both undergraduate, secondary and open-distance education systems. Sociology alumni started to work, as sociologist in public institutions is approximately 1560. Even though it is preferred by huge number of students, sociology alumni have difficulty to find a job.

“Survey of Career Plans After Graduation” applied to senior students as a part of quality improvement studies of Sociology Department of İstanbul University in Spring Semester of 2015 and 2016. The aim of the study is to find out what kinds of concepts and skills seniors think that they gained as a part of their majors, which skills they place on their resumes, and their future plans. In the questionnaire, students were asked why they chose sociology as a major, what skills and concepts they learned through program

qualifications, what activities they participated in during four-year period, what they intend to do after graduation as future plans, and what kind of experiences they have during job search process.

The survey instrument is developed with the light of American Sociological Association studies about “what can bachelor level graduates do their degrees in sociology?” The result of the study will be described in three parts, which are demographic characteristics of students; students’ evaluations about the concepts and skills they learned in department, and their experiences; and job searching processes and their future/career plans. Moreover, Turkish senior sociology students’ results will be compared with the results of American ones.

RN18 - Sociology of Communications and Media Research

RN18 | Session 01a Academic Labour, Digital Media and Capitalism

Theorising Academic Labour

Thomas Allmer
University of Stirling, United Kingdom
thomas.allmer(at)uti.at

Modern universities have always been part of and embedded into capitalism in political, economic and cultural terms. Situated in this context, the overall task of this paper is to make a critical contribution examining universities, academic labour, digital media and capitalism. Questions that need to be raised include but are not limited to:

What is the historical role of universities and academic labour and how has it changed over time? What kind of workers are academics and how are they related to knowledge, informational and cultural workers? Given that the academic work process is today strongly mediated through digital media, to what extent can academic workers be considered as digital workers, and academic labour as digital labour? How are the working conditions of academics characterised by extension and intensification in the realm of the digital university?

I address these questions based on a critical social theory approach. Firstly, I engage with the history and context of the university. Secondly, I deal with the forms and concepts of academic labour and provide a systematic analysis of working conditions at higher education institutions. Thirdly, the impact of new information and communication technologies on academic labour is outlined. Fourthly, the paper concludes with a summary and discusses political potentials and alternatives.

The paradox of disintermediated knowledge: the unwitting path to marketisation of educative system

Lorenza Boninu
University of Pisa/ MIUR, Italy
lboninu(at)gmail.com

In my contribution I assume that the progressive dematerialization of the book is expected to affect the social value of legitimate knowledge transmitted by the school with consequences not so easy to predict,

in spite of the enthusiastic claims of political decision-makers. First of all the digital metamorphosis of teaching-learning mechanisms leads into discussion the complex topic about immaterial labour (Lazzarato 1996, Terranova 2000, Gill and Pratt 2008) in the Net. The massive growth of a horizontal, networked, interactive fruition of elearning resources makes it important to highlight the unpaid work that they depend upon. The diffusion of this kind of prosumerism (Toffler 1980, Ritzer and Jurgenson 2012) might irreparably devalue the intellectual labour: if everyone in turn can teach and learn and the results are evaluated by the community of users, with no regard of professional skills and official degrees, as in the case of Wikipedia, the consequence is a general weakening of the teachers' social role (Eijkman 2010). On the other hand we can see a clear attempt to standardize the educational routines on the Net by the intervention of strong subjects, with high reputation and a great economic and organizational set-up (i.e. Google, Amazon, Apple, Microsoft and so on). The consequences of these processes should be set into the frame of general marketisation of education. At last it is worth noticing how the rise of the so called MOOCs in this context could affect in several ways the educational system: it concerns the value socially attributed to scholastic knowledge, the educational policies and the budget cuts, the pedagogical assumption in this kind of practices.

Analyzing «attention economy»: communicative capital, communicative labour and communicative exploitation

Vladislav Dekalov
Saint Petersburg State University, Russian Federation
andavior(at)gmail.com

In the paper I discuss globalization, homogenization and commodification of everyday communicative practices following works of critical theorists such as C. Fuchs and J. Dean. I consider latter's theory of "communicative capitalism" as a starting point for elaborating and clarifying two concepts, "communicative capital" and "communicative labour". For this purpose I develop P. Candon's findings on Bourdieusian / Dean's "capital", and focus on "attention" as a key resource of informational economy.

Communicative capital circulates on different levels of the global computer mediated network. Hypothesis is that all network users are competing and cooperating in the "attention market": they invest their communicative capitals to attract other network users attention and then to converse it into economic / social / cultural capital.

The core contradiction is a dramatic asymmetry in attention distribution between few "stars" and a long tail of "losers". While the first ones are setting the agenda, the second ones react, comment and interrupt them. Having more opportunities to use other types of capital and being more «digital literate», the «stars» concentrate a great deal of network users' attention, exploit «net-workers» and eventually derive

of economic / social / cultural profit (here it's important to take into account a complexity of «digital institutes» that makes capital dynamic opaque and unpredictable).

In the presentation I will give some illustrations (based on my researching of Russian Internet communities) how common users and «digital professionals» apply different tactics to empower and to protect their communicative capitals. I'll also outline a number of theoretical issues need to be conceptualized and verified in my future studies.

Workfulness - Disconnection is the new black

Anne Kaun, Carina Guyard
Södertörn University, Sweden; Södertörn University,
Sweden
anne.kaun(at)sh.se, carina.guyard(at)sh.se

Telenor, one of the major telecommunication companies in Scandinavia, recently introduced the notion of workfulness adapting the well-established idea of mindfulness to the workplace. Workfulness is aimed at companies that are working in digital connected working environments at high-speed. Workfulness encompasses strategies of disconnection for the employees to enhance focus and efficiency including mobile and e-mail free work hours and technology-free meetings. The presentation seeks to investigate the concept of workfulness as part of an emerging trend towards disconnection in digital media industries. While earlier workflow models of companies within the digital economy emphasized increased connection, disconnection has now become a new way to organize the work of stressed laborers. Drawing on a diverse set of materials ranging from a critical textual analysis of Telenor's workfulness guidebook to the analysis of promotional videos as well as interviews with key persons at Telenor and a manager at a company that has implemented workfulness into their workflows, we are investigating how disconnection becomes valuable by an intensification of the labor process and by taking responsibility of digital stress, thereby preventing a societal backlash against digitalization. At the same time, we are investigating why particularly online technology-intensive companies such as Telenor are forerunners in the field of digital disconnection.

RN18 | Session 01b Theatricalization, Contemporary Communication and Media Representations

Introduction: the symbolic importance of political theatricalization in contemporary communication

Christiana Constantopoulou
Panteion University Social and Political Sciences,
Greece
christiana.constantopoulou(at)panteion.gr

Theatricalization is an important aspect of social life in general, of political life in particular. Aspects of the political scene and action are given in mass and new media discourse as well as in mass cultural

productions (as «narratives» of the contemporary society). Given that people understand reality first of all on the symbolic level, the analysis of these narratives is an ideal approach of the meaning given to politics and communication nowadays: images of the economic crisis, of the migrants and/or refugees, of identities (given by media discourse or by mass cultural productions), constitute a basic imprint of the expressions of the current «social myths». Examples of emblematic media events (ex. the oath of office of the President of the United States) and of the political «stories» narrated in TV serials (ex. The Man and the City, Women of the House, The West Wing, 24, The Good Wife) and cinema (ex. All the President's Men, Fahrenheit 9/11, The Contender, The Ides of March) will be given in order to figure out this essential side of the contemporary political symbolization reflected in the social representations.

Race and class in German media representations of the 'Greek crisis'

Yiannis Mylonas
Higher School of Economics, Russian Federation
ymylonas(at)hse.ru

Research showed that the mainstream media coverage of the EU's economic crisis has been, not only offensive and prejudiced for the people of the countries most affected by it, but most crucially, utterly relying on elite understandings of the crisis, as articulated by the political and the economic establishment of the EU. Indeed, the hegemonic public framing of the Eurozone crisis followed an 'Orientalist' approach, through spectacular narratives stressing cultural and moral failures of 'national characters' and exceptional national institutions that are (supposedly) fundamentally different from the 'European' canon. This way, regimes of exception were able to be publicly constructed as plausible explanations for the crisis (as a 'self-inflicted' problem by those not following the European norm), and equivalent exceptional policies (such as austerity regimes) to be implemented in the supposedly problematic countries. Drawing on the findings of previous research, this contribution presents the class and racist dimensions of the German mainstream media's 'Greek-crisis' representations, by focusing on the crisis 'epicenter', Greece, a country relentlessly targeted and slandered by the German media and the German elites in particular. The chapter concludes that both in their light and in their serious versions, the German media publicly construct the so-called 'Greek crisis', in the line of the bourgeois and the post-democratic principles that are currently directing the EU.

Alone voice onstage at Russian media: subjectivation through bodily symbolism as avant-garde political discourse (Pavlensky's case)

Vyacheslav Kombarov

University of Novosibirsk; Institute of Economics and Industrial Engineering (Siberian Branch of Russian Academy of Science), Russian Federation
vkombarov(at)gmail.com

Understanding discourse as process of becoming of text in particular social context with the use of specific language, we consider the body and use of bodily symbolism as a corporal discourse – as the text produced by carrier of this body – which content is signifier that referring to the vital social and political issues which viewed as signifieds.

In situation when alternative (to main ideology) political speech practices are taboo in today's media or discredited due to supporting only legitimated ideology, the body (and a set of corporal words and phrases created by artist working with body as an object for statements) is becoming nearly only possibility for subject of political discourse to express its ideas, desires and protest.

Object of our study are bodily art practices of Russian artist and actionist Peter Pavlensky, who uses his naked body in the urban space, creating corporal statements of political order. His body discourse involves the use of body parts, material objects, as well as urban structures – which fits the body – endowed with sacred and the political value: Red Square, a psychiatric hospital, etc. Using the approach of Badiou, we will show how body discourse on politics separates from the dominant political discourse in the mainstream media. Kristeva theory allows us to understand how naked body and artist's bodily work constitutes order of signifiers that media audience decodes as political statements. Corporal performance allow to subject, deprived of the right to speak, to use his body as language to become the subject of political discourse in artistic sensual way. Act of creation of body text becomes the act of political resistance.

Political Theater as „act of citizenship“ in urban public space. Madrid migrant household workers emplacing citizenship through creative protest

Lara Jüssen

University of Bonn, Germany
ljuessen(at)uni-bonn.de

The latest upheavels of crisis capitalism made social movements resurge that enact, emplace and embody citizenship in powerful public articulations, as the Spanish indignad(at)s in 2011.

Latin American un/documented household workers in Madrid sell their care-work on a world market that canalizes them into the private household where they look after children and elderly, wash, clean, cook and manage the household. Embodied experiences of precarity are severed by rudimental labour laws, and live-in household labour in which isolation is pressing,

as well as affects and affectedness through classist, sexist and racist discriminations. Social exchange in groups then provides empowerment, when ways to respond to discriminations are analysed.

Art's resistive power (e.g. Rancière 2008) is particularly enacted, emplaced and embodied through political theater, especially when performed in urban public spaces. Then, the streets become cultural, political and poetic places of resistance and incites urban walkers to reconsider the cities' scenery and resituate themselves as citizens (Carreira, Vargas 2010). Augusto Boal with his Theater of the Oppressed, later Legislative Theater, intended to animate people to develop political agency through theater (Boal 1989, 1998).

The Madrid activist collective "Territorio Doméstico" enacts public space interventions, as when they staged their "fashion walk of precarity" in Madrid's public space in March 2011. Shortly after, household law was reformed, also due to the adoption of the ILO-Convention 189 little before. So, in order to visibilise work-placed realities of household labour, "Territorio Doméstico" actively and politically uses Madrid's public streets and plazas for political performance and demonstration.

RN18 | Session 01c Migration Flows as Moral Panic

The Political Economy of Moral Panics: A Computational Social Science Analysis

Pasko Bilic, Ivo Furman, Savas Yildirim

Institute for Development and International Relations, Croatia; Istanbul Bilgi University, Turkey; Istanbul Bilgi University, Turkey

pasko(at)irmo.hr, ivo.furman(at)bilgi.edu.tr, savas.yildirim(at)bilgi.edu.tr

The purpose of this paper is to test how ownership and ideological leaning influence textual and linguistic output in the production of media narratives during the refugee crisis. We focus on media reports in Croatia, a country which experienced the highest influx of refugees in late 2015. Ten media organisations were selected to capture various ownership types (commercial, public, non-profit) and ideological positions (right-wing, public service, left-wing). We collected all articles published by these organisations (N = 352) in the period of two weeks before the sexual attacks that occurred in the German city of Cologne on New Year's Eve, and all articles published two weeks after the attacks. The dataset was analysed by using Natural Language Processing (NLP) and Correspondence Analysis.

The most noticeable change between the analysed time periods is the relative diversity of concepts used in the sample before the event, and an evident clustering of most media actors in the period after the event. The prominence of concepts such as "us" and "we" in the period after the attacks points towards a newly constructed line between "us" and "them" as "refugee sex offenders" and "refugee terrorists". Overall, there is a noticeable change from a

humanitarian discourse to a security oriented discourse which mobilises fear to impose stronger control of national borders. We argue that our empirical data confirms the moral panic theory (Cohen 1972), and in particular the political economy of moral panic approach which calls for the exploration of the relations between power, material interests and culture (Cricher 2011).

Communication in Europe: the representation of migrants “translated” into moral panics

Emanuela Pece, Emilian Mangone
University of Salerno, Italy; University of Salerno, Italy
epece(at)unisa.it, emangone(at)unisa.it

This paper will highlight how between the different European territories there is a lack of communication on a range of social phenomenon – primarily with regard to the phenomenon of migrants – something that not only determines the definition of the political agendas of different countries – creating disparities on the basis of proximity to the problem – but also by promoting public opinion stereotypes that lead to value orientations that do not always translate into positive action towards the other.

Social representations of “diversity” appear to be mainly influenced by the information conveyed by the mass media in their dual role as mediators of reality and opinion leaders, often becoming a “distorted reflection” of reality. News about arrivals of migrants in the Mediterranean can be a few examples through which the public opinion constructs a specific image of the Other. At the same time, using words such as illegal immigrant, refugee, emigrant, may help in reinforcing an image able to reduce socio-cultural distances – or, conversely, to expand them. In this sense, public opinion will tend to juxtapose their own frames of interpretation to those proposed by the media, re-building a specific kind of reality filtered by the media. In support of the above, the present paper aims at illustrating, as an example, a comparison of the “representations” offered by some of the main European national newspapers of some events associated with the phenomenon of migration.

An invisible communication. How the Belgian Agency for the Reception of Asylum Seekers and open centres communicate with migrants?

Amandine Van Neste-Gottignies
Université libre de Bruxelles (ULB), Belgium
Amandine.Van.Neste(at)ulb.ac.be

Press analysis shows that editorial processing volume on migration issues continues to increase. It attracts constant, complex media coverage. These questions – beyond being topical – are essential to the constitution of public opinion and public policy. The issue of migration, or more specifically “the refugee crisis”, is an important matter of speech and communication (Rea, 2016), hence it is essential to analyse communication in this area.

So far, researchers in media and communication have taken an interest mostly in the analysis of media

content and the representations of migrants. The perspective I have taken is different: I believe that, beyond what the media, politicians or people are saying about migrants, it is important to question what bodies that daily manage asylum are saying to migrants – such bodies are no less producers of representations and content.

As a case study, this paper analyses how the Federal Agency for the Reception of Asylum Seekers and open centres communicate with asylum seekers. An important preliminary result turns out to be that communication to migrants is hardly visible. This finding leads me to explore the potential reasons behind this lack: is it a question of shortfall of resources? Are we talking about an unmediated channel of communication, in a way that leaves no trace? Is communication to migrants deliberately invisible?

From a socio-historical approach (Noiriel, 2006), I incorporate both corporate communication and discourse analysis (Charaudeau, 2011). Studying such practices implies field survey methods including interviews, life story approach and participant observation in reception centres (Goffman, 1968).

Media frames and the tone of news coverage on the migrant crisis: A quantitative content analysis

Nicoleta Corbu, Alina Bârgăoanu, Raluca Buturoiu, Flavia Durach
National University of Political Studies and Public Administration, Romania; National University of Political Studies and Public Administration, Romania; National University of Political Studies and Public Administration, Romania; National University of Political Studies and Public Administration, Romania
nicoleta.corbu(at)comunicare.ro,
abargaoanu(at)comunicare.ro,
raluca.buturoiu(at)comunicare.ro,
flavia.durach(at)comunicare.ro

The European Union is under severe pressure due to the multiple crises it has to manage. Among them, the migrant crisis is remarkable, since it is shaking both the individual member states and the EU as a whole. The media coverage of the migrant crisis is relevant as media still are the main means of information concerning distant issues (migrant crisis included), facilitating people’s access to social reality. We aim to (1) identify the most prominent frames media employ with reference to the migrant crisis and (2) reveal the tone of voice media use when portraying issues related to this crisis. Thus, we content analyzed 1511 online news articles, published during April 15, 2015 and February 29, 2016.

Findings show that online media outlets mainly refer to the migrant crisis in responsibility terms, while the second most used frame is the conflict one. At the same time, online media portals prefer using neutral or negative perspectives when portraying the migrants. These results might be interpreted from two interconnected perspectives: (a) from an optimistic perspective, the fact that the responsibility and conflict frames dominate media’s discourse could be signs for

an imperative need to find those responsible for the crisis, as a first step towards finding possible solutions to overcome it; while (b) from a pessimistic perspective, responsibility and conflict frames, doubled by the negative tone of coverage might be signs of an immature crisis, which could easily escalate, putting the EU on an even more difficult position.

RN18 | Session 02a Media Content – Image and Representation

Opinions of Television Audience about Television Content: Results from a General Population Survey

Stelios Stylianou
Cyprus University of Technology, Cyprus
stelios.stylianou(at)cut.ac.cy

The purpose of this paper is to present findings from a telephone survey of a representative sample of 1000 people from the general population of adults in Cyprus (conducted in the context of a larger research project that aimed to estimate the prevalence of certain elements of content in Cyprus television by means of a quantitative content analysis). The presentation includes findings about hours of television viewing per week, types of programs watched, opinions about television and television viewing and interaction with media organizations through traditional and new means. The variables of main interest are viewers' opinions about televised content; specifically, the extent to which viewers think that the amount of televised violence, crime, disasters, human suffering, prejudice and fanaticism is "acceptable". The results of the survey are juxtaposed with relevant findings from the quantitative content analysis. The analysis also explores associations between viewers' opinions and other measures, such as viewing habits and demographic characteristics (gender, age, education, income and family composition). Special attention is paid to the issue of children in the household and on children's viewing habits, as, according to the findings of the survey, one in three children younger than 12 watch television daily or a few times per week after 9 p.m. on weekdays or after 10 p.m. on weekends.

Image as Evidence: Baring Pain in the News Media

Miranda Christou
University of Cyprus, Cyprus
miranda.christou(at)ucy.ac.cy

My starting point in this presentation is that images of bodies in pain in the news media are becoming increasingly more 'real', unprocessed and immediate: viewers are exposed to dead bodies, bodies that have been burnt, crushed, broken, in positions that seem 'unnatural' or painful; bodies in abject conditions. Literature in media studies so far can be divided in three main debates: the truth and reality debate (focusing on the spectacular aspects of media reports on wars, Baudrillard 1991), the aesthetics debate (examining the pornification of horror and violence)

and the ethics debate (how witnessing distant suffering impacts compassion, Boltanski, 1999, Moeller, 1999, Chouliaraki 2008). I attempt to go beyond these debates and address the question of the human body as visual evidence to point out how ethnic and national discrepancies in the differential exposure of the vulnerable human body are not simply representations of 'reality' but productions of cultural difference. More specifically, I compare images of two dead children that have been widely circulated in the media: a dead child refugee on the shore of Turkey (2015) and a dead child from the Nice attacks (2016). I discuss the question of whether the visibility of body, flesh and injury serves to humanize or de-humanize the exposed bodies. I argue that providing 'evidence' of other people's hardship is a process that defeats the intention to humanize these 'other people'.

Newspaper Coverage of Ethical Issues Concerning Pharmaceutical Industry - Comparison between the U.S. and Poland.

Marta Makowska, George Sillup, Stephen Porth
Warsaw University of Life Sciences, Poland; Saint Joseph's University, Philadelphia, PA, USA; Saint Joseph's University, Philadelphia, PA, USA
marta_makowska(at)sggw.pl, sillup(at)sju.edu, sporth(at)sju.edu

In different countries, media coverage shows the same subject in various ways. Something that is important in one country and on the front pages of all newspapers can be totally ignored in the other one. The research question addressed is: "Does media coverage of ethical issues in the pharmaceutical industry vary between U.S. and Poland?"

The presentation will be based on a three-year content analysis of two leading newspapers from U.S. and Poland - New York Times (NYT) and the Gazeta Wyborcza (GW). In both countries, the same methodology was used to identify and evaluate the issues.

Results indicated that in both countries' newspapers top issues affecting the pharmaceutical industry were - drug safety, healthcare reform and high drug prices. In the U.S., the issues linked to the pharmaceutical industry were more often on the front page, which is indicative of greater public interest about the issues than in Poland. Analysis of headlines revealed a statistically significant difference between both countries ($p < .05$). The Polish newspaper, GW, had a greater number of negative headlines than the NYT. The statistically significant difference was also observed in the tone of articles ($p < .001$). Articles in NYT had a neutral tone or were more positive toward pharmaceutical industry than those in the GW, where as many as 64.8% were negative. Articles in the NYT had more fair balance than articles in the GW.

Results of this comparison between coverage of ethical issues concerning pharmaceutical industry in the U.S. and Poland enable better understanding of the specific of approach to the ethics of pharmaceutical marketing in the two countries.

Sustainability of Community Networks in the UK and Greece: Evidence from Key Actors

Dimitris Boucas, Maria Michalis
University of Westminster, United Kingdom; University of Westminster, United Kingdom
boucasd(at)westminster.ac.uk,
maria.michalis(at)westminster.ac.uk

Community networks have since the beginning of the 1990s comprised settings for providing Internet access for a community. The philosophy behind their development has varied, from providing connectivity where the market has failed to do so, to empowering the users to control more of their data. In doing so, they have adopted various models, ranging from the more formal and organised to the more improvised and informal. Moreover, they have often relied on external funding and voluntary work by key individuals or groups.

The paper seeks to address the problem of sustainability inherent in such networks. In doing so, it uses a conceptual framework on sustainability, which involves multiple dimensions, namely economic, political and socio-cultural. This is used as a starting point for evaluating the sustainability prospects of certain community network cases in the UK and Greece (selected through purposive sampling).

Being an interpretive study, the paper seeks to identify the important sustainability issues as experienced and understood by key actors involved in the development and management of these networks. To this aim, a set of interviews with these actors have been carried out using a semi-structured questionnaire derived from the conceptual framework mentioned above. The interviews verify the broad aspects of the framework but also provide additional insights as to the issues of economic, political and socio-cultural sustainability in the networks under examination. Conclusions are drawn as to the future of such networks in the era of sophisticated Internet platforms, cheap cloud computing and social media.

RN18 | Session 02b Communication Theory and Social Change

The judging audience. Exit, Voice, and Loyalty in the Field of Media Consumption

Michael Jäckel
Trier University, Germany
jaeckel(at)uni-trier.de

The judging audience, an entity described as early as the 18th century, claims for itself the right to react erratically and impulsively. Whenever there is a great variety of supply, the customer is king because, among other reasons, he can direct his demand for a good product towards competing media. While doing so, he can actively engage, or remain in the passive state of the observer.

Therefore, the audience's interests are catered to in various ways: Some go strictly by supply and demand and, as a result, see the audience's responses as a kind of "divine judgment", subsequently catering to the

tastes of the masses and the average taste of a homogenous audience. Others seek more interactive formats and attempt to intensify the dialog within and beyond the corresponding media.

These kinds of interaction cannot be generally characterized as institutional. It must be assumed that such forms of protest or articulations of a variety of qualified opinions do not occur on a constant basis. Audience participation can be swept up in cycles similar to the ones Hirschman generally described for the political arena. Articulating and organizing audience interests can be categorized into institutionalized and non-institutionalized as well as continuous and non-continuous interactions. The range of audience reactions ranges all the way from exit to loyalty.

Literature:

Hirschman, Albert (1970): *Exit, Voice, and Loyalty. Responses to Decline in Firms, Organizations, and States.* Cambridge, Mass.

Public Data Opened Exclusively for the Commons?

Arwid Lund
Lund University, Sweden
arwid.lund(at)kultur.lu.se

Open Data is tightly connected to Big Data, arousing political energies among activists, start-ups, the creative industry, and proponents of E-government. The movement for open knowledge needs to be critically examined ideologically through a political economic perspective.

Open knowledge is comprised of two levels under capitalism: the data and knowledge level are regulated in different ways. Database protection regulates the data level and its only aim is to protect economic investment. Knowledge is often protected by copyright.

Whereas there has been a steady development of copyleft-inspired licenses opening up the enclosures of copyright, boosting commons-based projects, no such licenses can be constructed on the data level. On the data level nothing exists in between the open and the closed, the central middle ground for commons-based production. This paper highlights that the 'open'-movement accepts and in practice supports that public institutions' data, or private consumers and users' such, is open or opened up, and commercial actors' data closed but building on open data from the former two categories.

More radical options as demanding all data - including companies' data - being open in a call for general transparency, or closed in a call for everyone's absolute right to privacy, may seem unrealistic, but what if the state opens its data exclusively to commons-based data services under a database protection law that denies commercial actors the same right? This strategy would create a middle ground between the open and the closed that goes against neoliberal privatisations while empowering the civil society.

Mediatized Capitalism: the numbness of permanent adjustment through reflexivity

Paulo Martins

ISCTE-Instituto Universitário de Lisboa, Portugal
aquiaolado(at)gmail.com

People bow to the realm of Web 2.0, “disguised as free”, exchange. Instead of inter-defined social situations, individuals “run after the” never-ending fluxes. Experience is restructured through material and immaterial processes, in an overwhelming part, autonomous of human creators.

In neoliberalism, capitalism is not simply another media, capitalism is the media, and mediatization becomes the pivot of social ordering, strongly decreasing the demos’ transformative action possibilities. This brings a new code to the social configuration we live by/in/on. It roars, rarifies and reifies social realities, from sender-through channel-to receiver; from production-through distribution-to consumption.

Under Mediatized Capitalism communication becomes too noisy: “my message” is everyone else’s noise, as the messages to them are my deafness. Listening is hard in roaring environments. Communication returns to unidirectionality: a specialty of some who have literacies, access and resources. The medium becomes exclusive of a few. Voice becomes rarified. Also, communication modulates individuals, reifying conventions of legitimacy, colonizing attentions and guiding intentions, closing us in refeeding fluxes and facilitating the unending iterations. Blinding us alternative ways of existing. Thus, Senses become colonized, leaving us only with the ability to “think-it-trough” in our “inner-conversations”.

Deep mediatization and mediated construction of reality that derive from a datafied/interconnected materiality/ecosystem imports in a multiscale new ordering. Rather than Media Effects is the “digestion” and its absorptions/eliminations/reframings of intense Media Reflections on habitus and other structures of cognitive system that must be the core of analysis: the reflexivity of identities. For it is its pivotness, as an inexorable gate of this process, which primarily keeps feeding the new order.

Generational perceptions of social acceleration in the context of deepening mediatization

Signe Opermann

University of Tartu, Estonia
signe.opermann(at)ut.ee

This paper will address the acceleration of social time (Rosa 2013) due to the evolution of communication technologies and the wider process of mediatization (Hepp and Krotz 2014, Lundby 2014), which have come in several waves and changed the media environment but also the ways of how we live with media (Couldry and Hepp 2016) in the information age. The focus of this paper lies on social generations (Mannheim 1927/1952) that are defined as groups of people that have come of age in the similar socio-historical and cultural setting (Spahiu 2016). In this

paper, social acceleration and its implications for different social groups (incl. different generations) are studied not only from the viewpoint of “time wealth” and “time poverty”, caused by the technological acceleration and increasing pace of life, but also examined as a challenge of how to cope with time-based competitiveness and increasing speed and complexity of society’s socio-economic condition from which some groups can benefit more than others.

The study explores data from a wider research project of the University of Tartu (UT) in Estonia to study the acceleration of social and personal time in the information society. Besides a quantitative multidimensional analysis of the data from the 5th round of the representative survey “Me. The World. The Media” conducted in 2014 by the UT (n = 1,500) also qualitative data from a series of focus groups will be used, in order to more thoroughly examine the perceptions of social acceleration from both the inter- and intra-generational perspective. The focus groups will include representatives of various areas of specialty, e.g., academic people from various generation groups from different universities in Estonia.

RN18 | Session 03a Unmaking Journalism: Change and Alternative

Media Internships as a Critical Pedagogical Practice: Negotiating Exploitation, Criticizing the Curriculum, and Resisting the Creative Work Ethic

Ergin Bulut, Onder Can, Melike Aslı Sim
Koc University, Turkey; Koc University, Turkey; Koc University, Turkey
ebulut(at)ku.edu.tr, ocan16(at)ku.edu.tr, msim15(at)ku.edu.tr

In this paper, we complicate media internships literature (Perlin 2011; de Peuter, Cohen and Brophy 2015; Costea, Watt and Amiridis 2015; Hope and Figiel 2015; Ashton and Noonan 2013, Perlin 2011) through an emphasis on the experience of an overrepresented group of interns: students at an elite institution in Istanbul. Similar to their peers, these students intern to have a taste of working life, network with professionals and build a portfolio. Nevertheless, they are both aware of their status as students studying at an elite institution but also critical of internships in pioneering media companies. Therefore, rather than depicting interns as trapped precarious subjects, we approach internships as a pedagogical process where critical engagement with life is possible. We look at the multiple positioning of college students in that they not only benefit from their social and cultural capital to access networks of cultural production but also critique their school curriculum, work life and work ethic in media industries. While not necessarily willing to form a collective form of organizing to change conditions, they perform self-reflexivity and critically negotiate exploitation, seeing it as a trade-off where they have their lines in terms of where they are willing to say “no” to their bosses. Not reluctant to acknowledge inequality, media interns in

our study demonstrate an incomplete process of subjectification through which they not only address the illusory aspects of promising elite institutions and navigate a precarious terrain but also draw the lines in terms of professionals they want to be.

The Myth of Global Journalism: BBC World News Online Coverage of the Syrian Refugee Crisis

Sergul Tasdemir

Galatasaray University, Turkey

sergultasdemir(at)gmail.com

The so-called “refugee crisis” in Europe, possibly the biggest story of the last few years attracts little media attention and minimum coverage usually takes place in particular instances; a political deal or a shocking image. Fear plays an important role in the framing of immigration in receiving countries and politicians harness that fear whose voice are present in the media and therefore in the public mind. The coverage of the Syrian “refugee crisis” will be analysed in the BBC World News online following the death of Alan Kurdi, a three year-old Syrian child whose body was washed up on a Turkish beach in September 2015. This article aims at investigating the BBC World News' commitment to global journalism practices through content analysis guided by a framing paradigm.

Exploring the ‘alternativeness’ and economic prospects of cooperative media in the post-journalism era. Are users willing to become part of the media reform?

Paschalia Spyridou

University of Cyprus, Cyprus

lia(at)ucy.ac.cy

Alternative forms of journalism are said to act as a democratizing influence in society in part because they are primarily informed by a critique of existing ways of doing journalism, in part because they sustain a counter-public sphere and contribute to a sense of active-citizenship. Traditionally, scholarly efforts to conceptualise and analyse alternative journalism emphasised small-scale projects. However, in light of mounting dissatisfaction with mainstream media and growing pressure from the changing wishes of critical citizens, some alternative media manage to move beyond the marginal domain and move into the mainstream domain in terms of reach and penetration. Recent operationalizations of alternative media as critical media irrespective of their size proves relevant, and allows us to include in the discussion emerging forms of alternative media, such as cooperative media where the organizations are effectively owned by and run for their members – in this case, journalists. Such endeavours tend to rely on a dual model of funding: advertising and crowdfunding.

Against this background the study explores the case of EFSYN, a Greek journalistic project developed in 2012 by laid off journalists operating under cooperative principles. Using a web-based survey (N=3,540), the study attempts to shed light on users' perceptions of the social and journalistic value of

EFSYN, and explore predictors of financial support from the users. The study joins an emerging field of work exploring the ‘alternativeness’ and economic sustainability of alternative forms and business models in journalism.

RN18 | Session 03b Social Media and Tensions Between Equality and Inequality

The Sharing Industry and Sharing Strategies of Polish Social Media Users

Kamil Filipek

University of Warsaw, Poland

filipek(at)icm.edu.pl

Sharing on social media has become a daily routine for many people worldwide. But what does the term “sharing” mean for Polish social media users? What sharing strategies they apply and what resources they share with others?

Sharing is a concept that includes a variety of forms and relates to a variety of resources exchanged by social media users on online platforms. It is a constitutive activity of Web 2.0 and part of what is social in social media. It needs to be considered as both an opportunity and a threat. On the one hand, social media offer users access to diverse resources, material and symbolic. Users with higher amount of resources accessed through social media networks may have better access to social capital and, consequently, act more effectively when searching for a job, asking for assistance, or digging for valuable information etc. On the other hand, users' resources are turned into commodities providing profits to the social media shareholders and owners. Moreover, sharing on social media may evolve into selling, as users offer given amount of resources for free with hidden intention to sell missing parts or extra resources. As a consequence, sharing burdened with commercial flaw and deprived of obligation of reciprocity may destroy what is social in social media. Based on qualitative (IDI) and quantitative (online questionnaire) research this study reconstructs dimensions of sharing on social media. It examines motives and goals behind online sharing, as well as, focuses on factors enhancing/constraining free and commercial sharing. It is found that sharing has 5 dimensions, while individuals strategies are result of ecological attitudes, sociability and resources embedded in personal networks.

Digital inequalities in four South-East European Countries

Željka Zdravković

University of Zadar, Croatia

zzdravko(at)unizd.hr

This paper is based on the research of patterns of Information and Communication Technology (ICT) usage among citizens in four South-East European Countries (Bosnia and Herzegovina, Croatia, Serbia, Slovenia). Even though the issue of digital divide is an important topic in most of the South-East European

Countries, the emphasis in this paper is directed towards understanding how different patterns of ICT usage are structured by various demographic and socioeconomic factors. Theoretical framework is based on the theory of social uses of the Internet (López-Sintas et. al., 2010) discussing digital inequality in term of homology between social standing and digital practices. Analyzing the representative survey data collected in four countries in 2015 we developed typology of digital users applying two-step cluster analysis. A multinomial logistic regression analysis is being used to determine whether socioeconomics and sociocultural factors can explain different types of ICT users. The results of the analysis indicate some cross-cultural differences between four countries concerning frequency and the pattern of the digital use that can be theorized within the light of digital divide on national level. Additional findings show that in all countries demographic, economic and cultural factors have been predicting cluster membership of digital users implying that results can be seen in the context of social theory of Internet use - giving the framework to understand digital inequality not as a new form of inequality but within the existing social inequalities in South-East European Societies.

Can the subaltern post?

Mehmet Mutlu

Middle East Technical University, Turkey
mehmet.mutlu(at)metu.edu.tr

This study attempts to search online 'habitus' of the subaltern classes in the cultural and political context of Turkey, through their social media mediated narratives. Therefore, answers to the relevant questions will be sought. Do and to what extent the subaltern use new media and social media platforms? Do they post? Why, how and what do they post? How do they experience and make sense of their class position on the Internet? Is there a hegemonic meaning of subalternity in the contents shared by them? Do the online narratives of subaltern articulated to dominant political and cultural discourses and how? Can the Internet be taken as a space of class encounter? What are the forms of representation of self and others? Do the posts of them include symbolic reversals? What kind of denotations, connotations, metaphors and metonymies do they use? Can the online activities, particularly the anonymous existence on the net, be taken as hidden resistance? Do the use of social platforms provide symbolic satisfaction? What are the functions of visual contents? Is a selfie a form of self-representation for the subaltern? Do the visual contents, particularly personal photos, represent the subaltern's everyday life? Data of the study will be compiled by netnography and the collected data will be analyzed by discourse analysis. Since it is the most used platform in Turkey, Facebook will be the "field" of study. Sampling group will be selected from Sincan district of Ankara, the peripheral area where the subaltern classes are regionally concentrated.

Rebuilding social media: Insights from Engaging Autism

Arnon Zangvil

Private researcher and software platform architect,
Israel
zangvil(at)gmail.com

Clinical treatment of children with autism and autistic spectrum disorders has generated a body of knowledge on how meaningful communication and relationships can be developed by overcoming underlying developmental problems. In this work, the "Developmental Individual-difference Relationship-based (DIR)" model for working with autism is explored for insights that may be applied to the design of digital communication and social media.

This DIR model is a developmental model, and focuses on the underlying deficits that lead to autistic symptoms, rather than only on the symptoms themselves. If earlier stages of development aren't mastered, subsequent stages may proceed, but in a constricted form. The cornerstone of DIR is that language and cognition, as well as emotional and social skills, are learned through relationships that involve emotionally meaningful exchanges. (Engaging Autism, Greenspan, Wieder, 2009). The first three stages of development under this model are: "shared attention and regulation", "engagement and relating", and "purposeful emotional interaction".

To allow "shared attention and regulation", sensory input needs to be properly regulated to avoid overload or starvation, and match the individual's unique sensory profile. This enables the transfer of attention and emotion from internal sensations, to the outside world. Shared attention and regulation is then the basis for the next stages of development in which engagement is made with another, and a shared world is entered.

Viewing digital communication and social media interactions under this prism reveals the importance of designing interactions that allow individual-difference sensory regulation and shared attention, as the underlying foundation of meaningful communication and relationships on social media. In this paper, I draw on my hands-on experience in architecting software platforms, to try and offer such design alternatives.

RN18 | Session 03c Work in Media and Communication Industries

European national security journalists in the age of surveillance: An endangered species?

Anthony Andrew Mills

University of Vienna, Austria
anthonyamills(at)gmail.com

Europe, buffeted by financial crisis, existential political fears, and the rise of populist-nationalist parties, risks being 'unmade' by undemocratic forces fuelling public mistrust in institutions, social regression and aggression against communities. Within this context, journalists as a social group crucial to the survival of a democratic Europe find themselves caught between pressures of the market, labour precarity and the

growing mistrust of the public. Adding to the squeeze, new national security surveillance legislation, coupled with the extraordinary surveillance capacities revealed by Edward Snowden, threatens a fundamental pillar of watchdog journalism: the ability of journalists to communicate securely with sources, resulting in a noxious chilling effect (Mills & Sarikakis, 2016a; Mills & Sarikakis, 2016b).

Although Stoycheff (2016) revealed post-Snowden self-censorship on Facebook, and a Pew survey (2015) of investigative journalists found concerns about surveillance had kept 14% from pursuing a story within the last 12 months, there is no academic literature that comparatively assesses the impact of surveillance on the sociology of national security journalism in Europe.

This paper maps and analyses national security reporting in Europe in three time periods: 1) before Wikileaks 2) After Wikileaks and before Snowden 3) After Snowden. The paper examines a) the degree to which journalists' ability to report on national security has been threatened by surveillance, and surveillance legislation; b) the specific surveillance of journalists 3) general frameworks of surveillance.

The paper is based on analysis of national security reporting in print media in three European countries - the UK, Germany and France – that played a leading role in covering Wikileaks and Snowden. It also draws from interviews with 50 European national security journalists.

The reasons for dissatisfaction with work and turnover. Case study in a call centre of a Portuguese bank

Vera Moreira, Paulo Marques Alves, Maria do Carmo Botelho

Universidade do Minho; ISCTE-University Institute of Lisbon, Portugal; ISCTE-University Institute of Lisbon, Portugal

eu.vera.moreira(at)gmail.com,

p.alves61(at)gmail.com, maria.botelho(at)iscte.pt

Following the emergence of the "flexible accumulation" (Harvey, 1989), the call centres emerged and expanded. This "tayloristic, housewifized service labour" (Fuchs, 2014), is the symbol of the business model of the current stage of capitalism, which is subordinated to a logic of rationalization of costs, through the widespread of a generalized precariousness.

Alongside with the old coercive ones, new hegemonic logics of domination (Burawoy, 1979) are implemented and a newspeak arises in order to produce the consent of domination, leading the workers to cooperate with the reproduction of the capital.

Under these conditions, collective action is very difficult and the individual exit is the attitude that prevails.

This paper is based on a research in a call centre of a bank where the turnover among the outbound operators is very high. Its goal is to understand the reasons that can induce this phenomenon. A

structured questionnaire was administered to the operators that put an end to their contracts with the temporary work agency that placed them in the call centre.

Former workers felt that they were unable to intervene in the organization of their work, that they were not free in the execution of the tasks, which were not varied, and that they do not identify with them.

As a consequence, they were exhausted emotionally, with a feeling of disbelief and dissatisfied with the job content, what may have led to the exit attitude. It was concluded that the reward for positive feedback at work and the identification with the performed tasks are key influencers of satisfaction, relationship that is mediated by burnout, especially for emotional exhaustion.

Project networks and the local labour market. The implications of foreign film productions for the Croatian audio-visual industry

Jaka Primorac

Institute for Development and International Relations, Croatia

jaka(at)irmo.hr

This paper provides a critical analysis of the changes in labour market in Croatian audio-visual industry that are brought about by the foreign film productions and its' contextualization within local structural factors on the one level and global challenges on the other. The analysis begins by exploring the historical and structural factors (Murdock and Golding, 2016; 766) influencing the local labour market in Croatia's audio-visual industry; then it goes on to decipher patterns of interactions and power structures created within particular project networks (Jones, 2000) as a result of incoming productions. This is done by presenting data from case study research on foreign film productions in Croatia executed during 2015 - 2016. The case study is underpinned by an exploratory, sequential, mixed-method design (Cresswell, 2009) that combines an analysis of quantitative indicators i.e. fiscal indicators of the Foreign Film Incentive Programme provided by the Croatian Audiovisual Centre and data from the Croatian Bureau of Statistics; and qualitative data based on eleven expert interviews (Bogner, Littig and Menz, 2009) with key stakeholders within audio-visual production in Croatia using the interview guide approach (Patton 2002). The aim of the paper is to provide a background for a more multi-layered discussion on the commodification of labour in media and communication industries in general (Mosco, 2008), and to contribute to our understanding of structural imbalances in the global creative economy.

Where is Social Class in Brazilian Communication Research?

Rafael Grohmann

University of São Paulo/ FIAM-FAAM University, Brazil

rafael-ng(at)uol.com.br

The papers presents research results on how the

concept of social class has been approached in communication research in Brazil. We analyzed 48 congress papers, 42 PhD and Master thesis between 2010 and 2014 that involve social class in communication studies. Then, we conducted a bibliometric analysis, considering the most-cited authors, and we analyze qualitatively how the concepts of social class and communication are studied in these researches, theoretically and epistemologically. That is, what are the meanings of social class in communication studies? What their theoretical approaches? What does this imply for communication studies? Do these researches consider the social subject and the struggles? Is there social ontology? In general, we can observe theoretical and methodological weaknesses with respect to the concepts of social class and communication, often occurring a naturalization of the concept of class. The theoretical meanings of social class are trivialized or shallow, not considering issues of struggles and conflicts, with inequalities transformed into mere differences. There are no Marxist authors among the most cited. What are the implications of the disappearance of struggles and social subjects for communication research? How can we think of a critical theory of communication that thinks of class struggles? We seek, finally, how we can think of class struggles in communication from a Marxist point of view considering the ontology of social being.

RN18 | Session 04a Public Service Media and its Old and New Challenges

From State to Public Media, and Back? PSM in Romania after the removal of the radio-tv fee

Raluca Petre, Mariana Tocia, Alexandra Codău, Valentin Vanghelescu, Adelina Tocitu
 Ovidius University of Constanta, Romania; Ovidius University of Constanta, Romania; Ovidius University of Constanta, Romania; University of Bucharest, Romania; SRR, Radio Constanța
 rpetre(at)univ-ovidius.ro, marianatocia(at)yahoo.com, ada_codau(at)yahoo.com, valentinvanghelescu(at)yahoo.com, alexia_adelina(at)yahoo.com

This paper aims to problematize the public service media (PSM) sector in Romania in light of the recent removal of the radio and television public taxation (January 2017). After 1989, the transformation of media in Central and Eastern Europe has been driven by ideas related to the virtues of free market and the lack of legitimacy of public intervention; in light of the specific legacy of tight state control. Nevertheless, in Europe, public options are currently being reconsidered for the media (Brevini, 2013; Picard & Siciliani, 2013), given the serious limitations that the deregulated, commercial media systems turned out to have. At the same time, in Romania, the public support for the media has just been removed. Can a state media system turn into a public media system, and then get back? Is there a public media sector in

Romania at the moment? In order to provide a coherent answer to these questions we operate a preliminary mapping of the public radio and public television organizations, as well as their environments. More specifically, in this paper we analyze the formal structure of the public radio (SRR) and public television (SRTv) against the ideal type model of public service media (Mendel, 2013). In order to get a preliminary understanding of the subject, we use secondary data analysis and overview pluralism and programming diversity at the content level; editorial independence at the journalism practice level; freedom from political control at the formal governance level; accountability and transparency at the procedural level, and appropriate funding by analyzing the new financing order.

Public Television in Romania. A critical assesment of its beginnings

Romina Surugiu
 University of Bucharest, Faculty of Journalism and Communication Studies, SPARTA Center, Romania
 romina.surugiu(at)fjsc.ro

In Romania, the public television had a monopoly position spanning four decades, between 1956 and 1991. Following the BBC model (Scannell, 1990), the public service was attributed cultural, moral and educative roles and its mission was to support the political organization of the Romanian communist state (the so-called 'popular democracy'), and to improve the general knowledge on issue related to society and science.

Based on historical documents, the paper will analyze, from a critical perspective, the beginnings of the public television in Romania (1956-1963). The black and white television was organized following an ideology of scientific experiment and technological development as pillars of the society. At the same time, the institutional organization of television from the 60s was kept unchanged for many years, and still continues to influence the present state of the public service in Romania. The stormy public debate on the law that has eliminated the license fee for public broadcasting from January 2017 onward, raised the need of the critically assesment of the history of public television service in order to understand its present challenges and difficulties.

This research is conducted within the project TNSPE (Télévisions et nations en « semi-périphérie » européenne: comment constituer une identité nationale par la télévision (1958-1980). Etudes de cas : la Roumanie, la Bulgarie et la Belgique), financed by IFA-Institutul de Fizica Atomica and AUF-Agence Universitaire de la Francophonie (PN 3 / Sub-3.1 Bilateral / Multilateral/ Module AUF-RO, 2016-2017).

Public and Corporate News Media in Turkey: Changing the Habitus of Journalists

Cem Koray Olgun
 Adiyaman University, Turkey
 simulacr(at)gmail.com

How can we understand the media in this times? Media is encompassed with economic and political fields. Under the domination of the both fields, media has lost its function of critical power and it becomes an instrument for capitalism. Having broadcasting the use of public good is not possible in these conditions so. Pressure on the media in particularly can be seen through the news media. The censorship begins to the process of news production. Thus, together with the pressure, censorship and self-censorship have been rooted in the news media.

In Turkey experience, we can see the pressure on the media-especially news media- in two ways. Firstly, the direct pressure of political field against the media. Secondly, the indirect pressure of political field, which using economical field and doing so impose a sanction to the media corporates. In this case, the most important question is should go beyond the structure and should be the focus on social actors. However, my questions are: What is the role of the journalists in this process? Can they really affect the news production process? How do they deal with the pressure, censorship, and self-censorship? What are the conditions of working in news media?

In accordance with this aim, in-depth interviews were conducted with thirteen journalists who working at the public television channel (TRT) and ten journalists who working in the corporate television channels in Turkey. In this paper, this qualitative data has analyzed and discussed with support from the theory of political economy of communication and Pierre Bourdieu's field theory.

Public Service Broadcasting in an Age of Interactive Media

Himmet Hülür, Cem Koray Olgun
Abant İzzet Baysal University, Turkey; Adiyaman University, Turkey
himmethulur(at)gmail.com, simulacr(at)gmail.com

We live in a time the that internet technologies are becoming prevalent and the inevitable means of communication almost in the every sphere of society. Individuals not only have access to the broadcasting that they prefer but also can execute their own broadcasting through social media without feeling mainstream media as necessary. In the present day broadcasting cease to be in the monopoly of radio and television and leave itself to individual's appreciation. Internet is now emerging as a serious alternative to the mainstream media. Although the Internet's hegemony of publishing seems to be destroying the function of public service publishing, it is a fact that we need public service publishing more than ever. The internet, the newest actor of the culture industry, is removing the principle of publishing for the public interest with an alternative publishing claim to the mainstream media. The publishing promised by the Internet is nothing more than an entertainment package based on the culture industry in this case. Under these circumstances, the question of how public service publications can function is gaining importance. Does public service publishing is less

possible today, in which publishing reached an endless power, than the previous periods? Or is it an opportunity for democracy to reduce the impact of the culture industry?

RN18 | Session 04b Social Media and Civic Participation

Space of resistance – everyday practices of rejecting normativity on Tumblr

Katrin Tiidenberg
Aarhus University / Tallinn University, Denmark
katrin.tiidenberg(at)gmail.com

Critique, according to Foucault, is the art of voluntary inservitude, a reflective form of indocility. Social theorists both before and after the explosive spread of networked communication have pointed out that despite the inescapable power of normalization in (post) modern societies, people can and do carve out spaces of localized resistance. Sometimes, this resistance gains enough traction to challenge dominant discourses pertaining to specific aspects of subjectivity and self-expression.

By fostering or hindering particular practices, social media platforms can transform social norms and afford cultures of critique. Tumblr in particular is often associated with a variety of non-normative expression (SJW, body-positivity, queer etc). Most of the research interested in socially mediated subversion focuses on artists' and activists' use of digital platforms for creating and spreading counter-narratives. But does everyday self-presentation on social media carry subversive potential as well?

This presentation builds on five years of ethnographic research with a sexually explicit community on Tumblr. It argues that their collaboratively construed safe space functions as a subversive, norm-suspending one. For my informants, Tumblr-participation leads to an explicit shift away from the disciplinary power of normalization. This can mean rejecting norms of bodily aesthetics, troubling the gendered norms of sexuality, questioning feminist self-expression, or engaging in non-normative interpersonal relationships. The presentation analyzes both the personal and communal practices, as well as Tumblr's platform affordances to make a case for the socio-technical assemblage that makes reflective indocility possible.

"Public Opposition in the Era of Digital Activism: An Analysis of the Form of Digital Activism of the "United June Movement" in Turkey

Ayşe Fulya Sen
Firat University, Turkey
fulyasen(at)firat.edu.tr

The network formation of the Internet and new media encourage people for communication and also represent the dynamic forms of participation in social and political issues. The alternative and critical public spheres created by new media provide a forum for individuals and groups on the debates. As Bennett

(2003) indicates, activist networks use new digital media to coordinate activities, protests, and publicise high-quality information about their causes. When it is considered that the press and officials criminalise many activists, the activist networks reach to the public via alternative media and social media platforms. Norris (2007) emphasises that in today's world, alternative channels of political engagement, mobilisation, and expression rapidly emerge in modern societies, including the general rise of demonstrations and protest politics. Social movements, online political communities, and transnational policy networks constitute new patterns of political activism.

This study argues that new political activism can go up civic awareness and strengthen communities and to achieve these goals that political activism will need a pluralist and democratic public sphere provided by media. This paper will focus on the activism practices of "Birleşik Haziran Hareketi (BHH)" (the United June Movement) and discuss the activism creation potential of the website and social media accounts of "Birleşik Haziran Hareketi". Also, it will analyse the news coverage of BHH in both mainstream and alternative news media to discuss the visibility of BHH in the news media. Also, this paper will examine the website and Twitter account of BHH and reveal how it presents itself to the public and mobilises citizens and activists. Also, this study aims at discussing the importance of pluralist media in terms of creating a democratic public sphere.

Social media activism and the impact of urgency, on-line solidarity and resistance upon the perception of time. A case study of a patients' social movement.

Antonello Bocchino

University of Westminster, United Kingdom
antonello.bocchino(at)my.westminster.ac.uk

'Timeless time' as defined by Castells results when there is a perturbation of chronological events in a given context of the network society. Through the analysis of the on-the-ground activities of the Occupy Wall Street movement, Castells describes 'timeless time' as an interruption in the routine of daily life, coupled with a hope "born from the material verification that another life is possible" (Castells, 2015:172). This paper, by contrast, examines 'timeless time' using a case study of an Italian patients' movement that grew out of a medical discovery (Zamboni, 2006), which challenged the existing medical orthodoxy (Kuhn, 1996), about the causes of the chronic disease, Multiple Sclerosis (MS). This discovery challenged also the drug companies that profit from MS by offering alternative treatment options.

Based on auto-ethnography since the inception of the social movement in 2009 and on over 60 in-person, audio-recorded, semi-structured interviews of the movement's activists, this paper argues that, during its first year, the movement generated an experience of timeless time solely through its activities on social

media.

Two elements were essential in fostering the experience of timeless time within the movement. Firstly, social media facilitated timelessness by allowing for simultaneous social practices of solidarity and resistance at a distance, thus fostering connectedness. (Van Dijck, 2013:12). Secondly, as MS is a disease which progressively worsens patients' quality of life, funding research into the new discovery was a matter of urgency since any delay could result in further disabilities, including being confined to a wheelchair. With the visualisation of a tangible hope, patients were inexorably drawn to the day-by-day occupation of the social media streets (Gerbaudo, 2012).

Taiwanese Celebrities in the Chinese Language Market: Exploring the Politics of gender, ethnicity, and nationalism

Fang-Chih Yang

National Cheng Kung University, Taiwan
fcyang(at)mail.ncku.edu.tw

Recently the Ministry of Culture in China released a blacklist of entertainers from Japan, Taiwan, and S. Korea and banned them from entering into China's market. This is not new, given China has used its economic power to boost patriotism for political expansion, especially with regard to issues of Taiwan independence. But this boycott has implications for many Taiwanese entertainers who see China's market as their central to their career survival. However, how has China become the primary market for Taiwanese entertainers and how do different Taiwanese entertainers adopt different interpretive repertoires to respond to China's boycott in order to advance their career? To answer these questions, the paper first deconstructs the economic concept of "the Chinese language market" by tracing its historical formations and transformations, with a particular emphasis on ethnic struggle as an over/determining factor in configuring this market. As ethnicity plays an overdetermining factor in national belonging which is also gender-specific, the second part of this paper addresses how male entertainers from different ethnicities adopt available interpretive repertoires to negotiate with the Chinese language market and China's nationalism. The celebrities under analysis include: Huang An, Dai Li-ren, Jackie Wu, Chen Zhao-rong.

RN18 | Session 05a Social Media Exploitation, Communicative Capitalism and Alternatives

"From Industry 4.0 to Society 4.0, there and back. The "question" of participation."

Tatiana Mazali

Politecnico di Torino, Italy
tatiana.mazali(at)gmail.com

The new industrial paradigm Industry 4.0, or smart industry, is at the core of contemporary debates. The paradigm has at heart a technological disruption: the

merging of the real world of industrial plants and the virtual world of digital information. The public debate on Industry 4.0 typically offers two main perspectives: the technological one and the one about industrial policies. On the contrary, the discussion on the social and organizational effects of the new paradigm is still underdeveloped. The project proposed here specifically examines this aspect, and studies the change that workers are subject to along with the work organization in smart digital factories. The study originates from an empirical survey conducted by the author together with a multidisciplinary research group between 2014 and 2015 in some of the largest Italian factories.

In particular, this work analyzes the links between digital society, digital culture and Industry 4.0, focusing on the issue of people's participation in the process of change.

Many elements of the Industry 4.0 paradigm are widespread outside the factory, in society; they are not only technological elements but also cultural. One of the key aspects of the analysis is the question of participation and the "person-centered" culture (where "question" has the double meaning of: subject to be analyzed, or topic; and problem, object of controversy and disputes). The subject will be addressed critically by presenting both the "RE-personalization" processes (from the centrality of the users-consumers in consumption practices to the centrality of the worker in the work paradigm 4.0) and the new processes of "DE-personalization" caused by digital automation.

Theory of You(Tube): A Critical Theory of the Commodified Identity

Trenton James Lee

University of Westminster, United Kingdom
leetr(at)umich.edu

As digital media platforms (DMPs) continue to develop - mechanically, technologically, and socially - it is important to turn to critical social theory to ensure this development is both moral and sustainable for society. With this in mind, this project aims at uncovering the significance of the recent development in the spectacle of the celebrity; users of DMPs engage in a project of the self, developing the skills and tools in order to support themselves with their branded identity. These so called "influencers" can be found across many platforms, such as the Instagram model (Instagrammer), Vine star (Viner), and YouTube creator (YouTuber). According to the narrative which has seemed to develop in regards to the influencer, their careers begin when they express themselves creatively, giving them an opportunity to build and engage an audience, leading to both a financial income - with advertising revenue and brand deals - and a gift income - with audience crowdfunding and mail-in gifts. This project includes interviews from influencers of one platform, YouTube, and their audiences, as a way to illustrate the phenomenon in more depth, by identifying the process of the commodified self. With the help of two theoretical fields - identity theory and marxist/critical political

economy - this project aims to understand how DMPs, and their users, can generate exchange value from sociality taking place online. Sociality has an important use-value in identity processes, however, with the introduction of DMPs, the project of the self is thrown into the world of commodities, just as Giddens (1991) warns us.

'Wikipedia works in practice, not in theory.'

Achieving alternative peer production through mundane routines, encyclopedic ideologies, and regimes of qualification

Christian Pentzold

University of Bremen, Germany

christian.pentzold(at)hiig.de

Wikipedia is autonomous co-production of free knowledge par excellence. With its numerous entries and users, the social project epitomizes the potential and power of an internet-based 'info-communism' (Fierer-Blaess & Fuchs, 2014). In turn, given its public popularity and cultural significance, the information resource is seen as quintessential empirical evidence of a peer production that is radically decentralized, collaborative and nonproprietary; based on sharing resources and outputs among widely distributed, loosely connected individuals who cooperate with each other without relying on either market price or managerial commands (Benkler, 2006).

This paper takes its start from this vision of an alternative mode of knowledge compilation and form of knowledge repository and asks how and under which circumstances the endeavor is made to function. It argues that Wikipedia's grand scheme and idea rests on the rather mundane affairs of establishing, maintaining, and ordering laborious work routines. Through their housekeeping or 'mop and bucket' work as they say, Wikipedians make themselves responsible and amenable to the project's success. The responsibility is thus placed with a small group of active editors who commit themselves to Wikipedia's goals and who qualify and (self-)govern their engagement so to follow tasks, organize activities, and sanction those who fail to be 'good' users.

Based on a three-year ethnography in the German- and English-speaking Wikipedia, the paper examines three stations: first, it reconstructs the anchoring practices of editing and coordinating. Second it shows how these are confounded by ideologies of Wikipedia as an encyclopedia, a mission, and a community. Finally, it examines the regimes of qualification contributors with their contributions become involved in as soon as they start to edit.

RN18 | Session 05b News Production: Practices in Post-Factual Times

Mapping the patterns of fake news

Ioanna Kostarella, Sofia Theodosiadou, Maria Touri
TEI of Western Macedonia, Department of Digital Media and Communication; Aristotle University of Thessaloniki, Greece, Department of Journalism and

Mass Media; Leicester University, UK, Department of Mass Media and Communication
 ioanna_kostarella(at)hotmail.com,
 stheodosiadou(at)gmail.com,
 maria.touri(at)googlemail.com

It is becoming obvious after generations of relying upon traditional media to tell us what is going on in the world, people are now finding their news sources to be increasingly inaccurate or biased. This level of distrust has significant and permanent implications on how journalists do their job. Deceptive news result from disregard of one or more of journalistic professional norms, often taking the shape of fabrication or plagiarism.

Today's journalism is openly threatened by the different versions of "truth": deception, fake news, 'pseudo – events' are building the new profile of journalism. The theoretical point of departure for this research is the problematics of fake news in new media. The essence of the threat posed to democracy by the prevalence of "fake news" is that totally false allegations acquire power and therefore gain influence over public opinion. Sensationalism seems to prevail over traditional media formats, in an attempt to get more clicks.

Through a content analysis approach of some of the most popular 'fake news' sites, this research will try to reveal discursive and journalistic style patterns in online news. Concepts such as fake news/parody and irony will be coded, along with the use of specific writing styles (exclamation marks, use of capital letters, vague or promising titles), in an attempt to detect some of the most common patterns and combat 'fake news'.

Cultural Policy, Digital Communication and Fake News: The cultural model to regulate Fake News

George Gantzias
 Hellenic Open University, Greece
 gantzias(at)eap.gr

Cultural policy and digital communication are changing the way to communicate and to access information in our everyday life. Fake news is a reality in digital communication. The mass media together with social media are making money by producing fake news i.e. stories that have the flavor and style of faithful journalism but are written in bad faith and without care for accuracy. According to Tim Cook, the boss of Apple is calling for governments to launch a public information campaign to fight of fake news, which is 'Killing people's minds'. Cultural policy in digital communication together with regulatory mechanisms and public interest theories are transforming the production of fake news into new digital propaganda both locally and globally. According to Swift, "American's trust and confidence in mass media 'to report the news fully, accurately and fairly' has dropped to its lowest level in Gallops polling history, with 32% saying they have a great deal or fair amount of trust in the media. This is down eight percentage point from 2015". This paper examines the

theories of regulations and the role of digital propaganda in recent socio-economic crisis. It analyses cultural policy and digital communication as important factors to develop a cultural model to regulate fake news. It points out that 'fake news' debate is a deeper socio-cultural shift. Finally, It recommends developing a cultural policy algorithm to monitor fake news by using the public interest principles application program for producing news.

What Makes online Content Viral?

Nadezda Kirilina
 Higher School of Economics National Research University, Russian Federation
 nakirilina(at)edu.hse.ru

What makes people click the Like button on Facebook Statuses? Does it contain a cool link or a funny photo? Does the status actively engage its readers? What Makes online Content Viral?

We have analyzed the Facebook Pages of 3 extremely popular News sources: CNN, the New York Times, Buzz Feed. All three Pages have millions of fans, post the same types of Facebook statuses, and post statuses extremely frequently to Facebook (around 8-9 times a day). 50'000 posts for each group were analyzed.

This study examines how content characteristics impact virality. The study defines what certain pieces of online content (e.g., advertisements, videos, news articles) are more viral often than others. We have examined is positive content is more viral than negative. Is content that evoked high arousal emotions—positive or negative— more viral than content without emotion?

Journalism, democracy and Europe: towards a sustainable future

Pieter Maesele
 University of Antwerp, Belgium
 pieter.maesele(at)uantwerpen.be

Similar to the presidential elections in the United States, public debate across Europe in early 2017 appears to be limited to business as usual (i.e. the post-political neoliberal consensus) on the one hand, and its right-wing ethnonationalist, populist competitor (that taps into romantic nationalism, cultural homogeneity and xenophobia) on the other.

The aim of this paper is to demonstrate how the mundane application of mainstream journalistic practices and values is responsible for limiting the frame of reference to business as usual and its far right opponents. The argument is twofold.

First, based on a diverse literature from media studies and political philosophy, I argue how the ideal of objectivity in its different forms (from professional truthfulness to public rationalism) is bound to fail in making visible the contingency of the neoliberal global order, thereby directly contributing to a general inability to make a more emancipatory and egalitarian configuration of globalization subject of debate.

Second, based on recent data regarding the coverage

of new left parties such as Syriza and Podemos in Belgian elite newspapers, I demonstrate how this ideal of objectivity is translated in discursive strategies of depoliticization which are key in explaining how these political parties are delegitimized and how neoliberal ideological configurations and courses of action are naturalized in the process.

This paper concludes by discussing how particular alternative journalistic logics and discursive spaces could contribute to a form of journalism that facilitates a democratic debate about alternative sustainable futures for Europe.

RN18 | Session 05c EU Fiscal Crisis and the Media

Media coverage in the post-truth era: The case of refugee and financial “crises” in Europe

Christos Frangonikolopoulos, Nikos Panagiotou, Sofia Theodosiadou, Stamatis Poulakidakos

Aristotle Univeristy of Thessaloniki; Aristotle Univeristy of Thessaloniki; Aristotle Univeristy of Thessaloniki; National and Kapodistrian University of Athens, Greece

chfragk(at)jour.auth.gr, nikospanagiotou(at)gmail.com, stheodosiadou(at)gmail.com, stamatisp(at)media.uoa.gr

The aim of this proposal is to discuss the role of European Mass media in the post truth era. European Union is in the middle of a financial, political and social turmoil. The fiscal crisis in various member-countries and the ongoing refugee flows from the Middle East (predominantly from Syria), have created a context of internal political, financial and social transformation in the European Union.

Amidst this context, the information concerning the advances in the European structure, become of utmost importance. In 2016, we have encountered the emergence of a new term describing the “information condition”, both in the political and media domain, the so-called “post-truth”, signifying a circumstance in which objective facts are less influential in shaping public opinion than appeals to emotion and personal belief (Oxford Dictionary 2016). The proposed project seeks to formulate a comprehensive conceptual frame of post-truth era focusing mainly on the media and conduct research on the discursive characteristics of port-truth.

Our research will seek to address post-truth characteristics in the public discourse of politicians and journalists as expressed in mainstream Greek and German media, kathimerini.gr, efsyn.gr in Greece and Sueddeutsche Zeitung (SZ) and Frankfurter Allgemeine Zeitung (FAZ) in Germany, regarding the coverage of the EU financial and refugee “crises”.

Among others, we will research the amount of reports referring to facts, compared to those covering the public expression of opinions, we will seek to locate the selective (or not) evocation to data and the evocation to feelings (either positive or negative ones).

Socio-Economic Inequality and the Print Media: A Comparative Analysis of Piketty's 'Capital' in Selected European Countries

Andrea Grisold, Hendrik Theine

WU Vienna University of Economics and Business, Austria; WU Vienna University of Economics and Business, Austria

andrea.grisold(at)wu.ac.at, htheine(at)wu.ac.at

After decades of benign neglect in both the academy and the media, the issue of socio-economic inequality has become an increasingly important problem. The economic crisis, unfolding from 2008 onwards, resulting in years of austerity, has exasperated class and regional division. There have been numerous socio-economic and political outcomes from this, not least the Brexit vote in the UK, or the election of Donald Trump. Another sign of the heightened interest in socio economic inequality was the surprising popularity of Thomas Piketty's 'Capital in the 21st Century' (C21). The book reached the top of the best seller lists in 2014 and was described as a 'media sensation' and Piketty himself as a 'rock star economist'.

This paper, drawing from a major international and cross disciplinary study, looks at the media treatment of C21. By drawing on critical discourse analysis, we investigate how print media in the UK, Ireland, Germany and Austria cover matters of socio-economic inequality, and how these media treat specialised and complex subjects such as economics, including its data and methodology. This is of clear concern to media research and the political economy of the media, as we debate our findings in the context of post 2008 criticism of journalism for its uncritical coverage of business and economics. Finally, we discuss insights concerning the public perception of socio-economic inequality, given that the media comprise an important and influential source of information on inequality topics, as the full range of economic inequality is not assessable through everyday life experiences.

From 'Austerity Britain' to Obsessive Austerity – Framing Austerity in 'The Economist' Magazine

Timo Juhani Harjuniemi

University of Helsinki, Finland

timo.harjuniemi(at)helsinki.fi

This paper analyses how the financial magazine The Economist has framed austerity, an economic policy idea that has become highly contested in the aftermath of the global financial crisis and amid the euro crisis. Mainstream media is a space in which public consent for such economic ideas as austerity is harvested and The Economist is an influential agenda-setter on pressing political issues. This paper pinpoints the historical peaks in the use of the word austerity in The Economist and deploys a frame analysis in order to identify how the magazine has justified or criticized austerity and what have been the economic problems that should be dealt with austerity. According to the paper, The Economist has

legitimized austerity as a solution to curb public spending and reduce the role of the state in the economy. The Economist has framed austerity as a technocratic fix to solve economic problems caused by populist or naive politicians. Austerity represents a form of apolitical reason – as opposed to politics which is often motivated by the short-sighted electorate or by ideology.

RN18 | Session 06a Alternative Narratives in Contemporary Communication

Fashion Blogs' and Vlogs' Challenge for Fashion Theory: Relation between Fashion Type and Its Media

Viktorija Zilinskaite
Vilnius Gediminas Technical University, Lithuania
viktorija.zilinskaite(at)vgtu.lt

The presentation will focus on relation between fashion blogs and vlogs as media in fashion dissemination and historical change of fashion media. The research was carried out in University focus research area Innovation management.

While there was change in fashion dissemination from direct visual interaction supported by verbal creation of meaning to professional dissemination of fashion through magazine and TV, shift towards blogs and vlogs was even more essential the previous change in fashion media. Through XX century associated with high social status and professional dissemination fashion media turned to user created media that succeeded to challenge fashion magazines and TV.

The research has shown that change in fashion media rather showed changes in social structure than challenged essential aspects of fashion theory. The essential powers in fashion – distinction and imitation tendencies remain regardless the change of social entity dictating fashion. Importance of blogs and vlogs in mediation and dissemination of fashion shows change of recognition of media body processes in contemporary fashion system.

Fashion blogs and vlogs domination in fashion dissemination field rather supports classical fashion theory dissemination aspects through visual interaction supported by verbal creation of meaning. However essential valued feature shifted from social position towards possibilities, what changed social center in fashion system.

Designing alternative narratives to contrast violent Islamist online propaganda: a participatory approach.

Sara Monaci, Caterina Mazza, Gabriella Taddeo
Politecnico di Torino, Italy; Politecnico di Torino, Italy;
INDIRE, Italy
sara.monaci(at)polito.it, caterina.mazza(at)polito.it,
g.taddeo(at)indire.it

Violent extremist propaganda on line poses a major threat to international peace and security. In consideration of the self-proclaimed Islamic State (IS) high-quality contents impact on foreign fighters in

Europe, a number of initiatives have been launched at international level, in order to contrast violent Islamist narratives. Typically, past approaches focused on 'take down' policies whose objective was to remove extremist social-media accounts on Twitter, Facebook, etc. At present an important need to create, to produce and to disseminate counter and alternatives narratives arises: compelling contents able to undermine the arguments of extremist groups and to offer different perspectives on the main reasons related to violent radicalisation. The paper presents the participatory approach methodology, developed in the context of the EU funded project SAFFRON – Semantic Analysis against Foreign Fighters Recruitment Online Networks (www.saffron-project.eu), to design a social media campaign for the prevention of the violent radicalization phenomenon among European youngsters (15 – 30). The empirical research included a number of qualitative interviews with experts in the field, 5 participatory design workshops and focus groups in Italy and France which involved both youngsters (political refugees, young converted to the Muslim faith, representatives of the Muslim community, university students, secondary school students etc.) and experts (practitioners, journalists, media educators, academics, representatives of the Muslim community) considered as qualified testimonials. Thanks to this qualitative approach, the paper also presents some reflections about how delicate themes such as religious beliefs, social integration, cultural conflicts could be addressed from a communicative point of view, and how, instead, they currently have developed by mainstream as well as social media.

Fusing Work and Play: New Intimacies Emerging in Gaming Houses of Professional Video Game Playing in Turkey

Önder Can
Koç University, Turkey
ondercan90(at)gmail.com

This paper examines the e-sports scene in Turkey. As a major emerging venue of monetized video game playing comprised of teams, professional leagues, players, and commentators, e-sports is a rapidly developing economic and social phenomenon across the globe. With its younger population and sufficient technological infrastructure, Turkey drew extensive economic capital into e-sports during the last four years. E-sports teams are receiving heavier sponsorships and investments from major soccer clubs and international brands. Professional players live together as a team in Gaming Houses (GH) funded by these companies and "playbor" (Kücklich, 2009) for 14-15 hours a day. They fall behind at school and take up breadwinner roles in their families at a very young age. Thus, every moment of their lives is imbued with the tension between work and play. Drawing on existing literature on the intermingling of game and labor in e-sports such as Nicholas T. Taylor's *Power Play: Digital Gaming Goes Pro* and T. L. Taylor's *Raising the Stakes: The*

Professionalization of Computer Gaming, I want to examine the material, social, and spatial dimensions of the re-organization of working and living spaces in GHs. Based on ongoing ethnographic fieldwork in Turkey's GHs, e-sports tournaments, and interviews with professional players, I explore everyday intimacies of fun, family, and work in GHs, where the line between public and private, work and play blurs. Specifically, this research will show how these intimacies of everyday life in the GHs make possible and render invisible excessive demands and under-regulated working conditions in e-sports.

APP ecosystems: From an evolutionary perspective

Hui-Lan Chang
National Chengchi University, Taiwan
diordiorster(at)gmail.com

This paper aims to examine the interactive relationship between environment and the mobile application (APPs) by applying a perspective based on media archaeology.

The paper will use "evolution" as its theoretical framework and explore the meaning of APPs in historical evolution, emphasizing on how the APPs and its utilization from people form a symbiotic relationship and a variable domain; Meanwhile, this paper explores the evolution process of APPs and how the resulting format of media undergoes changes, which is an issue rarely discussed by previous researches.

The paper is divided into four parts. First, I will elaborate on why I chose "evolution" to be the main theoretical framework when exploring the interaction between environment and APPs. The second part within this framework starts with APP's "time tense" problems and incorporates them with a Variantology perspective, revealing the possibilities of how APP's evolution process and environment interact with each other. In the third part, I briefly describe how I employ Facebook as a case study and uncover a media narration that bears discontinuity.

Finally, this paper asserts that, in a time when the mass media environment faces tremendous changes, it is time to bring these related questions into the mass media field in order to help us break through the division of old and new media, and start contemplating, in a resonance perspective, on how to understand concrete questions of how APPs formulate and evolve.

RN18 | Session 06b News Production in an International Perspective

Financialization of News in China in the Age of the Internet: the Case of Xinhuanet

Xin Xin
University of Westminster, United Kingdom
x.xin1(at)westminster.ac.uk

In the book "How the Market is Changing China's News: the Case of Xinhua News Agency", I discussed

the transformations, both structural and in terms of journalistic practice, undergone by the top Party organ of China, from the start of the reform age in the late 1970s until late 2000s. I also discussed how the state agency endeavored to become financially independent in the 1980s and 1990s, willingly receiving a reduced amount of governmental subsidies each year for nearly two decades. After having suffered some setbacks, in the early 2000s Xinhua turned back to the government for more financial support. Until 2016 over 50 percent of Xinhua's annual income was generated by the agency itself and the rest came from state subsidies. Although state subsidies remain important for justifying the state's control over news content, they are no longer seen as an optimal form of financing in China. The government has actually begun to seek a new means of financing media since 2009. Xinhua's news website, Xinhuanet, was selected by the government for a media reform experiment, which transformed Xinhuanet from a governmental organization into a listed enterprise. In 2016 Xinhuanet went public. This marks the beginning of Xinhua's financialization in the Internet age. This paper discusses the main implications of Xinhuanet going public for the Chinese media transformations as a whole. Xinhuanet's success in news provisions has indicated that the online news flows within China remain concentrated in few hands controlled by the state. In this sense, the Chinese media transformations in the Internet age are leading to media concentration instead of diversification, similar to the situation found in more developed media markets.

Giving an account of oneself in journalism: Footing and ethical violence in journalistic discourse

Gustav Persson
University of Gothenburg, Sweden
gustav.persson(at)jmg.gu.se

For journalism, interview subjects are fundamental in its strive to enact its claim to objectivity and impartiality. But what does it mean to be an 'I' in journalistic discourse? This paper takes its starting point from Swedish Public Service Radio interviews with migrant activists. Two central questions informing the analysis throughout this study are: What are the epistemic assumptions on which journalistic discourse grounds its reporting of social actors and what consequences does such assumptions have for social actors who act in public? Through a discourse analysis of radio interview excerpts, this paper aims to explore the tension between a journalistic 'episteme' of the 'I' and the discursive effects these have on the uttering subject. The analysis takes interest in the different ways in which the activist 'I' is constituted through the news programs. The paper employs an analysis of footing (Goffman, 1981) in the interaction between journalist and activist. This analytical framework is coupled with theoretical encounter with Judith Butler's concept 'ethical violence' (Butler, 2005). The latter is introduced as critical attempt for

journalistic research to confront the possibly (but perhaps necessarily) violent and intrusive aspects of journalistic discursive practises and how these aspects is especially relevant to acknowledge when journalism, as an institution, is interacting with actors marginal to the social realm of journalism itself (in this case migrant activists). What does an interviewee have to give up, and accept, in her strive to be listened to in public radio? What kind of subjectivities does journalistic discourse allow one to have and express?

The representations of digital journalists on migration and (rising) populism in Romania

Luminita Rosca

University of Bucharest, Romania, ICUB - The Research Institut of University of Bucharest, Faculty of Journalism and Communication Studies, SPARTA Center
roscaaluminita.1(at)gmail.com

The present paper aims at outlining the manner in which the public sphere is shaped nowadays in the context of rising nationalism and populism. The analysis will take into consideration two important aspects: multiple mediations and their effects on the public sphere (Castells, 1996, 1997; Dahlgren, 2005; Flichy, 2001; Goode, 2005) and the representations of digital journalists on the challenges of rising populism and on-going crisis of refugees in Europe.

In Romania, the digitization appears as the most important factor of economic growth in the context of globalization. While traditional media industries have been radically transformed, online media erupted in various and unanticipated forms of alternative communication and information. The digitization has effects on shaping the public sphere, and in this process, the journalists represent one of the most important actor of change or maintaining the status quo.

The analysis has two objectives: 1. to provide an overview of the socio-political context of Romania in order to identify the general framework of shaping the public sphere in the context of the rising role of online media and social networks in public communication, 2. to underline and discuss the representations of Romanian journalists on the phenomenon of populism and migration.

To meet the first objective, I take into consideration social documents: reports, legislation, economic and social indicators from official statistics. For the second objective, I rely on a qualitative analysis on a 100 structured interviews applied on Romanian digital journalists on the topics of migration and populism.

Representations of contentious action in news and social media: A case study of a Cypriot environmental initiative

Gregoris Ioannou

University of Cyprus, Cyprus
gregoris.ioannou(at)gmail.com

Focusing on the Cypriot environmental campaign

“Save Akamas”, this study compares and contrasts the mediatization of contentious action in mainstream print media and the social media. The analysis operates at two levels: a) the protest coverage by three national newspapers b) the communicational strategy of the campaigners as implemented through social media. At the first level a framing analysis of news media coverage in the “protest paradigm” discusses the narratives produced and the sources and definitions used in order to legitimize or marginalize the campaign in the mainstream media. The empirical sample is all the relevant news items produced a few days before and after the three main protest events of the campaign. At the second level insights from social movement theory on identity and digital culture theories on the self and on-line behavior are utilized in order to illustrate the dynamics of the communicational effort of the campaigners. The data for this is a sample of posts from the campaign’s facebook page and how these were promoted by individuals during the campaign. Interviews with key activists will complement the social media posts and allow a more in-depth discussion of social movement communication strategy and tactics. Through juxtaposing print media and social media framing of issue-based protests, this article contributes to a comparative approach integrating the mainstream media representation of dissent and the mobilization of digital “selves” for the needs of social movements. In doing so it raises broader questions on political subjectivity and structures of representation.

NR18 | Session 06c Political Discourse and Mediatization of Politics

From Referendum (2015) to Grexit: how and why the Greek media failed

Georgios Giannakis Pleios
University of Athens, Greece
gplios(at)media.uoa.gr

On July 5, 2015 in Greece was held referendum on whether the Greek people will approve or reject the new measures or “3rd memorandum” proposed by the “troika”. But in a large part of the public debate the real question raised was whether Greeks accept any measures in order country will remain in the Eurozone or they reject such measures that conflict with the election program of Syriza government six months ago, even though it meant country's exit from the Eurozone. The Greek mainstream media which from the very beginning of crisis strongly accepted the austerity policy of “troika”, supported almost fanatically the proposed by the lenders measures, often breaking the Greek electoral law and any previous levels of (im)partiality as well.

Despite the extensive support by the Greek media of the proposed austerity measures and of the remaining in the Eurozone “at any cost”, nearly 62% of the voters voted against. It seems that the Greek media failed in their advocacy and propaganda function, which raises many issues regarding the relation between the elites, the media and public, the media and the power

relations etc in time of crisis.

In the proposed paper we: a) present an extensive content analysis of the media coverage of the referendum campaign by the 7 nationwide television stations, 12 national newspapers and the 5 bigger news portals, b) analyze the causes of media's failure to enforce the elite's strategy and c) discuss that failure in the frame of the theoretical analysis regarding media's social function in contemporary capitalism in crisis.

Us vs them: Populist discourse in political communication

Roy Panagiotopoulou

National and Kapodistrian University of Athens,
Greece

rpanag(at)media.uoa.gr

Populism has become a key factor in today's media representation. This kind of discourse frequently frames the news about economy, political decisions, immigration policy, et.al.; it dominates discourses of security, national priorities, euroscepticism, xenophobia, racism, and it permeates people's lived experiences in precarious times.

Populist parties mainly of the far right wing are continuously gaining support by the voters in many EU countries. This stance is not only a result of the ongoing financial crisis and the new pressure coming from the massive migration flows since 2015, but also of the quick shrinking of the middle classes. It seems that in times of economic - political uncertainty, national policies tend to prevail and be sustained by larger parts of the population.

Populist ideology cast a shadow on the media and its power to shape and influence publics and audiences. Many Media express openly negative stances against other nations, refugees and asylum seekers. Thus, the migration issue develops to a major challenge for the future integration of the EU and for mutual solidarity.

This paper seeks to address the range of forms and practices within which populism is mediated in its many varieties of themes and expressions. We will analyze publications promoting narratives of safeguarding national priorities versus treats caused by the 'others'. Articles published between September 2015 – 2016 in one national newspaper in Greece, Germany, Austria and France will be examined. Regarding the monitoring of news items we will use a combination of framing and content analysis.

"Us" and "Them". Construction of Brexit in the German Press. Exploring the Hegemonic Contemplations of Germany

Emmanouil Takas

Panteion University, Greece

manostakas(at)gmail.com

The way the German Press constructs the "why" of the Brexit and the "what implications" Brexit has is a way of understanding, evaluating and processing Brexit itself, since any phenomenon is being understood through its causes and its implications

(Heider, 1958). This construction does not function as an "objective" description of the phenomenon, but as an element of representation and examines how the depiction of reality is being understood. As an element of representation this process is also affected by cognitive biases (Weiner, 1986). Aim of this study is to explore how the German Press constructs the causes and implications of Brexit. 170 newspaper articles referring to Brexit were examined (Deutsche Welle = 87 and die Zeit = 83) for a period of one week, starting at the day of the UK Referendum. Content analysis is employed with the use of an observation sheet and attribution theory (Weiner, 2004) was operationalized. The research questions driving this research are:

- Which are the causes and implications of Brexit according to the German Media?

- How is the British, German and European identity constructed in the German Media and how do cognitive biases affect this construction?

Findings underline the "unwillingness" of Germany to domesticate Brexit into the German rhetoric, by constructing a two-level identity. The first one refers to "Us" the Europeans vs "Them" the UK and the second "Us" the stable German economy vs "Them" Europe that needs to be strengthened.

Romanian women politicians and electoral campaigns. Case study: the local 2016 elections

Daniela Roventa-Frumusani, Alexandra-Oana Irimescu

University of Bucharest, Romania; University of Bucharest, Romania

danifrumusani(at)yahoo.com,

alexandra.irimescu(at)gmail.com

In the present day context of liquid boundaries, hybridization of roles, identities and theatricalization of politics, we intend to show how women politicians' life (public and private ones) are represented during electoral campaigns and also how virtual space is contextualized/recontextualized, using the concepts of frames, public sphere and gendered identity.

Firstly we replace the public sphere issues in the frame of the technoscape 2.0. Secondly we will analyze the debates and perspectives of optimists and pessimists of the communication 2.0 in general and of the political communication in particular, especially how are constructed/deconstructed/reconstructed in the Romanian public sphere the images of political women leaders.

We analyze the semio-discursive representations of women politicians during the last local electoral campaign (June 2016). The main objective is to present the iconic and discursive representations of these new political actors. In the conclusion we discuss the consolidation/vs/destruction of gender stereotypes.

This analysis develops questions related to the reception and interactivity in the digital environment, using quantitative and qualitative discourse analysis applied to photos and messages on women's politicians Facebook, in order to emphasize actors' agentivity and users' attitudes and opinions

concerning the feminine campaigning and leadership.
Key words: Public sphere, Facebook, electoral campaigns, women political leaders

RN18 | Session 07a & RT Session 01 Media Narratives - Social Realities

Greeks of the Prime Time Television Serials in Turkey

Serife Cam
Ankara University, Turkey
cam(at)media.ankara.edu.tr

This study elaborates the images of Greek characters of the prime time television serials in Turkey which are produced after 2000. In this context, this study explores the construction of Greek identity, which stands as one of the main categories of national difference situated across Turkish identity, within the relations of sexuality, class, religion and cultural differences. Firstly under the theme of "sexuality of national difference in serial narrative", this study attempts to reveal how the concept of difference is marked as feminine and how this marking operation is visualized on women Greek characters in serial narratives. As a second issue this study deals with how serial narratives define, name or describe cultural and historical cases and traumas experienced by Greek minority once lived or still living in Turkey. Thirdly this study discusses how economic and class differences are especially crucial in the production of Greek stereotype that depends on "undeserved gain" in serial narratives. Finally this study deals how serial narrative emphasizes and frames principal role of religious difference which may be the first thing that comes to mind when the issue is the difference between Greeks and Turks. Referring to these four main issues this study will express multicellular and sometimes contradictory characteristic of Greek images. However these characteristics are not an obstacle in the consistent image production of cultural texts.

Technology and Science as Fiction Narratives and its social politics issues

Christiane Wagner
UNICAMP, Brazil
christiane.wagner(at)malix.univ-paris1.fr

While technological development is an important representative of forms, it is observed that the structure, i.e., the sense of building a narrative through images deals with the condition of the artificer or artist in the ability to develop and perform with the idea of transforming or improving.

Besides the attraction of images, which was always emphasised in the communication process and language development, the world and Weltanschauung are changing as a result of scientific and technological advances. This was posited in Jürgen Habermas's work titled *Technik und Wissenschaft als "Ideologie"* (Technology and Science as Ideology, 1968). Nowadays, among them is

"dehumanization," which has become the universal use of the word to treat individual aspects shaped and structured to fit the new society and its political and economic issues. This term has to name an almost widespread impression in the face of the accelerating technical progress and its social and political effects. Sometimes, these effects were interpreted as "problematic" in life as human has become dependent on functional purposes. Moreover, were added to the discussion the notions of progress, the social impact of automation, and the role of intellectuals and scientists as builders of the "invention," generating "the artificer," who had to overcome its evolution, creating techniques to emerge as humans from the narratives. The visual narratives increase the focus on socially and politically engaging work through new technologies and artificial intelligence towards forming a collective imaginary. For instance, the American science fiction television series created by Jonathan Nolan and Lisa Joy, intitled *Westworld*, will be analyzed concerning the politics of technological development and its social effects in Europe.

From Robin Hood to Mr. Robot: popular cultural narratives of protest on television

Alexa Robertson
Stockholm University, Sweden
alexandra.robertson(at)ims.su.se

Contemporary protest is often theatrical and intertextual. Protesters in Hong Kong raised their voices in 2014 not just to call for democracy, but also to sing an anthem from *Les Misérables*, and the historical Guy Fawkes figure has been at demonstrations the world over ever since the allegorically masked revolutionary was first seen masterminding a mobilization against a fascist British state in *V for Vendetta*. The uprising represented as spectator sport is a trope that runs through popular culture from *Spartacus* to *The Hunger Games*. The screen is a common denominator in all such accounts, with films like these ending up on television, disseminated in the same flow as news reports, in entanglements of commemoration and remembering. With this phenomenon as its point of departure, the paper argues that the study of representations of protest in television drama can provide insights into how well television has met the challenge of representing the people who feel that political representation and professional journalism has failed them - the protesters who take to the streets, and screens, of the world. The characterization and narrative settings of film and television series provide tools for understanding complex political situations that news representations of protest cannot, it is argued. Evidence is presented to support the view that there striking symbolic similarities between the figures of *Spartacus*, *Robin Hood*, *Katniss Everdeen* and *Elliot Alderson* and the decadent capitals threatened by their outrage, and that the narratives in which they are embedded comprise powerful ideological frameworks in which contemporary protest can be understood and bolstered.

Cyber-Optimism and the Realities of Digitalizing Communications: The Predicament of Digital Civil Society

Yury Asochakov

St.Petersburg State University, Russian Federation
yasochakov(at)yandex.ru

This paper aims at analyzing the prospects of interaction and confrontation between digitalizing communications in civil society and the state.

Information globalization produces special effect on the overall social and political transformation. "Digital fever of the 90s" created cyber-utopianism – a hopeful faith in the emancipating nature of the online communications, the belief that technological stimulation of political participation, the revival of community-based social structures, and broad intensification of social life, will lead to the creation of a new and the most effective civil society with the framework opposed to post/industrial hierarchies and based upon the network structure ensuring equality of its digital citizens. Social developments of the new millennium show that the tendency of the civil society's relocation to the virtual space of the Internet, where the opposition and the protest movements are also transferred to, breeds the variety of forms of informational falsification and disruption and political "slacktivism". This paper examines these phenomena as not mere unfavorable side-effects but as unavoidable authentic elements of the virtualization of social life with the increased level of uncertainty.

Political connotations of cyber-utopianism are generally used by political institutions in the context of liberal ideology as an indicator of the information freedom and a marker of liberal allegiance. This paper analyzes how in response to the increase of informational freedom in civil society, modern states (both liberal and authoritarian) use symmetrical technological countermeasures which can not only undermine the chances of digital liberalization, but also increase the risks and possibilities of upgrading traditional forms of political repression.

RN18 | Session 07a & RT Session 02 Media in Society and Politics

Online Opposition to Immigration: how extremism are challenging the European Public Sphere

Dario Lucchesi

University of Padua, Italy
dario.lucchesi1(at)gmail.com

An outcome of Refugee Crisis is the deterioration of the quality of the public sphere and a weakening of control over misinformation and populism. This is especially true considering social media as spaces of protest and discrimination against refugees and asylum seekers. Social Network Sites (SNS) represent specific spaces of public opinion, called third places, which are necessary for the construction and diffusion of public discourses. The contemporary debate defined cyberghettos (Dahlgren 2005; Papacharissi 2004) those closed cyberspaces where

some processes of destabilization of political discourse are characterized by conflict and hate. In this ambit, SNS play a central role into the construction of migrants' representation and increased forms of discriminations and hostility.

This contribution presents an analysis of 3 Italian Facebook pages where users post comments towards migrants to identify the main forms of communication and discursive genres that are employed in constructing representations of the Refugee Crisis. A critical Discourse Analysis of comments will be carried out to examine the role of users in disseminating intolerance and racism focusing on the relationship between user-generated contents and arguments, rhetorics and political discourses of the new and old populism in the online public sphere.

Forced migrations have led to 3 different tensions: an internal one against migrants, one directed to how Italy is handling migrant emergency and a third one destined to change the shape of EU. These tensions are analyzed within daily comments: the outcome could be a closed public sphere that strengthens consensus towards policies that support closing borders and spread the hate speech online.

The viralization of politics: Investigating the link between candidates' Facebook performance and electoral success

Marton Bene

MTA TK, Hungary
bene.marton(at)tk.mta.hu

This study investigates whether the number of average shares of posts on SMD candidates' Facebook pages during election campaign influences the personal vote they gain. Politicians' contents on Facebook can achieve the wider Facebook public only if they are shared by their followers. The distribution logic of networked media logic is virality (see, Klinger – Svensson, 2014): being widely shared is a requisite for being successful on social media. However, one can raise the question of whether wider visibility of politicians' message on Facebook can have actual political effect on candidates' performance. The database contains all Facebook posts of three most voted candidates owing Facebook pages from all single-member districts posted during the last two weeks of Hungarian parliamentary election campaign of 2014. The results show that the average number of shares per posts on candidates' Facebook pages is positively associated with the shares of votes after controlling for the vote share of the candidate' party on list in the districts as well as the age, gender, local political position and party leadership position of candidates.

Indicators of Effectiveness, Impact and Return in Online Campaigns for Traffic Institution Social Media

Alberto Fernandez, Igor Sadaba, Angel Gordo, Sergio D'Antonio, Cesar Rendueles

Universidad Complutense de Madrid, Spain;
Universidad Complutense de Madrid, Spain;

Universidad Complutense de Madrid, Spain;
 Universidad Complutense de Madrid, Spain;
 Universidad Complutense de Madrid, Spain
 albefe02(at)ucm.es, igor.sadaba(at)cps.ucm.es,
 ajgordol(at)cps.ucm.es, sergiodontonio(at)ucm.es,
 cesar.rendueles(at)cps.ucm.es

Online campaigns allow and ease access to certain aggregates or risk groups that are not easily attainable through analogical or conventional means. Also, these new social media ease the use of certain techniques such as digital marketing gamification, segmentation of audiences or impact measures for such campaigns. Through a social network analysis of the two main channels of DGT (Traffic Public Institution) on Facebook and Twitter have been mapped and diagnosed those types of communities (influencers and bridge communities) that accompany and heed publications from mentioned institution in social networks. As a result from a series of in-depth interviews, at first to community managers (expert programmers of social networks and writers of online campaigns) and, then to a particular group of risk (repeat offenders). A series of digital strategic lines of communication intervention was proposed. Documentary and empirical analyses performed allow for complex design specific targets at lower cost and more effective campaigns. After obtaining some basic ideas for campaigns online awareness on road safety (DGT), it has been chosen to developing a specific model of online campaign that takes account of all the technological and methodological innovations that social networks currently allow.

The popular meaning-making of media in a political crisis: the Ukraine crisis and Baltic Russian-speakers

Jānis Juzefovičs, Triin Vihalemm
 University of Tartu, Estonia; University of Tartu,
 Estonia
 janis.juzefovics(at)gmail.com, triin.vihalemm(at)ut.ee

Transnationalism is conceptualised as a condition where people's norms and interactions are configured by multiple socio-political and economic systems. This paper analyses transnationalism as a media-related phenomenon, based on the example of Russian-speaking audiences in Estonia and Latvia. Baltic Russian-speaking audiences have a geopolitically plural media repertoire, and due to extensive Russian media following, they live mentally in two societies. On the base of focus-group studies, the authors analyse Russian-speakers' understandings of the media system and news interpretation strategies to unravel the geopolitical and channel-specific systemic bias during the Ukraine crisis. The authors use the approach of the conceptualisation of first- and second-order observers introduced by Niklas Luhmann. The audience members taking the position of first-order observers (i.e. assuming news messages to be transparent reflections of an external "real world") used authenticity and territorialisation (i.e. messengers' physical proximity) as meaning-making

strategies. The search for authenticity motivates them to maintain a plural media repertoire. The audience members who held to the ideal of neutral, arbitrary journalism practices for the sake of public interests took the position of second-order observers (i.e. conceiving news texts as journalistic constructions). These audience members were more confused as media consumers and demotivated in keeping the plural media repertoire in the context of the political crisis. The implications of the long-term media war on transnational (civic) identities will be discussed.

RN18 | Session 07a & RT Session 03 New Challenges for New Media in a Fast Changing Social Environment

The International Role of Public Service Media

Yulia Belinskaya
 University of Vienna, Austria
 yulibelinskaya(at)gmail.com

There is a consistently growing scholarly discussion that recognises the importance of public service media. PSM had been an object of interest among researchers for more than 3 decades. Public service media are indispensable part of democratic process and its facilitators. The role of public service media is the most apparent on the national scale, but within the conditions of globalisation there is a need to discuss the changes that PSM undergo on the new international level. There is the lack of scientific research on the current position of PSM within its shift to international scene.

Under the globalised circumstances contemporary public service media have been facing numerous challenges, as well as new opportunities. The technological development has created the new media landscape, more visible and interconnected. As global communication became an everyday practice, the civic role of public broadcasters should have gone through radical reinterpretation. It is presumed that the new international role of public broadcasting institutions impacted their mission for universality and cultural diversity. Moreover, the assumption is that there are institutional and regulatory undergone by PSM.

Public service media have to face the globalised environment and foresee the international impact of their messages. Diasporas in this sense are not only passively influenced by the PSM, but simultaneously are playing the role of the transmitters and the first buffer of the messages translated by PSM. Thus, the public service media should be explored on the following levels: at the level of institutions, professional practices and audiences.

Youth and the on-line information environment: Uninformed citizens?

Eva Espinar-Ruiz, Cristina González-Díaz, Rodolfo Martínez-Gras
 University of Alicante, Spain; University of Alicante,
 Spain; University of Alicante, Spain
 eva.espinar(at)ua.es, cristina.gdiaz(at)ua.es,

rodolfo.martinez(at)ua.es

Information and communication technologies continue generating changes in most social aspects and, of course, in the way people and young people in particular manage different sources of information. There are still important lacks of knowledge around these media changes, fundamentally due to the relative ignorance about young people's consumption and use of information and information sources. For this reason, the main objective of this paper is to know how young university students access, use and consume news. Our interest focuses on: preferences, motivations and gratifications that lead young people to consciously or unconsciously choose among different news and sources; utilization of devices, platforms and distribution channels (traditional mass media, websites, social networks, etc.); what kind of information they consume, how they consume it, how they interact with this information (comments, participation in networks, etc.); how online information relates to other media consumption and other areas of daily life (interests, social relations, political and civic engagement).

In order to analyze these aspects, a strategy of data production based on quantitative methodology has been designed, using a survey as the research technique in its online self-applied modality. The total population is made up of all the students in Sociology and Advertising and Public Relations degrees at the University of Alicante (Spain), enrolled in levels 1st and 4th during 2016-2017 academic year. The final selection of the sample has been made by means of multistage sampling, using simple random to select groups and then a quota sampling to select the final units.

Beyond Black and White: The Role of Media in Portraying and Policing Migration and Asylum in Italy

Pierluigi Musarò, Paola Parmiggiani
University of Bologna, Italy; University of Bologna, Italy
pierluigi.musaro(at)unibo.it,
paola.parmiggiani(at)unibo.it

This paper investigates the media's role in shaping perceptions and policies concerning the so-called migrant crisis as well as how this affects solidarity with newcomers, specifically focusing on Italy. The first part of the paper examines the coexistence of the humanitarian narratives of saving lives and the spectacle of militarised borders. It unveils how the daily transmission of sensationalist and stereotyped images of migrants contributes to their transforming in-to subjects and objects of fear, both experiencing the fear of being rejected and eliminated and inspiring fear in the resident populations. The second part addresses the need for innovative approaches in the construction of a positive public image of migrants and refugees. Through an analysis of several communication campaigns, realised by state and non-state actors for the promotion of social coexistence

between citizens and newcomers, this paper calls for a fundamental shift in the way we communicate about migration. A concluding reflection on the challenges and opportunities posed by the arrival of migrants and asylum seekers in our societies, proposes that they should not only be perceived as objects of policies, but should be considered active partners of their own inclusion in the receiving societies.

RN18 | Session 07b Theatricalization and Digital Representations

Artivism: politics and art. Case studies from an international project

eva aladro, dimitrina semova, paula requeijo
Universidad Complutense de Madrid, Spain;
Universidad Complutense de Madrid, Spain;
Universidad Complutense de Madrid, Spain
ealadro(at)ccinf.ucm.es, d.jivkova(at)ucm.es,
p.requeijo(at)ccinf.ucm.es

In our contribution we describe the procedures and results of the European Project (Erasmus Plus) "Artivism: Social Practices as Instruments to Social Transformation" where four European institutions are working, collecting and studying different political/artistic phenomena connected with political and social action in the main cities of Spain, France, England and Hungary.

The Project focuses on establishing a Worldwide Artivism Archive which will collect the main artistic phenomena throughout the globe. We show the different phases of the Project, such as the Idea Bank with the main issues of young political and social interests, the Artivism Archive in which we select "artists" connected with Ideas of our Bank, and finally the Initiation to Artivism Workshops which will in the end channel the artistic forms of social and political action to the youngsters .

In our exposition we will specially focus on some interesting cases concerning the Idea Bank we have developed and how the artistic efforts towards a new impulse in political life are enriching social and political agendas of social life. Artivism is enriching and giving new life to the theatricalization of political life as prove some important political processes born in last years. We will present how the birth of a new political energy was born in the artistic way of mobilising people, although this new impulse is not present in mainstream mass media and traditional public opinion. We will discuss the struggle between activism new politics and old ways of social tendencies, to change and evolution.

YouTube reviewers: Exploring the emerging practices and boundaries of online reviewing

Maarit Jaakkola
University of Gothenburg, Sweden
maarit.jaakkola(at)gu.se

This paper inquires into the boundaries and definitions of digital-native reviewing beyond the traditional institutional milieu of arts and cultural criticism.

Reviewing new cultural products has been an integrative part of the artworld, but reviewing in the field of popular culture has been less systematized, recognised and studied (cf. Orlik 2016, Wright 2015, Blank 2007). In this paper, I will first outline a tentative definition of reviewing and then test and contest it with three cases that I exploratorily call video reviewers, comedy reviewers and player-reviewers, who represent different groups of YouTube content creators with a critical relationship to cultural products. By analysing and discussing their videos as a boundary work from three perspectives with an integrated (and updated) conceptualization of criticism - professionalism, entertainment, and fanwork - I intend to arrive at a framework in which the concept of reviewing/criticism can be theoretically conceptualized in the context of digital environments and global popular culture for further study.

Gamification in Russian Bloggers' Communication as a form of Teatralization.

Elena Chankova

Russian State Social University, Russian Federation
chev3(at)yandex.ru

Modern social discourse (networks, blogging and more) is characterized by the absence of shared rule. The collapse of social institutions rules in virtual space is a social problem in contemporary media discourse. Social consequences of the phenomenon are expressed in the form of weakened normative regulators, drastic value change and lack of socio-cultural norms. Participants' expectations become unpredictable and uncertain. The usual mechanisms of social interaction are broken in the new virtual condition. In this situation actors use reflection to regulate their behavior. Moreover, rationalization of behavior and the construction of new norms of communication contribute to overcome the uncertainty. Rationally behavior of an individual serves as a tool to overcome the breaks in linearity.

The content analysis of Russian blogs concerned with important social and political events in Russia and in the world allow to reveal specific forms of virtual interactions. It is the form of gamification - the hybrid of gaming and pragmatic action. This form refers to the situation that is not regulated by social institutions. The most confident actors perceive the situation as a game. They substitute the essence of the situation and seek through a reflexive search, foreseeing the best options for self-realization in the game. In conditions of uncertainty, the actors distort the situation instead of increasing certainty. They turn the situation into a game and instead of sharing meaning they seek every opportunity to win. The parties are seeking to hurt each other and not to prove the truth and make a fool of oneself in front of others. This is the real behavior of people in the network.

Ukrainian and Russian Digital Media Narratives about "The Crimea Issue": Theatricalization of Politics and Hybrid War

Oksana Lychkovska

Odessa I.I. Mechnikov National University, Ukraine
lychkovska(at)mail.ru

Our contribution deals with specific character of contemporary hybrid war represented in digital media. The main element of actual political performances is creation of ambivalent narrative constructions such a narrative of crisis which reflects political postmodernism in public and media spheres. Actual political narrative encompasses all crucial components of postmodern ideology: relativity of truth, truth and lie are defunct as antipodes, reality takes shape in fiction, fact-checking of breaking news is absent as far as its necessary is arguable. Thus, the boundaries between law and lawlessness, between sovereignty and interference in internal affairs, between war and peace, reality and fiction began to dissolve. Situations of postmodern in politics concede when the same political actors are combatants, arbiters and moderators of peaceful settlement. The Ukrainian case, "the Crimea issue" and Russian-Ukrainian hybrid war is one of such illustrative example of theatricalization of politics which can have rather crucial effects.

Sociological content-analysis of Ukrainian and Russian media narratives concerned "the Crimea issue" enabled to reveal principal components of information hybrid war that took place in traditional and digital media: concealed mechanisms of political confrontation, new "soft power" as misinformation which forms dissociated consciousness and controlled personality. The examination of special categories of narrative analysing such as "agenda settings", "types of content's general modality", "presence/absence of imperative modality", "special visual ways of influence", "character of conflict", "heroes/committees of conflict" permitted to construct and compare two opposite models of postmodern hybrid information wars: authoritarian and libertarian ones relative to "authoritarian and libertarian" media conceptions.

RN18 | Session 08a Social Media Use - Promises and Expectations

Measuring Interest in Online Identity Management. Scale Development and Validation

Valeriu Frunzaru, Demetra Garba evschi

National University of Political Studies and Public Administration, Romania; National University of Political Studies and Public Administration, Romania
valeriu.frunzaru(at)comunicare.ro,
demetra.garbbasevschi(at)comunicare.ro

In commodity culture, self-identity is subordinate to its image and the self is evaluated primarily in terms of public display of social and personal information. Moreover, individuals are increasingly appraised on existing online information. Yet, online identity is, to some extent, still viewed as a byproduct of an inevitable online, rather than a consistent effort or strategic endeavor from the part of the individual. In this context, the need to evaluate online identity becomes more and more relevant to researchers

trying to assess online behavior associated with the effort of gaining material rewards.

The academic literature in the field is still lacking the proper instruments to evaluate individuals' interest for online identity management (OIM) as the digital labor of self-presentation and impression management that can be performed for social or material rewards. The aim of this study is to test and validate an improved version of the first scale to measure interest in OIM (Frunzaru and Garba evschi, 2016) by integrating two key dimensions: invested effort (a) and anticipated rewards (b). At the same time, it approaches scale validation through correlations with materialism, sincerity, self-efficacy and self-monitoring.

Using a sociological survey (N=625), the study shows that this new instrument is both valid and reliable, broadening its scope with new dimensions of the measured concept (as compared with its previous version). We suggest this more complex instrument might be used as a standard tool to measure interest for online identity management.

Union Solidarity International: The Unfulfilled Promise of the Internet and Social Media

Torsten Geelan, Andy Hodder
University of Cambridge, United Kingdom; University of Birmingham, United Kingdom
tkg22(at)cam.ac.uk, A.J.Hodder(at)bham.ac.uk

Since the turn of the century, digital technologies have been central to the union revitalization literature. This paper provides a case study of Union Solidarity International (USI) – a new type of organisation founded in 2013 as part of a collaborative project involving the UK's largest trade unions. USI's mission is to encourage and support international solidarity between trade unions and other worker movements around the world by harnessing the dynamism of the Internet and social media. This involves four strands of activity: disseminating news, assisting campaigns, providing communication training and conducting research.

In contrast to existing research, which utilises surveys of union officials to delineate the attitudes towards digital technology, our analysis focuses on how they are used in practice. Data were gathered over a three month period (Jan 1-31st March 2015) from USI's website and Twitter account. Tweets (n=1,465), followers (n = 6,388) and Google Analytics were analysed to investigate the type and focus of content produced and to investigate the characteristics of its audience. Interviews conducted with USI staff provide additional insights into their media practices (organisational resources and communication strategy).

The paper shows that, per month, the website averages approx. 40,000 unique visitors, and the Twitter account reaches more than 200,000 with varying levels of engagement. Mostly with people from the United Kingdom or the United States, as language continues to act as a barrier. The paper concludes with reflections on how USI could enhance engagement with its online and offline audience, and

the extent to which it has been able to facilitate international trade union activity – in light of an increasingly restrictive political economy of digital technology.

"Violence in "La Liga" throughout Twitter: actors' interactions and network analysis

Emilio Fernández Peña, Natividad Ramajo Hernández, José Manuel Pardo Gila
Centre d'Estudis Olímpics i del Esport Universitat Autònoma de Barcelona, Spain; Centre d'Estudis Olímpics i del Esport Universitat Autònoma de Barcelona, Spain; Centre d'Estudis Olímpics i del Esport Universitat Autònoma de Barcelona, Spain
emilio.fernandez(at)uab.es,
natividad.ramajo(at)uab.es, gilajose(at)gmail.com

The following paper will deal with the diffusion and nature of violent episodes in "La Liga", the first division Spanish football championship, throughout the social networking website Twitter. This presentation will analyze more than 3 million tweets from the different main actors: teams, players, supporters, specifically 6 groups of hooligans and will reconstruct the violence exchange between these diverse protagonists. At the same time, it will undertake a network analysis of the different above mentioned actors, deepening into their network relationship and reconstructing this way the ecosystem of the Spanish elite football regarding the violence.

This paper will present the first season data analysis of a 3 years research project funded by the Spanish Ministry of Economy and Competitiveness and co-funded thanks to ERDF (European Regional Development Fund CSO2015-69289-R (MINECO/FEDER)). As provisional conclusions we can point out that it might exist a clear continuity, in some cases, between the actions and words in the stadium and on Twitter. This may be a typical behavior in the case of some violent hooligan groups, who tend to not differentiate so clearly the virtual reality of Twitter and the football stadium, contrary to the more peaceful supporters. On the other hand, the first Twitter network analysis or our research shows a connection between teams, players and nonviolent supporters, whereas we observe a total isolation of the hooligan groups that are not linked to the rest of "La Liga" ecosystem actors, which may be considered a good news in the struggle against the violence in the Spanish stadiums.

Ideas, Opinions and Ideologies of the Internet and Social Media: A Case Study in China

YUQI NA
University of Westminster, United Kingdom
yuqi.na(at)my.westminster.ac.uk

This prospective research aims to find out different types of users' ideas, opinions and ideology or ideologies of the Internet and social media in China. From a critical perspective, ideology disguises contradictions in reality through the mediation of inversed appearances. Thus ideology is embedded

deep inside political economic situation of the capitalist system. These deceptive or partial understandings of reality also exist in the 'digital age', such as the 'free' access to the Internet, prosumer, playbour, etc. The main hypotheses of this presentation are based on this critical understanding of ideology and an analysis of the Internet reality from a critical political economic perspective.

This research will conduct interviews and focus groups to scrutinise people's opinions of the Internet and why. Three types of participants will be distinguished and compared based on the division of digital labour: intense users, mental/knowledge workers dealing with codes, and manual workers in ICTs. Furthermore, three main categories of issues relating to the Internet will be addressed: 1) cultural issues, such as individualism, social coercion, freedom and fun (playbour); 2) economic aspects of the Internet such as the free access, online privacy, targeted advertising; and 3) political issues such as surveillance and democratic participation. This research hopes to identify the key ideology or ideologies of the Internet and social media among different types of users in China and why.

RN18 | Session 08b EU Policies and the Media

(De)Constructing Europe in the online news media

Dimitris Trimithiotis

University of Cyprus, Cyprus

dimitris.trimithiotis(at)yahoo.fr

This contribution aims at presenting how media frame political discourse about European Union (EU). It rests upon a research related to the production of news stories about EU, by Cypriot online news media. The study proposes a twofold analysis of these media texts by articulating their content with their process of production: a content and discourse analysis of the news stories and an analysis of the production process of the stories through interviews with those directly involved.

Specifically, it gives emphasis to the different ways media (de)construct and interpret "Europe", in relation to their:

- a) ideological background (political profile and linkage with political parties);
- b) organisational structure (division of labour and vertical/horizontal internal hierarchy);
- c) ethnic origins (Greek Cypriot/Turkish Cypriot media).

This proposition also aims to contribute to the methodological and theoretical discussion on the linkage between discourse and context analysis in the field of media research. It shows that an analytical perspective that takes into consideration simultaneously both media content and its process of production has important benefits for research. The use of such approach is heuristic and helps to avoid interpretative mistakes by analysts. It stress the importance of reconnecting sociological interrogations on interactions and power relations between actors within the field of production of media discourse to

media research. This is particularly important in studying how organisational structures, symbolic power relations and cultural factors influence discourses of media about Europe and affect the ability and the mode of participation in the process of production.

Back to the local! EU Cohesion policy as a strategy to reduce democratic deficit and to contrast populisms.

Marinella Belluati

Universty of Turin, Italy

marinella.belluati(at)unito.it

The crisis of trust in European Institutions is a fact which is becoming more and more dangerous to the Union. The recent Brexit and the growth of Populist movements against Europe are signs that reinforce the needs of rethinking the European public sphere.

One possible direction is to restart from the local dimension closer to the civil society and more able to give back concreteness to EU opportunities. Not many European citizens are aware of the impact that the regional projects financed by the EU have on their lives and communities. The starting point can be the Cohesion policy on financing the ESI Funds 2014-2020. The expected results of this policy are a) to strengthen its economic, social and territorial cohesion; b) reduce disparities between the levels of development of the various regions; 3) encourage awareness about EU policy; 4) improve public debate. In order to reach these objectives, in 2016 the annual European Week of Regions and Cities (EUWRC) in Brussels, put together 5.000 policymakers, press, researchers, students and representatives of various regional projects around Europe. One of the issues raised at the event was that of communicating the impact of the Cohesion Policy to the people of Europe and the effort to improve engagement. The media space has been recognized as crucial in this effort.

Starting from this point, and convinced that this is a good direction to improve the EU image in the public debate, my contribution will concentrate on the impact data of the Cohesion policy in Italy whit particular attention to activism monitoring and communication tools.

European institutions: a new type of communication for a new era? How Facebook and Twitter have been integrated into communication and media activities. The case of the Members of the European Parliament

Sandrine Roginsky

UCL (université catholique de louvain), Belgium

sandrine.roginsky(at)uclouvain.be

While social media have been celebrated by the European institutions as tools to get closer to citizens, it is important to assess how their members, politicians and civil servants, have been using them in a context of political tumult. Drawing on a longitudinal qualitative research, started in 2009 on the use of social network sites, such as Facebook and Twitter,

by European institutions as well as political actors, this communication will focus on media practices both by Members of the European Parliament and journalists covering the EU institutions in Brussels. In doing so, it will contribute to the second stream of the Call for Papers, “communicating the new era”, in order to understand how the use of social media has been incorporated into work practices and whether this has brought some change in the relationships between politicians and journalists, and to a lesser extent between politicians and their various audiences (party members, activists, citizens, opponents, etc.). It will also question the place that social networks sites, such as Facebook and Twitter, have taken in the media ecosystem, analyzing trainings provided by the two companies to Members of the European Parliament. The theoretical approach builds on sociology of use with an interactionist and constructivist perspective to allow for a rigorous and contextual analysis of communication and media practices by politicians and journalists. To do so, the research triangulates different types of methods, i.e. participant observation, semi-directed interviews and discursive analysis of published messages.

RN18 | Session 09a Digital Labour, Value Creation and Knowledge Labour

Invisible Face of Digital Labor in Turkey: Working Conditions in Software Industry

Cagdas Ceyhan, Duygu Hatipoglu Aydin
Anadolu University, Turkey; Yalova University, Turkey
ceyhancagdas(at)gmail.com,
duygu.hatipoglu(at)gmail.com

The software sector is a growing industry and has a market share of \$ 4.2 billion in Turkey. Qualified, considerably young labor force is employed in this sector. This labor, particularly based on knowledge and information, is exposed to new forms of exploitation such as flexible working hours, telecommuting, working on temporary project basis. Unremunerated labor is the invisible and typical characteristic of this work model.

In this study, we try to understand working conditions of software sector in favor of employees. In this respect, we conducted 14 in-depth interviews with employees in software sector in Ankara and Istanbul. Main questions of the research are how employees define their working conditions, what do employees think about forming a union, in the digital labor in general where software sector employees place themselves. Employees major issues are flexible working hours, temporary projects and working on project basis. Software industry employees precisely reveal some characteristics for precarity, particularly in terms of emotional aspects.

Precarious work is a common work form in Turkey since early 2000's. Although the software sector has an educated and qualified work force in Turkey, the working conditions have precarious working qualities in software sector. This study examines precarious working conditions in the digital labor market for the

first time in Turkey.

Printed Publications As a Source of Information about the Policy

Vasilyi Kornienko, Mikhail Basimov
Kurgan State University, Russian Federation; Russian State Social University, Russian Federation
kornienko45(at)mail.ru, basimov_(at)mail.ru

In a sociological study investigated attitudes to various nationalities, social groups, some politicians, political activity and type of the personality. The strongest dependence of estimates of the importance of printed publications as a source of information about policy (X37) is observed for the independent parameter (X32) “The Adoption of Vladimir Putin”:

X32-1(X37=-3525); X32-2(X37=7664); X32-3(X37=56); X32-4(X37=250); Factor of the connection strength =1.07(0.19); Coefficient of correlation =0.20

For the 1st quarter (25% of respondents) most negatively estimating V.Putin is extremely low (-3525) the value of assessments of the value of printed publications as a source of information about politics (X37). The transition to the 2nd quarter evaluation of V.Putin accompanied by a very sharp jump of assessments X37 (with -3525 to +7664). After that the transition to the 3rd quarter noted though less, but also very sharp recession of estimates of X37 (with +7664 to +56). The 4th quarter of respondents according to the independent parameter practically does not differ from the 3rd quarter (about 0). Thus, we have the dependence of the maximum in the 2nd quarter and overall positive dynamics (with -3525 to +250), general growth, which is expressed in the insignificant coefficient of correlation (R=+0.20). The inverse dependence is also very weak (SV=0.19), i.e. the assessment of the significance of the publications will not affect the assessment of V.Putin (as well as on the other parameters of the research).

Thus, an uncertain attitude to V.Putin (the 2nd and the 3rd quarters) contributes to the sharp dynamics (first increases, then decreases) in the assessment of printed editions as a source of political information.

Labouring in Information and Communication Technologies (ICT) Sector in Istanbul, Turkey

Başak Bozkurt
Marmara University, Turkey
basakbozkurt88(at)gmail.com

In Post-Fordist era, with the development of ICT, labour as a practice has expanded and occupied all areas of life. This new form of labour called “digital labour” has become the definition of our epoch. A midnight telephone call or an urgent mail in need of immediate reply may force a worker to create a surplus value. The boundaries between work and private life are blurred. Employees are expected to be flexible, competitive and to take risks, avoid bureaucracy. Surveillance and control mechanisms have pervaded every aspect of life. The new form of power exerted on employees by employers has changed from face to face contact to an electronic

one. The electronic cage, such as cameras, electronic entrance systems, working-time calculation programs have substituted the iron cage of bureaucracy. Employees are struggling against flexibility, precarity, deskilling with different tactics and strategies such as slowdown, quitting. Yet, measures such as individual employment contracts and/or performance systems prevent workers from struggling together.

This study aims to answer the questions below: How do employees in ICT sector feel the effects of new capitalism? What are the tactics and strategies of employees to avoid exploitation and unremunerated labour? What is the place of Turkey in ICT sector? For example, is Turkey a cheap labour pool like India? In order to find answers to such questions, a qualitative research will be conducted by using in-depth interviews with employees who work with/without having employee contract and/or subcontract in different companies in Istanbul, Turkey.

Work and sensibilities. Mercantilization and processes of expropriation around digital labour

Pedro Matías Lisdero, Adrián Oscar Scribano
CONICET, Argentine Republic; CONICET, Argentine Republic
pedrolisdero(at)gmail.com,
adrianscribano(at)gmail.com

The expansion of a series of phenomena that link work and new media has resulted in (among others) the emergence of debates that cross different areas of knowledge. The notion of digital labour has revitalized discussions around critical studies of communications, but it has also been relevant to those inquiries of the metamorphosis of labor relations, or in even everyday life studies. Thus, one of the outstanding perspectives has problematized the forms of work necessary for the production, circulation and use of digital media (Fuchs & Sandoval, 2015). Following the questions that come from here, this paper explore the contributions of the sociology of the body and the emotions to understand the practices associated with digital labour. To do this: first, it explores a series of theoretical debates around the definition of these labour, in order to underline the relevance of re defining the area of exploitation linked to these practices. Second, it develops some arguments from a sociology of bodies and emotions perspective, which allows to understand in what sense the technological mediation linked to the expansion of ICTs constitutes a re-configuration of “the politics of the senses” (look, see, observe, touch, etc.). Finally, it analyzes some cases of workers from the ICTs industries (from testimonies and records of virtual ethnography) that allow us to connect their daily experience with certain mechanisms of expropriation and mercantilization of the vitality of bodies.

RN18 | Session 09b Social Media, Connection or Disconnection?

The power to switch off: media refusal and disconnection in the networked society

Magdalena Kania-Lundholm

Uppsala University, Sweden
magdalena.kania(at)soc.uu.se

This paper explores the notion of disconnection in the context where networked technologies' non-use and/or refusal is mostly perceived as deficit, lack, exclusion and problem to fix. These issues are reflected across the variety of public discourses including the debate on the so-called “digital divide”, ICTs policies attempting to tackle the divide as well as in the growing body of research focusing on the beneficiary aspects of networked technologies, described by critical scholars as the “digital sublime” or “digital discourse”. The paper aims to contribute to the relatively small but growing body of research that makes an attempt to understand disconnection not as deficit but rather as an inherent element of the reality in the digital age.

I argue that if we problematize this techno-deterministic, optimistic view on networked technologies where digitization of society equals efficiency, development and progress, we might consider disconnection not necessarily as deficiency but rather an alternative use, resistance or contribution. Hence, the paper argues that disconnecting with networked technologies is more than elitist stance (voluntary non-usage). Instead of inclusion / exclusion we should rather talk of different levels of (dis)engagement, new emerging subjectivities and identities. In other words, non-users and ICT refusers are not outside but part of the information society. If we understand disconnection in this way, then refusal of technology does not only depend on individual motivations and structural constraints but also the meanings given to networked technologies and connectivity as such.

Smartphones, Individual And Group Use: Introduction To a ‘Smart’ Era.

Nikolaos Sfakianos
Panteion University of Social and Political Sciences,
Greece
niksfakia(at)hotmail.com

The history of mobile technology dates back to 1983, when the first mobile phone was invented. Smartphones are the evolution of the first mobile phones and comprise a technologically advanced gadget. When it comes to everyday life, it is identified that people spend more and more time on these devices. This observation lead to questioning whether this use has social consequences and if it changes the way social subjects interact. This paper focuses both on individual and group use of smartphones, trying to identify what makes smartphones so attractive to use, how does this device affect social relations and if it can replace our human friend. To answer these questions a preliminary research was conducted, results of which are presented in this essay, and use of bibliographic information was made. In addition, the social and communicative context of modern society is defined and a description of how things works at the time of information age is given. Coming to an end, we

will see that connectivity differs from communication, that information it's not the same with knowledge. But the main question still remains: can smartphones get us closer to a 'smart' era?

When information wanted to be free: Information bifurcation and the origins of Web 2.0

Eran Fisher

The Open University of Israel, Israel
eranfisher(at)gmail.com

This article follows the social life of the aphorism 'information wants to be free' – an epitome of digital culture – in order to trace a decisive transformation in the ontology of information in the digital economy. The aphorism emerged in 1984 as a way to highlight the contradictory disposition of information to be free and commodified, a contradiction that posed a threat to a well functioning digital capitalism on the Web. By 2005, this contradiction was resolved through a socio-technical constellation – Web 2.0 – which not only allowed, but thrived on the co-existence of free and commodified information. Web 2.0, with its applications and culture of participation and co-creation, thrives on the free flow of one type of information, which results in the production of another type of information that can be commodified. Rather than viewing Web 2.0 as a technological innovation that allows the capturing and commodification of social communication, this article traces the discursive process by which information, as a singular entity, caught within a contradiction, is bifurcated into two types of information, with one hailed as free and the other commodified by new media companies. This discursive process, unfolding throughout two decades, between 1984 and 2005, is seen as the discursive condition of possibility for the emergence of Web 2.0 capitalism.

Everything Sticks: the archive as a theoretical concept for the analysis of contemporary digital cultures and politics

Paolo d'Urbano

Doha Institute for Graduate Studies, Qatar
pdu0612(at)gmail.com

The paper employs the archive as a theoretical concept to discuss how power works in/through digital media, to overcome the immaterial/material dichotomy and to imagine what a politics of digital commons would look like. Building on the reflections of Virno, Lazzarato and Terranova, the archive identifies one of the main locus of power in contemporary capitalism. Once web 2.0 media companies enclosed the digital commons, the end result takes the shape of an archive or, in its most contemporary incarnation, a database.

Following the works of Foucault and Derrida, the archive has been employed in different disciplinary fields. Postcolonial scholars used it to describe a specific, and quite effective, dispositif of colonial domination (Richards, Stoler). Some media scholars identified it as a paradigmatic form of postmodern

media (Caygill, Featherstone), while others used it to highlight the increased capacity of mass surveillance (Poster).

The archive can thus be used to address questions related to power and the political economy of digital commons such as ownership, access, control and consignment. Better than the panopticon, it indicates the way in which Internet users, their memory and knowledge, are turned into commodities. As a theoretical concept, it clearly shows us the thresholds that are constantly created, reconfigured, trespassed and violated by movements, governments and media outlets. More importantly, the archive invites us to look at digital media from a different perspective, one that is focused more on their capacity to record, store and elaborate data, rather than on their supposed capacity to provides us with real-time, transparent and 'rational' communication. For, despite all the emphasis on fluidity and openness, everything sticks in contemporary capitalism.

RN18 | Session 10a Media Coverage of Migration and Solidarity Networks

Community media in refugee settlements – “utilitarian content as vehicle for social advancement”

Madalina Paxaman

Independent Researcher
mada.paxi(at)gmail.com

In the recent years, the expansion of various forms of collaborative media has shifted the scholars' attention from the mainstream to participatory media (Jankowski 2003).

The vast majority of studies regarding community media belong to the Western countries where collaborative media emerged supported by the new communication technologies (Nassanga 2009, Fuller 2011). However, scholars admit that there is still a gap in this field of study in both theory building (Jankowski 2003, Howley 2013) and in the investigated geographical areas. Sub-Saharan Africa is a region that deserves higher attention from the researchers. Within this space, community media in refugee camps represents a particular area of interest.

Dadaab Refugee Camps represent the largest refugee camp in the world, now hosting approximately 350 000 people (UNHCR 2014). Implemented as a temporary solution, the camps remained in place for 25 years.

Apart from having their basic needs fulfilled, displaced people have also other human needs such as belonging, social recognition, self-realization. The emergence of community media in refugee camps is regarded as a step forward in addressing these needs.

However, because of administrative challenges and security restrictions, the academic community has seldom investigated the participatory media occurring in these specific settings.

This paper aims at addressing this gap in knowledge by examining how community media responds to the information and communication needs of the refugees

living in Dadaab Camps. Moreover, this paper discusses the functions played by community media inside Dadaab Refugee camps and their role in the social advancement. Using semi-structured interviews, textual data, and direct non-participatory observation, this investigation analyzes the most relevant community media in Dadaab Camps: The Refugee Magazine, Gargaar Radio, and Dadaab FM.

Do alternative media in Greece build 'politics of connection' among diverse democratic struggles?

Pantelis Vatikiotis, Dimitra Milioni
Kadir Has University, Turkey; Cyprus University of Technology, Cyprus
pantelis.vatikiotis(at)khas.edu.tr,
dimi.milioni(at)gmail.com

The rhizome metaphor has been used to describe alternative media and capture their characteristic diversity and fluidity, as well as the elusiveness and contingency of alternative media identities. The rhizome concept is about a network, and the non-linear, nomadic ways in which the various points in the network connect to each other. It therefore implies the concept of the counterpublic sphere or sphericules. Rhizomatic media are necessarily diverse and do not operate within fixed set of rules; rather, rules are constantly being remade and new linkages are being formed (or existing linkages are being broken). However, what is also salient is the need for this diversity to link democratic struggles allowing the common articulation of different struggles and build a "politics of connection", a nodal point that articulates different elements of radical politics into a coherent project able of realizing structural changes. Even within postmodernist accounts, thinkers call for joint action of alternative media with radical actors, internationalism and collective action.

Against this background, the present study maps the subjective, structural and informational relations and connections within the Greek alternative mediascape, drawing on interviews with media producers in 13 media alternative projects in Greece and a social network analysis (SNA) of their informational linking patterns. The analysis reveals various linkages and absences of linkages (sometimes where least expected), the presence of both cooperation/solidarity and isolationism/fragmentation, and the key role of how the various projects situate themselves in regard to (their own definitions of) 'ideology'. Lastly, we discuss how these findings feed back into the concept of the rhizome in the context of alternative media.

Making or Unmaking Europe through the Readmission Agreement: Media Coverage of Immigration in Turkey's Case

Tugba Hasdemir, Selcuk Cetin
Gazi University, Turkey; Gazi University, Turkey
tubahasdemir(at)gmail.com,
selcukcetin06(at)hotmail.com

Immigration is one of the issues which concern to important amount of people and it receives extensive

coverage and commentary in the media globally. Recently, the Readmission Agreement between the European Union and Turkey and in parallel with it, the policy of visa liberation to the citizens of Turkey in the territory of European Union, are highlighted topics discussed in the political arena and received broad coverage in the media of Turkey and of European countries.

The readmission agreement between Turkey and the EU, dated back August 2014, is an important legal documents to cope with the issue. This agreement and the immigration policy of Turkey and the position of European countries were highly discussed when the law which approved the decision of the Immigration Committee was promulgated on May 2016.

This presentation aims at exploring these recent discussions and analysing how the readmission agreement, the relation between Turkey and the EU, and European identity received coverage in the media in Turkey. The research data will be collected from the news published between April-December 2016 in four different Turkish newspaper websites: *Hürriyet*, *Sabah*, *Yeni Şafak*, *Cumhuriyet* since these newspapers conduct different editorial rules and policies, and have different political attitudes towards the issue. The findings of qualitative content analysis of the news stories will be revealed and the presentation will be concluded with some recommendations for future studies.

Online practices of migrant solidarity networks across Greece and Turkey

Eylem Yanardagoglu, Pantelis Vatikiotis
Kadir Has University, Turkey; Kadir Has University, Turkey
eyanardagoglu(at)gmail.com,
pantelis.vatikiotis(at)khas.edu.tr

The contribution of existing and emerging activist groups and solidarity networks to the refugee/migrant crisis has put the use of online tools and social media at heart of debates regarding further mobilization and formation of action frames.

Different approaches point out, more or less, the determining role of the social technologies in the formation and organization of activist processes and practices on the basis of 'networked sharing activities'. The present study critically reflects on the development of networking and sharing patterns across the formation of solidarity groups for the refugees and immigrants and the organization of relevant actions in Turkey and Greece.

In theoretical level, the study draws on the theoretical framework of 'connective' action developed by Lance Bennett and Alexandra Segerberg (2012) and evaluates the shortcomings and challenges of communicating messages/events and organizing solidarity actions through local, national and transnational networks.

In empirical level, it probes into eight migrant solidarity groups in Turkey and Greece (four in each case) which have significant online presence in order to

explore the ways in which they use social media for mobilizing and organizing actions. The data includes in-depth interviews conducted in Athens, Thessaloniki, Istanbul and Izmir, as well as participant observation of the No Border Camp 2016 in Thessaloniki.

Solidarities may be fragmented between societies across Europe while skepticism towards new media and social technologies is enduring. However, the economic and political crisis seem to facilitate the constitution of new solidarities as activist groups increasingly appear to be more open to utilize digital media tools to reach out other networks.

RN18 | Session 10b Theatricalization in Contemporary TV Fiction

Crossing borders or building fences through television films?

Adriana Daniela tefănel

University of Bucharest, Romania, Faculty of Journalism and Communication Studies, Centrul SPARTA
adriana.stefanel(at)fjcs.ro

The hidden messages in television series should not be overlooked, nor their power to reinforce or challenge stereotypes. To use Gramsci's words (1992), one might state that the hegemonic power works towards television –and television series, as well- in order to impose social values and norms to individuals and social classes in a non-violent, but efficient way.

The aim of this paper is to explore, in a quantitative manner, the level to which Crossing lines TV series could reinforce the stereotypical view on ethnic/national groups, on women and on the poor. Our research hypothesis is that behind the overlay of intra-European cooperation against crimes it lies a stereotypical view of the Other.

We will argue that even under the European flag of unity in diversity, the dichotomy Good-Evil is sublimated by Centre-Periphery one. From this perspective, the Good ones are circumscribed to the Western Europe, while the Evil ones originating from the East, yet committing the crimes in the West. Most of the crimes in the series are against „the typical (western) middle European” and might easily extrapolate to „a way of life”; each of these crimes becoming an archetypal attack to a way of life.

This research is conducted within the project TNSPE (Télévisions et nations en « semi-périphérie » européenne: comment constituer une identité nationale par la télévision (1958-1980). Etudes de cas : la Roumanie, la Bulgarie et la Belgique), financed by IFA-Institutul de Fizica Atomica and AUF-Agence Universitaire de la Francophonie (PN 3 / Sub-3.1 Bilateral / Multilateral/ Module AUF-RO, 2016-2017).

Immigrant Woman: That Despicable Whore – images of women immigrants in two Greek T.V. serials of the 2000's.

Regina Zervou

Institute for Education Policy, Greece
rzervou(at)gmail.com

During the 90's the structure and economy of Greek society changes due to the massive influx of immigrants coming from Middle East, Eastern Europe and Africa. The Greeks, being themselves an immigrant nation only a few decades before, seem perplexed in coping with the new situation. Fear, mistrust and stereotypes prevail. After having entered in the news broadcast on a daily basis, the immigrant narratives found their way to the family TV serials. But not just any immigrants: immigrant women, being the weakest link, are the ones mostly exposed to media maltreatment.

This study concerns two similar cases of immigrant woman's representation in two very popular serials of greek T.V. in the beginning of the 21st century, right before the outburst of the economic crisis. 'Ten minutes of sermon' and '50 – 50', displayed during 2000-2003 and 2005 – 2007 respectively, were comic serials dealing with the problems of contemporary middle class families, such as divorce, adultery, adolescence, parent – child relations. The protagonists were 'next door' men and women that the audience could easily identify with. In both of them an immigrant woman with the exact characteristics makes her appearance as the 'temptation' of the married householder. These dominant images of female immigrants portray the way immigration and gender have been elaborated by the mass media, especially the mass cultural productions. The analysis considers the intersection between gender and race in the context of the problematic status of female immigrants through qualitative content analysis of the relevant episodes in those two TV serials.

The Theatricalization of patriarchy's power through Turkish television series: the legitimization of rape

Dimitra Laurence Larochelle

University Sorbonne Nouvelle - Paris 3, France
larochelle.laurence(at)gmail.com

Turkish cultural industry is a great producer of television series. These series (based on the model of American soap operas and Spanish speaking telenovelas) are successfully exported overseas. Their contents are characterized by dominant myths and archetypal values and roles, particularly concerning genders. Within this context, patriarchy values and power are crystallized and reproduced. A very interesting example of this is the Turkish serial entitled Fatmagul'un sucu ne? (translation: What is Fatmagul's crime?) which has as main theme the rape of a young girl in Turkey who is forced to get marry one of her four rapists. We propose to present our research' results concerning the analysis of content as well as the decoding the public in Greece made for this serial in particular. How this serial becomes a patriarchy's tool in order to legitimate the existing power equilibrium between two genders in general and rape in particular? How women in Greece interpret this serial's representations? How they define what a violence against women is and what isn't? These are

the questions we would like to answer through our communication.

Zombifying: violence, death and destruction of bodies in *The Walking Dead*

Jorge Henrique Fugimoto
Federal University of São Paulo, Brazil
jorgefugimoto(at)gmail.com

Television series acquired more attention from public and critics over the last two decades. They earned technical sophistication and, with the advent of cable television and Internet, became present in daily life of people across the globe, universalizing subjects and thus obtaining significant indices of audience. *The Walking Dead* is a series first displayed on 2010 and produced in USA. In short, the show presents the sheriff Rick Grimes (Andrew Lincoln), that after awakening from coma in an empty hospital of Atlanta, is forced to fight for his survival in a "new" world, inhabited by "living dead". Many variations on the theme appeared with success in movies, leading some critics to relate the plots with certain events experienced by society. Taking this background into account and in order to examine more thoroughly the relation between audiovisual products and Sociology, this paper aims to internally analyze the series, trying to establish analysis charts and highlighting elements such as the formation of character, narrative, color, sound, etc. Starting from the hypothesis that the cultural product discussed in this work could point to discrete manifestations of certain desires or fears from society in which it was created and distributed and taking into account those audiovisual elements, the objective is analyze the possible relations between violence, death and the destruction of body shown on the screen with some contemporary events, like the 9/11 attacks, the "War on Terror" and the global circulation of images and videos exhibiting beheadings, dismemberments, mutilated bodies and torture.

RN18 | Session 11a Twitter, the New Political Communication Medium?

Twitter and the TV : two spaces interrelated for public debate

Jean-Marc Francony, Françoise Papa
Université Grenoble Alpes, France; Université Grenoble Alpes, France
jean-marc.francony(at)umrpacte.fr,
francoise.papa(at)univ-grenoble-alpes.fr

Are the classical concepts of political science and of information and communication sciences (such as public opinion, influence, opinion leaders, etc.) operative for the analysis of the activity of publication of the population of tweets authors? Given the specificity of the communication on Twitter, how, beyond conversations, to identify opinions and analyse the processes of social construction of opinion on this network?

This presentation, which deals with the study of

editorial activity on Twitter, is based on a corpus of electoral data consisting in tweets collected during the European election campaign in 2014. Centred on a key event of the campaign, a televised debate, our study has brought to light the need for a double contextualization of the utterance:

- Internal contextualization, consisting in the determination of the partisan affiliation and the political affinities of the twittonauts. The automatic identification of political communities was undertaken starting from the study of categories of enunciation, subjected to a lexical analysis. The aim was to identify, characterize and register their authors in a network of relations to define, where appropriate, their communication strategy.

- External contextualization by the analysis of the speeches of the participants in the televised debate, taking place simultaneously. The contextual and synchronous analysis of the flow of messages, carried out on the basis of a temporalized transcription of key sequences of the televised debate, made possible to compare the two spaces of debate.

These studies, although partial, contribute to progress in understanding the dynamics of political expression in social networks.

Twitter and Populism: The case of four Greek political leaders

Iosif Chalavazis
National and Kapodistrian University of Athens, Greece
iosifhalavazis(at)gmail.com

In this thesis I analyze how populism, the thin-centered ideology, transforms into the world of Twitter. Is still the same populism as we knew from the past, or the new media technologies lead in to a new dogma? By using a framing model, I measure the populist rhetoric of four party leaders (Alexis Tsipras of SYRIZA, Kyriakos Mitsotakis of ND, Fofi Genimata of PASOK and Panos Kammenos of ANEL) and after that, by combining quantitative and qualitative methodologies I attempt to describe the new form of populism and its characteristics. Also in this paper I examine the theories around Twitter as a tool of Political Communication and their methodological research problems.

Social Media. The political expression aspect

Marina Rigou
Panteion University of Athens, Greece
rigoumarina(at)yahoo.gr

Social media, a proper subset of new media, has changed the way we communicate in a revolutionary way. It does not only constitute a new multilevel and multifaceted communication model, but a new culture as well: The culture of continual connectivity. Based on user participation and user generated content, social media gave people the power to express themselves, to interact and to networking, and also to mobilize others for causes. It was a promise for revitalizing the public sphere and enhancing the

political procedure and political communication. But this promise was not fulfilled. This paper examines the causes of this “frustration” and analyses the conditions of this “new political communication” using the 2008 USA elections campaign (“This campaign is about you”) which established social media as a useful personalized tool for raising money and supporters.

Social media gave the power to people to raise their voice and intervene whenever they think is necessary. Politicians also bypass the traditional media gatekeeping. Christine Lagarde felt the pressure of the people when in an interview with Guardian on May 2012, said she had more sympathy for the little kids in Niger than the stricken by the economy crisis people in Athens. Angry Greeks waged Facebook war against IMF head and she was forced to post a statement saying she was “very sympathetic to the Greek people”. This paper examines also the comments on her post and the separate Facebook page that had sprung up titled “Greeks are against Lagarde” and answers to the questions that this kind of expression arise: What kind of public sphere social media constitute and which are the consequences on politics and society.

The role of news media in high trust and low trust societies

Eiri Elvestad, Angela Phillips
University college of Southeast Norway, Norway;
Goldsmiths, University of London, UK
Eiri.Elvestad(at)usn.no, A.Phillips(at)gold.ac.uk

The increasing spread of ‘fake news’ highlights the need for more knowledge about how news audiences trust and evaluate different news sources. The field of news audience research is dominated by studies from the US, where citizens have lower trust in institutions, each other and news media. In this study, we show how living in quite different societies when it comes to trust, has implications not only for news exposure, but also for the role of news in these societies. We use survey data (N=583) and interviews with 25 students from Norway and the UK. We find that students in both samples have higher trust in their traditional news media than in social media, but there are some differences between the two samples. The Norwegian students have a much higher trust in traditional media and in institutions, while the UK students have a little higher trust in social media than the Norwegian students have. Further, we found some differences between the high trust-Norwegians and the low-trust-British students’ relation to news media, political interest and civic engagement. While the UK sample is skeptical to institutions and news from traditional news sources, but more politically interested and politically engaged and are closer to the ‘actualizing citizens’ model (Bennett 2008), while the young Norwegians are more in line with the classic ‘dutiful citizen’ (Putnam 2000) as they trust institutions and follow their traditional news media closely. This paper concludes with a discussion on ‘fake news’ exposure in a high-trust versus a low-trust society.

RN18 | Session 11b Digital Activism and

(Alternative) Media Connected Crowds and the Free Appropriation of Feminism

Guiomar Rovira Sancho
Universidad Autonoma Metropolitana, Mexico
ondina_peraire(at)yahoo.com

Connected crowds have two characteristics: 1. The intensive use of digital networks which enable more reticular and distributed spaces of participation. 2. The break-up of the boundaries between the public and the private spheres, by fostering the presence of performative spaces in the streets, where “the personal is the political.” The cycle of connected crowds is “feminizing”, it adopts a free-appropriation feminism and puts it into practice. Challenged by this new scenario, the goal of this paper is to argue how connected crowds appropriate issues and methods that can be considered contributions of feminism. Therefore, I will explore to what extent a series of features of such crowds can be considered feminists, and will observe in which degree they are a cross result of: 1. An important implication of women in collective action. 2. An imaginary of a diffuse feminism in collective action. 3. The more horizontal and connective technology tools provided by Internet, which promote distributed forms of interaction.

Connected crowds as a new type of contentious politics took over the streets with the Arab Spring in 2011, the Spanish 15M, Occupy in the US, #YoSoy132 in Mexico, the defense of Gezi Park in Istanbul, the #PasseLivre movement in Brazil, the #UmbrellaRevolution in 2014 in Hong Kong, #NuitDebout in Paris in 2016 or the WomenMarch in Washington in 2017 (among others).

How have protests in the streets and camp-outs of this cycle been related to technopolitical uses of digital networks and what place has been given to the practices of reproduction of life and care? What are the political imaginaries and the semantic networks built within the foreshadowing of the desired world ?

Celebrity activism during the Greek refugee crisis

Sofia Nika
National and Kapodistrian University of Athens,
Greece
s.nika(at)outlook.com

The ongoing Greek refugee crisis has attracted a plethora of celebrities who wanted to witness the drama of thousands of war-torn people striving to reach the shores of the North Aegean islands. Global and national celebrities have offered their solidarity to the refugees’ plight, and praised the local communities for responding to the situation with responsibility and generosity. In their effort to mobilise public support and raise awareness, they utilised their personal social media, publicised the accounts of their visits, participated in media campaigns and fundraising events. Whereas these actions were received to a great extent with fervour, some were subjected to a hail of criticism and sparked controversy (e.g. celebrities wearing emergency jackets took selfies at

the Cinema for Peace gala, the cover of the Greek magazine "Down Town" which featured celebrities posing as refugees). Of course, criticism levelled at celebrity activism is not uncommon. Celebrities' motives behind their involvement in humanitarian causes and the sincerity of their philanthropy are often questioned. Nonetheless, it's still of particular interest why Greek celebrities' actions of solidarity during the refugee crisis were largely decried. This paper, through the discourse analysis of media articles covering Greek celebrities' humanitarian actions for the refugees and relevant tweets in the Greek Twittersphere, will examine why both the Greek media and public were highly critical of Greek celebrity activism. It will be argued that the disapproval of Greek celebrity activism interrelates with the idiosyncratic structure of the Greek celebrity system, as well with the recent socio-economic conditions.

Sleeping with the enemy: Mixed marriages in the Israeli media.

Sylvie Fogiel Bijaoui

College of Management Academic Studies, Israel,

sylvieb(at)colman.ac.il

Despite the fact that research on mixedness has been recently growing, media studies seem to be less concerned with this field of research (except for film studies). In this paper, however I analyze the way the mainstream media discourse in Israel constructs mixed marriages.

The case study is the media coverage, during the 2014 Israel-Gaza armed conflict, of the marriage, on August 17, between a Jewish woman, converted to Islam, to a Muslim-Arab Israeli. Due to new media activism and repeated demonstrations against and for the wedding, the event was on the agenda for several weeks.

Based on a content and semiotic analysis of 72 items, mainly published in August 2014, in three leading newspapers and on two leading internet sites., three discourses are identified:

- Haaretz (liberal) reflects a human rights discourse;
- Ynet and Walla News sites (liberal), mostly reflect a "Romeo and Julia" individualist approach;
- Israel Hayom (Nationalist, a free daily newspaper, with a wide audience directly connected to the Prime Minister Nethanyahu) and Makor Rishon (Religious-Nationalist) reflect a "collectivist-nationalist approach" which sometimes is also racist, sexist and classist.

I argue that these discourses actually point to a "latent integration" of the Palestinians, citizens of Israel in Israeli society - echoing the supporters and the opponents of such a process.

My conclusion refers to the urgent need to study in Israel as in the "Global Village" the media construction of mixedness with a special focus on the growing impact of the new media on the traditional mass media.

RN19 - Sociology of Professions

RN19 | Session 01a Academics between Professionalism and the Market

Europeanisation, knowledge society and the emergence of a 'new' professional group

Teresa Carvalho, Sara Diogo
University of Aveiro and CIPES, Portugal; University of Aveiro and CIPES, Portugal
teresa.carvalho(at)ua.pt, sara.diogo(at)ua.pt

The so-called knowledge society and knowledge economy can be interpreted as a meta-narrative or as a governance tool to accomplish European integration. A chronological analysis of the emergence of knowledge society/economy as a governance tool takes us to the Lisbon Council and to the subsequent creation, at the level of the system of scientific research, of the European Research Area (ERA).

This paper discusses how the assumption of the knowledge society as an ideological integration in the EU and in the ERA resulted in pivotal points to create, in a top-down perspective, researchers as a professional group. Actually, in the framework of the European Charter for Researchers produced in the context of the construction of the ERA, a potential shortage of researchers was identified, along with the lack of appealing and sustainable careers for researchers and appreciation for their work. This initiative encouraged the European states to promote political initiatives in order to foster innovation and research assumed as the best solution to improve economic competitiveness. As a result, policies have also encouraged an increase of PhD graduates.

Based on the analysis of the Portuguese case (based on content analysis of political documents and of national statistics), this paper shows how the transformation of research systems induced an increase in the number of researchers, resulting in the establishment of a professional group that challenges the theoretical framework of the sociology of professions. This group main distinctive feature is the acquisition of high qualifications but, in opposition to what has been defended until now, scientific knowledge does not seem to improve access to privileges neither to collective mobility.

The academy as profession: Processes of social inclusion and exclusion

Brenda Beagan
Dalhousie University, Canada
brenda.beagan(at)dal.ca

In the context of a neoliberal knowledge economy, management and marketing principles have proliferated in the academy, with performance indicators, productivity, and accountability as the professional measures of value. At the same time, Canadian universities have seen rising numbers of academics from historically under-represented groups – those marginalized due to race, ethnicity, disability, working class background, gender identity or sexual orientation. While legislation may ease the entry of such groups into the profession, it does little to ensure cultural change within to provide genuine inclusion. This paper examines processes of inclusion and exclusion within the academic profession, based on qualitative interviews with 30 such academics across Canada. Semi-structured interviews were conducted by phone or in person, transcribed verbatim, and iteratively coded through regular team discussions using software AtlasTi.

For some groups, a major concern was normalization and self-surveillance, navigating disclosures of stigmatizing social identities, and constant concern with proving themselves 'good enough' academics. Members of some groups entered the social field of the profession lacking valued social and cultural capitals, as well as habitus, which left them fighting a pervasive sense of dis-ease with institutionally encoded rules. For those who were most visibly 'Other' overt hostility was surprisingly common, in addition to everyday 'microaggressions' that reinforce marginality. Many participants had taken on extra, often invisible, and unaccounted work to promote equity for others, in their research and/or service work. Examining experiences across groups, within the relatively elite context of the professions, highlights similarities and differences in contemporary mechanisms of social exclusion.

The role tensions and new challenges for Russian academic professional in the conditions of neoliberal reforms in higher education system

Roman Abramov
National research university Higher School of Economics, Russian Federation
socioportal(at)yandex.ru

It raises the question of the role status and professional positions of academic professionals in today's Russia. My research project was aimed at studying of transformations which the academic profession in modern Russia experience and how members of academic community react to these transformations. The empirical survey was devoted to the examination of the working time budgets of academic professionals in modern Russian universities and scientific organizations in the context of current educational and academic reforms. The empirical evidences for the fragmentation of academic profession budgets in modern Russia based on the changes in working time were showed. Two approaches to the classification of academic staff were used. The use of cluster analysis procedure in

application to another group of academic staff helped to distinguish five categories of academic professionals: (1) teachers-researchers, (2) teachers, (3) researchers, (4) universal soldiers and (5) experts. These groups were classified by comparing professional goals, evaluations of working conditions, the university's strategic goals, and attitudes toward publication policy. Different types of academic professionals showed different rates of satisfaction with their working time budgets: those who do a lot of teaching and administrative work tend to be less satisfied that can be explained through the changes in the system of faculty certification in Russia, and response to these changes the part of academic profession presents. Any further conceptualization of a teacher's life must account for the high level of differentiation in their professional activities. That said, important grounds for this differentiation are various patterns for using work time.

Academic Mobility within the EU - a Voluntary or a Necessary Move: the Case of German Academics in the UK

Elena Samarsky

University of Oxford, United Kingdom

elena.samarsky(at)jesus.ox.ac.uk

According to German national records, emigration is much more attractive for better-educated, white-collar citizens, with academics displaying the highest migration rate. The case study of academic migration from Germany is intriguing due to the country's financial power, relatively high quality of life, working conditions and high wage rates. The paper uses in-depth interviews with German academics (various career stages) employed across selected universities in the UK. Interviews provide a detailed description of motivations for relocation to the UK, attributes of the "dream job", as well as general information on particularities of an academic career and institutions in both countries. In the course of the project, it became evident that although securing financial stability was a non-negotiable factor in migration (e.g., work contract signed before relocation) non-pecuniary motivations played a significant role as well. Migration narratives of this group, whose human capital is transferable, and whose expertise is positively evaluated in the UK, are mainly characterised by the search for personal development and career advancement rather than a direct increase in their income. Such records are also consistent in showing that in the case of academics, scientific freedom and independence are the main attributes of a perfect job and are strong motivators. The atmosphere at the potential workplace as well as characteristics of the city also played a role in accepting the job. Moreover, such migration is often depicted as an opportunistic action, mainly described as a voluntary and rather imposed decision. However, findings allow suggesting that such opportunities are rather an outcome embedded in the peculiarities of academia in Germany and UK and their historical and structural developments.

Teachers ahead, organisation of work backlogs? - on conditions for workplace learning & a discrepancy between profession and organisation

Karolina Parding, Anna Berg-Jansson, Susan McGrath-Champ

Lulea University of Technology, Sweden; Lulea

University of Technology, Sweden; Lulea University of Technology, Sweden

karolina.parding(at)ltu.se, anna.jansson(at)ltu.se,

susan.mcgrath-champ(at)sydney.edu.au

The aim of this paper is to examine and discuss conditions for competence development among teachers, in relation to choice and decentralisation reforms. The article is based on analyses of some 30 interviews with Swedish teachers, focusing on their experiences of their working conditions.

The findings indicate a discrepancy between how the interviewees describe sought after and current conditions for competence development. It seems to a large extent, the (employing) organisation has the priority of interpretation both in regards to what skills should be developed and how work is formally organised. Moreover, conditions seem to vary extensively between, and even within schools. In other words, the contribution lies in brand new empirical findings, and the fact that these findings mirror the findings from a study carried out some ten years ago. We show how schools, as workplaces, still seem to have some distance to go in terms of organisation of work, as it relates to conditions for competence development in the form of workplace learning.

Our findings may have currency for other professional groups with similar governance-contexts, and teachers in other similar governance-contexts.

A practical implication is that the findings indicate a need for further developing true workplace learning strategies in schools, founded in an understanding of schools as workplaces; further, strategies that should be seen as a core HRM issue as these have the capacity to enhance the work environment and thus increase the attractiveness of the profession.

RN19 | Session 02a Digitalization and New Technologies

The emergence of data science: A micro-level explanation of professional status formation

Philipp Brandt

University of Mannheim, Germany

phbrandt(at)mail.uni-mannheim.de

This paper explains the formation of data science, the community of nerds, experts, hackers and engineers at the center of the technological transformation around large-scale data processing. It uncovers the underlying social dynamics through extensive field observations that span three years of data science's infancy in New York City. The first study observing occupational formation directly, it contributes to a micro-level understanding of professional emergence that complements Abbott's seminal argument of boundary conflicts. It (i) retraces how this area of

expert work emerges in the eyes of those who define its foundation, purpose, and relevance, and (ii) offers theoretical innovations for understanding their efforts systematically. The social mechanism explaining data science's salience unfolds through local action, wherein data nerds retain larger significance and status from arcane solutions to concrete problems. This account scrutinizes how their fleeting connections suffice to leverage established technological, academic and economic resources in order to define a distinct identity. Amid paying keen attention to concrete relationships with clients, scientists and peers, data nerds are pragmatists. They articulate larger problems in terms of intermediary goals, considering available data and quantitative techniques, and rigorous evaluation of their utility. This focus on concrete observations lets nerds collectively sidestep deeper frameworks that typically dominate quantitative and technical expertise. The current lack of a conceptual perspective capturing these micro-level dynamics has limited the literature's understanding of modern technological changes and undermined its ability to help devise work arrangements that reconcile new opportunities with public and private perils they entail.

Globalization in IT profession: new prospects or pains of professionalization?

Irina Antoshchuk

European University at Saint-Petersburg, Russian Federation

irinantoschyuk(at)gmail.com

Information technology (IT) is characterized as an immature or failed profession as it has been largely unsuccessful in its efforts to professionalize in different national contexts. Still, IT industry has been rapidly developing as well as becoming increasingly globalized for the last few decades. Multinational corporations with hundred thousand employees across the world, spread of offshoring and global software work, high level of spatial mobility of IT specialists signify profound changes in IT professional practices. But while substantial attention is paid to globalization in IT industry, little is known about globalization processes in IT profession. Does it represent a new phase in IT professionalization? Is there an IT transnational professional project? Does it strengthen IT position and its control over the market? The paper addresses these questions analyzing International IT Professional Practice programme (IP3) and European Framework for IT Profession as prominent initiatives to advance IT professionalism on an international and supranational level. Based on works of Larson (1979), Fourcade (2006), Faulconbridge and Muzio (2011), the paper argues that both initiatives are hardly capable of solving organizational and ideological tasks of professionalization. Efforts to establish meta-framework for qualification and ethical standards remain limited as both IP3 and EUCIP strive to embrace national specificities and incorporate intraprofessional diversity. Therefore they rather

contribute to the creation of vision of IT professionalism, uniting different stakeholders and stimulating discussion in the professional community, than help IT attain full professional status.

Digital infrastructures configuring social work

Elizabeth Martinell Barfoed, Teres Hjärpe
Lund University, Sweden; Lund University, Sweden
elizabeth.martinell_barfoed(at)soch.lu.se,
teres.hjarpe(at)soch.lu.se

In Sweden, as in other European countries, digitizing social services is on the agenda. Digitalization is embraced by national authorities with buzz words like "quality", "control" and "efficiency", as a means of offering better services for the user. In Sweden, this aim can largely be regarded as a top-down endeavor. Digitalization and standardization are two sides of the same coin, with the former being a prerequisite for the latter. On the one hand, standardization is regarded as means to professionalize social work, on the other hand social workers are turned into accountants, reporting "hard facts", i.e. figures and statistics to the national authorities. Comprehensive manuals and guidelines play a vital role as digital infrastructures; making the social workers "do the same" and report "facts" in a systematic way. The manuals build upon complex classification systems, carefully crafted and produced by international research networks. Once translated (and sometimes mildly changed according to contextual considerations) the Swedish social workers are offered short in-service training by the national authorities in how to use the manuals. The starting-point in this paper is a rhetorical analysis of the language used in these manuals. The focus of analysis is how the social worker and the client are constructed, and how social work as a professional practice is presented.

Social Work images in Russian mass media and educational literature: cultural resource of professional status

Elena Iarskaia-Smirnova, Valentina Yarskaya,
Rostislav Kononenko

National Research University Higher School of Econ,
Russian Federation; Saratov State Technical
University, Saratov, Russia; National Research
University Higher School of Econ, Russian Federation
elena.iarskaia(at)gmail.com, jarskaja(at)mail.ru,
kononenko-rv(at)mail.ru

In this paper the public representations of social work in mass media and educational literature throughout the period 1992-2015 are analyzed as one of the cultural resources of professional status; the main barriers for enabling resources of the professional status of social workers are discovered and analytically described. It was found out that in the printed media social work is most often presented as a part of state policy and public social services for the population. The depiction of the format and nature of these services vary in the publications within the studied period following social policy reforms and

development of professional status of social work. Several concepts and modalities of descriptions of social work were singled out in the media discourse. The symbolic classifications of social work clients and actors of change are found in the selected educational editions. The content analysis results were contextualized in the broader context of social work training in today's Russia. It is shown that the discussions of social inequality are implicitly built into the discourse of textbooks and professional periodicals but the marginal status of the profession is not reflected upon. The low economic resources, limited power and low prestige of the profession are silenced. The results show that social work is developing in a context where global and local forces intersect, the paternalistic and liberal values compete, socialist and pre-socialist legacies meet liberal policies and conservative orienteers and form a new complex agenda for the development of the profession.

RN19 | Session 03a Political Impact of Professionalism

Activism among public defenders of the state of Sao Paulo: analysis and a career profile

Juliana Tonche
University of Sao Paulo, Brazil
jutonche(at)gmail.com

This paper aims to present the main results of a postdoctoral research carried out on the Public Defender's office of the State of São Paulo. This study, which is part of a thematic project on conflicts in the construction of urban spaces, focuses on how the Public Defender's office acts in this context, mainly working on activism issues among public defenders. We seek to understand the activism of these professionals from their own perspective: we try to perceive how they mobilize this category in a context in which they feel strongly encouraged to reinforce the relevance of their professional activity and their social role (the creation of this institution is recent and professional conflicts are diverse). Therefore, activism is pertinent among these professionals since they understand that their activity is constructed in opposition to other legal careers and their work would also be much more "humane" (because of the constitutional guarantee of defense of the accused); We also seek to contribute to the contemporary debate studying a topic that has been subject of little research in Brazilian social sciences so far, as is the case of public defenders in São Paulo. Quantitative and qualitative data will be presented (in their contrasts and complementarities) in order to build a profile of the Public Defender's office of the State of São Paulo and this is relevant, from a sociological point of view, for it allow us to glimpse the results of training and recruitment processes of this particular state agency.

Abortion and conscientious objection in Italy. A professional matter.

Arianna Radin, Elena Spina, Bianca Maria Orciani

Università di Torino, Italy; Università Politecnica delle Marche, Italy; Università Politecnica delle Marche, Italy
arianna.radin(at)unito.it, e.spina(at)univpm.it, bmorcian(at)mta01.univpm.it

Almost forty years after the legalization of voluntary interruption of pregnancy, abortion is still a professional as well as ethics matter. In fact, on the one hand this law regulates a practice that was practiced clandestinely and usually by not trained individuals, until then; on the other hand the Italian State grants the health care professionals to have recourse to conscientious objection for not practicing it. However the number of conscientious objectors has grown exponentially in some Italian areas where there are hospitals in which it is no longer viable, damaging the right of the local population.

Our hypothesis is that the choice of conscientious objection is now a matter of career opportunities rather than an ethical choice. Our paper presents the first results of a multidisciplinary study, carried out last year in Italy.

The paper is divided in three parts. In the first part we describe the social and professional climate about abortion before the promulgation of the law. In the second part we propose legal framework, with a focus on both objection of conscience and two recent decisions of the European Committee of Social Rights. In the third part, we analyze the current situation concerning the interruption of pregnancy and the conscientious objection through the reading of the available data and the stories of the medical staff in hospital services involved in the study.

Revisiting professionalism as a source of critique

Christiane Schnell
Institute of Social Research at the Goethe-University Frankfurt, Germany
ch.schnell(at)em.uni-frankfurt.de

Sociology of professions passed periods of uncritical affirmation as well as of fundamental critique of professions. Therefore the crucial question seemed to be, in how far professionalism represents true liability or if emphasising universal values might be explained as an ideology which first if all covers the self-interests of professionals. In my paper I am reflecting the relation between professions and society slightly differently, with an accent on the tension between adapting or criticizing mainstream rationalities and values of contemporary societies. Therefore two cases based on my research on journalism and on medical doctors will be presented to elaborate these questions. The focus is drawn on the conflicts professionals have to deal with and the potential to oppose against contemporary constrictions of the social reality due to neoliberal technocracy or what is called "post truth".

Foreign Correspondents in Greece: Analyzing the working routines and cultural challenges of the foreign press corps

Iliana Giannouli

National and Kapodistrian University of Athens,
Greece

giannoul(at)media.uoa.gr

Greece, like many small countries, usually goes unnoticed in the foreign press as a low interest country, mostly associated with specific types of stories. This 'model' has changed since the outburst of the global financial crisis, which sank the country and its economy into the deepest recession in its modern history. In the 'era of the economic crisis' Greece's appeal for international news organizations has risen dramatically, leading to an unprecedented rise in the number of Athens based foreign correspondents.

By analyzing data collected via 30 in depth semi-structured interviews during the period 2011-2014 we try to examine both the occupational culture and organizational structures within which foreign correspondents work. In addition, we try to highlight the problems correspondents encounter as they exercise their daily duties, which affect their final dispatches.

The up to now findings suggest that despite the pressures and the challenges put forward by technology and the 'deadline dominated culture', foreign correspondents perceive themselves as 'semiotic agents', feeling 'responsible' for explaining Greece's problems and complexities to their home audience. Although many commentators perceive foreign correspondence as a 'dying occupation' this 'tribe of journalists' proves that in a highly interconnected world 'being there still matters'.

Foreign correspondents are still the only secure answer to the understanding of foreign affairs, as "through their eyes" we can hope to shape a more comprehensive image of the "global village" that is today smaller and yet more complex than ever before.

Life story interviews method in studies of de-industrialization

Siarhei Liubimau

European Humanities University, Lithuania

siarhei.liubimau(at)ehu.lt

This paper discusses potential of life story interviews method to study the inherited and emerging meanings of work, profession and professional asset in formerly mono-functional towns. Empirical settings of this project is Visaginas, a town built in Soviet Lithuania in late 1970-s for the workers of Ignalina Nuclear Power Plant and for their families. INPP presupposed a conversion of high level exceptional professional status into high level social status. The closure of INPP and gradual loss by the town of its core function have provoked a question about the preservation of town's relatively high quality human capital and urbanity. Already now it is possible to judge about current possibilities of transmission of family professional assets and about the range of vocational trajectories

available for the generation raised after the INPP closure.

In particular proposed paper discusses whether and how life story interview is helpful for identifying the interrelations between values and attitudes emerging in family and education milieus around terminated industrial projects on one hand and the spatial approaches to social cohesion on the nation-state and the EU levels on the other hand. In this way, the proposed paper discusses how exactly particular urban infrastructural conditions shape such priority terms as 'smartness', 'sustainability' or 'inclusiveness'. It explores how the general trend of diversification of functions of urban fabric in formerly mono-functional towns correlates with the emergence of new professional identities and biographies.

RN19 | Session 04a Health Professions in Change

Refreshing professions theory: contributions from actor perspective(s) to understand multi-professional teamwork in health

Helena Serra

Universidade Nova de Lisboa/Faculty of Social
Sciences and Humanities, Portugal

helena.serra(at)fcsh.unl.pt

Frontiers between health professions act as articulating mechanisms to be found in the division of health work and, at the same time, as barriers to the interactions of the various skills (Serra, 2011). In contexts of strong economic and efficiency controls resulting from New Public Management (NPM) reforms, new questions arise concerning the understanding of how cooperation between different health professions is construct as they work together in the best interest of patients. As teamwork is a network of semi-independent professionals who tend to represent their professional organisations and groups, the impact of managerialism in healthcare may not improve the situation and brings new challenges to sociology of professions. Research on professions tends to analyse tension/cooperation problems among health professions ignoring the fact that multi-professional cooperation as the same character as mono-professional cooperation, to preserve collegiality through co-existence. This idea challenges the three stands on professions theory: the general idea of service ideal, discretionary power and professional dominance. My argument is that these three stands allow us only to explain part of the tensions/cooperation problems and that professionals are strongly influenced but not determinate by their professional logics. The actor perspective offers a useful interpretation in understanding individuals' cooperation problems among health multi-professional teamwork.

Health organisations vs nursing professionalization: Institutional, organisational and cultural barriers to the recognition of nurse's autonomy in Italian healthcare contexts.

Barbara Sena

Unitelma Sapienza University, Italy
barbara.sena(at)unitelmasapienza.it

In recent years, the nurse's role has acquired great importance in health care organisations as well as in the sociological literature on professions. However, the publications on Italian nursing are still scarce. In order to fill this gap, this article tries to provide an analysis of the evolution of nursing profession in Italy, highlighting a current paradox that prevents the completion of the professionalization process: on the one side, some national reforms has significantly raised the level of training of the nurse and the National Health System has promoted new social-health integration pathways, involving a strengthening of nurses role outside hospital organisations; on the other side, organisational, managerial and cultural barriers still prevent the formal and social recognition of nursing as autonomous and specialised profession in many Italian health organisations. The paper will initially draw on the literature on sociology of professions and specifically on nursing professionalism, trying to highlight the factors and agents involved in the recognition of the autonomy process and the enhancement of this profession. In the second part, some institutional and empirical aspects of the Italian public health organisations will be presented in relation to the evolution of nursing professionalism. The analysis will include national legislation and local health policies, research literature and the data of three sociological surveys coordinated by the National Regulatory Board for Nursing Profession in Italy (IPASVI).

The paper aims to demonstrate which factors influence in a relevant way the persistence of this Italian paradox in the process of professionalization of new health professions.

Professionals and volunteers: Recognising diversity in the health care division of labour

Marianne van Bochove, Michael Paul Saks
Erasmus University Rotterdam, The Netherlands;
University of Suffolk, United Kingdom
vanbochove(at)bmjg.eur.nl, m.saks(at)uos.ac.uk

In the mainstream literature on the relationship between professionals and volunteers, professionals tend to be contrasted with volunteers as abstracted, distinct and homogeneous groups. However, this paper argues from a neo-Weberian perspective with reference to health care in Western societies that the landscape is more complex than simply that between paid groups with exclusionary social closure and those who are unwaged in the division of labour. First, there is considerable diversity within health professions themselves based on differential forms of social closure, not least in relation to hierarchies and scopes of practice. Second, groups of unpaid volunteers also vary in terms of level of responsibility depending on

factors such as sector of employment and social background, including previous professional and other qualifications. Although they may be linked to volunteers, they should also not be confused with clients involved in self-care or such groups as informal family carers who are vital too in the health care process. Third, it is very important that, in terms of the paid workforce, there are interconnected interstitial groups of non-professionalised health occupations, including the often neglected health support workers who form the largest and most diverse elements of the health care labour force. Drawing on empirical studies of health care from Western Europe and North America, it is argued that recognition of this diversity is vital if the dynamic role and relationship of professions and volunteers in delivery to clients in the division of labour is to be fully understood and health care policy enhanced.

The making of new professionals in Danish Type 2 diabetes care taking

Sine Grønberg Knudsen
Roskilde University, Denmark
sigrkn(at)ruc.dk

Public health strategies in many OECD countries have seen a shift from treatment to prevention, in particular within chronic illness care taking. This study focuses on one aspect of this shift: The recast of the health professional as a facilitator with the task of making patients responsible for their own health. While existing literature tend to emphasize the implications this responsabilization has for the patients, few have critically addressed the recasting of the subjectivity of the health professional. This study argues that the imagined new professional creates tension in health professionals' approach to patients. Although emphasis in most countries' public health strategies is the optimization of patients' self-management, the emergence of standardized Disease Management Programs (DMPs) ignores the complexity in individualized chronic illness care taking. To illustrate this, I analyse the recast of professional subjectivity through interviews with health professionals in the case of Type 2 diabetes care in Denmark. This case suggests that the new subjectivity puts the health professional into a dual dilemma. On the one hand, attempts to individualize the treatment around the self-managing patient are at odds with adhering to standardized descriptions for best practice. On the other hand, adhering to the standardization makes it difficult to promote a self-managing and active patient.

RN19 | Session 05a Professions in the European Market

Market inspired professional work conducted towards homeless people in Danish shelters

Nanna Mik-Meyer
Copenhagen Business School, Denmark
nmm.ioa(at)cbs.dk

Everyday life in public organizations is influenced by

conflicting rationales that does not always fit with the norms and ethics of the professions working in these organizations. Scholars use concepts such as 'organizational professionalism', 'hybrid professionalism', 'situated professionalism' etc. to emphasize the effects of outside factors on professional work. This current paper will focus on how market values affect professional work in a shelter for homeless people. Empirically, the paper depart in interviews with nurses, social workers and homeless people (N=24). Knowledge systems of professions and the battles between competing knowledge systems (Abbott 1988: 30) are of course important and relevant to study when examining how different actors perceive homelessness. Professions with distinctive professional backgrounds obviously affect the way they conduct their work and are perceived by others (Freidson 2014: 15). In other words, it does make a difference whether a homeless person is encountering a nurse or a social worker when seeking help. However, norm-systems originating outside the disciplinary boundaries of professions influence the work situation as well. For instance, NPM-professionalism is a concept that emphasise that professionalism is in fact an organizational matter. Professions—whether they are nurses or social workers—must set achievement targets and performance indicators etc. These NMP techniques govern the interactions between professionals and citizens in a way that does not leave as much room for the exercise of disciplinary-based discretion as previously and as a result may therefore hinders the ethics of the profession to come as much into play as ethics used to. The paper's goal will be to discuss the way in NPM techniques and other market values affect professional work conducted towards vulnerable groups such as homeless people.

Marketization and Technological Change: Turkish Surgeons in a Changing Context

Gülşah Başkavak

Middle East Technical University
cgulsah(at)gmail.com

Turkey is undergoing a transformation of the healthcare system in ways both similar to and different from the changes in European countries. Turkey is among the growing number of countries that have implemented market oriented reforms in their healthcare services as part of "the global reform epidemic". Surgery and surgeons occupy a central place in the debates regarding the pros and cons of the transformation policy and technological advancements in surgery followed in the last decade. While health professionals are usually considered as a unified group in this literature, this study focuses on the surgeons. In this context, this paper aims to explore how these changes are experienced by the surgeons, how surgeons adapt to the extensive transformations in their environment and how the specific characteristics of surgery determine the ways of adaptation taken by different surgeons. The paper is based on a field research conducted in Istanbul,

Turkey including in-depth, semi-structured interviews with twenty-six surgeons from six different surgical branches, together with observations in hospitals and operating rooms. The findings of the study indicate a variation in the ways surgeons adopt, resist or cope with transformation. Surgeons are more advantaged compared to other doctors, due to their close relationship with medical technologies. While this advantage allows them to develop various strategies, the increasing dominance of marketization is also observed. The paper aims to propose a typology of surgeons according to their responses to the transformation in healthcare system in Turkey, which has direct effects on their work.

"Monitoring "change management": EU experts in the Task Force for Greece

Marylou Hamm

Université Libre de Bruxelles, Belgium, Sciences Po
Strasbourg, France
marylou.hamm(at)ulb.ac.be

Since 2010, the formulation and implementation of Structural reforms (SRs) in Member States (MS) are at the heart of the European economic governance. For countries considered fragile, specific mechanisms have been created and institutionalized. Significantly, the Macroeconomic adjustment programs, set up by the troika, make us of conditionality to promote SRs considered to be urgent and necessary. Reforms are presented as in line with objectives of best governance, based on strong indicators and rational thinking.

This contribution focuses on tools put in place by the European Commission for the coordination of European governance and especially the implementation of SRs - in parallel to its role in the troika. More specifically, I analyse practices linked to the claim of European expertise on change management and technical assistance. By looking closely at a specific group of civil servants who intervene as experts in countries "under programs", specifically members of the Task Force for Greece, I ambition to bring sociological insight into an issue often accounted in rational terms or institutional bargaining. The study proposed here is an opportunity to study in depth what are the "best practices" and how they are transmitted, diffused, resisted. Relying on document analysis and interviews, this paper addresses several issues: What tools has the Commission used to further monitor the crisis resolution and foster structural reforms? How have they been organized and justified? What lies behind the claim of a "European expertise"? Who are the "experts" of change management and how do they operate?

Professional identity of the inhabitants of the metropolis in the context of precarization of Russian society

Oxana Posukhova, Ludmila Klimenko, Anna Frolova,
Dmitry Isaev, Oxana Nor-Arevyan, Nikolay Trapsh
Southern Federal University, Russian Federation;

Southern Federal University, Russian Federation;
 Southern Federal University, Russian Federation;

 Southern Federal University, Russian Federation
 belloks(at)yandex.ru, lucl(at)yandex.ru,
 amikoshonstvo(at)mail.ru, disaew(at)mail.ru,
 noroks(at)yandex.ru, dukekeleshbey(at)gmail.com

In 2016 a research team of the RSF project № 16-18-10306 designed the concept of the research and analyzed professional identity in a historical perspective. The authors draw on the fact that in a stable socio-economic system professional identity has integrative functions in relation to the entire social system, facilitating reproduction of the existing social structure and patterns of social and labor relations. Uncertain Labor Relations induce labor precarization that enhances social inequality and creates system deprofessionalization risks. Therefore there is a deformation of professional identity, that weakens its integration potential for the Russian society.

The authors formed a working understanding of professional identity in which it can be socially constructed, is attributed to secondary communities and compete for priority with primordial identification systems.

For residents of the metropolis with individualized life trajectories, professional identity - the main integration criteria in the social life because self-awareness and self-determination within socio-professional group can adequately define structured differences between the different groups of the citizens, to get away from highlighting differences between metropolises and the "other" Russian

In the process of maintaining the integrity of society through societal reproduction and translation of values and normative behavior, professional activity plays an important role, particularly activity of socially-oriented professions (teachers, doctors, military, law enforcement).

Reformation of the social structure of Russian society has led to the fact that societal relevant professional groups have lost value and semantic foundation of group solidarity. These occupational groups have negative, injured professional identity - blurred professional motivation, erosion of public service values, reduced commitment to professional ethical code and weakened perception of professional group as a referential.

RN19 | Session 06a Gender in Contemporary Professionalism

The contemporary evolutions of an established profession: the case of the notaries in France.

Corinne Delmas
 Lille 2, France
 corinne.delmas(at)univ-lille2.fr

In France, notaries have undergone considerable changes last years. To summarize, we could say that this profession protects its monopoly and its borders

by accepting a weakening of the professional model which has been dominant for a long time, namely a patrimonial and a traditional model

The profession of notary, which exist in 28 countries in the EU, is an exemplary case of professions whose the borders and the monopoly have been defined and protected by the state. State delegates its authority to the notaries. Named by the Minister of Justice, notaries practice in liberal structures with a status inherited from the former venality of services. Self-regulation and state regulation were historically the norm for this profession. But a market rules add to this co-regulation today because of globalization and the liberalization of services in European Union. Indeed, institutions like the World Bank, the European Commission or the Ministry of the Economy and Finance in France analyses the legal professional regulations as restrictions of competition in a context of globalization. Notaries are particularly in Bercy's sights. Today, this profession is the object of a reform – so-called the reform "Macron"- which deregulates it. Its liberalization by this reform seems to accelerate current evolutions like the rise of entrepreneurship. If a traditional model is very present, other approaches, more modernist, even capital-intensive, are growing in a sector wich is characterized by strong contrasts between a majority of SME and some large companies. The contributions providing empirical research will deal with these effects of the globalization and the enforcement of neo-liberal politics on this established profession.

Women physicians in the Nordic countries

Elianne K. Riska
 University of Helsinki, Finland
 elianne.riska(at)helsinki.fi

Today women constitute an increasing proportion of the physicians in most western societies. This trend has been seen as the result of policies that demand gender equality in higher education and in high-prestige professions. The Nordic countries constitute a good case study on this issue: In 2016 over half of the practicing physicians were women in Denmark, Finland, Norway and Sweden. Yet, a closer look at women physicians' work profile in the Nordic medical professions reveals a persistent vertical and horizontal gender segregation.

This paper examines the apparent paradox of the numerical achievements in gender equality in the Nordic countries and the actual gender segregation in the work that women physicians do. Two policies related to this paradox will be examined. First, the importance of the role of the welfare state for working women will be reviewed. Second, the individualizing perspectives used in public discourse for explaining women's low proportion in highly prestigious medical specialties, like surgery, will be analyzed. Specific explanations—e.g., preference theory and the pipeline argument—are often used to explain the lack of success of women physicians to advance in their career in the medical profession. These individualizing frameworks turn away attention from the need to

mentor young women physicians in order to advance their careers.

Portuguese Police Women in the Iberic Peninsula Police context

Maria João Guia, Marta Ibáñez Pascual, Sara Leitão Moreira, Sílvia Esteves
University of Coimbra Centre for Legal Research, Portugal; University of Oviedo, Spain; Faculty of Law, University of Coimbra; Faculty of Medicine, University of Coimbra
maria.joao.guia(at)ij.uc.pt, mibanez(at)uniovi.es, sflmmoreira(at)gmail.com, silviaesteves72(at)gmail.com

In the scope of the project "Women in men's world: socialization, labour organization and public images", project led by Marta Ibáñez Pascual, University of Oviedo, we are researching about the working careers traditionally occupied by men, which have recently started to integrate women. In this project, we aim to understand what trajectories have been more successful and what barriers have been raised to the integration of women into police services. Being a project led by a Spanish team, one must bear in mind that police services in Spain have rearranged to congregate only one Police Service, while the Portuguese police structure remains separated (even if aggregated under the Ministries of Justice, Home Affairs and Economy).

The Portuguese research team is implementing joint methodologies - therefore we pretend to present the preliminary results of the evolution of the 5 more representative police services in Portugal, their structure and the history of its evolution, as well as the moment where women started to be integrated in each of them. We will also present the hierarchical structure of each police service, analysing the categories women have been occupying and comparing these numbers and categories with the representation of policemen. We will also present the analysis of the interviews that will be undertaken and that will allow us to get in touch with the challenges and difficulties of women integrated in what are traditionally professions of men, highlighting their appreciations and feelings towards their best and worst moments in these professions.

Women Engineers' Professionalism in the Times of Reforms

Olesya Yurchenko, Valery Mansurov
Institute of Sociology of the Russian Academy of Sciences, Russian Federation; Institute of Sociology of the Russian Academy of Sciences, Russian Federation
olesya(at)mail.ru, mansurov(at)isras.ru

There is a lack of studies examining the professional and career development of welfare sector professionals. This paper is devoted to the conditions for the professional development of women engineers in Russia. There have been transformations in the common standards of practice, payment, and social

attitudes. Women-engineers' social status and their views on their current social and professional standing have become one of the important issues in the ongoing project Russian Engineers: Formation and Development of the Profession. We have conducted a qualitative in-depth interview and quantitative research of women engineers in Moscow and other Russian cities. A higher proportion of women engineers is one of the peculiarities of Russian industry. Women's high interest in higher education in Engineering remains unchanged since the Soviet period. At the same time, in terms of administrative position, most women have been rank-and-file engineers. The highest managerial posts are mostly preoccupied with men engineers, whereas many women engineers work on a part-time basis. It is critical to understand the diversity of factors that lead some women to persist in engineering and others to leave it. The research showed the difficulties of combining engineer careers with motherhood, workplace environmental barriers and gender stereotypes that hinder professional development of women.

RN19 | Session 07a Subjectivity in Professional Work

Between misrecognitions and satisfactions: health social workers' professional identity

Florin Lazar, Alexandra Maria Ciocanel, Georgiana-Cristina Rentea, Daniela Gaba, Anca Mihai, Shari Munch
University of Bucharest, Romania; University of Bucharest, Romania; University of Bucharest, Romania; University of Bucharest, Romania; School of Social Work, Rutgers, The State University of New Jersey
florin.lazar(at)sas.unibuc.ro, alexandra.ciocanel(at)gmail.com, georgiana.rentea(at)sas.unibuc.ro, daniela.gaba(at)sas.unibuc.ro, anca.m(at)sas.unibuc.ro, munch(at)ssw.rutgers.edu

As biopsychosocial professionals, health social workers occupy a niche in a professional ecology in which the patient is located between medicine, psychotherapy and social work. Despite the aim of interprofessional communication and collaboration, tensions can arise between professionals based on professional status and differing perspectives of patients' problems among disciplines. In this way, relationships with members of the interdisciplinary health care team and the patient-social worker relationship play a role in the construction of health social workers' professional identity. Based on a thematic analysis of 18 semi-structured qualitative interviews with participants in a broader mixed-methods research project regarding the social work workforce in Romania, this paper explores the lived experience of being a health social worker in Romanian medical hospitals and NGO health settings. Four major themes were identified: (i) relationships with patients; (ii) relationships with medical personnel; (iii) relationships with public institutions; (iv)

documentation work. These themes represent different dimensions of health social workers' professional identities revealing the challenges and satisfactions that contribute to shaping their workplace subjectivities. Although collaborations between professionals can run smoothly, tensions arose when health social workers' professional role is misrecognized by medical personnel and by beneficiaries (i.e., patients), or when organizational barriers set limits to fulfilling social workers' goals. Consequently, the findings provide important insights into how health social workers in this study constructed their professional identities when working in collaboration with health care settings and public institutions not always supportive of their work.

Professionalism as a constraining or supporting aspect in amateur arts: the case of Song and Dance Celebration

Agnese Hermane, Agnese Treimane
Latvian Academy of Culture, Latvia; Latvian Academy of Culture, Latvia
agnese.hermane(at)lka.edu.lv,
agnese.treimane(at)inbox.lv

The Nationwide Song and Dance Celebration (NSDC) is the largest amateur-arts event in Latvia that takes place every five years since 1873 and focuses on choral and dance group performances. NSDC is included in the Representative List of the Intangible Cultural Heritage of Humanity and also is protected by a specific Law, which states that this Celebration is aimed to be both with high participation and high artistic quality. The first depends very much on the leaders of the artistic groups, who can be defined as pro-ams (professional amateurs). The latter is provided by chief-leaders, who are high class professionals, and also authorities in Latvian music and culture. Both are paid by government for this job. But the majority of participants are amateurs.

The ability of different collectives and strategies of their leaders varies greatly. This minimizes the solidarity and causes tension – professionals wish to raise the artistic quality while most of the amateurs care more about such aspects as emotional fulfilment and social interaction. This causes a gap between amateurs and professionals. At the same time in many cases it is very hard to draw the line between both.

Thus the main focus of this study is professionalism in amateur-arts movement. The quantitative and qualitative data has been collected to analyse the opinions of chief-leaders and amateur art group leaders. The data presents result of several years' work in the framework of the state research program "Sustainability of Latvian Cultural Traditions in an Innovative Environment (HABITUS)".

Defining what a "good teacher" is: the teachers' perspective

Matteo Moscatelli, Gianluca Argentin
Catholic University Milan, Italy; Catholic University Milan, Italy
matteo.moscatelli(at)unicatt.it,

gianluca.argin(at)gmail.com

The present work explores the issue of teachers' professional identity. More precisely, we focus on the essential qualities of a good teacher, adopting the point of view of about 2,300 Italian middle-school teachers. We interviewed the participants to an action-research, delivering a professional development focused on the topic of relational skills at school. During the pre-intervention interview (CATI), we asked teachers three open questions: respondents were called to define the three main characteristics identifying a "good teacher". This methodological approach is unusual in the study of this topic, characterized by a dichotomy between data collected through in depth interviews or pre-defined items. The collected words were classified and inductively grouped together by type, adopting an holistic approach (Korthagen, 2004) and relying on a synthesis of different theoretical paradigms (Dilts, 1990; Tickle, 1999; Stoof et al, 2000; Bergner & Holmes, 2000; Polk, 2006; Bouton, 2016). The large amount of available data was analyzed both with qualitative and quantitative methodologies and software. "Empathic", "Patient", "Helpful", alongside with "Competent" and "Trained" are the most quoted traits. Three key dimensions emerged from our textual analysis: relational skills, effective didactic skills, personality traits. The majority of interviewed teachers (around 50%) stressed the relevance of relational skills, but they frequently mix them with specific didactic skills. Teachers' perspective about the definition of a "good teacher" is constant among teachers' socio-demographics and individual characteristics and does not vary by taught subject. This result is quite surprising, considering respondents' high heterogeneity in terms of previous pre-service training, career pathways and everyday working experience. The homogeneous answers suggest that relational skills are a widely agreed keystone in the definition of teachers' professional identity.

Industrial relations at crossroads: The case of "briefcase professions" in Greece

Charalampos Arachovas, Valia Aranitou
Panteion University of Social and Political Sciences, Greece; University of Crete
charach(at)panteion.gr, varanitou(at)yahoo.gr

There is no doubt that the recent economic crisis has seriously affected the world economy and has changed western societies' functions, outlook and expectations. Social welfare becomes less generous while notions like debt viability, austerity, leverage, competitiveness and productivity manage to attract again the interest of policy makers. Under these new circumstances many economists suggest that the fastest and safest way out of the crisis is through the deregulation of labour markets, especially for countries which are dealing with serious debt problems.

Greece is probably the most glaring example. The

economic crisis has been proven to be much deeper, and the economy hasn't recovered yet, despite the three Memorandums signed so far. Instead, Greek economy suffers from extremely high unemployment rates, huge private sector's output shrinkage and a collapsing society, while the pressure on labour market is unprecedented.

This paper will attempt to shed some new light on the nature of informal employment, whether it has altered itself during the crisis and explore the reasons for which employees "choose" to engage themselves in informal economic activities.

More specifically, it will try to a) analyse the undeclared work challenge in Greek economy, b) clarify the real self-employed issue given the very high self-employment level in Greece, focusing on how informal small producers actual work for big enterprises especially in the tourism sector and c) analyze the so called «briefcase professions» and their inflows.

The latter reflect a new type of economic activity which becomes increasingly important in Greece and it is carried out by professionals who have close down their businesses but who are still active in the market in absolute informal forms, as a survival strategy.

RN20 - Qualitative Methods

RN20 | Session 01a Analysing Populism

Sexual Difference in Serbia and Croatia: A Dispositive Analysis on Homophobia in the Western Balkans

Martin Mlinarić

Martin Luther University Halle-Wittenberg/Medical Faculty, Germany

[martin.mlinaric\(at\)medizin.uni-halle.de](mailto:martin.mlinaric(at)medizin.uni-halle.de)

Objective: The finished PhD project examines the status of sexual difference within the framework of post-socialist transition to liberal democracies and the Europeanization of two post-Yugoslav societies after the outburst of the 2008 financial crisis.

Background: The latest (2008) European Values Survey (EVS) documents the high degree of homophobic attitudes in Serbia and Croatia. Banned pride parades in Belgrade (2011–2013), right-wing hate speech and violence in Belgrade or Split (2010/2011), and the Croatian referendum on constitutional protection for heterosexual marriage are just the tip of the iceberg. However, both countries implemented anti-discrimination bills (2008/2009) and Croatia (2014) recently introduced same-sex unions (2014) for gay and lesbian couples.

Methods: A societal comparison was applied that is based on the qualitative analysis of Serbian and Croatian mass media coverage (printed, online and TV media). The qualitative dispositive analysis (n=801) analyzes discursive contexts, formations/strands, and links in both dispositives in the period after the introduction of anti-discrimination bills (2009–2013). The qualitative data was coded inductively with MAXQDA.

Results: The Serbian context circulates rather around public visibility of sexual difference, whereas in Croatia legal-symbolic equality and recognition becomes more important. In both transition-dispositives sexuality is linked with democracy and liberal-permissive multiculturalist tolerance. Sexual difference becomes in the permissive strand a metaphor for the liberal-democratic transition of peripheral European societies. However, provincial minds (prohibitive strand) oppose successfully “gender ideology” and “homosexual propaganda” anticipatory with liberal-secular concepts, like pluralism and anti-discrimination.

Conclusions: In both countries only partial concessions for sexual difference are granted in the sphere of public visibility (Serbia) and same-sex

partnerships (Croatia) due to successful and anticipatory resistance of Christian inspired populist movements.

Computational and interpretive analysis of populist argumentation. Counterknowledge and conspiracy theory in Finnish anti-immigrant online publics

Tuukka Ylä-Anttila

University of Helsinki, Finland

[tuukka.yla.anttila\(at\)gmail.com](mailto:tuukka.yla.anttila(at)gmail.com)

Populism is increasingly claimed to represent ‘post-truth politics’, based on emotions, taking a relativist or ambivalent position to facts. Often, this is attributed to online media enabling anyone to create and disseminate ‘counterknowledge’, challenging established knowledge authorities and policies. Understanding populism as political argumentation that claims to represent ‘the people’ against the corrupt elite, I argue that counterknowledge is instrumental in populist mobilization. I study counterknowledge and conspiracy theory in anti-immigrant online publics by computational and interpretive methods in the case of Finland, which has seen an unprecedented wave of anti-immigrant politics in the 2010s. I analyse 318,081 messages on the anti-immigration discussion board Hommaforum and 13,497 news articles by the popular conspiracist countermedia ‘WTF Media’ (MV-lehti) using a combination of topic modeling to locate relevant discussions, and a qualitative, interpretive reading of views on knowledge, counterknowledge and conspiracy. A multi-faceted view emerges. While often subscribing to conspiracist views, many anti-immigration activists nevertheless claim to hold knowledge, truth and evidence in high esteem, and profess positivist and empiricist views – an overblown ‘scientism’, overly reliant on the possibilities of scientific inquiry to gain knowledge about society and use it for ‘rational’ governance – and strongly oppose any ambivalent or relativist truth orientations. For them, it is the multiculturalists and ‘establishment hacks’ who are ‘post-truth’. The populist relationship to truth is multifaceted but in my material, often absolutist and black-and-white, like its relationship to power and democracy. Methodologically, I argue that combining topic modeling with interpretive qualitative analysis is fruitful, since it lends credibility, robustness and reproducibility to qualitative interpretations by enabling the use of larger data and grounding the findings in quantifiable patterns in texts.

An interpretive perspective on self-perception and communicative strategies in contexts shaped by perceived precarity and social decline

Niklaus Reichle

University of St.Gallen, Institute of Sociology, Switzerland

[niklaus.reichle\(at\)unisg.ch](mailto:niklaus.reichle(at)unisg.ch)

This paper examines how the relatively small white Afrikaans-speaking population segments in South

Africa emotionally and communicatively cope with precarity and socially downward mobility. Conventionally claimed yet empirically understudied, these population segments are said to develop emotionally laden resentments against ethnic or racial 'others' and to support populist leaders and movements.

But how are notions/perceptions of precarity constituted in particular interview situations? What are the communicative strategies/practices in which they are manifested? In which world views and political ideas are these perceptions embedded? And how is social decline experienced and coped with emotionally as well as cognitively?

This paper draws on a case study that is currently being conducted on two specific university campuses in South Africa. It gives an insight into the fieldwork – particularly into interview situations concerning student residences on these two campuses. The paper focuses on a first attempt to typify communicative strategies of dealing with the perception of socioeconomic and ethnocultural precarity as well as of social decline.

RN20 | Session 01b Digitization and Mobility in Qualitative Research

Using interactive maps with young people – scanning diverse mobilities

Sinikka Aapola-Kari, Tarja Tolonen, Matilda Wrede-Jäntti

Finnish Youth Research Network, Finland; University of Helsinki, Finland; Finnish Youth Research Network, Finland

sinikka.aapola-kari(at)nuorisotutkimus.fi,
tarja.tolonen(at)helsinki.fi, matilda.wrede-jantti(at)helsinki.fi

In this paper, we present a method based on using interactive maps with Finnish young people. We have utilized an internet cloud map application with groups of young people. We have interviewed 125 young people, born in year 2000, from five research sites around Finland, in relation to our study 'Youth in Time'. This is a qualitative, longitudinal project coordinated by the Finnish Youth Research Network, in cooperation with researchers from the universities of Eastern Finland and Helsinki. We aim to follow the lives of the same young people for at least ten years.

In the map workshops, young people worked in small groups and pairs, and marked their 'important places' in their localities, as well as places they avoid. In addition, they showed us where they had travelled, and/or where significant people in their lives lived. The groups' results have been transferred to the same base maps, which has allowed us to make comparisons along the divisions of gender, mother tongue, ethnic background as well as locality.

The method has proved to be fruitful, both in terms of increasing research participants' own participation and agency in the research relationship, and in producing interesting results about young people's diverse mobilities. In our longitudinal research, we also aim to

return to this method later with the same participants, which will reveal any significant changes in young people's mobilities as they move from one stage of education to the next.

We shall present the technical details of the method as well as some results in our presentation.

Exploring social worlds in migration and sports – Challenges of mobile research

Bernd Rebstein, Ajit Singh

Bayreuth University, Germany; Bayreuth University, Germany

bernd.rebstein(at)uni-bayreuth.de, ajit.singh(at)uni-bayreuth.de

Dramatic changes of modern societies, often described in connection with differentiation, fragmentation and globalisation, are most obvious and force people to being mobile. Thus social and spatial mobility as a 'mundane' concept refers also to the explicit requirements of different social worlds as work, leisure, education, politics or economy (Sheller/Urry 2006). In the last decades especially the 'mobility turn' considers these changes and sheds light in a broader sense on multiple forms of interleaving movements of people, objects, information, knowledge and ideas.

Our paper discusses this perspective and focuses on the relevance of mobility for the constitution of social worlds. Reflecting method(ological) challenges of different research projects in the fields of migration (festivals and events) and sports (trampoline training) we address the questions (1) how to examine different phenomena of mobility and (2) how to empirically access and follow (Marcus 1995) mobile subjects, objects and ideas within multi-sited ethnographic research.

Using different sorts of data, it will be shown, that on the one hand mobility becomes empirically observable through collaborative embodied practices and the communicative construction of spaces, knowledge and materials. On the other hand we foreground the adequate and flexible use of qualitative methods to capture and investigate social forms of mobility as a constitutive part of the (multi-sited) research fields. Finally we argue that mobile research sensitizes to consider mobility and sociality as a 'fluid' and mutual accomplishment of communicative actions.

Metaphor about MOOC power: systematic metaphor analysis

Tatiana Semenova

National Research University Higher School of Economics, Russian Federation

tatiana(at)semenova.me

There are different and at the same time opposite points of view about massive open online courses (MOOCs). Some researchers believe that MOOC is a way to break national borders and expand democracy among developing countries as well as a means to overcome inequality. Since this is an open source of knowledge for everyone despite race, gender, socio-

economic status, educational background etc. Nevertheless studies have shown that the majority of MOOC participants are citizens of developed countries with higher education. Moreover the achievement of MOOC participant is affected by their characteristics (for example, educational background, social status, learning style, previous experience in online learning, previous experience in course subject). That is why other researchers consider MOOC as a means of supporting and increasing inequality in society. The third and the last point of view is that MOOC is a tool to expand one ideology, one belief about course subject (especially the ideology of Western countries), propagandizing their cultural values. In our study we will show metaphors which underlie different views on the MOOC power. Systematic metaphor analysis (SMA) is used as a method for the analysis qualitative data. SMA, developed by Rudolf Schmitt, is based on the George Lakoff and Mark Johnson's theory of metaphor. The research sample is the articles about MOOC power issued in the last four years. In our work, we will also show the pros and cons of SMA and compare it with the discourse analysis.

RN20 | Session 02a Ethnography I

Autoethnography: Biographical Episodes in Ethnographic Narratives

Dennis Saturno Erasga
De La Salle University, Philippines
dennis.erasga(at)dlsu.edu.ph

Ethnography as a research methodology reads context as a form text. In the postmodern sense, ethnographic reading is a mediated process and what mediates between the researchers and what they read is their biography. By extension, there will always be biographical remnants in all ethnographic enterprises. The challenge therefore for researchers is to be able to discriminate which portions of the ethnographic regimen are vulnerable to biographical bias. Locating these portions would allow researchers to balance the demands of a sound sociological research. The present paper explores the implications of these challenges by imagining fieldwork as encounter with multidimensional yet progressive modalities- from the archival to the scopic culminating in the biographic-autoethnography. It maintains that the biographical echo of ethnographic works reverberates more in the research writing phase than in the actual fieldwork, where the multiple and fragile positions (biographic episode) a researcher invokes and brings into play ultimately displace the authentic context (scopic episode) of the data set initially co-produced and co-interpreted with research participants in the field.

No such thing as a complete picture. Studying meeting control by refining the angle on various types of data

David Wästerfors
Lund University, Sweden
david.wasterfors(at)soc.lu.se

The use of multiple methods and triangulation is often understood as a route towards a more complete picture. To only use ethnographic observations, for instance, may blind the observer to important events that occurred before his or her entry in the setting but to add interviews and documents is presumed to make it easier to achieve a so-called holistic view. In an ongoing sub-study within a Swedish project on meetings and meeting cultures in various organizations, we are in the midst of cultivating a different take on multiple methods. Our purpose is not to uncover completeness. Rather, we aim at analyzing a particular slice of formal meetings across various cases and locations: meeting control and meeting deviance. The moral order of having a meeting and the background expectancies of showing loyalty to a given meeting culture stand at the center, not a whole organization or all its meeting patterns and activities. We collect observational data on meeting-moralizing talk, gestures and mimicry by fieldnotes, we collect accounts and narratives on meeting dodging and drop-outs by interviewing, and we collect irony, sarcasms and complaints about meetings via the Internet. We even make use of participant observations in our own work places when we happen to find ourselves in a meeting (for instance on how to engage in "side involvements" during meetings), since our local office culture at work seems to be fairly shared with cultures in the field. In this presentation, I will explain and exemplify our strategy in terms of (a) our theoretical perspective on meetings (interactionism and ethnomethodology), (b) our phenomenon-driven design of the project, and (b) our interest in situational or Goffmanian ethnography.

Capturing subtle conflicting moral expectations: the case of administrators vs. professors.

Malin Åkerström
Lund University, Sweden
Malin.Akerstrom(at)soc.lu.se

Increases in administrative demands, paperwork and meetings, account for different professionals' grumblings about lack of time to do their "core tasks". At the same time managers and administrators have gotten a more central role in many contexts. In the present study the university is selected as a case. The university is a particularly interesting form of organization, as it has presumably changed quite rapidly to a more a business-like organization. One of the social consequences is demands on professors to subordinate themselves to new management requirements, which in turn are claimed to create various tensions between administrators and professors. Such tensions arise, for instance, concerning new forms of meetings such as management committees, and in connection to personnel meetings. How does one empirically capture the various morals—often depicted as an understated struggle – among "administrators" and "professors"? In this study, we use materials of various kinds: Gossip, small-talk, unstructured interviews, and investigations of formulations in

surveys on work environment. We pay particular attention to formulations such as “ought to”, “should be”, or “My and their task is to ...” ? But what do the various sources depict? Are such divisions uttered with expressive caution, and if so, in what ways? Such inquiries demand a novel sensitivity regarding fieldmembers' remarks en passant and their subtle demarcations.

Using ethnography and autoethnography in research of emotions in educational organization. Methodological difficulties.

Beata Pawlowska
University of Lodz, Poland
pawlowska.beata(at)gmail.com

The aim of the paper is to discuss the use of ethnography and autoethnography in research on emotions in educational organizations. I will show some methodological problems and difficulties when studying emotions using selected qualitative methods (semi-structured and narrative interviews, observations). I will argue that emotions, commonly recognized as subjective states experienced by an individual, and their meaning for an individual should be reconstructed with reference to actions and social processes in which actor is involved (recognizing wider context – organizational and social).

Doing organizational ethnography requires both openness to new circumstances but also well planned conception immersed in organizational reality that can be pretty easily adjusted to circumstances appearing along the research process. In presentation I will discuss our experiences connected with ethnography and autoethnography in educational institutions (primary and secondary schools).

The focus of the presentation will be on answering questions: What kind of methodological difficulties may emerge during research process in reference to each of above mentioned techniques of research of emotions? How to go beyond declarative layer of data and reach the one which is meaningful but often hidden because of interactional specific of interview situation? I will take up the problem of data reliability, informants verification methods, relation between researcher's auto presentation and gathered data.

The discussion are based on 8 years of qualitative study in educational institutions (participant observation of school life; 56 semi structured interviews and 25 narrative interviews with school managers, teachers, school workers, parents; documents analyses and visual data analyses).

RN20 | Session 02b Objectivity, Subjectivity and Reflexivity I

Irrelevant? - Constructing knowledge out of nonsense

Lars Fynbo, Tea T. Bengtsson
University of Copenhagen; SFI The Danish National Centre for Social Research
lf(at)soc.ku.dk, ttb(at)sfi.dk

In this paper, we discuss passages in qualitative interviews, which do not, at a glance, appear to carry any significant meaning. We regard these passages as discursive deviations, or nonsense that disrupts rather than contributes coherence to the interviews. From a symbolic interactionist perspective, we conceive of the qualitative nonsense as ‘irrelevant’, i.e. as challenging the interviewers' attempt to capture the respondents' accounts and narratives. We argue that, for qualitative research, even nonsense can be useful data that enables us to better understand the people and cultures that we study. Drawing on four independent sociological studies, in which we interviewed a total of 150 socially vulnerable or socially stigmatized people, we have analysed eight specific examples of apparent discursive nonsense. The first study took place at a Young Offender Institution in Denmark, the second inside conventional Danish pigsties, the third with drug addicts in back alleys in Copenhagen, and the fourth in the private homes of parents, who had a child placed in out-of-home care. We analysed the passages of nonsense in relation to their interview settings and the different social contexts of the interviewees. The nonsense, we conclude, expose often overlooked social aspects of contemporary morality and sociology, such as coping with violence and shame, or letting go of the senses in an attempt to escape a particular social reality.

How to be creative in the field and at the desk? Creative thinking in qualitative research.

Krzysztof Tomasz Konecki
University of Lodz, Poland
Krzysztof.konecki(at)gmail.com

I would like to present the possibility of broadening the traditional methodological and technical skills of researcher and analyst but also the intellectual capacity of the researcher associated with combining data, categorizing, linking categories, as well as the interpretation of the causes and consequences of the emergence of certain social phenomena. Some methodologies, methods and research techniques are more conducive to creative conceptual and interpretative solutions. Therefore, I describe the serendipity phenomenon in such methodologies as grounded theory, ethnography, phenomenological research and contemplative inquiry. The problem of intuition in qualitative research will be also described in the paper.

From the review of issues of creativity in qualitative research we can derive the following conclusions:

1. Creativity in qualitative research depends on the strength of a priori conceptualization and stiffness of the adopted methods of research and analysis.
2. If the methodology is more flexible (as the methodology of grounded theory) the researcher can get to phenomena that have not realized of, and which are still scantily explored in his field of expertise.
3. The phenomenological and contemplative approaches allow the use the investigator's feelings and experience as they appear in the studied phenomena, which usually do not take place in

objectifying and positivistic research.

4. The investigator may therefore consciously use these methodologies and approaches that foster creativity.

5. The researchers can improve their skills in thinking and creative action by doing some methodical exercises (journal writing, writing poetry as a summary of the collected data, the use of art as representation of the phenomenon, the use of meditation, observation of the body feelings etc.).

The humor approach in a multi situated ethnography with Roma groups: becoming a reflexive researcher.

Greta Persico

State University of Bergamo, Italy

greta.persico(at)unibg.it

The paper analyses one of the most used research tools, the ethnographic diary, written during a multi situated ethnography carried out with three Roma groups: Sinti in Italy, Roma in Romanian and Calòn in Brazil, from 2009 and 2014. The main focus of the principal investigation were the effects of relations of power between those minority groups and democratic institutions (such as schools, local police and social services). However the topic of this paper isn't the Roma people as it would be expected, but the researcher and her reflexive learning process on the field.

The first part of the paper focuses on three theoretical approaches frames within which: the reflexivity of the researcher in ethnographic field work, humor as approach for doing social research with labeled groups and humoristic writing as a deuteron learning strategies to discover more about themselves, own frames and their effects on the relationships with people involved in the research. The second part of the paper describes the experience of a complementary diary writing, the humorous column (named S.P.Q.R.) based on the same ethnographic material. The "Sono Pazzi Questi Ricercatori" (Those researchers are crazy) column consists of several episodes written with an ironic style describing critical and intercultural incidents, embarrassing or funny circumstances happened in the field. In this narrative humor becomes a mean through which the author reaches a deeper awareness of her own limits, frames, and meaning about what was happening during the fieldwork. Therefore, this peculiar version of reflexivity and of reflexivity writing, becomes an attitude of research, a matrix of thought.

Reflexivity as a Methodological Resource

Larissa Schindler

JGU Mainz, Germany, Germany

larissa.schindler(at)uni-mainz.de

Questions of quality standards in methodology are often raised in a normative, rather than in an empirical way. This is reflected in the fact that the everyday practices of social and cultural studies have been excepted for a long time from Science and

Technology Studies, that have moved everyday activities of the sciences, i.e. their practices, into the focus of sociological research. This is the case even though important sociological thinkers like Bourdieu, Garfinkel or Luhman have placed sociology within their social theory and even though reflexivity has been the topic of a downright fervent debate. In the last few years, however, a considerable number of studies has been concerned with (qualitative) sociological research in practice, that is with the sociological description of sociological work. Interestingly these studies do not draw a connection to questions of methodology; some of them explicitly refuse to do so, for they understand it as a primarily normative concern.

In my paper, I claim that the reflexivity inherent to this practice (qualitative research) can be understood as a valuable methodological resource. Thus, questions of methodology can be raised on an empirical basis. Particularly I suppose to start questions of methodology by closely examining the research practice, as I will do based on empirical data from a qualitative study on air-travel. In this way we gain a deeper insight into the dynamics and procedures of this research practice and can thus develop quality standards on a profound basis.

RN20 | Session 03a Ethnography II

How do you get access to violence-promoting Islamist extremist environments?

Henriette Frees Esholdt

Lund University, Sweden

henriette.frees_esholdt(at)soc.lu.se

Based on an ongoing research project, this paper discusses the methodological challenges of accessing violence-promoting Islamist extremist environments, specifically those in Sweden, in order to collect qualitative data. Recently, there has been an increased interest among researchers in examining why young people raised in the West are attracted to violence-promoting Islamist extremism. To understand this question, the obvious solution would be to go directly to the source: the young people themselves. However, it is difficult to generate data by going directly to the source in this case. How should you as a researcher identify potential informants, where do you find them, and how do you contact them? As other researchers have noted, going into a university or a mosque and asking for interviews with those who share the views of individuals suspected of planning terrorist acts is unlikely to be successful. One possible way to recruit informants is to interview people participating in so-called exit programs or people convicted of terrorism. However, there are no such exit programs available in Sweden at the moment, and very few individuals have been convicted of terrorism. This paper discusses "go-alongs" (a combination of observation and interview) with persons in preventive work against Islamist "radicalization" (e.g. police and social workers), when they are to have some kind of meeting (e.g. preventive conversations) with young

people at risk of getting involved in violence-promoting Islamist extremism, as one possible method to get access to “radicalized young people” in Sweden.

Meetings and documents: Making the background a topic for detailed ethnographic inquiry

Katarina Jacobsson

Lund University, Sweden

katarina.jacobsson(at)soch.lu.se

A growing proportion of the working hours for many employees in contemporary organizations are devoted to administrative tasks. Organizational researchers have portrayed and analyzed this phenomenon with terms such as, for example, administration society, governmentality, and audit society. Administrative practices, such as meetings and paperwork, are often depicted as means for conducting core tasks, or as background noise, delaying or interfering with professionals' primary duties. But what happens if we take on anthropologist Helen Schwartzman's invitation to put meetings and documents in the foreground? In a new project on the dynamics of administration we aim to formulate explanations of contemporary work life beyond the usual bureaucracy criticism. Methodologically, this means an approach where principal tasks of an organization (i.e. education, health care, social services) are bracketed in favor of a systematic study of peripheral tasks. This approach can add to the general view on increasing administrative work represented in research, working life, the mass media; mainly that it is a burden imposed from above. By focusing our observations on meetings and how documents are used before, during and after meetings, we find that there is often an immediate and taken for granted administrative orientation from the professionals themselves. Human service workers, for instance, show a peculiar busyness with “meta-administrative” tasks such as drawing up flow-charts of decision-making processes, making elaborate check-lists, producing graphic models or statistics in bar charts to be presented at the staff meeting, etc. In this paper, I exemplify how the strategy of moving the background to the fore may give opportunities to discover new aspects of a phenomenon – in this case the joy, aesthetic, and magic of administration.

Negotiating Mevlevi Sufism: An Ethnographic Attempt for Policy

Nevin Şahin

Ankara Yildirim Beyazit University, Turkey

nevinshahin(at)ybu.edu.tr

Being a Sufi tradition of 8 centuries, Mevlevi Sufism experienced a peculiar process of transformation in the 20th century. Following the prohibition of its practices in 1925, the order lost its centuries-old ties but evolved into cultural heritage, thanks to the inherent indulgence. Being awarded the official title “intangible cultural heritage of humanity” by UNESCO in 2008, the ritual enjoyed international recognition but it also suffered from popularization and politicization,

not only on national level but also around and beyond Europe. The Turkish government, being held responsible for the preservation of the cultural heritage by UNESCO, started to take action against misrepresentations of whirling dervishes, sema ceremony and Mevlevi Sufism. However, the representation of Mevlevi Sufism by the state has also been problematized as well as the representations by tourism entrepreneurs and “fake religious leaders”. What can an ethnographic study on the transformation of a ceremony from religious ritual to cultural heritage and touristic commodity offer in terms of representation and preservation in unmaking and remaking Europe? How is the researcher influenced by the field and how does the field impact policies on religious rituals? The findings of the ethnographic field research on Mevlevi Sufism in Turkey and Italy conducted between 2013 and 2015 are to be considered in this paper around power relations so as to reflect on the relationship between research and policy.

Ethnography as “a way of being in the world” – Managing non-linearity in a multi-sited ethnography on home births

Mário J.D.S. Santos

University Institute of Lisbon (ISCTE-IUL), Portugal

mariojdsantos(at)gmail.com

There are many known ethical and methodological challenges in researching the field of health through the lens of social sciences. However, accessing and being in the settings surrounding home births is not hindered by formal barriers. On the contrary, the non-linearity of the research process demands keeping low levels of formality and high levels of engagement, which might be argued as compromising the use of ethnography as method.

During the first months of fieldwork, my wife's pregnancy and our later option for a home birth entangled me in a messy combination of the lived experience of first-time fatherhood and the unplanned, reflexive and inquiring gaze of autoethnography.

Also, accessing a doula course, usually exclusive for women and discursively grounded in essentialists perspectives, required full participation in all activities, including several moments of sharing each participant's private, family, and sexual life. My (male) presence triggered discussions on gender that allowed me to undercover a set of findings which would be difficult to meet if I were a woman. In the end, I was granted the exception of being accepted as a doula within the wider community of practice.

Qualitative research methods often feature methodological flexibility. Yet, acknowledging the non-linearity of this research process meant more than accepting the possibility of adapting or changing the strategy along the way. It required framing ethnography as a way of being in the world rather than a method, and a creative management of the complexity inherent to the diversity of contexts linked to home births.

RN20 | Session 03b Objectivity, Subjectivity and Reflexivity II**Going through the (E)Motions: Thoughts about reflexivity, emotions and qualitative research**

Lior Elefant

Tel Aviv University, Israel
lior.elefant(at)gmail.com

When I started writing my MA thesis, in which I analyzed the gender-mixed Israeli-Palestinian dialogue encounter space through the experiences of Jewish-Israeli women, I was very involved in the field. I thought the encounters were one of the best ways in which civil society can contribute to the peace process, and one of the few spaces in which women and men have the same opportunities and influence. While The Israeli-Palestinian Dialogue Encounters research field is vast, the gender perspective is generally neglected, and the male perspective is considered universal. As I feminist, I decided to make nine in-depths interviews with women who participated in a dialogue encounter. However, when I finished the interviews, I realized I was wrong about the encounters, and my research almost collapsed. Moreover, the women talked mostly about their feelings, and one of the main themes that stood out was how emotional the encounter was for them. In a field that is mostly concerned with "objectivity" and "Knowledge", I knew that I had to create a new research format. One that will enable the reader to experience the research emotionally and thus not only contribute to the discourse, but maybe also make actual change.

In this paper, I wish to present some of the challenges that I had faced during various stages of my research. I would like to take you on a journey that connects the heart with the mind and maybe leads to a new way of thinking about conflict resolutions and peace research.

The Capitalist City and Demands for more Democracy. Methodological Reflections on Objectivity and Subjectivity

Chantal Magnin

Institute for Social Research in Frankfurt, Germany
magnin(at)em.uni-frankfurt.de

New and direct forms of public participation are being tested in urban planning projects. Within these processes the participants expect to be more involved, which leads to a concept of citizenship with a higher focus on political co-determination and proximity to political decision makers. Those informal forms of public participation in large-scale urban planning projects represent a focal point of various normative views of democracy, solidarity and urban life.

This paper discusses the initial results from of an ongoing qualitative research project which focuses on the expectations of citizens who are involved in these forms of participation in Germany and Switzerland. The reconstruction of their expectations towards democracy is conducted by means of interviews. They are contextualized by analysis of the invitations to the

participation processes as manifestations of the institutional settings. By comparing projects in Germany and Switzerland it will be possible to find out how the influence of institutional requirements can be weighted when attempting to answer the question according to specific normative patterns. The differences between democratic claims will be reconstructed in the context of the growth in importance of cities for capitalist investments, their rapid development, and the search for new patterns of adequate problem-solving.

Against the background of this research project, I want to ask how and if we could understand subjective claims and the frame of reference (Erving Goffman) as specific forms of subjectivity or objectivity. An alternative would be an approach that focuses on phenomena and problem situations more from a perspective of a structural sociology.

An attempt fuzzy analysis of the political opposition factors

Evgenii Evseev

Saint Petersburg State University, Russian Federation
e.evseev(at)spbu.ru

One of the key issues relevant to social studies of the society's political functioning lies in identifying objective factors of transformation of the political space formed with the help of democratic structures. From a practical point of view, the most interesting challenge is to analyse the dynamics of political support among the population expressed through the fundamental right to elect public authorities.

It seems reasonable to structure political space with regard to the current government and look at divisions related to support of / opposition to the ruling government.

One of the ways to overcome limitations typical of classical quantitative methods in the study of the voting process is to apply fuzzy sets Qualitative Comparative Analysis (fsQCA), suggested by Charles C. Ragin. An attempt was made to show that the fuzzy mathematics methods, in particular fsQCA, are the most adequate and powerful in such cases when it is necessary to take into account some factors, qualitative in its essence.

The main part of the report contains the results of the analysis of empirical sociological research conducted in the Pskov region in Russian Federation (2013). The study revealed the complex relationship between the treatment of the political opposition and the xenophobic members of certain groups. The obtained results show that the support of political opposition among Pskov Region respondents is in many ways determined by the level of their xenophobia. In particular, it failed to identify that the support of administrative bans in relation to different groups is a typical feature of the declared support of political opposition.

Fieldwork and the Field: Socio-anthropological Explorations.

Jeuty Thakur

Jawaharlal Nehru University, India

jeuty_thakur(at)yahoo.com

One of the key methods of qualitative research has been the practice of fieldwork. However, it has travelled far since Malinowski did his fieldwork in the Trobriand Islands, both with regard to the methods and techniques used, and the kind of communities and problems studied. Far from being a mere research technique, fieldwork has become an integral experience both of sociology and social anthropology. The proposed paper will have a theoretical focus and interrogate the concept of the 'field', its evolution over time and its various connotations in the sociological world today. It would also include an exploration of the relationship between the researcher and her 'objects' of inquiry, bringing in the ideological strands of objectivity and subjectivity. Following the diktat of Methodological Dualism, should the researcher erect a wall of separation between herself and her 'objects'? Or should one follow the lines of Methodological Monism which breaks the wall and the researcher's own self, far from being withdrawn, becomes active and relational? What does this kind of reflexivity entail for the process of research? Is it a compromise with 'objectivity', or does it bring in new elements in the way research and fieldwork is essentially understood? From Emile Durkheim to Clifford Geertz to M. N. Srinivas to Alvin Ward Gouldner, the paper would map the developments in the theoretical positions over time.

RN20 | Session 04a Participation and Observation

The Research Forum as a Conceptual Frame for Social Self-Clarification in Participatory Research

Stefan Thomas

University of Applied Science, Potsdam, Germany

stefan.thomas(at)fh-potsdam.de

Participatory methods proliferate an ongoing research process based on communication and understanding between the research partners who are involved in their daily life practices and the researchers. The research forum can be conceptualized as a communicative space where active participation of the co-researchers becomes a reality. It aims at an ongoing discussion for social self-clarification with regards to the research topic between science on the one hand, and situated practices on the other. The paper wants to introduce a conceptual frame inspired by the Roman Forum in which democratic aspirations of modern society are combined with the scientific quest for knowledge and the pursuit of reflection. There are four levels, that I want to exemplify with my research experience, by which the aspirations of the research forum are brought forward:

- opening up spaces for Social Encounters
- establishing Communicative Practices

- proliferating Social Self-Clarification
- encouraging Public Opinions and Counterpublic Discourses

The paper argues that establishing a research forum is a key for successful exchange of and interlinking the perspectives of all sides involved in a research project. The background of the methodological considerations is found in three participatory research projects that I have conducted in different contexts—in a homeless shelter, in intergenerational co-housing projects, and in a peer research group with unaccompanied minor refugees.

Participatory approach to foster evidence-informed policy making and social inclusiveness in Europe

Adriana Valente, Valentina Tudisca

The National Research Council of Italy, Institute of

Research on Population and Social Policies, Italy; The

National Research Council of Italy, Institute of

Research on Population and Social Policies, Italy

adriana.valente(at)cnr.it,

valentina.tudisca(at)irpps.cnr.it

Although Europe longs for being defined as knowledge-based society, public policies are far from being informed by evidence, due to competing elements influencing policy making, but also to the lack of tools to understand if policies are evidence-informed. Here we show how qualitative research can be relevant to the policy process to elaborate measurable indicators, presenting a participatory methodological approach for developing, validating and contextualizing indicators to assess if and to what extent a health policy is evidence-informed and social inclusive, by involving stakeholders and vulnerable groups. This process consisted of several interdependent steps of knowledge co-production. The first draft of indicators was developed based on theoretical frameworks - Evidence-Based Public Health, Knowledge-to Action Cycle, Stages-of Knowledge Use and Organizational Change theories - as well as policy analysis, stakeholder interviews, policy game and stewardship interventions in three European countries. Then we involved researchers and policy makers in public health and cross-sectors from six European countries (Denmark, Finland, Italy, Netherlands, Romania, UK) in two internet-based Delphi rounds to collectively refine, integrate and validate the initial indicators (76 panelists), followed by participatory national conferences to contextualize the validated indicators by assigning them to policy phases and performing SWOT analysis, widening the participation at national, regional and local level (103 participants). Having jointly considered perspectives of researchers and policy makers from different sectors, at different territorial levels, ensures common understanding of the indicators and incorporation of common social values, fostering joint use of the indicators by both communities at national and European level.

How to Do Things with Words: The Analysis of

Power Relations through Participant Observation

Ulrike Tikvah Kissmann, Christoph Sucherdt
University of Kassel, Germany; University of Kassel,
Germany
ulrike.kissmann(at)uni-kassel.de,
christoph.sucherdt(at)uni-kassel.de

John Austin has demonstrated that people can “do things” – bring about social facts – with words. We will present findings from our study on the youth welfare service where we analysed the day-to-day practices of professionals. The way social workers talk about routines is a means to establish power relations within these same routines. Through talk they distribute agencies that enable or prevent actions of their co-workers vis-à-vis the children. We will use the protocols from participant observation in order to show how words transform social relations and bring about real facts. Drawing upon Ethnomethodology we investigate participants’ accounts of their day-to-day practices. We will show that many accounts consists in “he or she said that he or she says...” and that these words are a means to wield power because they help to control agencies and resources. Finally, we want to ask whether one can also “do things” with things and to broaden the discussion from words to materialities. We are planning to collect video data and we may be in the position to support the discussion by way of example.

RN20 | Session 05a Videography and Visual Research**Thematic Analysis of Visual, Sonic and other Non-Textual Sources**

Jen Tarr
London School of Economics and Political Science,
United Kingdom
j.s.tarr(at)lse.ac.uk

Thematic analysis is a widely-used tool in sociology, one which goes by a variety of names including interpretive or qualitative content analysis. As a method, it aims to find key descriptive and analytic themes within a body of data and to develop these in relation to relevant literature. However, the majority of applications of this method have involved text, usually in the form of interview transcripts but sometimes also documents and archival materials or ethnographic fieldnotes. How does one apply thematic analysis to visual and other sensory materials?

The Communicating Chronic Pain project examined non-textual strategies for communicating about pain, using social media images, drawings, sculpture, concept maps, digital photographs and sound recordings. This paper will explore how we adapted the tools of thematic analysis for use with these materials, and why we chose this method over more typical analytic strategies for visual materials such as semiotics. How do we identify key ‘themes’ in materials as abstract as sound recordings? And can this provide broader insights into the processes of analysis in qualitative research? These issues will be

explored with a view to enhancing our understanding of quality indicators in qualitative approaches.

Visual Research in the 21st Century: Trends and Challenges

Nicolas Martin Legewie, Anne Nassauer
Deutsches Institut für Wirtschaftsforschung (DIW
Berlin), Germany; Freie Universität (FU Berlin),
Germany
nlegewie(at)diw.de, anne.nassauer(at)fu-berlin.de

Since the early 2000s, the proliferation of cameras has led to a tremendous increase in visual recordings of human behavior. Mobile phones, CCTV, or body cameras capture the daily lives of people, as well as extraordinary events; interpersonal interactions, as well as group dynamics. This vast novel pool of data enables new approaches to analyzing human behavior and situational dynamics. Applications range widely, from sociology and psychology to criminology, education, and beyond.

Despite the great potential and numerous applications of this approach, a consolidated methodological frame does not exist. Our presentations aims to discuss opportunities and challenges these novel types of data entail for qualitative research. In addition, we will draw on various fields of study to outline what we call “Visual Data Analysis” (VDA); a methodological framework for analyzing visual data of behavior, interactions, and situations;. We discuss VDA’s research agenda, methodological forebears, and applications. Further, we introduce an analytic toolkit and discuss what quality standards need to be assured when using visual data for qualitative analysis. How can validity be ensured when studying human behavior and interactions caught by CCTV or mobile phone cameras? How might VDA yield new insights on meaning making and solidarity between and within groups in the 21st Century? With this paper, we aim to contribute to establishing VDA as a methodological frame and as an interdisciplinary analytic approach. The paper aims to enhance efficiency and comparability of VDA studies and foster communication between different disciplines employing the approach for qualitative research.

Video and the Arts: How Audiovisual Ethnography Shapes the Sociological Perspective

Dafne Muntanyola Saura
Universitat Autònoma de Barcelona, Spain
dafne.muntanyola(at)uab.cat

Does video as a tool modify the sociological perspective? We present here a methodological reflection on an audiovisual ethnography of a dance studio with the neoclassic company Wayne McGregor Random Dance, together with other examples from research on filmmaking and visual arts. Martin Jay (1999) points out that we live in an era of ocularcentrism. The philosopher defines a shared epistemology that shapes cultural and artistic production around the image. Dancers and audiences share visual typifications such as the romantic duet.

We claim that the sociological view in audiovisual ethnography needs theory. Through a natural history (Cicourel: 1974) of qualitative data collection and analysis, we show how the video happens to be a key tool in the research process. The video camera shapes the dynamics of fieldwork methods such as observation and interviewing. As part of the ethnographic method, it also modifies data analysis. We will explain the role that ELAN ©, Atlas.ti and other audiovisual softwares play in the reconstruction of ethnographical texts. We will also explain the do's and don't's of tool use by the members of the research team and the dance company. An audiovisual ethnography of dance appears as flexible and methodologically relevant. In complex and seemingly chaotic work environments, such as artistic settings, audiovisual tools can help the researcher understand the patterns of creative interaction and communication. However, reification, intrusiveness and subjectivity may still be present in the field work. Thus, the use of video tools calls for a methodological awareness based on reflexivity, literality and reproducibility.

How visual narratives influence the projected image of a tourist destination. A Japanese focus on Transylvania

Florin Nechita, Hiromasa Tanaka, Sami Kajalo
Transylvania University of Brasov, Romania; Meisei University, Japan; Aalto University, Finland
florin.nechita(at)unitbv.ro, tanakahi(at)leal.meisei-u.ac.jp, sami.kajalo(at)aalto.fi

Tourists use visual content in order to capture their experiences with other people, places and cultures. This paper investigates the influence that visual narratives have on the projected image of a Romanian tourist destination - Transylvania. Visual data has been used in the research for both the quantitative and qualitative methodological approach. The implication of qualitative methods emerged from the principal approach of this research to obtain an in-depth understanding of how visitors perceive, interpret and communicate the social reality of the visited destination. The qualitative study investigated how photographs and films taken by 14 Japanese students while participating at TCC project affect perceptions on Transylvania as a tourist destination by their colleagues and friends. The quantitative approach came from the study's specific focus on potential visitors' perception of several destination attributes, previously identified using the content analysis of the visual data collected by the Japanese visitors.

Japanese visitors' perceptions of the analyzed destination communicated in visual form are full of insights that should inspire authentic and effective promotional campaigns, where destination marketing organizations need to incorporate user-generated content in their marketing communication.

Videography of String Quartets

Theresa Vollmer
Technische Universität Berlin (TU Berlin), Germany
theresa(at)soz.tu-berlin.de

In general, very little sociological research has focused on the detailed process of playing music together. This also applies to playing music in a string quartet. The very few existing sociological investigations about string quartets don't treat the concrete playing of music.

Playing music together is an excellent subject to analyze the bodily communication within a group of musicians 'on stage'. Videography and video interaction analysis is able method to analyze the nonverbal interaction between the musicians. Thus the music itself can be subject of an investigation. The videography is embedded in a focused ethnography, but the special input of this research project, is the subjective perspective of a musician, which is one of the main issues of the research.

The researcher herself is playing the violin cello in a string quartet and thus able to reconstruct the subjective perspective of a string quartet member – including the special kind of seeing, hearing and feeling. Furthermore, the rehearsals of the quartet are filmed. In this way, the author analyzes the playing music from a lifeworld approach and triangulate this angle to the interaction perspective, which based on the video interaction analysis.

First results shall be presented and methodical and methodological aspects of the research will be discussed.

RN20 | Session 06a RN20 Keynote session: Mixing and Merging Methods

Beyond mixed methods: the merged methods alternative

Giampietro Gobo
University of Milan, Italy
giampietro.gobo(at)unimi.it

After the initial life (which coincides with the origins of social research in the 1850s, and lasts until 1940s), mixed methods revive at the beginning of 1970s. However, this second life (or renaissance) receives the deleterious imprinting of quantitative methods. In fact, some of the old positivist assumptions are still reproduced and active in most of mixed methods research. This imprinting is traceable in the ambiguity (and purposive semantic stretching) of the term 'qualitative': from the 1990s, it encompasses almost everything (even approaches considered positivistic in the 1950s!). Whereby the semantical extension of the term 'qualitative' has become a sort of Trojan horse for a new legitimation of many quantitative and positivist researchers: a great swindle.

Today 'qualitative' is nonsense and acts as a bug, which muddies the qualitative-quantitative debate. For this reason, it would be better to remove the bug (i.e. to discharge the term 'qualitative' from the language of social research and methodology), reset and start over from the level of specific research methods, considering carefully and balancing their diversity before mixing them.

The paper outlines two (complementary) ways to

integration of methods (“mixed” and “merged”), arguing that merged” methods realize a higher integration than “mixed” methods, because the former overcome some weaknesses of the latter.

“Using the Research Question to Ground Rigorous Research

Marie Buscatto

University of Paris 1 Panthéon Sorbonne, France
marie.buscatto(at)univ-paris1.fr

As beautifully demonstrated by Giampetro Gobo in his criticism of the Mixing Methods argument in favour of the Merging Methods one, the current opposition between qualitative and quantitative methods is not only sterile methodologically and inappropriate epistemologically, but it mainly prevents us from developing adequate epistemological discussions on the use of methods.

Our argument is to show that using the research question as the ground on which to base our epistemological thinking would help solve such difficulties (Buscatto, 2016, 2017). It not only helps the researcher guide her choice of methods throughout her research, but also gives him ways to make sure that collected data throughout one’s research with different methods can be analysed all together in meaningful and appropriate ways in order to avoid misinterpretation or over-interpretation.

Based on our experience as an ethnographer studying the marginalisation of women in the French jazz world (Buscatto, 2007, 2010), we will show how this obsession with developing and testing our research question was key in not only defining which method to use step by step – observations, quantitative data, interviews, newspapers analysis -, but also in deciding how to merge them when analysing our “data” to build-up sound sociological results as rigorously and meaningfully as possible.

Merging methods: Tensions in care interviews for collecting big data

Gerben Moerman, Laila Wiersma, Roman Pankow
University of Amsterdam, Netherlands, The; University of Amsterdam, Netherlands, The; University of Amsterdam, Netherlands, The
gmoerman(at)uva.nl, l.wiersma(at)uva.nl,
Roman.pankow(at)student.uva.nl

In this paper, we critically reflect on Giampetro Gobo’s logic of merged methods in light of our

experiences with new data collection methods, using care interviews to collect big data. These care interviews form an interesting case study of tensions in a merged methods setting, and how participants deal with these tensions.

Our study forms part of a larger programme of research collecting large-scale longitudinal epidemiological data on children age 0-4, who along with their parents, attend preventative public health services for children in Amsterdam. The data gathered are classical epidemiological data, such as height and weight, but questions on “softer” information, such as perceptions and satisfaction of the parents on growth, food, sleep and movement have been added. For the collection of these big data, conversational “interveys” (open questions with closed answers) are held in the care meeting between a nurse or doctor and (a) parent(s) and the child.

Based on video-analysis, what we see is that in these interveys tensions arise in logics and priorities of conceptualisations between parents, health professionals and the epidemiologists. Eventually these care interviews even become microcosms for classical mixed methods tensions in ontology and epistemology. What is remarkable, however is the skilful management of these different logics by the health-professionals and parents. In this paper, some examples of tensions and their solutions are shown.

RN20 | Session 07a Whose Side are we on? Ethics and Action in Qualitative Research

“Ok guys: what is actually your real assignment?” – The micropolitics of at-home ethnography

Markus Gottwald, Frank Sowa

Institute for Employment Research, Germany; Institute for Employment Research, Germany

markus.gottwald(at)iab.de, frank.sowa(at)iab.de

The paper presents an ethnographic study with a specific institutional constellation: The research project undertaken by the Institute for Employment Research (IAB) seeks to explore the enhanced system of targets and controlling in the German labour administration. This is remarkable because the IAB is not only a well-known and recognized research institute in academia but also a specialized department of the German Labour Administration itself. This means that from the outset the project’s ethnographers are interwoven with their observational subject in a structurally unavoidable way. Their organisational affiliation makes them part of their field of study. The greatest challenge for ethnographers originates from the projects political dimension: The design and the implementation of the accounting system is an organizational battleground where different actors are having different interests. Within this context the ethnographers become micropoliticians because of two reasons: Firstly, the ethnographers are considered to have micro political power. So, for the administrative staff it is important to figure out – paraphrasing Becker – “Whose side they are on?” Secondly, due to attempts to make the

ethnographers allies for their own purposes the researchers have to act just like micropoliticians in order to maintain scientific autonomy. Therefore, it is all about keeping the distance. In this respect the paper will provide methodological and technical strategies avoiding the possibility of 'going native' as well as the threat of being crushed between different interest groups.

Adding you up and fitting you in? Ethical challenges in longitudinal designs with vulnerable groups

Signe Ravn

University of Melbourne, Australia

signe.ravn(at)unimelb.edu.au

Doing research over time is crucial for studying processes of social change and the ways in which individual pathways take form and subjectivities are forged and in the past decade or so, qualitative longitudinal methods (QLR) have been gaining increasing popularity. This is also the motivation for a longitudinal design in my current research project; an ongoing qualitative project focusing on the everyday lives and imagined futures of young women with disrupted educational pathways in Victoria, Australia. The project will follow the women over two years, allowing for a close investigation of how a particular historical time (post-feminist, neoliberal) and geographical place (Australia, transitioning to a post-industrial economy, gender-segmented labour market) combine to form a landscape that poses substantial challenges for a group of young people that do not conform to the normativity of linear educational trajectories. However, as much as longitudinal designs hold great promise, they also come with a set of ethical challenges, in part due to the 'cumulative power' (McLeod & Thomson 2009, p. 76) of information as new waves of data are added to the research, but also in terms of managing the researcher-participant relationship over time and securing low attrition rates. In addition, researching a group that may already feel monitored and 'judged' only adds to these challenges. In this presentation I draw on experiences and examples from previous research on vulnerable youth to identify and discuss potential ethical challenges. I then turn to a discussion of ways of giving the participants a more active stake and agentic experience in the current project, and in qualitative research designs more broadly, by looking to more participatory and imaginary methods.

From "public" to "open", then onto "big" data: Ethical and methodological considerations about online social research

Styliani Barmpati, Georgios Vagias, Konstantinos Koskinas, Maria Koletsis, Alexios Brailas
Panteion University of Social and Political Science, Greece; Panteion University of Social and Political Science, Greece; Panteion University of Social and Political Science, Greece; Panteion University of Social and Political Science, Greece; Panteion University of Social and Political Science, Greece

stellabarbati(at)gmail.com,
george.vagias(at)gmail.com, kkoski(at)panteion.gr,
mariakoletsis(at)yahoo.com, abrailas(at)yahoo.com

The transition from Web 1.0 to Web 2.0 and, recently, to Web 3.0 resulted from changes and transformations concerning the technologies of interaction, communication and networking. From HTTP protocols and websites emerged blogs, social networking media, wikis and folksonomies, and subsequently, the semantic web, open technologies and "big" data. This transition was paralleled by an unprecedented explosion in the volume of information and data that is daily produced and delivered in the context of the political economy of the internet. According to the Internet Live Stats, which is overseen by the World Wide Web Consortium (W3C), the rate at which users of the cyberspace create, publish and "consume" digital content – posts and comments in communities, fora, blogs and social media platforms (Facebook, Twitter, Youtube, etc.) – is truly frantic. This is an unprecedented wealth of information that simultaneously generates but also occurs as a result of the virtual (as a convergence of online /offline social interconnections) life of individuals. Furthermore, it is a volume of data that social scientists can quite easily find (searchability), retrieve (accessibility /openness) and study, provided that this is found in a permanent and trusted location in cyberspace. With the above in mind, the paper will explore: a) the methodological tools and limitations social scientists should deploy in a virtual context; b) the code of ethics that protect both the researcher and the users; c) the appropriate methods that ensure validity and reliability of the findings, given that these are at the same time part of the content – from an academic and research point of view – of the web.

RN20 | Session 08a Combining Methods

Using Qualitative Methods to Unpack Emergent Phenomenon: Exploring the Complementary Use of fsQCA and Narrative Analysis

Jeremy Schulz, Laura Robinson

UC Berkeley, United States of America; Santa Clara University, United States of America

jmschulz(at)berkeley.edu, laura(at)laurarobinson.org

This study provides methodological reflection on the grounding of qualitative research on two levels: 1) the use of formalized qualitative comparative analysis (fsQCA) and 2) the use of mixed methods highlighting traditional strengths of qualitative methods alongside emergent methodological opportunities. We show how both of these qualitative methodological approaches provide unique strengths opaque to quantitative approaches. To do so, the research examines how we linked qualitative data from original questionnaires and interviews to a novel analytic technique: Formalized qualitative comparative analysis (fsQCA). The results show how these qualitative methodological approaches provide nuanced analysis maps multiple pathways to loan-aversion on the part of male and

female high school students from a California high school. Formalized qualitative comparative analysis (fsQCA) techniques are employed alongside process-tracing with qualitative data to accomplish two analytical tasks: 1) distinguish distinctively female and male forms of prospective loan aversion and 2) explain how these types of loan aversion emerge. The fsQCA analysis is employed to identify three distinct near-sufficient pathways to loan aversion, the anticipatory pathway, the parental background pathway, and the borrowing experience pathway. Narratives from the interviews with the students who best exemplify each of these pathways are used to explore the generative processes behind them. These results are discussed as methodological exemplars to show how the use of qualitative methods sheds light on loan aversion arising from both gender-differentiated expectations about the future as well as gender-differentiated experiences in the past. This being said, presentation of findings is secondary to the larger (and primary) discussion of qualitative methods, their strengths, and their potential uses in tandem with one another, as well as emergent qualitative approaches.

Quantifying Qualitative Findings in the Imitation Game Method

Otto Erik Segersven, Ilkka Arminen, Mika Simonen
University of Helsinki, Finland; University of Helsinki, Finland; University of Helsinki, Finland
otto(at)segersven.fi, ilkka.arminen(at)helsinki.fi, Mika.Simonen(at)helsinki.fi

The Imitation Game is an experimental research method in which participants from two different groups, via computer mediated typed communication, with their own questions and answers, attempt to imitate one another's social group as well as identify the imitating non-group members from genuine group members. The method – based on Alan Turing's artificial intelligence experiments – was further developed by Harry Collins and his team for social scientific purposes.

The most common analysis of the data is quantitative and aims to inspect the distribution of interactional expertise - a knowledge referring to the individual's capability to grasp the conceptual structure of another's social world. The results are interpreted as illuminating how inclusive or exclusive social groups are and provide an analytical insight on the social group composition of societies.

Our preliminary qualitative work, however, has shown that different groups use different types of questioning strategies – questions and their assessments – making straightforward comparisons between groups or societal group compositions obsolete. Instead, we propose that imitation game experiments make visible interpretative practices of meaning making of group formation, revealing people's methodical practices of building alignments between members of (different) groups, and in that way constructing social groups. In our current research, we aim to operationalize our qualitative analytical framework to quantitative

purposes in the hopes of giving quantitative support to our initial findings.

A Survey in Parisian Public Baths. When Quantitative Data Lends Itself To Qualitative Analysis.

Géraldine Vivier, Françoise Courtel
National Institute for Demographic Studies, France; National Institute for Demographic Studies, France
vivier(at)ined.fr, francoise.courtel(at)ined.fr

As a heritage from the hygienist movement which spread new norms of comfort and well-being from the late 19th century onwards, seventeen public baths remain in Paris today. They receive (free of charge and without restrictions) anyone who wants to have a shower, and especially people with no access to hot water and/or privacy (Lévy-Vroelant, 2016). Nevertheless, users and uses of public baths are little-known. Who goes to public baths, in which circumstances? What role do these amenities play in the city today? To answer these questions, a quantitative survey based on a random sample of users was tested in 2016. A self-administered questionnaire was designed, and translated into Arabic, Romanian and English to maximize participation. This test allowed to improve the survey protocol and paved the way for quantitative and qualitative analyses. In this presentation, we focus on the way the data (users' flows, questionnaires) can be examined in a qualitative perspective as so many "snapshots" of the people who turn up (or not) at a given time in a given bathhouse, e.g. depending on origin or gender. Taking advantage of the self-administered questionnaire, we zoom in on Sudanese refugees who seized the opportunity to express themselves about their situation. Taken as an archive, in form and content, their questionnaires show the solidarity but also the heterogeneity of people sharing the same refugee status and living conditions in a makeshift camp in Paris. Thus, besides their hygienist vocation, public baths appear as "front-line amenities" for the most vulnerable.

Social network analysis: combining quantitative methods with qualitative approach

Daria Maltseva
Higher School of Economics, Russian Federation
d_maltseva(at)mail.ru

Social network analysis was institutionalized and became widely known as a form of quantitative methodology, which uses different formal statistical and graph metrics to calculate the relationships between different actors (people, their groups or organizations) represented as networks [Wasserman, Faust, 1994]. At the same time, there is also a tradition of qualitative approach in social network analysis. Even though originally this approach was created in 50th by social anthropologists, its development took place in late 80-90th, together with the stream of "cultural turn" in sociology and the appearance of the field called "relational sociology"

[Emirbayer, 1997; White, 2008; Hollstein, 2011]. The next possible direction of the social network analysis development is the integration of quantitative and qualitative approaches, which corresponds to the “mixed-methods strategy” of research. The main idea of this integration is to consider the “dual nature of social reality” by focusing both on network structures of relations and external contexts and internal individual meanings of these relations [Bidart, Cacciuttolo, 2013; Bolibar, 2015]. We study the structure of professional community of Soviet and Russian sociologists by means of network analysis of biographical interviews, using the integrative approach. In the presentation, we will present the model we use to combine the structural analysis of data with its qualitative characteristics, such as relational contexts, modality of ties and temporality.

RN20 | Session 08b Narratives, Narrative Research and Time

Analyzing spiritual transformation: A qualitative, multimethod approach

Amir Sheikhzadegan, Michael Nollert
University of Fribourg, Switzerland; University of Fribourg, Switzerland
amir.sheikhzadegan(at)unifr.ch,
michael.nollert(at)unifr.ch

Adopting an integrative theoretical approach in a comparative research on religious conversion and reconversion to Islam – with reconversion being defined as the re-embrace of one’s own (neglected) faith – we develop, in line with Jindra (2014), an analytical instrument which integrates three qualitative methods:

- a) a biographical approach including narrative interview after Schütze (to analyze individual life stories) and grounded theory after Strauss and Corbin (to compare the individual life stories);
- b) an analysis of the social networks relevant to the conversion process;
- c) an analysis of the social-constructivist aspects of conversion narratives, which stem from the religious tradition the individual has converted into.

Our model differs, however, in two aspects from Jindra’s:

1. Religious conversion and reconversion as specific forms of “spiritual transformation” (Paloutzian 2005) also imply a transformation of the identity of the (re)convert (Travisano 1970; Paloutzian 2005; Gooren 2010). Even though an analysis of individual life stories after Schütze usually renders a good understanding of the identity of the respective subject, we integrate, for this purpose, the method of “reconstruction of narrative identity” developed by Lucius-Hoene and Deppermann (2004), as we expect it to yield a more systematic and profound insight into the identity transformation.
2. In order to better analyze the social networks of the subject, we apply the method of network card combined with a “names list” and a “names

interpreter”, as it has been reported to be a promising qualitative network analysis tool (cf. Richter and Nollert 2014; Dahinden 2015).

Networks as identification resource – Evidence from narrative self-verifications of nascent entrepreneurs

Stefan Bernhard, Nilgun Massih-Tehrani
Institute for Employment Research, Germany; Institute for Employment Research, Germany
stefan.bernhard(at)iab.de, nilgun.massih-tehrani(at)iab.de

The presentation draws on and develops qualitative methods in network research. It focuses on aspects of social networks that formal (quantitative) methods neglect, i.e. social networks as identification resources. While research on social capital has stressed the importance, varieties and challenges of networks as resources, their contribution to identification processes has attracted little attention. In light of the emphasis given to “identity” and “interaction” in recent network theorising, this is an astounding omission. We address this research lacunae by looking at processes of self-verification in the transition from unemployment to self-employment. To reinforce their identification with the new and challenging role of an entrepreneur, people use self-verifications towards members of their personal networks. Drawing on narrative network interviews with nascent entrepreneurs I distinguish forms of self-verifications from networks and different usages of personal networks for identification projects. Our study shows that identifications resources are an important resource dimension of social networks that complements traditional forms of social capital.

Linden Fiction 2050: The narrative making of “spaces of social imaginary” as part of urban sustainable development in Hannover-Linden, Germany

Annette Grigoleit, Julia Barthel, Lena Gressmann
Leuphana University Luenburg, Germany; Leuphana University Luenburg, Germany; Leuphana University Luenburg, Germany
grigoleit(at)uni.leuphana.de, kokoro1(at)gmx.net,
lg059836(at)stud.leuphana.de

In 2015, residents of Linden, Hannover were invited by the cultural centre “Faust” to create fictional texts on positive utopias about qualities of living together in 2050. The participants’ short stories embrace wishes about the future like post-capitalistic solidary economic systems and modes of living and working together.

As part of a research project, which identifies and analyses spaces of possibilities in Hannover, we got access to 28 published narratives, which enables to explore the potential of a detailed individual desire production and of an imaginative, visionary space of possibility for sustainable urban development. How do local participants deal with aesthetic stimuli for creating future sustainable worlds? To which horizons

of meaning and (forms of) knowledge do they implicitly refer to?

A heuristic framework of the research design enables to understand different reference points to the social imaginary (Herbrik 2011/2013) within the research process not only methodologically for the interpretation of narratives in which the authors can connect and transcend horizons of meaning and realities. Sequential analysis is particularly suitable for approaching the apparently new and areas of reference to the social imaginary, because the comparison between as real assumed with designs of other possibilities and the assumption of several simultaneous realities is an important part of the knowledge process. (Herbrik 2017) The sequential analysis is supplemented with a content analysis and with an analysis of categories of literary and everyday narratives.

As methodological illustration we will give some insights within our reflexive analysis of emotions and ways of interpretative acting, especially while role-taking as scientists of sustainability and sociologists.

The possibilities of our narrative analysis approach will be exemplified by two cases.

Understanding temporality. Using qualitative methods to explore quality of time

Justyna Malgorzata Kramarczyk, Mireille Diestchy
Adam Mickiewicz University, Poland; University of
Strasbourg, France

jkra(at)amu.edu.pl, mireille.diestchy(at)gmail.com

Due to the constantly growing importance of human efficiency and flexibility in contemporary capitalist societies, for years various ways of using, perceiving and managing time by individuals have been under scrutiny. The quantitative aspects of time, with their decontextualized, external, and measurable nature, have been widely described in sociological literature (e.g. Adam 2003; Rosa 2013; Wajcman 2015) as well as broadly examined in terms of the allocation of time, duration, pace or timing of undertaken activities (e.g. Fisher 2015; Bittman 2016).

However, bearing in mind that temporality is a quintessential social construct, including diverse meanings, values and emotions, we would like to focus our attention on qualitative attributes of this phenomenon. It seems to be crucial - in contrast to above-mentioned tendency - to get more knowledge of how modern people describe varied daily temporalities, what types of associations are related to them, how the quality of time is defined etc.

Based on our empirical findings, we are going to provide methodological reflection concerning quality of time. The presented research projects, conducted in 2012–2015 in Poland and France, are suggestions of using qualitative approach to explore the significance of time in individuals' everyday life. The primary objective of our speech is to shed some light on fundamental aspects of 'time quality', like temporal autonomy, balance between work and private life, sense of agency. Furthermore, we would like to prove that the usage of qualitative methods, particularly

interviews, allows to understand other strands of temporal phenomena.

RN20 | Session 09a Analysing Solidarities

"Roma living conditions? I do not care for them at all!" Attempt to interpret lack of solidarity to poor in Slovakia."

Zuzana Kusá

Slovak Academy of Sciences, Slovak Republic
zuzana.kusa(at)savba.sk

Paper is triggered by the finding that people of different age and education spontaneously mention social protection programs covering Roma (too) as the evidence of the unjust character of Slovak society. The lack of solidarity with jobless people and with Roma in particular is notorious fact about public opinion in Slovakia. Attempts to explain it are however mostly succumbed to various fashionable political sciences perspectives and not grounded in data about everyday reasoning. My attempt to interpret the lack of solidarity and compassion for the poorest group in Slovakia is based on the material generated by eight focus groups varied by age and attained education and running according identical scenario that debated ideas about the just society, concerns and solidarity with social categories differing by social distance and vulnerability and social trust (this design is intended to make possible integration of FG data with the 2017 wave of European Values Survey). As the participants of FG debates were asked to give reasons/justifications to their opinions, video records and detailed transcripts of the debates make possible to do their contextual interpretations. The paper introduces the analytical and interpretation process and suggests that constant comparative methods is not only GT strategy but also the way how FG participants substantiate their beliefs and opinions: it will show how the lack of solidarity goes hand in hand with their feeling of being unjustly treated both in sense of remuneration (EU comparison) and in sense of the (assumed) access of Roma to services, especially housing.

Comparing Societies in Qualitative Research: Perspectives, Methodological Implications and Problems

Kornelia Sammet, Franz Erhard

Leipzig University, Germany; Leipzig University,
Germany

sammet(at)uni-leipzig.de, fr.erhard(at)uni-leipzig.de

The paper addresses the methodological implications and problems of the comparison of different countries in qualitative research. The presentation refers to a current research project on "Worldviews of Unemployed People". Based on biographical interviews and group discussions with unemployed people conducted in multiple research sites in Europe and the UK, we explore how they interpret the world and their lives, how they position themselves in society as well as their ideas of solidarity and charity .

In the project, we assume that welfare state regimes are rooted in religious traditions and connected with different cultures of poverty. Therefore, different concepts of poor relief and the poor as a social figure are guiding ideas of social security in the national contexts. In our research, we compare societies as diverse macrosocial contexts structured by social inequalities, social policies and institutional forms of support, control and sanctions. In these various contexts, unemployed people have to handle specific conditions and hence develop different strategies of dealing with dependency, the lack of means, and social exclusion.

Comparing societies in qualitative research confronts us with methodological challenges. This applies especially to the principle that typologies have to be built on the relevances of the research field and not on differences imported into the data. We have to take in account that similarities and differences can be found on different levels and fields. In the paper, we discuss strategies of qualitative comparison of societies as ways of reconstructing the same as different and the different with regard to its similarities.

Solidarity and subjectivity in extreme mountaineering

Anna Kacperczyk
University of Lodz, Poland
anna.kacperczyk(at)gmail.com

The paper addresses the problem of social bonds and ethical issues constructed and sustained in particular segment of social world of climbing that is extreme mountaineering. My starting point is 7-years study on social world of climbing that bases on ethnography and grounded theory methodology. Using visual and narrative data, contemporary and historical materials I conduct analysis, that reveals lines of attraction and repulsion in climbing sub-worlds that create the net of moral evaluations and ethical judgments that, in consequence, allow to asses any climbing act. The idea of solidarity that is to be realized in the principle of partnership and ethical standards imposed on the climbers in the highest mountains – can be seen as a form of collective process that encompass individuals who share the same perspective of how to act and who participate in common communicational channels. The ethics of the climbing world reveals the complexity of its normative structure and can be easily shown through the analysis of arenas around the style of action, the controversy over the climbing awards, disclosures of the mystifications, tracking down the cheaters and discussions on immoral behavior in the mountains. All these issues remain strongly influenced by the structure of the values accepted by climbers. In the paper I discuss also the problems of data collecting and analyzing.

RN20 | Session 10a General Issues in Qualitative Research I

Lost in translation: Challenges of cross-language qualitative research

Nadine Jukschat, Gina Rosa Wollinger
Criminological Research Institute of Lower Saxony, Germany; Criminological Research Institute of Lower Saxony, Germany
nadine.jukschat(at)kfn.de, gina.wollinger(at)kfn.de

This presentation discusses the problems of cross- and multi-language qualitative research and reflects the methodological implications of such research projects for all stages of the research process. Thereby one main focal point lies on the translating problem: Translation has to be understood as an interpretative act, where meaning may get lost or may be changed. Considerations are based on experiences within a research project on convicted transient offenders in Germany conducted in 2016/17 at the Criminological Research Institute of Lower Saxony (KFN). To understand and reconstruct the motives and biographical background of the burglars, the aim was to conduct biographical narrative interviews. Because interviewees came from more than 13 different countries and spoke just as much languages but hardly any of them spoken by the researchers the main challenge was to find a research design that satisfied qualitative research standards as well as practical and economical concerns. Drawing upon our experiences recommendations for research in multi-language contexts are suggested, aiming to contribute to the validity of qualitative research in this field.

Approaching the curse of abundance in the contemporary field of qualitative research

Grzegorz Bryda, Natalia Martini
Institute of Sociology, Jagiellonian University, Poland; Institute of Sociology, Jagiellonian University, Poland
grzegorz.bryda(at)uj.edu.pl, natalia.ewa.martini(at)gmail.com

The presentation addresses the problem of a “curse of abundance” in the contemporary field of qualitative research which – although already perceived at the beginning of the 1990s – has not been satisfactorily resolved. Due to the vast internal diversity found in qualitative research today, as well as the accompanying exponential expansion of pertinent knowledge, qualitative researchers struggle to orient themselves in the dominion of their own research practice. This gives rise to problems in comprehensively reviewing the latest variations of qualitative research practices and comprises a barrier in the development of a methodological awareness among the practitioners themselves. The presentation argues the need for the qualitative research community to confront the negative consequences of this “curse of abundance”. Drawing on the preliminary research undertaken by the authors it examines the potential of the concept of domain ontology derived

from information technology to create a model representing knowledge of state-of-the-art qualitative research which will recognize the dominant ways by which qualitative research practices are conceptualized and implemented, organize current knowledge about these practices, and articulate this erudition in a legible system of representation. The presentation argues that the domain ontology of the field of qualitative research might establish a much needed foundation for communication between researchers and support the formation of a coherent and consistent way of capturing the whole variety of qualitative research practices. Consequently, it might facilitate the cumulative development of methodological knowledge, leading to the improvement of specific research approaches and an increase in their transparency.

Case study research and its application in investigating sensitive and difficult to access social phenomena.

Sylwia Mecfal
University of Lodz, Poland
sylwia.mecfal(at)wp.pl

This paper is a reflection of the case study method and its particular application in my own field research in 2013- 2014 in four small towns in the lodzkie voivodeship, Poland. Although the choice of research method, the case study, made it possible for me to apply various research techniques and to gather rich material, it also left a wide area of flexibility for me to use my intuition rather than methodological knowledge. There is a disagreement between researchers about what 'case study' is. VanWynsberghe and Khan (2007:80) propose a definition of 'case study' as 'a transparadigmatic and transdisciplinary heuristic that involves the careful delineation of the phenomena for which the evidence is being collected (event, concept, program, process, etc.).' Gerring (2004: 341) states that 'case study is a (...) research design best defined as an intensive study of a single unit (a relatively bounded phenomenon) where the scholar's aim is to elucidate features of a larger class of similar phenomenon.' Yin's (2009) understanding of 'case study' points us to 'empirical inquiry', which is probably closer to 'research method'. Yin sees 'case study' not only as a way of gathering the data, but also as a way of analyzing and interpreting the data. In my research I tried to apply Yin's understanding of 'case study'. The phenomena under investigation were sensitive and controversial (unclear links between political, business and journalistic circles in a local context, conflict of interest, etc.). This influenced my decision to keep the towns' names confidential in order to protect informants' confidentiality. It resulted in better access to informants, their experiences and opinions, but it also influenced the perception of research credibility.

RN20 | Session 11a General Issues in Qualitative Research II

Collective identity and anti-austerity protest: Graffiti from Athens' city-center

Dimitris Serafis, Dimitris Kitis, Argiris Archakis
University of Neuchatel, Switzerland; University of the Witwatersrand, Johannesburg; University of Patras, Greece
dimitrios.serafis(at)unine.ch, dimitris.kitis(at)wits.ac.za, archakis(at)upatras.gr

This paper examines the way that collective identity was discursively constructed during the anti-austerity protests of June 28 and 29, 2011 on the environs of the Greek parliament. Drawing on the framework of Critical Discourse Analysis, we study the interrelation between macro-level of dominant values and views (e.g. austerity), and micro-level of individual positions as expressed in graffiti slogans, which appeared during the protests. We conduct a systemic functional (SF) analysis to scrutinize the transitivity structures of graffiti slogans and we employ the notion of anti-language as central at the micro-level. We draw on the notion of collective identity, as this is examined in studies of collective action and social movements, to frame the graffiti at the macro-level. Among our main findings is that the writers of graffiti slogans construct their collective identity on a two-fold oppositional axis: the first consists of the dominant institutions (e.g. government, IMF) or "others", which are negatively represented, while the second consists of a positively represented and inclusive in-group or "we". We provide representative examples to illustrate the aforementioned findings.

Emotional encounters in research: some reflections on childhood and public sphere

Vinnarasan Aruldoss, Sevasti Melissa Nolas, Christos Varvantakis
University of Sussex, United Kingdom; University of Sussex, United Kingdom; University of Sussex, United Kingdom
V.Aruldoss(at)sussex.ac.uk, S.Nolas(at)sussex.ac.uk, C.Varvantakis(at)sussex.ac.uk

Drawing on recent scholarship and theoretical developments in the study of 'emotions', we consider how a focus on emotion offers us valuable insights and new perspectives on understanding the relationship between childhood and public sphere. Children and emotion have long been ignored in the public sphere literature as well as in public life, because both have been presumed to lack reasoning and thought. In this presentation, we try to unpack this argument and identify ways in which emotion can mediate childhood and public sphere. Our analysis reports on findings from ERC funded Connectors Study, a longitudinal comparative ethnography that employed creative methods (photography, drawing, mapping among others) with 45 children aged 6-9 years in three cities: Athens, London and Hyderabad. The analysis draws on our multimodal data that was created over a period of 18-months spent hanging out, playing and doing research activities with the children in the study. We operationalised 'the relationship

between childhood and public life' using sociological (Sturdy, 2010) and political science (Flyvbjerg, 2001) literature that asks us to conceptualise our relationship to the public sphere as one of the concern for the things that matter to us. We map out emotional encounters in which children's embodied personal feelings on what matters to them are made public by inter-subjective interactions, bodily performance, art work and speech acts. The contribution will focus on the sociality of emotion, the meanings attributed to those emotions by children, and how that matters to developing a context sensitive understanding of children's relationship to public life.

Researching institutional culture: a tale of two universities

Liz Jane McDonnell, Alison Phipps, Jessica Taylor
Sussex University, United Kingdom; Sussex
University, United Kingdom; Independent Consultant
ejm33(at)sussex.ac.uk, A.E.Phipps(at)sussex.ac.uk,
jessica22.taylor(at)gmail.com

Using a combination of integrated qualitative research methods (document analysis, observation, interviews, focus groups and open text survey) and the organisational development tool Action Inquiry, Grounded Action Inquiry (GAI) is designed to facilitate cultural change within universities. The challenge of 'lad culture', sexual violence, bullying and harassment, the shortage of academics from black, Asian and minority ethnic (BAME) backgrounds and the persistent under-representation of students from less privileged socioeconomic situations, has necessitated the development of more sustainable and in depth approaches to equality and diversity in universities. This paper explores how this innovative and intersectional approach worked in two very different university settings – an elite and a 1960s university. We will reflect on how GAI evolved in each context and the adaptations we made as a result of institutional realities. GAI brings into relation, research data that describes culture and, organisational development tools that facilitate a deeper exploration of the data in a dialogic setting. Linking these two processes, within an intersectional framework, are core to facilitating meaningful cultural change within varied university settings.

RN21 - Quantitative Methods

RN21 | Session 01a RN KEYNOTE SESSION: Explaining Social Cooperation. From Experimental Research to Big Data Analysis

Explaining Social Cooperation. From Experimental Research to Big Data Analysis

Andreas Diekmann
ETH Zürich, Switzerland
diekmann(at)soz.gess.ethz.ch

How does social cooperation in groups, markets, and societies evolve? Under which conditions will cooperation decay? What are the pros and cons of various methods to study the emergence, stability and erosion of social norms and cooperation? I will, particularly, focus on the mechanisms that promote self-organized cooperation in the digital world. One of the decentralized mechanisms is reputation by feed back giving. Reputation is a powerful mechanism to sustain cooperation even among traders in the dark net. However, there is also the problem of cheating and effective reputation systems have to mitigate the possibility of faked ratings. Empirical analysis based on experimental designs, statistical techniques of causal analysis, and „big data“ collected by web crawling provides new insights into the mechanisms that promote, stabilize or weaken social cooperation.

Sustainable Cooperation and Societal Resilience

Rafael Wittek
University of Groningen, Netherlands, The
r.p.m.wittek(at)rug.nl

The past two decades came with impressive progress in the multidisciplinary science of cooperation. Thanks also to methodological advances in the collection and analysis of data on cooperation, we now have a much better understanding of the conditions that get cooperation going. I propose that the next important step on the research agenda is to advance our insights into what keeps cooperation going. However, shifting the focus to problems of sustainable cooperation has non-trivial theoretical and methodological implications, several of which I will highlight in this contribution. I will argue that the sustainability of cooperation resides not in the stability of a specific exchange relationship, but in the ability of a cooperative arrangement to ensure value creation also under changing circumstances. This implies not only that sustainable cooperation is joint production that is both stable and valuable, but also that we need

to distinguish between the “internal” benefits that the cooperation yields for the cooperators, and its “external” or social value. I will conclude with a discussion of the research design challenges that come with a focus on sustainable cooperation issues.

RN21 | Session 02a Measuring Solidarity Potentials and Constraints in Contemporary Europe

How to measure solidarity

Katja Rackow
University of Vechta, Germany
Katja.Rackow(at)uni-vechta.de

The concept of solidarity seems to be well known and is regularly demanded in various political and social debates. However, theoretical concepts, explanations and descriptions are diverse and based on different dimensions and levels. What all attempts to define solidarity have in common is the assumption that solidarity mainly is the support and help given from individuals or groups to any other person or specific groups of people. In addition, some authors also refer to abandonment as an important element of solidarity. Furthermore, different ranges of solidarity can be identified, for example the question of whether there is a general solidarity.

The variety of these theoretical assumptions and considerations is reflected in the empirical measurement of solidarity. Predominantly, general attitudes and values are queried. The possibilities of the empirical measurement of everyday activities still seem to be hardly recognized. Basically, the attempts to measure solidarity refer to just one or two dimensions, but there is no concept dealing with all aspects of solidarity. From my point of view, the operationalization of solidarity is not exhaustively developed and probably often only suitable for certain historical and social (national) contexts, what makes international and historical comparison difficult.

Therefore I will first systematize how sociologists have conceptualized solidarity and in a second step I will compare these theoretical concepts with the various ways of measuring solidarity empirically. By contrasting theoretical concepts and empirical measurements I will discuss strengths and limitations of these approaches and try to develop suggestions for future research.

Regional Disparities and Solidarity: How Geocoded Online Experiments Help to Contextualize Experimental Sociology

Felix Bader, Marc Keuschnigg
LMU Munich, Germany; University of Mannheim,
Germany; Linköping University, Sweden
felix.bader(at)lmu.de, marc.keuschnigg(at)liu.se

Trust and the willingness to share are key ingredients to solidarity. Therefore, we use incentivized trust and fairness games to assess the context-dependency of spontaneous and deliberate solidarity within and between regions of Germany. We drew a

representative sample of the German population (N=2,440) from the largest available offline recruited online access panel to participate in experiments measuring pro-social behavior (dictator game, trust game) on the internet. Our online design transports a homogeneous decision situation into heterogeneous living conditions captured by participants' geographical location. We test how local macro disparities in economic affluence, social capital, and modern history translate into different practices of social behavior. We find considerable differences in pro-social behavior across German municipalities and argue that geocoded online experiments provide a sorely needed complement to laboratory and survey research. Selectivity of participant pools and disregard of local context has motivated questions as to the external validity of laboratory experiments in the social sciences. Bringing context back into social experiments is particularly relevant for sociological research which — unlike most experimental research in economics and psychology — fully acknowledges the importance of local social arrangements in a multi-level explanation of individual action. The research tools we developed allow the implementation of behavioral experiments into web surveys.

Preferences for Regional Redistribution: The Effect of Geographic Proximity and Structural Similarity

Kerstin Lorek
Friedrich-Alexander-Universität Erlangen-Nürnberg,
Germany
kerstin.lorek(at)fau.de

Diverging economic strength and living conditions between regions create inequalities of life chances for the local population. States as well as the European Union use regional redistribution to reduce regional inequalities and to create equivalent living conditions in all regions. However, eroding solidarity and the observed return to national identities and anti-Europe positions put the acceptance and stability of those regional redistribution instruments at stake. The question arises which factors influence individual preferences for regional redistribution. Considering the regional aspect of the redistribution especially, this work analyzes the influence of geographic proximity and structural similarities between regions on individual preferences for redistribution. External effects of relatively weak regions might result in preferences guided by self-interest whereas solidarity norms might favor regions with similar structural composition as one's own region. In Germany 439 persons participated in a survey experiment consisting of several sets of two hypothetical regions randomly varying in several characteristics representing self-interest and structural similarity. Respondents had to decide which proposed region should receive the redistributed money. Additional sociodemographic data was gathered and the data were merged with information on the respondents' regions. The results show that respondents are aware of regional inequalities and mainly support regional redistribution.

In the experiment especially regions with lower economic strength and living conditions are the recipients of regional redistribution. While the purpose of the financed project is relevant for the respondents, we observe only negligible effects of geographic proximity and structural similarities between the respondents' region and the hypothetical receiving regions.

Voting rights and intergenerational justice: Framing effects and voter attitude

Attila Gulyás, Béla Janky
Hungarian Academy of Science, Hungary; Hungarian
Academy of Science, Hungary
gulyas.attila(at)tk.mta.hu, bela.janky(at)tk.mta.hu

Abstract: In our work, we present the findings of a survey-experiment which addressed the opportunities for voting rights reforms aiming to increase the political weight of younger generations. We hypothesize that due to biases of the public discourse, voters do not see intergenerational redistribution of public resources as unfair so they do not think that current electoral systems are to be changed. Our study sheds light on the legal efforts to improve intergenerational justice and present the findings of a survey-experiment focused on framing with an online sample of 1000 respondents. The results show that raising the issue of intergenerational justice to respondents could increase younger voters' openness to voting rights reforms, but could not diminish the resistance of middle aged and elderly voters.

Solidarity and Helping Others: the Case of Post-Maidan Ukraine

Anna Domaranska
Institute of Sociology National Academy of Sciences
of Ukraine, Ukraine
anna_doma(at)list.ru

The study of helping others has become an important aspect of solidarity research. A recent study by Saari and Pessi (2014) concluded that helping others relates to general social development, pointing out that "an adequate "success" must have been achieved in issues like living standards before there will be room for such priorities as helping others" (2014, p. 264). On the other hand, despite the drastic drop in the living standards of the Ukrainian population since the events of 2013-2014, the participation in practices of helping others and volunteer activities have become very common. The aim of this study is to examine the participation in practices of helping others in post-Maidan Ukraine, considering real action, specific forms of helping behaviour, and groups of people who need assistance. The Monitoring Survey of the Institute of Sociology of NAS of Ukraine is used. The results show that the participation in practices of helping others relates to holding democratic values and aspiration for the European future of Ukraine, while non-participation associates with such features as "discord", "individualism", "passivity", and negative attitude to the idea of Ukraine's accession to the

European Union. In addition, the participation relates to such individual-related characteristics as younger age, living in Central and Western regions, belong to categories of 'professionals' or 'legislators, senior officials and managers', while gender, income, and religious denomination do not significantly predict whether respondent takes part in practices of helping others or not

RN21 | Session 02b Interviewer Effects and Measurement Errors

Observing the work of interviewers: how the quality of the data collection is constructed

Efi Markou, Emilie Bourgeat

French Institute for Demographic Studies (INED), France; French Institute for Demographic Studies (INED), France

markou(at)ined.fr, ebourgeat(at)gmail.com

Between February and November 2015, 27,000 people aged 20-69 were interviewed by telephone about violence undergone in different life contexts (family, couple, work, public space...). Realized by the French Institute for Demographic Studies (INED), the survey mobilized 110 interviewers, hired by the survey institute charged with the data collection.

Being present at the call center on a daily basis, the INED team held a field diary, reporting on call monitoring, individual or collective debriefings, interactions, and important events. Its 350 pages constitute a rich ethnographic material, completed by the numerous sheets where interviewers manually recorded the problems encountered during the calls and by the evaluation questionnaires they filled out after completing a questionnaire.

Based on this material, the paper aims to study how the working conditions of the interviewers affect the response behavior and the data quality. Working conditions cover the remuneration, the precarious and flexible status, as well the physical conditions (rooms, computer equipment, etc.), or the temporalities (schedules, advancement of data collection, special periods such as Ramadan, etc.). The paper will take into account the interactions between the various actors involved: interviewers, respondents, the INED team and supervisors from the survey institute, knowing that the last two didn't necessarily share the same objectives. Finally, it is meant to provide insight into participants' response to the survey and also to shed light on how investigators led them to adhere to the questionnaire. It aims thus to better understand not only the conditions of production of the data but also the meaning given to their "quality".

Identification of interviewer effects in real and in falsified survey data

Uta Landrock

University of Kaiserslautern, Germany

landrock(at)sowi.uni-kl.de

In face-to-face interviews the interviewer has an important impact on the quality of survey data, but

there is also the risk of interviewer effects. Even more problematically, the interviewer may decide to deliberately falsify interviews or parts of them. We want to answer the research question whether in falsified data similar "interviewer effects" appear as in real data or whether "interviewer effects" are stronger in falsified data and may be used as an indication for a data contamination by interviewer falsifications. We use experimental data, collected in the project "Identification of Falsifications in Survey Data (IFiS)" by GESIS, and apply intraclass correlations as well as multi-level regression models and compare interviewer effects in real survey data and in data falsified by interviewers. As main results we can report: 1) In the real data we do not find evidence for interviewer effects. 2) In the falsified data we find strong interviewer effects. 3) In the case of falsified data we find significant effects of the interviewer's answer to the same question of the questionnaire. Thus, in order to detect falsifications, we recommend collecting as much information as possible about the interviewers. For example, the interviewers could answer the survey questionnaire as part of the interviewer training. Based on this information datasets or suspicious cases may be checked for interviewer effects.

The flexible verbal interaction coding

Marco Palmieri, Francesca Marconi, Serena Liani

Sapienza Università di Roma, Italy; Sapienza

Università di Roma, Italy; Sapienza Università di

Roma, Italy

marco.palmieri(at)uniroma1.it,

francesca.marconi(at)uniroma1.it, sereliani(at)libero.it

The verbal interaction coding is a quantitative technique used to encode the verbal interaction between interviewer and respondent. This technique is employed both to pretest survey questions, locating those which cause interviewer's and respondent's verbal deviations from the ideal sequence of standardization and, in data collection, to monitor and evaluate the interviewers' behaviors according to the standard guidelines. Some scholars highlight that the main limit of this technique is to consider "as negative" all deviations. Actually two types of deviation exist: the deviation "harmful" to data quality (indicator of inaccurate question formulation or interviewer related error) and the "virtuous" ones, when interviewer and respondent vivaciously interact to understand each other. In this paper the authors present a study in which they tested a more qualitative verbal interaction coding, designed to overcome this limit. Thanks to this approach, during the questionnaire pretest, questions were reformulated only when many dangerous deviations gathered around, leaving out those which collected virtuous deviations. After the pretest, the researchers trained the interviewers and recommended them to adopt the virtuous behaviors, in order to have a flexible conduction and meet the respondents interpretative needs. During the fieldwork, the interviewers were monitored live, and who implemented a strict standardized conduction or

“harmful deviant behaviors” was involved in a second training. In short, the authors of the study assert that a more qualitative verbal interaction coding, is useful to exceed its endemic limit because it allows to discern between bad and good deviant behaviors.

Weighing the moral worth of actions: a factorial survey approach to measuring the ordinary normative evaluations of altruistic actions

Inna Deviatko, Andrey Bykov

Higher School of Economics, Russian Federation; Institute of Sociology of the Russian Academy of Sciences; Higher School of Economics, Russian Federation; Institute of Sociology of the Russian Academy of Sciences

deviatko(at)gmail.com, andrey_bykov(at)mail.ru

For I. Kant the genuine moral worth of human actions including those praiseworthy actions which are commonly called altruistic depends on one's determination to act dutifully guided only by the moral law itself (Kant, 1785). So, even actions motivated by sympathy to other human beings, happiness, let alone reciprocation and self-interest, do not truly express a good will and, therefore, cannot be considered morally worthy. Philosophical controversies surrounding Kant's approach are mirrored in recent disputes on different species of altruism (e.g., Piliavin, 2009). However, no matter what moral philosophers and social scientists think about relative worth and “purity” of different motives of altruistic behaviors, it is still worthy to investigate what social factors determine ordinary people's judgments about comparative moral worth of different prosocial actions (Simpson, Willer 2015). But how these lay normative judgments and post hoc evaluations can be studied in general and, specifically, when they are related to those norms which support costly social actions with positive externalities to others? We conducted a full-factorial vignette experiment aimed at examining the role such factors as relatedness, donation size, and reciprocity (conceptualized as history of interactions and probability of meeting in the future) play in third-person normative judgments about moral worth of altruistic actions. We found significant main effects of relatedness, donation size and probability to meet in the future and, generally in line with Kant's view, higher ratings for larger donations to non-relatives with low chances to meet in the future (regardless of history of past interactions).

What do we measure with unequal or equal number of scale points? The midpoint problem and the left-right scale

volker huefken

Heinrich-Heine-Universität Düsseldorf, Germany
volker.huefken(at)phil.hhu.de

According to the multitrait multimethod experiment, the 11-point produces the highest validity of left-right data (Kroh 2007). Although the unequal 11-point scale achieves better results, “it will lead to both overestimates of the degree of opinionation in the

population and the ordinality assumption that researchers typically invoke when analysing bipolar response scales” (Roberts & Smith 2014) remains without validation. In this paper, we used in a population survey a category follow-up probe administered to respondent who initially select point 5 (metric center) in the 9-point and who select point 5 (imagined center) in the 10-point left-right scale, to determine whether they selected this alternative in order to indicate distinct opinion, or to indicate that they do not have an opinion on the issue (position). According to the midpoint problem the question comes up, do equal or unequal scale work better? On the one hand, there is evidence that the midpoint encourage people without information (indifference) to admit it. On the other hand, offering or excluding the midpoint option doesn't substantially influences results.

We find in our CATI survey – conducted in 2016 – the vast majority of responses turn out to be what they initially selected. About every fourth reallocate the responses (e.g. no answer, d.k). About every third can be assigned on the LR-Scale. The respondents remaining in the center (may be genuine neutral or endorsement of the status quo) is moderate. Against this background, a different approach – may be a multistage measure (?) – should be taken into consideration.

RN21 | Session 03a Value Research in a Cross-National Perspective

How do people perceive and relate to their own values?

Lena Seewann, Roland Verwiebe, Margarita Wolf
University of Vienna, Austria; University of Vienna, Austria; University of Vienna, Austria
lena.seewann(at)univie.ac.at,
roland.verwiebe(at)univie.ac.at,
margarita.wolf(at)univie.ac.at

In light of recent challenges – financial crisis, refugee crisis, Brexit, far-right-popular parties on the rise - a new debate about European identity has risen, revolving to some extent around the question of what “European values” are and should be. To date multiple international surveys have refined the measurement of values in Europe. The present contribution aims to expand the debate on values, shedding a light on how people perceive and relate to their own values.

Against that background, we present a new scale developed in a multistage mixed method project (narrative interviews, focus groups, representative online-panel survey) on the formation of values taking Austria as an exemplary instance. The scale introduces five bipolar items covering prime dimensions of value perception, which demonstrated significant variance during a qualitative exploratory research phase and during later quantitative testing: 1) the perception of values as guidelines during conflicts, 2) value relevance in everyday life, 3) value awareness, 4) value stability and 5) the extend of value validity.

To highlight first results and possible uses of this

scale, our results from a quantitative survey conducted in 2016 (N=1.500) show that value perception differs significantly between social groups. For example, highly educated people state that they are highly aware of their values and see their values as universally valid. At the same time, lower educated people are more likely to perceive their values as clear guidelines for their lives. Significant differences can also be found in regard to age, religiousness and migration background.

An Examination on the Change and Continuity of Cultural Values: The Example of Turkey

Sevda Gülşah Yıldırım, Muammer Demirel
uludağ üniversitesi, Turkey; uludağ üniversitesi,
Turkey
sgulsah(at)uludag.edu.tr, mdemirel(at)uludag.edu.tr

Values, according to a definition, is founded based on culture and emphasis a choice consistently. Values either disappear over time or continues for years by transferring to next generation. The cultural values of society which disappeared, changed or extant can give us information about that community in many ways. This study is to aim to reveal changes that occur in the cultural values of Turkish society by years. Moreover, the effect of the social and political changes that occur inside or outside on cultural values will be examined. For this purpose, data that obtained from questionnaires developed by World Values Survey will be analyzed comparatively. When determining the years to be examined, it was considered whether these survey were implemented in Turkey. For the comparative analysis, it was selected the results of questionnaires implemented in 1990, 1996, 2001, 2007 and 2011 in Turkey. The results of these surveys have selected the findings of the items which uncovered the values they expected their children to learn at home, the unwanted neighboring types, the human characteristics that the participants likened to themselves, and the behaviors that the participants found to be right or wrong. Analyzes are ongoing.

Refinement of the Link between Schwartz Values and Political Participation: Findings from Ukrainian Euromaidan

Oleksii Shestakovskiy
Independent scholar, Ukraine
o.shest(at)gmail.com

The literature on Schwartz values asserts two principal motivational conflicts predisposing to activism. The first is prioritizing personal autonomy and independence (Self-direction the most) against conformity and restraining self (Conformity, Tradition). The second is promoting others' welfare and interest (Universalism) over self-interest (Achievement, Power) and safety (Security). However, in some countries (including Ukraine), the second conflict does not work, and overall values' effect is lower.

I argue that it is explained, at least in post-communist countries, by a "Conservative Universalism"

phenomenon when corresponding values are highly inter-correlated. For the neighboring higher order values should be well-separated to have strong relations with political participation.

I tested this idea with the data, gathered among participants of Euromaidan events in 2013. They were combined with 2012 ESS Ukrainian data in Structural Equations Modeling framework. I expected that (1) two conflicts between values were stronger among Euromaidan participants, and (2) "Conservative Universalism" values were more split in Euromaidan to motivate protests effectively.

The Euromaidaners' priorities corresponded with the theory. They valued openness and others' interests more, and had a split in "Conservative Universalism". However, the latter was unusual. A separate factor, named "Submissive Conformity", loaded Tradition-humility and Conformity items, and opposed to Self-Direction-Stimulation. Security-personal item went to Self-Enhancement. The rest of Conservation and Self-Transcendence items still formed a single "Non-conformist Conservative Universalism" value.

The findings corroborated that Schwartz values should have a certain distinct structure to motivate political participation stronger, but value divisions can differ in particular societies. The latter can also explain specifics of post-communist protests.

RN21 | Session 04a Quantitative Research on Ethnocentrism and Migrant Integration

The dynamics of ethnocentrism in European regions. Comparing enduring and emerging determinants of solidarity towards immigrants

Wolfgang Aschauer, Jochen Mayerl
University of Salzburg, Austria; University of
Kaiserslautern, Germany
wolfgang.aschauer(at)sbg.ac.at,
jochen.mayerl(at)sowi.uni-kl.de

This presentation examines cross-national differences in solidarity towards immigrants in Europe. We focus on so called macro-solidarity which refers to a basic concept of humanity that represents the overcoming of interests which are restricted to communities (micro-solidarity) or nation states (meso-solidarity). This concept of solidarity is operationalized through attitudes towards immigrants as a special type of ethnocentrism. The main thesis to be tested is that "classical" enduring determinants (socio-demographic factors, subjective values and structural factors) are still able to explain ethnocentrism but these factors are enriched and mediated by a cluster of five emerging explanatory factors which reflect societal malaise: dissatisfaction with society, political distrust, fear of social decline, lack of recognition, and social distrust. The thesis of societal malaise as a powerful concept to explain contemporary restrictions of macro-solidarity is tested with a Multiple-Group Structural Equation Model using data of 21 countries from European Social Survey (wave 6 2012). A theory-guided approach is used to categorize European nations into six heterogeneous European regions to

analyze regional differences in determinants of ethnocentrism. Empirical-statistical analyses reveal that new emerging factors of societal malaise indeed are stronger predictors of ethnocentrism in comparison to classical determinants. In addition, societal malaise acts as mediator of classical explanations of ethnocentrism. In comparative perspective, determinants of ethnocentrism are strongly heterogeneous throughout the six European regions.

The Roots of Xenophobia

Olga Yakimova

Ural Federal University, Russian Federation; The Laboratory for Comparative Social Research (LCSR), a National Research University the Higher School of Economics, Russian Federation
yakimova.ola(at)gmail.com

In the early 21st century xenophobic beliefs are still widespread. The process of the observed mixing of populations and the continual influx of immigrants does not come hand in hand with increased tolerance for ethnic diversity. Deep aversion to immigrants has been the reason for protests by the indigenous population in Germany, France, Russia, etc. Since the 1990th, xenophobic, deeply conservative and extreme right-wing parties have arisen and re-emerged as an electoral force in much of Europe. In the 2014 elections to the European Parliament, there was a dramatic surge of support for xenophobic political forces. In France (Front National) and Denmark (Danish People's Party), xenophobic and anti-European parties moved into first place, winning a large share of the vote than the major parties that have governed these countries for decades. In this context increasing xenophobia can be considered a factor that undermines support for the European Union as a whole, and Brexit (2016) is a bright illustration of this.

Despite a significant amount of provided by cross-national research evidence on how local population react on newcomers our understanding of the dynamics of attitudes toward immigration and its fundamental causes remains nebulous.

In my research, on the example of countries that are European Union members and some other countries that have experienced substantial flows of economically-motivated immigrants (the U.S.A., Russia, Australia and Canada) (Total N=32), I seek to put the problem of intolerance towards immigrants in a broader societal and economic context. Using the World Value Survey database from 1989 till 2015, I argue that not ethnic diversity alone and not current economic conditions, but existential insecurity is the major cause of xenophobic attitudes.

Youth's Moral Attitudes as a Basis for Prevention of Radical Actions

Anastasia Tertyshnikova, Nikolay Narbut, Zhanna Puzanova, Tatiana Larina
Peoples' Friendship University of Russia, Russian Federation; Peoples' Friendship University of Russia,

Russian Federation; Peoples' Friendship University of Russia, Russian Federation; Peoples' Friendship University of Russia, Russian Federation
tertyshnikova_ag(at)rudn.university,
narbut_np(at)rudn.university,
puzanova_zhv(at)rudn.university,
larina_ti(at)rudn.university

The peculiarity of the young Russians current generation is that they have no need to battle to survive (as it was in 1990s), but life prospects are vague because socio-economic system established in Russia limits their career, business and professional opportunities and self-realization prospects.

Aspirations somehow to express yourself coupled with so-called "intemperate youth speaking" stimulate young people to enter various extremist organizations, radical movements.

Study on the rejection of extremist views and terrorism manifestations as part of spiritual, moral and patriotic education of youth was conducted in September 2016 on the basis of RUDN University sociological laboratory. Sample: 516 Russian students of RUDN University. According to data the majority of young people is not ready to participate in the opposition rallies, and if by chance they were, "would probably have tried to get away from there." The expression of protest following the Pussy Riot's example youth regards as too radical, preferring the quieter forms of protest that shows partiality to the feelings of believers. Regarding the motives that drive young people entering into a sect, note 3 main reasons

- The ability to find support;
- The need for identity
- Ability to feel like an important part of society.

However, the main reason for the popularity of radical youth organizations and motive for joining them is the ability to earn money.

The key indicators of different areas of analysis leads to the conclusion about the morality level and today's youth values and its relation to radical and extremist views. However, a continuous work on spiritual and moral development is necessary to reduce to zero cases of manipulation and substitution of values among young people (V.Karaulova case)

How general is generalised trust?

Inga Gaizauskaite

Mykolas Romeris university, Lithuanian Social Research Centre, Lithuania
inga.gaizauskaite(at)gmail.com

When analysing trust, a common distinction is being made in the scientific literature, namely, distinction between trust in people who are (personally) known and people in general. The latter is referred to as "generalised trust". In surveys, generalised trust is measured by wording "Generally speaking, would you say that most people can be trusted, or that you can't be too careful in dealing with people?". A good measurement tool has to be unequivocal and all parties should interpret it in the same way. That is, the same connotation shall lay behind conceptual

definition, idea of survey question and perception of respondents who answer to the generalised trust question.

The presentation attempts looking at the correspondence (or rather lack of correspondence) between conceptual definition, operational definition and perception of respondents. In a qualitative research on formation of social and political trust in Lithuania, 14 in-depth interviews with young people were conducted. In the course of each interview, at a particular point a participant was given a card with standard survey question and was asked to provide his/her answer. Immediately after that the participant was asked "Could you please tell, who were the people you were considering when answering the question?" Categories named by the participants do not correspond to the idea of "social generalized trust". Participants mentioned neighbours, co-workers, acquaintances and other categories of people who do not fall under conception of "unknown, general". The presentation attempts fostering further discussion about the development of a better measurement tool for social generalised trust.

RN21 | Session 05a New Directions in Network Analysis

Studying self-identity with networked content analysis

Modesto Escobar, Juan Carlos Revilla, Luis Martínez-Urbe

Universidad de Salamanca; Universidad Complutense de Madrid; Fundación Juan March
modesto(at)usal.es, jcrevilla(at)cps.ucm.es, lmartinez(at)march.es

This contribution focuses on the application of content analysis using visual interactive statistics that combine multivariate and social network analysis. These techniques allow the representation of the most frequent topics in a given set of texts as well as their co-occurrences and connections to their subjects' attributes. In this respect, several coincidence gradients for the items under study can be defined. These gradients range from zero to total coincidence with statistically probable coincidences in between with predetermined confidence levels.

As an example of its application, we will present the analysis of thousands of answers to the question "who am I" from three international web surveys conducted in Spain, USA and Chile. The analysis compares the responses across three dimensions: a) meaning or content of what is expressed, which gives an indicator of subjectivity; b) reference or entity with which the individual is identified in its definition, giving a measure of anchorage, and c) attribution or traits with which the subjects are defined as expressing individuality. Our hypothesis that individualization and subjectivity dimensions are of greater importance than anchorage in more modernized countries seems to be confirmed.

Social contingency of choice – surveying 'social tissue' instead of 'atoms'

Ireneusz Sadowski, Bogdan W. Mach

Institute of Political Studies of the Polish Academy of Sciences, Poland; Institute of Political Studies of the Polish Academy of Sciences, Poland
is(at)spoleczenstwo.pl, bmach(at)isppan.waw.pl

There is an inherent assumption built-in into traditional survey methodology - an assumption of independency of observations. What seems to be less recognized, is that this type of assumption leads to theorizing that is biased towards "atomistic" model of society. Independent random sampling conveys that units of analysis, just as tossed coins, do not influence each other, while most of social theory puts interpersonal influence at the crux of social processes. As a result a gap emerged between theory and research, the latter usually drawing casual links as endogenic relations between individual's traits. A good example comes from electoral studies where voting is explained mostly by respondent's attitudes or status characteristics (especially in rational choice perspective).

The aforementioned gap may be partially overcome by using micro-networks ("social clusters") instead of isolated individuals as units of sampling, surveying and theorizing. The study conducted by a team from Institute of Political Studies Polish Academy of Sciences, including the Author, have undertaken such task in 2016 (with the fieldwork conducted by CBOS, leading Polish survey agency). Random sample of Polish population consisted of two subsamples: one including only egos (n=944), another comprising of egos and alters – close friend designated in the name generator (n=768+1201). Such an undertaking creates both analytical opportunities as well as methodological questions on limits of possible inference. I'm going to illustrate both with simple descriptive statistics as well as multilevel modelling using the data on Polish voters' behaviour in 2015 parliamentary elections. It shows substantial contingency of egos' choice on the choice of alters.

Field theory as a framework to tripartite analysis of agency

Dimitris C Christopoulos, Mario Diani, David Knoke
MU-University Vienna Austria; Heriot-Watt University Scotland; University of Trento; University of Minnesota
dimitriscc(at)gmail.com, mario.diani(at)gmail.com, knoke001(at)umn.edu

We demonstrate how tripartite analysis can help us capture the multiplicity of entities and relational levels that collectively constitute action fields. We first elaborate the tripartite logic by focusing on three type of entities: political actors, their respective advocacy organizations and the events in which actors and organizations have a high salience. We look at both a "restricted" and a "general" tripartite model. We reduce tripartite structures to all possible bimodal combinations and examine the ones where agency can be inferred. In principle this means looking at

three levels, each of which yields important insights on the overall structure of political fields:

- a) ties created between individuals by the fact of being active in organizations and/or events;
- b) ties created between organizations by the fact of sharing core-members and events;
- c) ties between events that are attended by the same individuals and/or organizations.

The paper presented is of interest for social scientists that work on network structure and political agency and for methodologists interested in a novel approach to the network analysis of exceptional political agents.

Analysis of the networks of actors identified in a judicial file: The case of human trafficking

Cecile Plessard, Benedicte Lavaud Legendre
 Université de Toulouse Jean Jaures, France;
 Universités de Bordeaux, France
 cecileplessard(at)gmail.com, benedicte.lavaud-legendre(at)u-bordeaux.fr

The aim of this paper is to present the first results of our multidisciplinary research (Law, Sociology and IT) on the functioning of criminal networks linked to human trafficking for the purpose of sexual exploitation.

The ambition of this work is to define the exploitation relationship. We hypothesize that the analysis of social relations can describe the exploitation relationship and the situation in which it operates. The substance of the holding does not depend on the type of activity and the degree of constraint. It is a deliberate organization of the relations of the exploited persons: relations with the criminal group, but also with the entourage of the country of origin of destination. The aim is to account for the social organization of the criminal network by reconstructing all the relations between the actors. The identified network will not be a criminal network but the network of actors identified in a legal proceeding. The complexity and nature of the data resulted in the development of an input and analysis tool.

The methodological approach undertaken is the social network analysis: The relationship between two individuals is recorded by the criminal action that binds them (A prostitutes for B). To this are added links of different natures (links of filiation, same community of origin). The point of view adopted thus can clarify the roles of the actors in the network and their position within the latter (measure of centralities), types of relations and finally Form of the social structure (core / periphery, structural equivalence).

We will present the results of the first judicial file dealt with.

RN21 | Session 06a Advances in Quantitative Methods/Data Quality

A framework to analyse the performance of pre-election polls: the 2016 Spanish election

Pablo Cabrera Alvarez, Modesto Escobar Mercado
 Universidad de Salamanca, Spain; Universidad de Salamanca, Spain

pablocal(at)usal.es, modesto(at)usal.es

Opinion polls are widely used by media, political organisations and citizens in the context of election. However, in recent years, pre-election polls have systematically failed to correctly estimate election or referendum results in different countries. Well-known examples are the last General Election held in the United Kingdom (2015), the Brexit referendum (2016) or the last Spanish General Election (2016). The lack of accuracy of pre-election polls is not a new phenomenon, in the literature on public opinion there are many examples of pre-election polls analysis. Yet there is not a defined framework to carry out this analysis. Therefore, the first objective of this work is to define a framework for the polls' performance evaluation. This framework is based on the Total Survey Error (TSE) paradigm, which identifies the main sources of error in survey research. We adapt the TSE paradigm to account for some unique features of pre-election polls (e.g. timing...). We also develop a methodology to evaluate the different aspects covered in the framework. Afterwards, the methodology is used to shed some light on the lack of accuracy of the polls in the Spanish General Election (2016). In this election, the polls underestimated the magnitude of the conservative party's (PP) victory by 3% points on average. Moreover, all polls carried out during the electoral campaign showed Podemos, a left-wing party, second in terms of vote share, overtaking the Socialist party (PSOE); this turned to be wrong on election night. To identify the source(s) of the error will be useful to design and implement methodological adjustments which are discussed in the last part of the paper.

Thomas Kuhn Revisited: Computer Simulations of Different Forms of Scientific Revolutions

Georg P. Mueller
 Univ. of Fribourg, Switzerland
 Georg.Mueller_unifr(at)bluewin.ch

Based on evolutionary game theory, this paper presents a model that allows to reproduce different patterns of change of the central paradigm of a scientific community. One of these patterns is the classical scientific revolution of Thomas Kuhn, which completely replaces an old paradigm by a new one. Depending on factors like the acceptance rate of extra-paradigmatic works by the reviewers of scientific journals, there are however also other forms of change, which may e.g. lead to the coexistence of an old and a new paradigm or the complete failure of the new one.

After analysing the different types of paradigm-changes and the conditions of their occurrence by means of an EXCEL based simulation program, the article explores the applicability of the model to a particular case: the spread of agent based modelling (ABM) at the expense of the older systems dynamics approach. For the years between 1993 and 2012 the proposed model reproduces the empirical data in terms of the number of scientific publications

remarkably well. This obviously means a confirmation of our evolutionary game theory model. Thus the paper ends with a short discussion on how it could be used in order to simulate other forms of cultural revolutions, like e.g. the spread of Protestantism in different national environments after its start in 1517.

Evaluating the Impact of Active (Opt-In) and Passive (Opt-Out) Consent Procedures on Survey Data Quality

Joseph Sakshaug, Alexandra Schmucker, Frauke Kreuter, Mick Couper, Eleanor Singer
University of Manchester, United Kingdom; Institute for Employment Research, Germany; University of Maryland, USA; University of Michigan, USA; University of Michigan, USA
joe.sakshaug(at)manchester.ac.uk,
Alexandra.Schmucker(at)iab.de, fkreuter(at)umd.edu, fkreuter(at)umd.edu, elsinger(at)umich.edu

Obtaining informed consent from individuals to participate in voluntary research studies is widely considered to be an ethical research practice. However, there is considerable debate over how consent should be obtained from subjects. Many researchers argue that active (opt-in) consent is the only type of consent that accurately reflects the true wishes of the subject and is closer to the informed consent ideal than passive (opt-out) consent procedures. Opponents of active consent procedures argue that such procedures harm study participation rates and increase the risk of self-selection bias to a greater extent than passive consent procedures. Empirical evaluations of these claims are rare, given the lack of studies that experimentally assign subjects to different consent procedures and utilize a control group (in which no consent is sought) to facilitate comparison. We report on an experiment that overcomes these issues in a study of consent to transfer contact data from a federal register to a third-party data collector for purposes of carrying out a telephone survey. Specifically, we evaluate the impact of requiring consent on survey participation rates, self-selection bias, and the resulting survey estimates. We find that the passive consent procedure does a better job of minimizing self-selection bias and maximizing the validity of the survey estimates (relative to the control group) compared with the active consent procedure. However, neither procedure is ideal: Both consent procedures increase the total self-selection bias and reduce the sample size. We conclude with a general discussion of the main findings and their practical implications.

Who participates early or late in a survey? Results from a mixed-mode general population panel

Tobias Gummer, Bella Struminskaya
GESIS - Leibniz Institute for the Social Sciences, Germany; Utrecht University
tobias.gummer(at)gesis.org, b.struminskaya(at)uu.nl

Survey researchers are often confronted with the question about the length of the field period. A longer

fielding time can increase participation but it also requires more effort from survey managers. From practical experience, we know that respondents differ in when during the field period they participate in our surveys. We argue that in order to make an informed decision on the length of the field period, it is necessary to better understand the respondent's decision to participate. In the present study, we draw on theories of survey participation like the Leverage-Saliency Theory and Social Exchange Theory as a theoretical framework to explain why respondents participate early or late in a survey.

To test our theoretical expectations, we use data from the GESIS Panel, a probability-based mixed-mode (online and mail) panel of the general population in Germany that was recruited in 2013 and started its regular operation in 2014 (N active panel = 4,938). We analyze both the online and the offline samples, in which respondents were invited to bi-monthly surveys with a field period of two months. Drawing on information collected during the recruitment interview and the first self-administered survey in 2013 we fit regression models to explain when during the field period respondents participated in the panel. Shedding light on the timing of the respondents' participation can help survey practitioners to better understand survey participation and, thus, to use the length of the field period as a means to design surveys more responsively to the respondents' needs.

RN21 | Session 07a Increasing Comparability in Cross-National Research

Testing measurement invariance in a CFA framework – State of the art

Philipp E. Sischka
University of Luxembourg, Luxembourg
philipp.sischka(at)uni.lu

In recent years, several studies have stressed out the importance to guarantee the comparability of theoretical constructs (i.e. measurement invariance) in the compared units (e.g., groups or time points) in order to conduct comparative analyses (e.g. Harkness, Van de Vijver, & Mohler, 2003; Meredith, 1993; Vandenberg, & Lance, 2000). If one does not test for measurement invariance (MI) or ignores lack of invariance, differences between groups in the latent constructs cannot be unambiguously attributed to 'real' differences or to differences in the measurement attributes. One approach to test for MI is in a confirmatory factor analysis (CFA) framework. The presentation will be about new developments in the MI-CFA framework. Among other things, the presentation tries to answer the following questions:

- Which scale setting method to use (marker variable, fixed factor or effect coding method) when testing for MI?
- Should a top-down- or bottom-up-approach be used?
- How to test MI with a large number of groups (>30)?
- What are the possibilities to evaluate whether MI exists (e.g., statistical significance of the Chi-square after Bonferroni adjustment, changes in approximate

fit statistics, magnitude of difference between the parameter estimates)?

- How to determine confidence intervals for fit indices?
- Can MI be graphically analyzed?
- How can be dealt with non-invariance?

These questions will be tried to answered by an application to a real world dataset (N ~ 40.000), with a one-factor/five indicator model of a well-being scale tested in 35 groups.

Criteria of verification measuring equivalence in cross-national sociological surveys

Oksana Zhuleneva

Institute of Sociology NAS of Ukraine, Ukraine
oksana.zhuleneva(at)gmail.com

Conducting of cross-national research in sociology means a transition from consideration variability within a one group (countries) to double the variability in cross-national comparison. The difficulty of cross-national study lies in the fact that the construct with a certain set of measurement indicators must measure social phenomena in the same way. The construct must cover all the characteristics of social phenomena and indicators must be relevant to all characteristics of social phenomena in every country where we compare the data.

In order to obtain relevant data, it is important to prove that the measurement is valid, corresponds to all characteristics of measurement country and at the same time allows to use the same indicators, which makes possible to compare with other countries.

It is important to prove the stability of the theoretical construct from the cross-national aspect by demonstrating invariance in different socio-cultural contexts. The identity analysis of structural ties and connections between them are the base and the main condition of measurement of construct in cross-national study. If the structural identity of indication connections has been proven, there are prerequisites and a necessary basis for commensuration of the construct being investigated.

Therefore the main methodological question of this report focuses on criteria of equivalence measurement and achievements of data relevance. And how we can prove that the measurement results can be attributed to all member countries.

In this report the author focuses on criteria of equivalence measurement verification and achievements of data relevance and must answer a question what can help researcher in the realization of this goal.

Weighting in SEM – analysis of ESS for selected countries in modelling evaluation of public performance, satisfaction and political trust

Jolanta Perek-Bialas, Magdalena Burdach

Jagiellonian University, Cracow, Poland; Warsaw School of Economics, Poland; Warsaw School of Economics, Poland

jolanta.perek-bialas(at)uj.edu.pl,
magdaburdach(at)gmail.com

The paper deals with application of various weights strategies in Structural Equation Modeling (SEM) based on ESS data for an example of G. Bouckaert and S. Van de Walle model on the relation between public performance, satisfaction and political trust. Analysis are performed based on three rounds of European Social Survey (5th, 6th, 7th) and selected countries of Central and Eastern Europe as previous analysis were limited only to Poland and Germany. Especially various weights for analysis within country (design weights) or between countries comparison (population size weights) offered in ESS can be sensitive to SEM output/results. MGCFAs are used with models built for three ESS rounds separately as well for all three jointly, and for single country, between countries and between years. Conducted modeling presents high potential in use of ESS data in MGSEM analysis but also significant influence of data weighting on obtained results. It is interesting to emphasize that while in case of single country and single country between years, the effect of applied weights on coefficients, latent means differences etc. is relatively smaller, than in the case of multigroup analysis, between countries, where the impact is noticeably higher. In conclusion, we would like to contribute to the discussion of using these approach in sociological analysis and if it is worth to apply and if and how using different data weighting in SEM allows to draw convergent conclusions.

Robustness of multilevel models to sampling bias in multi-country survey programs

Petra Martina Baumann

University of Graz, Austria

petra.baumann(at)edu.uni-graz.at

Multi-country data sets analyzed via multilevel modeling are popular in sociology. One prerequisite for valid results from multilevel models is random sampling on each level. However, multi-country data often inherently suffer from sampling bias, on the country as well as on the individual level. Ignoring the rather theoretical question if there actually is something like a population of countries to which inference may refer, multi-country survey programs usually exhibit sampling bias on the country-level in two ways. First, countries are not randomly chosen to participate, they are rather invited and/or select themselves into a survey program. Second, often not all countries participating in a survey program are analyzed, either because a sub-survey is not available everywhere or interest lies in a certain group of countries only. Not addressed in this paper is sampling bias on the individual level caused by clustered sampling used in many survey programs.

To assess the impact of country-level sampling bias on multilevel modeling, a Monte Carlo simulation is conducted. In addition to the data-generating process based on data distributions and a multilevel model, bias variables are introduced to model the sampling issues individually as well as in combination and with different sample sizes and different model setups.

Results are then compared to the initial "true" values,

and also to results of an analysis without any sampling issues. These comparisons illustrate the risk these issues pose to the validity of sociological findings. The discussion then includes possible remedies to gain valid results.

Measurement equivalence with correction for measurement error: a comparison using the ESS

Andre Pirralha, Wiebke Weber

Universitat Pompeu Fabra, Spain; Universitat Pompeu Fabra, Spain

andre.pirralha(at)upf.edu, wiebke.weber(at)upf.edu

Comparing between countries has always been one of the main goals of social and behavioral sciences. Recently, the growing availability of cross-national survey data has given a definite push to this trend, particularly when it comes to comparing individual attitudes between countries. Nevertheless, as subjective constructs, in order to compare attitudes, we need to be sure that they measure the same concept and that the measurements are equivalent. The most common way to test for measurement equivalence is in the framework of multigroup confirmatory factor analysis (MGCFA). Over the last decades, different data analysis tools have been developed to assess measurement equivalence. Even though it is widely known that measurement error can seriously attenuate the relationships between variables, most previous work on measurement equivalence has only focus on random error and largely ignore the potential effect of systematic error, including method effects. This is an important issue because it is often claimed that equivalence analysis is too strict without mentioning that some of the differences that cause parameters to be not invariant can be corrected in the measurement process. The main reason not to correct for measurement error is the difficulty in obtaining the quality estimates for the measurements. However, with the

SQL 2.1 software the quality estimates are now freely available. In this paper we aim to illustrate how these estimates can be of use in equivalence testing. Using data from the European Social Survey, we set out to determine the impact of full correction for measurement error in measurement equivalence analysis.

RN21 | Session 08a The Transition of Quantitative Research in an Era of Digitalization

Computational Social Science: A Literature Review on interdisciplinary approaches

Christopher Zirrig, Anne Suphan

University of Hohenheim, Germany; University of Hohenheim, Germany

christopher.zirrig(at)uni-hohenheim.de,

anne.suphan(at)uni-hohenheim.de

We are concerned to a systematic classification of the uses and interpretations of the term "Computational Social Sciences" (CSS) to visualize interdisciplinary

approaches and fruitful intersections. For example, social science learn from computer science exploitation and design of new data. Vice versa computer science learn from social science methods dealing with socially relevant data and issues.

To point out similarities and differences, we conduct a two-step literature review: First, we collect 53 articles from "science direct", that deal with the keyword CSS. We analyze them concerning scientific disciplines, used definitions and methodological difficulties they are facing. Second, we search "scopus" for the keyword CSS and add 286 articles to conduct a cluster analysis to verify our results from the first step. We determine five broad categories: The first category deals with computer science, neuroscience, biology and other sciences. The second category is about user-generated content. This involves methodological questions such as data mining and the development of new tools. In the third category we find forecasting and epidemiological inquiries. The fourth category deals with the development of social science theory in the course of CSS developments. The fifth category summarizes what is additionally discussed in the discourse about CSS. From a methodological point of view we detect intersections among the field of CSS and visualize opportunities for interdisciplinary approaches.

Introducing Space-Sets : What Are They, How to Operationalize Them and What Do They Bring to Sociological Knowledge?

Ettore Recchi

Sciences Po, France

ettore.recchi(at)sciencespo.fr

In the palette of standard sociological explanans of behaviours and orientations, the 'relation with space' of individuals is unjustly neglected (Gieryn 2000). A strong emphasis on this factor was placed, however, by one of sociology's founding fathers, Georg Simmel, in his *Space and the Spatial Ordering of Society* (2009 [1908]). Drawing on Simmel's and others' insights, the concept of 'space-set' was coined to designate the complex of geographical sites where individuals spend their social existence (Recchi and Kuhn 2013; Recchi 2015). Space-sets comprise the objective and subjective spatial careers of individuals, stemming from past and present practices, unified by the memory of one's presence in a geographical location. Space-sets are like personal maps of the physically experienced world. They can also be conceived as ego-centred networks, in which the points are not other people but places. As in social network analysis, the size, width and salience of space-sets vary dramatically across time, space and social strata.

A first operationalization of space-sets was introduced in two 2016 surveys, carried out independently in France and Italy. In France, space-sets were recorded as part of a tablet-based longitudinal survey (ELIPSS: 700 cases, representative sample); in Italy, they were the focus of an online retrospective survey (Doxa-Mobilità: 1000 cases, representative sample). Both incorporated the same set of questions, but with

different types of maps and collection methods. The paper will discuss advantages and pitfalls of these differences, as well as issues of external and construct validity of indexes (size, width and salience) capturing cognitive, experiential and biographic dimensions of space-sets.

Title: The use of automatized digital text analysis in exploring large scale qualitative interview material on young adults heavy episodic drinking

Jakob Demant, Geoffrey Hunt

University of Copenhagen, Denmark; Aarhus University, Denmark

jd(at)soc.ku.dk, gh.crf(at)psy.au.dk

Digital methods as spread fast within social science because it has proven to be a valid instrument to keep track of the vast amounts of social data that are constantly generated and archived online, social scientists. But digital methods also provides a platform to rethink methodologies for data acquisition and analytical tools (Venturini & Latour, 2010). The aim of this paper is to explore how the tool Topic modelling (TM) can provide new aspects to analysis of large scale qualitative interview data. TM are a quantitative analytical tool which can potentially reveal patterns and themes in textual material. Topic modelling presents textual themes through a variety of topics accompanied by a cluster of words created on the basis of words that statistically appear together in the text corpus. The data consist of in-depth, face-to-face interviews with 140 young Danish adult men and women (18-25) with recent drinking-to-intoxication experiences. Most Danish young people in this age group are active alcohol users. The age group was chosen because in this age period alcohol use, heavy episodic drinking, and intoxication typically peak. Discussion: The topics identified within the material relates well to the manual coding by research staff. But TM also identified new findings. Digital methods are interesting because it breaks down the quantitative qualitative divide. The use of TM should not be seen as a way to make a qualitative analysis of the qualitative material, but as a way to use some quantitative tools in a broader analysis.

A data mining and web mining approach for labour market analysis

Ciprian Panzaru, Claudiu Brandas, Ania Ceausescu
West University of Timisoara, Romania; West University of Timisoara, Romania; West University of Timisoara, Romania

ciprian.panzaru(at)e-uvt.ro, claudiu.brandas(at)e-uvt.ro, ania.ceausescu84(at)e-uvt.ro

Online job portals have become an important data source about labour demand and supply structure and dynamics. Our research is focused on the analysis of the labour market dynamic using web mining and data mining techniques. Analysing data from job portals allow us to identify the characteristics of labour market and correlation between labour demand and the labour supply.

For the development of the case study, we focused on the European labor market. Consequently, we scraped data from the several European job portals. The extraction and structuring of data was done through web content mining. Data analysis was carried out with data mining clustering techniques using the simple k-means algorithm. For a better understanding and visualisation we put the results in a visual form using Google Fusion Table and Google Maps. The analysis highlighted the importance of the web data in identification and understanding the specificities of the labour market. We showed that big data analysis and extraction of knowledge from data collection could be successfully used to analyse labour market.

RN21 | Session 09a Measuring Societal Transformations in Turbulent Times

Objective deprivation and subjective economic stress in Europe before and after the financial crises

Stefanie Kley, Johannes Huinink
University of Hamburg, Germany; University of Bremen, Germany
stefanie.kley(at)uni-hamburg.de,
huinink(at)empas.uni-bremen.de

In the decade before the beginning of the current financial, economic and sovereign debt crises, the European labour markets became more inclusive. In the course of such convergence one might expect that the degree to which material deprivation is associated with subjective economic stress becomes more and more the same in each country. This contribution analyses the question whether or not Europeans felt troubled by material deprivation to a similar extent in the last decade, what might shed light on the emergence of a generalized system of social stratification in Europe. The analysis makes use of all available country-data from the European Union Survey on Income and Living Conditions (EU-SILC) for every two years between 2005 and 2013. Mixed effects multi-level OLS-regression is applied to measure the relationship of material deprivation and subjective economic stress. The results show that the effect of material deprivation on economic stress increased between 2005 and 2013, whereas it reached its peak value in 2009, at the peak of the financial crises. The finding that in poor countries material deprivation is associated with economic stress to a lesser extent than in rich countries replicates earlier findings. The differences between the countries in the relationship between household's material deprivation and economic stress widened until 2009 and narrowed slowly afterwards. Post-estimation reveals that for deprived persons, living in Social-Democratic and corporatist countries is less stressful, closely followed by Liberal countries, whereas living in Southern European and Post-Communist countries adds extra burden on deprived households. In each of the respective years, more than one third of the overall variance in subjective

economic stress stems from the country level.

Democratic Legitimacy under Pressure: Public and Elite Perceptions before and after the Global Financial Crisis

Hendrik Jakobus Kotze, Carlos Rivero
Stellenbosch University, South Africa; Valencia University, Spain
hjk(at)sun.ac.za, carlos.rivero(at)uv.es

The central question asked in this paper is how perceptions changed about democratic decision-making in selected countries after the Global Financial Crisis. Basically, we want to answer how much, if any, democratic legitimacy suffered due to the 2007-2009 Global Financial Crisis.

The research takes form of a quantitative analysis based on the World Values Surveys and a unique set of Parliamentary Elite surveys conducted in 2006 and 2012/2013, the same years as the WVS. This time span allows the analysis of the possible effect of the worst impact of the Global Financial Crisis on perceptions of democracy. Countries from different continents are included for comparison. We included: South Africa, Chile, Germany, Sweden, South Korea, Poland, and Turkey. The selection of cases is representative of a wide range of political, social and cultural diversity (catholic, protestant and Islamic; old and new democracies, presidential and parliamentary democracies).

For our analysis we divided regime performance, our independent variable into distinct "baskets of goods": an economic basket, that includes economic assets, jobs and an array of basic social services and a political basket, containing peace, civil liberties, political rights, human dignity and equality before the law. We thus explore two possibilities: One, that democracy is circumscribed to political issues such as political rights and civil liberties and, two, that democracy is expected to produce economic outcomes such as providing shelter and income. Our independent variable is an index of support for democracy.

Based on regression analysis our findings delivered a mixed pattern of support for democracy in the selected countries. Interesting questions for further research could be posed based on the patterned outcomes.

Socio-Cultural differences in Confidence in the European Union

Juan Diez-Nicolas, Ana Lopez-Narbona
ASEP Spain; University of Malaga, Spain
100613.2721(at)compuserve.com,
alopeznarbona(at)uma.es

This paper attempts to explain Confidence in the European Union in very different societies on the basis of social, economic and political factors in these societies using data from the six waves of the World Values Survey project. Every social fact must be analyzed and interpreted in two dimensions: space and time. The WVS project provides both possibilities, since it has included a question on Confidence in the European Union among more than a dozen other

institutions in six waves since 1981 and in more than 100 different societies.

The more than 100 countries will be grouped in seven geo-cultural groups that will be used as units of analysis, though for certain purposes individual countries will also be used as units of analysis.

An index of Confidence in institutions will be produced on the basis of the institutions used.

Family values and number of children across Europe: does generation matter?

Tatiana Karabchuk
United Arab Emirates University, United Arab Emirates
tkarabchuk(at)uaeu.ac.ae

The paper deals with the interaction between family values and number of children in European countries focusing on age effects. The goal of the paper is to reveal the relationship between values and fertility patterns through generations among European countries. The analysis is done for five separate age groups: 19-28, 29-38, 39-48, 49-58, 59-68 years old. The authors claim that younger generations have more egalitarian, individualistic values that prevent people from having many children. Applying modernization theory of Ronald Inglehart we explain generation effect on value changes and fertility patterns. The empirical part of the paper is based on European Value Study of 2008 (47 countries). The paper shows the significant interdependence between generations - fertility patterns and generations - values. The multilevel approach allows us to control for cross-national cultural differences and countries' development level.

RN21 | Session 10a Methodological Challenges of Quality of Life Research in Europe

Investigating the structure of the 2006 European Social Survey measurement of wellbeing

Anastasia Charalampi, Catherine Michalopoulou,
Aggeliki Yfanti
Panteion University of Political And Social Sciences, Greece; Panteion University of Political And Social Sciences, Greece; Panteion University of Political And Social Sciences, Greece
acharalampi(at)panteion.gr, kmichal(at)panteion.gr,
aggelikiyfanti(at)panteion.gr

Background: In 2006, a module on personal and social wellbeing was included in the European Social Survey (ESS) questionnaire. Although, wellbeing was defined as a multidimensional construct, in the literature, to the best of our knowledge, there is no evidence on its structure (dimensionality) and psychometric properties.

Purpose: To investigate the structure and assess the psychometric properties of the personal and social wellbeing included in Round 3 of the ESS.

Method: ESS data of 2006 for Portugal and Spain were used. Each sample was split randomly into two halves. Exploratory Factor Analysis (EFA) was

performed on one-half sample in order to assess the construct validity of the scale. Then, the structure was validated by carrying out Confirmatory Factor Analysis (CFA) on the second half sample. Based on the total sample, subscales were constructed according to the six key dimensions proposed for ESS: evaluative wellbeing (EV); emotional wellbeing (EM); functioning (FUN); vitality (VI); community wellbeing (CW); supportive relationships (SR). The subscales' reliabilities and internal consistencies were investigated.

Results: EFA resulted in a six and four factor solution for Portugal and Spain, respectively. CFA showed an adequate fit for both the Portuguese – EM (negative), EV, EM (positive), FUN, CW, VI – and the Spanish model – EV, EM (negative), EM (positive), FUN.

Conclusions: Although our analysis did not confirm the theoretical structure of the ESS measurement of wellbeing, it did produce reliable and valid subscales. Our results suggest that further research is necessary at country level to provide subscales suitable for use in analyses.

Life Satisfaction and Wellbeing in Central and Eastern Europe: Predictors and Dynamics

Kseniya Kizilova

World Values Survey Association, Austria

kseniya.kizilova(at)gmail.com

Current paper deals with the analysis of dynamics of the level of well-being in the post-Communist and post-Soviet societies of Central and Eastern Europe. The paper focuses first of all on subjective indicators of well-being, among them general life satisfaction, satisfaction with financial conditions and feeling of happiness. These indicators are used for calculation of the index of subjective well-being. The data used for analysis comprises from the World Values Survey wave 2 (1990-1994) to wave 6 (2010-2014). The following 10 countries are included into the analysis: Latvia, Lithuania, Estonia, Poland, Hungary, Slovakia, Belarus, Moldova, Russia and Ukraine. Highly developed societies of Western Europe (Austria, Denmark, Norway and some other) which are characterized also by high level of life quality and population social well-being are included into the analysis for comparative purposes. The paper provides overview of the dynamics of the level of subjective well-being in the mentioned countries in the whole period of post-Communist and post-Soviet transition – from 1989 to the present days. A brief comparative overview of the level of subjective well-being in other world regions in 2010-2014 (WVS wave 6) is presented. Cluster analysis method is used to distinguish 3 groups of respondents depending on the level of their subjective well-being. Principal components analysis and multivariate analysis are used to define the domains of respondents' life which are to a largest extent affected by the level of subjective well-being as well as to determine the main factors causing particular level of subjective well-being in transitional societies of Central and Eastern Europe.

Life Satisfaction and Subjective Commuting Success: The Case of East-West commuters in the Central European Region

Raimund Haindorfer, Roland Verwiebe, Christoph Reinprecht

University of Vienna, Austria; University of Vienna, Austria; University of Vienna, Austria

raimund.haindorfer(at)univie.ac.at,

roland.verwiebe(at)univie.ac.at,

christoph.reinprecht(at)univie.ac.at

This presentation addresses life satisfaction among East-West commuters in the Central European Region. Reviewing the literature, the life satisfaction concept is seen to be applied – more or less explicitly – as a general indicator of subjectively successful migration. This interpretation is based on a theoretical presumption regarding the migrants' motives. Life satisfaction studies often conceptualize migration as an attempt to generally improve life.

However, present research has mainly considered the consequences of migration for migrants' life satisfaction as a function of income gains. Other outcomes of migration are less often thematized. Moreover, it is questionable whether high levels of satisfaction are to be equalized with subjective migration success. Against this background, this presentation addresses the question: Which economic and non-economic factors affect commuters' life satisfaction and subjective assessments according to which commuting has been beneficial for one's life in general?

This presentation is based on quantitative and qualitative data drawn from a research project on Czech, Slovak and Hungarian commuters who work in Austria. Theoretically, the multi-dimensional triad of Having, Loving and Being is being placed into the research context. Preliminary quantitative results indicate that though there are some identical determinants (e.g. income, commuting time) for life satisfaction and subjective commuting success there can be observed several interesting differences (e.g. in the relevance of language skills or experiences of ethnic discrimination, gender differences). All in all the empirical findings underline the perspective that life satisfaction and subjective migration success stand in connection but should not be viewed of as identical concepts.

Survey design in quality of urban life studies

Michał A. Chrzanowski

Jagiellonian University (Poland)

m.chrzanowski(at)doctoral.uj.edu.pl

Measuring quality of life and public services is crucial for citizen driven city administration. Quantitative studies is an effective tool to let city administrators know what the public actually needs. In doing so they prevent disputes over what citizen's attitudes really are, in relation to proposed policies. However, how a survey is designed can also influence policymaking, by indirectly steering the answers of the public. This paper discusses survey design and sampling in the

context of urban studies, in relation to results usability and policy making.

Many urban phenomena represent a challenge in relation to survey design and delivery. For example, citizen participation and gated communities, both subject to a great deal of scientific interest within urban studies, are problematic in terms of sample non-response, and as a result many studies examining these issues are plagued by sampling bias. Choices related to survey design are often closely related to various city policies. Attitudes and preferences are often tied to specific local environments characterised by a district urban layouts, or by the social profile of its tenants. A sampling frame that fail to take these social realities into account will not only be likely to get biased results, but may also cause social exclusion of certain groups of citizens.

The paper presents a set of best practices related to survey design in urban areas, based on the experiences of conducting a series of repeated cross-sectional urban surveys in cooperation with the city council of Kraków and Jagiellonian University.

RN21 | Session 11a Measuring Enduring and Emerging Social Inequalities in Europe

The challenge of assessing financial hardship. A comparison of direct and indirect measures of poverty in Europe

Ralf M. Lüth

University of Kassel, Germany, Germany
lueth(at)uni-kassel.de

When social policy researchers want to explain the factors that lead to poverty, analyse its implications and develop or evaluate ways to prevent poverty, they need an instrument to identify the poor. This presentation deals with different approaches to this endeavour. A common definition of poverty is the inability to achieve a minimum standard of living due to a lack of resources; it is widely agreed that this minimum standard should be fixed in relation to the general living standard of a given society. But there is a multitude of concepts for determining this minimum living standard and for identifying those people that are excluded from it. A fundamental distinction here is the one between direct and indirect measures of poverty. While the latter focus on the resources available to an individual, direct measures of poverty capture the goods and activities that a person must forgo.

The presentation compares various operationalisations of poverty used in contemporary Europe (i.e. income poverty, material deprivation, social exclusion, welfare receipt). Based on data from the German Socio-Economic Panel 2012, it explores the mismatch between the populations identified as poor by different operationalisations.

Drawing on these findings, possible improvements in regard to the existing indicators are discussed.

The overall aim of the presentation is to highlight both options and problems when measuring poverty in

social policy research, with a special focus on the comparability of popular measures throughout contemporary Europe.

European labour markets in crisis

Dafni Dima

University of Edinburgh, United Kingdom
d.dima(at)sms.ed.ac.uk

This paper aims to study the impact of the 2008 financial crisis on European labour markets at national, regional and individual level. I explore whether labour market patterns changed and whether employment inequalities appeared wider during the crisis. The contributions of this paper are its dual comparison and the use of longitudinal data. Most of the recent empirical studies either focus on one or few countries, or cover only the first phase of the crisis, 2008-2010. The comparison of eleven European countries during 2005-2008 and 2009-2012 with the use of longitudinal data allows the dynamic study of the impact of the crisis on labour market trajectories. Using the longitudinal component of the EU-SILC dataset, with proportional country weights applied, I study all individuals between 25 and 64 years old who have been followed for the maximum duration of the panel, i.e. four years. The outcome variable is the unordered categorical labour market status, self-declared by the respondent. I first apply the latest techniques of Sequence Analysis to study labour market transitions as a whole and not as single events. Then I use Optimal Matching Analysis to measure a symmetrical dissimilarity matrix used for the Cluster Analysis, which aims to identify labour market groups. Finally, I use a multilevel model to study the regional labour market variation across time, with a complex 3-level data structure, with observations nested within individuals nested within regions. I allow for random intercepts at regional level and I control for socio-demographic and contextual characteristics.

The role of diverse social networks in maintaining generalized trust. Social class and prevailing inequalities.

Andreea Alecu

Oslo and Akershus University College of Applied Sciences, Norway
alecu(at)hioa.no

The level of generalized trust is often linked to institutional performance. Other factors such as participation in social networks are, however, also of high importance, but have received less empirical scrutiny in recent scholarship. The scholarship has mainly investigated whether the number of close friends as well as the frequency of contacts is associated to the level of generalized trust. However, close networks of friends might be highly particularistic and foster similar ideas and attitudes. This paper aims re-examine Putnam's (1995) claim that interactions with people from different backgrounds fosters generalized trust, by taking into account the diversity

of one's network and the strength of ties. This is achieved by employing a measure derived from Lin and Erickson (2008) social capital, which accounts for the strength, range and prestige of one's social ties. The preliminary results, based on a comprehensive Norwegian cross-sectional survey, support this hypothesis and indicate a significant correlation between the number of acquaintances and generalized trust, even when observations are matched using coarsened exact matching on social and background characteristics. There is, however, a ceiling effect. Individuals with most ties in a few professions are less trustful compared to those with a diverse network. Nevertheless, there are no significant differences between those with an average span in their network, and those with networks above the average. Furthermore, individuals whose social network encompasses individuals with a higher status are also more trustful.

Who is talking at the end of wealth surveys?

Martin Schürz

Economic University of Vienna, Austria

Martin.Schuerz(at)oenb.at

In the second wave of the Austrian Household Finance and Consumption Survey 2014 (www.hfcs.at) we have included a field for comments of the respondents. Respondents were invited to mention topics they consider themselves as important. After answering standardized questions this provides an opportunity for them to bring in their subjective perceptions on wealth.

We will analyze the comments according to socio-economic variables of the respondents such as net income, net wealth, age, education and other variables. In particular we focus on internet non-response behavior and on the issues selected by the people. The dominant theme is inequality in various dimensions. By studying these results one gets a better understanding of subjective perceptions of inequality by respondents of wealth surveys.

Inverted Classroom-Reducing inequalities at universities

Andrea Breitenbach

Philipps-Universität Marburg, Germany

andrea.breitenbach(at)staff.uni-marburg.de

Heterogeneity among students has been on the rise for several decades. It has manifested itself not only in sharply different knowledge requirements, but also in other areas, such as heterogeneous conditions of living. This has created new challenges for teaching, in response to which only a few new concepts are being developed. For learners in heterogeneous situations, in particular, new teaching concepts can rarely be found. Also, there are hardly any offers for employed students, commuters etc.

As a result, digital teaching formats, such as the Inverted Classroom Model, can make crucial contributions towards softening the impacts of student heterogeneity. In this new teaching model, face-to-

face and self-learning phases are almost 'flipped'. For example, videos would be prepared and made available, replacing classical lectures. The time in the plenary session offers the opportunity for active collaboration like solving problems together, discussions etc.

The way in which the ICM responds to the heterogeneity in the area of statistics for social scientists was explored by a mixed methods study. The study evaluated the concept over four semesters and assessed the results.

The results threw up very interesting findings: the students prefer the concept to classical lectures and consider the learning effect to be higher. Also, such independent learning posed no difficulties. Learners with poor mathematical knowledge even worked on more exercises than those with greater knowledge. The fear of dealing with statistics will also presumably reduce. In addition, the students reported it as good; the new concept of teaching entails no disadvantages. This positive overall picture is buttressed by further quantitative results: students learning by means of ICM perform significantly better and do better in written exams.

RN22 - Sociology of Risk and Uncertainty

RN22 | Session 01a Methods and Methodologies in Risk Research

Studying risk frames in the media. Usefulness and limits of automated content analysis

Maria Grazia Galantino
Unitelma Sapienza, Italy
mariagrazia.galantino(at)unitelma.it

Media framing, as a process for selecting and emphasising specific aspects of perceived reality and connecting them in a narrative that promotes certain interpretations, is considered essential in shaping political and public discourse as well as the opinion climate. This is particularly relevant for studying risk, as most theories and research show the importance of the media in shaping interpretations and public awareness of risk. In this paper, we suggest that the 'dictionary approach' of computer-assisted content analysis can be useful for a systematic empirical analysis of how the term risk is actually used in the media coverage.

Discussing results from an ongoing research that examines risks in the press coverage of migration in Italy (2011-2012 and 2015-2016) and Germany (2015-2016), we aim, firstly, to highlight how "migration risk" (or related terms) is framed in the media discourse. Against this empirical background, we then focus on methodological challenges of automated textual analysis, which can follow different logics and techniques, but always requires a big amount of 'human intervention'. Dictionary-based content analysis, in particular, assumes that the meaning of a given set of texts can be identified through the presence of particular keywords and words co-occurrences, which can be organised in categories. This leads us back to the conceptualization of risk, which remains the starting and the guiding point of any empirical research. It also reveals the necessity to use a mixed-method approach (quantitative and qualitative), which may overcome the limitations of automated text analysis but remains problematic when using large text corpora.

The Semantics of „Risk“ in International Comparative Social Surveys

Aiste Balzekiene
Kaunas university of technology, Lithuania
aiste.balzekiene(at)ktu.lt

International comparative surveys provide rich empirical basis for scientific research in the field of risk and uncertainty studies and testing the models of risk perception determining factors, just to mention few like International social survey programme (ISSP), Eurobarometer or Gallup World Polls. Items in the questionnaires of international comparative surveys include such words as "danger", "worry", "threat" that are that are further used quite interchangeably in scientific analysis as measures of risk perception. This may lead to inconsistent conclusions regarding the features of risk perception in cross-national perspective.

There has been little methodological debate in the sociology of Risk and Uncertainty on how the construction of risk perception measurement items in international comparative surveys may affect the research results and interpretations. This presentation will review how risk perception is worded in different questionnaires, what measurement scales of risk perception are used and will illustrate the risk perception cross cultural differences based on the empirical examples from international comparative surveys (mainly ISSP and Eurobarometer). The empirical data will be discussed in the light of theoretical debate about semantics of "risk".

Who is to blame for the terrorist attack: an experience of using blogs and survey data as sources of responsibility ascriptions

Kirill Gavrilov
National Research University – Higher School of Economics, Russian Federation; Institute of Sociology, Russian Academy of Sciences, Russian Federation
gavrilov(at)socio.msk.ru

The study is based on our previous analysis of blog posts concerning the 2011 Domodedovo airport bombing where we found that individual terrorists are rarely blamed in contrast to other actors (Gavrilov & Tolmach 2014). Then we mostly ignored the research of responsibility ascriptions based on "lay people" explicit judgments (Lickel et al. 2003; Lagnado & Channon 2008). Now our methodological goal is to test the possibility of combining content analysis of blogs and the survey data. The substantial goal is to examine the specificity of responsibility attribution in the situation of a terrorist attack.

Firstly, we conducted a pilot study that included the content analysis of essays written by HSE students about the terrorist attacks in Volgograd in December 2013 (n = 26) using the methodology of the Domodedovo study. We also made an online survey of these students with questions regarding the level of responsibility of different actors involved in the terrorist attacks. The result was that almost all the actors had high blame ratings, even the actors not mentioned in the essays.

Secondly, we conducted a study of the Charlie Hebdo shooting in January 2015. Apart from essays and online survey with students (n = 80) we also made a content analysis of blog posts (n=300). The analysis

showed a significant difference in the attributions of blame depending on the data source: individual terrorists were not blamed according to data obtained via unobtrusive methods, but the survey data suggest the highest levels of their responsibility.

Are political representatives more risk-loving than the electorate? Evidence from the German Federal and State Parliaments

Christian von Scheve, Moritz Heß, Jürgen Schupp, Aiko Wagner, Gert G. Wagner
Freie Universität Berlin, Germany; German Institute for Economic Research (DIW); Technical University Dortmund; German Institute for Economic Research (DIW); Freie Universität Berlin, Germany; Berlin Social Science Center (WZB); German Institute for Economic Research (DIW)
scheve(at)zedat.fu-berlin.de, mhess(at)post.uni-dortmund.de, jschupp(at)diw.de, awagner(at)wzb.eu, gwagner(at)diw.de

Political representatives frequently make decisions under risk and uncertainty that not only yield domestic but also global consequences. Although decision-making is crucial to politics, little is known about the representation of traits that systematically influence decision-making, in particular the risk propensity of voters and politicians. Given that in representative democracies, few political elites make decisions that have consequences for most members of society, it is an interesting question whether political representatives do resemble their constituents regarding their risk propensity. Representing constituents is critical for the functioning of democratic political systems, but voters might be much less or substantially more risk seeking than their political representatives. This presentation reports results from a study that investigated the degree to which political representatives' risk propensity resembles their constituents' risk propensity. Using representative samples of the German Federal Parliament, four German State Parliaments, and the general population of Germany, we show that political representatives are significantly more risk loving than the average citizen in all eight domains of risk-taking we assessed and in a hypothetical choice experiment – even when using conservative matching procedures and politically interested citizens as the comparison group. We discuss the results in light of two possibly contrasting sociological interpretations of the origins of these differences: theories of occupational selection and theories of risk as culture.

RN22 | Session 02a Public Discourses and Media Representations of Risk I

Discourse-semantic differences in national climate change debates: UK and Germany

Marcus Müller, Jens O. Zinn
TU Darmstadt, Germany; University of Melbourne, Australia
mueller(at)linglit.tu-damstadt.de, jzinn(at)unimelb.edu.au

Since Beck claimed that new mega risks such as nuclear power, genetically modified food, terrorism and climate change would transform the social world into a risk society, scholars have come back to emphasizing the forces which shape different national responses to risk. The media are a socially central arena for societal debates which reflect public understanding and responses to risk while the media themselves have been identified for mediating public understanding of risk (Tulloch & Zinn 2011). This is the case on the level of national media cultures (Grundmann & Scott 2014) as well as newspaper specific stance (Müller & Vogel 2012). In this presentation we employ corpus linguistics methods to analyze differences in the understanding and discursive representation of climate change risk in newspapers from the United Kingdom and Germany from 2003 to 2013. We show that in the UK 'risk' is communicated twice as much as in Germany. In the German context the explicitly negative phrases such as *Bedrohung* and *Gefährdung* are significantly more in use than respective concepts in the UK (*hazard*, *threat*). There is a tendency to refer in the UK news to the risky future of the climate change world more generally while in the German discourse pragmatic strategies to manage hazard (*Bedrohung*) and threat (*Gefährdung*) of climate change dominate. We will conclude with possible reasons for these differences.

Constructing the space of the local media: the political attitudes of the local mass-media and their environmental risk representations

Efim Fidrya, Olga Fidrya
Immanuel Kant Baltic Federal University, Russian Federation; Immanuel Kant Baltic Federal University, Russian Federation
efim.fidrya(at)gmail.com, o.fidrya(at)gmail.com

This is the study of the environmental risks representations constructed by the local mass-media and the relation between the images constructed and the political attitudes represented by these media. The theoretical concept we used is the 'social space' theory developed by Pierre Bourdieu. We assume the risk images represented by mass media are not simply 'reflecting' the 'objective reality', but rather constructed depending on their social and political attitudes, conditioned by the mass-media's position in the respective field of the symbolical production. This research is based on the case study of the media representation of the risks of the development of the salt mining in the village of Nivenskoye in Kaliningrad region. Data was collected using content analysis of all publications made in the local media on this topic since the beginning of the salt mine development in 2014.

We measured some key characteristics of the mass-media (number of unique visitors, circulation, frequency, amount of state funding etc.) and the attitudes towards the key political actors (federal and regional authorities), the number and the tone of the publications on the topic, and also the way the risks

were depicted (kinds of risk, its causes and potential victims).

In order to analyze the relations between these variables the multiple correspondence analysis was used, and the resulting space of the local mass media was constructed with the risk images as an active categories, and the mass media characteristics and the political attitudes they represent as a supplementary categories. The consistent groups (clusters) of media with the distinct risk representation dispositions and specific characteristics were outlined and characterized.

Interpretative Repertoires of Environmental Risks in Discourses on Urban Infrastructure Projects in Lithuania

Audrone Telesiene

Kaunas University of Technology, Lithuania

audrone.telesiene(at)ktu.lt

The presentation aims at discussing environmental risk communication in cases of urban infrastructure projects. Specifically, the focus is on the social constructions of environmental risks, as being discussed by different urban infrastructure projects' stakeholders (e.g. municipality, developers, local communities, etc.). EU directive on environmental liability obliges the stakeholders to take the environmental impact and the possible mitigation measures into account. The stakeholders are also required to properly inform the society and communicate about the projects, the anticipated impacts and compensatory measures.

The author of this presentation draws on discourse theory and 'interpretive repertoires' as an analytic concept to analyze the forms of language the discourse makes available for articulating possible environmental risks.

Results presented during this conference are part of a wider project that is generally designed to foster sustainable urban development, by analyzing experiences related to urban infrastructure projects, their environmental impact, and environment compensation measures in Lithuania and Sweden.

Data for discourse analysis includes texts produced by various stakeholders and published in public media channels (newspapers, web pages, forums, etc.) and related to Lithuanian urban infrastructure projects cases. NVivo is used for data processing. Questions to be discussed: What risks of urban infrastructure projects are discursively constructed and what interpretive repertoires are formed? By what discursive and rhetoric means? Do the discourses encourage or discourage (or provide other repertoire of meanings) the environmental compensation measures in urban infrastructure projects in Lithuania? The research project 'The Perception and Practices of Environmental Compensation: Urban Infrastructure Projects in Lithuania and Sweden (EnCoM)' is funded by a grant (No. MIP 011/2015) from the Research Council of Lithuania.

RN22 | Session 03a Theoretical Advancements in Risk Studies

Doing unsafety in the public sphere

Ida Sjöberg

Mid Sweden University, Sweden

ida.sjoberg(at)miun.se

In this paper I will examine how unsafety in the public sphere can be understood as a place where power structures and norms are actively done by people's everyday performance. In this sense unsafety is not an "objective" condition, but instead something that is created and maintained in different ways in different contexts. The subjective feeling of safety in the public sphere is an important aspect of people's quality of everyday life and their social life, as unsafety can lead to restrictions of this regarding their ability to use and claim space in the public sphere. There is a dividing line in the research regarding the focus point of the understanding of unsafety in public spheres, whether unsafety should be understood in relation to the physical environment, or in relation to the social and political power relations that permeates the public sphere. By drawing on the theory of doing risk, which combines intersectional and risk theory, this study examines how different social groups' experiences of safety in the public sphere are done in the intersection of the two dimensions of public space. The study consist of five focus group interviews with university students, LGBT-people, immigrants, wheelchair users and elders. The analysis focus on how risks and safety are done in the intersections of the physical and the social dimensions of the public sphere, and aims to interpret this in relation to the norms and power structures that is reflected through these dimensions.

Changing risks- perceptions related to old-age and retirement in post-communist societies

Daniela Urse

University of Bucharest, Romania

dana.pescaru(at)gmail.com

This paper proposes an analysis of the changing nature of risks associated with old age and of how individuals, in different social and political contexts, perceive them. The analysis departs from the theories of reflexive modernity(Giddens), risk society(Beck), governmentality and social insurance (Foucault, Ewald), which depict the transformation of risks from hazards handled within traditional ties to external risks (subject to social insurance programs), and, eventually, nowadays to private responsibilities. In both the communist and the capitalist societies the risks associated with retirement from the labor market and old age were handled through the authority of insurance seen as a legal obligation (Ewald). The evolution is especially relevant for post-communist societies, as they experience multiple transitions: from planned to capitalist economies or from a cybernetic model(Giddens) to a society of risks and uncertainty. The mentioned theories predict a weakening of the individuals' confidence in the efficiency of the former

insurance programs and a diminishing importance of insurance as a legal obligation, in which case the moral obligation of individual responsibility should prevail (Ewald). While the perception of risks is also the result of the mainstream politics, theories of risk society also foresee different attitudinal patterns, depending on the level of education (Beck) or on the degree of welfare programs institutionalization (Giddens, Beck). From this perspective, the paper analyses the individuals' perceptions of risks related to old age and retirement, striving to disentangle their eventual transformation, through distinguishing possible attitudinal patterns. This would also contribute to filling the gap between theoretical and empirical analyses, existing in this field.

Exploring the network of actors contributing to mitigating flood risk in Lomma, Sweden

Per Becker

Lund University, Sweden; Mid Sweden University, Sweden

per.becker(at)risk.lth.se

Urban flood risk is a big and growing concern in Sweden. Although much focus is placed on rainfall, hydrology, and engineering conceptualizations of both consequences and solutions, social research contributes to explaining and understanding risk and how actors perceive, construct, and manage it together. This paper applies social network analysis to investigate the network of actors in Høje river catchment area contributing to mitigating urban flood risk in the town of Lomma in southern Sweden. By analysing representations of the social network of individual respondents based on different types of professional dependencies, as well as trust, influence and friendship, a number of interesting structural and relational aspects emerge. Aspects that may have direct implications on how flood risk is managed, now and for the future. This structural analysis is complemented with a more reputational analysis of who the individual respondents consider having most influence over flood risk in Lomma in general, regardless of direct dependencies to these actors or not. The study is finalized during the spring of 2017, but early findings indicate a significant enviro-organizational rift; a systemic discrepancy between the hydrological system of the river's catchment area causing floods under certain circumstances and how society is organised to address this challenge.

Temporalization and digital infrastructures as driving forces of risk and uncertainty

Heiko Kirschner, Tilo Grenz, Maria Schlechter
University of Vienna, Austria; University of Vienna, Austria; University of Vienna, Austria
heiko.kirschner(at)univie.ac.at,
tilo.grenz(at)univie.ac.at,
maria.schlechter(at)univie.ac.at

Advancing institutional differentiation is coupled with a detachment of institutionalized rationalization from local and biographical contexts. This detachment can

be held responsible for an increase of uncertainty in the biographies of people. Hence, this development has been tried to be grasped with the concept of individualization on behalf of socio-economic status, liquidity with regard to political and social stability, as well as with the economically driven acceleration of social conditions. All of the above concepts are united by the insight, that people are now more than before confronted with an increase of risk and uncertainty.

The complexity and effect of this process of detachment may be described as temporalization, which manifest itself in flow architectures of data. These global flows cause a concentration of knowledge and attention towards data which is only available in the here and now. This pacing leads towards a constant decrease of the half-life of valid knowledge which calls for constant adjustment and adaption. Both, the pacing and the decrease in half-life are bound and enabled by specific digital infrastructures. With regard to the institutionalization of knowledge, temporalization can be described as an accelerated ageing of (still) valid or legitimate knowledge, which increasingly renders people with states of uncertainties. In our talk, we would like to present cases in the field of eSports and the Apple App Store in order to illustrate the concept of temporalization and its impact on the concepts of risk and uncertainty.

RN22 | Session 04a Current Research in Risk Perceptions and Understandings

Ethical aspects of final disposal of spent nuclear fuel at the host community level: The resident survey in Pyhäjoki and Eurajoki in Finland

Tuuli Vilhunen, Matti Kojo, Tapio Litmanen
University of Jyväskylä, Finland; University of Tampere, Finland; University of Tampere, Finland; University of Jyväskylä, Finland
tuuli.a.vilhunen(at)student.jyu.fi, matti.kojo(at)uta.fi, tapio.litmanen(at)jyu.fi

This paper focuses on ethical views of residents of two SNF disposal sites in Finland. Due to severe social and technical dilemmas related to spent nuclear fuel (SNF), the ethical issues have drawn researchers' interest already several decades. In addition to this several countries and international organizations have outlined their ethical frameworks and principles from the 1980's onwards. These frameworks and principles have been evaluated and mostly criticized in recent literature of ethics on nuclear waste, but less attention is paid on ethical values and attitudes of local residents living in the vicinity of proposed SNF disposal sites. The objective of this study is to compare how residents of two Finnish communities, a greenfield site Pyhäjoki and a nuclear community Eurajoki, perceive ethical issues related to nuclear waste management and also to explain how ethical attitudes are related to acceptance of final disposal of SNF. The data (N= 454) was gathered in the end of 2016. Besides older ethical questions, further construction of nuclear power in Finland has given a

rise for series of new ethical questions related to spent nuclear fuel (SNF) management, e.g., is it in the overall interests of society that there should be two final disposal sites for spent nuclear fuel on Finland and should the greenfield site accept siting of repository as they have accepted the siting of a new nuclear power plant.

The sky in a room: working practices of Air Traffic Control Officers

Diego Coletto, Micol Bronzini
University of Milano-Bicocca, Italy; Polytechnic University of Marche, Italy
diego.coletto(at)unimib.it, m.bronzini(at)univpm.it

Since Vaughan's seminal work (1996; 1999), social scientists have shown that risk is not an objective fact but it is rather a social construction defined by subjects and grounded on their actual experience and local contingencies (Catino, 2004). Drawing on this theoretical framework the paper presents some findings of an ethnographic research concerning Air Traffic Control Officers (ATCOs) working in four different air traffic control facilities in Italy. As other professionals in High Reliability Organisations (HROs), ATCOs have to provide real-time risk analysis and safety assessment (Vaughan, 2002), while coordinating with pilots and other controllers, both inside and outside their facility, with the possibility of harmful consequences in case of mistakes. A practice-based study of situated action (Suchman, 1987; Vaughan, 1998; Bruni, Gherardi, 2007) has been adopted in order to understand how ATCOs approach to risk, making sense of what they see on the radar, detecting and interpreting signals of potential danger and promptly correcting possible anomalies (Vaughan, 2002). To this end, we looked at the interactions between professionals and technological artifacts, team working and cooperative practices, processes of communication and coordination. The attention will be focused on the 'creative use' of technological artifacts, the role of local knowledge and script in the process of sensemaking (Weick, 1995), labeling, the importance of social redundancy and proactive behaviours, the institutional evolution in favour of a no blame culture, but also the leeway of 'negotiation' between the safety first culture and the optimization of air traffic fluidity.

How technology shapes risk perception: the case of one American university campus

Veronica Moretti
University of Bologna, Italy
veronica.moretti4(at)unibo.it

Looking at risk within a sociological perspective implies to take into consideration the remarkable transformations of the last years (Giddens, 1999; Rosa 2015). Nowadays, digital technologies have expanded the opportunities for people to access and share information (Lupton, 2015) and this condition might lead to see the future much less safe than before (Beck, 1986).

This research analyses the level of risk perception among students at an American university. The purpose is to explore whether students perceive themselves safer by using technological tools (mobile phone and email) and by receiving timely notifications (crime alerts) on crime events. Indeed, throughout the crime alerts students are constantly warned about crimes occurred in the surroundings area of the campus. These new digital opportunities are direct to increase security levels by making people think more carefully about the decisions they take in everyday-life.

Regarding the research methodology, university student risk-perception data have been obtained through questionnaires and semi-structured interviews. The research sample is composed by undergraduate students, because they spend more time on campus compared to graduate students.

The findings show a controversial relationship between students and technology. Indeed, students do not seem to recognize the potential of these tools but, at the same time, they cannot stay without these facilities.

RN22 | Session 05a Risk, Uncertainty and Inequality I

Risk Perception and Terrorist Activity: The case of Sweden

Anna Olofsson, Saman Rashid
Mid Sweden University, Sweden; Mid Sweden University, Sweden
anna.olofsson(at)miun.se, saman.rashid(at)miun.se

We investigate whether terrorist activity abroad affect risk perception regarding terrorism at home. Terrorism uses violence deliberately to obtain political or social objectives thorough the extortion of a large audience beyond that of the immediate victims. Although the most common form of terrorist activities are domestic, transnational terrorist attacks, which involves more than two countries, may take place in order to capture more media attention and, hence, affect people emotionally by spreading fear and insecurity. Previous literature show that terrorist incidents in a country reflects people's risk perception regarding terrorism. However, little is known about whether risk perception regarding terrorism are effected by terrorist incidents in other countries. This paper contribute to the literature by investigating whether risk perception regarding terrorism in a country with almost no terrorist incidents, Sweden, is affected by different terrorist activities abroad. For the empirical analyses we use micro-level data on risk perception obtained from a national survey conducted in Sweden in four different years, 2005, 2008, 2011 and 2106. Unlike previous literature, our data contains direct question regarding risk perceptions in question. Data on terrorist activities is obtained from Global Terrorism Database (GDT). We make distinction between domestic and transnational terrorist incidence to investigate whether their impact deferrers. We also consider the geographic distance between the country

(or region) where the terrorist incidents take place and Sweden. We include individual characteristics in order to control for individual heterogeneity and to consider various socioeconomic aspects. We expect a positive relationship between the extent of terrorist incidents and risk perception regarding terrorism, nonetheless the relationship is stronger for transnational terrorism than domestic ones. Furthermore, we expect that the relationship declines with geographic distance.

Fear of the Others and the Others' Fears – Comments on Contemporary Racism

Judith Eckert

University of Freiburg, Institute of Sociology, Germany
judith.eckert(at)soziologie.uni-freiburg.de

Germany, like other countries, has been experiencing a rise of right wing populism with racism becoming more sayable. One explanation is that racism originates from fears which also seem to increase. At the same time, it is said that we have to take seriously people's fears. Consequently, anti-racist voices reach an impasse – who would dispute people's fears?

This paper, however, explores another relationship between fear and racism. Things look different when combining social constructionist risk theory (especially sociocultural approaches to risk and securitization theory) on the one hand and theories of inequality and racism on the other hand.

By applying this to a qualitative interview study about fear in Germany and by using narrative analysis, one is able to distinguish fear as an emotion from other emotions (like anger and feelings of injustice) and from fear as a powerful rhetorical device. The latter results from the common notion that communicating fear is an expression of the speaker's emotional authenticity, which makes his or her argument irrefutable. While securitization theory helps us to understand what makes security (and, thus, fear) such a powerful rhetorical device, sociocultural approaches to risk demonstrate how constructions of risk are linked to constructions of Otherness. Contemporary forms and functions of Otherness and Othering can be understood by including Bourdieu's sociology of inequality and theories of racism. Accordingly, constructing the dangerous Others who are to be feared is a classifying practice. This serves not only to maintain one's own privileges. It also contributes to and makes invisible the Others' fears. Ultimately, this touches another question: whose (supposed) fears are heard.

Governing the Seasonal Migrant Agricultural Workers in Turkey via constructing them as a 'vulnerable group'

Elif Elci Carikci

Middle East Technical University / UNFPA
elifelcicarikci(at)gmail.com

Vulnerability discourse has been widely used in environmental studies since decades. However, by 1990s social vulnerability emerged as a key discourse to indicate the target groups of social development

and social policy. Taking up the Foucauldian governmentality concept as an analytical perspective, this paper argues that social vulnerability discourse is a social construction and operates as a technique for regulating and controlling population groups. Apparently, these groups are constructed as they are considered risks for the society and for the neoliberal order.

This paper analyzes construction of 'vulnerable group' discourse and its consequences through a case study. The paper focuses on construction of Seasonal Migrant Agricultural Workers (SMAW) in Turkey as a 'vulnerable group' in development and social policy in Turkey. Here it is important to indicate that SMAW have been economic subjects since the Ottoman times. However by 2000s SMAW are constructed as a 'vulnerable group' and accordingly transformed into the objects of development and social policy in Turkey. The construction of SMAW is conducted through several actors such as state, NGOs, international organizations and through various tactics. Hence the paper discusses the construction of knowledge about SMAW and the construction of power over SMAW in Turkey with its consequences. The paper challenges the risk discourse embedded in the neoliberal policies to be able to bring the issue of inequalities back to the discussions in development and in social policy.

This paper draws on PhD research conducted at the Middle East Technical University under the supervision of Professor Ayse Gunduz Hosgor and Professor Helga Rittersberger Tilic.

Risk, uncertainty and the role of serendipity in international student mobility

Gabriel Weibl

Comenius University, Slovak Republic
gabriel.weibl(at)fses.uniba.sk

This paper presents interdisciplinary research on risk and uncertainty in the context of international student mobility. It focuses on the role of serendipity in mobility, perceived by incoming international students at New Zealand universities, the University of Oxford and the Charles University. The data originates from a longitudinal and comparative study which first assessed the push and pulls factors of student mobility. It then examined the students' experiences abroad in terms of various topics (knowledge transfer, development of intercultural competencies, the forming of identities, future mobility and employability) and eventually returned to students' views on serendipity throughout their study abroad. Risk and uncertainties account for some of the barriers to mobility, where knowledge or absence of knowledge, play an important part in the decision making process. It is difficult to measure uncertainties, because they are considered as unknowns, similar to the notion of serendipity, which is often understood as chance, good fortune or a lucky coincidence. The findings revealed that serendipity was, in half of the cases, almost 'inevitable' element of mobility (NZ universities and Charles University), while it was experienced by

the majority of international students engaged in this study at Oxford. Moreover, in several instances the emotive charge of the serendipitous events fluctuated over the period of time. International student mobility is a global phenomenon with political, economic and sociocultural implications; however, the experiences of individuals are subjective and lived (abroad) locally. Importantly, serendipity has a significant chance to shuffle events leading to and/or during the mobility.

RN22 | Session 06a Risks in Health and Social Care I

Artificial Hearts – uncertainties, new bodies and new conceptions of life and death

Marisol Marini

University of São Paulo, Brazil

marisolmmarini(at)gmail.com

Human hearts are scarce resources. Such scarcity was produced through unfolding arisen with mechanical circulatory support (MCS), applied in “open heart” surgeries in the 1950's, which has enabled replace heart and lung functions temporarily. Since the 1980s, however, several ventricular assist devices (VADs) and artificial hearts has been developed. Such technologies shall be understood in the current scenario related to high rates of heart diseases.

In the international scene, associated mainly with American and European institutions/companies, there is no consensus about what kind of technology is better for the human body and for society as a whole. The controversy around the different devices reveals how these technologies may amend the body's material existence (Annemarie Mol, 2002), besides changing life and death conceptions (Margaret Lock, 2002).

The imagination implicated in the human organs replacement project (Lesley Sharp, 2014) could be described as a phenomenon related to the mechanistic assumptions associated with human and life conceptions within modern medicine (Nikolas Rose, 2007). The research takes as the main object/subject technologies developed by a bioengineering foundation, which is part of a public hospital specialized in cardiology in São Paulo, Brazil. Based on ethnographic research in the laboratory where these devices are being produced, I reflect on the local production of those technologies, seeking to understand what is “social about the production of scientific knowledge itself” (Sarah Franklin & Margaret Lock, 2003), what kind of uncertainties related to life and death, nature and culture arise from this project.

Negotiating Double Vision: Risk and Uncertainty Management in Hospital Cardiology

Phaedra Daipha

Rutgers (until 7/2016) / independent scholar, United States of America

pdaipha(at)uchicago.edu

While the double presence of the future is hardly

exclusive to the decision-making environment of medicine, what is distinctive about medical prognosis is that doctors must typically address short- and long-term risks concurrently because of their mandate to heal. Drawing on a 2-year ongoing comparative ethnography of hospital cardiology, I identify three patterns of what I term “double vision” in cardiology practice: balancing, bridging, and switching. Each pattern of negotiating short-term results and long-term outcomes translates into distinct risk management and decision-making behavior because it is associated with a distinct view of what is at stake. Not surprisingly, these patterns of medical prospection vary by cardiology subspecialty and, more so, by medical specialty. In fact, especially in the context of cross-functional hospital teams, the negotiation of uncertainty and risk (and the diagnostic and treatment decisions that result from balancing, bridging, or switching between the problematic short- and the long-term future) becomes so tangled that it can only be resolved by relying on organizationally-mandated procedural standards of care rather than professionally-mandated substantive ones.

Assessing risks to vulnerable adults and referrer motivation: An Analysis of how Social Workers Screen Adult Safeguarding Referrals.

Jeremy Dixon

University of Bath, United Kingdom

j.dixon2(at)bath.ac.uk

Safeguarding adults forms a core part of adult social work and involves workers making efforts to protect vulnerable adults from abuse. In England and Wales, the status of safeguarding practice has been raised by the introduction of The Care Act 2014. This law gives local authorities duties to lead assessment teams and to prevent abuse or neglect where it occurs. Drawing on ethnographic research data in one local authority in England, this paper considers safeguarding practice as a form of governmentality. The paper focusses on how workers decided which referrals met the threshold for further assessment and which were screened out.

Safeguarding referrals were received from a wide range of sources including care homes, the emergency services and members of the public. In line with legal criteria social workers considered the degree to which the person had prior support needs, whether they were experiencing abuse or neglect and whether they were able to protect themselves. However, workers also sought to assess the motivation of referrers. Safeguarding referrals were seen as a means by which individuals or organisations might seek to attribute or avoid blame or as a means of placing individuals at the front of the queue for social services. Considerations about referrer motivation were used alongside case information to consider whether reported risks were genuine.

Emerged from uncertainty. The role of epistemic communities, communities of practice and interest groups in healthcare: discursive approach

Paulina Polak, Maria Swiatkiewicz-Mosny, Aleksandra Wagner

Jagiellonian University, Poland; Jagiellonian University, Poland
 paulina.polak(at)uj.edu.pl,
 mariaswiatkiewiczmosny(at)gmail.com,
 aleksandra.wagner(at)uj.edu.pl

The paper aims in discussing how some discursive strategies of coping with uncertainty are used to struggle for position or dominance by social actors in health care field.

Illness constitutes one of the most notorious sources of uncertainty. One who falls ill, doesn't know what comes next, which therapy to choose and how his or her organism shall react to it. Uncertainty entails the search for an interpretative framework, knowledge and praxis, which will help deal with the illness.

The ill searches for others in a similar position. In such a way, often on the internet (frequently the first source of knowledge about an illness), but also offline, communities of practice are formed by patients, possibly accompanied by experts (doctors, nurses etc.), to help those affected by a particular condition.

Illness also creates a space for particular interests. There, not only do patients fight for their goals (reimbursement of medicines, medical equipment or therapies), but oftentimes big business enters as their partner or hidden associate.

The third type of groups are epistemic communities, formed by experts (mainstream medical, CAM and non-medical), who actively participate (or struggle to participate) in public discourse on healthcare and become part of power relations in the field.

Using the framework of discursive approach we will demonstrate how epistemic communities, our main point of interest as active participants of the public discourse of healthcare, emerge – from uncertainty (of the situation) – through interpretation (of that situation) – to institutionalization (making the interpretation reflected in public policy).

RN22 | Session 07a Public Discourses and Media Representations of Risk II

Making anxious parents in China: An analysis of Parenting Science magazine and children's health risks 1980-2014

Qian Gong
 University of Leicester, United Kingdom
 qg8(at)le.ac.uk

This paper engages with theorisation of contemporary society offered by Beck (1992), Lupton (1999) and Wilkinson (2001) to explore the workings of the Chinese risk society. It approaches risk at micro (individual, subjective) level, and links it to the experience of anxiety via the concept of 'risk-consciousness'. Focusing on children's health care, this paper investigates the interplay between the

media and the workings of risk-consciousness in China.

The study draws on two sets of data - twenty-four focus groups with Chinese parents and grandparents discussing their (grand)parenting experiences, and texts collected from Parenting Science. Data collection from the magazine uses a systematic sampling technique based on historical slicing approach (Martens & Scott, 2005) to investigate the shifts in the public discourses of parenting. It selects the first issue of every year between 1980 and 2014 (in total 35 issues) and analyses feature articles, Q&As and adverts. The analysis of the magazine is supplemented with evidence from focus group discussions.

The paper argues that everyday, mundane, normal activities of children's life such as eating, sleeping, bowel movements and learning have been increasingly identified with problems which are often linked to risks arising from environment pollution, malnutrition, underdevelopment, allergy, and accidents. This has resulted in increased risk-consciousness and a heightened sense of anxiety among parents. This paper discusses whether the risk-consciousness is an inevitable result of marketisation and neoliberal arrangement of health care, and considers the relation between economic and political change and the emerging 'risk society' in China.

Organisational discourse on "protection of the public" by regulated professions' organisations in Canada: tracing evolution along admission requirements for foreign-trained professionals.

Jean-Luc Bédard, Sarah Morin
 TÉLUQ, Canada; Université Laval, Canada
 jbedard(at)teluq.ca, sarah.morin.1(at)ulaval.ca

Regulated professions aim at protecting the public through rules and by-laws that define membership conditions. These regulatory norms are related to competencies and professional acts that their members should be able to perform. Admission of foreign-trained professionals challenges these regulatory systems. On the one hand, economic and legal arguments put pressure on faster admission of these already trained professionals, (almost) ready to practice and integrate local workforce. On the other hand, professional regulators that control access for public protection need to ensure that the local standards are met. Most professionals are required to successfully attend some form of practical training that ensures actual competence in their new country. How do professional regulators measure the gap and define consequent training requirements, hence assuring appropriate risk management? Examples from 3 provincial jurisdictions in Canada (British Columbia, Alberta, Quebec) will be used to illustrate the challenges surrounding this arbitration, involving mainly institutions of immigration, professional regulation and training (including in university and work settings). This analysis underlines limits of the neoliberal approach that has fostered transnational

mobility of highly qualified, regulated professionals, with its most recent realisation taking form in the Comprehensive Economic and Trade Agreement (CETA) between EU and Canada.

'Violent radicalization' in Canada, news media, and the social production of risk

Kristopher Gordon Millett
Concordia University, Canada
krisgmillett(at)gmail.com

Theorists on risk point to the concept's increasing influence on how governments conceive of and manage social problems, as well as the important role of news media in constructing what is considered a 'risk' in the public imagination (Lupton 2013).

Using discourse analysis methodology, this paper examines stories on violent radicalization in the Canadian news media, looking at how the phenomenon it represented through the language of risk. Stories examined depict a pervasive and largely new threat to national security, which has no known causes, and affects primarily 'normal' youth. These representations, in turn, serve to justify a risk-management policy approach in the terms of 'counter-radicalization', which is reinforced in the news coverage by the presence of symbolic elites (Van Dijk 1993). This includes politicians, academics and security establishment representatives who corroborate the extent of the threat and the need for additional resources to predict and contain future radicalized violence.

The paper argues that media coverage of violent radicalization through the paradigm of risk elides needed deeper inquiry into to the degree that the phenomenon, and its purported outcome of domestic 'homegrown' terrorism, is sociocultural and politically constructed threat to national security. Moreover, the paper questions the efficacy of risk management approaches to matters of public safety under counter-radicalization programming, and the problematic scrutiny accorded to Muslim Canadian diaspora communities as risky subjects through surveillance and securitization. The paper provides an exploratory look into the author's ongoing doctoral research on discourses surrounding the concept of radicalization in Canada.

The media reporting on the closure of a Swedish maternity unit: An intersectional analysis of the construction and framing of risk

Emelie Larsson
Mid Sweden University, Sweden
emelie.larsson(at)miun.se

Sweden has in several international rankings been appointed one of the safest countries to give birth in, yet in recent years, public cuts in maternity services has been the topic of a growing public debate. As the

maternity unit at the hospital in Sollefteå – an 8000 inhabitants town in northern Sweden – closed on February 1, local protests drew attention to the increasing distances to maternity care in some rural parts of Sweden. The Sollefteå case has gained attention in national as well as international news media and several newspapers have written about the risks associated with women having to travel far to give birth. In the planned article, an intersectional feminist approach will be used to explore how these risks are being made and negotiated in two Swedish newspapers; one newspaper distributed in the Sollefteå area and one nationally distributed newspaper. The news texts will be analyzed using critical discourse analysis, enabling a deeper understanding of the role that context and ideology play in these particular constructions of risk.

RN22 | Session 08a Risk, Uncertainty and Inequality II

How environmental, social, spatial and ethno-racial inequality are connected to coastal risks: a comparison between the Mediterranean coast and the French West Indies

Arnaud Aurélie, Claeys Cécilia, Lambert Marie-Laure
Aix-Marseille-Université - LIEU, France; Aix-Marseille-Université - LPED, France; Aix-Marseille-Université - LIEU, France
aurelie.arnaud(at)univ-amu.fr, cecilia.claeys(at)univ-amu.fr, ml.lambert(at)wanadoo.fr

This paper draws on sociology, geography and law to provide an interdisciplinary analysis of how exposure to risk intersects with socio-economic, spatial, ethno-racial, legal and environmental inequalities. The analysis focuses on the exposure of populations to coastal risks (e.g., erosion, cyclonic swell, submergence) which, in France, have become the topic of increased regulation since 2012, in the aftermath of cyclone Xynthia.

Our research is based on a comparison of two municipalities: Carry-le-Rouet (CLR) in mainland France and Capesterre-Belle-Eau (CPE) in Overseas France. The interdisciplinary corpus of data is comprised of 83 semi-structured, geo-referenced interviews conducted with inhabitants and institutional actors, as well as a set of spatialized data (geographic perception; physical-, regulatory- and socio-economic data).

Our findings underscore an exacerbated accumulation of vulnerability in the municipality of CPE, which encourages situations of compounded risk. Since the abolition of slavery, its shores have been a place of relegation for poor populations, some of whom live in temporary or informal settlements exposed to several coastal risks that are aggravated by the expansive hardening of the coastal shoreline. Such vulnerable populations still have trouble taking advantage of the legal reforms aimed at their protection. In the municipality of CLR, however, the coastal districts exposed to cliff erosion have become places of social prestige over the past few decades. Their rich and

influential inhabitants have the ability to influence local government decision-making in their favour and to resist recent legal reforms.

Uncertainty in a mass poverty context: stress in personal memories of Mumbai dwellers

Aude Martenot

University of Geneva, Switzerland

aude.martenot(at)unige.ch

Economic reform and brutal entry into capitalism have challenged social organization of urban India during the last twenty years. Recent uncertainties caused by modernity (individualism, environmental and political risks, defeat of the Welfare State's protective system) are added to traditional norms, such as cast system, age and gender stratification. So, there is a conjunction between poverty, vulnerability and accumulation of dangers particularly in developing countries (Beck, 2007). In large cities like Mumbai, this phenomenon can be observed (Drèze & Sen, 2013), especially in slum areas where people are living under unhealthy conditions.

Those observations lead to the question: does modernity provoke new forms of vulnerability in a country where mass poverty has existed for a long time? We conducted two large scale surveys in the slums of Mumbai in 2012 and in a formal neighborhood of the city in 2014. The main sample is composed by 1255 interviews of women and men aged between 20-84 years. Through analysis of subjective perception of main turning points across the life course, this presentation focuses on the topic of stress, taking into account the variables of age, gender and socioeconomic levels to address cross-sectional vulnerability (Pearlin, 1989). Among the events mentioned by the interviewees, we found that women encounter more negative events and daily hassles, or chronic stress, than men. We also noted that poverty and low level of education involve more mentioning of out-of-timing changes, as well as more mentioning of an absence of change, suggesting that old and new inequalities are coexisting.

The Changing Urban Space and Everyday Life in Istanbul: An Analysis of the Gated Communities of Neoliberal City in the Era of Risk and Uncertainty

Kayhan Delibas, Kadir Sahin

Adnan Menderes University, Turkey; Karabuk

Universitesi, Turkey

kdelibas(at)adu.edu.tr, kadirsahin09(at)gmail.com

As a result of the neoliberalism, especially work related uncertainties, we are witnessing a radical transformation of urban life and social relationships in the 'new cities' in Turkey.

As uncertainty became a new way of living in light of the changing circumstances, new ways of life began to emerge around 'risk and fear' in cities. In what could be defined as the 'late modern era' we argue that gated communities have become the most important result of these times. The actors of this new stage in Istanbul are the 'new middle class'. In these

new urban conditions (neoliberal city) where 'deformity', 'contact', 'danger', 'strangers' or any symbol which represents public life induces fear, while lasting passivity has become an important strategy for safety and security. We are witnessing a process where the neighbourhoods and streets, which tie the private and public sphere in 'traditional modern cities', are transforming into areas of threat. Cities are no longer spaces where differences mix together but instead spaces dived into camps by the 'fanatics of private life.'

As it is the best example of these transformations, this research was conducted within the framework of the gated communities in the Istanbul metropolitan area. Drawing on in depth interviews (N 57) this research aimed to identify the transformations in relations to risk, fear and uncertainty.

Coping with risks, and subjective experiences of wellbeing in times of economic crisis and permanent austerity: the case of Finnish families with children

Marja Kristiina Palmu, Mikael Nygård

Åbo Akademi University, Finland; Åbo Akademi

University, Finland

marja.palmu(at)abo.fi, mikael.nygard(at)abo.fi

As Nordic welfare model, Finland has been acknowledged for its encompassing family policies with high degrees of parental employment and low incidence of poverty in an international comparison. During recent years, however, sluggish growth, high levels of unemployment as well as recurrent austerity measures (such as child benefit cutbacks) have gradually undermined the economic security of families, notably among single-parent and multi-child families in Finland. Together with more uncertain labour market attachments of Finnish parents these cutbacks have put families under increasing strain and increased the risks of poverty, health differences as well as other forms of ill-being. In this paper, we analyse everyday risk conceptualizations and risk-coping strategies of Finnish parents as well as their evaluations of how work-related and economic uncertainty affect their subjective wellbeing. Subjective wellbeing is here defined broadly as an umbrella concept covering different dimensions, such as economic, social or psychological wellbeing as well as physical health. The data consists of 22 qualitative semi-structured interviews with Finnish- and Swedish-speaking parents from the region of Ostrobothnia in Finland and was collected in the autumn of 2016 and winter of 2017. On the basis of our findings we argue that families in Finland today encounter a high prevalence of risk and uncertainty, and that this has consequences for their wellbeing most notably for low-income families and their children. The findings also, however, show that parents employ different risk-coping strategies and that the association between risk and wellbeing is complex and not always straightforward.

RN22 | Session 09a Risks in Health and Social Care II**From Magic Moments to Intolerable Risks: The Government of Life in Childbirth**

Solène Gouilhers-Hertig
University of Geneva, Switzerland
solene.gouilhers(at)unige.ch

Despite the spectacular decrease of maternal and neonatal mortality rates, childbirth risks remain a current issue in the representations and practices of doctors, midwives and women. The possibility of serious and unpredictable complications justify that each birth needs monitoring and assistance from professionals in a hospital. Pregnancies are classified between low and high risk. Thus standardised procedures (like surveillance and interventions) are related to this construction of risk.

From a sociocultural approach of risk, the main object of my research is to analyse the construction process of risks in the day to day activity of birth settings. In order to address this issue, I developed a comparative ethnographic study of three different birth settings: maternity hospitals, birth centres and homes in Switzerland. I carried out in-depth interviews with midwives, obstetricians, mothers and fathers (N = 74) and in situ observations within a maternity hospital and a birth centre (10 months).

In this communication I aim to analyse why the construction of risk with respect to births is specific. In that way I show that two competing representations coexist among all actors' discourses and practices. On the one hand, the serious complications of childbirth - even if they are rare - are socially considered as intolerable. On the other hand, childbirth is viewed as an important and "magic moment" that needs to be preserved. These subjective perceptions of health, childbirth and risk are influenced by socioeconomic conditions, as well as social interactions. These representations - while shaping strong norms - participate in the government of life.

Anti-vaccination movement phenomenon in Poland. Parental struggle against medicalization in times of high risk

Radoslaw Tyrala
AGH University of Science and Technology, Poland
rtyrala(at)agh.edu.pl

Cases of the parents who refuse to vaccinate their children are still relatively rare in Poland, but the trend is rising year by year. One may observe formation of anti-vaccination social movement, that is growing fast in many countries (especially in the United States) since the mid-80's of 20th century. According to the opponents of this movement we are dealing with a threat to public order caused by a poorly educated, irrational, full of mistrust and blinded by conspiracy theories people. Moreover, in their opinion, vaccination refusal means the lack of solidarity with the rest of society because it gets lower the level of so-called herd immunity to different kind of disease.

And according to the anti-vaccination proponents their motives are deeply rational. They consider themselves as a people who are able to break through the veil of obviousness imposed by the marriage of capitalism, medical technology and pharmaceutical industry.

Anti-vaccination movement, like many other contemporary anti-modernization movements, is treated here as a symptom of a much wider phenomenon - distrust to science and technology, which is a consequence of the increasing risk generated by the abstract systems making our environment more and more complex and ambiguous. The aim of this paper is to present the phenomenon of Polish anti-vaccination movement, especially in the context of similar movements growing in the United States and in selected European countries, and attempt to analyze the reasons for its increasing popularity. I will try to do this with using such key categories like capitalism, risk, solidarity and (dis)trust.

The promise of caring competence: the role of private health insurance in managing everyday uncertainty

Liina Sointu, Turo-Kimmo Lehtonen, Liisa Häikiö
University of Tampere, Finland; University of Tampere, Finland; University of Tampere, Finland
liina.sointu(at)uta.fi, turo-kimmo.lehtonen(at)uta.fi, liisa.haikio(at)uta.fi

This paper discusses parents' concern for securing their child's health care and the role of private insurance in managing health related uncertainties. The Finnish tax-funded universal health care system offers primary health care for children free of charge. Yet, approximately half of families have a private health insurance for their child. To understand what makes private insurance a sensible choice for them, we explore parents' expectations of their child's health care. We concentrate on expectations of affecting and being affected by health care organizations, and on how these expectations are mediated by private insurance. The data consist of individual and focus group interviews.

The study shows that parents expect the health care organization and its practices to adjust to their needs. Especially, they look for the expressions of willingness and competence to act for the best interests of the child. When these expectations are mediated by private insurance, the service use is channelled to private clinics that make available certain practices, among them direct access to specialists, which are not obtainable on the public side.

Thus, for some families, private insurance creates a route to what is perceived as more caring and competent health care. Widespread use of private health insurance, however, has unintended consequences. As there is no upper limit to how good care can be, to follow the logic of needs leads to a limitless growth of demand, which public side cannot meet. By affecting the norms of what is good health care, private insurance—in itself a tool for managing uncertainty—creates new uncertainty, such as unequal access to health care and pressure to

families to seek private care.

Pandemic risk, preparedness and the role of sociological knowledge

Elisa Pieri

University of Manchester, United Kingdom
elisa.pieri(at)manchester.ac.uk

The risk of new global pandemics has become a pressing concern in the West. The likelihood and impact of future pandemics are discussed amongst scientists working in various medical fields – from immunology to virology, epidemiology and veterinary research. Pandemic threat and the planning towards its mitigation feature increasingly in policy discourse and strategy at various levels. Rather more intermittently the risks associated with pandemic outbreaks also permeate public and media discourse. Ad hoc international networks have been developed for infectious disease surveillance and response. Most nations have drafted plans to mitigate pandemic risk, some of which have been tested through simulations.

This paper argues that social and ethical tensions are likely to arise in connection to pandemic response and, importantly, already arise in relation to current pre-pandemic planning. Four areas of particular concern are (1) restriction to personal freedom vis a vis the imperative of public protection, (2) duty of care for health professionals vis a vis a right to reciprocity; (3) equity in the setting of priorities and allocation of finite resources; (4) containment vis a vis the duty to exercise international cooperation, given the global dimensions of pandemics.

In this paper I argue for the importance of drawing on sociological knowledge, alongside medical and other knowledges already dominant in pandemic planning, to reveal the values inbuilt in current preparedness strategies, identify the impacts of the mitigation planning measure proposed, and generate a better understanding of the (often unintended) social consequences of measures adopted during previous pandemics.

RN23 | Session 01a Exploring Sexuality: Methodological Challenges

Using emotion maps to open up understandings of macro-micro relations and everyday queer family life

Jacqui Gabb, Federica de Cordova, Chiara Sità
Open University, UK; University of Verona, Italy;
University of Verona, Italy
jacqui.gabb(at)open.ac.uk,
federica.decordova(at)univr.it, chiara.sita(at)univr.it

The efficacy of a practices approach in the sociological study of families is now widely accepted and a wealth of research in this vein has effectively demonstrated how family relationships become personally and socially meaningful. However, the reliance on interview techniques remains and experience is all too often neatly packaged in narrativized and linear accounts that remove the

ordinariness of everyday lives. In this paper we explore how using 'emotion maps' (Gabb, 2008) may help us to better understand the family dynamic and the ways in which emotional interactions and ordinary routines combine to shape macro-micro relations and queer-parent family life. To illustrate our argument, we draw on two recent empirical studies - Enduring Love? Couple relationships in the 21st century (UK) and Family Lives (Italy). Both of these studies used variations of the emotion map method to probe the routine relationship work that individuals and couples undertake to maintain familial, parental and sexual identities, and the parent-child relationship. The graphic technique is grounded in the everyday and generated insight on how acceptance, uncertainty, and stigma variously shape LGBQ family life, through daily interactions with extended kin and friendship networks, the structures of childhood, and professional services. In so doing the technique generated insight on some of the ways in which queer families intersect with and ordinarily defy heteronormative conventions.

Bisexuality in the Netherlands underexplored and invisible. About bi-specific issues, research gaps, and methodological reflections

Jantine van Lisdonk, Marianne Cense
Rutgers, the Netherlands; Rutgers, the Netherlands
j.vanlisdonk(at)rutgers.nl, m.cense(at)rutgers.nl

In many Western societies, including the Netherlands, same-sex sexuality is often conceptualized in a heteronormative way which leads to same-sex sexuality being reduced to representations of homosexuality. Bisexuality and non-binary sexual orientations (i.e. beyond the hetero/homo binary) remain marginalized in research. While the first Dutch large-scale bisexuality study has yet to be conducted, there is a growing attention among Dutch sexual orientation and sexuality researchers to report on bisexuality and bisexual people. Here, we provide a picture on bisexuality in the Netherlands based on national survey studies and several qualitative studies. Which experiences of bisexual people are covered in publications and which experiences remain underexplored or are not reported? Based on a qualitative study, we address unique issues bisexual young people face such as marginalization, limited space to express bisexuality, and the lack of bisexual or bi-inclusive communities. From a methodological perspective, we reflect on what the empirical picture and bi-invisibility tell us about the conceptualization of sexual orientation and related normativities. We suggest alternative ways of measuring sexual orientation in survey research and qualitative studies.

Visual representations of non-binary sexual identities amongst young Dutch adults

Marianne Cense, Jantine van Lisdonk
Rutgers, Netherlands, The; Rutgers, Netherlands, The
m.cense(at)rutgers.nl, j.vanlisdonk(at)rutgers.nl

International studies demonstrate a shift amongst

young people towards non-binary sexual identities (Cohler & Hammack, 2007; Savin-Williams, 2005). Non-binary sexual identities transcend conventional conceptualizations of sexual orientation as a hetero/homosexual binary and question the notion of sexual orientations and identities as fixed and non-contextualized. A British study showed that 48% of 18-24 year old people report their sexuality as not exclusively heterosexual or homosexual (YouGov, 2015). However, social norms can still be restrictive to non-binary expressions, as a recent Dutch study shows that same-sex attracted young people feel social pressure to present themselves as gay/lesbian or straight and that space for bisexual identities is limited (Van Lisdonk & Keuzenkamp, in press).

We designed a small-scale qualitative study to explore how 24 young Dutch adults experience their sexual identities, to which social norms they refer and what non-binary representations are present. We used the method Photovoice, in which participants are asked to capture aspects of their experiences by photographing scenes relevant to the research question (Catalani & Minkler, 2010). In the next phase the photographs are collaboratively interpreted in small groups, and narratives are developed that explain how the photos highlight the research theme. The results show interesting differences in the perception of sexual identity, the perceived social norms and the visualisation of sexual identities between participants who consider themselves heterosexual, gay/lesbian, bisexual, and asexual. These visual representations have the potential to get beyond the repetition of standard scripts and dominant sexuality discourses and show the diversity and richness of participants' lived experiences. We present findings and reflect on the strengths and weaknesses of using Photovoice in sexuality research.

Engagement with academic research about asexuality by people identifying as asexual: how different kinds of knowledge come to matter in making identities.

Lisa-Maria Ferent
University of Vienna, Austria
lisa.ferent(at)gmail.com

Asexuality is both an emerging sexual identity category as well as an object of scientific research, with many efforts to locate and legitimize it. Science is however not alone in the endeavor of forming asexuality, as research on asexuality is not only carried out by academics, but also by individuals identifying as asexual – most prominently those organizing around AVEN (an internet forum that has allowed for the formation of a community around this recent emergent sexual identity). People identifying as asexual can therefore on the one hand be described as 'objects' of scientific knowledge, while another perspective shows the asexual community not only as consumers but as (co-)producers of scientific knowledge. Most academic work about (patient) groups that studies the relations between scientists and non-scientists concerning the production and

dissemination of knowledge is situated in the (bio-)medical realm (most notably Epstein's work on AIDS Activism, and Callon & Rabearisoa's studies on AMF). Forgoing the complexities of these cases, a simple logic lies behind the engagement of these groups: find the cause, find the cure. In the case of the asexual community – where a firm distancing from pathology can be observed (see for example the case of HSDD in the DSM) – there is still abundant engagement with academic research via practices such as research participation, census-making, and archiving and discussing of scientific studies. Through analyzing qualitative interviews with members of AVEN, this paper investigates the motives for this engagement as well as how different kinds of knowledge come to matter in forming and (re)presenting collective and individual identity.

RN23 - Sexuality

RN23 | Session 01b Spaces of Sexuality

Urban space and sexuality: The alternative geography of lesbian partying in Paris.

Aikaterini Stamatopoulou

Harokopio University of Athens, Greece

catherine.stamatopoulou(at)gmail.com

This paper aims to present the urban geography of lesbian and, to some extent, queer visibility in Paris. In particular, the focus is on the places lesbian and queer women frequent in order to meet and interact with each other. Through extensive bibliographical work, field research, two interviews with LGBTQ party organizers and informal communication with key informants, I tracked down the changes which have occurred in the LGBTQ Parisian scene since 2010 regarding the closing of lesbian businesses and the emergence of itinerant and ephemeral parties, which pass through the city, especially on the right bank of the Seine. Historical research, communication via Internet and social media, new venues for meeting people, informal networks and new cultural or festive associations are among the examined factors in conjunction with gentrification processes. The purpose is to present how the intersections of the urban place, gender and sexuality contribute to the (re)construction and promotion of more fluid lesbian and queer identities and geographies beyond the homonormative gay district of Marais. Taking into consideration the heterogeneity and multiplicity of lesbians and queer women, I suggest that LGBTQ parties interrupt the heteronormative continuum of public space and make the lesbian visibility more open, powerful and ubiquitous, even though they ought to be more inclusive.

Yet sexuality, is still a taboo. Gender spatial injustice in the case of Thessaloniki during a crisis era.

Maria Papadimitriou, Maria Sassalou

Aristotle University of Thessaloniki, Greece; Aristotle

University of Thessaloniki, Greece

mpapadimi(at)plandevl.auth.gr,

marisass64(at)hotmail.com

The study of gender and the roles that spring from the social-identities is a controversial and a long-lasting issue that concerns not only academics and researchers but also the societies themselves. The prevalent patriarchal perceptions have established a sense of normality; the cis-male gender is considered

as the dominant gender norm including also the view that women and lgbtq people are weak and inferior whilst the different sexual preferences have been condemned by society, as something unethical and abnormal. Based on queer, affective and intersectional approaches we realize, that there are cases of racism, social injustice and inequality, which are intensified in times of crisis. This social injustice is extremely interesting to be examined, not only for its sociological and psychological dimension but also for its spatial features. The spatial injustice comes into light as a result of the limited public appearance or by the risky appearance of those whose choices differ, concerning their sexual identity. From what was mentioned above, arise the following questions: Is it the same for a woman and a man to walk downtown at four o' clock in the morning? Can transgendered individuals visit each square at any time? Can heterosexual and homosexual couples enjoy the same standards of entertainment? For the purpose of the paper we document, map and monitor the city center of Thessaloniki during 2016-2017, a multicultural society in a crisis-ridden period. The social data collected by participatory action research, autoethnography and militant ethnographic analysis. The reasearch aim is not only to contribute in theoretical analysis but also to enforce sexual solidarity and emancipation of sexual practices.

What do Pride events mean to LGBT people in the UK?

Eleanor Formby

Sheffield Hallam University, United Kingdom

e.formby(at)shu.ac.uk

This paper - which draws on wider UK research on understandings and experiences of LGBT (lesbian, gay, bisexual and trans) 'communities' (Formby, forthcoming), involving 627 survey respondents and 44 participants involved in in-depth interviews and/or discussion groups - explores what Pride events mean to LGBT people. As I show, Pride events were often viewed as particularly significant temporary (LGBT) spaces. This was because they could facilitate feelings of solidarity, safety and freedom not always experienced elsewhere. However, Pride events were also subject to criticism for a variety of reasons, including a lack of 'politics', the presence of alcohol and other commercial interests, and the potential for some LGBT people to be excluded within, and from, Pride events. In addition, tensions were evident about 'flamboyant' displays of 'queerness' that unsettled some participants who did not want to be (seen to be) 'different' or 'extreme'. Nevertheless, a sense of celebration appealed to some. In this paper I will discuss the above research findings, and in conclusion show that for some people, 'pride' is time-limited and spatially-specific. Overall, the presentation will identify what an examination of Pride events can tell us about LGBT lives more broadly.

RN23 | Session 02a Regulating Boundaries: Sexual Politics and Rights**A 'tolerant' regulation or a refined control: the new prostitution law in Taiwan**

Mei-Hua Chen

National Sun Yat-sen University, Taiwan
mc153(at)mail.nsysu.edu.tw

In May 2009 two judges of Taiwan Yilan District Court filed a constitutional litigation claimed that the former prostitution law that punished female sex workers while tolerated male clients violated the equal protection of Taiwan's constitutional law. The Justice of Constitutional Court ruled that criminalized sex workers was unconstitutional and gave the Legislative Yuan to come up a new regulation in two years in Dec 2009. The Legislative Yuan preferred the Swedish model that punishes clients. It therefore made both selling and buying sex as administrative sanctions in order to provide 'equal protection' to both clients and sex workers in Nov 2011. However, pimping and running a brothel are still criminal crimes.

Based on interviews with sex workers, judges of district courts, forefront police officers and 874 district court decisions regarding prostitution between 2009 and 2015, the article aims to analyze how the new regulation has been unevenly impacted on different sectors of Taiwanese sex industry and sex workers' lives. Firstly, the seemingly 'tolerant' regulation creates a paradox for Taiwanese sex workers' rights movement. Currently, most sex workers prefer to 'paying the fines when they got arrested' and thus diminishing the momentum of the entire movement. Moreover, according to the court decisions, male clients are less punished by the police. Furthermore, small indoor sexual venues that involve the third parties, e.g. 'Thai massage parlors' and 'Vietnam skin care', have been gradually replaced streetwalkers as the key targets for police crack down. Chinese and Vietnamese immigrant women who concentrated in these sectors appear as the most vulnerable group under the new regulation.

Disability and sexuality in France : sketch of a social history.

Pierre Brasseur

Université Lille 1, France
brasseurph(at)gmail.com

In the last ten years, new views about the sexuality of disabled people have risen in French political and intellectual fields as well as in associations. They wonder about a possible legal recognition of the sexual surrogate status. Some see here a form of hidden prostitution; others insist on the importance of a "sexual surrogate" to a challenged person, for he or she to be a full-time citizen. If this demand seems to be new, the fact that disabled people yearn for a conjugal and sexual life is not a novelty.

With a socio-historical approach, this paper will show how society answered to that claim in the past. We will also be interested in how the connection between

sexuality and handicap evolved and changed since the beginning of the 20th century, through an analysis of views from scholars and/or professionals. Through the results of a systematic analysis and data reduction of archives — articles, books, conference proceedings, thesis, etc. — we will throw light on a very modern question by reconstructing its intricate history. This thinking is part of a more global thesis in sociology called "In the realm of the Senses: a sociological study on Love and Handicap", co-supervised by Jacques Rodriguez (Lille 3) and Geneviève Cresson (Lille 1).

LGBT prisoners in Brasil: subjects, policies and rights in dispute

marcio bressiani zamboni

Universidade de Sao Paulo, Brazil
marciobz(at)gmail.com

The aim of this paper is to analyze from an historical and anthropological perspective the emergence of a set of public policies for LGBT (lesbian, gay, bisexual and transexual) prisoners in Brazil. The central locus of the research are male units of the penitentiary system of Sao Paulo (Brazilian province with the biggest prison population: more than two hundred thousand people). The objective is to understand, on the one hand, the ways in which these various policies define the LGBT population, the demands that led to their development (keeping in view the broader frame of human rights in South America) and the representations mobilized by the social actors involved in their implementation. On the other hand, the trajectories of the subjects aimed by these policies will be considered, noticing the identification and differentiation processes involved in these dynamics.

RN23 | Session 02b Sexualities, Health, Technologies**About having issues: Boundary-work in the practices of relationship and sex counselling**

Marjo Kristiina Kolehmainen

University of Tampere, Finland
marjo.kolehmainen(at)uta.fi

This presentation draws upon an ongoing study on the formal and informal practices of relationship and sex counselling in Finland, employing ethnographic observations on various relationship counselling events and relationship enhancement seminars as well as textual data obtained from magazines and guidebooks as its data. As a part of the widespread therapeutic cultures, several organizations and professionals from parishes to LGBTQI organizations and from psychologists to sex workers now peddle relationship and sex advice. Advice is also targeted at diverse groups such as heterosexual, gay and lesbian couples, singles and the recently divorced. Within this presentation, the constitution of problems is explored in order to learn how particular understandings of gender, sexuality, class and ethnicity emerge in the processes of advice seeking and advice giving. The

aim of this presentation is to examine what is considered or recognized as a problem within intimate relationships, and how the definition of problems operates as a form of boundary-work producing, renewing, disrupting and challenging hierarchies and exclusions based on gender, sexuality, class and ethnicity.

(De)sexualisation of old age - ambivalent representations of sexuality of older people in media and active ageing policies

Jaroslava Hasmanova Marhankova
University of West Bohemia, Czech Republic
jmarhan(at)kss.zcu.cz

The paper maps images of older adults' sexualities using an interpretive content analysis of 1) newspaper articles addressing issues of sex and sexuality in older age in Czech newspapers over two years' span (2015-2016) and 2) booklets published by various Czech NGOs and public institutions that focus on the promotion of active ageing policies. The paper focus on the ways sexuality and sexual life of older people are portrayed. It points out the inherent ambivalence of the representations of older peoples' sexual life. Older people are portrayed as desexualized while simultaneously their sexuality is often constructed as persistent and potentially dangerous and "active" sexual life is presented as a way to healthy ageing and longevity. The paper critically analyses those representations with respect to the disciplinary practices surrounding the ageing bodies and highlights the need to critically evaluate the representations of active ageing. Although the discourse of active ageing present a more positive representation of sexuality in older age, it simultaneously creates a new normative vision that is both ageistic and heteronormative and where sexuality serves as one of the vector of the (in)ability to age "actively".

Medicalizing the sexy oldie? Age, gender and sexuality in the Viagra era

Raffaella Ferrero Camoletto
Dept. Cultures, Politics and Society, University of Turin, Italy
raffaella.ferrerocamoletto(at)unito.it

The paper aims at investigating the transformation of social representations and cultural norms concerning ageing and sexuality in Italy, exploring the intersection of two cultural phenomena which are analytically distinct but empirically intertwined: the "active/positive ageing" imperative and the advent of sexo-pharmaceuticals like Viagra and its competitors. At the crossroads of these two phenomena we find a shift from "asexual old age" or "sexually retired" ideal type to the new "sexy oldie" (Gott 2005) or "sexy senior" (Marshall 2010, 2012).

The paper is based upon an ongoing mixed-method qualitative research project, placed in a Northern-Italian metropolitan city, Turin, entailing participant observation in medical conferences and courses, in-

depth interviews, net-ethnography of medical websites, online forums, social media. For the scope of this paper, I will mainly focus on general practitioners' accounts of their clinical experience with elderly people's sexual health problems.

Previous research pointed out the difficulties GPs face when dealing with sexual issues, especially with midlife and older patients (Gott et al 2004a and 2004b; Hinchliff et al 2004; Hinchliff et al 2005; Bauer et al 2006; Andrews and Piterman 2007; Byrne et al 2010; Giami 2010).

The analysis of GPs' accounts will show how GPs both adopt and question socially available scripts of ageing, gender and sexuality. In their clinical practice, GPs are medically reframing as "sexual health" what they perceive as a "respectable sexuality" (Bertone and Ferrero Camoletto 2009; Wentzell 2013) for ageing men and women.

"Artificial intimacy" or "augmented sexuality". Human-machine sexual relationships from sociological perspective.

Grzegorz Kubiński
Pedagogical University of Cracow, Poland
grzegorz.kubinski(at)gmail.com

Contemporary culture is often criticized for being highly pornographic. Traditional media have been replaced by internet, mainly social media, which evolves as environment where pornography is omnipresent. From sociological perspective, internet-based pornography is well-known phenomenon, however there is also few new elements, requiring broader and more extensive research. Augmented reality, virtual reality or Internet of things give new opportunities for exploring human sexuality. Proposed article, focus on this new kinds of sexuality, which can be called "artificial intimacy" or "augmented sexuality". I would like to discuss and explore development of relations between human and machine, analyzing mostly users of internet forums concerning different sexual objects, beginning from 90's. My research shows, how humans attitude to pleasure-objects has changed and how important in this process new technologies are. The future forms of sex involving machines or robots (fembots) are coming and we should look at them, trying to find answer for the question, how human sexuality and intimacy will change. In my research, I compare not only internet sites, but also presents results of human studies who are in intimate and sexual relation with inanimate objects (called themselves "objectophiles", 20 in depth interviews) comparing them with research on real-dolls' users (12 in depth interviews). All this results show extremely new space of contemporary human sexuality.

RN23 | Session 03a Sexuality Studies in Southern Europe**Are you good enough to be a parent? Gay and lesbian parents negotiating identity and rights in Italy**

Giulia Selmi
University of Verona, Italy
giuliaselmi(at)gmail.com

In Southern Europe, Italy represents a paradigmatic example in relation to the social and legal recognition of non-heterosexual relational claims. Public and political discourses are occupied by a notion of the natural family fostered by Catholic ideology and defended by political parties across the spectrum. The perception of an unbreakable link between procreating and parenting keeps homo-parenting families as “unthinkable” and the absence of complementary gender roles in the parental couple is perceived as tempering the well-being of the child. The law mirrors these socio-cultural models: while in 2016 same sex unions have been finally recognized, the step-child adoption was stripped from the bill leaving the social parent without any form of recognition. Given this scenario LGB parents have to go through trial, case by case, to prove they are as “good” as straight parents are and be eventually recognized as parents. In such circumstances the legal arena becomes a very peculiar context of subjectification.

Drawing on the ongoing multi-method qualitative study FamilyLives - involving 11 lesbian couples and 3 gay couples – aim of this paper is to explore the trope of the “good parent” as a widespread and powerful narrative both within the homophobic rhetoric and the LGB parents community. I will account for its use in the process of negotiating parenthood against the social context by analyzing how the traditional narrative about family and parenting is both a tool against the public recognition of LGB parents and a frame in which these families reconfigure children and partners’ belongings in the social context.

Unsexing reproduction: narratives of lesbian and bisexual parents in Portugal

Ana-Cristina Santos
Centre for Social Studies - Univ Coimbra, Portugal
cristina(at)ces.uc.pt

In the aftermath of the sexual revolution of the 1960s, sexuality and reproduction seemed to be, finally, two separate categories. The democratized access to contraceptives, most especially the pill, parallel to the right to safe abortions upon request, granted women the power to choose when and if they would become mothers, regardless of sexual practice. However, when the topic is same-sex parenting, the link between sexuality and reproduction seems to retain much cultural significance. The recent history of medically assisted reproduction in Portugal offers a striking example of how sexuality and reproduction remain bounded in Southern Europe.

Drawing on original empirical material gathered in

2016 within the ERC funded INTIMATE Research Project, in this paper I challenge the assumption that sexuality and reproduction are culturally disentangled. The paper is divided into three main sections. First, it explores the cultural context in which motherhood is embedded in Portugal. Having repronormativity as its backdrop, this section dialogues with the legal framework that removed most obstacles to same-sex parenting in December 2016. The second section considers biographic narrative interviews conducted with lesbian and bisexual mothers in Lisbon between April and July 2016, with a particular focus on examples of cultural entanglement of sexuality and reproduction, on one hand, and participants’ unsexed reproductive choices, on the other hand. Finally, I suggest a reading of queer that can be used in future reproductive studies. In Southern Europe, a context in which reproduction and parenting have been historically constrained by strict rules around gender and sexuality, failing to be a particular kind of (heteronormative, cisnormative, mononormative) mother may offer a fruitful way for decolonizing reproduction.

Breaking through the heteronormative framework of parenting. Lesbian mothers accessing ARTs in Italy

Beatrice Gusmano
Centre for Social Studies - University of Coimbra,
Portugal
beatricegusmano(at)ces.uc.pt

In Italy, access to ART is neglected to single, not married and lesbian women. Notwithstanding this premise, interviewees realize that it is possible for them to access motherhood when meeting other lesbian women who became mothers through ARTs. This paper will focus on the process undertaken by non-heterosexual women in order to become mothers. It is developed within the European research project ‘INTIMATE. Citizenship, care and choice: the micropolitics of intimacy in Southern Europe’. The main aim of the research is rethinking the concepts of citizenship, care and choice through a study designed to explore LGBT experiences of partnering, parenting, and friendship in three Southern European countries: Italy, Portugal and Spain. Concerning ART, in 2016 the Italian fieldwork included qualitative interviews conducted to five self-defined lesbian or bisexual mothers who got pregnant through ARTs accessed abroad. The empirical data presented will take into consideration narratives linked with health issues, exacerbated by Italian restrictive laws on medical assisted reproduction: relationships with clinics and doctors both in Italy and abroad; economic costs of reproductive exile; good and bad practices by health professionals; the burden of hormone therapies; relationships with doctors during and after giving birth. Finally, it will be discussed how this process influenced their intimate relationships, and where they found support in order to break through the heteronormative Italian framework of parenting.

Go South! Epistemologies of queerness and disability from Southern Europe

Mara Pieri

University of Coimbra - Center for Social Studies,
Portugal
marapieri(at)ces.uc.pt

Recent developments in Social Sciences created a favourable terrain for dialogue between crip and queer approaches to the study of both disability and sexualities. When confronted with the peculiarities of Southern Europe, this dialogue triggers numerous challenges regarding theoretical and empirical research. Based on my PhD research in Portugal and Italy, the paper aims at exploring these challenges, focusing on cultural, political and academic aspects. Despite socio-legal changes occurred recently in Southern European countries, a dominant culture based on family-oriented and catholic values is still prevalent and has direct connections to the ways disability and queerness are constructed. Moreover, queer and disabled social movements largely follow unconnected political agendas. Finally, crip studies occupy an almost invisible space in academia, in line with the already existing difficulties queer studies face in this geographical context.

The paper aims at analysing the complexity of these challenges, in order to understand to what extent it is possible to use crip and queer as epistemologies intertwined with the peculiarities of Southern Europe. Also, it seeks to explore their validity as theoretical and political tools to address normativities, systems of oppression and, ultimately, the construction of citizenship.

RN23 | Session 03b Sexualities and Masculinities

'A cathartic moment in a man's life': masculinity and homosociality on the puttan tour

Isabel Crowhurst, Adam Eldridge

University of Essex, United Kingdom; University of
Westminster, United Kingdom
icrow(at)essex.ac.uk,
A.C.Eldridge(at)westminster.ac.uk

Rarely addressed in academic scholarship, the puttan tour is a well-known form of entertainment in Italy where young men, in small groups, drive around with the aim of spotting street sex workers. On some occasions the participants will approach the sex workers to strike a conversation. On others they will shout out insults from their car then drive away. This paper aims to advance a detailed analysis of this under-explored cultural practice drawing on a diverse body of scholarship exploring the intersection of masculinity, leisure, fun, and homosociality. By analysing stories of puttan tours gathered online from written accounts and videos, we explore the multiple and often equivocal meanings that are attributed to this collective homosocial male-bonding ritual, the emotional workings within it, and the ways in which it reproduces structures of inequality while normalising violence against sex workers

Militarized sexualities: military socialization, biomedicine, and male veteran sexuality in Denmark

Sebastian Mohr, Matti Weisdorf

Aarhus University, Denmark; Aarhus University,
Denmark
semo(at)edu.au.dk, matw(at)edu.au.dk

Whereas male veterans occasionally are represented as erotic icons as for example in Michael Stokes' photography, veteran sexuality is more often than not a rather different affair. While high-gloss photography portrays the glorification of militarized masculinity, the bio-medicalization of post-deployment veteran bodies and the aftermaths of military socialization often leave male veterans in vulnerable situations in which ideals about male sexual performance are exposed as unattainable through the experience of PTSD and sexual dysfunction. Socialized in an institutional regime that very much builds on and perpetuates the glorification of male prowess, male veterans might find it difficult to negotiate the discrepancy between experiences of male sexual vulnerability and militarized self-images as men and soldiers. This contribution explores this dynamic by attending to Danish male veterans' narratives of military careers and intimate relationships. The objective of this contribution is to conceptualize the interplay between military socialization, bio-medicalization, and the formation of sexual selves and builds on biographical interviews with Danish male veterans and ethnographic fieldwork at a veteran home in Denmark.

The making of masculinities, normativity and morality in non-monogamous internet-mediated dating

Katrien De Graeve

Ghent University, Belgium
katrien.degraeve(at)ugent.be

The paper reports on one part of a more extensive study that is concerned with ideologies of exclusivity in relationships and families and focuses on various sexual and relationship practices. It specifically reports on the narratives of men who engage in non-monogamous internet-mediated dating in Belgium. Data have been collected through traditional ethnographic methods and interviews, and through participatory internet ethnographic research in dating sites for non-consensually non-monogamous dating (cheating) and/or consensually non-monogamous dating (e.g. people in open relationships and polyamory). Building on feminist engagements with embodiment as a material-discursive phenomenon, the paper explores how the men's narratives negotiate aspects of hegemonic masculine sexuality, morality and relationship normativity. It argues that the men tap into dominant ideas of emotional detachment and separation of love from sex, masculine consumerism, hedonism, and individualism, yet also deconstruct (or complicate) hegemonic views of gendered morality and emotionality (through e.g. narratives of love,

commitment to family and caring roles, emotional expression and relational identities). Moreover, the men's narratives of their non-monogamous dating experiences are marked by various strategies of moral self-construction, in which both secrecy and honesty can differently operate as technologies of commitment and care. As such, divergent ideas on what constitutes 'a good men' are being shaped in a context of persistent heteronormative conventions and mononormative romantic love.

Understanding the intersection between masculinity construction, sexuality and men's health: an Italian study.

Valeria Quaglia

University of Milan, University of Turin, Italy

valeria.quaglia(at)unimi.it

The aim of this research is to investigate the complex relationship between gender, sexuality and health through a constructionist and critical perspective. It is specifically concerned with the preliminary findings of a research that I am carrying out in Italy on men experiencing sexual dysfunction caused by diabetes. Being diagnosed with diabetes can have a profound effect on a man's representation of himself and on his masculinity construction because it may threaten his autonomy, his ability to work, his freedom to eat and his sexual practices. This presentation shall focus on the latter, for sexuality in Western contemporary culture is considered as a key issue for the construction and performance of masculinity(ies). Sexual dysfunction is a common and underdiagnosed complication of diabetes, which may include disorder of libido, ejaculatory problems and erectile dysfunction. Its onset may challenge the expectations entailed by a hegemonic notion of masculinity (Connell 1995), which proposes an idealized model of men perceived and thought as "sex machines" (Potts, Tiefer, 2006). The advent and diffusion of Erectile Enhancement medicines (EEM) has brought a medicalized alternative to sexual dysfunction that supports the normative and penetrative sexuality expected within this model; however, different sexual scripts and practices are feasible and will thus be discussed. Drawing upon in-depth interviews, sexuality narratives in this study are understood as a complex individual experience, varying according to the different relational contexts and according to the historical and life course time in which it occurs (Bertone, Camoletto 2015).

RN23 | Session 04a Queer(y)ing Kinship in the Baltic Region

High risk projects, Sharing Economies and Fertile Resistance: Affective stories of kinmaking, relatedness and futurity among LGBTQ familymakers in Stockholm

Ulrika Dahl

Uppsala University, Sweden

ulrika.dahl(at)gender.uu.se

What makes queer family making queer and (how) do queer forms of parenting challenge normative assumptions about gendered parenthood? Sweden is frequently upheld as a progressive and LGBTQ inclusive nation, where marriage is gender neutral and family law recognizes same-sex parenthood. At least for some parts of a LGBTQ generation coming of age in a 21st century era of rights, children and family is no longer inconceivable; rather conception is increasingly part of a queer imaginary and an imagined queer futurity, at least for lesbians. Yet, ideas about and routes to becoming parents differ greatly along lines of gender, race, age, class, citizenship and geographic location. This paper presents findings from ongoing ethnographic research among differently situated LGBTQ people in urban queer communities in Sweden and discusses a range of kinship models, from designed multi-parent families to biogenetic lesbian kinning. In particular, I analyse how metaphors drawn both from neoliberal economics and activist ideas of community point to affective investments in particular kin-relations and rationales for different forms of reproductive strategies. These stories, I argue, tell us something about what queers reproduce and challenge when they aim to reproduce queerly. The research is part of the larger research project "Queer(y)ing kinship in the Baltic Region", funded by the Baltic Sea foundation, in which we look at the diverse meanings, experiences and implications of queer kinship and family making in different national settings around the Baltic Sea.

Is She Still a Family or Rather Some Stranger? – Liminal Kins and Kinship Plasticity in Families of Choice in Poland

Joanna Mizielińska

Institute of Psychology Polish Academy of Sciences, Poland

jmiziel(at)gmail.com

In this presentation I draw on diverse findings from the research project Families of Choice in Poland (2013-2016) (PI: J.Mizielińska) which sheds light on the actual practices of queer kinship in Poland. The following are investigated more closely:

1. Quantitative study concerning the family life of 3085 LGBT people
2. 53 Individual in-depth narrative interviews with LGBT people
3. Chosen cases from ethnographic studies of 21 families observed for one month
4. Focus group interviews with lesbian mothers and their children

I focus on queer families' ways of describing their kin-relations and the meaning of "families" as well as their models of displaying them (Finch 2007). This often involves strategic use of kin language and reference to the importance of flesh and blood. Analysis reveals a high degree of polemic interplays and ambivalences, regarding especially the role of social mother and the donor/father within lesbian families, which I define as liminal and/or relative strangers (Nordquist & Smart 2014). In their narratives lesbian mothers and their

children struggle between biogenetic normative understanding of the family and discursive one based on parental practices of care and shared affections. Through processes of kinning and de-kinning (Fonseca 2011) they are often “trapped” in old kinship scenarios and nomenclature (mother/father) while creatively transgressing them. By investigating family maps of research participants I aim to demonstrate what kind of relatedness really matters to them, how it is (re)negotiated and changes. By doing this I intend to show that queer kinship is always already very plastic and based on contradictions between choice and blood.

Intimate Relationships of Non-heterosexual People in Poland. Findings of the Multimethod Study Families of Choice in Poland

Agata Stasinska

Polish Academy of Sciences, Poland
stasinska.agata(at)gmail.com

In my presentation I will reconstruct the image of non-heterosexual intimacies by drawing on the findings of the multimethod project Families of Choice in Poland (PI: prof. Joanna Mizieleńska) on non-heterosexual families of Poles. My analysis is based on the qualitative stages of the research: 53 individual in-depth narrative interviews with LGBT people and ethnographic study conducted in 21 non-heterosexual families based on intensive participatory observation, and over hundred thematic narrative interviews.

In my presentation I will go through particular results concerning different intimate practices such as: displaying affection in private and public space, (non)monogamy, bodily practices, symbolic ways of showing affection. I will show how non-heterosexual relationships subvert and adapt to their needs heteronormative scripts of building intimacy. I will demonstrate how factors such as gender, age, social class, and length of the relationship greatly influence one's experiences of intimacy. Moreover, I will show how lack of legal recognition and social acceptance of non-heterosexual relationships in Poland shape their intimate life.

The close analysis of empirical data allows me to claim the following:

1. The false presumptions of big sociological theories (i.e. Giddens' “disclosing intimacy”) and the necessity to understand intimacy through daily intimate practices and “silent intimacy” (Jamieson).
2. The burning need to intervene into universalistic Western ideas of queer intimacy in order to show how intimate arrangements are deeply related to several local socio-cultural circumstances. Therefore, I point out to the necessity to move away from the commonly used definitions and preconceptions of queer intimacy and take into account locality and positionality of each relational subject.

The changing status of queer families in the midst of rapid social transformations in Estonia

Raili Uibo

Södertörn University, Sweden

raili.uibo(at)sh.se

The semi-peripheral position of Estonia on the porous border between “East” and “West” forces Estonia to constantly (re)construct its national identity. The intensified anxieties about looming demographical decline, combined with vicious resistance to immigration and rising insecurity due to recent global events pushes family politics at the centre-stage of Estonia's nation-building project. Questions about who belongs, who extends the image of the nation and who can reproduce it are especially acutely debated in the light of recent legal changes in the status of queer families. In 2014 Estonia became the first ex-Soviet republic to recognise civil unions of non-heterosexual couples. The legal battle about recognition of marriages performed overseas is currently again raising aggravated discussions around who has the right to build and be called a family. But despite the highly affective public debate there is hardly any knowledge about how queers actually are making families and kinship in the midst of such rapid social transformations. Therefore I aim to shed light into the various ways urban queers understand and practice family in contemporary Estonia. I also seek to highlight which ideas and practices are created, reproduced or challenged by changing the status of the queer family within and beyond the confines of the law. For that purpose I will draw on my ethnographic engagements and interviews with mainly non-heterosexual women and non-gender conforming people, carried out in winter/spring 2016/17. The paper will thus be an addition to the growing body of research that is teasing out the local ways of making queer kinship in the the Central Eastern European region (cf. Nedbálková 2011, Zhabenko 2015, Mizieleńska et al 2015).

RN23 | Session 04b Sexual Violence: Policies and Narratives

Telling (particular) sexual abuse stories: Exploring contemporary narratives of childhood sexual abuse in popular culture

Jo Woodiwiss

University of Huddersfield, United Kingdom

j.woodiwiss(at)hud.ac.uk

Since the Jimmy Savile case in the UK, widespread media coverage of celebrity sexual abuse cases has raised public concern and large numbers of adults have identified themselves as victims of historic childhood sexual abuse (CSA).

In this paper I will draw on research with self-identified adult victims of CSA, self-help literature aimed at adult victims of CSA, and popular UK television drama featuring a CSA storyline, to look at contemporary narratives of CSA. I will argue that one particular story has become so dominant that it not only permeates all aspects of popular culture but its telling constrains or even prohibits discussion about the nature, causes or consequences of sexual abuse (or indeed sexuality) in childhood. This is a story based on an assumption of

childhood sexual innocence and a belief that sexual abuse in childhood is inevitably psychologically damaging.

I argue that this story is underpinned by a fear of or about children's sexuality, and a desire to maintain their innocence and protect them from sexual knowledge and therefore has implications beyond sexual abuse. Not only does this contemporary story deny what Liz Kelly termed 'the other side of being a victim' but it also serves to (re)position children as sexually innocent and lacking sexual agency, and denies them access to sexual knowledge and education. In addition it constructs particular adult behaviours or occupations (such as so called 'promiscuity' or sex work), seen as symptoms of sexual abuse, as wrong and thereby restricts the parameters of what is seen to be acceptable (sexual) behaviour.

Non-offending paedophiles – the pain of desire?

Martin Fafejta

Palacky University Olomouc, Faculty of Arts, Czech Republic

[martin.fafejta\(at\)upol.cz](mailto:martin.fafejta(at)upol.cz)

Since the so-called sexual revolution, sexual pleasure has been often described as a liberating activity that should be open for all. At the same time, people who come out as paedophiles, who have not ever abused any child, and strictly refuse any sexual activity with a child are often labelled as (potential) child molesters and they seem to deserve almost no solidarity. The presentation will be based on a qualitative research among non-offending paedophile members of the support group Czech and Slovak Paedophile Community and it will address the issue of their (sexual) subjectivity. The main questions are: how they cope with their (sexual) desire and to what extent they view it as immoral or dangerous; what they view as sexual and erotic and what is seen as an abuse by them; what love for children means to them and how they cope with it. As communication partner H. says, paedophiles "tend to process feelings and responses triggered by children differently from those triggered by a potential [i.e. legal] 'sexual partner', even if in essence these may be the same feelings and the same responses." Paedophiles may (have to) perceive desire, love, sexuality, eroticism in a very different way compared to non-paedophiles. In contemporary capitalist society, sexuality is very often described as a fulfilling activity. However it can be a source of personal fear or trauma, if one is paedophile who often hardly finds some solidarity of majority.

Consensus and Consent: How sexual violence becomes a political tool in contemporary Turkey

Sanem Su Avci

Ankara University, Turkey

[sanemsuavci\(at\)gmail.com](mailto:sanemsuavci(at)gmail.com)

The political turbulence in Turkey in the recent years (2013-2016) has brought to our attention striking phenomena concerning sexuality, violence and power.

Sexual violence, and more significantly, the threat of sexual violence have been used in this period as a quasi-public method of deterrence, especially by governmental and pro-government forces, against alleged political adversaries. This paper aims to discuss these phenomena from a perspective that focuses on the performativity of the act or threat of sexual violence. It takes sexual violence not as an act that is grounded upon pre-existing differences, but one that works to construct these differences. It studies acts/threats of sexual violence, asking the question: "what/how does the deed aim to achieve?" The study uses the methodology of discursive analysis to determine how sexuality and its role in constructing difference are seen by the various political groups involved in the aforementioned power struggle. The material for analysis are retrieved from the fundamental texts endorsed by these groups, from texts and speeches by leaders or organizations of the groups, and from politically engaged discourses in conventional and social media. Results of the discursive analysis demonstrate that the various sides of the power struggle commonly share a binary vision of sexuality, one that is humiliating and stigmatizing for one side while being rewarding and empowering for the other. The study argues that this shared vision enables sexual violence to become a tool and a weapon in power struggles - to the detriment of communities and individual lives. It argues that a slow but sure way out of this situation is the public endorsement of feminine sexuality.

Consent and Lack: The Problems and Possibilities of Sex without Reliable Consent

Paul Reynolds

Edge Hill University, United Kingdom

[reynoldp\(at\)edgehill.ac.uk](mailto:reynoldp(at)edgehill.ac.uk)

Sexual consent is the ethical 'gold standard' of legitimate sexual conduct, and non-consenting sex is generally deemed both illegal and morally wrong. However, there are significant populations whose consent is unreliable but who make legitimate claims to exercising sexual desires: These include: people with intellectual disabilities; people with autism and Aspergers; people who have aged and have intellectually debilitating conditions such as dementia or Alzheimers. Such populations have been traditionally desexualised, but more enlightening thinking, new pharmaceuticals and technologies and the aging of the post-war generations with changed sexual attitudes is changing these cultural perceptions and creating challenges for professionals, care workers, families, partners, public authorities and these people themselves. Is the best solution to ignore risk and hope for no negative consequences, or emphasise risk and intervene to deny sex. At the margins, such as the early stages of dementia or mild intellectual disabilities, where it is not clear how far the capacity to consent is compromised, this is a delicate problem to address

This paper will explore the conceptual framing of this problem and identify its particular contradictions and

nuances, and its implications both for how we balance risk and legitimate desire and how we understand consent. It draws insights from work by current empirical research with Allison Moore on UK examples, but its central focus is to map and frame the conceptual issues that force us to think about consent critically, and requires a fresh look at how sexual relations are conceived as ethically sound beyond the often simpl e'fiction' and 'insufficiency' of legal and conventional understandings of how sexual consent is understood and actioned.

RN23 | Session 05a Queering Families in Europe

The Promise of Transnational Europe for the LGB Migrants: The Management of Stigmatized Identities and the Transformation of Family Norms

Tanja Vuckovic Juros

Université catholique de Louvain (UCL), Belgium
tanja.vuckovic.juros(at)gmail.com

The Europe of porous borders is potentially a space of opportunity for those denied certain rights, such as gays and lesbians from Central and Eastern European countries (CEE) with the constitutional ban on same-sex marriage. In countries that allow same-sex marriage and adoption, such as Belgium, these individuals can establish legally recognized same-sex families. The consequences of such an institutional space – unavailable to them in their home countries – manifest at individual, interpersonal and collective levels. By examining these consequences through in-depth interviews with the LGB migrants from CEE who are now in same-sex marriage or who are raising children with a same-sex partner in Belgium, the present study investigates how different institutional practices affect the lived experience of a stigmatized identity and shape the LGB migrants' strategies in exposing their families to the presumably less hospitable home-country environments. The analysis is guided by three research questions: (1) What are the LGB migrants' stigma management strategies, including the presentation of their same-sex families, in Belgium and in their home countries?; (2) What are their perceptions of evaluations of their homosexual identity due to their family status, in Belgium and in their home countries?; (3) What are their perceptions of change (if any) in family values among their family members and neighbors back home? By answering these questions, the present study investigates how the promise of transnationalism for the LGB migrants – to widen the space of rights and shift family norms through transfer of institutional models across borders – is executed on the ground.

The Construction of Lesbian and Gay Parenthood in Sociological Research. A Critical Analysis of International and Italian Literature

Luca Trappolin

University of Padova (Italy), Italy
luca.trappolin(at)unipd.it

Sociological research in Western societies has

included lesbian and gay parenthood within family studies, although with a broader success in English speaking countries. Many books and articles – written also in Italian – provide a review of the available literature and discuss the emergence of the phenomenon, the development of research questions and outcomes.

The task of drawing a history of homosexual parenthood has been addressed by several authors, with a main focus on the transformations of meanings attached to lesbian and gay parents, their families and kinship. Their analysis have seldom addressed the shifts in the social forms of homosexual parenthood.

This paper seeks to fill this gap in the history of homosexual parenthood by examining the evolution of the forms of parenthood addressed in qualitative research. The most relevant studies carried out in USA and UK from the Seventies to present days – together with all research carried out in Italy – will be questioned in regards of their samples (the gender and number of the involved parents, and how children were conceived), the ways researchers recruited participants and interpreted their narratives.

Notwithstanding the heterogeneity of all samples throughout the selected time frame, results will show how sociological investigation has progressively constructed and justified a sharp separation between heterosexual and homosexual experiences of parenthood. Two key elements will be discussed in order to explain the process: the political strains of lesbian and gay communities for achieving legal recognition of their families, and the researchers' assumption about the innovativeness of such formations.

Good parenting and healthy sexualities: an inquiry into the therapeutic in LGBTIQ discourses

Chiara Bertone

University of Eastern Piedmont, Italy
chiara.bertone(at)uniupo.it

The paper addresses the meanings and workings of therapeutic culture in discourses around parenting and LGBTIQ identities, experiences and rights. Inspired by previous research on accounts of parenting by mothers and fathers of LG-identified children, it further examines this issue through an analysis of advisory books and self-help material published or promoted by organisations of families of origin of LGBTIQ persons, as well by as organisations of LGBTIQ parents in Italy, and their change in time. This material reveals how therapeutic understandings have been persistently mobilised as tools for making sense of everyday experience and for shaping claiming strategies, but also shows important changes over time.

In analysing these texts, the paper investigates in particular which feeling rules around good parenting and healthy sexuality are created, and how they may contribute to upholding or challenging social hierarchies; who is identified as legitimate expert; which implications the trope of the suffering child and the construction of victimized subjects have in defining contents and boundaries of sexual citizenship.

Negotiating stigmatized sexual identities: coming out to the family of origin and transparent closet in Slovenia

Alenka Svab, Roman Kuhar
University of Ljubljana, Faculty of Social Sciences,
Slovenia; University of Ljubljana, Faculty of Arts,
Slovenia
alenka.svab(at)fdv.uni-lj.si, roman.kuhar(at)gmail.com

Coming out to the family of origin, especially to parents, is one of the key events for most gays and lesbians in the process of forming their sexual identity and also in their life course generally. Combining quantitative and qualitative data (survey and focus groups) from two studies on everyday life of gays and lesbians in Slovenia (carried out in 2004/05 and 2014/15), the presentation will focus on the narratives of coming out to parents, how gays and lesbians negotiate their identities in the family of origin after coming out and the two most common social situations that are formed after the coming out, namely the transparent and family closets. We will discuss the consequences of these two situations for lesbians and gays in comparative perspective in order to trace any changes during the ten-year period. In general, both studies have shown that the everyday life of lesbians and gays is still strongly determined by heteronormativity, homophobia and often various forms of violence, with family setting being no exception. The (preliminary) comparative results of both studies suggest that there are no major positive changes in the field of coming out to parents and other family members and that transparent closet seems to be the experience for the majority of lesbians and gays. Nevertheless, some changes are traced in the differences between maternal and paternal reactions to coming out.

RN23 | Session 05b Sexual Violence and Education

Sexual Offences in Denmark - Results from a National Survey

Marie Bruvik Heinskou, Lasse Suonperä Liebster, Peter Ejbye-Ernst
Aalborg University, Denmark; University of
Copenhagen; NSCR
mheinskou(at)socsci.aau.dk, lsl(at)soc.ku.dk,
pe(at)soc.ku.dk

During the last years, the question of whether or not Denmark suffers from an increasing culture of violation mirroring incidents of rape and sexual coercion has been a hot topic. Thus, the low number of convictions and the complexities of the reported cases has brought about questions to be answered. The aim of the present paper is to present the actual prevalence of sexual offences in Denmark and to investigate the various forms of offenses and their distributions among men as well as women. Thus, this paper work with a conceptualization of rape having both men and women as potential victims and will deploy a bottom-up empirical approach in developing

new typologies of sexual offences sensible to situational characteristics. The project is overridingly concerned with: 1) The number of victims of the various forms of offences. 2) The characteristics of the incidents. The population of interest is men and women above the age of 18 who potentially are victims of sexual offences. The analysis will initially take the form of descriptive statistics similar to those presented in existing victim survey reports but will additionally present a latent class analysis which is viable in identifying distinct classes or ideal types of a given phenomenon. The data collection has been carried out in collaboration with TNS Gallup and collected in two phases: 1) Reports from 3.000 Danish men and women is collected; 2) Reports from 250.000 Danish men and women have been collected through social medias/medias. The paper presents the overall results.

Tackling Sexual Violence in Neoliberal European Universities: Introduction to the USVReact Project and its Challenges

Pam Alldred
Brunel University London, United Kingdom
Pam.Allred(at)Brunel.ac.uk

USVreact is the short name for Universities Supporting Victims of Sexual Violence: Training for Sustainable Services, a large DAPHNE-III co-funded project (2016-18). The aim of the project is to develop training for university staff who may receive disclosures of sexual violence, and to embed these within institutions. This research project, led by Brunel University London, includes 24 institutions across 7 European countries. Each partner university is piloting a training programme with university staff and the revised programmes will be shared freely among universities as resources to improve responses to sexual violence.

We are keen that feminist research and survivors' experiences inform the 'training' and, to be frank, we aspire to achieve educational goals not merely training. There is the danger that we seek the learning outcomes of Feminism 101 in a day or less of training. In particular we seek to employ the GAPWork Project's inclusive definition of gender-related violence that problematizes the gender order as a whole, and would enable the university care pathways to respond sensitively to gender normative/transphobic/homophobic abuse, as well as VAW.

We have reviewed best practice and the diverse policy landscapes in Greece, Italy, Spain and the UK. The evaluations will each be situated in the context of these and the particular cultural politics, institutional cultures and practices, but we will then attempt to consider what elements of context are common across the European contexts. How is sexuality shaped by the neoliberal context in which universities are required to operate? How is reputation functioning in gender-specific and institutional ways, and following Phipps (2015) what are the implications for sexual violence in particular?

USV React: Training on supporting victims of sexual violence at university: an example from Panteion University

Alexandra Zavos, Paraskevi Touri
Panteion University of Social and Political Sciences,
Greece; Panteion University of Social and Political
Sciences, Greece
alexandra.zavos(at)gmail.com, vtouri(at)gmail.com

This paper discusses the experience of setting up, for the first time, a training program on supporting victims of sexual violence at university, at one of the leading public Social and Political Science Institutions in Greece, Panteion University.

The issue of sexual violence at university has, so far, not been the object of specific institutional policies or interventions either at Panteion, or at other Greek universities. The training program introduced at Panteion University aimed to address this vacuum. Delivered over a period of six months to members of the university community, including members of staff and administration, as well as students, the training focused on raising overall awareness on the issue, discussing possible strategies for supporting victims, as well as facilitating the development of grassroots level responses that can feed into new institutional policies. Moreover, the links between sexual violence at university and gender based violence more generally were further explored, contributing to a broader understanding and evaluation of institutional academic culture in Greece.

RN23 | Session 06a Sexual Experiences and Welfare Services: Old and New Challenges

(Sex) Work and the Welfare State: Russian-speaking Women Engaged in Commercial Sex in Finland

Anastasia Diatlova
University of Helsinki, Finland
anastasia.diatlova(at)helsinki.fi

The paper explores the relationship between commercial sex and the Finnish welfare state. Along with other Nordic countries, Finland is considered to be a welfare state with some of the most extensive social services and benefits. However, these services and benefits are not available to everyone within the borders and can only be accessed through compliance with regulations and work-related obligations. The paper is based on semi-structured interviews with Russian-speaking women engaged in commercial sex and with representatives of police, NGOs, social services, and migration officials, and ethnographic field work in commercial sex venues and NGOs. It shows how the women relate to the welfare state and how they inhabit it, particularly in relation to work, unemployment and social benefits. It demonstrates how within the welfare state the financial benefits and work conditions in the field of commercial sex can be better than those offered by the social services.

Social construction of homosexual identities and HIV/AIDS in Bulgaria

Shaban Darakchi
Bulgarian Academy of Sciences, Bulgaria
shaban.darakchiev(at)gmail.com

According to the Bulgarian Ministry of Health, as of May 2016, there are 2 283 registered people infected with HIV, and 72 percent of them are men who have sex with men, as 60 percent of these registered within the last 5 years. While homosexual men are the most affected group by HIV/AIDS this group has not been included in the priorities of the national program for prevention of HIV/AIDS in Bulgaria. Main objective of this study is to examine how sexual life and sexual behavior is being affected by the emergence of HIV/AIDS, and to what extent this is changing the notions of sexual practices within three generations of MSM and how different measures for HIV prevention are accepted within the community and how relevant they are in Bulgarian context.

Semi-structured and face-to-face in-depth interviews form the core field methods of the project. The data is gathered in the period January 2015- August 2016 from sampling of 60 MSM living in Sofia, divided into three generations, i.e. three groups of 20 participants. The data is analyzed using "critical discourse analysis" with the support of the HYPER research software.

The rise of homonormativities and the consequences for gay men's understandings of their risk of HIV infection.

Brian Kavanagh
Open University, United Kingdom
brian.kavanagh(at)open.ac.uk

The introduction of civil partnerships and gay marriage has created a new 'ideal-type' relationship structure, to which gay people can now aspire. This relationship structure has been reinforced by 'cultural referents' and the positive images of gay coupledom presented across various media (Murray, 2012). However, there has been increasing concern within the communities that this shift towards homonormativities and the desire to appear as 'good homosexuals' has led to the silencing of alternative voices (Croce, 2015). One of the consequences of this shift identified by Butler (2002) is that there may be a rise in moral judgments about those who do not wish to engage in the institution of marriage/civil partnership and a new hierarchy between legitimate and illegitimate sexual arrangements may be created. This research indicates that such hierarchies are appearing in the MSM communities in the UK and alternative transgressive discourses are being muted. The celebration of sexual diversity previously associated with MSM is replaced by increasing conservative moral judgments about men who are more promiscuous and/or engaging in sexual risk-taking behaviours. Thus, an imagined illegitimate other who embodies these risk-taking behaviours is created, against which men can measure their own sexual activity. In doing so, these men sanitise their own risk-

taking behaviours and thus break the link between their own sexual behaviours and a heightened risk of HIV infection. This paper will discuss aspects of this othering process and the consequences for those working in the field of HIV.

RN23 | Session 06b Women's Sexual Lives and Subjectivities

“Longing to tell”: In search of women’s sexuality in contemporary South Africa

Memory Mulalo Mphaphuli
Univesiteit Gent, Belgium
Memory.Mphaphuli(at)Ugent.be

Conversations about female sexuality remain difficult and somewhat a taboo continues to strongly restrict open discussions. This article explores the way in which black women see and understand their sexuality in rural and urban settings of contemporary South Africa. To this end a qualitative ethnographic research study was designed and a total of 38 young and old black women between the ages of 20 and 60 years were interviewed using a face-to-face interview guide to facilitate the discussions over a period of 6 months. In this discussion I will transcend the well-established boundaries, which for instance focus mainly on reproductive health, family planning and HIV and AIDS, and instead prioritise a discussion which considers, how and when women if at all speak about sex and their bodies, in other words ‘how sex and sexuality are put into discourse’, as Michel Foucault (1979: 11) puts it. Drawing on this discussion I will highlight how black female sexuality centres around meanings and symbols attached to female genitalia and how power is generated by what is said about them. Furthermore based on the participants’ perspectives the article illustrates that female sexuality is influenced by ideas of purity, family pride, shame, and marriage. I argue that women’s bodies and sexualities are largely policed and regulated by communities, fathers and boyfriends in multiple ways. Overall the aim of the article is to highlight that sexuality is embedded within a complex web of nonsexual social relations.

Place to ‘bi’? Affective negotiations of bisexuality in relationships

Annukka Lahti
University of Jyväskylä, Finland
annukka.lahti(at)jyu.fi

Normative western understandings of intimate relationships continue to draw upon discourses of romantic love and finding ‘the one’. Bisexuality, as a desire that cannot be bound to only one object choice within the heterosexual matrix that locates male and female at opposite poles, is persistently culturally associated with temporariness, multiple partners and promiscuity. In my presentation I will explore the affective effects of this for Finnish bisexual women’s and their (ex-)partners’ relationship narration. The study draws on longitudinal interviews conducted in

2005 and 2014–2015. While partnered and in a relationship, participants favoured the conventional relationship discourse, in which the relationship was understood and/or lived as enduring and exclusive union. Woman’s bisexuality was often absent from this talk. When the woman’s bisexuality was discussed, the exclusivity and future-orientation of the relationship became subject to affective negotiation. In the individual follow-up interviews many of the bisexual women also discuss affective experiences of sexual excess beyond cultural relationship and gender norms that complicated their monogamous relationship narratives. My analysis shows that dichotomous and hierarchical categories of gender and (bi)sexuality reproduce these negotiations. Yet I am further interested in what kind of effects affective tensions and intensities, silences and contradiction have and what do they ‘do’ in the participants’ relationship narration, when approached from a psychosocial perspective.

RN23 | Session 07a Sexualities and Migration: Sexual Othering, Sexual Subjectivities

Refugees and Queers. Discourses on LGBTIQ Refugees in Germany

Carolin Kueppers
Bundesstiftung Magnus Hirschfeld, Germany
carolin.kueppers(at)mh-stiftung.de

Angela Merkels ‘open-border-policy’ in 2015 led to a polarizing debate and the media was abuzz with articles on refugees. In the discursive field positions stretched among the new welcome-culture, a ‘we can do it’-vibe, and paternalistic ascriptions as well as racist backlashes and right-wing populist propaganda. In this mélange, one specific group of refugees came into the picture: lesbian, gay, bisexual, transgender, intersex and queer refugees (LGBTIQ refugees). Gender and sexuality based persecution is a reason for asylum in Germany and an estimated 10% of all refugees are supposed to be LGBTIQ refugees. Their representation in mainstream media is ambivalent, oscillating between multiple discrimination and the attribution of being ‘the good refugee’ – the westernized, modern and non-islamist refugee, who will be able to blend in. The paper pursues the question how pictures and depictions of queer refugees have changed in German media over the last three years and analyses this contradictory discursive area of intersectional discrimination and alleged social desirability.

Exclusionary moments: Same-sex sexualities and migrants sense of belonging.

Linda Solveigar Gudmundsdottir
University of Iceland, Iceland
lig14(at)hi.is

Migration to Iceland has increased considerably in recent decades, whereas the proportion of foreign nationals was 1,9% in 1996 compared to 8,9% in 2017 (Statistics Iceland, 2017). Also counting those who

have gained an Icelandic citizenship and second generation immigrants, the number sums up to around 12% of the population (Statistics Iceland, 2017). At the same

time, the image of Iceland has increasingly become associated with a 'safe space' or a 'utopia' for people with same-sex sexualities, which is a recreation of older images of Icelandic exceptionalism and relates strongly to how the Nordic countries are often presented as a 'gender equality paradise' (Ellenberger, forthcoming; Þorvaldsdóttir, 2011). The largest immigrant group in Iceland hails from Poland and more generally from Central and Eastern Europe, which is also where the focus of this paper lies. But as it turned out, this group is representatively small when it comes to people with same-sex sexualities. Potential reasons for this discrepancy will be discussed, as well as deliberation on issues relating to participants class belonging and disidentification; shame and resistance; and their sense of belonging and cultural intimacy. The study is based on interviews with twelve migrants from Central and Eastern Europe, who consider themselves to have same-sex sexualities, in one way or another, and have been living in Iceland for one year or more. The paper argues that shame is placed on participants in various ways and from differential social structures. While it also illustrates

how participants apply their agency within these cultural scenarios, and how 'exclusionary moments' have become an integrated part of their everyday life.

European Sexual Other: Syrian Male Refugees as Europe's New Sexual Frontiers

Armagan Teke-Llyod, Dilek Cindoglu
Abdullah Gul University, Turkey; Abdullah Gul University, Turkey
armagan.teke(at)gmail.com,
dilekcindoglu(at)gmail.com

This paper examines the depiction of Syrian male refugees in certain ethno-sexual terms in the European migrant receiving countries. In analyzing prevailing public discourses and practices regarding Syrian migrants in Europe, we argue that European borders and culture are regarded also as an ethno-sexual boundary that contains practices of civil sexuality, a frontier of gender peace and women's sexual freedom which is now threatened by the invasive and uncontrolled sexuality of single young Syrian men. In every migrant receiving society, migrants can have problems of adjusting to the new environment, but what is highlighted in this research is that Syrian refugee migration is primarily constructed through the prism of its male members' sexual excesses. Single Syrian men are often denied entry at the borders or when they manage to reach at Europe, media depictions and public programs aim at revealing and taming men's attributed hyper-sexuality. In using Joane Nagel's concept of ethno-sexual frontier, we examine the prevailing frames of ethno-sexuality through which Syrian men are construed as a threat to (i) European values such as 'gender

equality' as well as (ii) to European sexual practices such as proper flirtation and intimacy. When critiques are leveled to Syrian men (and by extension, to the whole groups of Syrian and Arab migrants) regarding their improper sexual conduct, Europe's ethno-boundaries are simultaneously constructed in gendered terms as superior to racialized Eastern Others.

RN23 | Session 08a Youth Transitions

School Cultures and Gender Variant Children: Parents' and Guardians' Perspectives

Zowie Davy, Sebastian Cordoba
De Montfort University, United Kingdom; De Montfort University, United Kingdom
zowie.davy(at)dmu.ac.uk,
P16164649(at)my365.dmu.ac.uk

Gender variant children are increasingly visible within the school system in the UK. Several cultural, social and psychological related issues contribute to the stigmatization of gender variant children and their families. Gender variant children are often bullied and victims of psychological and physical violence, based on transphobia and homophobia. These contributory factors can lead to suicide, suicide ideation, self-harm and much school absenteeism. Moreover, these factors impinge on academic and psychological development and can impact negatively on gender variant children's immediate and later lives. Little research has looked at the school context for gender variant children and their families in the UK. Using a qualitative interview method and drawing on Friere's (2000) personal limit theory we were able to learn from parents and guardians of gender variant children, how to appreciate and affirm gender variant children's membership in (school) culture, and understand how the oppressed, if and when they were, can be freed from the tyranny of, in this case, gender and sexuality oppression and stereotypes. Drawing on Freire's (2000) personal limit theory, we develop an analysis which shows how parents of gender variant children negotiate interpersonal and structural limits placed on both their children and them. The analysis will demonstrate that normative binary genders and sexualities are at the heart of oppressive school policies and while there is some work being done to combat trans and homophobia in schools it is often the fear of 'sexual perversity' and the potential for contamination that is a major factor in the construction of limits on parents and their gender variant children.

Coping with diversity, struggling with norms: Rural and urban experiences of non-heterosexual and trans youth on career choice, work and education in Finland

Jukka Pekka Lehtonen
University of Helsinki, Finland
jukka.p.lehtonen(at)helsinki.fi

I will focus on non-heterosexual and trans youth stories on their educational and career choices as well

as their experiences in heteronormative educational institutions and workplaces, also in relation to expression of their gender and sexuality. I will analyse, what kind of meanings are given to location, gender identification, sexual orientation and gender. In the presentation will be analysed the responses and stories of non-heterosexual and trans youth. The data is a survey produced in 2013 by the Finnish LGBT human rights organization Seta and the Finnish Youth Research Network. My research project is part of a larger Academy of Finland funded project "Social and Economic Sustainability of Future Worklife: Policies, Equalities and Intersectionalities in Finland" (WeAll nro 292883, www.weallfinland.fi). The survey data I use in this article consists of 1861 responses, out of which 994 were non-heterosexual women, 380 non-heterosexual men, 404 transmasculine respondents and 83 transfeminine respondents. I will describe differences and similarities between these groups of respondents in relation to their experiences of education, work and career choice from the point of view of their location and area (rural-urban). All respondents are under 30 years old and from around the country of Finland. The survey and stories reveal that trans youth experience their situation in many contexts more challenging than non-heterosexual youth. There are also gendered differences between non-heterosexual women and men, as well as between transfeminine and transmasculine respondents. There are also various differences – and some similarities – between young people living in rural and urban settings.

Mediating Aspirant Religious-Sexual Futures: In God's Hands?

Yvette Taylor

University of Strathclyde, United Kingdom
yvette.taylor(at)strath.ac.uk

Based on an Economic and Social Research Council (ESRC) project 'Making Space for Queer Identifying Religious Youth', this paper explores the construction of vocational and familial futures, in times of 'aspiring', 'post-welfare,' or 'crisis' youth transitions, as mediated by sexual-religious identification. By considering the intersectional relations of both sexuality and religion in constructing young people's aspirations, the paper highlights pragmatic and caring orientations, including a 'calling' to religion as a site of present-future vocational and familial investment. I challenge the separation of religion and sexuality in youth transitions, and in notions of the 'times we're in' as compelling certain kinds of future-orientated aspirant (and secular) selves. Overall, I hope to contribute to theorising the intersection sexuality and religion in further understanding the subversive – and conservative – potential of religious-sexual values and futures. Such orientations interface with aspects of 'getting by' and 'getting on' and at once re-inscribe and stretch normative vocational and familial choices.

RN23 | Session 10a Sexual Politics in Europe

Homosexuality in Serbia: Between Formal Acceptance and Informal Rejection

Miloš Jovanović

Faculty of Philosophy, University of Niš, Serbia
milos.jovanovic(at)filfak.ni.ac.rs

Generally Europeanization is defined as "a process in which states adopt EU rules" (Schimmelfennig & Sedelmeier, 2005). As Serbia is getting closer to the EU, this process is gaining in momentum, but running far from smooth (Subotić, 2010; 2011).

This paper, as part of the Horizon 2020 project: "Closing the Gap Between Formal and Informal Institutions in the Balkans" (№6935237), investigates the interaction between new "EU-like" formal and informal institutions, shaped by cultural tradition, legacies of socialism, and mostly by adjusting to, confronting, and evading the formal rules.

Formal endeavors aimed at the change of the social status of the LGBT persons in Serbia are a case in point, as they are directly linked to the idea of Europeanization (Bilić 2016). In accordance with the EU conditions, a number of laws aimed at fighting discrimination of LGBTs were passed, programs with the same goal were implemented, and several Pride Parades took place without incidents (as Belgrade was "besieged" by heavy police forces). At the same time, high state officials publicly manifest their reluctance toward non-heterosexuals, with the police practicing indirect resistance toward organizing the Pride (Ejdus & Božović, 2016).

The LGBT affirming actions were characterized by short time-span, superficiality and artificiality, which makes this case a paradigmatic one of Serbian Government's attitude to Europeanization: the formal obligations (as imposed) are fulfilled, while simultaneously enormous (informal) efforts are undertaken in order that no changes occur in the society.

Attempts to diffuse EU rules and regulations seem to be of no avail if local adaptation, interpretation and appropriation of these norms and resistance which they spawn, is not taken into account.

Europeanization, Serbia, LGBT, (In)Formal Institutions, Practices

There is no sex in Russia: how Russian authorities create specific type of sexuality

Liubov Bronzino

Peoples' Friendship University of Russia, Russian Federation
lbronzino(at)gmail.com

A phrase There is no sex in the Soviet Union was pronounced on the Soviet TV in 1986, then it became very popular and is considered as a concentrated expression of both soviet policy in sex and specific attitude of soviet people to sexual relations.

Russian authorities nowadays try to establish an order of sexuality (in Foucauldian sense), which I can call quasi-soviet, i.e. the order, strictly connected with the soviet value system (based on the communist ideology), on the one hand; on the other hand, it

inevitably corresponds to post-modern society, which is now forming in Russia.

Soviet attitude to sexuality was ambivalent, but it can be clearly explained with the use of Foucault's theory: asexuality was proclaimed as a fundamental approach to intimate life of the soviets, a passion and a lust were prohibited, and a family was the only approved form of intimate life. Government however managed sexuality in a suitable and comfortable for it way, which was a population growth and childbearing by two-parent families. The sexuality under control was aimed at birth of workers and soldiers, i.e. the legal pattern of sexual behavior for the soviets was constructed on the Foucault's idea of the combination of proclaimed asexuality and latent promotion of sexuality, "suitable" for the authorities.

During the 20th century the soviet society was reflected by global trends, which had become prevailing after Soviet Union's collapse. But 'conservative turn' in contemporary Russian politics is aimed at return of soviet order of sexuality.

These conclusions were obtained as a result of discourse analysis.

Queer movements in neoliberal Poland

Justyna Struzik

Jagiellonian University in Kraków, Poland

justyna.struzik(at)uj.edu.pl

A history of queer movements in Poland does not expand beyond the last twenty years. Only in the 1990s, the first collective efforts visible in the public sphere specifically addressed the issues of the LGBT people, and – in a broader sense – the change in regards to a social understanding and defining of sexuality. Similarly to other countries in Central Eastern Europe, the Polish queer movements are emerging in a particular moment in history after the fall of the Berlin Wall and when democracy and capitalism are taking shape in this part of Europe. In my paper I would like to discuss queer movements in the contemporary neoliberal Poland. I have conducted a study with Polish activists (in-depth interviews) focusing on the presence of class/economic dimensions within the movements. In this paper, the key issues are those pertaining to:

- privatization of the struggle for the rights, by which I mean transferring the responsibility for providing a sense of security/stability to the individual in the context of the non-engagement of the state (eg. "Private weddings", not recognized by the Polish law);
- precarization of the labor market affecting the activists and having a negative impact on involvement in the movements.

Narrating Homophobia In Italy. Institutionalization of a neologism between 1979 and 2007

Paolo Gusmeroli

University of Padua, Italy

paolo.gusmeroli(at)unipd.it

The heuristic value of the term 'homophobia' has been highly criticized in literature. Nevertheless, the word

has known a relevant institutional and popular success, working as an 'umbrella' concept also for a growing bulk of psycho-sociological research.

Recently, taking in account its ambivalence, researchers focus more and more on the performative effects of (anti)homophobia discourses, policies and practical uses, independently from 'expert' codifications.

This paper moves in the same direction, investigating the trajectory of the neologism 'omofobia' in the most widespread national newspaper ('Il Corriere della sera'). We collected a sample of 422 articles, going from 1979 (first appearance) until the end of 2007 (its 'consecration'). Through this period we follow two well known processes: the shift from grassroots activism to mainstream politics, on one side, and the ambivalent framing of 'homophobia' into a 'urban crime' debate, on the other.

Applying both content and discourse analysis, we discuss the ambivalent effects of (anti)homophobia appropriations by different 'communities of interpretation'. The analysis has detected a plurality of voices and meanings, but also temporary convergences on quasi-hegemonic practical definitions.

Results concern two parallel and related levels: first, we observe how the strategic use of public alarms, and a particular political configuration, created a space to ask for more protection by the state for Lgbt subjects. Second, we consider how '(anti)homophobia' was progressively declined in a hate crimes paradigm, while entering in the political field, with very relevant consequences for its normative re-interpretation.

RN23 | Session 11a Grasping Change in Sexual Experiences: New Media, New Norms

The Changing Contours of Pleasure: Recreational Sexuality and Creative Labour

Dana Kaplan

The Open University, Israel

dana.kaplan(at)mail.huji.ac.il

This paper proposes a class-based, material explanation to the rise of Recreational Sexuality as a form of labour in neoliberal capitalism, within the emerging framework of critical heterosexualities studies. It starts from the assumption that in order to better grasp the current cultural-material nexus that shapes current modalities of sex and sexuality, it is pertinent to shine light on "normative", heterosexual middle-class experiences as well. More specifically, this paper historicizes the (sociological) concept of Recreational Sexuality, juxtaposing it to Procreational and Relational understandings of sexual relations. Arguably, in the current neoliberal moment Recreation is a concept that captures an overarching sex industry and a concomitant cultural sexualization, jointly operating under the logic of 'Sex-capital' (Preciado 2013). But more significantly, it attests to a gradual erosion of the distinction between the spheres of production and reproduction that for long defined the modernist gender/sex hierarchies. This paper

demonstrates, based on a discourse analysis of in-depth interviews with 31 (mostly) middle class, heterosexual Israelis, how Recreational Sexuality becomes a middle-class disposition. Accordingly, one's sex life is understood as more than merely a playful consumption of sexual lifestyle commodities, but, more importantly, a precondition to employability. I argue further that Recreational Sexuality has appropriated elements and practices from queer lifeworlds, in a way that also helps reshaping the contours of pleasure, which is now understood less in terms of a relational exchange, and more in terms of self-investment and the enlargement of self-appreciation.

“I lack the right to exist. I'm not there”: Trans women, online media and subjectification

David Primo, Adriano Zamperini, Ines Testoni
University of Padova, Italy; University of Padova, Italy;
University of Padova, Italy
david.primo.dp(at)gmail.com,
adriano.zamperini(at)unipd.it, ines.testoni(at)unipd.it

Transsexual and Transgender people have become more visible in the institutional media, although these portrayals sensationalise and ridicule trans people experiences by focusing primarily on a supposed fictionality of their gender. In this way, those media concur to the dissemination and legitimisation of hegemonic transnormativity (McDonald, 2006 & Garosi, 2011). Conversely, online media proved to be a fundamental political and social platform for transgender people. Nevertheless, few studies focused on how trans people use those media to build their self-recognition and political subjectivities. Drawing on the theoretical standpoint of Judith Butler's (1997) Theory of Subjectification, in this work I will focus on the different ways Italian trans women use online media resources to express different positionalities about transgenderism, transsexuality and gender transitioning. In particular, I will present the results of a discourse analysis on 44 online non-academic resources (self-presentations, advice blogs and narrations of everyday life experiences) written by 10 Italian trans women. I identified four positioning strategies: “Transgender”, “Transsexual before being a woman”, “A woman who was born male” and “Just a normal woman”. These positioning strategies are not mutually exclusive, but rather they act as discursive and narrative resources which enable trans women to continuously redefine their experience in different situations. Moreover, I suggest that these discursive positionalities cannot be strictly categorised as emancipatory or conformist, as they simultaneously enact the reproduction and the destabilisation of the hegemonic discourses about gender and sexuality.

Mobile sexualities: Becoming-queer across material borders online

Scott David Kerpen
Cardiff University, United Kingdom
kerpensd(at)cardiff.ac.uk

This purpose of this paper is to explore the notion of queer solidarity in increasingly liquid mediated worlds. It aims to develop an understanding of how collapsing spatial and temporal boundaries, brought about by processes of technological advancement and globalisation, enable marginalised sexual and gendered identities to connect with queer social-discursive-material worlds beyond their own (Groves et al. 2014; Hine 2000; Jones 1997). Drawing on in-depth interview data collected from three individual case studies using creative and semi-participatory methods, this paper thinks about some of the ways young queer men from post-industrial towns digitally negotiate heteronormative constraints of working-class masculinity. It considers how becoming with communities of 'choice' online, rupture those which are spatially and temporally defined offline (Jones 1997). Though the data presented focuses on a dissolution of boundaries within the UK, such agential possibilities are useful for thinking about the internet's liberatory potential in a European context, where users can transcend national borders and in doing so queer social, cultural and political systems of organisation. However, in taking a more critical stance towards such a utopic vision of the internet, this paper also considers how narratives can easily become fractured through mediated space (Jones 1997). Though positive in hollowing-out some of the affective constraints of heteronormativity, the digital may threaten queer solidarities offline. Though online connections mattered a great deal to the participants, their affective potential was limited by social and material distance. As such, concerns were raised around how such technologies may limit possibilities of mobilising queer identities for social and political change at more local levels.

RN24 - Science and Technology

RN24 | Session 01a Health, Bio-Medicine & Social Context I

Populations as brands - science and technology in the construction of identities

Aaro Tupasela
University of Copenhagen, Denmark
aatu(at)sund.ku.dk

The collection, use and distribution of human tissue samples have stressed the new pathways in which human body parts and related information are becoming productive. This presentation probes the question of how the concept of branding can elucidate the way historico-cultural narratives of origin and authenticity are coming to play an increasingly important role in leveraging populations as new types of scientific products. Using the notions of heritage and identity, geolocation, and scientific recognition, I argue that the branding of populations represents, not just novel ways of creating difference, but also provides new ways in which master narratives of population history are created. The processes by which genetic specificities of various populations and their concomitant samples are made productive vary, yet illustrate how narratives of genetics, national identity, group identity, and uniqueness in the medical sciences become intertwined with notions of productivity and bioeconomic potential.

The creation and development of national population biobanks in Estonia and Iceland: a field-theoretical analysis.

Külliki Seppel
University of Tartu, Estonia
kulliki.seppel(at)ut.ee

Initiated in late 1990s with the aim to explore interactions between genes and environment, population biobanks fuelled media attention in the most controversial part of genetic research: while within genetics, the trend since the late 20th century has been towards growing acknowledgement of the complexity of genes and the multifaceted relations between genes and environment, the public discourse has often been using the language of genetic causation. The sociological analysis of the phenomenon has been dominated by the Foucauldian perspective warning of the prospect of the geneticisation of social problems, naturalisation of inequality, etc. Alternatively, this paper takes a

Bourdieuian perspective and argues that the public discourse of genetic causation should not be viewed in such a totalising way but rather as a strategic tool used by geneticist to gain symbolic capital in the context of the growing dependence of the scientific field on economic and political fields. The paper, based on the analysis of the cases of Icelandic and Estonian biobanks, discusses how these, in their search for public and economic recognition, were bound to strategically engage in this controversial public discussion. Biobanks as scientific projects are especially dependent on external field: their creation and upkeep requires a huge financial investment; the recruitment of a large group of sample donors requires high level of popular support and mobilisation.

Secondly, the paper discusses how the subsequent developments of the biobanks epitomize the insoluble differences between the logics of economic and scientific fields. Neither of the initiatives, planned as public-private cooperations, has maintained its initial ambitious goals, both have had to make a transition into more habitual (though very different) institutional arrangements in the biotechnological field.

Big data and public healthcare: resisting new economic subjectifications of exclusion

Paraskevas Vezyridis, Stephen Timmons
University of Nottingham, United Kingdom; University of Nottingham, United Kingdom
paraskevas.vezyridis(at)nottingham.ac.uk,
stephen.timmons(at)nottingham.ac.uk

Since the economic crisis of 2007-08, a growing global economic literature promotes the role of the State as the decisive broker of population datasets for new innovation ecosystems to sustain economic growth. In healthcare, the fight against the (economic burden of) disease and the responsabilisation of health management, amid the reduction of the welfare state, have expedited the development of national technological infrastructures for big data analytics.

This paper examines socio-technical and ethical challenges around care.data: a failed primary care programme by NHS England aiming at developing a central database of complete patient journeys for various secondary analyses. Based on ethnographic interviews with health data researchers, General Practitioners and citizens who resisted this database, we argue that a new social contract is drawn up for the commercialisation of public health data.

Understanding these state initiatives as mass surveillance programmes, patients resisted normative assumptions of size and speed towards conscribed data sharing practices. Contrary to a morality of ambiguous overriding public and science interests, they mobilised a morality of egalitarian access to public health services. Rejecting extensive institutional discretionary appropriation of data use rights, they called for more distributed forms of big data ethics so as to steer research, innovation and economic exploitation away from marketisation and the dismantling of the national health service.

As the healthcare, research, business and

surveillance models are becoming synonymous, we need to discuss what kind of research, service improvement and generally economic growth out of this public good is beneficial for society as a whole.

Expectations and impatience: A study of a policy mood

Heta Tarkkala, Ilpo Helén
University of Eastern Finland, Finland; University of Eastern Finland, Finland
heta.tarkkala(at)helsinki.fi, ilpo.helen(at)uef.fi

Across Europe, innovation policy is saturated with enthusiasm about big data. Our presentation examines a political preoccupation with digital databases and big data in the domain of health care in Finland. Finnish public health care databases and biobanks are seen to already contain big data and to offer a huge potential to make Finland a 'test bed' for medical genomics and personalized medicine. For past few years, national innovation strategies have highlighted visions of data-driven biomedical research and health care and focused on rearrangements to make the Finnish big health data available for 'global' research & development work. In the visions of innovation policy, utilization of big health data stored in public databases and biobanks will enhance scientific and, in particular, commercial competitiveness of Finland.

We analyze emerging impatience in innovation policy focused on health databases and health-related big data. Advocates of innovation in biomedical research and business encourage health sector stakeholders to move fast in making their health data more easily available and accessible. This political preoccupation spreads a mood of impatience among the actors and stakeholders who run biobanks, health care institutions and public databases and who actually plan and carry out technical and political reforms in health data management. In our paper, we point out sources and a rationale that create impatience in innovation policy, and we discuss about consequences of such a policy mood. Does impatience foster or hinder efforts to make Finland an international success story of data-driven medical genomics and personalized medicine?

Building Research Networks through International Scientific Laboratories in Russia

Nadia Asheulova
Institute for History of Science and Technology,
Russian Academy of Sciences, Russian Federation
asheulova_n(at)bk.ru

The paper focuses on the current situation regarding international S&T cooperation, academic mobility and science policy in Russia providing an overview of recent initiatives, current challenges and existing trends. One of the government initiatives includes establishing new types of international laboratories

under the guidance of leading scientists from all over the world. More than 160 international laboratories have been established. We conducted a study to investigate the laboratory life in such organizations. To understand the building research networks through international scientific laboratories in Russia we used the actor-network theory by Bruno Latour. Our analysis is based on interviews with experts, leading scientists and heads of laboratories, as well as with young researchers from international laboratories in several research and education centres of Kazan, Moscow, Rostov-na-Donu, St Petersburg, Ufa, Yekaterinburg. The results of the study demonstrate that the idea to invite leading scientists for organizing international laboratories is efficient. The paper is prepared within the framework of the Russian Foundation for Basic Research, 15-33-01357.

The Role of Micro And Macro Factors by Establishing and Maintaining of European R&D Collaborations

Franc Mali
University of Ljubljana, Slovenia
franc.mali(at)fdv.uni-lj.si

In the paper, my starting point assumption will be that the various social factors influence the formation of joint R&D collaborations in European Union (EU). In spite of all difficulties Europe is encountering in the last time, R&D activity is still staying on the front line of its integration. R&D collaboration in context of EU is transforming in a highly organized collective »enterprise«. Seen as a whole, the processes of EU R&D integration is forming by a series of strategies, guidelines, directives, all of which together comprise the official EU "philosophy" from which the idea of a common »European Research Area" should be realized in practice. In this processes of formation of joint R&D collaborations, the national contexts from which the partners in EU R&D networks originate, have still very important role. In the paper, we will present the role of so-called national context on the case of Slovenia. I will present the macro and micro factors that encourage (or discourage) Slovenian scientists to establish and maintain R&D collaborations at European level. In accordance with concepts of social network theory I will define micro factors as those factors which regard to the expectations of scientists. The macro factors relate to the external frameworks over which the individual scientists have no direct influence. By combining the obtained results of our empirical analysis of macro and micro factors, I'll try to conclude with more general reflexivity about the role of national contexts in recent trends of European R&D integration.

Role of the scientific-research in the context of the new development paradigm

Jadranka Švarc, Jasminka Lažnjak, Drago Čengić,
Saša Poljanec-Borić
Institute of Social Sciences Ivo Pilar, Croatia; Faculty of Humanities and Social Sciences, University of Zagreb; Institute of Social Sciences Ivo Pilar, Croatia;

Institute of Social Sciences Ivo Pilar, Croatia
jadranka.svarc(at)pilar.hr, jlaznjak(at)ffzg.hr,
drago.cengic(at)pilar.hr, sasa.boric(at)pilar.hr

This presentation reflects on the changes in the role and position of the scientific-research caused by the shift in development paradigm and related public policy context. It is argued that paradigm shift, from industrial society and “managed economy” towards the “entrepreneurial economy” has moved the focus of public policies from scientific research and research-based innovation towards entrepreneurship and business innovation. Although the role of entrepreneurship is crucial for materialization of research results and innovation, the role of the scientific-research requires re-consideration under the new circumstances, especially in economically less developed countries where research systems are weak and vulnerable.

The paradigm shift in the EU research policy is formulated within the EU Cohesion policy based on the ideas of strategies of smart specialization (S3) which provide strategic framework for research policy and priorities guided by the principle of “entrepreneurial discovery process”. Despite S3 emphasizes the critical role of the scientific-research and key technologies in the entire EU, the implementation of S3 in less developed countries like Croatia failed to provide sustainability of the research system.

The evolution of the “national innovation system” focused on research-based innovation into the “national entrepreneurial system” focused on business innovation, small companies and self-employment coincided with the upswing of guiding principles of S3. These concepts and processes will be discussed in order to shed additional light on their impact on scientific research in less developed countries. The impacts are illustrated by changes in (1) operational, (2) conceptual, and (3) financial aspects of scientific research in Croatia.

Changes in Post-socialist Science Policy and Personal Narratives of Researchers

Sanja Petkovska
University of Belgrade, Serbia
sanjalicica(at)gmail.com

After the end of socialist era and introduction of liberal capitalism, Serbia is more openly facing a challenge of increasing globalization and europeanization, causing many social, economic and political challenges. This transformation has been especially visible and actual in the field of science policy. New discourses and priorities were introduced producing certain expectations regarding the investment in research and evaluation of the scientific results on a global scale since the Second World War, thus gradually shaping the national policies. While accepting the global principles, post-socialist national academic communities were facing specific problems, especially related to low investment in science, old research infrastructure, traditional division between research

and teaching, etc. Therefore growing internationalization of science in post-socialist countries created an atmosphere of uncertainty and turbulence that can be approached from many levels. Besides the policy studies that could say more about the state of former socialist countries in the context of emergence of the paradigm of new production of knowledge, interesting approach could be to examine how the subjects of knowledge production - researchers themselves, approach this change. Therefore an qualitative empirical study has been conducted about how researchers in Serbia perceive growing internationalization and europeanization of science policy in Serbia. The accent has been given to the evaluation of the results of research work which is an dramatic issue (especially for social sciences), but also to all the problems that local researchers are facing with globalization in local context. Sample of 25 researchers on different research positions participated in interviews and provided interesting insight to the problems of being a scientist on post-socialist periphery in the era of globalization and European integration.

RN24 | Session 02a Health, Bio-Medicine & Social Context II

Why Did the Animal-proof Netting and Paper Egg Tray Policies Fail? : The Social Construction of Artifacts' Political Properties

Yu-Ju Chien
National Taiwan University, Taiwan
yujuchien(at)ntu.edu.tw

To prevent avian flu outbreaks, since 2004 the government has introduced two artifacts that enhance farm biosecurity to poultry farmers, including bird-proof netting and paper egg trays. Although these two artifacts seem like appropriate technology and suitable for small-scale production, most farmers did not embrace them. This article explains farmers' resistance by investigating the market structures in which farmers and retailers operate and interact. By interviewing government officials, veterinary experts, and poultry farmers, the study found that farmers' economic rationality and practices are embedded in the conventional low-cost, mass production market model, whether in poultry or egg production. The less leverage a farmer has to determine the price of his/her products, the less willing s/he is to alter preexisting practices and adopt new artifacts. The paper concludes by arguing that farmers' economic rationality and behaviors are situated in their market chains. When developing agricultural policies that affect farmers' livelihoods, it is necessary to consider take into account how market structures shape stakeholders' experiences and the political properties of relevant artifacts.

Profiles of malaria research in Portugal: the dynamics of capitalism in non-economic driven scientific practices

Ana Ferreira

Faculdade de Ciências Sociais e Humanas da
Universidade Nova de Lisboa, Portugal
aferreira(at)fcsh.unl.pt

Productivity, development of marketable products or services and socio-economic growth are increasingly recognized as drivers of scientific activities. This is revealed in profit-driven practices and in the incorporation of non-monetary dynamics of capitalism by the scientific field. However, it remains to be addressed how research in malaria, that focusing on a disease endemic to poverty is not expected to be a major target of biotechnology and/or pharmaceutical companies, is framed by these processes.

This paper characterizes the scientific landscape of malaria research through the analysis of all Web of science-indexed publications involving Portuguese organizations (1900-2014; n=467). These organizations have been contributing to the understanding of malaria's pathophysiology for a long time, a feature that is attributed to malaria's endemicity in continental Portugal until the 1970s, and its current presence in regions of all former Portuguese territories.

First, data was systematized by content and bibliometric analyses. Subsequently, multiple correspondence and cluster analyses revealed a bi-dimensional landscape (who is publishing versus what is being published) and three profiles: beginners (early non-experimental publications); local appropriations (low-impact research in which Portuguese organizations lead others from former Portuguese territories); global patterns (applied research developed by heterogeneous actors, in which Portuguese organizations are subordinated to others belonging to countries with more established S&T systems).

These profiles reveal the construction of the Portuguese scientific system and unveil that the development of performance- and application-driven dynamics in malaria research is not hampered by its low profit potential. This approach can be extended to other biomedical fields to understand the dimensions underlying the (re)construction of science.

Fear of Cancer Recurrence: Genomic medicine and the reconfiguration of liminality

Julia Elizabeth Swallow, Emily Ross

University of Leeds, United Kingdom; University of
Edinburgh, United Kingdom
J.E.Swallow(at)leeds.ac.uk, Emily.Ross(at)ed.ac.uk

A shifting emphasis within medico-scientific practice towards genomic understandings of cancer has led to the development of a range of techniques and practices based on molecular profiling. These include trialling of different treatments over time in response to molecular changes within tumours, the development of biomarkers which indicate the presence of cancer,

and tests assessing a patient's individual risk of cancer recurrence. These targeted tests and therapies are presented as enabling a more precise understanding of the risk of cancer recurrence, and of treatment response and management over time. In the context of these developments we argue that the notion of 'cancer survivorship', and experiences of the cancer trajectory, are poised to become increasingly complex. Drawing on the sociology of time, and presenting qualitative data gathered across healthcare sites in the UK, we examine the ways in which molecular tests and therapies (re)produce and reconfigure patients' subjective experiences and fears of cancer recurrence. We situate these within wider cultural discourses surrounding cancer, and highlight the potential for genomic techniques to shift the meaning of futures beyond cancer for patients and their families. We show that experiences of liminality in particular, often drawn on in sociological explorations of life following treatment for cancer, may be reconfigured by genomic medicine. With the potential for genomics to impact upon societal understandings of cancer more widely, our work contributes to the sociology of risk and uncertainty, STS (science and technology studies) approaches to diagnosis and screening, and sociological work exploring the meanings of health and disease in everyday life.

A Bloody Mess: ethnographic inquiry into blood's enactment and representation in a Belgian Blood Establishment

Nathan Wittock, Michiel P.M.M. De Krom, Lesley Hustinx

University of Ghent, Belgium; University of Ghent,
Belgium; University of Ghent, Belgium

nathan.wittock(at)ugent.be,

michiel.dekrom(at)ugent.be, lesley.hustinx(at)ugent.be

In social science, blood donation has conventionally been considered the purest example of altruism. Recent evolutions – related to transfusion-transmittable infections, contested donor exclusion policies, and bio-medical advances that enabled commodification – added three 'big stories' to the conventional understanding of the 'gift relationship': those of the blood economy, biological citizenship, and risk governance. While these stories have multiplied our understanding of blood, we argue that they are examples of perspectivalism (Mol, 2002): they frame blood from different angles but fail to grasp the entanglement of technological, biomedical, political and sociotechnical aspects of this 'bio-object' (Vermeulen et al., 2012). Following a post-ANT approach, this paper suggests an ontological response (Law & Singleton, 2005) to move beyond the four stories and the disciplinary bound and reductionist research that they inspire. We examine blood through the notions of fluid space and fire space (Law & Mol, 2001) to uncover its multiple and entangled ontologies. Drawing on ethnographic research into blood supply management in a Belgian blood establishment, we follow blood from its donation

onwards to reveal that it is simultaneously a matter of science and sacrifice; a product with economic, healing and ethical value; lifesaving and life-threatening; and sourced from altruistic donors and part of a depersonalized assembly line. These findings show that blood is more multi-faceted and variable than the four “blood stories” suggest. As such, our study contributes to re-imagining blood, and opens up new pathways for studying this ‘bio-object’ and its role in a safe and sufficient European blood supply.

RN24 | Session 02b Science Policy & National Research Systems II

Who can research and innovate responsibly? – Challenges of RRI in European academia

Anita Thaler, Magdalena Wicher
IFZ - Inter-University Research Centre for Technology, Work and Culture, Austria; IFZ - Inter-University Research Centre for Technology, Work and Culture, Austria
anita.thaler(at)aau.at, magdalena.wicher(at)aau.at

Post-academic (mode 2) science or transdisciplinary research used to emphasise the need to involve different actors in the research process in order to gain knowledge that is more robust, and to leave the ‘ivory tower’ of academia (Gibbons et al. 1994, Nowotny 2006). With social innovation, knowledge co-production and responsible research and innovation (RRI; Owen et al. 2012) etc. there exist numerous other approaches, which should challenge implicit hierarchies of different types of knowledge. Moreover, especially with RRI the European Commission aimed at tackling so called ‘grand challenges’ (2012), comprising global environmental and societal problems.

“Responsible innovation means taking care of the future through collective stewardship of science and innovation in the present.” (Stilgoe et al. 2013, p. 1570)

Besides this aspect of contributing to “the overall good” (Karner et al 2016, p.24), responsible research and innovation is characterized by its process. Responsible research should not only include stakeholders in a later stage to enhance acceptability of innovations, but open the – transparent – research process interactively to relevant actors from the beginning.

However, these very characteristics of a responsible science are opposed to current rewarding processes and career systems in academia. We will present challenges of the RRI framework based on empirical findings and discuss necessary system changes in research funding and academia, so that “RRI does not become a hobby” for “retired professors” (like two experts stated in interviews).

The bureaucratic cesarism of the European space agency: building a European state through science

Julie Patarin-Jossec
Université de Bordeaux, France

julie.patarin-jossec(at)u-bordeaux.fr

Since the soviet space station Mir, space programs are focused on scientific research as the only peaceful use of outer space. The specificity of science in human spaceflights contexts (rather than aboard satellites or than remote activities) as aboard the International Space Station (to which Europe contributes) is that it requests a division of labor among scientists leading experiments, operators preparing the latter for space conditions and astronaut performing the protocol, through a specific bureaucratic system. This bureaucratization may allow the development of a political authoritarianism led by the organization of an international institution rather than by a State (as Gramsci and Nicos Poulantzas outlined it). Based on the concept of “Cesarism” developed by Antonio Gramsci to understand the rigidification of state apparatus when the latter is destabilized during an economic crisis transformed in an organic crisis threatening the political sphere, this communication aims to understand how the bureaucratic organization of the European Space Agency and its management of scientific research in manned spaceflights contributes to maintaining a weakened political power in the aftermaths of the overaccumulation crisis of capitalism occurred in the 1970s, as well as it participates to the building process of a European state through a cesarist monopolization on scientific production, which crafts the legitimacy of its space policies. While an existing literature already highlights the function of the cesarist policy of the European Central Bank on financial products in the European governance, space activities allow introducing science as a keystone in the understanding of relationships among moving back of democratic institutions (such as during Gramscian organic crisis) and capitalist system of production.

A reflexivity exercise on the Gender equality in S&T issue in FP7 funded programs: new challenges for Horizon 2020 projects

Maria Carmela Agodi, Ilenia Picardi
University of Naples Federico II, Italy; University of Naples Federico II, Italy
mcagodi(at)gmail.com, ilenia.picardi(at)unina.it

In the 2009 Report of the MASIS Expert Group, 'Challenging Futures of Science in Society - Emerging Trends and Cutting-Edge Issues', the diagnosis was one of a patchwork of ongoing partial and contested transformations. Identified trends included the re-contextualization of institutions and practices of science in society, the growing interest in accompanying institutional changes, and science new reflexivity about its own role and impacts.

Our focus is reflexivity about the gender equality in S&T issue as addressed in the EU framework Programs and its impact on a national context, as the Italian one. We have been involving in our study different sister projects addressing gender inequalities in S&T, being funded under the 7th Framework Program Call “Science in Society” (GENOVATE,

TRIGGER, GARCIA...). Researchers working within one of the Gender in S&T programs funded under the Horizon 2020 call "Science with and for Society (PLOTINA) addressed too, in a thoughtful exchange oriented to mutual learning. The results of this reflexive exercise reveals ambivalences, strains, tensions, organizational opportunism, but also the opening of opportunities and levers for institutional change, addressing deep epistemological and societal roots of European political and scientific arenas. Gendering processes appear to be an overarching and ever changing while re-contextualizing mechanism of cultural, structural and institutional dynamics, to be sociologically understood and politically addressed. Gender equality is not conceivable as a fixed and predefined target, but as a changing and permanent cultural, structural and institutional issue.

Economists and economic schools of thought in nuclear policy: the role of institutions of economic expertise in Finland, France and the UK

Markku Lehtonen
GSPR, Ecole des Hautes Etudes en Sciences
Sociales, France
m.lehtonen(at)sussex.ac.uk

Public debate on nuclear energy has until recently been largely dominated by topics such as accident risk, energy security, and radiation-related environmental and health risks. In recent years, economic concerns have taken the forefront of these debates, with risk increasingly discussed and analysed within an economic frame. This paper examines the growing weight and changing forms of economic argumentation in the governance of nuclear power in three European countries building or planning nuclear new-build: Finland, France and the UK. The paper traces the trajectory of the EPR (European Pressurised Reactor) from a promising new technology in the late 1980s through being a showcase of French-led nuclear renaissance, to its present status as an economic nightmare highly damaging to the reputation of the industry.

The paper combines interview data with media analysis based on pragmatic sociology and conducted with the help of the semi-qualitative Prospéro software tool. It concentrates on the visibility of different economic experts in the public arenas on one hand, and within the policymaking institutions on the other. It highlights the operation of economic expertise through various national and international organisations (e.g. OECD-NEA, IEA, IAEA, Euratom, EU DG competition, environmental NGOs, national research institutes). Observations from the comparative empirical analysis are examined in the light of earlier research on nuclear energy from the perspective of technopolitical regimes and cultures (Hecht 1998; Felt & Müller 2011), sociotechnical imaginaries (Jasanoff & Kim 2009; 2013), and "state orientations" (Dryzek et al. 2002; Teräsväinen et al. 2011).

RN24 | Session 03a Scientific Careers and Practices I

Europeanization and Faculty Mobility - Toward a European Academic Field?

Stephanie Beyer, Nilgun Massih-Tehrani, Christian Baier
University of Bamberg & Zeppelin University, Germany; IAB, Germany; University of Bamberg & Zeppelin University, Germany
stephanie.beyer(at)uni-bamberg.de,
nilgun.tehrani(at)uni-bamberg.de,
christian.baier(at)uni-bamberg.de

The Lisbon Strategy raised the public and political awareness of global economic competition and strengthened the role of higher education and research. As a result, European and national politics seek to increase extra-European mobility and strengthen international competitiveness. In this context the European Research Council (ERC) aims to provide top researchers working in Europe with high amounts of funding and academic prestige and thus establish a European "brand" of academic excellence. Using generous funding the EU seeks to attract non-European researchers and tries to form globally competitive research institutions. For this purpose ERC-grants allow grant holders to move their grant to another host institution within Europe.

Using CV-data and a social network approach we ask whether ERC grantees show specific patterns of mobility and how these patterns are related to the Europeanization of higher education. Our results show typical career paths of European faculty and their mobility between European and extra-European universities. We focus on ERC starting grant holders in Germany and France to highlight the differences in mobility patterns. Differences in the structure of national academic fields give rise to different patterns of intra- and transnational mobility. We identify patterns of "brain drain" and "brain gain" within countries, within the European Research Area and between Europe and the global centers of academic prestige in the US. Our findings suggest that global Research Universities in the US and the UK seem to be the beneficiaries whereas peripheral European countries and less prestigious universities get lesser funding and attract less researchers. In conclusion we argue that the changes in the European academic landscape may not lead to an equal horizontal integration across European universities and countries.

Making European research through the structural change for gender equality

Marcela Linkova
Institute of Sociology, Czech Academy of Sciences,
Czech Republic
marcela.linkova(at)soc.cas.cz

Since 2009 the European Commission and member states have supported the structural change as the approach to advance gender equality in research. This

approach entails three priority areas: gender balance in decision-making, gender balance in research careers, and the gendering of the content of research and innovation. In recent years, there has been a drive from the European Commission to capitalize on the experience built, to provide instruments for further uptake of this approach (such as the EIGE online tool which builds on experience from various FP and Horizon 2020 projects).

The adoption of this approach at policy level and its recognition as an instrument in building the European Research Area fosters the perception that this approach is universally applicable and implementable. The experience from the field, however, suggests that the implementation is messier than may be gleaned from expert and policy documents, with historical, cultural, socio-economic, disciplinary and other factors contributing to the types of enactments the structural change takes in particular settings.

In this paper, I will draw on my experience as a gender expert involved in the implementation of two structural change projects (TRIGGER, EGERA) and active in the European gender equality domain, to outline a research inquiry into the structural change as a particular type of a European project. While the three objectives may appear self-evident, I will explore what sort of boundaries, exclusions/inclusions and challenges they may be creating for gender equality implementation through labelling countries and institutions as more and less advanced.

Is it really only about ability? On early-stage career paths of women academics

Marta Vohlídalová

Institute of Sociology Academy of Sciences CR,
Czech Republic

marta.vohlidalova(at)soc.cas.cz

Traditionally, there is a high degree of trust in fairness and meritocracy as regards the conditions for research success and building a research career in the Czech Republic. If we accept this explanation for the low proportion of women in Czech research, it would mean that there are either not enough women capable of working in research or that women do not care about academic careers. Critical studies show that the rules of career progress in research and the criteria determining what and who is/not excellent imply a range of inequalities whether based on gender, race or class. The paper investigates the trajectory of women's early-career academic paths and the mechanisms, factors and barriers affecting women's early career stages in the Czech Republic. It follows fourteen academics through two interviews repeated after an interval of seven years. While at the time of the first interview these researchers had made a promising start with many successes, after seven years, when the majority had children, only two were on an upward trajectory. More often their careers were stalled or regressing; some women had even decided to leave academia. The analysis shows the background to and context of seemingly free career choices which, when examined up close, prove not to

be quite as free as they first appeared. The study underscores that the reason for career stagnation is not necessarily lack of talent, ability or motivation but that the causes can be found in the structural conditions which affect career choices.

RN24 | Session 04a Scientific Careers and Practices II

Searching for the best colleague: Normative models of university professors regarding tenure and promotion

Laura Cruz-Castro, Luis Sanz-Menendez
CSIC -Consejo Superior de Investigaciones Científicas, Spain; CSIC -Consejo Superior de Investigaciones Científicas, Spain
Laura.Cruz(at)csic.es, Luis.Sanz(at)csic.es

Criteria for evaluating professors are intertwined with at least three types of dimensions; firstly, they might be related to the multiplicity of university missions: knowledge production, teaching, knowledge transfer, training of new academics; secondly, they can also be linked to some of the functional needs of the organization: reproduction, growth, stability, loyalty, innovation, performance, reputation, fund raising, etc.; lastly, evaluation criteria and evaluation objects (outputs, processes, signals, potential) are entangled. In reality, all dimensions appear combined, and therefore the analytical challenge is to integrate them and build a meaningful empirical taxonomy in which we could identify distinct profiles.

Using survey, we analyze the normative views of more than 5000 Spanish academics about the evaluation criteria that should be applied in departmental tenure and promotion decisions. We use cluster analysis to identify groups of respondents according to their views of what makes the best candidate. We identify four clusters which differ in the relative value given to research performance, teaching, or transfer, but also to, local commitment or contribution to collective tasks, or the ability to bring funding. We perform quantitative analysis of the data to provide first the basic descriptive findings, and secondly we test some key associations between the variables.

Our results will show light on the connection of evaluation with university missions by providing empirical evidence on the preferences and opinions of academic community itself. We also expect to contribute to the literature on the institutional and social bases of academic judgment in a changing the university context.

The final countdown: University professors and retirement

Julia Reuter, Oliver Berli
University of Cologne, Germany; University of Cologne, Germany
j.reuter(at)uni-koeln.de, oberli(at)uni-koeln.de

In recent years differentiating phases and types of careers has been at the center of research on university careers. However, far too little attention has

been paid to one stage of the “lifecycle” of careers: The retirement from university. Besides anecdotal evidence little is known about the final career transition due to the fact that most of the research on university careers focusses on the processes of obtaining a professorship. Our presentation is primarily concerned with this knowledge gap, because retirement is an important aspect of the reproduction of the academic field. What’s more, if one understands “science as a vocation” (Weber), retiring from science may be different than retiring in other fields.

In our talk we will present an exploratory research project on the final stage of university careers in Germany. Firstly, we will conceptualize the end of university careers as a status passage. Secondly, we will briefly introduce our approach to the topic in terms of methods and data. In order to understand the complex nature of retirement we conduct qualitative interviews with professors from a variety of subjects. Our interviews deal with a variety of questions like the following: How do professors experience and deal with the official end of their occupational life? What rituals mark the status passage of retirement? In the last part of our presentation we will present preliminary findings and discuss directions for further research.

Who is the “right scientist”? Occupational identity, disciplinary differences and exits from academic path

Katerina Cidlinska

Institute of Sociology of the Czech Academy of Sciences, Czech Republic

katerina.cidlinska(at)soc.cas.cz

Occupational identity is constructed by a community of workers in a particular occupational group as well as in a specific profession. It is also influenced by the social image of the profession and its history. Another contributing factor is socialization via professional training. In case of science as profession this is launched during university studies, and especially during the postgraduate phase when students begin to take an active part in scientific production, obtain their first research contracts and conditions of research assessment and funding start to impact them directly. Individual disciplines have different cultures that affect the building of a scientific identity as well as discipline communities and role models of senior researchers. As a result, there is a more or less shared idea of a dominant normative occupational identity: an image of the “right” scientist. In my presentation I focus on who early career researchers picture when asked to imagine the “right scientist.” I also analyse the link between such an image and their ambitions regarding a scientific career and their potential decision to leave the academic path. The questions I want to focus on are: Are there any disciplinary differences in the image of a “right” scientist? What does the particular image mean for the future development of individual disciplines? The presentation builds on the analysis of in-depth interviews with 1) people at the position of postgraduate student and postdoc in the Czech Republic and 2) Czech people who have left their

academic path in the last five years from the position of postgraduate student and postdoc. The analysis is part of my dissertation project aimed at the attrition from science.

RN24 | Session 05a Scientific Careers and Practices III

Research Misconduct: Causes and Impact for Science and Society

Georgia Koumoundourou, Ioannis Tsaousis, Vasiliki Petousi

University of Crete, Greece; University of Crete, Greece; University of Crete, Greece

gkoumoundourou(at)gmail.com, tsaousis(at)uoc.gr, petousiv(at)uoc.gr

All sciences are anticipated to provide accurate statements about the world we live in. Consequently, researchers are expected to practice research responsibly. Unfortunately, this is not always the case. For more than 25 years, policy makers and the research community have been continually debating on how to name, study and deal with research behaviours, deviating from responsible conduct of research. Research Misconduct (RM) has undoubtedly been proved to be harmful not only to science itself or research community, but also to the society. Putting all theoretical frameworks and research findings together with their limitations and literature gaps identified, the goal of the present study was to provide, using an international and interdisciplinary sample of researchers employed in both the academia and industry, an updated estimation of their perceived severity, their perceived prevalence and their actual involvement in an extended list of research practices deviating from research integrity. Additionally, the study aimed at identifying researchers’ reactions when faced with RM in their working environment, the potential causes (both individual and situational) of the phenomenon, and the perceived impact accompanying RM. Data were collected via an online survey questionnaire developed for the purposes of this study and analyzed using both descriptive and inferential statistics. Preliminary results will be presented and theoretical as well as practical implications for both, science and society, will be discussed.

This research is part of the HORIZON2020 funded program DEFORM: Determine the global and financial impact of research misconduct. Project ID: 710246.

Scientists’ practices, narratives and discourses on research integrity and research misconduct. An international and interdisciplinary perspective.

Eirini Sifaki, Vasiliki Petousi

Hellenic Open University, Greece; University of Crete, Greece; University of Crete, Greece

eirini_sifaki(at)yahoo.gr, petousiv(at)uoc.gr

Research misconduct, its extent, characteristics, causes and consequences for individuals, society and mainly social cohesion and stability constitute ‘grand

challenges' for European institutions, policy making and funding. Arguably, definitions, estimates and policies against misconduct reflect fundamentally different beliefs about the incidence of misconduct, its causes, and its implications for science and society. Although a rapidly increasing volume of research addresses the phenomenon, limited attention is given in the ways scientists themselves understand, interpret and assess research misconduct. Given the importance of scholarly publications for the endeavor of science, and in order to fill this gap in the literature, in this presentation we examine the content of scientific discourse on research misconduct and research integrity in scholarly publications. An historical overview of the formation and the configuration of the current discourse on research misconduct and research integrity will be presented through the analysis of a number of publications retrieved from PubMed, Scopus, and WOS. Our research shows that the narratives on scientific misconduct focus on practices, discourses and perceptions of scientific conduct that are deeply influenced by practices of work, trust, modes of analysis, and methods of interpretation, values, and institutional arrangements. Furthermore, researchers' proposed responses to these societal, institutional and scientific challenges and the ways to deal with research misconduct and promote research integrity are examined. Findings are linked to institutional, structural and systemic changes on the ways research is performed in the 21st century. The research is part of the HORIZON2020 funded research program DEFORM: Determine the global and financial impact of research misconduct. Project ID: 710 246

Mainstream and heterodox economics as contested styles of scientific reasoning

Anders Hylmö
Lund University, Sweden
anders.hylmo(at)soc.lu.se

In the aftermath of the 2008 financial crisis, a new wave of critique of mainstream economics has emerged. This has been coupled with a growing interest in heterodox economics, which has become a widely used umbrella term for alternative approaches to economics during the last few decades. This paper investigates the historically enduring division of the field of economics between the dominant mainstream and heterodox economics using the concept of styles of scientific reasoning, derived from work in the history of science. The paper draws on two sources. First, a literature study of recent debates among heterodox economists and historians of economic thought about the contested nature of mainstream neoclassical and heterodox economics. Secondly, the literature study is combined with the findings from 20 recent in-depth interviews with Swedish researchers in economics. The division between mainstream and heterodox economics is shown to be grounded in both methodological and substantive theoretical commitments and dispositions that form relatively enduring intellectual styles that seems to persist

despite some recent diversification within the discipline. Ian Hacking's notion of distinct styles of reasoning in the history of science, appearing as historically enduring conceptions of ways of doing science, each with their own set of ontological and methodological presuppositions and prescriptions, has been used in previous research to shed light on modelling practices in modern economics. I argue that the styles concept may also be fruitfully employed to understand the enduring intellectual divisions between orthodoxy and heterodoxy in modern economics.

Scientists' views in the quandary of animal experimentation

Fabienne Crettaz von Roten
University of Lausanne, Switzerland
Fabienne.CrettazvonRoten(at)unil.ch

The European Directive 2010/63/EU on the protection of animals used for scientific purposes leaves national authorities with the delicate task to implement and apply it. This directive, not regulation, provided flexibility for member states, which was sound in view of the turbulent history of animal experimentation in some countries like Switzerland.

This presentation aims, first, to provide a socio-historical analysis of animal experimentation in Switzerland since the 1950's, in terms of science, science policy and society. This analysis highlights two new constraints for scientists conducting animal experimentation: to be accredited through a course and to apply the 3Rs principles. The course is mandatory and the 3Rs applied since the end of the 90's, but little is known about how scientists cope with that. We therefore sent a survey to 4 cohorts of participants of the course and 510 scientists answered it (48% of response rate).

This study falls within the sociology of science that focuses mainly on the production of scientific knowledge: How are the cultural norms and the practice of science production taught and learned by scientists? How does scientific institution react to societal concerns and demands? How do scientists cope with changes decided by scientific institution?

The results showed that participants fully agreed with and appreciated the course. The use of live animals during the course was supported and explained by six arguments that invoke cognitive, emotional and foresight-enabling factors. A wide majority considered that the 3Rs principles were adequately applied during the course, but some elements could be improved. Finally, analyses reveal differentiated answers when considering subpopulations in our sample (for example, scientists trained in biology, participants from Asian countries).

RN24 | Session 06a Science and the Public**Public opinion on the role of science in Ukraine**

Tetyana Petrushyna

Institute of Sociology of NAS of Ukraine, Ukraine
tanya.petrushina(at)gmail.com

EU countries constantly monitor public opinion on various issues of science within a special Eurobarometer project to ensure effective dialogue between science and society. Considering that Ukraine has never taken part in such survey, the Institute of Sociology of NAS of Ukraine has started to monitor public opinion about national science since 2014.

Collective consciousness reflects objective deterioration in the sphere of science. Negative assessments of state of science in Ukraine dominate in public perception, especially compared with the world level of science. The role of science in modernization of Ukrainian society is perceived mainly as insignificant. However, the level of people's trust in Ukrainian scientists remains the highest among the major social institutions.

While the contemporary state and business have no interest in developing of science in Ukraine, there is a public demand for the development of national science. According to the monitoring study conducted in 2016, 79% of Ukrainian respondents said that society cannot exist without science. The majority of population (74%) consider that the development of the Ukrainian state and economy is impossible without the development of national science. Moreover, every third respondent has a strong opinion that government primarily should take into account recommendations of Ukrainian scientists while working on the Development program for Ukraine.

We also studied general interest of the Ukrainian citizens to the world of science and their attitude to scientist career choice.

Communicating research. A study on the role of researchers in the public space of communication

Giuseppe Pellegrini, Andrea Rubin

University of Padova, Italy; Catholic University of Milan, Italy

giuseppe.pellegrini(at)unipd.it, andrea.rubin(at)libero.it

Research on Public Communication of Science and Technology (PCST) has been focused on non-experts and mediators so far. The role of scientists as communicators has not been extensively explored yet although most of them are involved in communicative practices.

To address this issue we have developed a study aimed to evaluate the researcher communication strategies in a public event. The analysis was carried out as part of SHARPER (SHaring Researcher's Passions for Excellence and Results), an Italian project developed on the framework of the Marie Slodowska Curie Action European Researcher's Night.

During these events, from 2014 to 2016, information

about researcher expectation, preparation and communication strategies were collected. Moreover were recorded information on the event organization, management and development. All the outcomes were collected using ethnographic observation, a type of qualitative research method that combines immersive observation and directed one-on-one interviews.

The results of the study showed several communication strategies that can be combined based on the researchers skill to adopt different communication styles and instruments. Main findings underline different approach regarding the contexts, the formats and the contents of the speeches. These dimensions were used to design a typology that show when the researchers are or not in tune with the audience shading a light on common communication gap.

Overall the outcomes of this work bring knowledge in the Public Communication of Science and Technology field.

Affected for good or evil: Conceptions of "citizenship" and "publics" shaped by crime management technologies

Nina Amelung, Helena Machado

CES Coimbra, Portugal; CES Coimbra, Portugal

ninaamelung(at)ces.uc.pt,

helenamachado(at)ces.uc.pt

More recently crime control regimes have become enforced with the technological systems for exchanging forensic DNA-data across national databases in the European Union. How do such transnational regimes of crime management technologies affect the "public" - understanding the "public" in line with Dewey as including those "indirectly and seriously affected for good or evil"? In this paper we address the question by exploring the conceptions of "publics" of different stakeholders working and professionally accompanying the development of these systems of identification of "suspect populations". We begin our paper by discussing different notions of citizenship – biological, scientific and political citizenship – and their resonance in the literature of social studies of science and technology. Thereby we provide a search heuristic of diverse conceptions of the publics and factual and possible forms for public involvement. Based on interviews conducted at the UK and Poland we explore what "publics" are imagined in the context of an "old stager" and a "newcomer" in the domain of the uses of large computerized DNA-databases applied in criminal investigation. Finally, we discuss the identified shared underlying notions of citizenship and conceptions of the public rendered and naturalized by logics of the production of symbolic boundaries between the fields of science, criminal justice and the "general public", and their implications for democracy. Beyond commonalities we also identify national differences and specific civic epistemological conditions for the enactment of forms of public involvement.

Supporting the Paris Climate Consensus: disciplinary cultures of young scientists and their role in social engagement with complex and wicked climate change

Marija Brajdic Vukovic
University of Zagreb, Croatia
mbvukovic(at)gmail.com

Climate change is the defining 'wicked' challenge of our age, and the specific 'climate science' provides insufficient tools to meet this challenge once it has been acknowledged. In this paper we measure extent of agreement of young scientists with Paris Climate Consensus that climate change is primarily anthropogenic, globally challenging and generally universally detrimental, with respect to their disciplinary backgrounds as well as science communication attitudes and anthropocentric value base. Using multivariate analyses we find that engineering sciences (tech and bio tech) differ from the rest of the scientific disciplines and the general public of the same age, in support for the rationale behind climate change mitigation, anthropocentric values and public engagement with science. A specific disciplinary culture of disengagement may lead these otherwise instrumentally powerful biotech and technical sciences researchers to an underestimation of the global biophysical and social consequences of climate change, and insular application of their work to strengthen its contemporary drivers. We conclude by proposing integrating measures to break the cycle of disengagement, and join the technologies behind behaviour and experiences of citizens with understanding of different social contexts of climate policy.

RN24 | Session 07a Science, Technology & Education

Vocational Education and Training workers' role in Spanish industrial firms' innovation

Cristina Lavía, Beatriz Otero, Mikel Olazaran, Eneka Albizu
University of the Basque Country (UPV/EHU), Spain;
University of the Basque Country (UPV/EHU), Spain;
University of the Basque Country (UPV/EHU), Spain;
University of the Basque Country (UPV/EHU), Spain
cristina.lavia(at)ehu.eus, beatriz.otero(at)ehu.eus,
mikel.olazaran(at)ehu.eus, eneka.albizu(at)ehu.eus

This study is based on the concept of innovation as an interactive learning process. The interactive learning model argues the importance of incremental innovation and the role in that innovation of qualified workers, but so far attention has remained focused on scientific personnel that tends to characterise high-tech industries and scarcely any attention has been paid to the role of intermediary workers in innovation processes. This study is based on evidence from a survey of 1,142 Spanish industrial SMEs and examines the degree to which technicians and employees with a vocational education and training (VET) profile are represented in these firms and their

involvement in innovation activities. More specifically, it seeks to answer two questions: Are workers with VET qualifications involved in the companies' innovation processes? and Which are the specific variables that condition participation by intermediary staff in innovation? To achieve these objectives, a synthetic weighted index of participation in innovation was constructed. Considering this index as a dependent variable, the best representation of the relations detected with other explanatory variables was performed by a binary logistic regression controlling for the technological level of the companies. The results show that in low-tech sectors, the presence of VET personnel in technical posts, the existence of external cooperation in innovation, the innovative capacity of the company and a greater level of involvement of operators in organizational learning practices were found to multiply the probability of greater participation in innovation.

Communicating, educating and engaging young people in disaster risk: the role of scientists

Ana Delicado
Institute of Social Sciences, University of Lisbon,
Portugal
ana.delicado(at)ics.ulisboa.pt

Natural and technological risks are a subject matter for constant expert assessment, monitoring and mitigation. But part of the role of scientists working on risk is also to engage with the public on these issues. Disaster risk management relies increasingly on the involvement of communities, in order to identify capacities and to build resilience. Young people are a relevant part of the community, but who are mostly seen as targets of communication or education, rather than active participants in case of an emergency. But several cases have shown how they can make a difference in the prevention, preparation and response to disasters.

This presentation aims to discuss how scientists working in the fields of disaster risk are involved in communication, education or engagement activities aimed at young people, how they envision their roles and how they perceive young people's capacities and interests. In short, it purports to examine the encounters between experts and a particular part of the 'lay' public in the arenas of disaster risk reduction. The presentation is based on the project CUIDAR Cultures of Disaster Resilience amongst Children and Young People, a European project (funded by the Horizon 2020) that aims: (1) to understand children's experiences of disasters; the impact on their lives, their resilience and the longer-term recovery process; (2) To discover how children can best be supported in disasters and how to enhance their resilience to future emergencies; (3) To influence emergency policy and practice to better meet the needs and build the resilience of children and young people.

Social Context of Mathematics Education as a Source of Barriers in Science and Technology Perception.

Anna Baczko-Dombi
University of Warsaw, Poland
anna.baczko(at)gmail.com

The perception of mathematics in society seems to be based on stereotypes that “mathematicians” are opposed to “humanists”. In case of mathematical education we can observe a process of abandoning mathematics by a part of students who on quite early levels of education start to consider themselves as “humanists”. They start to feel anxiety toward mathematics that leads to serious decisions possibly narrowing down their further path of education and is recognized as a source of barriers in developing interest in the field of science and technology.

In my presentation I would like to refer to a selection of results of a study on Polish youth, parents and teachers. I will provide in-depth analysis of the social context of abandoning mathematics, with special emphasis on the role of support from parents and teachers. I am going to present considerations whether a student who has had problems with mathematics had got anybody whom he could ask for help. I will analyse both declarative and real resources of support. I would also like to address factors that expose children for risk of not receiving such help, which leads to a higher risk of “escape” from mathematics and, as a consequence, science and technology.

The Problem of Recognition in Academic Communities

Mikko Salmela
University of Helsinki, Finland
mikko.salmela(at)helsinki.fi

Researchers strive for collegial recognition as the highest reward of their scientific activity, partly because it is instrumental in achieving academic positions, but also because it affirms their social identities as researchers (Hagstrom, 1965; Bourdieu, 1988; Bloch, 2012). Yet researchers depend on each other in getting recognition. This is the case with both main forms of collegial recognition, institutional recognition that manifests as top publications, tenured positions, and research grants, and social recognition, non-institutional practices of gift exchange such as knowledge sharing (Berthoin Antal & Richebé 2009) in everyday scholarly interaction. I suggest that academic rivalry hampers the recognition-based motivation of scientific activity, having detrimental consequences on the quality of research as well. I distinguish between structurally and psychologically driven negative epistemic effects of rivalry. The former operate through the pressure to publish more than one’s rivals, resulting in lower quality of publications, disruption of the communitarian ideal of science, impoverished scope of research topics, and academic misconduct (Landes, Marchman & Nielsen 2012). The latter manifest as psychological consequences of

rejection, such as anxiety, anger, humiliation, shame, feelings of inferiority and loneliness as well as decreased creativity, productivity, and professional satisfaction; declined research collaboration; and abandonment of potentially fruitful but unappreciated lines of research (Day 2011). Finally, I identify a collective action problem that impairs the give-and-take of social recognition in conditions of academic rivalry, influencing researchers’ capacity to achieve institutional recognition as well. I propose collaborative research and publishing, both intra- and interdisciplinary, as means of alleviating this problem.

RN24 | Session 08a Science, Technology, Innovation & Society I

A New Innovation Logic With ICT Platforms

Bendik Bygstad
University of Oslo, Norway
bendikby(at)ifi.uio.no

It is hard to overstate the importance of digitalisation in the current transformation of the economic and social structures of Europe (Blau, 2015). Examples range from surveillance systems to the music industry to welfare technologies and social media. ICT solutions are usually monolithic systems from large companies.

Something interesting, however, has happened the past few years: the coming of platform ecosystems, built on the logic of two-sided markets (Parker et al., 2016). One important implication is that the monolithic structure of IT systems, breaking them up into segments (Bygstad, 2016):

- Heavyweight ICT: Platforms, containing large volumes of transactional data, such as financial data, e-health, social media
- Lightweight ICT: Mobile phone apps, tablets, Internet-of-Things

This has a special interest for sociologists, for two main reasons. First, sociologists should engage with the dramatic changes that digitalisation drives, and in particular focusing on transformations that goes beyond the company level (Weber and Rohrer, 2012). This means, they should engage in platform solutions, with the aim of making them as open as possible. For instance, medical data should not be owned by the hospitals but owned and maintained by citizens.

Second, the coming of lightweight ICT enables new forms of innovation. The most obvious example is the “app” revolution where small programs on handheld devices substitute heavyweight GUIs, for instance to get information on when the next bus is arriving. Another example is the use of commercially available sensors in health care. Lightweight innovation is a process well suited for bottom-up sociological research and innovation.

Which Culture Makes a Country Innovative? The Cross-National Patterns of Cultural Factors Fostering Innovativeness

Andrzej Wojciech Bukowski, Seweryn Rudnicki

Jagiellonian University, Poland; AGH University of Science and Technology
 contraAB(at)wp.pl, sew.rudnicki(at)gmail.com

This presentation examines the effects of culture on national innovation rates. Several competing measures of national innovation performance and data from up to 83 countries spanning more than the last two decades are employed to show what cultural environments foster innovativeness. The results question the dominant impact of the triad of high individualism, low power distance and low uncertainty avoidance. Instead, the role of long-term orientation, a factor omitted in the prior studies, turns out to be a positive, strong and the most robust cultural factor across different models. The results also show that the effects of individualism and other cultural factors are less robust, depending on the measure of innovativeness and the use of controls, and tend to change in time. The findings suggest the existence of two fundamental cultural environments fostering national innovativeness: one based upon traditionally Western values like individualism, and the other including certain types of collectivism and orientation for future rewards, that one can combine with European (Protestantism) as well as Far East (Confucianism) great cultural traditions. Generally, the results question universalistic interpretations and show culturally diverse ways to national innovation success.

The sociology of organisational innovation: an application to science-industry relations

Sandro Giachi, Manuel Fernández-Esquinas
 CSIC - Spanish National Research Council, Spain;
 CSIC - Spanish National Research Council, Spain
 sgiachi(at)iesac.csic.es, mfernandez(at)iesac.csic.es

This research aims to contribute to the sociological debate about organisational innovation, bringing evidence from the field of science and technology studies. Studies from the sociology of organisational innovation proposed that the generation of technological innovation from R&D is facilitated by a complex division of techno-scientific labour and the employment of a heterogeneous workforce. This set of characteristics fits quite well with the new generation of science-industry research centres that is emerging within the European research system. They are inter-organisational structures for collaborative research that agglutinate workers from different sectors within a flexible environment. So, they encompass a strategic locus for studying organisational innovation in the science and technology field. We perform a multivariate analysis using an original dataset about a country-level sample of cross-sector research centres existing in Spain. Our findings show that science-industry research centres are not so innovative as expected, because of their capacity as knowledge transfer mechanism is limited, especially if compared with their research capabilities. By contrast, we identify three types of cross-sector research centres according to the professional composition of their

workforce, a measure of the diversity of knowledge and skills existing within the organisation. We match each type with a specific institutional logic: scientific, industrial, or hybrid. Centres with a mixed professional composition (a hybrid logic) are the most innovative. Therefore, our findings suggest that the presence of organisational complexity due to the hybridisation between the scientific logic and the industrial logic fosters research outcomes more likely to be converted into technological applications and, ultimately, organisational innovation.

RN24 | Session 09a Science, Technology, Innovation & Society II

Unmaking and remaking Europe through design: what role for sociology?

Mariacristina Sciannamblo, Maurizio Teli, Chiara Bassetti
 Madeira Interactive Technologies Institute, Portugal;
 Madeira Interactive Technologies Institute, Portugal;
 University of Trento
 cristina.sciannamblo(at)m-iti.org, maurizio.teli(at)m-iti.org, chiara.bassetti(at)unitn.it

How can technology design provide a contribution to the unmaking and remaking of Europe through the promotion of counter cultures and alternative economic models? How can the collaborative design of new technology unmake neoliberal Europe? What can be the role of social research in that?

We would like to attend these questions by discussing the sociotechnical implications of an interdisciplinary European action research project, 'PIE News', aimed at designing and implementing a digital platform, Commonfare.net. The platform will allow people and social groups that are at risk of poverty or social exclusion to be informed and to inform through storytelling about available welfare measures and grassroots initiatives, and to find support in networking activities able to bring value to their life. The overarching ambition is fostering the emergence of the Commonfare, a form of welfare based on grassroots initiatives and equitable democracy, promoting social solidarity.

Our presentation focuses on the role of sociology in the interdisciplinary work that characterizes the project design approach, that is public design, a sociologically-inspired effort to create a technological infrastructure as a site of political potential, thereby openly challenging the extractive models of contemporary digital platforms. In particular, we will show how, in the considered case, social theory acts as a way to identify relevant sociological and societal problems, and how social research methods can support people to express desires, to share knowledge and counter-narratives, and to co-construct opportunities for change.

The Dilemma of Intimacy and Surveillance Practices

Tuççe Zeynep Abalı Akgül
Adnan Menderes University, Turkey
tugcezeynepabali(at)gmail.com

Throughout the 20th century, we witnessed so many technological developments and the most important ones were the invention of computer and the Internet, which affected societies in many ways. As is seen in Turkey, states adopt these technologies to their governance practices for the last two decades.

We can see e-government applications of states related to the progress of information technology. When the available literature is examined it can be seen that many studies regarding e-government applications have been carried out. The current literature refers e-government as a way of transparent, quick, easy, equal state service as well as a tool of strict governance, surveillance, violent intimacy and violent personal liberties despite secrecy law. Turkey started e-government project in 2004. From this date forward e-government applications have been carried out for all the institutions of state and some private sectors. One of the institutions is public health service. Considerable number of health data collected via Family Health-Care Information System. Accordingly this research, examines Family Health-Care System, which is highly related to intimacy and personal liberty of individuals. It is also aims to understand the surveillance behind it and to know how family practitioners have been forced to take information from their consultants and how health records serve for the big data. This study will be the only one concerning the Family Health-Care Information System with a sociological point of view. It will be a qualitative research including the views of family consultants who work in Aydin/Turkey.

Virtual Bodies and Sport Activities: The case of the Avatars in Second Life Fitness Club

Nikolaos Patsantaras, Irene Kamberidou
National and Kapodistrian University of Athens, Greece; National and Kapodistrian University of Athens, Greece
npatsant(at)phed.uoa.gr, ikamper(at)phed.uoa.gr

Virtual environments (VE) are virtual social spaces that provide powerful means for creating, activating and modifying virtual bodies—Avatars—without dependencies on biological factors, formal rules and explicit conventions. VE offer unlimited possibilities to create the desired body and express personal bodily preference in virtual sport spaces without restrictions regarding established roles and behavioural expectations. Such a VE is Second Life (SL) in which the user is represented by an Avatar. This study focuses on a virtual sport space: the Fitness Club of Second Life. It examines the rules and regulations of this virtual space along with the role of 26 Avatars as bodily representations, including their bodily behaviours-exercises-practices in the SL Fitness Club.

The data for this study was selected through systematic observation of 26 Avatars (apx. 180 hours) during March, April and May 2015, followed by detailed descriptions of single phenomena. Regarding the structure of space and bodily behavior, the results indicate less differences between sport virtual spaces and sport physical spaces, the opposite of what we had originally assumed. According to the results, the Avatar Fitness Club appears to be a highly individualistic and narcissistic environment. Moreover, every user can perform his/her bodily activities in a rather liberating way, occasionally surpassing biological limitations. When the Avatars exercise they imitate the movements of the physical sport world, namely they mimic the physical body. Further studies are needed to show the influence of an Avatar's performance-bodily exercises on the real user, the individual behind the computer screen.

RN24 | Session 10a Energy, Climate Change & Sustainability

From sustainable to smart cities: re-branding or re-assembling urban energy infrastructure?

Harald Rohracher, Darcy Parks
Linköping University, Sweden; Linköping University, Sweden
harald.rohracher(at)liu.se, darcy.parks(at)liu.se

Visions and programmes of sustainable or green cities are increasingly being substituted by ambitions to become a 'smart city'. The question of how this discursive 'shift to smart' has unfolded and how it has reshaped urban sustainability programmes has been hardly investigated so far. In our paper, we are interested in how this transformation from sustainable to smart cities took place and to which extent it led to a re-assembly of socio-material practices of urban development. We want to identify both continuities and disruptions in this transformation and ask to which extent it reconfigures transition paths towards more sustainable cities. To which extent does the shift from sustainable to smart city goals just lead to a re-branding and re-packaging of existing projects and goals? Did the character of urban interventions change as the result of new actor constellations? Was this shift accompanied by controversies and conflicts? Our key interest is to find out how the 'shift to smart' reshaped sustainability goals and practices. In this context we ask: Does environmental sustainability become framed differently in smart city initiatives? Do smart city visions influence how sustainability is enacted in these cities?

We will investigate these questions based on case studies of two middle-sized cities: the Swedish city of Malmö and the Austrian city of Graz. The 'shift to smart' foregrounds and backgrounds different types of projects and seems to result in an eventual reframing of sustainability projects. Despite this short-term continuity it is thus not unlikely that the re-framing of sustainable into smart cities will in the long-term result in a reshaping of pathways of urban change.

Trust in science and the credibility of information sources: an experimental approach on climate change

Luis Sanz-Menendez, Laura Cruz-Castro
CSIC_IPP- Consejo Superior de Investigaciones Cientificas, Spain; CSIC_IPP- Consejo Superior de Investigaciones Cientificas, Spain
Luis.Sanz(at)csic.es, Laura.Cruz(at)csic.es

There is evidence that citizens generally distrust governments. Some researchers suggest that the credibility crisis is a symptom of a general decline in trust in other people and in all kinds of institutions. There are also increasing concerns about the trust in science and the credibility of scientific institutions and scientific results. Traditionally both issues, the credibility in government and other social agents and the confidence in science, have been addressed independently.

In this paper we aim to address the following research questions: Do citizens find scientific information from government sources credible? do they trust other sources more? Do citizens believe some social actors more than others as providers of scientific information?

To address these questions, we have designed an experiment to test the credibility of scientific information reported about the evolution of CO2 emissions provided by five different institutional sources (the Spanish Government, the United Nations-IPCC, Greenpeace, an Industrial Manufacturing Association and a consortium of Public Research Organizations) to the Spanish public.

More precisely, we have taken a population-based survey experiments approach, in which experimental subjects are randomly assigned to conditions by the researcher, and treatments are administered as in any other experiment. The information comes from a survey implemented in Spain and administered to almost 7000 citizens, with the five different treatments (the source of information) randomly allocated to subsamples.

Results will be presented about the extent to which citizens believe the reported scientific information by different sources extent to which there are significant differences. Findings could provide insights about whether citizens find scientific information more or less credible depending on the institutional source.

Central and Eastern European social science journals on an academic semiperiphery

Nikola Petrović, Maja Jokić, Stjepan Mateljan, Boris Stamenić
Institute for Social Research in Zagreb, Croatia;
Institute for Social Research in Zagreb, Croatia;
Institute for Social Research in Zagreb, Croatia;
Institute for Social Research in Zagreb, Croatia
nikola(at)idi.hr, maja(at)idi.hr, smateljan(at)idi.hr, stamenic(at)idi.hr

Similar to its economy CEE science finds itself on a semiperiphery, with occasional breakthroughs towards

the core of global science. We analyse CEE journals as one of the main carriers of academic reputation of this region. In contrast to leading Western social science journals that are predominantly published by major publishing houses (Larivière, Haustein and Mongeon, 2015), leading journals in post-socialist Central and Eastern Europe are mostly published by national academic institutions.

This paper presents results of the quantitative and qualitative analysis of social science journals indexed in Scopus and based in one of the 15 European post-socialist countries (Croatia, Estonia, Latvia, Lithuania, Poland, Czechia, Slovakia, Hungary, Romania, Bulgaria, Slovenia, Bosnia and Herzegovina, Serbia, Montenegro and Macedonia). The classification of these journals based on their disciplinary orientation and type of publisher is presented and compared with the classification of social science journals from these countries that are indexed in Ulrichsweb. Semi-structured interviews with current or former editors-in-chief of social science journals indexed in Scopus are used in order to place them within a broader social and scientific context.

We investigate how these journals attempt to achieve a more prominent role in the highly competitive world of scientific journals and why they fail or succeed. Opinions of journal editors show that there are different stances towards the privatisation of journal publishing and reactions to these processes. Social science journals' missions, orientations and survival strategies are categorised and compared. Also these journals forge different transnational networks within but also outside the European research area.

RN24 | Session 11a Information Technologies and Society

(Un)Making Europe in the Context of Search Engine Policy

Astrid Mager
Austrian Academy of Sciences, Austria
astrid.mager(at)oeaw.ac.at

This article discusses the co-production of search technology and a European identity in the context of the EU data protection reform. The negotiations of the EU data protection legislation ran from 2012 until 2015 and resulted in a unified data protection legislation directly binding for all European member states. I employ a discourse analysis to examine EU policy documents and Austrian media materials related to the reform process. Using the concept 'sociotechnical imaginary', I show how a European imaginary of search engines is forming in the EU policy domain, how a European identity is constructed in the envisioned politics of control, and how national specificities contribute to the making and unmaking of a European identity. I discuss the roles that national technopolitical identities play in shaping both search technology and Europe, taking as an example Austria, a small country with a long history in data protection and a tradition of restrained technology politics.

Bottom-up digital innovation for social innovation: Investigating citizens' involvement in ICT development to tackle social issues

Davide Dusi

Ghent University, Belgium

davide.dusi(at)ugent.be

Recent technological developments and emerging socio-technical arrangements fostered the change of users' role from passive to active participants in the development of Information and Communication Technologies (ICTs). This shift harbors promises for social progress through technological development and power reconfiguration through participation. Recently, citizens' participation in the design and development of ICTs is increasingly deployed as a means to tackle social issues and a practical technique of empowerment.

This contribution aims to describe the socio-technical arrangements characterizing processes of citizens' involvement in technology development for social innovation and to clarify the role assigned to or played by them in these practices. It draws on the analysis of a project of citizens' engagement in the design and development of digital solutions to tackle the issue of unemployment in Belgium. Participants were asked to engage in idea-generation activities, transform the generated ideas into digital prototypes, and develop the prototypes into functioning digital tools. Data were collected through ethnographic research methods. Findings resulted from their triangulation.

The analysis of the aforementioned project unveils the limits of citizens' involvement in participatory practices of ICT development for social innovation. Through the production of participatory subjects, such practices can characterize themselves as technologies of government whereby hierarchies and power asymmetries are reproduced. Rather than empowerment, they seem to favor the exploitation of participants' work and the harvesting of their knowledge. Consequently, greater attention to their design and to the alignment of all the involved heterogeneous actors to favor actual empowering processes seems desirable.

The Coming of Digital Singularity – a Silent Moral Panic

Karol Kaczorowski, Mateusz Trochymiak

University of Warsaw, Poland; University of Warsaw, Poland

k.kaczorowski(at)uw.edu.pl,

trochymiak.m(at)gmail.com

The main purpose of our speech is to present the hypothetical (that may soon become real, however) emergence of a technological singularity which is – according to Vernor Vinge – “a hypothetical point in the future development of civilization in which technological progress becomes so rapid that that it will render all human predictions obsolete”. This may come about in three ways: (1) Large computer networks (and their associated users) may “wake up” as a superhumanly intelligent entity.(2)

Computer/human interfaces may become so intimate that users may reasonably be considered superhumanly intelligent. (3) Biological science may find ways to improve upon the natural human intellect. We would like to discuss the first two issues, but take a more “subtle” approach. Our main focus will be on making predictions concerning the emergence of super-intelligent artificial intelligence and the consequences that this may have for the labor market, demography, human relationships and other areas of social life. In recent years, we have been witnessing a transfer of private data of individuals and groups to the virtual space on an unprecedented scale. But are users of electronic devices and the Internet ready for the emergence of an independent, autonomous, virtual partner (in the form of an AI), whose role over time can become unpredictable? What concerns does society voice about this? How do these concerns differ depending on geography, demography and economy? Our speech will be an attempt to answer all of the above questions.

(De-)Constructing Cloud-based smartphone applications. Implications for privacy, surveillance, and its interdisciplinary research

sascha.zantis(at)rwth-aachen.de

Cloud Computing (CC) describes access to computing services as ubiquitous pools of scalable, rapidly provisioned resources. Significant everyday-communication is realized via CC – especially when considering the ubiquity of smartphone usage: only cloud infrastructures provide smartphones and their applications (“apps”) with full functionality, e.g. overcoming smartphones' limited computing, storage, and power resources.

But cloud-based apps lead to severe privacy concerns deeply rooted in increased information asymmetry between smartphone users, service providers, and application developers: although users decide which apps they use, they neither have knowledge nor control over the use of cloud services by these apps. Furthermore, since most CC providers are located outside users' own legislation, contracts and other legislative measures only have a very limited reach of binding applicability. To overcome these concerns and allow users to properly assess risks of cloud usage, our approach analyzes network traffic of smartphone apps with the goal to detect and uncover cloud usage. Resulting information is presented to the user and put into context through anonymous comparison with her peer groups (“comparison-based privacy”). By doing so, the project aims at enabling smartphone app users to make an informed decision on suitable means for a

more sufficient, self-determined data protection. Moreover, the label of informational self-determination is expounded in this context, so that our research does not give an undue impression of safe use. Finally, our contribution sheds light on difficulties between such an ICT project and its ethical dimensions: i.e., the dichotomy of individual self-determination as opposed to the project's "dual-use" characteristics through all-encompassing surveillance by ubiquity, scalability, and personalization. Accordingly, we critically discuss our interdisciplinary, stakeholder-oriented conceptualization and its context-aware and reflective design

RN25 - Social Movements

RN25 | Session 01a General Session A

Following participants after demonstrations: The evolution of their motives for participating

José Manuel Sabucedo, Cristina Gomez-Roman,
 Lourdes Mirón
 University of Santiago de Compostela, Spain;
 University of Santiago de Compostela, Spain;
 University of Santiago de Compostela, Spain
 josemanuel.sabucedo(at)usc.es,
 cristina.gomez(at)usc.es,
 marialourdes.miron(at)usc.es

Social movement studies tend to investigate participants intentions to demonstrate, their past participation or their reasons to attend a particular protest. In this study we want to go a step further and study how their motives suffer changes (if they do) after the mobilization takes place. Recent studies show that those who participate develop psychological well being after participation, so we want to find out if this is true, and how this affects future participation.

For doing so we interviewed participants of a Union demonstration (n=185). We measure traditional variables of collective action (collective action frames, perceptions and attitudes towards political system, moral obligation and emotions). In this first step we found that there are two types of participants depending on their intensity of participation: occasionals and regulars, who also differ in their reasons for mobilization. The next step is, months after the protest, contact participants to measure again these motives and also their psychological and social well being.

We expect to confirm that those participants who participate regularly will score higher in psychological and social well being, as well as will keep their motivations intact, which will make them more willing to participate in future demonstrations. Occasional participants, who keep their motivations and psychosocial well being in similar levels as regulars, will be also motivated for future mobilizations, whereas those who experience a decrease will withdraw their commitment.

This study contributes to the literature giving understanding on what lead participants to become regulars and keep up with their commitment.

The role of moral obligation and other psychosocial variables on protest participation intention.

The main goal of this study is to analyze the predictive strength of moral obligation and other psychosocial variables on the intention to participate in future acts of protests. In order to so, a random sample was gathered in the so called "dignity marches". Sample was composed of 640 protesters and 563 non-protesters. Three groups were formed based on participation intention: protesters with high intention of future participation, non-protesters with high intention of future participation and non-protesters with low intention of future participation.

The data analysis consisted in a logistic regression, with the aim of find out which variables better predict intention to participate within both protesters and non-protesters. An ANOVA analysis was also performed to examine the differences in the intention to participate between the three groups.

The variables that better tell apart those with high intention of future participation from those with low intentions of future participation are: moral obligation, injustice, identification, past activism and positive emotions. As expected the factor ANOVA shows more significant differences between the group of protesters and the group of non-protesters with low intention of future participation, than between protesters and high intention non-protesters. These last two groups only show significant differences in two variables: moral obligation and past activism (the protester group scoring higher in both them).

Given moral obligation's predictive strength and its potential as a differentiator between groups with different levels of participation intention, its role in activism prediction is analyzed.

Gezi Movement's Collective Identity and Social Networking Sites in the Gezi Movement's Construction of Collective Identity

Duygu Karatas
 University of Westminster, United Kingdom
 w1449472(at)my.westminster.ac.uk

Employing the analytical collective identity concept of Melucci, the research will examine the construction of collective identity in Gezi protests and the role of social networking sites in this process through three years after the birth of Gezi.

In recent social movements, communication linking both of the spaces has formed a hybrid of communication forms including digital and face to face interaction, on the grounds of interpersonal interaction, social networking and content sharing. Also, the emergence of SNS have presented new dynamics and challenges for interactions, self-representation, personal expression and alternative media.

The construction of collective identity is of crucial importance to the formation of the solidarity and maintenance of the movements over time. There is also an empirical gap in the literature that investigates the process of collective identity construction in the latent phase of movements. This research will shed light on the formation of the solidarity between diverse actors taking part in the protest and changing conceptions on different identities and democracy, attitudes in media consumption, as well as the connections, interactions, negotiations and expressions taking part in the process, on both online and offline spheres, in both visible and latent phase of Gezi protests. The study tries to combine social movements, communication and identity concept.

A multi-methodological approach will be adopted through an ethnographic analysis of Twitter accounts of the activists, to be combined with qualitative in-depth interviews. The research identifies the most relevant actors, namely the Twitter users engaged with the collective identity of Gezi, through the analysis of hastagged communication based on influence and activity measures.

Key Words:

Collective identity, social movements, Gezi protests, communication, social networking sites, social media

The 2013/14 EuroMaidan protest movement in Ukraine and active engagement in civic organizations

Tetiana Liubyva, Tetyana Nikitina

Institute of Sociology of National Academy of Sciences of Ukraine, Ukraine; TV channel "Ukrayina" ("Ukraine")

tlubivaya(at)gmail.com, nikitina_tania(at)ukr.net

One prominent debate concerning Social Movements is that about their impact on active engagement in civic organizations and, consequently, on Social Capital development (Inglehart, 1997; Inglehart and Welzel, 2006; Putnam, 2004).

Ukrainian statistics show that engagement into civic organizations decreased significantly during the Yanukovich presidency (2010-2014) to sharply rise again during and after the so called EuroMaidan Revolution, reaching an historical high of 18% engagement amongst people 18 y.o. and older in 2016.

Drawing data from the national-wide survey Ukrainian Society, carried out by the Institute of Sociology of National Academy of Sciences of Ukraine since 1992, we have observed that key characteristics of those who declared having participated in the EuroMaidan in 2014 and 2015 are strikingly similar to those who declare belonging to a civic organization.

Active participants in EuroMaidan and civic organizations have bigger locus control, they are more interested in politics and have clear political orientation, they are more satisfied with their life, they are more willing to protests if their rights and interests are violated, and their feelings towards their own future and future of Ukraine are more positive when compared to those not engaged into civic

organizations or not having participated in the EuroMaidan movement.

EuroMaidan movement may not have consolidated by creating its own organization or bureaucracy but may have played a decisive role in promoting individuals to engage more actively in their local communities.

Such results, consistent with those from Stepanenko (2015), may be interpreted as evidence in favour of Inglehart's approach, according to which Social Movements enhance active engagement in civic organizations, improving the national stock of Social Capital.

How to change the world when you are depressed: Social activism in the post-Gezi period in Turkey

esin ileri

EHESS

esinileri(at)gmail.com

Activists engage in the construction of their self (subjectivation) as they become actors. The process of subjectivation goes along with a certain degree of inter-subjectivity: meeting other persons in the frame of movements, and transforming oneself through the encounter with the other but also through the experience of the movement. Nevertheless, in the context of an authoritarian-state we are confronted to a rapid shift of daily priorities: in the one hand there are protests and gatherings scheduled in advance, and on the other hand urgent calls are continuously made (like the case of recent post-coup purge against academics). After the Gezi movement, seen by activists as a source of hope, to be confronted to this flow of changing priorities generates a certain degree of powerlessness that often that pairs with despair and inability to act. Based on my PhD fieldwork (31 in-depth interviews with and two focus-groups), this article explores how Gezi Park activists, coming from various backgrounds, constructed themselves as subjects (an individual who takes himself as a principle of meaning) and actors within the Gezi movement and then delves into different facets of the post-movement depression (for example anguish, despair, trauma, polarization or responsibility) and at last, focuses on how the latter affects the present of social activism in Turkey and prefiguration of activists for the future.

RN25 | Session 01b General Session B

'Unpacking the virtuous circle: aggrieved protesters, eventful protests or both at the same time?'

Martin Portos Garcia

European University Institute, Spain

martin892002(at)hotmail.com

Spain was among the most heavily hit countries by the Great Recession. Focusing on the micro-level of analysis, this article sheds light on the multi-directional relationship between grievances and protest participation in times of austerity. It uses data from four waves of a unique online panel survey conducted

with Spanish respondents in 2010-2012.

On the one hand, I find that the political and socioeconomic attitudinal dimensions mediate the effect of objective-material indicators of grievances on individual protest participation. Some specific groups, relative losers of the recession (e.g. those on a mortgage, public workers plus their household members) are more likely to protest. While the worse-off and the underprivileged (in terms of income, job status, etc.) are not more likely to protest, individual hardship affects egotropic perceptions of the economy (i.e. individual financial well-being), which boost sociotropic views of the economy (i.e. perceptions on the general economic performance). The latter influence government/opposition approval, which ultimately determine protest engagement. On the other hand, participating in protests affects political attitudes, which feed back onto sociotropic grievances. In turn, these have an impact on egocentric values, thus shaping mobilisation potentials.

In a nutshell, this contribution argues—and provides empirical evidence—for a multi-directional, complex, and dynamic understanding of the causal association between grievances and protest behaviour. By tackling the issue of reverse causality between attitudinal grievances and protest participation, I have found not only that a nuanced view of grievance theories help account for individual-level mobilisation in a context of material deprivation, but also protest performances have an eventful character, shaping further contentious processes.

Recurrent Mass Protest in Post-Collapse Iceland

Jón Gunnar Bernburg
University of Iceland, Iceland
bernburg(at)hi.is

The global protest wave associated with the Great Recession presents opportunities to study how social crisis spur mass contention, particularly in affluent, democratic societies. The present case study focuses on the major processes underlying recurrent mass protest in post-collapse Iceland. Iceland was the early riser in the global protest wave. Icelanders were first to respond to the Great Recession with popular protest; after the collapse of their banking system in 2008, they have twice brought down leading government players by means of mass protest demonstrations. Using mixed methods (interviews, discourse analysis, surveys, and police data), I study the dynamics of mobilization work and public participation in two major protest campaigns in post-collapse Iceland: 1) the “Pots and Pans Revolution” in 2008-2009, and 2) the “Panama Leak Protests” in 2016. Both campaigns were “successful”, in that they led to early elections, but their trajectories differed. The earlier campaign emerged despite the absence of prior protest; a social crisis produced “breakdown-opportunity” that was conducive to repeated cycles of effective “agency-framing” and growing participation, ending with success. The latter campaign, emerging in a time of growing prosperity, followed a different

trajectory; a political scandal ignited a pre-existing protest frame and widespread perceptions of “critical mass”, spurring spontaneous mass protest with minimal agency-framing. Furthermore, the work reveals significant changes in the “biographical profile” of protesters across the two campaigns. Thus, low income, corruption beliefs, and leftist attitudes influence participation more in the latter campaign. That protest in post-collapse Iceland has become class-based and more ideological likely reflect the narrowing of protest frame since the crisis. .

Let's Talk First: Learning to Oppose Austerity

Dan Mercea
City, University of London, United Kingdom
dan.mercea.1(at)city.ac.uk

The paper examines the UK-based movement People's Assembly against Austerity. It probes the degree to which critical reflections on UK political institutions expressed on social media outlets connected to the movement contributed to building bridges among disparate social groups affected by austerity politics and to enabling their joint collective action. Of the recent anti-austerity protests, numerous have been accompanied by vibrant activity on social media. Rather than to propose yet another examination of participant mobilisation on social media, this project aims to shed light on the process of movement social learning among its Twitter following and the degree to which it fosters renewed solidarity in response to austerity politics.

The paper has the following objectives. First, it ascertains the extent to which social learning transpired as commentary on democratic institutions and, secondly, as talk about collective action directed at those institutions. We envisaged that although the incidence of these two types of civic information may vary, they would be intertextually interconnected. Consequently, the analysis of democratic institutions would feed into and inform talk about collective action. Thirdly, we examine the juxtaposition of enduring trade union and episodic anti-austerity activism. We expected to find indications of cooperation among similar organisations (e.g. trade unions) congregating under the umbrella of the People's Assembly. The analysis was run with a combination of network, semantic network and discourse analysis. Our results suggest movement social learning transpired in the communication of substantive issues, organisation and strategy that together contributed to the articulation of an organisationally diverse in-group.

Blue Danube Waltz against the System: Shifting Master Frames in Hungarian Environmental Movements

Szabina Kerényi
Hungarian Academy of Sciences, Hungary
szabina.kerenyi(at)gmail.com

My paper is partly based on the research conducted within the international H2020 project COURAGE – Cultural Heritage of Dissent in the Former Socialist

Countries, which aims to explore opposition culture under the authoritarian regimes in the Eastern block. In the paper I would like to discuss the conditions and possibilities of single issue grassroots movements to extend their master frames into anti-systemic movements against authoritarian rules and tendencies in times of crisis.

I would like to approach this problem through empirical studies of cases from the environmental movement in Hungary, where the environmental theme has provided particularly powerful and influential repertoires of contention. The paper will present a diachronic analysis from two segments of time – the Danube movement of the late '80s of socialism (the movement against the dam), and environmental protests in today's Hungary (the City Park movement and the mobilization against the dam on the Danube) in the post-crisis period on the semi-periphery of Europe. The paper does not aim to discuss or compare the macrostructural frames but will focus on the changing frames and repertoires of the bottom-up environmental movements – how they shift from single issue movements to anti-systemic movements, what is the role of such movements in times of crisis, how do movement agents build networks of solidarity, how do global movement trends that influence their sets of action and strategies in the 80s and today? And last but not least – how can these movements challenge authoritarianism from below?

Marxists-Leninists on the factory floor: an encounter between workers and intellectuals

Guillaume Tremblay-Boily
Concordia University, Canada
guillaume.tremblay-boily(at)ucs.inrs.ca

Current trends in Europe point towards a political gap between salaried professionals in the social and cultural services who tend to rally to the libertarian left, and, on the other hand, production workers who are attracted towards the populist right (Oesch, 2008). However, the existence of a political and cultural gap between these two socio-economic categories is not a new phenomenon, although it has taken a different shape – and has perhaps deepened – in the last decades.

This paper will focus on a group of intellectuals' radical attempt to bridge this gap in the 1970s, drawing on a close study of the accounts written by French Marxist-Leninist activists. Over the course of the 1970s, over 2000 highly-educated French activists – most of them from middle-class and upper-class backgrounds – became factory workers, following Mao Zedong's advice to learn Marxism "through practical work and close contact with the masses of workers and peasants" (Mao, 1966). Their goal was to contribute to the political organization of the working-class from the inside.

Findings from these activist accounts will address a few key questions of interest to any social actor pondering how to politically unite workers from highly diverse social backgrounds. How successful were the activists' attempt to join in the workers' struggles?

What frictions, collaborations, tensions and partnerships emerged from this encounter between individuals possessing varying amounts of cultural capital? How did their conception of political action evolve through their mutual encounter?

This paper is part of an ongoing doctoral research comparing the trajectories of Marxist-Leninist intellectuals among the working-class in France and in Canada.

RN25 | Session 02a The Present of Social Activism and Participatory Processes in Europe: Learning from the Past

From social experience to event: restructuring of collective subjectivities through social movements.

Ferran Giménez Azagra
University of Basque Country, UPV-EHU- CADIS-
EHSS
ferran21_2001(at)yahoo.com

Attending mobilization cycle started before the outbreak of 2007 crisis, by defining this as a period in which establishing elements of social mobilization are re-defined, this part of the research, from a PhD project, seeks to draw an explanatory model capable of taking into account the subjectification processes that develop into collective action. From an interpretive and constructivist approach, ethnographic field work was conducted between 2013 and 2015, by using participatory observation in some events of the Platform of Affected by Mortgage, PAH, and the Candidacies of Popular Unit, CUP, in Catalonia. Two focus groups and thirty in depth interviews to selected key informants with specific criteria have been conducted, too, as well as documental analysis of text produced by social actors.

Following theoretical purpose of sociology of experience from F. Dubet, from a splitted reality in different logics of action, alongside contributions of M. Lazzarato to theoretical frame of symbolic domination, we analyze five key dimensions of social movements: mobilization structure, repertoire of action, assembly, discursive frame and collective identity. Thereby we propose a procedural conception of social movements in which the concept of event allows us to define mechanisms of subjectivity restructuring. Provisional findings point to a presence of interaction structures with both emotional and political purposes as a base of this processes, as well as a fusion of logics of action related to the configuration of possible subjectivities in collective action.

Bringing in the Past to the Fight for the Future: The 'Grandparents' Movement' laioflautas / Yayoflautas in the Spanish Anti-Austerity Protests

Christoph H. Schwarz
Philipps-Universität Marburg, Germany
christoph.schwarz(at)staff.uni-marburg.de

Far from being a mere 'youth movement', generational discourses have been highly relevant in the Spanish

indignados movement. One of the first groups to participate in the occupation of the Plaza del Sol in Madrid in 2011 was Juventud sin Futuro (Youth without a Future), which explicitly and critically engages with the category of 'youth' in its campaigns against austerity. However, the Spanish case is rather unique in the sense that this framing strategy is complemented, on the other end of the age spectrum, by a 'grandparents' movement', set up to support the younger activists: The *iaioflautas* or *yayoflautas*, older indignados activists, define themselves as 'the generation that fought and achieved a better future for our sons and daughters'. The movement brings together very experienced activists, some of whom had already organized clandestine resistance under Franco, with newcomers who had never been politically organized before. In the recent years, activists with very different backgrounds have thus regularly been at the frontline of occupations or other anti-austerity protests, marked as *yayoflautas* by their characteristic yellow vests.

Based on campaign material and life story interviews with activists, this paper discusses three questions: What are the strategic advantages of a framing strategy based on seniority in the post-Franquist context? Which repertoires of contention have been passed on between the old and young generations within the 15M-movement, and along which lines? And, finally, is there a typical biographical trajectory of 'becoming a *yayoflauta*'?

What happens after a 'Zero Point'? The Effects of Gezi Parkı Protests on Political Mobilization and Protest Repertoires of Youth in Turkey

Tuba Emiroğlu, Öndercan Muti
Mimar Sinan Fine Arts University, Turkey; Humboldt University of Berlin, Germany
emiroglu.tuba(at)gmail.com,
ondercanmuti(at)gmail.com

During the last two decades, the politization and political mobilization of youth have gained an important academic attention. The social movements around the globe beginning with social forums, continued with oppositions against different summits and recently emerging as occupation of squares and public places have increased this interest. In Turkey, the famous Gezi Parkı Protests, which began with the aim to stop the demolishment of a park but became widespread in different cities as a summer long movement demanding various democratic rights, draw the academic attention on the political mobility of youth and new forms of this mobility. During these protests, activists from a wide range of social movements and ideologies achieved to mobilize millions of people against the police brutality and all kinds of state violence and pursued different strategies and repertoires, both on national and international level. In this paper, the results of a field research done three years after the most extensive cross movement experience in Turkey will be presented with the aim to discuss the dynamics of cross movement mobility letting different social

movements and people to form a singularity. In addition, the possibility of these dynamics to build a permanent political mobilization and a singular movement will be explored by looking closer at the process following Gezi Parkı Protests. Lastly, the protest repertoires and types of political participation of young people in this process will be argued.

Re-defining the enemy: the public discourse of Golden Dawn on refugees

Daniela Chironi, Giorgos Souvlis
European University Institute, Italy; European University Institute, Italy
daniela.chironi(at)eui.eu, george.souvlis(at)eui.eu

The paper focuses on the public discourse that the Greek nationalist far-right party Golden Dawn (Χρυσή Αυγή) has developed on the topic of immigration since the beginning of the refugee crisis in 2015. The research question we answer is: how did the refugee crisis affect the political culture of the party under examination? Our goal is to highlight the representation of the "Foreigner" diffused by this party and show how this imaginary construction is used to define a new Greek identity built in opposition to that of the refugees. A secondary aim is to fill a gap in existing party literature that so far has focused mainly on Golden Dawn's repertoire of action and the characteristics of its members and supporters excluding an in-depth analysis of the public discourse that legitimizes its political behavior and its transformations over time. We believe that such an analysis can contribute to a more holistic understanding of the rise and consolidation of this far-right force in Greece.

To grasp the changes in the party's political culture we examine the articles regarding immigration published in the official newspaper of Golden Dawn, *Stoxos* (Target), in other minor newspapers and the party's leaflets, as well as the speeches that its Members of Parliament delivered in the last two years. Our methodology draws from the tradition of the so-called 'Essex-school' of discourse analysis, which is a fundamental qualitative method. We expect to find discontinuities in the party's constructions of the refugees' image as well as varying conceptions of popular sovereignty, of 'the people' and hence of democracy itself, with a strengthening of an exclusionary vision of the polity on ethnical bases.

"Omnia sunt communia!": Using Popitz' theory of power to understand institutionalizing dynamics of power in the commons movement

Christian Schroeder, Mikko Laamanen
University of Luxembourg, Luxembourg; Royal Holloway, University of London, United Kingdom
christian.schroeder(at)uni.lu,
Mikko.LAAMANEN(at)grenoble-em.com

In this paper, we analyse how the common's movement defends its idea against a formal or informal reappropriation of commons. For this purpose, we draw on the theory of Popitz describing

the institutionalization of power in spaces where people establish (new) social order. Analysing the process of power institutionalization allows us to hark back to the fundamental debate around the tragedy of the commons used by economists to legitimise a marketization of non-economic areas such as healthcare, science or education. This paper elaborates how the common's movement is organised, how it collaborates with state and municipal authorities to establish common spaces and how it organizes to defend common spaces from being reappropriated by individuals or groups. Our research question explores how the common's movement organizes common spaces and against tendency of groups that take ownership of commons. Our approach is based on an on-going ethnographic research comprising of participant observations at local commons assemblies, document analysis mapping the commons movement debates transcending movement spaces (such as the World Social Forum and the European Commons Assembly) as well as interviews with key informants. The paper is divided into three consecutive sections. In the first part, we will present Popitz' concept of the institutionalization of power. Against this background, we approach the conceptual basis of commons and conclude with thoughts on how the commons movement is organizing 'differently', how it collaborates with authorities and how the movement avoids the disposition to (re-)establish a social order in which commons are lost.

RN25 | Session 02b Remaking of Europe's Borders: Far Right Parties and the Migration Crisis

Anti-refugee mobilization in Italy and France: the far right beyond party politics

Pietro Castelli Gattinara
Scuola Normale Superiore, Italy
pietro.castelli(at)sns.it

While far right politics have long been considered exclusively a party phenomenon, in recent years various organizations have emerged throughout Western Europe that are engaged in street politics. In particular, the refugee crisis acted as a catalyst for extra-parliamentary far right organizations, which now represent an integral part of the broader anti-immigration movement. The paper provides an account of the rationale, nature and form of mobilization against refugees in Italy and France, two countries characterized by very different patterns of migration politics. Quantitatively, we use protest event analysis to trace the major characteristics and trends in far right mobilization against refugees since the beginning of the crisis. Qualitatively, we draw on 18 face-to-face interviews with key activists from different types of far right organizations in the two countries: ForzaNuova, CasaPound Italia and LegaNord in Italy, and BlocIdentitaire, Calaisiens en colère and Front National in France. This allows exploring the meaning of far right mobilization in terms of targeted groups, repertoires of contention, and frame construction.

Our findings indicate that the refugee crisis changed not only the size and scope of anti-immigration protest, but also its nature. First, contemporary anti-refugee mobilization involves far right political parties, as well as social movements and grassroots organizations. Second, these actors engage in a variety of actions, ranging from demonstrative and pacific street demonstrations, to confrontational actions which often lead to violence. Third, vigilantism stands out as a crucial feature of far right mobilization in the wake of the refugee crisis. The results confirm that the refugee crisis has changed far right mobilization both quantitatively and qualitatively, making street politics increasingly central to the strategies of the anti-immigration movement.

Blood, religion and culture Framing Islam in the online networks of the French Far Right

Caterina Froio
University of Oxford, United Kingdom
caterina.froio(at)eu.ox.ac.uk

While after 9/11 public debates about Islam have been more and more framed in cultural terms, the outburst of the refugee crisis has brought about new narratives based on security, public health and welfare state constraints. As a result, today Islam is at the core of far right discourse on migration and ethnic diversity. Yet, scholars disagree on whether a cultural frame of Islam can be distinguished from other more established representations of the immigrant 'other' based on ethnicity, race or religion. This study explores how the French far right frames Islam and Muslim minorities online. I apply Social Network Analysis to 77 far right websites in France, a context characterized by an assimilationist conception of citizenship and by increasingly heated public debates on secularism, integration and refugees. The analysis allowed the identification of three major interpretive clusters of Islam: blood, religion and culture. While the results confirm that opposition to Islam is mainly framed in terms of cultural and religious incompatibility, I also find a substantial degree of variation in how far right actors address Islam. Religious frames are mainly advocated by ultra-secularist and conservative Catholic organizations, and are based upon an exclusionary interpretation of the French laïcité as well as on the defense of the 'Christian roots' of Europe and France. Cultural frames instead polarize far right actors around exclusive understandings of French Republican values. The results allow to identify the major arguments on the basis of which Islam is depicted as an 'outgroup', and how it may become the backbone of joint campaigns and shared political identities between party and movement activists' mobilization in the far right.

Mobilization against refugees in Germany: Opportunities, repertoires, and discourse

Linus Westheuser

Scuola Normale Superiore, Florence, Italy

linus.westheuser(at)sns.it

When large numbers of refugees arrived to Germany in 2015's 'summer of migration', this was met with a fierce wave of mobilization on the radical right. Tens of thousands joined marches against the government's perceived leniency towards migrants and against the setting up of local shelters, while violent attacks on such facilities surged and the populist anti-immigration party AfD mustered polling results unprecedented in post-war German history. The paper aims to explain the dynamics of this mobilization wave, the relation between its electoral, protest, and violent repertoires, as well as why mobilization heavily clustered in certain regions of the East. Inspired by the approach of Koopmans and Olzak, the paper analyzes an original dataset of around 1000 instances of anti-refugee mobilization in Germany's Eastern states and combines it with fine-grained data on grievances and political opportunities, as well as a systematic sample of newspaper data capturing local-level discursive dynamics. Against the findings of previous studies, the local strength of radical right parties increased the likelihood of protest and violence, while socio-structural and migration-related grievance patterns by and large do not explain radical right mobilization. An interesting and previously unresearched exception are gender imbalances in local youth populations which show a consistent correlation with violence. The mediatized visibility of radical right claims and the legitimacy afforded them by moderate actors are shown to have furthered radical right mobilization. The data further suggests an evolution from violent to protest to electoral repertoires. Findings are contextualized in the political junctures of 2015 and recent Eastern German history.

From "cautious solidarity" to "ethnocentric cautiousness": a tentative explanation of the rise of anti-migrant stances in the island of Chios

Thomas Goumenos

independent scholar, Greece

goumenos(at)hotmail.com

Chios is one of the five Greek islands of the Eastern Aegean that have served as the points of entry and first reception for almost 1 million refugees and migrants since 2015. After the signing of the EU-Turkey Statement (in March 2016), which assigns a significant role to the Eastern Aegean islands with regards to control and deterrence of migration and refugee inflows, 2,000 – 3,000 asylum seekers remain at camps in Chios.

The implementation of the EU-Turkey Statement has been the catalyst for the transformation of the dominant stance of the local population in Chios vis-à-vis refugees and migrants: from one of "cautious solidarity" to one of "ethnocentric cautiousness". Although no hard evidence on the degree of anti-migrant radicalization exists until now, the

strengthening of xenophobic attitudes and the gradual legitimization of anti-migrant discourse is evident. Moreover, Chios stands out from the other islands due to the emergence of a mass organization (the Pan-Chian Committee for Struggle) that opposes the operation of refugee camps and has successfully organized mass rallies and other events.

This paper highlights the reinforcement of the anti-migrant agenda in Chios through the examination of dominant discourses (of local media, parties and authorities), incidents of anti-migrant violence, and the activities of the "Committee". Moreover, this paper argues that an explanation of the rise of anti-migrant stances in the islands of the Eastern Aegean has to take into account two crucial components of the local collective identity: "insularity", i.e. the feeling of isolation that living in a small island entails, and "frontiermanship", i.e. the (self-) representation of residents of border regions in Greece as symbolic and physical guardians of the national state.

Exploring aspects of extreme right activism and xenophobic manifestations

Vasiliki Georgiadou, Zinovia Lialiouti, Anastasia Kafe, Ioannis Galariotis

Panteion University, Greece; Panteion University, Greece; Panteion University, Greece; European

University Institute

v_georgiadou(at)hotmail.com,

jennylialiouti(at)gmail.com, ankafe(at)kpe-panteion.gr,

jgalariotis(at)gmail.com

The recent migrant and refugee crisis unfolded anti-immigrant sentiments and xenophobic attitudes across the European continent. Moreover, the anti-immigrant political agenda seems to be an important component in the current appeal of extreme right parties in Europe. In the Greek context, the refugee crisis interacts with the ongoing economic crisis and its social consequences. The neo-Nazi party of Golden Dawn is far from being marginalized despite the prosecution of its leadership after the murder of Pavlos Fyssas. Furthermore, GD, taking advantage of the political opportunity presented with the influx of refugees in the past year, manifested its activism in public schools and refugee camps, targeting refugees and their children. This paper aims to provide a comprehensive overview of GD's activism and to contextualize it by employing event analysis based on a collection of news sources focusing on violence against immigrants. In particular, we examine the role of two distinct actors: GD and the police seeking to explore potential links in this respect. Our empirical material was processed by computational social sciences methods and provides valuable insights on the evolution of GD and xenophobic activity in Greece since the early 1990s. Apart from the event analysis aspect, this paper also involves aspects of popular xenophobia by processing xenophobic messages in twitter communication during the economic crisis (2013-2016).

RN25 | Session 03a Bringing Marxism in Social Movement Research? How to Study Capitalism from a Critical Standpoint

The Struggles of the Precarious Youth in Tunisia: The Case of the Kerkennah Movement

Lorenzo Feltrin
University of Warwick, UK
l.feltrin(at)warwick.ac.uk

This paper analyses, from an autonomist Marxist perspective, the social movement against the energy corporation Petrofac that took place in the Tunisian archipelago of Kerkennah between 2011 and 2016. The two main theoretical axes underlying it are Endnotes' theory of precariousness and the post-workerist tradition of class composition analysis. The long-term tendencies of Tunisian employment patterns – with employment falling in agriculture, stagnating in industry and rising in the tertiary sector – are in line with the global trend linked to rising automation. For the vast majority of Tunisians, the tertiary sector does not mean a highly paid job in finance or creative work in the media industry, but insecure toil in low-end services, often informal and/or self-employed. These employment trends combined with contextual factors to generate an upsurge in the mobilisations of the precarious youth. The Kerkennah movement is thus seen as part of a broader cycle of mobilisations that started in 2008 with the Revolt of the Gafsa mining basin and continues into our days. The case of Kerkennah is particularly interesting both for its representativeness and for its specificities. It is representative because of the social composition of its core participants (young people in precarious employment), its demands (secure employment and local development), and its forms of collective action (the roadblock and the riot). This allows for some insight in similar contemporary episodes of social unrest across the country. It is specific because it was relatively durable. This allows understanding some of the conditions for protracted mobilisation of the precarious youth in underdeveloped countries. It will be shown that deeply entrenched communal solidarities are an important ingredient for the sustainability of the movement.

Struggles on the Canadian Biocommons

Wilhelm Peekhaus
University of Wisconsin-Milwaukee, United States of America
peekhaus(at)uwm.edu

This paper argues that biotechnology affords capital a scientific instrument to enclose genetic resources that have long been developed and cultivated in common. In particular, the paper concentrates on agricultural biotechnology and the resistance it has engendered in Canada. Although the geographical focus may be beyond the typical focus of the ESA, I believe that several of the lessons learned from the Canadian context are applicable to some of the struggles being waged around genetically engineered seeds and food

in numerous European countries.

The basic argument advanced is that, in what might be considered an instance of primitive accumulation facilitated by technological development and state policy, capital is striving to subvert the product of countless generations of common labour for its own valorisation purposes. Through various enclosure strategies, capital seeks to exploit the products and knowledge that derive from, and might otherwise promote, what I have termed the BioCommons.

Yet, such efforts at enclosure have met resistance. The people opposing agricultural biotechnology in Canada are united not by particular class interests but, rather, by a general rejection of the property regimes that capital has invoked around the products produced by this technoscience. They are struggling against capital's attempts to appropriate and exploit agricultural biotechnology in order to inject some degree of democratic control over its developmental trajectory. These people are mobilising based on practices of co-operation, communication, social solidarity, and justice across town and country with a pronounced sensitivity to the environmental issues thrown up by biotechnology.

Where is it kicking off? Integrating materialist state theory into contemporary social movement studies

Anne Engelhardt, Madelaine Moore
Kassel University, Germany; Kassel University, Germany
engelhardt00(at)gmail.com, maddim(at)gmail.com

Post-crisis there has been a proliferation of studies of social movements, yet these analyses fail to answer Paul Mason's question (2013), why is it still kicking off everywhere and what is the context, or antagonist, of these collective protests. We aim to answer this and, what we see as the limitation of existing approaches by highlighting the need to situate any study of social movements within materialist state theory. Methodologically, this integration requires to move beyond the mainstream approaches' limited focus on failure/success. Instead, we introduce a framework that operationalizes movements and struggles as processes related to, and forming part of, wider societal dynamics to explain contemporary collective action, but also what they are resisting to i. e. a specific capitalist conjuncture and the state. Current social movement studies have a limited approach to the state looking frequently at political opportunity structures, power resources etc. Instead we conceptualize the state as a field of crystalized power relations and contestation. From this vantage point, the relationship between the state and movements is more of a tug of war; the neoliberal state continually expands into different fields and social movements push back and challenge these power relations. The neoliberal state is a particular power formation provoking certain protest dynamics and claims, these are then subsumed into the state apparatuses and policy. In reverse, different state apparatuses try to shape the field of contestation through certain

structural selectivities. We explore this through two case studies: the dockworkers' strikes in Portugal and the right to water protests in Ireland during the same period. Both cases are complementary in understanding and building a wider state-focused approach to political struggle.

The golden “salto mortale” in the era of crisis: primitive accumulation and social movements in the case of Skouries gold mining in Greece

Konstantinos Petrakos, Vasiliki Makrygianni, Charalampos Tsavdaroglou
National Technical University of Athens, Greece;
Aristotle University of Thessaloniki, Greece; Aristotle University of Thessaloniki, Greece
kostaspetrakos31(at)gmail.com,
makrygianniv(at)arch.auth.gr,
tsavdaroglou.ch(at)gmail.com

As formulated by Marx (1990[1867], p. 200), “the leap taken by value from the body of the commodity into the body of the gold is the commodity’s salto mortale”. Following autonomous Marxists literature (De Angelis, 2007; Federici, 2011; Hardt and Negri, 2009), the circulation of capital could be interrupted by social, class, gender or ecological struggles. In order to unsettle this view, we build on recent critical scholarship on new enclosures, land grabbing and the permanence of primitive accumulation and we explore the inter-articulation of gold mining projects and neoliberal policies in the era of crisis. In this effort, we choose to examine the case of Greece a country in the epicenter of the recent financial and social crisis. During the last decade the Canadian company “Eldorado” has undertaken a gold mining investment in the environmentally sensitive area of Skouries. Against this project a fruitful social movement has emerged which has ecological, feminist, class, antiracist and inter-local features. Through this examination we want to investigate how the financial crisis provides an opportunity for multinational mining corporations to expand their zones of exploitation and how the social movements has the ability to contest, to postpone or even to cancel the circulation of capital and to reclaim the common resources. For the purpose of the paper, social data have been collected by participatory action research, militant ethnographic analysis and secondary literature through blogs and online materials.

RN25 | Session 03b Innovative Strategies Versus Political and Economic Targets

“The split elite thesis revisited: An “eventful” analysis of Serbia in the late 1980s”

Marko Grdesic
University of Zagreb, Croatia
grdesicmarko(at)gmail.com

This paper revisits the venerable split elite thesis – which suggests that divisions in the elite are a key facilitating condition that makes revolutions and protest possible – and presents it in refurbished form,

as a mechanism that connects elite and mass actors in a process of “eventful history.” Such a mechanism takes the split elite from a background static condition to an interactive process, as urged by the “dynamics of contention” approach and similar process-oriented approaches in political sociology. The case at hand is 1980s Serbia, then part of multi-ethnic socialist Yugoslavia. A mixed-method approach, relying on both quantitative and qualitative analysis, reveals that protest events are connected with elite events, chiefly sessions of the communist party. These elite events mattered in two ways: as structuring and as transformative phenomena. On the one hand, they functioned as targets for contention thereby providing a kind of grid for protest. On the other hand, certain party session were turning points that escalated contention to new levels. An “eventful” approach provides a way for challengers and protesters to activate the split in the elite, but it also provides a useful lens for researchers who wish to understand the interactions that underpin all situations or revolutionary contention.

Anti-abortion as anti-discrimination? New paths for anti-abortion activists in Sweden

Rebecca Elizabeth Selberg, Niklas Selberg
Lund University, Sweden; Lund University, Sweden
rebecca.selberg(at)genus.lu.se,
niklas.selberg(at)jur.lu.se

In 2014, two midwives sued two different county hospitals in Sweden on the basis of discrimination. They had both been offered positions at women’s clinics, but the offers had been rescinded after the midwives declared they would not perform abortions. The cases sparked a Swedish debate on abortion that is unusual for two reasons: first, because the right to abortion is strongly supported; second, because this is the first time ever that the issue of abortion has been raised through the courts. Historically, social and political change in Sweden has not been instigated through the courts, but via the parliament. The choice to turn to the courts instead of the legislator is a novel strategy for interest groups in Sweden, and begs the question of what type of framing processes are at play in the anti-abortion movement in the “woman-friendly” welfare state of the new millennium.

The aim of the paper is twofold. First: to provide a legal analysis of the anti-abortion activists’ arguments and reasoning, highlighting the theories put forward of the interplay between Swedish labor law and European human rights discourses. Second: to explore the particular case of Swedish anti-abortion activists drawing on Swedish labor law, anti-discrimination rhetoric and European human rights discourse as an example of interest groups identifying and actuating changing discursive opportunity structures in the context of internationalization. This paper thus seeks to contribute to a deepened understanding of the relationship between law, society and social change by exploring some of the ways in which movements invoke legal constructs and legal institutions.

Social media and the revitalization of the trade union movement in Sweden

Katrin Uba, Jenny Jansson
Uppsala University, Department of Government,
Sweden; Uppsala University, Department of
Government, Sweden
katrin.uba(at)statsvet.uu.se,
Jenny.Jansson(at)statsvet.uu.se

Trade unions have faced the significant problem of member decline for several decades, even in countries with traditionally high union membership like Sweden. Social media have been proposed as an important means for revitalization strategies because it is fast, cheap and has the potential to reach many. The purpose of this study is to investigate how Swedish trade unions use social media for revitalization purposes; we do this by focusing on one social media channel, the YouTube. By combining unique meta-data of more than four thousands videos and detailed data about 400 videos, we demonstrate that Swedish trade unions use social media for member recruitment and political activism, but much less for coalition building. We also find some interesting variation between the three main trade union federations, which call for future research about the variation of revitalization strategies.

RN25 | Session 04a Precarious Solidarities with Refugees Since the Summer of Migration

The Rise and Erosion of a Solidarity Movement: Grassroots Groups of Volunteers before, during and after the Migration Crisis in Hungary

Aniko Bernat
TARKI Social Research Institute, Hungary
bernat(at)tarki.hu

The aim of this contribution is to understand solidarity 'in working' through the contradictions experienced by the Hungarian society during the recent migration crisis: new forms of civil activity have emerged in the Hungarian society, which, in general, demonstrates a low level of solidarity with 'foreigners' and 'the other' characterized by high levels of xenophobia and low levels of trust and civilian activity. The study also aims to understand the transformation and erosion of the solidarity movement after border closures of Hungary and the migration flow bypassed the country.

The main research questions are therefore as follows: How was it possible that in a society with low level of trust and a tendency of not accepting 'the other' a dedicated and effective voluntary grassroots movement sprung up without an organizational history? What were the main motivations of their volunteers? What happened with these grassroots organizations after tightened border closures in Hungary, how and where the human capacities of volunteers transferred?

The theoretical approach on solidarity applied here is close to those political sociology theories which focus on how solidarity among citizens builds social cohesion and how it affects the construction of civil

societies and thus democracies (Putnam, 2000; Paxton, 1999). The research is also embedded in Chadwick's theory on hybridization of public sphere (2013).

The research relies primarily on qualitative research evidence (interviews with representatives of aid organizations as well as individual and group interviews with volunteers), completed with representative survey data and focus group results on anti-immigrant sentiments, trust and social attitudes on solidarity.

Solidarity with refugees in Greece: Exploring volunteering during the refugee crisis

Stefania Kalogeraki
University of Crete, Greece
kaloge(at)uoc.gr

Since 2015, Europe has been challenged by the increasing number of refugees fleeing conflict and persecution. With over 4 million people having been displaced by the conflict in Syria and the rapid increase in refugees from African countries rocked by war and violence, a refugee crisis has sparked. A significant number of refugees have followed the Eastern Mediterranean route towards European countries via Greece; as a result over one million people in search of sanctuary have traveled through the country. Greeks have been challenged to cope with a two-fold crisis, i.e. the economic recession and the refugee crisis. Whilst the government has been tremendously strained by both the economic depression and the massive migration, thousands of ordinary people have joined efforts to help providing services and support to refugees arriving in the Greek shores. The volunteers have been instrumental in providing refugees with solidarity activities (such as food supplies, medical aid, legal and financial support) and the government has come to partly rely on volunteering contributions to tackle the refugee crisis. The main rationale of the paper is to explore the prevalence of volunteering with refugees as well as the profiles and motivations of volunteers in the context of the recent refugee crisis. The paper uses nationally representative data from the EU funded project TransSol (Transnational Solidarity at Times of Crisis) which provides a unique opportunity to explore volunteering as a form of Greeks' transnational solidarity to thousands of refugees fleeing repression and conflict zones to seek safety in Europe.

From border to border: activism along the Italian migrant route

Lorenzo Zamponi
Scuola Normale Superiore, Italy
lorenzo.zamponi(at)sns.it

Italy is the second "country of first arrival" for refugees that come to Europe by sea, after Greece: in 2015, of the one million refugees that crossed the Mediterranean, 154 000 landed in Italy. Most of them came from Sub-Saharan Africa (in particular Nigeria and former Italian colonies Eritrea and Somalia), Syria

and Bangladesh. Italy is a provisional stage in a longer route, since the precarious economic situation of the country makes it less attractive for migrants than Northern European destinations. For these reasons, the most critical points from a humanitarian point of view are the borders: the sea between Italy and Libya, in which thousands of people died in the last few years during shipwrecks, and the borders with Austria, France and Switzerland.

This paper reconstructs, through the analysis of 20 qualitative interviews to pro-refugee activists, the different forms of action, solidarity and organisation that have emerged along the Italian migrant route. The analysis focuses in particular on three aspects: the role of space, and in particular of the position along the route, in determining the conditions for activism; the relationship between the nature of reaction to emergencies that characterises some of these actions and the history of pro-migrant activism in Italy; the dynamics between claim-based protest and concrete solidarity initiatives in this particular context.

Constructing a welcoming culture? The role of civil society organizations in providing social support to refugees in a German city

Inka Stock

Bielefeld University, Germany

inka.stock(at)uni-bielefeld.de

Since the notable increase of asylum seekers in Germany in 2015, civil society organizations (CSOs) have become to play an increasingly important role in the provision of social services and support structures—particularly for the newly arrived. In this paper, I will analyze how the reliance on volunteers and the institutional contexts of urban administrations can shape CSOs strategies of navigating a space in-between humanitarian service provision on the one hand and political mobilization for migrants rights on the other.

The paper is based on a small field study involving interviews with volunteers and representatives of different civil society organizations in the city of Bielefeld, Germany.

My data show that dynamics of administrative decentralization have led civil society organizations to supplement public structures in refugee assistance on communal levels. However, they are relying heavily on volunteers to shoulder these tasks. On the one hand, this has increased the importance and legitimacy of migrant and other civil society organizations in communal social policy making processes.

On the other hand, volunteers' motivations, the activities they prefer to be part in and their own networks strongly condition some CSOs in the activities that they consider they are able to implement for and with asylum seekers. My data shows how this perception can also impact on organizations' fading interest to advocate for longer-term structural changes in communal refugee politics and instead contributes to their increasing preoccupation with activities which are geared to increase asylum seekers informal social support networks through non-state actors.

RN25 | Session 05a Social Solidarity Economy in Southern Europe in Times of Crisis

Subjects in Crisis. The Radical Imagination of the Syntagma Square Occupation in Athens and its Aftermath

Dimitris Soudias

Philipps University Marburg, Germany

soudias(at)uni-marburg.de

Participants of the 2011 occupation of Syntagma Square in Greece often describe their participation experience as 'magical', as one that made them 'more [politically] aware and active' and 'changed' them. What is it that makes participants point to the transformative character of participation and what remains of this experience today? This paper investigates the relationship between transformative experience in the 2011 occupation of Syntagma square and subject formation within the context of neoliberal restructuring in Greece by way of an abductive analysis.

The presentation is divided in two parts. The first examines the processes that occurred in Syntagma that made people point to the transformative character of participation. It argues that the transformative experience to which participants point can be attributed to the spatiality of the square occupation. Syntagma as a liminal space of resistance signifies a situation in which doxic assumptions are raised to the level of discourse, where they can be contested. Normative expectations are negotiated creatively allowing for processes of politicization and what Haiven and Khasnabish call 'radical imagination'.

The second part addresses what remains of the participation experience almost six years onwards. The paper argues that participants' subjectivity is constructed in the 'spirit' of Syntagma alongside solidarity, self-organization, self-responsibility, autonomy and direct democracy. The paper shows that these subjectivities continue to exist today and how the extra-ordinary spatiality of Syntagma Square has been transferred into participants' quotidian activities in the solidarity movements. Yet, while these new subjectivities and spatialities are resisting or bypassing neoliberal statehood in Greece, they sometimes also unwittingly reproduce it by contributing to an imagination of the state that is not responsible for service provision.

Direct Social Action in Italy: Self-Organisation, Mutualism and Solidarity Economy in Times of Crisis

Lorenzo Bosi, Lorenzo Zamponi

Scuola Normale Superiore, Italy; Scuola Normale Superiore, Italy

lorenzo.bosi(at)sns.it, lorenzo.zamponi(at)sns.it

In the context of the economic crisis and the related public policies there seems to be an increase in the types of collective action that we define as Direct Social Actions: actions that do not primarily focus

upon claiming something or other from the state or other power holders but that instead focus upon directly transforming some specific aspects of society by means of the very action itself. This definition includes boycotts, solidarity actions, political consumerism, alternative finance (e.g. crowd funding, food banks), collective purchasing groups, occupations, self-management, free legal advice, medical services, etc. How do these forms of action relate to the context? Which social and political groups are more likely to adopt these forms of action? Are these practices considered alternative or complementary to protest? How is the prefiguration of political change embedded in these practices? We answer these questions for what regards Italy through the coding of alternative action organisations' websites and through 40 qualitative interviews.

Anti-neoliberal contentious politics: Movement dynamics and party politics.

Nikos Serdedakis
University of Crete, Greece
serntedn(at)uoc.gr

Neoliberal austerity policies implemented in Greece radically deteriorated the living conditions of the majority of the population, thus producing a great amount of grievances expressed in radical collective action. Despite the initial dynamic of this new cycle of protest, collective action soon started to relent in particular after the decline of the Greek Indignados "movement".

In the first part of the paper we will examine the dynamics of protest using quantitative data resulting from a protest-event analysis research program conducted in the Department of Sociology (University of Crete). Emphasis will be given to mechanisms and processes that can explain the peak of collective action during the period 2010-2012 and the factors leading to the gradual decline of protest afterwards. In parallel we will focus on the square "movement" phenomenon suggesting an alternative to the current main stream understanding of its unity and of its internal differentiations, divisions and political outcomes.

In the second part of the paper we will explore the intersection between movement and party politics that can explain the retreat of protest and the electoral victory of SYRIZA. We argue that movement and party politics nexus in Greece can be traced in the transnational diffusion of protest after the "Battle of Seattle". Innovative trends of network building and frame alignment processes, leading to the constitution of the Greek Social Forum and of the so-called "Space of Dialogue for Left's Unity and Common Action", can reveal a deep relational path of intersection between movement and party politics in Greece.

New repertoires of contention during crisis: the case of Thessaloniki

Katerina Loukidou
National and Kapodistrian University of Athens, Greece

loukikat(at)yahoo.gr

During the crisis period in Greece, apart from numerous collective protests against austerity measures, experience indicates an increase in informal organizations emerging "from below", addressing demands to the state. They oppose state policies, often combining a "reforming" attitude towards the state with the launching of alternative responses to social demands, based on the principles of self-organization and direct democracy. Could that be indicative of a repertoire change, according to Tilly?

The paper attempts to examine civil society organizations through the lens of social movement theory, focusing on new associational examples during crisis in Thessaloniki, the second largest city in Greece. It offers a comparison between formal and informal organizations and provides findings of 50 personal interviews with prominent members of various organizations, who address demands to the state or oppose public policies. The interviews aim to reveal the reasons for choosing a registered or an unregistered type of organization and the interaction with the Indignants and other collective protests of the period 2011-2014.

The main hypothesis is that there is a new, alternative example of collective action, which consists of creating highly politicized civil society organizations, who avoid registration in formal archives and deny any kind of relationship with the state. This way, associations have the ability to access a wider range of means and resources in order to protest, creating new dynamics and changing the repertoires of contention.

RN25 | Session 06a Violent Repertoires of Action in Times of Economic Crisis

Form-of-life as a new paradigm for riot research

Rui Coelho
Scuola Normale Superiore, Italy
rui.coelho(at)sns.it

This paper investigates the concept of form-of-life as a new paradigm for researching riots. Its central argument is that the subjectivity and political participation of rioter collective subjects can only be understood through such lens.

Since Badiou declared that we find ourselves in a time of riots, violent protests are becoming increasingly intense and frequent around the world. Notwithstanding the relevance of the topic, the main academic approaches to this issue are inadequate. Both the structuralist and individual-based perspectives miss the main processes at play in riots, one by relying merely on the description of the macro-social characteristics of riot populations and the other by ignoring the inherently collective nature of riotous subjects.

The key to a new paradigm is the Agambean notion of form-of-life, which some French rioters have started using as a tool to speak about their own political

activity. The concept is especially useful when looking at violent protest because of how it accounts both for the subjectivation processes that lead to the constitution of the collective subjects who engage in such actions and its inherent political dynamics as destituent war machines. To illustrate the aforementioned theoretical shift, this paper considers hooligan groups as an example of a riotous form-of-life.

Violent protests in times of crisis, comparing local environmental movements in Greece

Angelos Evangelinidis
University of Graz, Austria
angelosevans(at)gmail.com

The recent anti-austerity cycle of protest in Greece included many violent events against state authorities. These violent acts, however, did not occur in a vacuum but were a result of loss of legitimacy by both major parties as a result of the crisis. This is more evident in the ad hoc movement actors such as local environmental movements that only rarely resort to violence compared with the traditional social movements. Aim of this paper is to highlight the importance of violent repertoires in terms of efficiency and to provide a contextualization of the wider anti-austerity protests by looking into two NIMBY movements that unfolded under the same timeframe in a comparative perspective: the movement against the siting of a waste landfill facility in the city of Keratea, and the movement against gold mining in Chalkidiki, in northern Greece. Their decision to use violent tactics, however constrained, was taken in order to have their claims heard and, at the same time, due to the inefficiency of other forms of protest. Local environmental protests are an ideal case-study for examining social movement radicalization processes and repertoires' evolution due to their relative narrow scope and short time-frame. Although superficially identical the two cases above differ in their outcomes. In the former case, the movement succeeded in achieving its aims, the latter instead was defeated as a result of state repression. By addressing this issue, we contribute to the understanding of the causes and consequences of strategic choices by movements.

The Outcomes of Rioting: Exploring the Effects of The 2014 Gamonal Riots on Emotions and Collective Identity

Alba Arenales
Independent researcher, Spain
aarenales(at)ucom.es

After months of mobilization against the renewal of a street in Gamonal, a district of the Northern city of Burgos, Spain, locals experienced four days of rioting in January 2014. The neighbours of this historically working class district were opposed to the construction of a new boulevard because they considered the council was splurging public resources. This was seen as an act of corruption at a

time of crisis, when several budget adjustments and cuts were being implemented. Pre-existing social networks as well as a strong local identity were one of the main factors for the development of the riots. The district became a liberated space where emotional dynamics and collective identity played an important role to strength solidarity ties and to reduce repression risks, although some locals were arrested eventually. This paper examines what are the consequences of rioting in the district community. The aim is to focus on analysing the effects of using this form of collective action on activist's emotional bonds and identity, studying whether the solidarity ties and social bonds that were built remain. To this purpose, I will conduct in-depth interviews three years after riots broke out.

RN25 | Session 07a Citizenship from Below: Social Movements as Forms of Resistance and Redefinition of Citizenship I

Performing Resistance: Liminality, Infrapolitics and Spatial Contestation in Contemporary Russia

Kerstin Jacobsson, Christian Fröhlich
kerstin.jacobsson(at)gu.se, chrisfroehlich(at)gmx.net

This paper approaches public space as both a space of control and of contestation. The conditions under which public space can be appropriated, claimed and contested, however, differ considerably between democratic and authoritarian societies. This paper focuses on struggles in and over public space in contemporary Russia, exploring in particular the liminality of spatial contestation here. In the context of an over-regulated public space and increasing state repression, urbanites develop creative and subversive forms of performing resistance and protest, balancing on the border of private and public, as well as of overt and covert forms of resistance and protest, thus operating below the legal radar of the authorities. The paper approaches this borderland as a liminal region, investigating the repertoire of protest and contestation and the balancing acts developing here. To theorize liminality, the paper draws on theoretical insights from Henri Lefebvre and Michel de Certeau on everyday tactics as well as James Scott's notion of infrapolitics and everyday forms of resistance. In doing so the paper explores the revolutionary potential of low-visibility and liminal acts in an increasingly repressive society. The empirical illustrations come from media reports and Internet sources from across Russia as well as the authors' observations of urban struggles and activist interviews in the Moscow area in the period of 2012-16.

Anti-Austerity protests and legal strategies in Portugal and France

Carolina Alves Vestena
University of Kassel, Germany
carolina.vestena(at)uni-kassel.de

The worldwide wave of demonstrations that started in 2011 had a specific resonance in Europe. The protests in Spain, Portugal, Greece and more recently,

France, represent a milestone for the debates on the democratic characteristics of the European Union and the role of economic institutions in shaping political decisions. The critique of austerity is nowadays at the core of the claims of social movements, especially following the impoverishing effects of the “one size fits all” policies proposed by the so-called Troika. Since then, the academic and activist debates are trying to understand the multiple meanings of these struggles and also the movements’ strategies in this context. Considering these issues, this paper presents an analysis about the demonstrations in Portugal (2011) and France (2016) and is structured around two central lines of research. In the first place, it analyses how the movements reacted to institutional changes by developing a discourse against austerity. In this regard, the most important local issues that triggered the demonstrations – the memorandum of understanding in Portugal and labour law bill in France – are studied in detail. Secondly, strategies that accompanied the protests will be analysed, as for example, legal claims (possible strategic litigation) and collective mobilization that originated from these processes. Based on a qualitative approach of legal strategies and mobilization, this paper aims at developing a research agenda on the interconnection of law and social mobilization.

Irregular migrants and digital citizenship: How irregular migrants struggle for citizenship on the Internet

Minke Hajer

università degli studi di Milano/Universiteit van Amsterdam, Netherlands, The
m.h.j.hajer(at)uva.nl

Irregular migrants are excluded from formal citizenship and by implication from the national political community. However, this does not preclude activity by irregular migrants to become part of the political community or even to attain citizenship. Empirical research reveals irregular migrants struggling for citizenship in various ways, e.g. by demonstrating in cities and occupying buildings. While the literature on citizenship accounts for this sort of ‘incremental citizenship’, one aspect of these citizenship struggles has received little attention: the Internet. This paper presents an analysis of how irregular migrants use the Internet in general and social media in particular in their struggle for citizenship. I suggest irregular migrants perform ‘digital acts of citizenship’ and make ‘digital rights claims’. Based on a study of the digital dynamics of two groups of irregular migrants - the ‘We Are Here’ in Amsterdam and the ‘Ex Moi’ in Turin - the paper shows how irregular migrants challenge the prevailing notion of citizenship by making claims to it in the digital sphere. Furthermore it shows how irregular migrants develop counter discourses that challenge the discursive boundaries of the mainstream public sphere by developing alternative stories about their situation and alternative interpretations of mainstream media coverage. The paper concludes with a discussion of the (theoretical)

questions regarding the concept of (digital) citizenship, the boundaries thereof and the right to the ‘digital public sphere’.

To Be Young, Displaced and Syrian: Political subjectivities and enacting citizenship by non-citizens in Europe

Tasneem Sharkawi

Lancaster University, United Kingdom
tas.sharkawi(at)gmail.com

This paper looks at a group of young Syrian forced migrants as they engage in acts of resistance directed against the Syrian regime after they have resettled in Europe. The focus is on these sustained acts of dissidence and resistance as part of the resettlement experience of this group of young Syrians. Drawing upon theorizations of performative citizenship (Isin, 2002; Isin & Turner, 2007; Isin & Nielsen, 2008; Isin, 2009; 2012; Zivi, 2012; Isin & Seward, 2013; Isin, 2017) and political performativity (Butler, 2013; 2015), I explore the rights claims this group of young Syrians make, and the sites and scales involved in their activist engagement. The aim is to understand the ways they enact themselves as citizens (when they are not), and the set of practices that constitute their political subjectivities as Syrian refugees in Europe. Referring to research materials from participant-observations, intensive interviews, and social media artifacts, I share insights generated from early findings underlining some aspects of the participants’ experiences of grassroots organizing and mobilizing. These aspects address recurring themes of engagement with the public sphere of the European host societies; the emerging (refugee-founded) civil society in Europe, the formation of transnational networks of activism; and the ways activism engages with and challenges traditional notions of sovereignty and public opinion in Europe, and reconstructs the Syrian national imagination and national identity. (The title echoes Nina Simone’s song ‘To be Young, Gifted and Black’ written and performed in the wake of the Civil Rights Movement. I invoke the idea of performing citizenship through making rights claims that was in many ways at the heart of the African American struggle for civil rights.)

RN25 | Session 08a & RT Session 01 Urban Protests

Extractive Industries and Local Conflicts in Eastern European Cities

Eliska Drapalova

Hertie School of Governance, Germany
drapalova(at)hertie-school.org

In middle of the heated debate on how to reverse the climate change and global warming, some countries in Eastern Europe and Latin America are returning to extractive industries and natural resources exploitation (mines and timber in particular) to finance their national and regional budgets. These industries and the economic interests behind have an important

impact on the lives, environment, and politics of the localities where they are placed. This paper is interested in analyzing the effect of changes in the economic structure on local politics and urban conflicts. The paper looks at several cities from two eastern European countries (Romania and Czech Republic) that recently returned to these industries and investigates the interaction between the economic changes, politics and citizens' reaction. While in many Romanian cities affected by this economic "transformation", citizens have risen and protested like in Cămpeni (Alba County) against Ro ia Montană mining project. In the Czech Republic, the reopening of mines and new timber exploitation concessions were not strongly opposed by the population, with the exception of ecological groups. Even when the new energetic plans count on producing significant effects on cities in Ustecko Region like Litvinov and Horního Jiřetína (that should be razed to the ground). This paper uses a qualitative small-n case study and complements it with available statistical data on economic structure and politics. Theoretically, this paper combines political economy literature with a Marxist intake on extractivism and studies on urban conflicts and movements for the commons.

Citizenships from abroad. Territorialisation processes and citizenship practices in a Mediterranean city

Elisa Lombardo
University of Catania, Italy
elisa.lombardo(at)unicat.it

By means of the foreign immigrant category, the paper attempt to upset the static and apparently clear understanding of the relations between place and citizenship, framing it within a processual perspective, as a product of contextually rooted social relations. The empirical investigation of this relationship requires the adoption of a localized and low-scale outlook, and the city is the appropriate context for this aim. Within the city, the request of inclusion and access to welfare services and the claims of rights are linked to everyday practices and forms of social aggregation and solidarity, which in turn produce new links between subjects and between them and the territory where they live. Territorial and relational perspective of citizenship is connected to the partial denationalization of the rights and to the greater importance assumed by local and municipal levels of government in determining the collective well-being; also, it aims to highlight the spatial dimension of social phenomena. Spatial movements, residential concentration of groups, modes of collective organization, socio-territorial capital link inextricably citizenship social practices and places. Adopting a mixed-method approach, integrating quantitative and qualitative methods, as well as socio-territorial maps, we had observed some process of 'becoming citizens' in a city context of southern Italy.

The Conspirator, The Dissent, or The Ordinary Citizens: Competing Political Memories of the Gezi

Parkı Protests in Contemporary Turkey

Kaya Akyildiz
Bahcesehir University, Turkey
kaya.akyildiz(at)bas.bau.edu.tr

This presentation scrutinizes the political memory of Gezi Parkı Protests that took place all over Turkey in 2013 and it is based on a national survey conducted with 1957 respondents in 12 cities.

Despite being a some sort of an unfinished social movement Gezi Parkı Protests has already been historicized as a new beginning or as a failed attempt depending on the vested political interests. In the current political context, Gezi Parkı Protests memory has become tied to the interests of the ruling party that views these protests as a coup against the government and identify all dissents as "Gezici" (pro-Gezi). Gezi Parkı Protests is also linked to the aspirations of several protest groups who are unhappy with a number of government policies and exercising the most basic citizenship rights.

My study utilizes the demographical, socio-cultural, political identity and the political fears/distance as variables and the expressed emotions like pain, anger, shame, regret etc. accompanying the Gezi Parkı protest memories are analyzed in relation to aforementioned variables. The level of religiosity is found be relevant of Gezi Parkı protest; the level of self-declared conservatism, modernity, political identity, and political fears/distance are found to be diverged along the republican/secular and conservative/Islamist divide.

The Gezi Protests and the Enlargement of the European Public Sphere to Turkey

Isabel David, Gabriela Anouck Côte-Real Pinto
Institute of Social and Political Sciences, University of Lisbon, Portugal, Portugal; University of Manchester
isabela_davidova(at)yahoo.com,
cortecorto(at)yahoo.fr

The 2013 Gezi protests in Turkey constituted a branch of the wider global wave of contestation and dissent that has been sweeping the world since the start of the 2008 Great Recession and namely Europe. Despite similar themes (demands for greater democracy) and protest repertoires behind mobilisations in Turkey and in the European Union countries, and in the context of the Europeanisation of Turkey (stemming from its status as a EU candidate country), there are no empirical studies addressing the relations between Gezi and European mobilisations/protests. Namely, there is no research on how Gezi protestors frame their actions in relation to their European counterparts, that is, if or how the struggles in Turkey are connected to anti-austerity struggles in the EU and how this sets the tone for a European public sphere. This paper attempts to bridge this gap in literature through twelve semi-structured interviews conducted with activists (environmentalists, trade unions, LGBTI organisations, human rights organisations, feminists, professional chambers) at Gezi Park. The findings of our research reveal a

differentiated pattern of Europeanisation of the Turkish public sphere. While interviewees from Turkish civil society organisations founded after the Cold War (environmentalists, feminists, human rights organisations and LGBTI organisations) frame their struggles in a wider European context and display solidarity with their European counterparts, interviewees from historical or Kemalist Turkish civil society organisations (professional chambers, a Marxist organisation, an NGO and a trade union) either reject or question these links by emphasising the ambivalence of EU impact on Turkey's democratisation. However, this criticism of the EU can be interpreted as proof of their inclusion in a European public sphere sharing similar discontent.

RN25 | Session 08a & RT Session 02 Immigration Related Activism

Far right activism and racist violence against Syrian refugees in Greece.

Karmen Misiou
Panteion University of Athens, Greece
kar.mis1990(at)gmail.com

This research is an attempt to record the timeline of incidents of racist violence against refugees in Greece, between June 2015 and December 2016. Our aim is to investigate the forms of racist violence and the far-right actors who are involved in the above-mentioned events. Furthermore, the rhetoric extreme right groups and practice and their resonance in the local societies are examined, as well as the cooperation between members of far right parties (ex. Golden Dawn), 'outraged' citizens and police authorities. There are dozens of incidents that have been documented, such as racist speech, insults, abuses, physical and verbal attacks, beatings, constitution of militias and civil guards, bombings, commodities and housing destruction and obstruction. The incidents are analyzed based on the type of violence and actors. The reference material has been collected by newspapers (paper-based and electronic), news websites (regional and national wide), NGOs and solidarity group websites. Furthermore, named complaints have been used. The goal is to examine in which ways does the massive entry of Syrian refugees, during the last two years, have influenced the attitude of local societies and whether right wing activism and racist behaviours tend to become more acceptable because of the refugee crisis. The aim of this research is to highlight the aspects of racist violence, to investigate police authorities' attitude, to explore if local governments' speech and approach encourage the assaults and to outline Golden Dawn's role, thereby confirming members' participation and addressing in which ways does the party action entitles and diffuses.

Political non-citizens – An exploration of how immigrants rights activism transforms European democratic societies

Lea Rzadtki
Leuphana University, Lüneburg, Germany

rzadtki(at)leuphana.de

Europe is currently facing many challenges that reach its very core. Decreasing turnout rates and citizens' disinterest in institutional politics represent the internal dimension (Steffek, Kissling, & Nanz, 2008). Simultaneously, there are also external phenomena, at present among the most centrally discussed ones populism and migration (Rooduijn, 2015; Wodak et al., 2013). Debates on migration have become even more intense with increasing numbers of refugees reaching Europe over the past years so that civil societies' reactions to it bring together both dimensions. Immigrants rights movements and political action by non-citizens become particularly interesting in this context because, even where they are being integrated on a legal, social and cultural level, they often lack the recognition as political subjects. These movements have received more attention from citizenship and migration studies so far and it therefore seems promising to integrate notions, like Isin's acts of citizenship (Isin & Nielsen, 2008), with social movement studies' experience in analyzing protest and activism. This paper will emphasize the immigrants rights movement in terms of its role in European democratic societies—partly challenging them potentially posing a threat (e.g. Della Porta, 2010; Lorey, 2014), partly opening up new ways of developing them (e.g. Farro & Lustiger-Thaler, 2014; Norris, 2002). European societies will not end migration by continuing to close their borders so it is essential to explore the contribution that non-citizens might have to offer to re-make European notions of political community, civil society and citizenship. This paper will mainly address these issues through theoretical considerations together with first empirical micro perspectives from different actors involved.

Subversive humanitarianism: Understanding the civil responses to Europe's 2015 Asylum Crisis.

Robin Vandevordt, Anika De Praetere
University of Antwerp, Belgium; University of Antwerp, Belgium
robin.vandevordt(at)uantwerpen.be,
anika.depraetere(at)uantwerpen.be

In September 2015 thousands of Europeans provided help to recently arrived refugees. These spontaneous civil actions took many by surprise as they contrasted starkly with both the surging moral panic over the threats forced migrants might pose, and with the indifference with which the West had met the Syrian refugee crisis in the years before. We suggest that civil actions such as these can be understood best as forms of subversive humanitarianism: a morally motivated series of actions which acquire a political character not through the form in which they manifest themselves, but through their implicit opposition to the ruling socio-political climate. While we contend that the notion of subversive humanitarianism holds a wider historical and contemporary significance, we develop it in more detail by drawing upon ethnographic research in the civil camps in the

Maximiliaanpark (Brussels) and, to a lesser extent, Grande-Synthe (Dunkirk) and Calais.

“You can not evict a movement”. No Border Actions and Refugee Common Spaces in Idomeni and Thessaloniki

Charalampos Tsavdaroglou
Aristotle University Thessaloniki, Greece
tsavdaroglou.ch(at)gmail.com

The ongoing refugee streams that derive from the Middle East and North African conflict areas are a central issue to the growing socio-spatial debate about the different facets of contemporary crisis. While borders, in the era of globalization, constitute porous passages for capital goods, at the same time they function as new enclosures for migrant and refugee populations. Nevertheless, the moving populations contest border regimes and exclusionary policies and create a nexus of emerging common spaces.

A noticeable body of literature is currently emerging, exploring aspects of social philanthropy, NGOs' activities and State immigration policies related to the ongoing refugee crisis. However, there is little attempt to research how the refugees themselves self-organize and enact the production of seemingly anonymous, however highly personal and collective common spaces. The proposed paper aims to fill this gap.

The paper focuses empirically on Greece, which is situated at the epicentre of the refugee crisis, and on Idomeni and Thessaloniki in particular. Idomeni is the main exodus point where during 2015-2016 it was established a makeshift settlement with almost 20.000 people seeking to survive in appalling and precarious conditions. Thessaloniki is the city with the highest ratio of refugees per residents across the EU and in July 2016 it was organized a transnational No Border Camp, where activists from all around Mediterranean and Europe come together with migrants in a self-organized and direct-democratic gathering.

Following the background context, in this presentation, which is based in participatory action research and militant ethnography, I explore how the newcomers challenge the existing socio-spatial power relations and produce unique and porous common spaces, spaces in movement and threshold spaces.

RN25 | Session 08a & RT Session 03 Gender, LGTB

Instrumental and Distinctive Boundary Work between Activism and Politics

Petra A. Berankova
Charles University, Faculty of Social Sciences, Czech Republic
petra.berankova(at)fsv.cuni.cz

In my contribution, I focus on the blurred boundary between activism and institutionalized politics. Drawing on Michele Lamont's concept of symbolic boundaries, I tackle the question how activists relate themselves to the realm of politics. Through an

analysis of 40 interviews with Czech activists, I have recognized two ideal types of activism (which likened Buechler's typology of social movements theories). The first one is political activism, which is based on a broad definition of politics. I will show that within this category, activists lay symbolic boundaries which are based on ideological and thematic notions. They thematise politicians as allies or rivals according to the current strategies, so their boundary work is rather instrumental and they are willing to cross the boundary into politics, if it is needed. The second kind of activism, cultural activism, is based on identity politics, which is distinctly different from institutional politics. Unlike the political activists, these activists lay bright boundaries with politics, in order to distinguish themselves from instrumental acting and construct their own independent identity as activists. I argue that the relationship of activists to politics can be used as an indicator of their conception of activism, including their repertoires of action.

Re-defining Power Structures in Spanish Higher Education: The case of the Solidarity Network of Victims of Gender Violence in Universities

Tinka Schubert
University Rovira i Virgili, Spain
tinkatabea.schubert(at)urv.cat

While social movement theory has extensively explored the role of social movements in changing society, the importance and potential of these movements in the university context and for the overcoming of gender violence has been under researched. Neither social movement theory nor research on gender violence in academia has placed special attention on this aspect. However, some research acknowledges that specific legal changes have resulted from pressure of civil society, such as the Cleary Act in the US (McMahon, 2008). This paper presents the contribution of the Solidarity Network of Victims of Gender Violence in Universities, a specific movement that has emerged to address the problem of gender violence in Spanish universities tackling the silencing of the issue and the power structures making this possible. Qualitative data was collected using the communicative methodology, such as daily life stories and in-depth interviews with institutional representatives, faculty and students of five Spanish universities. The network has greatly contributed to raising awareness on this issue in Spain, which has already been highlighted by the pioneer research on gender violence in Spanish academia (Valls, 2005-2008) with 62% of students knowing about or having experienced situations of gender violence in universities. The paper contributes valuable knowledge on the potential of social movements theory to tackling the silenced reality of the university context, by analyzing how a specific network managed to challenge power structures and contribute to approaching the ideal of more humane universities at the service of society.

Religious Action and the Fight for LGBT Citizenship in Brazil during the Processing of Law Project 122/2006

Leonardo da Silva Santana, Evandro Piza Duarte
Universidade de Brasília, Brazil; Universidade de Brasília, Brazil
lssantanaadv(at)gmail.com, evandropiza(at)gmail.com

The present research is based on the analysis of the speeches of Brazilian senators on Bill 122/2006, which intends to criminalize homophobic conduct in Brazil. The project became known for the polarization it generated among Christian parliamentarians and political minorities, highlighting a greater visibility of both the LGBT movement and religious performance. The latter, even, underwent an important reformulation after the bill was approved in the Chamber of Deputies, strengthening its performance and articulation inside and outside the parliament. The PLC122 / 2006 was chosen in this research as representative to analyze if the religious performance in the National Congress limits the LGBT citizenship. The main argument defended in the work is that in Brazil, the struggle for the extension of citizenship for the LGBT population is an obstacle in the work of parliamentarians identified with the evangelical group within the National Congress. This limit is greater and decisive in the face of the precarious construction of the Brazilian secular state that, at the moment, can not define minimum limits for religious activity, which may prevent the restriction of citizenship of political minorities.

Young Women and Active Citizenship in Romania: understanding the role of family in shaping participatory practices

Daniela Silvia Angi
Babes Bolyai University, Romania
angi(at)fspac.ro

The beginning of 2017 has been marked, in Romania, by notable street protests against a set of controversial measures initiated by the government. In fact, for the past several years, a number of political developments occasioned the vocal mobilization of young people, which encouraged confidence in the emergence of a generation of assertive and civically aware youth. Certainly, protests are solely one of the many forms of political participation, and, taken alone, could only speak for the unconventional side of civic activism. At the same time, youth mobilization questions the deeply engrained idea that young people are disconnected from politics and community, estranged from public matters and detached from political and civic participation. In addition, it revives the interest in how young people understand and practice citizenship, and, importantly, in how they actually develop their visions on what active citizenship means and how it ought to be practiced. Against this background, the focus of this paper is on the role of family, as an agent of political socialization, in shaping young people's attitudes towards their public role as citizens. Moreover, the specific interest

is directed towards young women and their approaches on citizenship, in a society (and new democracy) that preserves substantial patriarchal features. Relying on interview data, I ask how young women accommodate, in their construction of citizenship norms and practice, possibly incongruent influences from parents (socialized in an undemocratic and restrictive political environment) and inputs from other sources of socialization that shape participatory attitudes and behavior.

RN25 | Session 08a & RT Session 04 Economic and Political Crisis

The (dis)connections of a 'shared society': Brexit and the social media interruptions producing fluid forms of citizenship

Photini Vrikki
Brunel University London, United Kingdom
photini.vrikki(at)brunel.ac.uk

This paper looks into the dynamics that have ruptured, alienated, and marginalised specific groups in the U.K. after the Brexit vote of 2016. Focusing on the ways social media are used by these groups to cope with the processes of disconnection, division, and exclusion that resulted from the referendum, (dis)connection on Twitter will be considered as 'a space for radical openness' (Hooks, 1989) that is embraced by groups at times to challenge their representation in society. The result of the referendum has catalysed new concerns about the future of Europe, the status of vulnerable communities, and the fragility of citizenship vis-à-vis nationalism, xenophobia, and racism. In this context of division and conflict there is an opening of new rhetorics that consider the complex ways in which Brexit has managed to selectively efface particular voices or perspectives, counteracting the Prime Minister Theresa May's claim for a 'shared society'. How do people seek to 'creatively interrupt' these dominant power relations in society at a digital level, and has this 'bottom up' communication produced social change? What have these interruptions crafted and what different kinds of visibility, participation, or citizenship are developing? And how do such 'interruptions', produced by emergent communities of solidarity, work in relation to ideas of civility and cohesion? This paper seeks to problematise the idea of digital (dis)connection as always passive, static, and voiceless, by revealing spaces such as Twitter as arenas that can be transformational, strategic, and wilfully used (Ahmed, 2014) to challenge and even 'successfully' produce anti-racist, anti-xenophobic, and inclusive movements that redefine citizenship as a fluid concept.

The struggle for a new politics in a post-ideological world. The case of the 'We Do Not Pay' social movement in Greece

Anastasia Veneti, Maria Rovisco, Stamatis Poulakidakos
Bournemouth University, United Kingdom; University of Leicester, United Kingdom; University of Athens,

Greece

aveneti(at)bournemouth.ac.uk,
mr268(at)leicester.ac.uk, s.poulakidakos(at)gmail.com

The twenty-first century witnessed the emergence of an unprecedented series of protests around the world. The global wave of post-2010 activism illuminates how depoliticization, civic disaffection and the rise of individualism go in tandem with the struggle for people's social and economic rights and the crisis of legitimacy of representative democracy. Looking at the case of the anti-austerity Greek social movement 'We Do Not Pay' Movement (To kinima den plirono), this project seeks to examine whether and how the protestors attempt to define their political presence and identity by exercising a new form of politics that responds to the challenges of a post-ideological world. In order to answer our main research objective, we explore the following issues: the message of the movement and the tactics used to mobilize the people that support it; whether the movement has allegiances to particular civil society groups and other partisan groups nationally and globally; how the protestors respond to austerity policies and ideologies at the national level and beyond; and whether the movement has been inspired by other social movements. To achieve such research aims, we have employed a qualitative approach by conducting semi-directive interviews with key members of the movement, including those involved in setting up and maintaining the movement's online presence in the web page (<http://www.kinimadenplirono.gr/>) and Twitter and Facebook accounts.

'Documenta' & the imagined solidarities of a crisis

Aris Komporozos-Athanasίου
University College London, United Kingdom
a.komporozos(at)ucl.ac.uk

My paper investigates the emergence of collective solidarities amongst local activist and artist networks within, around and against the "Documenta Art Fair". Documenta, the biggest art fair of its kind in Europe, is being hosted for the first time outside of Kassel (Germany) in an alleged attempt to "engage directly with a city in crisis" and create explicitly political "spaces of solidarity" in response to economic, border and refugee crises experienced in the city of Athens. Departing from studies investigating the political potentiality of 'art activism' in the economic crisis-ridden European City (e.g. Alexandrakis, 2015; Marciniak & Tyler, 2014; Giardina & Denzin, 2011; Lewisohn, 2008), my research traces sociologically (elaborating on Castoriadis' concept of 'imagination dialectics') the imaginaries of individual, collective and wider institutional solidarity, constituted as a multi-faceted, and often-conflicted, response to the crisis. The paper asks the questions: How do debt/credit relations underpinning the financial imaginaries produced by Documenta construct or prohibit collective political potentialities in crisis-ridden Athens? How do representations of 'the financial' within Documenta's claimed 'spaces of solidarity',

intersect with grassroots narratives and practices of local independent artists and activists? Empirically I draw on ongoing fieldwork in Athens, including interviews with local and foreign artists who are both mobilised against Documenta while also forming unexpected connections with some of the Art Fair's activities. The paper proposes a conceptualisation of the solidarities produced therein as a struggle between imaginaries of debt, dependency and alternative repertoires of change -- a struggle that is played out in the interstices of institutionally endorsed and radically enacted activism.

"You are not a loan": Financialization, debt-related grievances, and social movements

Christoph Sorg
Humboldt University Berlin, Germany
christoph.sorg(at)hu-berlin.de

The central idea of my paper is to trace the co-evolutionary diffusion of financialization, debt-related grievances, and contentious politics. In the first part I will review relevant literature from political economy, economic sociology and cultural anthropology on the diffusion of financialization and debt-related grievances as well as moralizing discourses on debt. In the second, more extensive step I will discuss my empirical data on various social movement organizations and networks against said grievances, thereby observing how grievances were (or were not) translated into collective action. Data for this multi-sited and global ethnography was gathered via participant observation, qualitative interviews and framing analysis.

My project will contribute to existing research by contributing to a necessary (re-)integration of critical political economy and social movement studies, highlighting recent transnationalizing tendencies of protest and providing empirical data on the debt movement, which is tremendously understudied. The paper presented here will summarize (preliminary) findings of my fieldwork and discuss these against the background of theoretical literature.

These findings include for instance:

- social movements played an important role in the emergence and development of financialized capitalism (as already pointed out by others)
- the internal contradictions of financialized capitalism and the Global Financial Crisis created social bases as well as political opportunities for debt-related movements
- contrasting neoliberalism moralizing the supposed irresponsibility of subaltern debt management, activists constructed broad definitions of the self and used highly moralized frames to instead stress systemic failure, elite irresponsibility, and the need for subaltern solidarity
- South-North and cross-movement diffusion of debt-related knowledges and counter-expertises was crucial

RN25 | Session 09a (Re)Doing Europe: the Making and Breaking of Transnational Solidarity Networks in Times of Economic Crisis

Migration in Solidarity or Solidarity-tourism? Greece between anarchism, civic volunteers and NGOs

Leslie Carmel Gauditz
University Bremen, Germany
gauditz(at)uni-bremen.de

Greece has become one of the major stages for transnational solidarity activism. Especially since the 2015's "summer of migration" the Aegean islands, but also metropolitan areas or camps at the border like Idomeni have attracted pro-refugee supporters from all over the world. This created and creates a very heterogeneous field consisting of anarchist activists, civic volunteers with humanitarian goals (and some free time between university or work) and professional NGOs. More often than not, the scene is completed by refugee-migrants (possibly belonging to one of the groups above) who decided to stay and help. It is a largely under-researched wave of temporary migration to Greece: depending on the site, active Greeks almost seem to be outnumbered by people from abroad. All these different actors carry very different power resources, and the question arose: In what way does short-term activity produce and effect the scene of refugee-solidarity in Greece? Activists have to negotiate who takes responsibility for decisions made for local projects, that want to help refugees but which could harm refugees or Greek infrastructures. At the same time, the material resources as well as energy and motivation of supporting migrants are pivotal to sustain a lot of projects. At the ESA2017 I would like to present partial analysis of a field stay in 2016, which was part of my ongoing PhD project. I will outline and cluster problems and advantages that can arise when a) different cultures (of country of origin and political cultures) produce friction and b) the time dimension produces very different needs for actors supporting refugees.

Networks of social movements in Greece and their transnational dimensions during the Euro-crisis

Sevasti Chatzopoulou
Roskilde University, Denmark
seva(at)ruc.dk

The importance of networks in social movements studies has been extensively acknowledged in the literature (Diani & McAdam, 2003; Krinsky and Crossley, 2014; Diani, 2015). In the literature, 'networks are often conceived either in structural terms through their role in connecting prospective activists to a protest opportunity, or in interpretative terms by shaping identity, which is essential in order to become involved in contention' (Passy and Monsch, 2014:24). Since the European Sovereign Debt (ESD) crisis, one important question on social movements' mobilization, concerns the extent to which social movements develop interactions within emerging networks at different levels -local, national or transnational- in order to make use of emerging and evolving political opportunity structures.

This article maps and analyses the emergence of

networks of social movements since the ESD crisis in Greece and their transnational dimensions. Specifically, the article investigates how networks' relations (ties) among the social movements (nodes) affect diffusion of information and exchange of resources in their effort to target and influence policy decisions (austerity measures) and their institutionalization processes. In doing so, the article uses the Social Network Analysis (SNA) method based on data collected through surveys. By using SNA statistical measurements, the article presents different dimensions of the network structures and levels (local, national and transnational) that these networks operate.

The analysis of the relations of the movements in the network shows that there are cognitive links (targets, issues) that tie the movements together in the network and enhance collective mobilization activities. Moreover, the network structures present noticeable transnational dimensions with respect to their relations (ties) but also concerning issues, targets and solutions since the ESD.

The Performative Strike of the Flight Attendants

Ozge Derman
Ecole des Hautes Etudes en Sciences Sociales,
France
ozgezderman(at)gmail.com

The present paper focuses on the performative action of the flight attendants of Turkish Airlines during "Gezi Park protests." As a part of the ongoing strike, which started 3 May 2013 and ended in February 2014, the hostesses on strike performed a remaking of the flight safety demonstration in a creative manner, wearing "V for Vendetta" masks on 5 June 2013. The protest actions were performed in the Turkish Airlines headquarters in Bakirkoy and Galatasaray Square in Taksim. The idea of performative experimentation of resistance stem from the experience of alternative political action repertoire in public sphere within Gezi Park protests.

Within Gezi Park protests, the "public space" took a new meaning through the building up of political action repertoire by means of performative interventions. The unexpected gestural protest of the flight attendants on strike revealed thus the transformation of the subjective and collective action in an everyday "theatrical stage." This form of performative action contributes to the solidarity with the trade unions, reinforces the political effectiveness of creative non-violent actions and triggers the dynamics of aesthetically reconfigured counter public spheres.

This paper adopts a qualitative methodology, introducing hermeneutics as a process of understanding. The data is provided by semi-structured interviews with the participants of the protest and by an inquiry based on hashtag ethnography and research on Twitter on specific hashtags such as #thydegrevvar, #thygrevde and the sharing of youtube video on 6 June 2013.

Transnational Social Movement Coalitions: A

Conceptual Framework

Bartek Goldmann
Scuola Normale Superiore, Italy
bartosz.goldmann(at)sns.it

The intersecting crises of capitalism, democracy, ecology and migration call for mobilisations that are capable of transcending narrowly defined identities, and establishing transnational solidarity networks with the necessary flexibility to accommodate multiple platforms. While a significant body of research has explored coalition building processes within social movements, less attention has been devoted to the study of coalition building processes across social movements, particularly with regards to their emergence on a transnational level. Accordingly, this paper presents the conceptual framework for early-stage doctoral research which seeks to understand the conditions and processes that facilitate or inhibit the formation and maintenance of transnational social movement coalitions via a comparison of two anti-austerity and two anti-fascist movements in Europe. By drawing on document analysis, participant observation and semi-structured interviews with movement organizers and rank-and-file activists the research aims to explore two specific themes. Firstly, it investigates the effects of organisational structures, environmental conditions and resource mobilisation on the form of transnational coalitions and the pace of their development. Secondly, it explores the relationship between transnational coalition formation and collective framing strategies in order to understand how social movement organisations negotiate conflicts around ideology, objectives and strategy which arise in the context of cooperating with diverse external groups.

Transnational Trade Union Action in times of crisis: The case of the European Action Days

Julia Hofmann
University of Vienna, Austria
julia.hofmann(at)univie.ac.at

Since nearly ten years the EU is confronted with one of its biggest crises in history. In this context, the economic, political and social divergence between the different European regions became more noticeable than in the years before. These growing disparities between the “North” and the “South”, the “East” and the “West” scratch on the small traces of a genuine transnational society in Europe which slowly developed since the founding of the EU in the 1990ies.

Against this background, a recently finished research project dealt with the question, if and how trade unions can contribute to the emergence of transnational ties and social networks in Europe. Trade unions serve as a good example for possible transnational actors as – besides their national anchorage – they are well connected across borders, have established European umbrella organizations and are acknowledged collective actors on the European level. Empirically, the project was based on the historical

analysis of the European Action Days which are specific forms of cross-border trade union mobilizations mainly taking place on the political level. The project showed that – besides the evident regional disparities – transnational trade union action increased steadily since the 1990ies and even augmented during the EU crisis. This development can not only be explained by the weakening of trade unions in different national contexts and the increasing importance of the EU in the sphere of IR, but is also an effect of positive, transnational protest experiences and memories as well as of shared transnational framings.

RN25 | Session 10a Citizenship from Below: Social Movements as Forms of Resistance and Redefinition of Citizenship II**Citizenship as a process for asylum seekers: role of urban social movements**

caterina giacometti
University of Milan, Italy
caterina.giacometti(at)unimi.it

Based on the recognition of social representations of passivity and submissiveness about asylum seekers and refugees and of the implementation of “governmental rationalities” (Oesch, 2012: 146) whose objective is the establishment of a separation between them and the rest of the population, I propose to reflect about urban social movements as “free spaces” (Polletta in Caciagli, 2015:4) that trigger and support asylum seekers’ “processes of citizenship” (“processi di cittadinanza” : Ambrosini, 2016: 92) through daily collective practices which propose and make possible new ways of living the city. In this view, citizenship itself is conceived as a “subject-position” (Isin, 2009: 370) which may be held by different subjects, with or without the legal status of citizens. Nevertheless, the re-construction of a social and political identity and the re-acquisition of a sense of citizenship seem to be slow and gradual processes that should therefore be studied, as anticipated, in terms of “processes of citizenship”. Then, urban social movements help these processes, becoming points of reference which break “governmental rationalities” aimed to exclusion and control of asylum seekers and playing a role of union between them and the society where they live. Moreover, such spaces satisfy the fundamental need of migrants, as of every human being, of “interaction” and “identification” (Catarci, 2014:74) and they challenge urban institutional rationalities by experiencing new, or renewed, models of collective living based on the active participation of every individual, including asylum seekers, in the recognition and the achievement of the objectives, the construction of welfare from below, and in some forms of political participation through the identification of claims and speeches understandable and sharable by all those who cross them.

Redefine “by the right side”. How mobilization against deviant populations participate to redefine local citizenships?

Kevin Vacher

Université Paris VIII - Vincennes - St Denis;

CRESPPA-CSU, France

kevinvacher13(at)gmail.com

For the past few years, scientific debates about social mobilization and renewal of citizenship have been focused “on the left side” : Indignados, Nuit Debout, Arab springs, Occupy Wall Street Most recently, the rise of some new studies about the far right or populist movements like the Movimento 5 stelle have participated to put the focus on the capacity of this political side to catch these issues of “democracy from below” and turn them into a new right paradigm. Sadly, these studies are frequently and paradoxically locked into a perspective “by the top”, as if these phenomena was mostly a partisan question. Citizen and their movements are regarded, therefore, by the dominant discourses as the social figure of the manipulated far right’s voter, receiving passively the security and anti-migrants discourses, but rarely as active actors.

We will make the hypothesis that, against the so-called “dangerous populations”, a historic segment of the citizenship is gathering nowadays by these discourses. Neither manipulated nor naturally legitimate, we will report from five cases studies of mobilization for the security in Marseille and Naples and how some citizens participate into giving a new meaning of the local spaces and citizenship “from the right side” and “from below”. Using an ethnographic position and multi-materials study, we will analyse their contentious repertoire and participation to the social control dispositive to understand the dialectic between redefinition of the citizenship and these social mobilizations. Finally, we will contribute to a critical understanding of these “ugly movements” (TARROW, 1994) putted into perspective with the vigilantism’s (PRATTEN and SEN, 2007) practices rising in occidental countries and the contemporary urban democracy (DELLA PORTA, 2004).

The transformation of European solidarities under the challenge of the “refugee crisis

Mario Rodríguez Polo, Jaroslav Šotola

Palacký University Olomouc, Czech Republic; Palacký

University Olomouc, Czech Republic

mario.rodriguez(at)upol.cz, jaroslav.sotola(at)upol.cz

The so-called “refugee crisis” has not only challenged establishment but also civil society and a variety of forms of public engagement. Authors focused their ethnographic efforts on the analysis of border corridors, train stations and emerging aid-chains in Central Europe which main aim was to provide aid to refugees across very diverse spots of the so called “Balkan route”. Through multi-site fieldwork and active engagement authors gained ethnographic knowledge on informal activities. The paper attempts to locate the so called “independent volunteers” in a new

reconfiguration of European solidarity imaginary where borders and orders are put under question. Informal initiatives are constructed in opposition to hegemonic values but in their performance they are not free of incongruences and ambivalences. Hybridity and ambivalence characterizing informal initiatives are performed through their agency when forced to confront or collaborate with authorities or to show ambivalence towards NGOs. Their actions are understood as a way of resistance, as they oppose establishment and confront it in their performance. Inclusive approach to refugees negates the social construction of migrants as main figures and holders of alterity. With their actions informal initiatives confront the established limits of who belongs to the deserving solidarity group, which is currently formed under a nation-state paradigm. Their conceptual positions argue for a universal framework. The sum of such oppositions and ways of resistance turned informal initiatives into a transformative actor challenging the deep structures of European societies.

RN26 - Sociology of Social Policy and Social Welfare

RN26 | Session 01a Worlds of Care

Blurring Welfare Boundaries: The Case of the Swiss Disability Insurance.

Emilie Rosenstein, Jean-Michel Bonvin
University of Geneva, Switzerland; University of Geneva, Switzerland
emilie.rosenstein(at)unige.ch,
jean-michel.bonvin(at)unige.ch

Since the 80s, the active turn of welfare policies has progressively transformed the scope and shape of welfare regimes across Europe. Literature has shown that activation has ambivalent impacts regarding both the entitlement to welfare benefits (moving from social rights to contracts) and the way they are delivered (from bureaucratic and standardized models to individualised solutions). Thus, the implementation of active policies contributed intensively to the redefinition of welfare boundaries, both on a material (access to welfare benefits) and symbolic level (especially between welfare recipients that are seen as “activable” and the ones confined to so-called “passive” benefits) (Lamont and Molnar, 2002).

Based on the case of the Swiss Disability Insurance (DI), this contribution precisely questions the ambivalent impact of these new boundaries by analysing the administrative trajectory of people applying for DI benefits. Using an innovative longitudinal research design, combining quantitative (sequence analysis) and qualitative data (biographical interviews with recipients of DI benefits as well as semi-structured interviews with DI professionals), our study sheds light on three tendencies: a shortening in the follow up of DI recipients; a discrepancy between the massive reduction in the access to “passive” benefits and a marginal increase of active measures provided; an increase of DI refusals, i.e. people who didn't receive the benefits they applied for. This raises two major issues for the future of welfare policies: on the one hand, the appropriateness of the focus on active programmes for disabled people; on the other hand, the coordination of DI with other welfare institutions, regarding the increasing number of people getting out of DI schemes.

These results are drawn from the NCCR-LIVES funded by the Swiss National Science Foundation, 2011-18.

Carceral rehab as fuzzy penalty: hybrid technologies of recovery in the new temperance crusade

Teresa Gowan, Sarah Whetstone
University of Minnesota, United States of America;
Bradley University, Illinois, United States of America
tgowan(at)umn.edu, swhetstone(at)fsmail.bradley.edu

The steep escalation of court-mandated drug rehabilitation since 1989 has reinforced the role of “rehab” as a primary node of social control. Drawing on ethnographies of three Midwestern male residential rehab facilities which each reflect dominant treatment paradigms, we delineate and analyze a diverse field exercising varied modes of the carceral and the therapeutic. Formed in different intersections with criminal justice and the dispersed US social state, the programs' highly contrasting models of addiction and recovery result in different forms of confinement and treatment. Partnered with the local drug court, the “strong-arm” facility “Arcadia House” uses full-time cognitive behavioral therapy designed to forcefully break down the “criminal addict” and “habilitate” him into “Joe Taxpayer.” The powerful faith-based organisation “Victory Ministries” similarly takes on the fundamental remaking of the individual, but where Arcadia melds penalty with the therapeutics of AA and NIDA, Victory works through a longer process of spiritual education and labor discipline to transform addicts into hard-working evangelical Christians. Both facilities emphasize that “healing” requires physical confinement with adherence to strict rules, and each works (through different pathways) to instill humility, a strong work ethic, and mental preparation for low-wage labor. In contrast, the hospital facility “Healing Bridges,” with its classically neoliberal, bio-political technologies of control, benchmarks the many ways in which carceral versions of rehab deviate from more medicalized middle-class understandings and experiences of rehab. Where the latter emphasizes pharmaceutical regulation and peer-led repair work in the AA tradition, the “strong-arm” rehab's extension of criminal justice beyond jail walls elaborates hybridized extensions of penalty in authoritarian projects to reconstruct the deviant poor.

Cash for care and the value of money: the case of the long-term care benefit in the Czech Republic

Radka Dudová
Institute of Sociology of the Czech Academy of Sciences, Czech Republic
radka.dudova(at)soc.cas.cz

In my presentation, I aim to analyse the value of money in the caregiving relationships. Care is situated on the boundaries between labour and love, or financial exchange and reciprocity; the introduction of cash for care policies may lead to a reformulation of these boundaries. Although some authors warn against commodification or marketization of care, monetary transfers have always been present in family relationships. The way the caregivers give meaning to the money they are entitled to and get

from the state, and the way they use this money, determines not only the way how they understand and perform their role of caregiver, but also the configuration of the relationships between various stakeholders in the field of care and social services and welfare state.

Using the theoretical frame of “special monies” by V. Zelizer, I compare the results of two qualitative research projects – one researching the life strategies of women giving care to their elderly parents and the other researching women caring for their children with disability (both groups are informal caregivers caring for a person entitled to “attendance allowance” in the Czech Republic). The analysis shows how the individual understanding of the same benefit is shaped by cultural values and norms as well as by institutional context, leading to distinct use of the money in different situations of care, which has then specific consequences for the economic situation of caregivers. I therefore argue that different situations of care require different policy solutions.

RN26 | Session 02a Welfare in Interaction

Collaboration and networking in child welfare and protection in Norway

Johans Tveit Sandvin, Cecilie Anvik, Christian Lo Nord University, Norway; Nordland Research Institute; Nord University, Norway; Nordland Research Institute johans.t.sandvin(at)nord.no, Cha(at)nforsk.no, clo(at)nforsk.no

Collaboration and networking have become ubiquitous in discussions of welfare reform, especially given potential benefits in service integration and stakeholder synergy, innovative practices and economies of scale. Over the last few years, the Norwegian government has encouraged a range of enhanced collaborative efforts and network schemes in welfare provision, some of which involve various private or voluntary actors.

In an ongoing project, we study inter-organizational collaboration and networking in the area of child welfare and protection (CWP) in Norway. Focus is on enabling and constraining factors that underpin such collaboration and networking. The project contains several phases, in which the first phase involves a mapping of collaborative initiatives and network experiences in a sample of Norwegian municipalities. In Norway, public involvement is comprehensive, and municipalities are expected to take a strong responsibility for social service provision, including for CWP.

The paper presents the patterns revealed from this mapping, including with regard to the type and frequency of collaboration with other services and stakeholders, the benefit of such collaboration and factors that promote and constrain such collaboration. Findings are discussed in relation both to the regulative structures CWP and municipalities are subject to, and in relation to relevant international research.

Overhauling Russia’s Child Welfare System: Ideas and Agents of Policy Change

Meri Susanna Kulmala, Zhanna Vladimirovna Chernova, Larisa Shpakovskaya
University of Helsinki, Finland; Higher School of Economics, Russia; Higher School of Economics, Russia
meri.kulmala(at)helsinki.fi, chernova30(at)mail.ru, lara(at)eu.spb.ru

This article studies the policy-making processes behind the major overhaul of the child welfare system recently announced by the Russian government. We highlight the fundamental change in the ‘ideal of care’ represented by the move to ‘deinstitutionalise’ the care system by promoting foster and adoptive families, closing most residential homes and radically reforming remaining ones. In exploring the evolution of the reforms and Russian government thinking on child welfare, we explain that the ‘political will from above’ (volya sverkh) behind these major reforms was shaped by a range of contextual factors, including advocacy by non-governmental actors, international norms, expert knowledge, shifts in wider family policy as well as public opinion. Such analysis helps to indicate the broader forces shaping policy change in Russia and explain cases when Russian NGOs have unusually high level of participation as ‘epistemic communities’ in policy design.

Social workers as street-level-bureaucrats in processes of eviction risk among families in Sweden

Stina Fernqvist
Uppsala University, Sweden
stina.fernqvist(at)ibf.uu.se

In the Swedish welfare state, assessment of applications regarding benefits for rent costs varies greatly between municipalities. This could partly be explained by formulations in the legislation but also by the inherent discretion in social work practice. This study focuses on practices of categorization in processes of eviction risk among families, where there are indications of parental cognitive difficulties. The paper in question aims at exploring social workers’ discretionary approaches in these client interactions, and specifically how indications of cognitive difficulties are handled in relation to financial problems. This paper highlights how they, as street-level-bureaucrats (Lipsky, 1980), define and assess these clients’ needs of support but also how they view their professional role and the scope for interventions regarding parental impairments in relation to need for income support.

This qualitative analysis is based on a small section of the above-mentioned study, consisting of interviews with nine social workers in different units of the social welfare agency, who encounter families in eviction risk and use discretion in their exercise of public authority. The tentative findings show that although the interviewees note that cognitive difficulties may partly explain the need for income support on a general level, the strategies to 1) address indications of

impairments, 2) emphasize the possible correlations between impairments and the financial problems and 3) adjust the process and/or offer alternative interventions vary greatly, which among other things suggest that the social workers may not get a full account of their clients' situation which in turn may affect the access to proper support.

Utilizing Meta-Ethnography as a Methodological Approach in the Study of Innovation in Children and Youth Welfare Services

Ingrid Fylling, Johans Tveit Sandvin, Robert Bye, Berit Vannebo

Nord University, Norway; Nord University, Norway;
Nord University, Norway; Nord University, Norway
ingrid.fylling(at)nord.no, johans.t.sandvin(at)nord.no,
robert.bye(at)nord.no, berit.i.vannebo(at)nord.no

Research on innovation in welfare services has grown extensively over the last years. Welfare innovation projects address and challenge traditional ways of service delivery, proposing new and innovative ways of organising welfare services as well as developing new services. In this particular research project, we study research on welfare innovation projects directed towards children and youth services. Innovative services in these areas might include initiatives aimed at preventing high school dropout, developing new forms of child protection services, and programs aimed at physical education and healthy eating for children and youth.

The aim of the project is to synthesize qualitative studies of welfare innovations in the field of child and youth protection in Norway, using a meta-ethnographic approach. According to Strike and Posner (1988), a meta-ethnographic approach also involves some degree of conceptual innovation as means of creating the whole. A meta-ethnographic analysis thus implies developing new concepts that capture the essence and the contribution of research studies combined. In this paper, we discuss methodological challenges in designing a meta-ethnographic project. One challenge when using the meta-ethnographic approach is defining the scope of relevant research in a field, or principles of inclusion and exclusion when mapping a particular topic of interest. We present and discuss different strategies for sampling relevant research contributions on the topic of innovation in welfare services aimed at children and youth. We also discuss the benefits of using the meta-ethnographic approach in areas where little research exists, and find that particular strategies of inclusion and exclusion allow us to map various kinds of relations between studies in this area

RN26 | Session 03a Marginalization and Poverty I

Creaming for integration: National and local policy strategies for integrating refugees in contemporary Norway

Kjetil Lundberg
Uni Research, Norway
kjetil.lundberg(at)uni.no

Integration of refugees is on the political agenda in a range of European countries. In Norway, a new set of asylum refugee centers, "Integration centers", are currently being developed as part of the integration strategy. The integration centers are characterized by providing full time programs combining language education with job training. The refugees' competences are mapped at an early stage, and formal educational papers are processed at an accelerated pace. The implementation of integration centers speaks to some of the critiques raised against the "introductory legislation" from 2003, for being too weak on employment orientation, and that the processes of teaching and training (e.g. language, Norwegian norms and culture, job training) starts too late. Refugees that are likely to be granted asylum, and who show signs of motivation for learning Norwegian and becoming integrated, are recruited to the integration centers.

This paper will examine the policy development of refugee integration in Norway on a national and local level. On the national level, policy documents on the new integration centers and the introductory programs will be subjected to attention. On the local level, data from a case study conducted on seven municipal programs through which refugees and immigrants were trained to work in eldercare, will be used. The paper aims to contribute to the field of sociology of social policy and social welfare, by examining these policies as a potential example of a shift from universalistic towards selectivity policy strategy, with the possible shift in policy aim from integrating all refugees, to center the attention and resources towards the most promising or "integrateable" refugees.

On the Pedagogization of Urban Marginality in the Era of Neoliberalization

Christian Sandbjerg Hansen
Aarhus University, Denmark
csh(at)edu.au.dk

Like so many other cities around the world, the process of advanced marginality has transformed Copenhagen (Denmark). This has involved a stigmatization of certain areas of the city in which "problem categories" of the population are concentrated. In Copenhagen, an answer to the forms of urban marginality that concentrate in stigmatized neighborhoods has been area based interventions and urban renewal projects. These projects have not just focused on improving the physical environment, but also the people living there. Thus, they have been intimately intertwined with corps of different social work agencies, forming a veritable pedagogization of urban marginality.

In this paper, I investigate this pedagogization by looking into interviews with social workers from the infamous Northwestern territory in Copenhagen. I highlight three themes that seem to structure the social workers understanding of themselves, their activity, and the place: The sense of bureaucratic demands and virtue

of professional autonomy that leads to strategies of both compliance and resistance to the neoliberal transformation of both state and place; the “friendliness” of their pedagogical ideals of practice; and the ambivalent categorization of the place, making it at one and the same time a “diverse area” worthy of middle-class dispositions, and a problem-child to be nurtured and civilized.

"Labour market integration of refugees in welfare states – a “European dilemma”?

Isabella Skrivanek

Danube University Krems, Austria

isabella.skrivanek(at)donau-uni.ac.at

Europe has experienced a substantial inflow of refugees over the past years. While in the beginning humanitarian considerations prevailed in some countries, strong concerns on the number of humanitarian migrants and their potential to integrate in European labour markets and societies have evolved in many countries and their electorates. OECD data show that it takes on average five to six years until humanitarian migrants catch up with employment rates of family migrants; which are still substantially lower than those of labour migrants. In the Austrian case, welfare dependency of refugees has become a contested issue in politics and prompted first changes, i.e. reductions for refugees in the minimum income scheme in three of nine Austrian provinces. Given these challenges, the suggested paper analyses the Austrian case in comparative perspective (Sweden, Denmark, US). The analysis is situated in comparative welfare state research and its strand of research on activation. It is assumed that refugee integration requires a coordinated approach (especially towards integration, employment and social policy) and that policy options are determined by the underlying institutional structure (welfare state regimes). The selection of Sweden, Denmark and the US for comparison is based on these theoretical considerations and the assumption that for Austria (as conservative welfare state with a “middle” position on the workfare/human resource development continuum of activation) idealtypically “pure” cases of one or the other approach are most interesting. The analysis is based on a review of literature, policy documents and first indicative results of interviews with Austrian stakeholders. Overall, the paper aims to contribute to research on how (whether) increased ethnic diversity “unmakes” previous welfare regimes and identify policy options beyond limiting entitlements.

„We have to reach the Personality“ Blurring boundaries between autonomy and paternalism in social activation schemes

Carolin Freier

Institute for Employment Research, Germany

Carolin.Freier(at)iab.de

Social activation schemes that don't include work experience focus on benefit recipients who have little prospect of finding paid work. In order to build long-

term labour market perspectives for this group in Germany, the schemes for example include theatre, dancing or sports activities. They could address health, financial, social or family issues as well and supply social work assistance. The activities and assistance were meant to structure the person's life, foster social contact and restore self-confidence. For that reason they are called social activation schemes. The Dutch government pioneered in introducing social activation experiments to allow long-term unemployed persons to participate in society in alternative ways.

Based on 45 interviews with experts in several employment offices and with providers of social activation schemes in Germany, the presentation will shed light on the way social activation affects boundaries between autonomy and paternalism. The presentation explores whether case workers in the employment services and social workers in the providers deal with the participants of social activation schemes in a new way and how they address aspects of their personality. Besides, the actors' concept of activation and integration will be examined.

The presentation argues that social activation is a paradox of the transforming welfare state: On the one hand it is supposed to foster autonomy and self-responsibility of persons remote from the labour market using holistic approaches. On the other hand, this holistic view of the lifeworld of unemployed persons could broaden the influence of the employment service, thus making the welfare state more paternalistic.

RN26 | Session 04a Marginalization and Poverty II

Persistent household over-indebtedness and exits from over-indebtedness. Evidence from EU-SILC

Stefan Angel

WU Vienna University of Economics and Business, Austria

stefan.angel(at)wu.ac.at

In contrast to income poverty there is less research on spells of deprivation measures, particular illiquidity and debt problems of private households. The aim of this study is to investigate differences between household over-indebtedness and income poverty dynamics with a focus on exit probabilities and persistence. Over-indebtedness is defined as a situation of illiquidity resulting in payment problems. The analysis is based on SILC panel data 2010-2013 for 25 European countries. With reference to the theoretical literature on poverty dynamics (social stratification perspective, life course perspective), we evaluate the effects of structural factors (f.i. sex, education) on the likelihood of exiting over-indebtedness as compared to biographical events (f.i. getting unemployed, changes in the marital status). Moreover, the impact of different welfare state regimes and single welfare state indicators on both the likelihood of exiting over-indebtedness and its duration are investigated. Particularly for exit rates from poverty, consistent country differences according to welfare regimes are not always found in the

literature. This could also apply to over-indebtedness. Preliminary results using ordinal logit models with the number of over-indebtedness spells as dependent variable show that the odds for more over-indebtedness periods are significantly lower for older age groups than for younger age groups. Moreover, a quick escape from both over-indebtedness and income poverty is more prevalent in liberal welfare states. There is further descriptive evidence, however, that once a longer time has been spent in deprivation, the likelihood of exiting over-indebtedness is highest in conservative welfare states respectively in liberal welfare states in the case of income poverty. Currently on-going analyses also apply multilevel regression methods and focus on the effects of single policy indicators.

The social unsustainability of EU anti-poverty measures

Giuliana Comisso, Giordano Sivini
University of Calabria, Italy; University of Calabria,
Italy
giuliana.comisso(at)unical.it,
giordano.sivini(at)gmail.com

The measures adopted by European countries to lift people out of relative poverty are not effective. Our review shows that: 1. no country uses the European relative at-risk-of poverty threshold (Eurostat) to define the poverty, but lower thresholds; 2. half of the poor do not claim the access to the measures; 3. in most cases, purely economic support are not sufficient to overcome social exclusion; 4. all countries require people to stay on the labor market as a condition to get income; 5. if not, sanctions are applied; 6. in most cases the net minimum wage is beneath the line of poverty.

Italy is the only country in the EU that has not yet adopted measures to address poverty: there was Greece too, but the Troika has imposed to prepare the measures. The major Italian parties have made proposals that follow the patterns of UK and Germany. We analyze their systems, and show that: 1. the access to the income is subject to the compulsion to underpaid wage labor and unpaid labor; 2. the compulsion is based on very stringent penalties; 3. the system creates dependency and subjection to the discretionary power of local management; 4. a lot of poor prevent from entering the system so as not to be subjected to treatment that infringe rights and freedoms, and which make them subject to the social stigma. We believe that the implementation of such system in Italy is socially untenable, and we propose measures that come close to some principles of universal and unconditional basic income.

Welfare goes ethnic - Securitised management of minorities

Lenka Kissová
Masaryk University, Slovak Republic
lenkakissova.kiska(at)gmail.com

In the last decades there has been a tendency in

Europe to retrench welfare provisions. Governments have tried to find ways how to legitimise unpopular cut-backs in areas such as health care, pensions or material need. In 2014 an Act on benefits in material need came into force in Slovakia. Even though the yearly expenses on material need in the country represent less than 1% of the overall state budget, this legal act has conditioned the benefit with workfare. Individual responsibility for life and well-being have become an integral parts of the welfare individualisation. Within such ideational environment the welfare cut-backs seem to have legitimate reasoning – state representatives limit social provisions in order to ‘adjust’, ‘educate’ and ‘motivate’ individuals to take care about their own lives.

The goal of this paper is to examine the perspective of the policy-makers, motivation and arguments legitimising the recently adopted Act on benefits in material need from the critical perspective, based on the political discourse analysis. Welfare beneficiaries are stigmatised from multiple perspectives – on the basis of ethnicity, social or economic status as they are depicted as abusers, living an abnormal and pathological life. They become subjects of regulation and control, re-establishment of the social order. Policy objectives seem to be legitimised in the political discourse through the images of risk and threat to the society, using the assistance beneficiaries as subjects of these security threats, having an ethnic dimension – and so, aiming at the social, economic and symbolic exclusion of the Roma.

Fighting unemployment and poverty at a time of economic crisis: in need of a broader welfare framework

Olympia Kaminioti
National Institute of Labour and Human Resources,
Greece
olympiakaminioti(at)gmail.com

Employment policies fight unemployment. Poverty policies fight poverty. Solidarity policies fight social exclusion. People usually face multiple problems. How successful can separate policies be if they address only a single aspect of a systemic problem? The current socioeconomic crisis in Greece (and elsewhere) has underlined the interrelating aspects of growth model, employment strategies, and welfare policies at a micro and macro level. At the micro level, the multiple problems of crisis sufferers cannot be addressed adequately by separate policy strategies. At the macro level the lack of a systemic perspective results in inefficiencies of policies and waste of scarce resources. Through the analysis of some existing policies, we propose ways in which a broader framework that addresses multiple problems of crisis sufferers and a specialized approach according to the targeted population taking into account the specific needs of this population could be beneficial at a time of great problems that need to be addressed with minimum resources. We aim to answer the question: How can we improve employment, poverty, solidarity and health at the same time? Integrative but

specialized policies that are tailored to the needs of recipients are suggested.

RN26 | Session 05a Partners for Welfare

Contradictions Finnish Nonprofit Associations Encounter while Searching for Public Funding Based on Gambling Profits

Veera Emilia Kankainen
University of Helsinki, Finland
veera.kankainen(at)helsinki.fi

Partnerships between third and public sector in service production has been emphasized also in Nordic welfare states after the introduction of the governmental ideals of New Public Management (NPM). It has been suggested that some regimes have even moved beyond NPM to 'relational governance' based on an idea of interdependency between civil society and state. Despite the ideals, Finnish nonprofit service producers have faced financial uncertainties in the era of new governance in 2000s.

This qualitative study critically investigates current governmental relationships between public and nonprofit actors. The data consists of 24 semi-structured thematic interviews of representatives of nonprofit social and health care organizations (NPOs) which have received public grants from the Finnish Slot Machine Association (RAY). The case is timely and interesting for number of reasons:

First, the social and health care NPOs have been heavily dependent on the funding of RAY. Second, the governance of RAY and channeling of its profits to beneficiary organizations has happened in an intertwined relationship between state authorities and NPO actors. Third, as the three Finnish gambling monopoly operators (including RAY) merged in early 2017, the state gained even more control over the allocation of gambling profits.

Against this background, the study asks: Under what kind of conditions and governmental relationships NPOs receive funding from gambling based profits?

The method used is thematic analysis which concentrates especially on roles and relationships between NPOs, state and gambling operators. The results indicate that NPOs use partnership discourse to describe their relationship to the public funder. Meanwhile, they also hint that power relations loom in the background and NPOs are pressured to adapt to policies of the funder and state.

Impact of the third sector on the socio economic development of Croatia and potentials for modernization of social policy system

Danijel Baturina
University of Zagreb/Faculty of Law, Croatia
danijel.baturina(at)pravo.hr

The third sector in Croatia, as the post-socialist country had specific path dependency and „thorny“ development. The third sector was initially not part of the concept of social policy reform and building a new

social system. State paternalism and patron attitude towards the third sector are still dominating. The centralized and paternalistic state is over regulating development of services and social programs. The legacy of the paternalistic social policy is still visible in the widespread expectations from the state to organize and deliver social services and lack of development of welfare mix approach.

This paper will analyze the impact of the third sector in Croatia and put it in the context of potentials modernization of social policy system. The paper will be based on the research conducted within the Ph.D. thesis "Impact of the third sector on socio-economic development of Croatia" undertaken within FP7 project "Third Sector Impact". The dissertation was based on qualitative research. Semi-structured interviews with key stakeholders in the sector and multiple case studies of third sector organizations were used as research methods.

Our analysis will highlight the impact of the third sector on social policy development and types of existing third sector-state relationships. The possible role of the third sector in the modernization of social policy system in Croatia, especially in introducing new elements like social entrepreneurship and economy, hybridization, and enhancing good governance will be analyzed. In conclusion, we will give recommendations for further strengthening contributions of the third sector on social policy system development.

Tax Authorities, Philanthropic Foundations, and the Recognition of Public Utility: the Moving Boundaries of the Welfare State in Switzerland

Alexandre Lambelet, Philip Balsiger, Caroline Honegger, Romain Carnac
EESP, Haute Ecole de Travail Social, Suisse Occidentale; Université de Neuchâtel, Switzerland;
EESP, Haute Ecole de Travail Social, Suisse Occidentale; EESP, Haute Ecole de Travail Social, Suisse Occidentale
alexandre.lambelet(at)eesp.ch,
philip.balsiger(at)gmail.com,
caroline.honegger(at)eesp.ch,
romain.carnac(at)eesp.ch

Philanthropic foundations or "foundations of public utility" are a specific, highly regulated form of giving, managing and distributing private resources. As private goods distributed in the service of a public interest or utility and managed by private actors, foundations constitute rather peculiar institutions sitting at the boundaries between public and private action.

What role do philanthropic foundations play in complementing public action in the pursuit of the common good? Questions of public utility and the role of private actors in promoting the public interest are intimately linked to changing conceptions of the role of the state in society. Over the past decades, neoliberal ideology and policies have questioned the scale of the welfare state; political, economic and financial crises have further eroded state capacity and social policies.

In this paper we study how federal and cantonal state authorities in Switzerland define the notion of “public utility”. Studying the recognition of public utility as an instrument of public policy to promote private initiative through tax reliefs can be a way to analyze how the boundaries between public and private actors are drawn and evolve over time. The paper is based on a research project that compares three cantons and the federal level and analyses a) legislative reforms, b) jurisdiction and c) tax administrators, using mainly interviews (with deputies, administrators and judges), and content analyses of parliamentary debates and court cases to study the practices and justifications leading to the recognition of public utility.

RN26 | Session 06a Investing in Welfare

A social investment perspective on lifelong learning policies: the challenges ahead

Yuri Kazepov, Ruggero Cefalo
University of Vienna; University of Vienna
yuri.kazepov(at)univie.ac.at,
ruggero.cefalo(at)univie.ac.at

In our contribution, we investigate the relationship between social investment (SI) and lifelong learning (LLL). SI as a policy perspective supports the relevance of the welfare state in employing public resources to foster productive social policies, in order to combine social inclusion and economic competitiveness (Esping-Andersen et al., 2002; Morel et al., 2012). The importance of education and a focus on the entire life course as put forward by the SI approach corresponds also with the basic principles of LLL, pledging – in its initial conception – for the integration of learning experiences within the entire life course (vertical integration) and the emphasis on life wide learning (horizontal integration) (Wain, 2001). Definitions, interpretations and the discourse on LLL have been changing over time, highlighting different priorities assigned to its political, social or economic dimension. We consider the current approach to LLL an example of SI policy. Discourses and practices in both fields stress the central role of public investment and aim at the advancement of human capital. In this paper, we will critically assess LLL policies from a SI perspective. At the same time, we want to challenge the limitations of the SI approach by avoiding the reduction of LLL to a functionalist understanding, as it implies a narrow and problematic notion of social inclusion and social justice. Instead, we argue with Walker (2012) and others, to approach LLL in theory and practice through a human capabilities approach and draw on the holistic dimension of LLL inherent in its initial conception.

Social investment as a feasible universal tool for eldercare policymaking? The case of Estonia

Häli Tarum, Dagmar Kutsar
University of Tartu, Estonia; University of Tartu,
Estonia
hali(at)ut.ee, dagmar.kutsar(at)ut.ee

The latest economic crisis in the EU created the need to renew the social policy agenda as the austerity measures applied by Member States threatened to undermine the existing value system. Therefore, the European Commission needed to encourage Member States not just to cut the costs of the social protection system, but to re-conceptualize social expenditure in the framework of social investment. Accordingly, in the spring of 2013 the European Commission introduced the Social Investment Package. However, the ongoing debate has drawn attention away from evidence concerning how social investment as an external norm would work in eldercare policy context. Is it a feasible Europe-wide universal tool when Member States are implementing different strategies for dealing with the aging population problem? We argue that the implementation of the social investment approach in the field of eldercare is a challenging issue for many Member States. To illustrate the argument, we explore the practices of social investment approach as it encounters local eldercare policies in the case of Estonia. We use qualitative data produced during interviews with policymakers to explore the issue. The study reveals that the new norm is implemented on top of the familialistic eldercare model, i.e. there is normative friction between the external and internal normative context. Based on the example of a familialistic country with low expenditures on eldercare, we claim that future eldercare models cannot entirely follow the logic of social investment and should combine new investing policies with old protective measures.

Social Investment in Europe. A cross-national comparison

Carolin Schönert
Westfälische Wilhelms Universität Münster, Germany
schoenert(at)uni-muenster.de

In 2013, the European Commission issued the Social investment package (SIP) as an answer to the economic crisis and the demographic change in the European Union. The transition of social policy from compensating measures to social investments (SI) should encourage the strengthening of human capital development, effective and efficient human capital usage as well as promoting social cohesion. The integration of a variety of social and market actors into the development, implementation and financing process should lead to these outcomes.

The paradigm lying behind the SIP is emerging in all European welfare states. However, its interpretation and the degree of implementation vary. There seems to be a high variation within as well as between countries even at sub-national levels. Thus, the dominant typology of Esping-Andersen is leading to an impasse and a welfare state change is hard to identify. However, a change of social collaboration, investment and service delivery can be evaluated at the sub-national levels concerning policy area, strategy or involved actors.

The paper will draw on the quantitative and qualitative findings of the Horizon 2020 project Innosi

("Innovative Social Investments – Strengthening communities in Europe"). The central questions will be: What are the commonalities and differences of social investment in different countries and regions? What are the social outcomes of these investments? Is there a measurable paradigm shift across different countries?

RN26 | Session 07a Regimes on the Move

The Balanced Development Index and the Welfare State Models in Europe.

Katarzyna Joanna Piotrowska
Kozminski University, Poland
kpiotrowska(at)alk.edu.pl

Set within the 'beyond GDP' paradigm, a Balanced Development Index (BDI) has been developed by a research team at Kozminski University in Warsaw in order to analyse and predict socio-economic changes. Four groups of detailed indicators are identified: two economic (external and internal) and two social (concerning both the objective and subjective current situation, and concerning public expectations for the future). They are subsequently aggregated into the general index (BDI). We observe the general level of the BDI as well as the congruency between four middle level indexes, which are interpreted in terms of balance relevant for future socio-economic development. This analysis is carried out for the 22 EU countries that belong to the OECD, between 1999 and 2015, using general available data (e.g. Eurostat and ESS).

This paper will present the results of this analysis, and combine it with cluster analysis carried out on the welfare state models existent in the post-Communist countries that belong to the European Union. (Piotrowska and Rae, 2016) Contrary to previous hypotheses we have found no evidence of the post-Communist EU states converging with the Esping-Andersen models. Also, we have found a distinct post-Communist welfare model, with its own identifiable features. We shall use the cluster identified in 2014 as the point of our present analysis.

This paper uses the Balanced Development Indicator as a means to analyse this welfare cluster and to see how it differentiates with other welfare clusters found in our analysis. In turn, we can then draw conclusions as to the extent that the welfare state model in CEE coexists with balanced socio-economic development in the region.

Vulnerability of the Nordic welfare model

Jorma Sipilä, Anneli Anttonen
University of Tampere, Finland; University of Tampere, Finland
jorma.sipila(at)uta.fi, anneli.anttonen(at)uta.fi

It is universally acknowledged that the Nordic countries have been particularly successful in international comparisons of equity and well-being. Obviously, the main secrets of this success have been the extensive coverage of social benefits and the

unrestrained access to public services. "All benefit, all are dependent and all will presumably feel obliged to pay", as Esping-Andersen (1990) said in his classic text.

Behind this success we find a number of specific historical conditions. The institutions have been formed during a long period of time, and they are not easily transplanted in other parts of the world. The contextuality of the conditions also means that it is not at all evident that the Nordic countries can uphold their welfare model.

What has happened to the core factors, which once strongly underpinned the construction of the Nordic welfare model? My ten core factors are protestantism, the political coalition of industrial workers and small farmers, high membership in labour unions, high levels of female employment and women's political influence, social cohesion, citizens' trust in state, strong local democracy, tax-financing, high social investment, and low corruption. But what about these factors today? Do they still hold, have they changed, or was the Nordic welfare state just an exceptional passing phase in world history?

Welfare Assemblages in the Post-Yugoslav Space: Legacies, agency and drivers of inertia

Siniša Zrinščak, Paul Stubbs
Faculty of Law, University of Zagreb, Croatia; Institute of Economics, Zagreb, Croatia
sinisa.zrinscak(at)pravo.hr, pstubbs(at)eizg.hr

Twenty-five years after the break up of the Socialist Federal Republic of Yugoslavia (SFRY), the emerging post-Yugoslav states exhibit both divergences and similarities in terms of their formal social welfare arrangements. Concentrating analysis on the three largest post-Yugoslav states – Bosnia-Herzegovina, Croatia and Serbia – this paper focuses on three aspects of the respective welfare trajectories in each country which have, thus far, not been given sufficient attention in the literature on social welfare in transition. The first relates to the legacy of social welfare in SFRY and in its constituent republics. Whether this legacy is ignored, misread, distorted or co-opted by international actors pushing diverse 'reform' agendas, it continues to have a variegated impact on welfare trajectories in the region. The second reframes our understanding of the significance of three conjunctural crises: the crisis of late socialism in the 1980s; the crisis of war and authoritarian nationalisms in the 1990s and the economic and financial crisis from 2008 onwards. The third revisits an understanding that 'agency matters' to address the multiplication of actors in a performative 'crowded playground' of welfare reform and the consequences of a 'projectisation' of reform mobilizing all manner of actors, 'domestic', 'international' and 'intermestic'. The paper is based on a review of the existing literature, updating of key social indicators and trends, and semi-structured interviews with key respondents in these three post-Yugoslav states.

“New social policy paths through external trajectories: The impact of the Economic Adjustment Programmes on the Greek Welfare State reform

Gabriel Amitsis

Technology University of Athens, Greece
amitsis(at)otenet.gr

Greece is the EU Member State most impacted by the 2008 - 2009 financial crisis, given that there were neither primary social safety nets for those unable to meet their needs through market or family settings, nor supplementary policies in case of specific needs. The national social protection model was strongly fragmented, and public spending was focused on civil servants salaries and state pensions.

A radical welfare reform was a high priority issue within the structural agenda of the three Economic Adjustment Programmes (known also as Bailout Programmes), which were implemented since May 2010 by major lending international partners (European Commission, European Central Bank, International Monetary Fund). These institutions identified serious problems and shortcomings in the regulation and funding of welfare, and they adopted a controversial social policy agenda with strong financial but limited social effects, which puts into question the traditional balance of power between national and international competences in the welfare policy-making process. This is a unique agenda, given that it may be considered as the first attempt to introduce for the very first time a broader external operational welfare trajectory in Europe, which changes dramatically values and ideologies of the European Social Model and may influence its solidarity and redistributive effects in the near future.

In this respect, the objective of this Paper is to discuss the impact of the Economic Adjustment Programmes on the Greek Welfare State reform and highlight the framework of relevant key national initiatives, as the Greek National Social Inclusion Strategy (adopted by the Greek Government in 2014 and re-affirmed by the European Commission in 2015).

RN26 | Session 08a Welfare Policies - Changes and Challenges

Disability and Independent Living in Portugal: policy changes and challenges

Fernando Fontes, Bruno Martins, Ema Loja, Mónica Lopes, Joana Pimentel, Paula Pinto, Silvia Portugal Centre for Social Studies, University of Coimbra, Portugal; Centre for Social Studies, University of Coimbra, Portugal; Institute of Social and Political Sciences, University of Lisbon, Portugal; Centre for Social Studies, University of Coimbra, Portugal; Centre for Social Studies, University of Coimbra, Portugal; Faculty of Psychology and Education Sciences, University of Porto, Portugal; Centre for Social Studies, University of Coimbra, Portugal
fernando(at)ces.uc.pt, bsenamartins(at)gmail.com, loja.ema(at)gmail.com, monica(at)ces.uc.pt, joanapimentelalves(at)gmail.com,

ppinto(at)iscsp.ulisboa.pt, sp(at)fe.uc.pt

The growing international recognition of disabled people's rights is far from translating into a substantive change in their living conditions and participation horizons. Those identified as disabled have often been disregarded, marginalized, silenced, made dependent, and their lives have been disproportionately affected by poverty and social exclusion. Likewise, Portuguese disability policies have been unable to change this reality.

Paradigmatic change in disability policies in other geographical contexts materialized through the establishment of 'Independent Living' for disabled people as a social citizenship right. Understood as the idea of disabled people's control over their lives, Independent Living encapsulates the right to live in contexts where they are not dependent on family care or on solutions offered in institutional contexts. This change has been implemented through 'direct payments', 'independent living funds', personal assistance and the formation of centers for independent living.

The Portuguese Welfare State, characterized by low levels of social protection, low benefits, different welfare-regimes and contrasting generosity levels is now introducing changes to implement 'independent living' for disabled people and to raise disability benefits above the poverty line.

Based on an ongoing research project "DECIDE - Disability and self-determination: the challenge of Independent living in Portugal" (reference no. PTDC/IVCSOC/6484/2014), and drawing on documentary analysis, semi-structured interviews and focus-groups with disabled people, NGO representatives and stakeholders, this paper examines, first, the changes currently taking place on Portuguese Disability Policies, second, the challenges and opportunities created for disabled people and, finally, the implication of these changes for the analysis of the Portuguese Welfare State.

Forgotten childhoods: Paradoxes and politics of De-Institutionalisation in Bulgaria

Barry Percy-Smith, Galina Markova
University of Huddersfield, United Kingdom; Know How Centre, New Bulgarian University, Sofia, Bulgaria
B.Percy-Smith(at)hud.ac.uk, galina.a.markova(at)gmail.com

A condition of Bulgaria joining the EU was to decrease the number of institutionalized children which in 2000 was 35 000. These children were effectively the forgotten minorities of childhood, handed over by parents without support and unable to cope, and left to eke out an institutionalised existence largely cut off from wider society and denied opportunities to participate as active citizens.

In 2010 Bulgaria embarked on a national programme of De-Institutionalisation (DI) funded by EU programs. In spite of a rhetorical commitment to DI at the level of national policy, there is no strategy for developing a robust child protection system as an alternative to

institutionalised care. The major problem is the capacity of professionals and community leaders to ensure those children develop community and family relationships – the new experiences needed to change their identities from “institutionalized” and/or “deprived of parental care.”

This paper draws on evidence from an evaluation of the DI that adopted an action research approach to generate learning to inform its implementation. The evaluation has highlighted that the process has the potential to introduce child-rights practices but so far fallen short in ensuring the complex needs of the children. This paper discusses the extent to which their marginalisation is perpetuated in spite of the potential opportunities European integration brings and in turn highlights the role politics plays in shaping childhood and reinforcing inequalities of disadvantaged groups. Examples of children’s Identity shifts are presented to illustrate the role of communities, services and research in this change.

Beyond euro-centric relationship between State and society. Analysis of a citizenship concept from a postcolonial perspective, in a Chilean public policy.

Victoria Soledad Rivera Ugarte
University of Bristol, United Kingdom
vr16134(at)bristol.ac.uk

Beyond euro-centric relationship between State and society. Analysis of a citizenship concept in a Chilean public policy from a postcolonial perspective.

At the light of the specific expressions of citizenship changes in Latin American countries and specifically Chile - manifested by the political disaffection, social inequalities and changes in the relationship between State and society- the objective of this paper is to explore the concept of citizenship from a postcolonial approach. Considering the contributions of De Sousa Santos, Quijano, Escobar, Dussel, Rivera Cusicanqui and others, this paper proposes that the current social policies' challenges in Chile are an expression of the colonial matrix of power (Quijano 1992, 2000). Consequently, to think in new horizons development involves the challenge of thinking beyond the Eurocentric perspectives and overcome that Dussel called the “developmental fallacy”.

For this purpose, an analysis matrix will be built, which will comprise dimensions to explore a specific social policy, which is the Law 20,500 500 about Partnerships and Civic Participation in Public Administration, implemented in Chile from 2011. This policy represents the Chilean State efforts to increase legitimacy in the public policy processes, including the citizens' perspective as an essential element in public decisions. Therefore, that policy is a good focus to analyse how the Chilean State understands the citizenship concept and, from there, the limits and contributions of the postcolonial approach. For this work, the critical discourse analysis will be done, focusing on official documents from governmental institutions and scholars articles.

The role of discretion in the decision-making practices of welfare agents: A case study of the Habitual Residence Condition.

Majka Monika Ryan
University of Limerick, Ireland
majka.ryan(at)ul.ie

In response to the expansion of the EU and the subsequent accession of 10 new member states on May 1st 2004 Ireland opened its borders and permitted citizens from the accession states to unconditionally contribute to their labour markets. However, citing the need to safeguard against ‘welfare tourism’, Ireland simultaneously introduced the Habitual Residence Condition (HRC) as an additional criterion for eligibility for social assistance payments. This added measure defines whether applicants, regardless of their nationality, are habitually resident in Ireland, which in turn is used to infer applicants’ centre of interest and so their relationship to the State. The requirements for implementation of the HRC differ to the traditional ways in which decisions on access to social assistance in the Irish welfare system are determined. Habitual residence is operationalised through a set of ambiguous criteria requiring decision-makers to use their own initiative (deploy discretion) and to find the balance between the HRC guidelines and the facts as provided by their clients.

Based on empirical data from interviews conducted with social welfare and appeals office staff in Ireland as part of my PhD research, this presentation introduces an original conceptualisation of the role of discretion (in the context of the HRC legislation) in decision-making practices of civil servants. It presents a theorisation of how through the process of organisational socialisation welfare agents acquire, and later reproduce, certain values, norms and beliefs particular to their organisation’s ‘moral economy’ narratives (Evans 2010).

RN26 & RN30 | Session 09a JOINT SESSION: Relationships Between Young Adults and Services

The more the merrier? Examining peer support in an online discussion group as a component of targeted youth work

Sanna Aaltonen, Antti Kivijärvi
Finnish Youth Research Society, Finland; Finnish Youth Research Society, Finland
sanna.aaltonen(at)youthresearch.fi,
antti.kivijarvi(at)youthresearch.fi

In Finland where professional outreach youth work has reasserted itself as an integral part of prevention of marginalisation, the domains of targeted youth work and social work have come closer in their methods of doing . Both social work and targeted youth work rely on one-to-one “talk work” that aims at promoting well-being and providing resources that help young adults to advance in life. While young adults are encountered as individuals by these services they may share similar kinds of experiences regarding both problems

and solutions. This begs a question on the potential of peer support and “making knowledge” as a collective activity.

In this paper our intention is to report preliminary findings of a research project where young clients of targeted youth services are invited to participate in group activities through anonymous online communities moderated by youth workers and youth researchers. The aim is to allow free discussion and to invite young adults with the help of structured discussion threads to share ideas on how to improve wellbeing and welfare services. These discussion groups are examined not only as communities that have the potential to allow new kinds of identities, belongings and relationships compared to face-to-face services but also as spaces entailing challenges like cyberbullying or contagion of harmful activities. The focus of the paper is on how online intervention is able to connect disconnected young adults with each other and the service, and how digital platform contributes to “making knowledge”. The paper draws on discussions held in the online groups as well as evaluation of the group activities done by both the young adults and the youth workers.

Microdynamics of moral work. Institutional interaction between young people and the state

Hannu Turba, Ralf Lüth

University of Kassel, Germany; University of Kassel, Germany

h.turba(at)uni-kassel.de, lueth(at)uni-kassel.de

Counseling interviews in institutional settings are usually the first place of face-to-face encounters between young people and the (welfare) state. Based on our research, we address these encounters by looking at two different fields: employment offices and specialized police agencies dealing with young people. As is true of any other human service activity, institutional interaction is characterized by “moral work” (Hasenfeld 1992): Decisions about services, benefits or sanctions highly depend on the moral categorization of clients, e.g. their “deservingness”. However, in the fields observed, particular tensions are likely to occur: On the one hand, young people are typically regarded as “innocent” and unconditionally deserving; on the other, the state agencies in question are concerned with the maintenance of order (especially in the face of growing claims of activation and responsabilization) and their relation to clients entails strong power asymmetries. Consequently, the measures taken do not necessarily meet young people’s needs.

Looking at street-level interactions between frontline workers and young people, we focus on the microdynamics of moral work. Research shows that the outcome of institutional interactions depends on several factors, e.g. the (alleged) compliance of clients, certain presumptions and stereotypes of the professionals (subject to age groups or social backgrounds) and – last but not least – the very dynamics of the interaction itself. In order to shed light on this black box, the paper underlines the relevance

of ethnographic fieldwork. It draws on results from existing research on the police and an ongoing project on labour administration.

Do Social Policies Appropriately Tackle Youth Disadvantage?

Jean-Michel Bonvin

University of Geneva, Switzerland

jean-michel.bonvin(at)unige.ch

This paper aims at assessing the appropriateness of social policies in favour of disadvantaged youth in the aftermath of the economic crisis. Two main issues are tackled: first, to what extent do public policies pay due attention to the multiple dimensions and causes of youth disadvantage? Second, to what extent are disadvantaged young people’s concerns listened to and taken seriously when designing and implementing social policies?

With regard to the first question, research shows that the social disadvantages experienced by young people in Europe since the economic crisis go far beyond labour market and income situations. They include a plurality of dimensions related to social integration, recognition, participation in society and politics, ability to project their futures, etc. Individual deficits or lifestyle choices are not enough to account for such disadvantage, wider socio-economic conditions related to economic opportunities, social norms, etc. are also at work. To what extent is this plurality of dimensions and causes reflected in existing public policies? Which relevant dimensions and explanatory factors are left out and which ones are given strong emphasis?

With regard to the second issue, emphasis is placed on whether and how young people are given voice in policy making processes and implementation. What are their aspirations, and to what extent are they allowed to voice these aspirations and make them count when decisions are made about their lives? Are some young people marginalized to the point that their voices are not given due attention?

This paper draws upon extensive research conducted in the SocIEtY project, funded by the EC, where 13 partners from 11 European countries were involved.

Welfare Policy and the Everyday Life of Youth in the Nordic countries

Ragnhild Holmen Waldahl, Cecilie Høj Anvik

Nordland Research Institute, Norway; Nordland

Research Institute, Norway

rhw(at)nforsk.no, cha(at)nforsk.no

In the Nordic countries, there is an increasing concern about the growing number of young people who are struggling to complete upper secondary education and who are unemployed because of mental health issues. The challenges associated with this group cut across different welfare policy areas. In the paper, we discuss how public authorities and services can become better suited to meet young people’s needs for multifarious and coordinated assistance, and how this could narrow the gap between experiences of everyday life

and welfare policy.

The paper is based on interview studies conducted among young people and representatives from public authorities and services in Norway, Iceland and the Faroe Islands in 2014 and 2015. The authorities and service areas represented are public employment services, education, social services and health.

In the paper, we highlight the challenges resulting from a lack of interaction between the various services tasked with aiding this group of youth. We discuss how the welfare services' silo organizations limit their ability to attend to the complexity of problems characterizing this group. Those who are capable of attending to the complex needs of the youth are individual, local actors, so-called enthusiasts, working closely around the youth and in extensive cooperation with other services.

RN26 & RN30 | Session 10a JOINT SESSION: Youth Guarantee and Activation Policies

"The construction of "young unemployed" and "youth professionals" in the policy texts of "Youth Guarantee"

jaana lähteenmaa

University of Tampere, Finland

jaana.lahteenmaa(at)uta.fi

YOUTH GUARANTEE is a policy programme directed at young unemployed in Finland, since 2013. Together with the Austrian version it is nowadays the model of "Youth Guarantee" in the whole European Union.

The "Guarantee" hasn't worked in Finland without problems (Since year 2015 it has worked even worse because of financial cuts). The problems began to too tight time-schedules - but also a too simplified picture of young clients as a presupposition of the program.

In this paper I analyze presuppositions of the program through its policy-papers, official announcements and its launching campaign (an advertisement – campaign.) I concentrate in the constructed picture of young unemployed versus "adult professionals" in : especially, how the first and the latter ones are constructed as "actors" (agents.)

The relevant axis in my analysis are the following: (1) the supposed passivity- activity -axis; (2) altruism-hedonism – axis ; and (3) collectivism – individualism axis and how the young and on the other hand adult professionals working with the young are "situated" in these axis in the policy-papers of Youth Guarantee. The analysis shows certain peculiarities and paradoxes in the aims of Youth Guarantee..

This analysis shows that there are interesting oppositions and paradoxes in the whole Finnish Youth Guarantee. The problems of the practices of Youth Guarantee can be partly due to these implicit peculiarities and contradictions of the programme itself. The European Union's Youth Guarantee has certain same kind of implicit presuppositions. So, this analysis is highly policy relevant.

"Making Europe" with the European Youth Guarantee – a driving force for improving the school-to-work-transitions of young people in the EU?

Marie-Luise Assmann

University of Bremen, Germany

m.l.assmann(at)uni-bremen.de

EU policies are gaining importance as structural determinants of young people's transitions into work. A recent example for the growing commitment of the EU as an agent for the young unemployed was the launch of the European Youth Guarantee (YG) in 2013. This presentation asks: How far does the new commitment of the EU make a difference for young people's school-to-work-transitions in the different EU member states? To what kind of policy change does the implementation of the YG lead on national level?

The countries Greece, Czech Republic and Germany with distinct types of (youth) activating labour market policies (enabling/work-first) in combination with different institutionalized school-to-work transitions (systematic/guided/solitary) are compared with regard to their YG implementation strategies. The qualitative and quantitative data is collected in the context of the Horizon 2020 project "NEGOTIATE".

I argue that the YG implementation strategies orientate path dependently on the general type of ALMP in a country and its level of institutionalization of school-to-work transitions. Pressures for convergence between national policies, as often examined in Europeanization literature, can't be observed in the case of the YG.

On basis of these assumptions we may question whether an EU policy as the YG induces much change in the member states at all. This can be confirmed as the YG shapes the discourses in the member states towards a stronger focus on policies combatting youth unemployment and pushes forward the development of enabling measures. Eventually, EU policy supports the countries on their way to improve the institutionalization of school-to-work-transitions. Especially in countries, where young people have been mostly left alone on their transition into work, major reforms are initiated.

"Make the future... today!" – Youth Guarantee Implementation Strategy in Portugal

Lia Pappamikail, Tatiana Ferreira

Institute of Social Sciences, University of Lisbon,

Portugal; Institute of Social Sciences, University of

Lisbon, Portugal

lia.pappamikail(at)gmail.com,

tatiana.mjferreira(at)gmail.com

The economic crisis caused high rates of youth unemployment in most European countries, leading to a social alarm climate. In this context, European Commission launched the Youth Guarantee (YG) to combat exclusion of young people under 25 who are not in employment, education or training (NEET), ensuring that they receive an employment offer, continue education, receive an apprenticeship or

traineeship offer within a period of four months of becoming unemployed or leaving formal education. Although around 300 000 NEET's under 30 have benefit from measures within YG, Portugal faces challenges in promoting early intervention and outreach NEETs non-registered in public employment services. This requires a strong partnership network involving not only public institutions but also a set of local partners, whose proximity to youth population allows them to tackle the heterogeneity of their situations and trajectories, accordingly to their expectations and needs.

Drawing on data collected within the European Commission granted project "Make the future... today!" (VS/2016/0373) – which aims to increase the number of NEET registered in YG system and to increase and turn more effective the YG partner's network – we propose to analyze the impact and challenges of the YG implementation in Portugal namely: i) unemployment's recent trends and NEET's rates since the YG implementation; ii) a preliminary evaluation of the project outreach activities as the improvement of the coordination and engagement of different partners involved in the process and the efficiency of the communication channels of YG to reach NEET.

Social investment in youth: the challenge of a Southern Region in Italy

Giuseppe Moro, Vittoria Jacobone, Caterina Balenzano, Lucia Ferrara
University of Bari, Italy; University of Bari, Italy;
University of Bari, Italy; University of Bari, Italy
giuseppe.moro(at)uniba.it,
vittoria.jacobone(at)uniba.it,
caterina.balenzano(at)uniba.it, lucia.ferrara(at)uniba.it

This paper discusses ideas concerning Youth Policies of Puglia Region (Southern Italy) that, coherently with both Union Nations' definition of youth as well as UN policies involving them, represent the social investment measures activated in the region in favour of young people with the objective to facilitate their transition, ever less linear and ever more diversified, to adulthood facilitating autonomy (full usability of rights) and interdependence (not only dependency) processes.

Indeed, the social system into which the young people are inserted is open to a wider range of opportunities and choice possibilities which, enlarging risk margins and instability, favorite attitudes of disengagement and ever more restricted social relations than in the past.

In such a scenario, much more complex due to the conjunctural economic crisis, the Puglia Region in last years introduced several and diversified trans-sectoral interventions of both 'positive activation' and 'offensive workfare' aimed, on the one hand, at reducing unemployment, on the other hand, at contributing to the development of young people as autonomous decision-makers (empowerment).

Monitoring and periodic evaluations of the implemented actions have allowed a participatory programme design starting from "specific" needs and,

in the logic of policy change, they have led the programmes with high social impact to become fully operational.

A programme that has received important recognition at both national and international level and that is still operative is 'Bollenti Spiriti', a powerful tool of activation of young people considered as precious resources on which to leverage for Regional social, economic and cultural change.

RN26 & RN30 | Session 11a JOINT SESSION: Policies for Supporting Young People at Risk

Medicalization of young welfare clients- an easy way out?

Froydis Marie Bakken
Oslo and Akershus University College, Norway
froydis-marie.bakken(at)hioa.no

Marginalization of young people has been one of several impacts from the economic crisis in Europe. Although Norway has comparatively low youth unemployment, the rates of young people (18-29 years old) on temporary disability benefits is triple the rate on unemployment benefit. As disability benefit recipients rarely take up work again, this bias has caused concern that Norwegian social policy unintendedly leads to medicalization and permanent labour market exclusion of young people, when the actual root cause is a decline of opportunities for the younger generations.

The point of departure is the relationship between young people and the welfare system. Statistically young people differ from older in i.e. diagnosis, work and life experience and welfare rights entitlement. The structure of the benefits is also designed to serve people with stable employment history, which rarely is the case with young people at risk for marginalization.

This paper examines how the institutional framework in tandem with medical criterion in assessment of welfare rights may lead to an exaggeration of limitations in the labour market due to illness, i.e. medicalization of young people.

The analysis is based on register data from the Norwegian Labour and Welfare administration and 50 qualitative interviews with young welfare clients, counselors, office managers, general practitioners and medical advisers in six purposively selected Norwegian municipalities.

Preliminary findings suggest that all actors medicalize young welfare clients to navigate in the welfare system and meet the requirements for benefit entitlement. The institutional framework however, opens up for the use of discretion. This means that even though medicalization is most often perceived as something negative, especially long term, it is not necessarily at odds with the law.

Youth welfare policy in Turkey in comparative perspective: a case of 'denied youth citizenship'

Volkan Yilmaz

Bogazici University, Turkey
vyilmaz(at)boun.edu.tr

This paper explores the main characteristics of social and economic policies for young people in Turkey. Inspired by Tom Chevalier's typology of youth welfare citizenship designed for Western European countries, the paper situates Turkey's youth welfare citizenship model within a comparative perspective and contributes to the extension of Chevalier's typology to a non-Western European country context. Relying upon the systematic analysis of findings of a nationwide survey on young people that was conducted in 2013, comparative youth statistics, official youth statistics, public expenditures data and existing policy frameworks, the paper suggests that Turkey fits well with the denied youth citizenship type in Chevalier's typology. Two conclusions are drawn with respect to Turkey's youth welfare citizenship model. First, with respect to the social citizenship dimension, the paper claims that social and youth policy structure in Turkey has a familialization effect on young people's access to income. In terms of economic citizenship, the paper suggests that Turkey implements a selective strategy that results in unequal distribution of labor market skills among young people.

Active labor market policy and youth lifecourse

Marti Taru

Tallinn University, Estonia
marti.taru(at)tlu.ee

Young people are well-known as a category which is characterised by a higher unemployment rate than older age groups. At times of recession, youth unemployment increases faster than that of other groups. This is perceived problematic and is addressed by active labor market measures. However, there is no reliable evidence on effectiveness of these measures. A study of meta-analysis on ALMPs effects showed that a) there is virtually no evidence about effects of the policy measures on youth and b) in general, the policy measures more often than not are not effective in addressing the problem of unemployment. Given the present level of knowledge about the effects of public policy measures on lives of young people, a deeper look into the interaction is appropriate.

The presentation looks at the role of active labor market policy measures on the lives of vulnerable young people who have experienced hardships finding job and/or acquiring sufficient educational attainment. Empirical analysis is based on semi-structured interviews with young people aged 18-30 years conducted in Estonia and Sweden in 2015 and 2016 for the project Except. The countries represent different public policy regimes with Sweden representing a country with high level of spendings on labor market services and Estonia a country with low

level of expenditures on labor market policies. Analysis shows that in comparison to other factors (family, other social protection measures), labor market services are not perceived significant in the work lives of young people. This is in line with earlier findings that labor market measures do not have strong positive impact on lives of unemployed people.

Unequal transitions in a paradise of equality? – Education authorities' views on the transitions of young people with immigrant backgrounds and/or with special educational needs

Mira Kalalahti, Anna-Maija Niemi, Janne Varjo, Markku Jahnukainen

University of Helsinki, Finland; University of Helsinki, Finland; University of Helsinki, Finland; University of Helsinki, Finland

mira.kalalahti(at)helsinki.fi, anna-maija.niemi(at)helsinki.fi, janne.varjo(at)helsinki.fi, markku.jahnukainen(at)helsinki.fi

One of the key principles of renowned Finnish education is that every young people must have equal access to high-quality education and training. The same educational opportunities should be available to all persons irrespective of their ethnic origin, migration background, age, wealth, disability or where they live. After the ninth grade of well-supported and guided comprehensive school, the Finnish education system diversifies into two non-compulsory and separate branches: general and vocational upper secondary education. This transition is a high stakes situation where young people with immigrant backgrounds and with special educational needs alike have reported to have difficulties to integrate themselves into the mainstream educational pathways. They may also face a considerable risk of dropping out of education or remain circulating in various short-term training programmes.

In this presentation, we analyse the ways in which local education authorities (teachers, study counsellors, principals, etc.) governing educational transitions consider the structural possibilities and obstacles that frame the educational transitions of young people with immigrant backgrounds and with special educational needs. The data consists of in-depth interviews and ethnographic data from lower and upper secondary schools.

The theoretical setting consists of the concept of the Finnish universalistic transition regime where individual educational paths are emphasised and counselling is an institutionalized part of the education. Our analysis is intersectional which means that we consider the different dimensions of social differences as intersecting. The results elaborate the ways in which ethnic and cultural background and disabilities intertwine with fragmented, non-linear and haphazard educational transitions.

**RN26 & RN30 | Session 11b JOINT SESSION:
Future Hopes and Transitions to Work**

Youth attitudes towards their future: the role of resources, agency and perceptions of hard work

Avril Keating, Gabriella Melis
University College London, United Kingdom;
University College London, United Kingdom
a.keating(at)ucl.ac.uk, g.melis(at)ucl.ac.uk

The future for young people is often presented in a negative light, with media headlines frequently describe a 'lost generation' facing a 'bleak future' and with little hope of achieving the lifestyle that their parents and grandparents have enjoyed. Despite this, recent surveys suggest that a majority of young Britons remain optimistic about their own future (although they tend to be pessimistic about the future of their generation as a whole). Similarly high levels of optimism were reported in a nationally representative web survey that we conducted in 2014 with 2025 young people aged 22-29 in England, Scotland and Wales. In this paper, therefore, we examine whether the optimism that young people feel is linked to their resources or to their attitudes. What we find (using multiple regression techniques) is that youth optimism is indeed stratified by resources (such as class, gender, and being in employment) but that perceptions of agency and the importance of hard work are more powerful drivers.

"It is not the lack of jobs, but the youth despising jobs": the reasons of youth unemployment from the eyes of different actors

Kezban Çelik, Hediye Sibel Kalaycıoğlu
Ondokuz Mayıs University, Samsun, Turkey; Middle East Technical University, Ankara, Turkey
kezban.celik(at)omu.edu.tr, ksibel(at)metu.edu.tr

Turkey has a young population; the share of people aged 0-24 constitutes 41.1% of population. The youth unemployment is quite high (25% in 2016), and it has increased more than that of adults. The following reasons are used to explain youth unemployment: lack of work experience by youth seeking jobs first time, easier dismissals of young workers during economic crises due to "last in first out" mentality, decreasing need for labour as a result of technological developments, and high expectations of youth from first jobs. Political actors and employers (business world) often use the expression in the title "the problem is not the lack of jobs, but the youth despising jobs" to explain the causes of youth unemployment in Turkey.

This explanation represents an incriminating approach to the unemployed youth. The essence of this accusing approach is that "there are enough jobs in the labour market but the young people are very selective about these opportunities". As the youth unemployment could not be explained simply by blaming young people, this paper aimed to understand the views and perspectives of different labour market actors in Turkey. A qualitative research methodology

was used in the study, including in-depth interviews with the three actors: public administrators, employers, and young people themselves. Each side had indeed both conflicting and overlapping dimensions of their viewpoints on the reasons of youth unemployment.

Less and less success on the labour market for the young? A comparison of the birth cohorts 1935 to 1979 in Germany from age 15 to 35

Tatjana C Mika
German Pension Insurance, Germany
tatjana.mika(at)drv-bund.de

Cohort studies aim at the ongoing process of social change. The methodological challenge is the measurement of older and younger birth cohort at the same age and with the same analytical and empirical concepts. The time between the end of formal education and the successful entry into the labour market became more difficult for some members of younger birth cohorts. Periods of employment are more often interrupted and unemployment with and without income replacement and sickness pay fill some of those gaps. Personal income growth is also slower to come by and less steady for younger cohorts.

The paper compares the changing pattern of the first twenty years of the employment careers for the birth cohorts 1935-1944, 1945-1954, 1955-1964 and 1965-1974. For this goal, an analysis of all cohorts together is carried out with longitudinal data from the statutory pension insurance ('Sample of the insured populations' records' (VSKT)) of the years 2002, 2005, 2007, 2009, 2011, 2012, 2014. The data make the life courses of those age cohorts at the same biographical period from age 15 to age 35 comparable, including the level of the gross income before taxes. However, a major challenge is the changing institutional framework, which requires a transformation of the biographical records in order to make them comparable. The results demonstrate the level of contributions to and respective future benefits from the Welfare State.

"Good practice of European youth-empowerment: the case of "Bollenti Spiriti"

Clementina Giulia Maria Gentile Fusillo
University of Warwick, United Kingdom
c.gentile-fusillo(at)warwick.ac.uk

Between 2005 and 2015, the Regional Government of Puglia (southern Italy) promoted Bollenti Spiriti (BS), a youth-policy programme financed by the European Social Fund. The programme was based on a radical shift in the understanding of the condition of youth: rather than addressing young unemployed citizens as a problem, it took up the challenge of considering them 'the solution'. BS funded over 700 teams of young entrepreneurs whose projects fulfilled the requirement of addressing questions of public interest (social exclusion, environmental issue, civic participation) through innovative ideas. In 2012 BS

won the European Enterprise Promotion Award for the section Promoting the Entrepreneurial Spirit.

I propose a case study focusing on the BS good practice and its insightful theoretical implications. Central to my argument is the idea that similar youth-entrusting / youth-empowering policies may play a role in the bottom-up identification and promotion of a European civic virtue. Citizens trained in such virtue, I argue, are willing to accept public challenges and able to turn the obstacles generated by the global crises into opportunities to shape a better society. In this perspective, young generations represent an occasion to redefine the word 'work', reconciling it with the meaning of one's life.

Young European citizens are authoring the meaning of their social and political lives, and courageously thinking themselves as 'imaginative institutors' of the future European society. BS is a local model of 'institutional complicity' aimed at supporting this courage in younger generations. I suggest that - transposed in the design of specific top-down European policies- it could impact importantly on the identity of the Union.

RN27 - Regional Network Southern European Societies

RN27 | Session 04a General Session: Southern European Societies: Current Issues

Networked and contentious? Exploring the determinants of movement parties' vote in Southern Europe

Lorenzo Mosca, Mario Quaranta
Scuola Normale Superiore, Italy; Scuola Normale Superiore, Italy
lorenzo.mosca(at)sns.it, mario.quaranta(at)sns.it

The economic crisis has had deep political repercussions in southern Europe. One has been the electoral success of the so-called "movement parties" opposing austerity policies (della Porta et al. 2017). Syriza in Greece, Podemos in Spain and the Movimento 5 Stelle (M5S) in Italy shaken the domestic political scenarios, proposing alternative platforms in opposition to traditional parties. In this regard, it has been argued that these actors have occupied a political space contiguous to contemporary movements in programmatic, biographical and geographical terms. Nevertheless, whether these parties have also attracted votes from movement constituencies is yet to be proved. Beyond a protest component, another peculiar aspect of movement parties may lay in the use of the internet and social networks to communicate with their potential voters. Indeed, digital media might have mobilized citizens far from traditional channels of political representation. By using three original internet-based post-electoral surveys in Greece, Spain and Italy, the article investigates the association between engagement in various forms of protest and the likelihood of voting for such parties in the three countries. Then, the article addresses whether the modes through which citizens get informed about politics are associated with movement party vote. The findings confirm that protest represents a supply of voters for Syriza, Podemos and the M5S, and that the probability of voting for these parties is stronger among those who use digital media as their main source of political information. However, the analyses also show that some country differences exist in these associations.

Transitions from military careers to civilian live: personnel motivations and institutional constraints

Ana Romão, Maria da Saudade Baltazar, David Pascoal Rosado, Dinis Fonseca, Helga Lopes

Military Academy; Military Academy Research Center; Centro Interdisciplinar de Ciências Sociais; Universidade de Évora; Centro Interdisciplinar de Ciências Sociais; Military Academy Research Center; Military Academy; Universidade Europeia; Military Academy Research Center; Centro Interdisciplinar de Ciências Sociais; Military Academy Research Center; Military Academy; Military Academy Research Center anaromao74(at)gmail.com, baltazar(at)uevora.pt, davidmiguelpacoalrosado(at)gmail.com, dmvfonseca(at)gmail.com, helga.lopes(at)academiamilitar.pt

The purpose of this communication is to highlight some of the dilemmas confronting the career personnel of the Portuguese Armed Forces when they leave the uniform service, to join the reserve component or due to retirement age. The transition to these two situations (reserve / retirement) has rights underpinned by specific legal requirements, which are intimately linked to the military condition and the operational needs of the Armed Forces. From the end of the last decade of the 20th century until now, there have been significant changes in the legislative framework of the military career, ultimate by the new Military Statute of the Armed Forces (EMFAR) in 2015. Among other changes, the new statute extends to 40 years the length of the military career, a fact that implies more contracting conditions to leave the active service and minor opportunities for promotions. As will be shown, the repercussions of legislative changes have been accompanied by increases in departures by the military in a position to benefit from the transition period between the former and the new legislation. For those who served the military institution, the transition to civilian life has individual and familial implications, necessarily translating into daily breakdowns, and may emerge as a condition of new life path (s) or inversely to problematic situations, both individually and in the family. The discussion proposed is based on the analysis of the legislative and political background, statistical data and case study results.

Lights and Shadow of the Knowledge Society in the time of crisis. The case of the highly-skilled emigration flows from Italy

Gerardo Pastore, Gabriele Tomei
University of Pisa, Italy; University of Pisa, Italy
gerardo.pastore(at)unipi.it, gabriele.tomei(at)unipi.it

In the era of the 'global competition for talents' (Cerna, 2016), the so-called 'brain circulation' (Gaillard & Gaillard, 1997; Boeri et al., 2016) is one of the most relevant leverages to improve development both in the origin and in the destination countries. In the Southern Europe states, despite the public discourse on the process toward the Knowledge Society, post-2008 economic crisis weakened the structural conditions and the institutional tools that should support this form of mobility. This increased the traditional gaps of this area and transformed the positive effects of the high-skilled circulation into a new form of 'brain drain'

(Triandafyllidou and Gropas, 2014; Recchi et al., 2016).

The paper presents some paradoxical aspects within the Italian route towards the Knowledge Society and it proposes a critical analysis of the implementation process of its theoretical background. The case of the increasing number of highly-skilled youths that leaves Italy in order to seek insertion in more dynamic knowledge-based economies constitutes a special focus and a topical entry-point for the discussion.

How economic crisis influenced high-skilled youth emigration? What are the repercussions of these processes on the Italian society, culture, economy and politic?

Using secondary-data analysis of national statistics and institutional analysis of the transformations in Academic policy, the paper unveils the process of cumulative influences between national R&D public expenditures cuts, University reforms, transformation of knowledge-based labour market and new flows of young high-skilled emigrations. Against the backdrop of this controversial aspects of the Italian case, the paper proposes some possible general strategies to overcome the paradoxes of the Knowledge Society in the actuality of the Southern European countries.

Theater as an educational tool in southern european societies

iliana pazarzi

university of piraeus, Greece

iliana.pazarzi(at)yahoo.gr

The importance of art and especially theater as a tool and not solely in the curriculum in educational systems is recognized by most European countries. My presentation will deal with theater as a necessary method in education because it develops significant life skills such as intuition, creativity, sensitivity, etc and it can be a mechanism for the socialization of the individual, and the participation of pupils to the societies. I will present the experience from Southern European countries

RN27 | Session 05a Education and Culture

Media literacy as an essential element for the full development of an active European citizenship

Kyriaki Pertsinidou

University of Piraeus, Greece

corinna.pertsinidou(at)gmail.com

This paper attempts to record European policies regarding media literacy which contribute to active citizenship. Reference is made to resolutions, communications, declarations, directives, amendments, research projects, working groups and conferences on behalf of the European Union in the field. Moreover the meaning of citizenship and active citizenship is clarified according to which citizens take an active and responsible part in the public sphere contributing to the coherence of the society. On the other hand, having given the concept of media literacy, which is the ability to access, analyze,

evaluate and produce in a variety of forms -print and electronic-, its connection with active citizenship, is presented. The critical evaluation of information and research skills that media literacy involves, empower citizens and enable them to exercise an active role in a participatory democracy. Additionally it is made clear the important role of media education in creating active citizens, since it teaches students at a very early age not to accept information without critical thinking, and to set basic questions in order to reveal its motives, purpose and validity. The media education encourages exposure to a variety of different points of view which results in the cultivation of appreciation and tolerance of "the different", necessary elements in a democratic society.

Also studies are presented showing the media literacy levels among the Member States and a comparison between Greece and Finland on the field is presented. The paper concludes by presenting proposals for strengthening media literacy level both at the EU and nationally.

Media literacy, media education, policies, European Union, active citizenship.

Culture and the Arts as valuable Vectors for European Cohesion in Sicily?

Fanny Bouquerel

Université Paris 8, France

fannybouquerel(at)gmail.com

The analysis of the implementation of the European Union Cohesion Policy in Sicily, focusing on its cultural component, brings a significant example of the integration process' fragility. Thanks to its considerable budget, this policy aims at offering a powerful instrument to reduce the inequalities throughout the continent, especially in its Southern and Eastern peripheries. Acknowledged for its contribution to the development of a heritage-based tourism, which is considered to be a major local asset, culture was given a predominant role, thus substantial funds were allocated to cultural programmes. However, this opportunity didn't translate into a dynamic cultural and artistic scene.

An approach at the microscopic scale based on numerous interviews and a long participatory observation discloses an ineffective operating framework. The extreme complexity of the Cohesion policy, which is the produce of a multilevel governance system, makes it difficult to agree on common concepts and to implement it. The increasingly divergent interpretation of the cultural referential in Brussels, Italy or Sicily has weakened its role, reflecting a simplistic vision paying attention only to heritage and focusing on its economic impact. In addition, though Cohesion policy promotes the principle of partnership, implying the involvement of all the stakeholders in a region, the powerful regional government in Sicily remained by far the main beneficiary of these funds. As a consequence, the cultural field and the world of art, which are poorly organized, remained largely excluded. This led to a feeling of indifference or rejection of this policy, which

instead of contributing to making Europe, may very well contribute to unmake it.

Erasmus+ School-to-School Partnerships as a tool of Europeanization within schools. The case of the 13th Kallithea high school.

Zoe Moniou
University of Piraeus, Greece
zoi9617(at)yahoo.com

This paper presents the European Erasmus+ School Partnerships as a tool of Europeanization within schools. Through the literature review and the case study of the 13th Kallithea high school I will highlight the project's impact on participating schools, educators and pupils. It will be concluded that, by participating voluntarily in this process of Europeanization, schools as a result are implementing innovative actions with European added value, are providing educational services of higher quality and are acquiring more qualified educators. Moreover, teachers and pupils acquire new skills and become more familiar with mobility, multilingualism and working outside the local and national framework. Erasmus+ School Partnerships have an overall positive effect in the European educational field, since they contribute not only to the schools' needs for change and improvement, but also to the EU's educational policy targets. It is, thus, imperative to integrate the Erasmus+ projects in the official greek school curriculum and to provide official motivation to participating teachers.

Does the Erasmus motivate brain drain?

Georgia Tzivra
University of Piraeus, Greece
gtzivra(at)gmail.com

The mobility of students and teachers in higher education has considerably gained the interest of the European policy through the implementation of programs such as the Erasmus. The international literature has mainly explored the positive effects that the participants enjoy in their later working life. Aim: the present study attempts to investigate the negative effects of the above mentioned program and specifically its relation to brain drain. Material and method: quantitative data were collected by related published literature for seven countries of the Eurozone. The estimated years were 2007/8 and 2013/14 that reflect the periods before and during the economic crisis. The selected variables are about the frequency (N) of outgoing & incoming students, the frequency (N) of outgoing & incoming staff (teachers) and the index brain drain. The relation of the variables was tested through a simple statistical correlation test and statistical significance was set at $p=0.01$. Results: the brain drain index didn't show any statistical significance with the other variables and therefore it does not occur negative effect on scientists' flee to foreign countries. Nevertheless the other variables i.e. the N of participants to the Erasmus presented strong statistical significance between them demonstrating

the dynamics of the program and the fulfilling of the mobility scopes. Conclusions: the experience of Erasmus does not motivate brain drain from one country, and therefore there is no negative impact in the domestic labor market.

RN27 | Session 06a The Impact of Crisis on Various Institutions

The Greek crisis and its significance for world capitalism

Kanakis Leledakis
Panteion University of Social and Political Sciences,
Greece
kanakis.leledakis(at)gmail.com

Greece has a relatively high per capita GDP and structural similarities with advanced economies. In 2009 Greece's sovereign debt was defined as 'unsustainable' which led to a series of 'rescue' packages enforcing, as a prerequisite of their contribution, austerity policies. These policies were unprecedented both as to their extent and as to the extremely short time scale they were implemented. The consequences for the economy were easily predictable: a drop of 25% of GDP and a rise of unemployment to 30% were observed with no visible prospects for recovery.

The most crucial consequence, however, concerns society as a whole. In this respect, we can focus on two crucial 'subjectivities', necessary prerequisites for the functioning of contemporary capitalist societies. The first is consumerism, a subjectivity on the level of everyday action, involving a 'practical' understanding of the self as a consumer and binding desire to consumption as such. The second is neoliberalism, providing a form of discursive subjectivity in which individuals identify with growth as an ideal. Austerity policies make the continuation of consumerism impossible while the universalistic character of the narrative of growth is undermined.

Although austerity policies have been present in most developed capitalist economies, they had never been implemented to such an extent. The long term stability of Greek society, therefore, is of general interest. Indeed, what we are faced with is a social experiment in real time, an experiment of importance far beyond the borders of Greece.

The distributional effects of the Spanish Great Recession

Pierre Blavier
INSEE, France
pierre.blavier(at)ens.fr

The idea of this study is to tackle empirically this issue regarding the distribution of both revenues and economic hardships. It aims at testing a variety of hypotheses : the range of the familial solidarity, the cushioning effect of the unemployment benefits, and the link between poverty and long-term unemployment. To do this, it uses the ECHP and EU-SILC data (« encuesta ECV » in Spanish), which both

have a cross-sectional and a panel components and both survey income and living conditions at individual and household levels.

First of all these allow to draw long-term evolution (1994-2015) of various inequality indicators. Secondly a Gini decomposition (Aaberge et al., 2000, López-Feldman, 2006) aims at identifying the redistributive effects of different kinds of revenues on inequality. Thirdly a sequence analysis (Abbott, Tsay, 2000, Robette, 2012) proposes an alternative approach to the long-term unemployment, both in terms of its patterns along the Great Recession and of economic hardships.

These analyses lead to three main conclusions.

Indeed inequality evolution since 1994 exhibits U-shaped curves. But this recently inverted trend has still not brought Spain to the level of the beginning of the 1990's.

Mixed evolutions are at stakes across the different kinds of revenues, but they suggest the importance of unemployment to explain inequality.

Therefore a closer look at unemployment sequences through sequence analysis depicts the formation of an important precariat, i.e. people alternating long-term unemployment and short-term employment, for whom many social characteristics and economic hardships can be shown.

Crisis and health inequalities in Southern European countries

Mauro Serapioni

Centre for Social Studies, University of Coimbra,
Portugal

mauroserapioni(at)ces.uc.pt

This paper discusses the state of the art of health inequalities in the southern European countries. After a brief contextualization of the welfare state in the southern European countries and a characterization of health systems in Greece, Spain, Italy and Portugal, the main health inequalities are described, identifying the potential inequity induced by the reform processes undertaken and the current austerity policies implemented. Considering this framework, new institutional arrangements were introduced in health systems and new articulations between public and private sector within services provision were made. This is a common practice registered in the Southern European countries, which is not only erecting financial barriers to access health system as it is contributing to renew health inequalities. Afterwards, the common features and similar trends among the analyzed health systems will be presented and analyzed, such as: the existence of inequalities to accessing services, related to social and economic variables; the progressive increase of the percentage of private expenditures compared to the total health spending; the geographical inequality in health observed in all the countries analyzed; the increase of the user participation in health costs through forms of co-payments and user fees; and the negative effects of the financial crisis that has particularly affected unemployed people and most vulnerable population

groups. Finally, the study emphasizes the responsibility of the health system itself in increasing health inequalities.

The Impact of the Economic Crisis In Hellenic Fire Brigade's Personell: A Proposal for the Organization A Special Psychosocial Unit

KALLIOPI VILARA

UNIVERSITY OF PIRAEUS, Greece

vilkal(at)hotmail.com

The personnel of the Hellenic Fire Brigade faces psychosocial impact in their personal and family life because of the special conditions that the nature of their profession has. So, special attention and psychosocial support is required in both personal and family level.

Since the beginning of economic crisis these psychosocial problems have been increased in such a degree that action must be taken immediately.

In this paper special mention will be given to a) the impact of economic crisis in Fire Brigade's personnel, b) the experience of the existing psychosocial units and other interventions already applied in national and international level and c) a proposal for the Organization of a special psychosocial unit concerning that problem by the Section of Hygiene and Safety of Hellenic Fire Brigade.

RN27 | Session 07a Urban Forms of Crisis

Solidarity in European societies: empowerment, social justice and citizenship. Results from the Spanish case studies on the spatial dimension of solidarity.

M. Angeles Serrano, Braulio Gómez Fortes, Gisela Redondo, Maria del Mar Ramis

Universitat Rovira i Virgili, Spain; Universidad de

Deusto, Spain; University of Cambridge, United

Kingdom; Universitat Autònoma de Barcelona, Spain

mariaadelosangeles.serrano(at)urv.cat,

braulio.gomez(at)deusto.es, gr3683(at)cam.ac.uk,

MariadelMar.Ramis(at)uab.cat

The world economic crisis has formed the context for the constitution of solidarity acts in and between societies across Europe, aiming to achieve a better society for all. Most of these solidarity acts are rooted in the civil society. Considering that in an European context social policies are no longer the product of national states only, it is essential to explore the initiatives that are being developed in different contexts and territories as well as the synergies open among the different stakeholders as a way to provide lines of action that can inform and strengthen not only policy-making in the local and national context, but also on the European and global arenas.

In this context, the H2020 Project SOLIDUS - Solidarity in European societies: empowerment, social justice and citizenship (2015-2018) is analysing in depth the acts of solidarity which are being developed

across Europe, the extent to which they respond to dialogic and inclusive processes and more importantly, the related outcomes and policy developments for overcoming the world economic crisis and reducing social inequalities, strengthening social cohesion and increasing well-being.

This paper draws on identifying the relevant drivers and barriers in relation with the spatial dimension of solidarity. Particularly we provide with the results of the five Spanish case studies of successful acts that are overcoming geographical and social inequalities and that are enhancing spatial and intergroup solidarity in the areas of housing, education, employment, health and civic engagement. Conducted under the communicative methodology, this analysis also shows the opportunities for scaling up.

Wall Slogans and Graffiti as urban forms of expressions in the time of the crisis

MICHAEL TSANGARIS, ILIANA PAZARZI

University of Piraeus, Greece; University of Piraeus, Greece

mtsang(at)unipi.gr, iliana.pazarzi(at)yahoo.gr

When economic crisis emerges and there are increasing requests for refugee spaces and support, people turn to easy and economical ways to communicate their political messages. As Greek economy struggles to recover, the civil unrest can be detected in the political statements on public walls. In times of crisis Metropolitan walls became arenas of the 'public sphere'. Wall graffiti and slogans consist alternative artistic mediums of expression and communicate the social bitterness and discontent. By occupying public spaces those unconventional, long lasting artistic forms of political activism are reviled by the authorities as acts of civil disobedience and belong to the sphere of contentious politics.

Based on the investigation of central urban districts walls in the city of Athens this paper explores the ways in which those genuine demonstrations of individual expression represent the people's resistance against the crisis on the symbolic level. Through those mediums is demonstrated a wide range of opinions, illustrating the diversity and the variety of reactions to crucial social issues. Using the semiotic approach we attempt to decode visual representations and symbolisms and clarify the political reasoning of the graffiti artists.

The phenomenon of the homelessness in patras, a large municipality in Southern Greece

Adamantia Giatra, Prezerakos Panagiotis, Athanasios Sachlas, Foteini Tzavella

Department of Nursing, University of Peloponnese, Greece; Department of Nursing, University of Peloponnese, Greece; Department of Statistics, Athens University of Economics and Business, Greece; Department of Nursing, University of Peloponnese, Greece

dgiatra(at)yahoo.gr, panprez(at)uop.gr,

sachlad(at)uop.gr, ftzavella(at)hotmail.com

OBJECTIVE: The study examines the phenomenon of homelessness in Patras, a large municipality of Southern Greece, in Peloponnese.

METHODS: The sample of this study included interviews by eight (8) homeless individuals and questionnaires by 120 local residents. The questionnaire was constructed on a five-point Likert scale.

RESULTS: The homeless are dominated by a feeling of social exclusion since they are deprived any public and social goods. They evaluate as a key challenge of their everyday life, the lack of food and of clothing. They also emphasize their preference to reintegration not in permanent structures but into "open" support schemes. From the quantitative research it became apparent that sensitivity levels were equal to 59.06 (\pm 10,468) units. There is a high level of trustworthiness in the data elicited from the new questionnaire (Cronbach's α = 0,732) while "the exploratory product analysis", produced 9 statistically significant factors.

CONCLUSIONS: Over the years seems as the homeless people feel socially excluded, with only companion their experiences, in a social confusion and they can not distinguish good from evil. People's awareness, in both theoretical and practical level, may contribute positively towards eliminating this phenomenon, in a society where unfortunately the governmental sector do not seem sufficient.

RN27 | Session 08a The Dimension of the Gender

Women and crisis. Are social interventions gender sensitive?

Folco Cimagalli, Cristina Sofia

LUMSA University, Italy; Sapienza University of Rome, Italy

cimagalli(at)lumsa.it, cristina.sofia(at)uniroma1.it

The recent economic crisis impacts on individuals and families and redefines roles, behavior patterns, individual strategies and expectations.

The topic of gender appears useful to understanding the changes taking place within the context of the regime of south-Europe welfare. As a large, multidisciplinary literature shows, poverty is not gender neutral. Women, especially in the Mediterranean culture, living a double failing: one into the family institution, which often relegates them to a secondary and dependent role; the other, internal to the labour market, which puts them in a fragile and precarious position. Therefore, there is a female way of living and face the poverty.

The research will explore if social interventions against poverty carried out in a Mediterranean city are able to operate in a gender sensitive manner.

The study focuses on some social intervention pathways initiated by the activation of the instrument "Experimental Social Card" promoted by the Ministry of Labour and operated by the City of Rome, which combines economic subsidy to a custom social intervention. In the study are considered the actions

taken towards female population to identify the characteristics of applicants (family structure, types of discomfort, age, etc.) and the recurring characteristics of activation projects. Through qualitative methodologies, the research presents the ways in which the question of gender is interpreted and used within these social interventions.

Economic Crisis and its Impact on Women in Greece

Nancy Papalexandris

Athens University of Economics and Business,
Greece

papalexandris(at)aueb.gr

Most of the industrialized world entered a deep recession in 2008–2009 as the financial crisis that began in the USA evolved to a global recession with multiple economic, employment, and social implications. Despite measures taken by governments worldwide, unemployment, poverty, inflation, and national debts rose in an unprecedented manner (Eurostat, 2009; World Bank, 2009). Southern Europe has been affected the most. As a result, the European Union (EU) reacted with harsh anti-crisis austerity policies, creating growing unemployment, falling real wages, cuts in the social security system, erosion of the collective agreement system and privatisation of public property (Busch, Hermann, Hinrichs & Schulten, 2013).

Women and young people have suffered most from this situation. Although attitudes towards the ability of women to move ahead are improving, the economic situation limits available opportunities and favours the equality gap.

In this paper we will present the overall economic crisis and its impact on women in employment, in education, in decision making and in entrepreneurship. We will then discuss initiatives which aim at supporting women in order to face the current crisis in Greece. Despite the limited results of supportive measures our research shows that there is a growing awareness that women can play a crucial role in helping the country exit its crisis.

Greek Society is accepting the fact that women should participate more in family, political or social decisions and have a stronger voice in proposing solutions for facing the existing situation. Hopefully, when the present economic crisis is over, women will face a smaller gender gap due to the high level of educational qualifications and ability to cope with harsh difficulties during the crisis.

Gender, (Un)employment and Gender Equality Policy in Europe: the place of Portugal

Manuel Carlos Silva, Aleksandra Queiroz, Ana Reis Jorge

Interdisciplinary Centre of Social Sciences (CICS.Nova_UMinho), Portugal; Interdisciplinary Centre of Social Sciences (CICS.Nova_UMinho), Portugal; Interdisciplinary Centre of Social Sciences (CICS.Nova_UMinho), Portugal
mcsilva2008(at)gmail.com,

aleksandraqueiroz(at)gmail.com,
ana.j.mr(at)gmail.com

Articulate gender with labour market reveals a complex task that involves several vectors, though, roughly speaking, we can say that the evidence of gender inequalities as cross-cutting trend is particularly harmful to women.

In relation with the Portuguese context, it should be noted that the Portuguese revolution of 25 April 1974, validated by the Portuguese Constitution with subsequent legislation, was a key milestone for the consecration of gender equality, certainly from the legal-political point of view, but also with impacts in the of area public policies and social and labour practices: support to pregnancy, maternity and family leave, assignment of minimum wage and unemployment subsidy in the context of growing feminization in education and labour market.

On the basis of Eurostat and national statistics, it is provided a map on employment rates by gender in the Member States of the European Union and, in particular, in Portugal and their phases of growth, stagnation and decline, as well as, to the contrary, the correlative unemployment rates. It is also given a map of part-time work and reasons for this modality, as well as the particularities of part-time work, the patterns of full-time or partial jobs and by countries and of conjugality and parenting in couples with children or without children. Finally, we will analyze the impact of motherhood on the employment of their respective couples; the female employment rate by level of education and number of children; the division of time by extrahousehold paid work and unpaid domestic work.

Migrant women in Greece, integration process and citizenship

Laoura Alipranti-Maratou

University of Athens, Greece

alipran3(at)otenet.gr

While immigration in Greece started in the early 1980s, the first important influx of economic migrants to Greece took place in 1990s, making Greece a new destination country. It is also worth mentioning that, in the population migrating to Greece, there is a large share of women migrants, searching for employment and a better life.

Concerning the integration process of migrant women many studies highlight the crucial importance of citizenship issues. In particular, the fact that women are not enjoying their rights to have access to social goods (in particular to social security) and their rights to participate in social and political life of the countries of residence are key indicators used internationally to measure the degree of social integration of economic migrants. Accordingly, migrant women's active political participation means a higher level of integration.

On the issue of migrants' social integration in new destination countries, a research has been conducted by EKKE (National Centre for Social Research) in

2010- financed by the European Integration Fund-, on a sample of 600 economic women migrants having had residence and work permit.

The present paper presents some research conclusions of the above mentioned survey, regarding the integration process of migrant women, living on a legal status in our country . Moreover, the paper focuses on the issues of the interest and participation of the women migrant in political life as well as in collective political activities and organizational schemes.

RN27 | Session 09a General Session: Solidarity and Work in the South

Vulnerable States' pursuit of solidarity as a necessity for democratic equality in the European Union

Nikitas Aliprantis

Strasbourg University and Democritus University of Thrace, Greece

daliprantis2002(at)yahoo.gr

In spite of the illusion created by the Charter of Fundamental Rights, the EU has aligned itself with the transmuted international capitalism and its break from the fundamental democratic principle of equality between States and their citizens in some fields. According to recent official statistics, the want of political solidarity has led four EU countries (Italy, Greece, Cyprus and Bulgaria), to assert that their participation in the EU is not advantageous to them.

To overcome the unmaking of Europe, it is indispensable and of vital importance, from the sociological point of view, to create political solidarity, joined with and supported by social forces (i.e. working and unemployed people as well as people hit by the austerity measures) not only of Mediterranean countries but - as it has already been suggested in the past - also of Balkan countries (and, perhaps, Ukraine in the future). They are all victims of inequality, inequity and one-sided arbitrary decisions, even if these are often formally presented as bilateral or multilateral, but in real terms they have become marginal.

Under present conditions, the objective of such large, energetic and engaging action would be, on the one hand, to enlighten these countries as to their gradually increasing indebtedness, social degradation and lack of fundamental principles, and, on the other hand, to prompt them to pursue real equality. If such initiative and activity does not succeed in altering today's reality, the disintegration of the EU seems to be inevitable.

The impact of applying alternative definitions to the European Union Labour Force Survey measurement of the unemployment rate for Southern Europe 2008-2014

Aggeliki Yfanti, Catherine Michalopoulou, Anastasia Charalampi

Panteion University of Political and Social Sciences, Greece; Panteion University of Political and Social

Sciences, Greece; Panteion University of Political and Social Sciences, Greece
aggelikiyfanti(at)panteion.gr, kmichal(at)panteion.gr, acharalampi(at)panteion.gr

Background: The unemployment rate is an important indicator with both social and economic dimensions considered to signify a country's social and economic wellbeing. For its measurement the European Union Labour Force Survey (EU-LFS) is using a synthesized economic construct according to the International Labour Organization (ILO) conventional definitions of the employed, unemployed and inactive. However, in the literature, the need for using more than one measure especially in recessionary times is emphasized.

Purpose: To investigate by applying two broader alternative definitions the social profile of unemployment as it compares to the conventional definition.

Method: The analysis is based on the 2008-2014 datasets of the EU-LFS for Southern Europe: Greece, Italy, Portugal and Spain. Two alternative definitions of the employment status are formulated as variations of the ILO conventional definitions. The social profile resulting from the alternative definitions of unemployment is then compared to that of the conventional definition.

Results: Applying these two broader alternative definitions to the Southern European LFS data, the findings show an increase of the official unemployment rate. Also, they reveal threatening unemployment rates for women, the young and those with no formal education.

Conclusions: Although, the changes in the definitions presented do not exhaust all possibilities, the results indicate the need, especially in recessionary times, for implementing alternative measures of unemployment to the EU-LFS in the tradition of the Current Population Survey.

Youth and employment in Southern Italy: Challenges emerging from a comparison between the Italian Jobs Act and the French labour reform

Fiorella Vinci

University eCampus, Italy

fiorella.vinci(at)tiscali.it

The datum relative to youth unemployment, which in Southern Italy over 2015 registered a value amongst the highest of those of the European Union countries outlines the economic heterogeneity of the European Union and spurs one to reflect on the different territorial efficacy of European and national policies.

The 2020 European strategy emphasises the building of the competitiveness of individuals and grounds innovation in regional and national labour markets on highly qualified educational and professional systems. But is it possible to render individuals competitive without considering the competitiveness of territories? And is it still possible to analyse labour separately with respect to production?

The article, placing itself in a research perspective

typical of the sociology of public action, suggests a comparison between the Jobs Act and the recent French labour reform.

The comparative analysis anchors the policies to their social justifications and to the political and economic traditions which generate them. In particular, the objective of territorial cohesion as an opportunity and at the same time a limit for the development of different regions internal to the various states appears on the one hand to be relevant as do on the other, the opportunities of enhancing the political dimension of flexicurity, of rethinking the relationships between workers and firms and of redefining the function of trade unions in the process of labour market innovation.

Intellectual Property and the Development Divide

Ewa Radomska

Jagiellonian University, Poland

ewa.radomska(at)doctoral.uj.edu.pl

Intellectual Property (IP) always plays a significant role in society, but the development of information society, the globalization of markets as well as the growing complexity of products and services has further increased the importance of IP rights. Until recently, the evidence available for economic contribution of IP rights has been fragmentary, focusing on individual rights and specific industries, and very often concentrates only on patents. However, currently there are some preliminary studies considered the impact of all types of IP on innovation, growth and development (encompasses not only economic, but also cultural, social, and political dimensions of national wellbeing) in European and non-European countries.

At the same time within the context of "IP globalization" some new insights into the concept of IP and its one-sided emphasis on utility-maximization are being provided from representatives of other social sciences. They, inter alia, indicate that there are growing and dangerous asymmetries in IP norm-settings and interpretations occurring in multilateral activities across the world. As a result the concept of IP encounters the concept of distributive justice.

Taking those relatively new perspectives as a starting point I will show, that European framework of IP poses political choices with far different inputs for decision-making than on the domestic level. What is more, I plan to indicate on the basis of proper data (inter alia those provided by EU entities), that policy choices related to IP which are made on the supranational level are very often disproportionate and affects countries with smaller markets, less international negotiating power, and poorer and less empowered consumers.

RN28 - Society and Sports

RN28 | Session 04a Sport Participation: Explaining Differences

The transition to adulthood: a game changer? Panel analyses of the impact of major life events on sport participation.

Jasper van Houten, Gerbert Kraaykamp, Ben Pelzer
Radboud University, The Netherlands; HAN University of Applied Sciences, The Netherlands; Radboud University, The Netherlands; Radboud University, The Netherlands
j.vanhouten(at)maw.ru.nl, g.kraaykamp(at)maw.ru.nl, b.pelzer(at)maw.ru.nl

In this study, we investigated changes in and differences between the sport participation of individuals during the transition to adulthood, and the role of major life events that mark this transition.

We employ a neo-Weberian theoretical framework related to changes in temporal and social resources to explain how life events marking the more adult statuses of individuals in the transition to adulthood, like leaving fulltime education, beginning to work, engaging in an intimate relationship, formalising a relationship through cohabitation or marriage and becoming a parent affect (1) the number of sports practised by an individual, (2) the frequency of sport participation, and (3) the probability of switching from practising sport (mostly) in a club setting to practising sport in other (non-)organisational settings, or to not practise sport at all.

With recent panel data (2009 and 2013) from the Netherlands Longitudinal Lifecourse Study (NELLS) on 2798 individuals, we were able to distinguish between-differences of respondents, from within-developments in respondent's life courses, and deal with issues of causality and the timing of the events.

Our analyses indicate, firstly, that the number of sports practised by an individual and his/her sport frequency decrease when he/she starts cohabiting or gets married, and when he/she becomes a parent. Secondly, individuals with adult educational, civil/marital and parenthood statuses participate in less sports and with a lower frequency than individuals with adolescent statuses. Thirdly, the likelihood of switching from practising sport in a club setting to practising sport in a light setting or to not practising sport at all, is affected by (changes in) an individual's status within the employment, relationship and civil/marital domain.

Ethnic and educational differences in the Dutch voluntary football sector

Arend van Haaften

Utrecht University, Netherlands, The
a.f.vanhaaften(at)uu.nl

In the past decades modern democracies, including the Netherlands, have been rapidly diversifying. Sports in general and voluntary sports in particular are often celebrated to cut across or neutralize social differences. However, up until now we have had a limited understanding of how Dutch voluntary sports in general or football specifically are organized in terms of social characteristics and how this has developed throughout the years. By combining membership data from the Royal Dutch Football Association and individual level data on the Dutch population from Statistics Netherlands, I will describe the ethnic and educational composition of Dutch voluntary football in general and on the club level over the years 2005-2014. The central aim of this paper is to get a closer understanding of ethnic and educational differences in the Dutch voluntary football sector and to assess its dynamic. In the paper, I will discuss the proportion and number of ethnic and educational groups for the years 2005-2015 and compare them to the same figures on the general Dutch population. Secondly, I will introduce three different parameters of social heterogeneity (out-group, polarization and fractionalization) and use these to discuss ethnic and educational heterogeneity on the club level.

Which social and individual factors determine students' sport activity in Central and Eastern European countries?

Klára Kovács

University of Debrecen, Hungary
kovacs.klarika87(at)gmail.com

After the change of the political system in the former Communist states of Central and Eastern Europe, differences between social groups and layers became more prominent, and certain social groups found themselves outside sports (as well). In connection with the main theme of the conference, the 'Great Recession' of 2008 have exacerbated social inequalities in terms of sporting opportunities. Exclusion in all segments of society, including sports, is linked to a lower social-economic status, poverty, unemployment, low education. In our study we analyzed the factors that influence and determine sport activity of students studying in higher education institutions in Central-Eastern European countries. In the research we included students – of primarily Hungarian ethnic background – studying in three Hungarian, five Romanian, two Slovakian, three Ukrainian and one Serbian Higher Education institutions, taking a sample in proportion to the total number of students studying in the respective institutions (N=2017). Our findings indicate that students in Hungary, as well as ethnic Hungarian students in Romania, Serbia and Slovakia, do little sport, in the entire region students do some sport

once a week only. An analysis of the social and individual factors influencing sports activities in a single model shows powerful differences in terms of gender and financial background in Hungary, Ukraine and Romania (the differences are the biggest in the latter). If we include attitudes based on subjective choice and way of life in our model, the gender differences vanish, and the subjective social-financial situation is only tangible in Ukraine. The most important factor influencing and shaping students' attitude and motivating them to do sports is the preservation of their health.

Sport betting. A sociological perspective

Przemyslaw Nosal

Adam Mickiewicz University in Poznan, Poland,
Poland

przemyslaw.nosal(at)gmail.com

Sport betting is the crucial aspect of the contemporary sport. It puts the players' rivalry in the network of global entertainment industry.

Moreover the relation between contest and betting delivers many important sociocultural contexts. The sport betting is an example of the "multi-level entertainment" or "the play-within-the-play". The betting intensifies the sport emotion and gives players the mirage of double-winning (in sport's and financial terms). It can be analyzed as the "modern pleasure". Next, the basis of betting is individual decision-making-process. It is related to the different motifs, patterns and personal strategies. All of them are socially constructed. Then, sport betting is also a complex example of the economy branch. This sector remains the compilation of sport and business aspects; global and local; real and virtual; fun and earning money; legal and illegal. These tensions make the betting on sport a very fascinating field of research. So there are many topics to explore.

Nevertheless, the area of social research on sport betting is rather covered by history, psychology, pedagogy or economy. Sociological analysis are mostly limited to some issues (Who bets? Why do people bet? How does betting combines with social stratification?). Thus, the perceptible gap in the sociological knowledge exists.

The presentation consist of two part. The first is based on the literature review. It summons the key findings of the completed research. The second is the sketch of the planned author's own research on sport betting. The arranged investigation focuses mostly on the two theoretical categories: the feeling-of-control and the agency. Applying them both to the sport betting helps sociologists to understand the social construction of this phenomenon.

RN28 | Session 05a Sport-clubs: Tools for Social Integration?

Sense making: the role of clubs in times of demographic decline

Marian ter Haar

Kenniscentrum Sport, Netherlands, The

Marian.terhaar(at)kcsport.nl

Sport and culture clubs are small powerful nodes in local networks. In times of demographic decline they seem vulnerable. Therefore, the central question for this study is, what is the significance of sport and culture clubs in relation to the social cohesion in the village, during times of demographic decline? Given the complexity, the dynamic connections generated by the village networks and their regional relationships the study takes an interpretive case study approach. Meanings are intertwined and situation-dependent. Thirty people from three villages in the Achterhoek were interviewed regarding their perception of the situation in these villages. This study reveals and explains patterns in the network of sport and culture clubs and the contextual relationship in the village. Contributing factors to social cohesion in the villages are the variety of people, the offer of sport and culture clubs, the cooperation between sport and culture clubs at events and especially the quality of the accomFmodations. The study illustrates that organizations who manage to renew the cherished traditions and rituals in the clubs contribute to social cohesion. Key figures and youth are crucial in this result. Key figures contribute to this result because of their extensive networks with varied and weak ties that create activity and youth because they connect young people through social media and add new ideas to what already exists. In this way club activities (sometimes slightly different) are robust contributions to tradition, innovation and identity of the Achterhoek.

Sport clubs and municipalities in Italy: modes of governance in grassroots sport

Irene Masoni

University of Pisa, Italy

irene.masoni(at)sp.unipi.it

The paper describes the relationship between the local public institutions and grassroots sport organizations, with a special focus on the role of municipalities in Italy, which are the most involved level of government in the support of sports services at grassroots level.

The research is divided in two sections: the first one is dedicated to the institutional characteristics of the national sport system. This part aims to analyze the Italian legislation and a number of documents elaborated by the public administration and by sport institutions both at local and at national level. This wide analysis of the institutional context is relevant to portray the actors in the Italian sport system and to understand the distribution of competences among different levels of government. The second part of this paper is devoted to some local cases studies. The field research includes both qualitative interviews and observations, and has targeted two groups: municipal policymakers and representatives of local clubs.

The research demonstrates that in Italy, public institutions can only partially influence sport associations and its activities. If we put aside the management of facilities, we may realize that the

grassroots sport system is based on the club's work, which organize their activities in coordination with the Sports Federations (horizontal-subsidiarity). The role of public institutions serves mostly to encourage both, bottom-up or top-down initiatives by means of grants, with particular attention on specific projects (dedicated to elderly, handicapped and so on).

Tenuous Cosmopolitan Canopies: Youth Soccer and Race in the United States

Alex Manning

University of Minnesota, United States of America
manni224(at)umn.edu

Youth Soccer in the U.S. is a social formation and an intersectional contested field of social reproduction with implications beyond the soccer field. I demonstrate how various spaces of youth soccer in a Midwest metropolitan city serve as contested racial terrain where racial discourses and racial meaning are constructed, reproduced, negotiated, and challenged. Through targeted ethnography and participant observation at various youth soccer organizations and events in a metro area, and interviews with parents, coaches, and players, I explore the following question: How is the field of youth soccer raced and what does this intersectional cultural arena tell us about how larger social systems of racial inequality and racial discourses appear and shape taken for granted, but prevalent cultural spaces?

I argue that youth soccer in a metropolitan city is a double-edged sword with regards to race because it often represents what Elijah Anderson (2011) refers to as a "cosmopolitan canopy" where people from different social backgrounds interact on a seemingly neutral ground. In addition to the presence of racially, ethnically, and internationally diverse youth soccer spaces, many participants champion the global, inclusive, and progressive potential of the game, and in turn reproduce the popular cultural narrative of sport being a colorblind site of racial progress. On the other edge of the sword I argue that happy diversity discourse and cosmopolitanism canopies of youth soccer are thin, tenuous and contain cracks where exclusive racial and ethnic boundaries are formed and where whiteness and anti-black racial discourse is reproduced.

Youth in Sport-Clubs: Social Composition and Attitudes

Emőke Török

Károli Gáspár University of the Reformed Church in Hungary, Hungary
torok.emoke(at)kre.hu

Our research focused on young athletes (15-29 years) in Hungary who take part in sports activities in sports clubs. The survey was conducted on a sample of 730 athletes in the Budapest region. We wanted to find answers for three major questions: how inclusive the clubs are (what is the social composition of the athletes); how the young athletes view the impact of sports on their lives; and what are their attitudes

regarding sports, competition and fair play. Our research was partly inspired by the recent debates concerning the negative impacts of sports (such as encountering physical as well as psychic violence or the use of illegal means to achieve victory). We also wanted to know if there are any differences according to the various branches of sports.

The results have demonstrated that sports clubs rather tend to increase social inequalities since the youth from disadvantaged families eventually fall out of sports activities, so they cannot profit from its benefits or achieve social mobility through sports. Our findings show that participation in sports activities formatively improves the young athletes' social network, and it also has a positive impact on other fields of life, such as studying at school. The athletes have a positive attitude to the impacts of sports activity on their lives. It should be noted that not only the social background of the young athletes shows characteristic differences according to the various branches of sports, but the attitudes regarding sports and sports competitions indicate that the „subcultures" of the various branches of sports are also significantly different.

RN28 | Session 06a Sport and Social Capital

The '4daagse' of Nijmegen: how sport events raise different aspects of social capital

Nienke Lammertink, Koen Breedveld

Mulier Institute / Radboud University, Netherlands,
The; Mulier Institute / Radboud University,
Netherlands, The
n.lammertink(at)mulierinstituut.nl,
k.breedveld(at)mulierinstituut.nl

There is widespread literature on the economic gains (or losses) that come out of organizing (mega) sport events. The general viewpoint appears to be that mega sport events can make economic sense, but not to all parties and not in all circumstances.

Much less literature is available on the social gains (or losses) of sport events. From a lay man perspective one can see the cheering, the enthusiasm, the shared emotions, and the cheerful social interactions that accompany most sport events. But what does that do to society from a social perspective? Does social cohesion truly benefit from sport events, and if so, how, and who benefits most?

In this paper we will present a model to study the social significance that come from sport events. For this we rely on the concept of social capital. We apply this model to a study on 'The 4 daagse from Nijmegen', a four-day walking event with a 100 years history, drawing over 40.000 participants and 1 million visitors annually.

For the study, we analysed data on the origins of the participants (gender, age, nationality) and surveyed 2.100 Dutch inhabitants and 1.400 participants. The outcomes show that the event increases social interactions between participants and non-participants, that it helps sustain social contacts, and raises feelings of connectedness. Females and lower

educated appear to gain more social capital out of the event than do males and higher educated. In order to explain this, we turn to theories of individualization and of gender-specific attitudes towards social-interaction.

(Un)doing the Nation. Sport Shooting and Archery in Switzerland.

Solène Froidevaux

University of Lausanne, Switzerland

solene.froidevaux(at)unil.ch

This presentation aims to illustrate how sport shooters (in sport-clubs) challenge through their actions and discourses the common prejudice according to which they are right-wing and nationalist people. More precisely, I will describe the various processes through which sport shooters but also archers (un)do the nation.

In my PhD thesis I'm investigating two male dominated sporting activities with a specific focus on bodies and objects to challenge the assumptions according to which these spaces are seen as a "masculine world". I'm particularly interested in understanding the links between the bodily practices and the processes of subjectivation who shape the experiences of women and men.

My ethnographic fieldwork has shown that some patriotic dynamics pass through bodily experiences (during the practice or not), a specific material culture and discourses. When the sporting people talk about their motivation to shoot there is often a political position underlying. In addition, the argument that the Swiss context is an honoured place to practice sports shooting is very present. William Tell, a national mythical figure is often invoked by the practitioners themselves to define the archers and the shooters as inheritors of "Swiss values" (here resistance, fraternity). Eating and drinking local food, buying specific weapons or products "made in Switzerland", participating in several shooting festivals are only some of the elements who show us that the sense of belonging can be linked to a territory, either national, either regional, or an imaginary one (the "nature" – especially for the archers). The goal of my presentation is consequently to think about the different levels of sense of belonging to a "place" through sporting activity that requires membership.

Does pro-cycling events matters? The influence of the Giro d'Italia start on sport participation and cohesion in the Netherlands in 2016.

Hidde Bekhuis

Radboud University Nijmegen

h.bekhuis(at)maw.ru.nl

Policy makers expected that the "Big Start" of the Giro d'Italia – the second largest professional cycling event in the world – in the province Gelderland, in the Netherlands, in 2016 should increase sport participation, and cycling in particular, and it should also increase social cohesion and patriotic feelings. If the start of the Giro really has a societal legacy such

as policy makers expected is examined in this paper. Unique panel data (n=726) are collected among the citizens of Gelderland; three months before, one week after and five months after the start of the Giro the same people were asked about sport behaviour, social trust and feelings of belongingness and pride. Based on previous panel studies about the impact of the London 2012 Olympics the expectation was that the impact of the Giro should be limited, especially the influence on long term. Regression analyses show confirmed this expectation. Sport participation isn't affected by the visiting the Giro, or following the Giro via media. However, visiting the Giro resulted in a temporally increase in social trust. And it seems that this effect is stronger for lower educated than for higher educated. However, the influence on social trust was gone five months after the Giro.

Trustworthiness of Diverse Cooperative Relationships in Taiwanese Pigeon Racing

Ya-Ching Huang

National Taiwan University, Taiwan

yaqing1230(at)gmail.com

Pigeon racing in Taiwan is a distinctive animal sport—not only a competition but also an illegal gambling organized by private pigeon clubs. Individual pigeon fanciers could simultaneously be breeders, trainers and gamblers. In most circumstances, pigeon fanciers usually develop diverse cooperative relationships which help gather capital, accomplish the division of labor and/or transfer technique in order to enhance the advantages of winning money. Based upon in-depth interviews with pigeon fanciers, this research investigates how individuals form the evaluative systems of selecting partners and establish cooperative relationships. Bridging the gap between social exchange theory and theory of emotion, this research argues that the fanciers evaluate partners not only from their frequency of winning competition but also from their trustworthiness the key to achieve long-term socioeconomic relationships. There are three dimensions that constitute the evaluative system of trustworthiness: whether training technique is completely recognized; whether the distribution of prize money is impartial; and whether the partner avoids conflict of interest. Once the trustworthiness among each other cannot be sustained, their socioeconomic relationship will be damaged and ended, even though the relationship benefits them.

RN28 | Session 07a Elite Sports: Inclusive or Exclusive?

Rio 2016 Olympics and the Zika epidemic: A discourse analysis of othering Brazil

Renan Petersen-Wagner

Leeds Beckett University, United Kingdom

r.petersen-wagner(at)leedsbeckett.ac.uk

Brazil was at the central stage of the global sporting spotlight during the last decade. After hosting the 2007 Pan-American Games, the 2011 Military World

Games, the 2016 FIFA World Cup, it culminated its role of host with the Rio 2016 Olympic and Paralympic Games. Drawing from Michel Foucault and Edward Said in this paper I analyzed how Brazil was discursively created by both foreign and local media. As argued by different researchers, the pre-opening ceremony phase is commonly associated with reporting on the games' preparations before giving way to the sporting activities, and as such will become the focus of my research. Out of 1540 news collected over a two months period, 646 news in both English and Portuguese (21st June to 5th August) of the pre-Games phase were critically analyzed. To demonstrate how Brazil was orientalist I turned my attention to how media used the outbreak of the Zika epidemic to discursively construct Brazil as inherently distinct and peripheral to the Global North. Zika was prominently featured in foreign news (109) in contrast to local news (4), and was commonly associated with Brazil's exoticness, lack of sanitation, favelas, corruption, crime, violence, and air and water pollution culminating in a discursive reality where Brazil was unable to successfully host the games. I conclude by emphasizing the importance of contemplating the discursive alt-reality created by the media that can ultimately shape public opinion in direction of maintaining the Global North-South hegemonic status quo.

Can media coverage of sport be at the service of social inclusiveness ?

Francoise Papa, Jean-Marc Francony
 Université Grenoble Alpes, France; Université
 Grenoble Alpes, France
 francoise.papa(at)univ-grenoble-alpes.fr, jean-
 marc.francony(at)umpacte.fr

Sport, particularly sport media events, offers a space for the visibility and expression of diversity. Sport, also regarded as an important means to build cohesion and social integration, is, as well, a field where discrimination (gender, homophobia, disability, ethnicity) arises, that counteracts this goal.

The media coverage of sport is far from reflecting social and cultural diversity and ensuring fair representation of all. Several studies have established that the media treatment of sport operates a sexual differentiation (hyper masculinization) of sports information despite a balanced presence of men and women at international meetings.

In France, the implementation of measures for the expression of diversity in the media is part of a dynamic promoted by the Council of Europe, relayed by the regulatory bodies to the media. Thus, since 2006, the expression of the diversity of French society has been a public service mission.

Our study focuses on the expression of ethnic diversity, gender and sexual orientation at three sport events broadcasted by France Télévisions in 2016: the "4 seasons of women's sport"; The European Athletics Championships; The Olympic Games.

It shows that the corporate communication of the "4 seasons of women's sport" event carried out by

France Télévisions, has no hold on professionals (editorial board and journalists) whose activity remains guided by the logic of audience rates and by sport hierarchies. The analysis of the comments delivered live during the European Championships and the Olympic Games also shows the limits of the instrumentally uses of sport in strategies of social engineering

Olympic dreams and the 99%

Kostas Zervas
 Leeds Trinity University, United Kingdom
 k.zervas(at)leedstrinity.ac.uk

The negative impacts of hosting the Games—gentrification, democratic lack, public money spending—have been well documented in recent years (see Lenskyj 2012; Giulianotti et al.2015). In many of these cases, the data that prove these controversial aspects of Olympics have been compiled by anti-Olympic movements or local monitoring groups themselves, which are usually formed to oppose bids and monitor Olympic preparation. Through their campaigns, these activists, who constitute part of the anti-Olympic groups/movement, have brought to light key questions on fundamental aspects of the life in our societies in relation to the choices that we make. While the Olympic sponsors, partners and affiliated contractors make record profits, the hosting countries and especially the citizens have to deal with the increasing cost of hosting, subsidising and privatising that comes with the Games. An interesting aspect of Olympics which probably is underestimated in the existing research is the fact that they contribute significantly in widening the gap between the rich and the poor in hosting cities. Beyond the costs and impacts of hosting, the Olympics systematically fuel economic inequality, probably the biggest social problem worldwide. Following previous research on Olympic activist groups, this session aims to provide new evidence on the relation of Olympic Games with economic inequality.

Face management strategies in winners' post-game discourses

Diana-Luiza Dumitriu, Nicolas Delorme
 National University of Political Studies and Public Administration, Romania; Université de Bordeaux, France; Université de Bordeaux, France
 diana.dumitriu(at)comunicare.ro, nicolas.delorme(at)u-
 bordeaux.fr

The post-game press conference provides a public communicative situation defined by three main aspects: its evaluative nature in terms of performance quality and responsibility of the output; its high level of formality in terms of communication contract (Charaudeau, 2002); and its high level of public exposure, which comes along with important face management threats (Goffman, 1967, 1971; Brown & Levinson, 1987). Although the focus in analyzing the face management strategies within this context has mainly been on the losers' choice of corrective strategies in saving their face, we argue that post-game press conference is a challenging face management context for winners too. Therefore, the main aim of this paper is to address the face management strategies mobilized by winner coaches in their post-game press conferences' discourses.

The study is based on a sport event-related corpus, covering: 94 coaches' discourses from the 2010 European Women's Handball Championship post-game press conferences and 79 coaches' discourses from the 2011 World Women's Handball Championship ones. The discourse analysis revealed a significant role played by the 'presentation rituals' (Goffman, 1967, 1971) in coaches' discourses, which are strongly related to the paradiplomacy dimension of sport actors' performances within international frameworks. Nevertheless, there is a clear duality of their discourses in terms of face negotiation, as the fair-play solidarity and sport courtesy, which are embedded in the communication contract of press-conferences, overlap with the strategic use of this public context for redefining or enhancing their symbolic power status.

RN28 | Session 08a RN KEYNOTE SESSION: Sociology of Sport as a Professional Project

Sportive vocation to the test of injurie

Lucie Forté Gallois
Université Paul Sabatier, France
lucie.forte(at)univ-tlse3.fr

This communication deals with the construction of the high-level athlete's sportive valuation. Indeed, although the sport performance is often individualized through the champion's figure, the production of the athletic excellence takes place into very specific forms of socialization during which diverse institutions and agents play determining roles.

On this matter, the first stage of the high-level sportive career is marked by a socialization of conversion which passes by the inculcation of a high-level sport vocation. Indeed, the move on from the practice of a playful and entertaining sportive activity to a very binding « serious leisure » (which sometimes becomes a labour) requires a « body and soul » form of involvement which presents numerous similarities with religious or artistic vocations. But the strength of this vocational inculcation must not overshadow the fact sportive vocations are very plastic, dynamic and even unstable: at every stage of the career, more or

less congruent forms of socialization may allow the consolidation of the vocations or their transformation. In this perspective, we will focus on the hardship of injurie which will be considered such as an event and socialization framework susceptible to generate vocational crises. Basing our analysis on a qualitative research, we will show that injuries play both structuring and deconstructing roles as they may generate vocational crisis but as they can also favour the preservation (and even the strengthening) of sportive vocations.

The sociology of sport as a professional project: Where next for the subdiscipline

Dominic Malcolm
Loughborough University, United Kingdom
d.e.malcolm(at)lboro.ac.uk

This paper draws on theoretical insights from the sociology of professions to presents a historical sociological analysis of the sociology of sport. Exploring previously published 'state of the field' reviews, the paper argues that in establishing why the sociology of sport emerged, how people identified its earliest manifestations, and how the subdiscipline's boundaries were drawn, the political dynamics and consequences of the social construction of the field become apparent. This social construction is conceived of as a 'professional project' through which a knowledge domain, and this group's authoritative status, was established.

Building on this retrospective analysis, the paper then examines the future prospects of the subdiscipline. It argues that there currently exist two central trends in the sociology of sport: what might be termed the management-ization and medicalization. Using the concept of professional projects the paper considers the potential opportunities and threats of these developments, identifying the need and the scope for the sociology of sport to remain distinctive and distinguished.

RN28 | Session 11b Young Sportsmen and Women: Frail Identities, Trying to fit in

Out of Touch with Children's Rights: Critical Reflections on the 'No Touch' Discourse in Youth Sport

Melanie Lang
Edge Hill University, United Kingdom
langm(at)edgehill.ac.uk

Children's participation in sport is generally regarded as beneficial, a component of a healthy childhood and a long adulthood (UNICEF, 2004). However, research has also identified the existence of child maltreatment in sport (Alexander et al., 2011; Brackenridge, 2001; Vertommen et al., 2016). Consequently, many countries have expanded child protection regulations to encompass sport and physical activity settings (Lang & Hartill, 2015). However, critics of these developments in the UK, Sweden, Denmark and Australia have argued that the extension of child

protection measures into sport amounts to over regulation and is fuelling a moral panic regarding the safety of children and the riskiness of adults (Furedi, 2013; Öhman & Grundberg-Sandell, 2015; Piper et al., 2013; Toftegaard-Støckel, 2015; Lyons, 2015). Such regulations are positioned as a “crude and prescriptive injunction” on adults’ practice (Piper, 2015, p. 12) and it is argued that “sound pedagogical values and caring physical interactions [are being] discarded” (Öhman, 2016, p. 12) so that coaching and PE teaching are becoming “impoverished and dehumanized” (Piper, 2015, p. 12). Somewhat surprisingly, alternatives to this negative, adult-centred perspective are, to date, rare. Drawing on ideas from the sociology of childhood and principles of children’s rights, this presentation critiques these constructions in an attempt to re-frame the debate around child protection regulations in sport. In doing so, it avoids (re)producing negative constructions and exacerbating current concerns about child sexual abuse in sport and encourages positive engagement with child protection regulations for the physical and mental wellbeing of all involved in sport.

Shaping Up Bodies: An Ethnography of Masculinities and Physical Training in Sydney

Alejandra Villanueva

Western Sydney University, Australia

A.Villanueva(at)westernsydney.edu.au

The present paper is a preliminary analysis of an ethnographic study with men who practice Crossfit in Sydney, Australia.

The role of sports has changed in the last decades due to socioeconomic and political transformations. The consolidation of a market ideology has had an impact in the ways people understand health and fitness, and more specifically, the ways men engage in different training regimes seeking to (re)produce specific body shapes that are regarded as highly valued. Bodies, as powerful symbols in social relations, are produced in both highly homogenous subcultural groups (Crossfitters) as well as in heterogeneous social fields; where different forms of capital such as status, knowledge or economic resources are exchanged. Accumulation of bodily capital through gym work is important in societies where athleticism, aesthetics and performance reflect the negotiations of value given to particular status symbols in specific fields and in particular historical times.

Sporting practices have a central place in wealthy first world societies of a post-scarcity era (Florida, 2002), and in Sydney the increase in consumption of fitness products (amongst them gyms) and the popularization of physical activity is arguably part of the city’s remarkable feature. Fitness holds a high value amongst diverse groups of people, thus different sporting practices and training regimes like Crossfit are useful to analyse the significance of physical activity in itself, but also to understand processes of male identity construction, socioeconomic inequalities and the social structures that shape the ways in which

health and leisure are understood and displayed.

Trying to fit in – Young people’s negotiation processes between sports culture and modern youth culture

Stine Frydendal Nielsen, Lone Friis Thing

Copenhagen University, Denmark; Copenhagen

University, Denmark

sfnielsen(at)nexs.ku.dk, lfthing(at)ifi.ku.dk

Sport is often saluted for its inclusive character and its ability to unite different groupings and facilitate a feeling of togetherness (Bailey, 2005; Smith & Green, 2004). However, research has also pointed to the fact that sport holds an exclusionary character, which is to be problematized and critically discussed in order to expose underlying assumptions of sport as a mean for social inclusion (Kelly, 2011; Maxwell, Foley, Taylor, & Burton, 2013; Munk & Agergaard, 2015). In this paper we present results concerning how students in a Danish upper secondary school manage to combine sports culture with youth culture. Results from this study show that this can be rather difficult, because living a healthy and physically active life doesn’t fit very well with current norms of youth culture, which involve a dominating social arena characterized by parties and alcohol (Nielsen, Ottesen, & Thing, 2016; Thing & Ottesen, 2013). By applying the figurational sociology of Norbert Elias (Elias, 1978, 1994 (1939)), this paper demonstrates how the matter of inclusion or exclusion regarding sport among young people is not a question of either/or. It is rather a process of negotiation, where they try to fit into different contexts – both sport- and non-sport related – and being included in one context often means exclusion from others. The study is based on 19 focus group interviews N=136 conducted over four years in 1 school.

Masculinities in a youth football context: Exploring attitudes toward gay peers among adolescent boys in an English professional football (soccer) academy

Adi Adams

Bournemouth University, United Kingdom

aadams1(at)bournemouth.ac.uk

Drawing on data generated from semi-structured, in-depth one-to-one interviews, this paper focuses on youth masculinities through an exploration of attitudes toward homosexuality among twelve (n=12) adolescent boys (14 and 15 years old) registered to the youth development program (Academy) of an English professional football (soccer) club. Findings highlight the presence of progressive yet unstable attitudes toward homosexuality espoused by boys at West-Side Academy (a pseudonym). More specifically, interview data points to contradictions between attitudes and subsequent behaviours surrounding homosexuality in this sample of young male athletes. Self-described attitudes of inclusivity, conflict with verbal accounts that demonstrate complicity in a range of homo-negative behaviours.

The idea of a 'hybridization' of masculinities is utilised as a way of understanding the complex imbrication of inclusivity and complicity in boyhood masculinities in this setting. It is suggested that this is a critical time for promoting change in attitudes and subsequent behaviours toward homosexuality in youth football environments.

**RN28 & RN33 | Session 10a JOINT SESSION:
Sports, Bodies, Genders and Sexualities I**

"Masculine Bodies, "Sexual Purity" and Discipline. How the practice of sport (re)defines sexual biographies"

Vulca Fidolini

University of Strasbourg, France

fidolini(at)live.com

By exploiting the outcomes of sociological research dealing with sexual conduct, representations, and norms in a group of young Moroccan men who have migrated to Europe, this contribution investigates the body as a place to develop sexual disciplines through practicing sport.

From a Foucauldian perspective, this paper will focus on a population of young Moroccan Muslim people who, through a personal relation to their body, produce individual sexual disciplines according to (their) Islamic precepts in order to preserve "sexual purity". In this frame, sport and body practices become privileged fields where different technologies of the self are engaged. These technologies will be the key to observing how young people build personal understandings of licit (allowed) sexual experiences through individual renegotiations of Islamic references. We will analyse the topic of sexual abstinence during premarital sexual relations showing how sport and body control become fundamental tools in order to reaffirm a Muslim identity abroad by redefining the meanings of a licit sexual script.

This path will lead us to analyse how the Foucauldian concept of technology of the self, related to physical activities, becomes an individualised field to build sexual scenarios, to negotiate a cultural identity abroad, to elaborate personal accounts of sexual biographies where family education, peer dynamics, and cultural belongings are at stake.

Gendered Success: Feminine Sporting Performance in Masculine Configurations

Florin Faje

Babes-Bolyai University, Romania

florin.faje(at)gmail.com

Recently, Romanian successes in professional sports have been largely achieved by women. Moreover, these successes have appeared in disciplines that are, historically and culturally, defined as male. Consequently, I investigate the emergence of femininity in masculine sporting configurations and inquire the interplay between gender identity and sporting performance. I do so by addressing three interrelated questions: how is the gender divide played

out in masculine sporting configurations? What does it mean to be a sportswoman in such configurations? How does gender identity impact upon sporting performance? Answers are sought in a comparative analysis of two cases, fencing and judo. Fencing and judo are combat sports that emphasize bodily encounter to "wound" or subdue one's opponent. They are masculinized rituals of individual engagement, historically deriving from the practice of the "duel" and martial arts, respectively. The forms of feminine body display are in stark contrast: the fencers' bodies are fully covered, from head to toe, in an equipment that no gaze can penetrate, while the judokas minimalistic attire reveals much of the body during the encounter. The two sports develop the bodies of their practitioners in ways that converge and diverge from current Western ideals of female physical beauty. The analysis captures the interaction of gender regimes and ideologies of performance in the making of highly efficient and controlled selves as well as in the making of highly skilled and able bodies. The results are intended to make a decisive contribution to the sociology of gender and sport and to provide some of the knowledge needed to encourage adolescents to take up sport and to prevent abandoning it once they do so.

The relationship between pain control and body building in sport practices from Franco

Dictatorship period to the present: the social process of medicalization in sport activity

Xavier Pujadas i Martí, José Manuel Parrilla-

Fernández, Sandra Sánchez-Sánchez

Universitat Ramon Llull, Spain; University of Oviedo,

Spain; University of Oviedo, Spain

xavierpm(at)blanquerna.url.edu, jmparril(at)uniovi.es, sanchezsandra.uo(at)uniovi.es

The objective of this research is to analyze the relationship between changes in pain control and body building in sports practices of four generations of woman athletes, studying and comparing the period of the dictatorship in Spain and the following one. Although the injuries are accepted by the athletes as a risk associated to their own practice, during the analyzed lapse of time a transformation in the ways of managing this risk is evident, as a process of change in the ways of dealing with the injuries caused by sport practice. The body care techniques adopted informally at first evolve towards a high degree of medicalization of the body, under the guidance of sports doctors.

This process of change is shown through in-depth interviews with women athletes from four different generations. The results indicate that the degree of control over pain is incorporated as part of the self-discipline and the identity of the athletes. They also show the process of learning body care techniques and its modifications through the different generations. This work is part of the doctoral thesis of Sandra Sánchez Sánchez (pre-doctoral fellowship FPU). It is part of the project "Women, Sport and Dictatorship: the oral memory of women sportsmen under the Franco regime (1939-1975)" (MUDEDIC), from the I +

D + I Program 2013-2016, and developed in the Research Group in Sociology of Food of the University of Oviedo.

New Alternative Masculinities as pillar for healthier, safer and more inclusive sports

Ana Vidu Afloarei, Marcos Castro-Sandúa
Universitat de Barcelona, Spain; Universitat de Barcelona, Spain
ana.vidu(at)ub.edu, marcos.castro(at)ub.edu

When violence in the sport arena is tolerated, normalized and considered as a constitutive part of sports (Fields, Collins, & Comstock, 2007; Wellard, 2009), its transformative dimension as a social phenomenon is dramatically undermined. A violent environment is radically incompatible with goals such as uniting people, overcoming differences, learning norms and values or inspiring persons to follow their dreams.

Previous sociological analyses have already examined competitive sports as a context of reproduction of hegemonic and violent masculinities (Anderson, 2005; Connell, 2008; Kivel & Johnson, 2009). Traditional masculinity models do not only reproduce the patriarchal order already established which contributes to also reproduce gender violence; but it also lead to unequal and unsatisfactory sexual-affective relationships (Gómez, 2015). Seeking for an alternative model of masculinity, research on preventive socialization of gender violence highlight the New Alternative Masculinities – NAM (Flecha, Puigvert, & Rios, 2013); its construction and enforcement is being built since the early childhood, as an effective measure for violence prevention (Gómez, Munté, & Sordé, 2014).

Our analyses of Media contents related to relevant sports events, conducted during the season 2015-2016, make evident that the traditional masculinity models and the values they embody are still mainstream and hegemonic. However, our work reveals inspiring elements for overcoming these models, which are closely connected to some of the NAM's characteristics such as friendship, solidarity, courage and taking a clear stand against violence, in favour of the victim. In addition, we analysed alternative sports contexts and initiatives, specially aiming at the promotion of positive values close to the NAM's features. Guidelines for the creation of healthier, safer and more inclusive sports environments are discussed.

RN28 & RN33 | Session 11a JOINT SESSION: Sports, Bodies, Genders and Sexualities II

Bodies in action. The Gender Order on the workplace and within sporting activities

Isabelle Zinn, Solène Froidevaux
University of Lausanne, Switzerland; EHESS, Paris;
University of Lausanne, Switzerland
isabelle.zinn(at)unil.ch, solene.froidevaux(at)unil.ch

This presentation tackles the question of how

gestures, postures and the body in its spatiality do gender. In order to explore how the body in action becomes gendered we will refer to both of our research projects on workplace settings and sporting activities that are segregated according to sex. We are both interested in teasing out when gender is made relevant by the participants and how exactly it plays out in interaction. The ethnographic fieldwork carried out in both of the settings in Switzerland has shown that the body plays a central role in the apprenticeship of the practices at hand. More concretely, I. Zinn, who is studying a female (floristry) and a male (butchery) dominated occupation, aims at understanding how gender is referred to and if and when it becomes a structuring element in terms of the organization of the workplace activities. S. Froidevaux is investigating two male dominated sporting activities (archery and sport shooting) with a specific focus on bodies and objects in order to challenge the assumptions according to which these spaces are seen as a "masculine world". She is particularly interested in understanding the links between the bodily practices and the processes of subjectivation who shape the experiences of women and men. By questioning the 'taken for granted' sex categories, we will make visible various gendered assumptions that serve to naturalize and reproduce social inequality on both of our fieldsites. This presentation should thus enable us to discuss how cultural assumptions about bodies tend to consolidate the gender order or as the case might be blur some of these assumptions.

Gender and Sexuality Perceptions of Early Childhood Educators: The case of a Private Kindergarten in Ankara, Turkey

Didem Salgam
Middle East Technical University, Turkey
didemsalgam(at)gmail.com

Just like many other societies, heteronormative gender and sexuality rules and roles are mostly adopted without questioning in Turkey. The reflection of heteronormative gender and sexuality can be seen in almost all areas of social life because most people perceive heteronormative gender and sexuality as the legitimate, normal, and unique form of sexuality. I argue that although some early childhood educators may have alternative and challenging gender and sexuality perceptions in Turkey, most of them have normative gender and sexuality understandings.

This presentation aims at discussing how early childhood educators perceive gender and sexuality, and how they reflect their gender and sexuality perceptions in their social interactions with children in a kindergarten setting. The discussions in this study are mainly based on an ethnographic field research, which I have conducted in a private kindergarten in Ankara for my Masters' thesis.

In this presentation, for the better understanding of gender and sexuality perceptions of early childhood educators, I will firstly point out how the male and female dichotomy is reproduced and reinforced by early childhood educators; secondly, I will be

discussing how desires and bodies of children are “normalized” by early childhood educators in the kindergarten. Lastly, I will briefly mention how compulsory heterosexuality operates in the kindergarten.

Fitting Queers-Queering Fitness?

Corinna Schmechel

Carl-von-Ossietzky-Universität Oldenburg, Germany
corinna.schmechel(at)gmx.net

In theoretical analytics, mainly those of gouvernementality studies, fitness sports is seen as a paradigmatic way of Foucault’s sense of modern government, knitting together self-technologies and sovereign biopolitical technologies, as well as capitalist strategies in consumer culture.

Empirical research done on gender in fitness sports so far stresses that even though fitness is an unisex sport, one clearly finds binary gendering in the spatial organisation of gyms and the concrete execution of exercise practices as well as in the motivations and ideals of participants.

But as the culture of fitness sports includes the promise that with the right effort of working out, everybody can reach the body s_he desires, doesn’t this notion in fact offers some linkage with queer aim of deconstructing the essentialist nexus of the body and (gendered) identity? Moreover all sorts of research on fitness locate it in the commercial fitness-gyms, which might be seen as the hearts of fitness culture but not the only fields in which fitness sports is practiced.

In my qualitative research combining participant observation and focussed interviews I explore the field of self-declared queer fitness groups in Berlin. With a praxeological social-constructivist understanding of bodies and space I examine how school sport halls are transformed into “queer safe(r) spaces” (in vivo). I will show how queer spaces, practices and bodies are mutually co-constructed and what paradoxes and contradictions result from the claim for a non-normative fitness culture, including dissent but also reification of hegemonial concepts of gendered physics and body norms.

Regendering the athlete. The construction/representation of gender in the journalistic discourse

Alessandro Porrovecchio, Fabien Wille
URePSSS EA 7369 (Unité de Recherche Pluridisciplinaire Sport Santé Société), University of Lille 2, France; URePSSS EA 7369 (Unité de Recherche Pluridisciplinaire Sport Santé Société), University of Lille 2, France
alessandro.porrovecchio(at)gmail.com,
fabien.wille(at)univ-lille2.fr

In the framework of the ANR RSJ-MéDis project, that aims at questioning the social responsibility of sports journalists in relation to the theme of “diversity”, we conducted an exploratory study on the athletics events of the Rio2016 Olympic Games. This communication

will introduce some of the first evidences emerging from two case studies: the final of the men’s decathlon and the final of the women’s discus throw.

Among the evidences emerging from the first case study, a gradually over-masculinized representation of the French decathlon athlete Kevin Mayer, based on an ethic of sacrifice and hard-work that converge in the gradual eroticization of the discourses around his body (a male journalist says “don’t call me a sexist, but he is so beautiful”). Concerning the second case study, we can observe a gradually more and more traditionalist representation of the female discus throw athlete Melina Robert-Michon (she is depicted as ‘a mother’, ‘non-professional’, ‘elderly’, ‘coming from a rural context’), which leads to her “normalization” and re-insertion in a normative gender order. A series of dichotomies persist in the journalistic discourses: Ego/Alter (Melina Robert-Michon vs. “the Chinese” and Kevin Mayer vs. “the bronze statue”); mother/whore; human/divine; sacrifice/gift; etc. This set of elements emerge when the narrative of the journalist becomes emotional, when the dominant male gaze becomes more evident.

RN28 & RN35 | Session 09a JOINT SESSION: Sport and Refugees: First Steps Towards Integration?

How sport clubs engage in refugee work: Empirical findings from a qualitative study in Germany

Tina Nobis
Humboldt-University of Berlin, Germany
Tina.Nobis(at)hu-berlin.de

With millions of refugees arriving in Europe, the idea that ‘sport facilitates integration’ has regained public attention and numerous sport organisations are engaging in refugee work. However, we know very little about how sport organisations (e.g. sport clubs) help integrate refugees.

Due to this lack of empirical knowledge, we implemented a study in 2016. We wanted to explore how sport clubs engage in refugee work. It was our goal to analyse motives, aims, and practises of sport clubs that focus on the integration of refugees. Since numerous studies have shown that gender plays a crucial role for sport participation, our study focuses on how female refugees participate in sport clubs. We conducted semi-structured qualitative interviews with 30 representatives from sport clubs (board members and coaches) who engage in refugee work.

I will present and discuss the conceptual framework and the empirical findings of this study during the conference. On the one hand, our data suggest that sports clubs have successfully reached out to refugees and that they can play an important role in deconstructing otherness. On the other hand, there are barriers closely connected to structures, cultures, and practises of sport clubs itself, which inhibit sport participation. We conclude that the integration in and through sports does not happen by chance and that sports do not improve integration directly. The sport

club's engagement for more participation of refugees takes time and it relies on specific efforts of the members involved.

War, Migration, Resettlement and Sport Careers of Youth Elite Athletes: The Case of the Syrian National Water Polo Team

Enrico Michelini
TU Dortmund, Germany
enrico.michelini(at)gmail.com

The reciprocal influences between war, migration, and resettlement, on the one hand, and sport careers of youth elite athletes, on the other hand, are here considered in sport biographies of youth refugees. Under theoretical and methodological aspects, this research rests upon the interactional concept of socialisation theory (Burrmann, Mutz, & Zender, 2015) and the qualitative technique of content analysis. These are used for examining and interpreting semi-structured interviews conducted with four former players of the Syrian national water polo team, who are now asylum seekers in Europe.

In summary, the influences between war-related events and sport careers are deep and reciprocal. The early and intensive socialisation in sport impacted the events which followed the outbreak of the Syrian Civil war in several ways. The determination to carry on sport activity influenced important decisions before and during the resettlement and plays a relevant role in the (re-)creation of continuity and meanings. Nevertheless, only one of the former members of the Syrian national selection is still involved in water polo at a high level. For the others, the possibility to follow a professional career is still virtually open, but impracticable. Indeed, all interviews report the need of an extreme will and a disposition to sacrifice in order to keep playing water polo, even just at an amateur level. For this reason, the prioritisation of sport on other urgencies may stimulate but also exceed one's adaptive resources.

Bibliography

Burrmann, U., Mutz, M., & Zender, U. (2015). *Jugend, Migration und Sport: Kulturelle Unterschiede und die Sozialisation zum Vereinssport*. [Youth, Migration and Sport: Cultural Differences and the Socialisation in Sport Organisations]. Wiesbaden: Springer-Verlag.

Fostering integration through sports? Analysing the long-term effect of youth sport activities on subsequent labour market success of migrants

Christiane Lübke, Sophia Fauser
Universität Duisburg-Essen, Germany; Universität
Duisburg-Essen, Germany
christiane.luebke(at)uni-due.de,
sophia.fauser(at)uni.due.de

Sport has been proven to be beneficial for various different life course outcomes: It does not only enhance well-being and health, engaging in sports also fosters educational success and labour market participation as it improves individual's skills such as self-confidence and provides access to social

networks. For these reasons, both researchers and social policymakers consider sport activities to be an effective tool for the integration of migrants and refugees in particular. There is, however, so far no sufficient research on the integrative effect of sport activities. Above all, it is not known whether the positive effects of sport endure over the life course and can therefore contribute to a long-term integration of migrants.

Adopting a life-course approach, this study investigates the long-term effects of youth sport activities on subsequent labour market success of migrants in Germany. It uses data from the Socio-Economic Panel. This representative household panel contains detailed information on youth sport activities (e.g. type and intensity) along with information on respondents' further life course development. This study focus thereby on the effect of sport on labour market success later on in life as this is a main indicator of successful integration. Our results confirm the beneficial effects of sport. Migrants who were involved in sports at the age of 17 are for example more likely to have reached a higher educational level and to be employed at the end of their 20s than migrants who were not. This effects seems to be independent of the type and intensity of the sport activity.

The role of sports clubs for early and sustainable integration of migrants

Anna Maria Faustmann
Danube University Krems, Austria
anna.faustmann(at)donau-uni.ac.at

European populations are becoming more diverse due to increasing global migration flows (intra-European mobility, labour market migration of highly qualified, asylum flows, student mobility, family reunification etc.). Research findings (Biffl et.al. 2015; IMF 2016; OECD 2016) stress the importance of early opportunities for social integration and getting into contact with the hosting society and it's institutions. Since migrants often lack formal qualifications, language skills, work experience or access to social networks, also their labour market opportunities are lower.

Sport is an important field for social integration and building up social networks since it's inclusive character allows overcoming language, cultural or other social barriers. (Morgan 2008; Nobis 2013) Amara et al. (2004) see an impact of sport on inclusion at different levels: At an individual level, sport can aid fitness and enhance health and well being. In terms of personal development, sports participation enhances self-confidence and self-esteem, in psychological terms, it fosters empathy, tolerance, cooperation, social skills and team work. At the societal level, it promotes the development of a community identity, coherence and integration.

Sport is therefore an important field of informal learning. Especially in team sports, athletes attain social and personal skills such as self-confidence, self-discipline, capacity for teamwork, willingness to

cooperate, flexibility or sense of responsibility (Golenia/Neuber 2010).

Both factors – the access to social networks in the host country and the opportunity of informal learning in sports – foster the (labour market) integration of migrants. Through appliance of a multiple regression model using the ISSP 2007 data on “Leisure time and sports”, the role of sports clubs for the promotion of migrant integration to society and labour market is being analysed.

RN28 & RS12 | Session 09a JOINT SESSION: Sports, Knowledge and Embodiment

Fitness, Health and Beauty: Reflexive Body Work and the Enterprising Self

Michael Meuser

TU Dortmund, Germany

michael.meuser(at)tu-dortmund.de

According to Bryan Turner, we are living in a „somatic society“ within which major political and personal problems are expressed through the body. Other notions like „staging society“ (Willems/Jurga) or „consumer society“ (Bauman) also focus on the high significance of the body in contemporary society. This is no more the body of hard physical labor in industrial production. It is the optimized body becoming increasingly important as a resource of distinction and success in occupational competitions as well as in intimate relationships. The paper focusses on that kind of work that people do by themselves or let do by body experts in order to optimize the own body according to an idealized body image. The ideal can be defined in medical terms (the healthy body), in aesthetic terms (the beautiful body) or by combining both (the fit body). For shaping those bodies, a specific body knowledge is needed which is increasingly available in various formats: life-style magazines like „Fit For Fun“ or „Men’s Health“, TV-formats like „Germany’s Next Top Model“ or „The Swan“, online portals like „NetDoctor“, self tracking apps and others. The more body knowledge is available the more the body is no more a fate, but becomes a permanent task and an object of body-reflexive practices. Referring to Foucault, it will be argued that reflexive body work becomes an important part of the self-management of the enterprising self, replacing repression by stimulating the body. Finally, the relation of self empowerment and self submission in body work will be discussed.

Pre-enactments as situated action plans – Comparing cases in traffic, medical testing and sports training

Ajit Singh

University of Applied Science Fulda, Germany

ajit.singh(at)uni-bayreuth.de

The contribution investigates projections and action plans not as individual mental concepts but as situated and observable activities in social interactions (Goodwin 2002). Projects are a relevant resource for

the sequential organization of social interaction through mutual engagement and cooperative activities. Thus, they work as “a guide to practical actions in the actual situation” (Garfinkel et al. 1970). In this sense projects aim to enable actors to plan and to limit the possibilities of acting alternatives.

Using video data on three different cases I will show different forms of bodily situated projections. In the first case I will show how traffic participants prepare immediate activities by gesturally, bodily and technically making traffic rules and projects accountable. Case II will be used to illustrate how a doctor turns a medical testing situation into a collaborative activity, by visualising embodied knowledge. The third case refers to complex forms of projections in a training situation in trampoline jumping. The coach multimodally instructs actions and refers to embodied knowledge to prepare the athlete’s future activities.

The used ethnomethods of multimodal projecting and accounting can be described as “pre-enactments” (Arnold 2012). I argue that pre-enactments should not only be considered as ideal representation or imagination to corporally produce intersubjectivity, but also as a means of temporally producing visibly situated action plans, in which actors can coordinate and orientate their prospective communicative actions. The visibility of bodies serves as both, a vehicle and a solution for recurring communicative problems by making embodied knowledge accountable.

Religious Space - Knowledge - Embodied Communication

Thea D. Boldt

Kulturwissenschaftliches Institut Essen, Germany

thea.boldt(at)kwi-nrw.de

Whereas the theoretical approaches to the problem of space in social sciences have been problematised in the wake of ‚spacial turn‘ and discussed broadly in the recent years, there is still a need for empirical research on spacing practices, also at the interface of Sociology of Knowledge and Sociology of Religion.

Taking spacing as a concept that relates materiality and sociality of space into account (Löw 2001) and brings space in close relationship with knowledge, communication, and body (Knoblauch 2017), this paper presents the empirical analysis of spacing practices as material objectivation of religious.

On the basis of videographical data recorded during a silent meditation retreat in a Buddhist meditation centre in Germany, the paper focuses 1) on material objectivation of religious as a product of communicative actions of the social actors involved in the design, construction and utilisation of religious spaces, 2) on the question in what way and through what means the organisation of ritual spaces influences the structure of religious rituals. Since the paper understands rituals as forms of knowledge (Soeffner 2004, 2010), the main concern of this paper is not only how ritual spaces are shaped in their materiality through (translocal, polycontextual and mediated) communicative actions but also, how

ritual spaces are being constructed through the relational arrangement of social actors, bodies, objects and technologies insofar that we are able to speak about the ritualisation of the space and ritualisation of religious practices at the interface between the materiality and sociality of religious.

Peaks and pitfalls – experiences of pain across discursive practices in recreational rock-climbing and running

Oana Mara Stan

University of Bucharest, Romania

marastan(at)sas.unibuc.ro

The study analyses discursive means by which members of recreational sports communities engage with pain. It dwells on member-provided descriptors of physical and mental pain associated to practicing rock-climbing and running, by portraying a typology of social meanings and sense-making strategies deployed to signify the role that pain plays in lifestyle sports involvement. Lifestyle recreational sports are regarded as self-identity markers. One interpretive thread views pain as escapist signifier of the search for stoic downshifting, purification, authenticity, humbleness and simplicity. The methodological approach relies on netnographic discursive psychology and critical discourse analysis. A comparative outlook inquires into pain descriptors in connection to coping techniques across two Romanian forums – one belonging to the rock-climbing group “La cocot” and an amateur runners’ site forum “Alerg.ro” (with a total of 29 investigated discussion threads with 214 comments).

The study taps into the social ethos of redemptive, cathartic pain as pre-requisite for athletic and psychological performance, with emphasis on inquiring on the discursive strategies deployed for the strategic use of pain as yardstick for effectiveness of training. It aims to pinpoint a typology of discursive practices according to compressed time, intensified and accelerated rates of spare time use by commodification mechanisms. It discusses emancipatory, transformative and disruptive influences on identity building of amateur athletes involved in the two lifestyle sports. Meanwhile, endurance and resilience to pain conceived as soreness from exertion appear as features of today’s self-effacing hero, who indulges in pain non-ostentatiously, as act of self-enhancement and self-discipline. Positive and negative implications of pain across recreational sports are considered, together with coping tactics for incorporating productive pain into training.

From collective representations to social imaginaries: Castoriadis' contribution to the social sciences

Christopher John Gilleard
University College London, United Kingdom
C.Gilleard(at)ucl.ac.uk

This paper considers Cornelius Castoriadis' writing on the social imaginary from the perspective of the tradition established by Durkheim of considering collective representations as social facts. While Durkheim was at pains to distinguish between individual and collective consciousness, interest in the latter has shifted from sociology to social psychology, in the study of 'social representations'. At the same time, Castoriadis' interest in how society represents itself to itself in and through the 'radical' imaginary has been used to advocate for the importance of personal agency and subjectivity as a source of social change rather than the stability and solidarity encapsulated by more structuralist interpretations of collective thought. While writers such as Charles Taylor have used the term social imaginary to represent shared assumptions, beliefs and narratives as a means of sustaining trust, Castoriadis' writings emphasised the role of the imaginary as a creative source of meaning making rather than a mechanism for relaying common beliefs. While recognising that collective representations do constitute social facts, in the sense intended by Durkheim, the present paper argues that the creative, 'radical' aspect of the imaginary produces a surplus of signification attached to any particular collective representation – of class, gender, race or sexuality for example. This surplus – the polysemous nature of social imaginaries – increases as the resources for any symbolic organisation of social thought expand, serving as a radical resistance to each and every attempt at culturally essentialising beliefs, belongings and identities.

Theorization of Social Governance in China and its Possible Meaning to European Sociology

Hongwen Zhu
Beijing Normal University, China, People's Republic of
zhuhongwen(at)bnu.edu.cn

A definition of sociology is popular in European

academics, Sociology is a social science that uses various methods of empirical investigation and critical analysis to develop a body of knowledge about society. Empirical investigation and critical analysis are the two main methods in sociology and therefore sociology could be categorized into two forms, i.e. empirical sociology and critical sociology. Social governance in today's China is a very popular topic not only in the field of social policy but also in the sociology. Social governance has become an important theme of sociology. The research and practice of contemporary Chinese sociology is obviously different from European one but it is probably a new way of the development of contemporary sociology.

The problem of a rationalized cultural structure of the civil sphere: a critical interpretation of Jeffrey C. Alexander's symbolic code of liberty

Veronika Frantová
Charles University in Prague, Czech Republic
v.frantova(at)centrum.cz

This paper critically elaborates on the concept of a binary symbolic code of civil society by Jeffrey C. Alexander and Philip Smith and through this narrowly-focused conceptual critique intends to contribute to a wider debate on the role of emotionality and rationality in the public space. Alexander is one of the few who has managed to make a breakthrough with the new paradigm in the last decades of social theory development. However, institutionalization of a "Strong Program in Cultural Sociology" without adequate reflection on its epistemological foundations bears the risk of cultural sociology becoming a hidden representative of neofunctionalist ideology instead of a critical discipline. Alexander limits himself to the critique of repressive forces of the non-civil spheres against the civil sphere, and as the only possible inclusive strategy offers a translation of so far exclusionary qualities of the referents into positive characteristics of the civil code of liberty. Contrary to this approach, I emphasize that the ideal of rationalized modernity that Alexander reveals through the symbolic code of the civil sphere still reflects hegemonic relations. Thus, I suggest deconstructing the inner structure of the civil code. Following one stream of the critique of Alexander's concept (Rabinovitch 2001; Meeks 2001), I particularly focus on the elimination of emotionality and irrationality from the discourse of civil society and show that they can be perceived and strengthened as positively civil, rather than being constrained to the familial or other non-civil spheres.

For a holistic social science

Risto Heiskala
University of Tampere, Finland
risto.heiskala(at)uta.fi

Sociologists, political scientists and economists do not read each other's work, and very few of them want to know anything about such synthetic research

programmes as political economy or historical materialism not to mention the results of natural sciences such as biology. The paper deals with the questions, how did we end up to this situation and, more importantly, how can we create a holistic research programme, which shows the path away from that balkanized state toward a social science, which understands that society is one totality, treats it as such and is thus capable to face the fatal problems of our time? Its strategy is to make a journey from political economists and Marx through Weber to Michael Mann's historical sociology with the so-called IEMP model for the study of ideological, economic, military and political power sources in its core. For creating capacity to properly treat the material side of society and tackle such fatal problems of our time as environmental crisis, violence reduction and inequality an even more extensive model is developed. In the spirit of the short-lived attempts for reconstruction of historical materialism by Habermas, Eder, Giddens and others in the turn of the 1970s and 1980s that approach unifies to one conception natural, artefactual, cultural, economic, violence-related and political sources of power and thus establishes what can be called the NACEVP model of social research.

RN29 | Session 01b Social Theory

Totalitarianism in the Age of Neoliberalism? The Contemporary Relevance of Carl Schmitt

Haldun Gulalp
GSCS, Turkey
hgulalp(at)gmail.com

One would have thought that totalitarianism was a matter of the past and also antithetical to neoliberalism. It appears, however, that a growing trend around the world displays their unity through the rise of seemingly democratic but essentially authoritarian regimes legitimized by politics of identity and community.

I argue in this paper that the ideas of Carl Schmitt, a prominent theorist of the Nazi era, would help us account for this puzzling situation. I do not mean to propose that Schmitt's theories would offer a causal explanation for this contemporary configuration, but rather I suggest that his normative political philosophy would help us grasp the inner logic of promoting totalitarian politics in the age of neoliberalism.

Schmitt's incisive critique of parliamentary rule famously distinguished between liberalism and democracy, and defined politics as the struggle between friend and foe, leading to the surprising conclusion that autocratic rule could very well be a reflection of people's power. It all depended on how you defined the "people" (the members of your community), revealing the short-cut between identity and autocracy. Schmitt's normative philosophy is essentially an ideology defended through theoretical reasoning, which ultimately legitimizes authoritarian rule as the will of the people.

I illustrate this point through a detailed examination of the case of Turkey, though one could generalize it to

other cases currently proliferating around the world.

Sociology of continuity - Review of some sociological theories

Martti Antero Muukkonen
University of Eastern Finland, Finland
muukkonenmartti(at)gmail.com

Although most of the sociological theorising has emphasised the change and speciality of modernity, there have been some attempts to see current values and practises as a legacy of the past - like Weber and Parsons did. Some aspects of our cultures are amazingly old. For example, in counting time and in dividing a circle we still use the Sumerian 60-system. Our calendar is - with two modifications - 6000 year old Egyptian Sothic calender based on the rise of the star Sirius.

In this paper I review some sociological and economic theories how cultures renew their old values and practices and how they change.

Already in 1950's collective behavior theorists Ralph H. Turner and Lewis Killian emphasised the impact of the past experiences in their Emergent norm theory. Later, basically as a continuum of the same tradition, Peter Berger and Thomas Luckmann argued for the routinisation of thinking. Michael T. Hannan and John Freeman, in their ecological organisation theory, have argued that organisations have a tendency to resist changes. In anthropology, Glifford Geertz presented his thesis of religion as being both a model of society and a model for society. In economics, Paul David and Brian Arthur developed the Path depency theory to explain why people choose QWERTY-keyboard and VHS cassettes instead of better ones.

These theories can be combined with the old Herbert Blumer's idea of "general social movements" - a stage of movement which is still a social trend and exists merely in public discussion and literature. Applying these ideas to cultures we could create a model for cultural continuity and change.

Basic Principles of Interpretation of Meanings of Social Phenomena in the Russian Sociological Tradition

Natalia Yurievna Matveeva
Moscow State University of Railway Engineering (MIIT), Moscow, Russian Federation
pmatveyev(at)yandex.ru

Contemporary social processes are characterized by the unique combination of co-existence and confrontation of various social meanings and ideas. The resolution of arising social problems depends on the correct understanding of meaning that underlie personal and group activities.

The original approach to the interpretation of social meanings was developed before 1922 and in the period of post-revolution immigration by Russian social scientists, such as S.L. Frank, S.N. Bulgakov, N.A. Berdiaev, P.I. Novgorodtsev and others. According to this approach, social phenomena have two sides: the actual event or process and inner idea,

meaning or significance. The meaning or idea creates the concrete attribute without which social phenomenon is unthinkable. Such meanings have a source of objective ideas, independent from the individual's consciousness, acting on the will and mind of people toward their realization in social life.

Certain methodological principles follow from this conceptualization of social life. They are based on an understanding of objective ideas that underlie the social processes, their relationships, and logical interaction between them and logic of their development. According to this approach, we need to study the meaning foundation of the contemporary events that give rise to the issue of (un)making Europe, such as Islamic factor and civilization's problems, European Union and Disunion, the role of Russia in Europe, contradictions in Turkey and some others. Sociological method must be founded on understanding of objective ideas of social events as opposed to trying to judge them on the basis of their external manifestations.

Five Domains of a Settled Life: Household, Production, Market, Authority and State:

Ibrahim Mazman, Erdem Yöntem
Kirikkale University, Turkey; Kirikkale University,
Turkey
ibrahimmazman5(at)yahoo.com,
erdemyontem(at)gmail.com

Aristotle, an ancient Greek philosopher dealt with household or oikos as the microcosms of society as it provides basic stability and order into basic human needs. At the same time, modern term, economy originates from these two words of oikos or household and nomos, namely order. On the other hand, German sociologist Max Weber in his major study, *Economy and Society* was also concerned with production of goods, the exchange of these goods in a market and ordering of these activities by an authority. This paper on the hand, in addition to Aristotle's concept of household and Max Weber's idea of authority as the basic provider of stability in society, tackles with the concept of state as the institutionalized entity of authority relations in society. In sum, this paper aims to compare Aristotle's concept of society and its basic unit, household with Max Weber's understanding of society and his approach to the concept of household. As Max Weber adds concepts of production, market and authority into Aristotle's concept of household, this study will also consider state and institutionalized authority relations in order to understand stability and order in a society.

RN29 | Session 02a Europe, Solidarity and the Problem of Social Integration I

The moral grammar of silenced and invisibilized social suffering

Benno Herzog
University of Valencia, Spain
benno.herzog(at)uv.es

Excluded or marginalized social groups often face problems of representation in the public sphere. What is more, the very notion of exclusion usually refers to communicative or discursive produced mechanisms of not being considered relevant for public processes of communication. Exclusion and marginalization could therefore be understood as processes of silencing or invisibilization of important social groups. The problems of representation are especially serious in the cases of social suffering, i.e. socially produced suffering and suffering that can be abolished or alleviated socially. Making silence heard, giving voice to the silenced and bringing the invisibilized back into the image of the public therefore is a fundamental task of solidarity in order to reach a higher degree of social integration.

The main aim of this presentation is to show how it is possible to disclose and understand the social grammar of normative claims of silenced and invisibilized social groups.

Therefore, and with the help of Axel Honneth's Theory of Recognition I will develop a theoretic model of critique that permits understanding silent and invisible suffering as universal normative language (I). In a second step I then will develop a typology of silencing and invisibilization that allows to direct research interest to specific fields of normative claims with different pretensions of validity (II). And finally I will give some general advices on doing empirical research aiming at normative social critique and that takes into account the grammar of the silenced and invisible language of suffering.

From Mechanical over Organic towards Homeostatic Solidarity

Krešimir Žažar
University of Zagreb, Faculty of Humanities and Social Sciences, Croatia
kzazar(at)ffzg.hr

The issue of principles of social cohesion has been one of the key sociological topics. Durkheim's distinction between traditional types of society that are integrated due to mechanical solidarity, and modern types of societies that derive cohesion from organic solidarity, still represents a classical reference point considering this issue. The basic aim of this paper is to examine whether contemporary societies can still achieve integration based on organic solidarity. Namely, the attributes of societies in the 21st century are considerably altered compared to societies that Durkheim depicted. Hence, the crucial thesis evinced here is that organic solidarity cannot function nowadays, as huge contingents of population are completely excluded from (dominant) social life and cannot even be subsumed under the logic of division of labour. In current times characterized by diverse types of social exclusion, an increasing number of people living in precarious conditions, growing inequalities, disparities, discrepancies and divisions, it is urgent to find an efficient principle of social integration. An inevitable ingredient of the new evoked type of solidarity that is tentatively labelled as

'homeostatic' is – sympathy. However, it would be naive to conceive sympathy as solely sufficient to attain solidarity. Therefore, it should be institutionalized and embedded in a type of new social contract. Guaranteed minimum income could represent an effective mechanism in this direction, leading towards the development of a society full of diversities that would enhance social life. A society grounded on the principle of homeostatic solidarity would represent the first truly humanistic society.

Democratic iterations , Assembly and new frameworks for solidarity

Gilles Verpraet
University Paris ouest Nanterre, France
gverp2015(at)gmail.com

The theories of social State and its rationalization (Weber, Habermas) comes to be challenged by the new theories of democracy from below (Frazer, Benhabib, Butler). The conjunction and disjunction between these two domains proceed by iterative mobilization and by democratic redefinition. In this context ,we question the category of “democracy by iterations”, formulated by Sheyla Benhabib (2006), inside the policies of diversity and who shape the necessary links between local, national and the global issues. The conception of the “ We” requires negotiation between three levels of recognition and of political exercise. . So can be specified the social processes between rights and identities sustaining framework for solidarity between the phases of iterative democracy.

This framework for iterative democracy can be specified between three lines and repertoires of european issues :- a/Anti crisis mobilization with assembly of young generations for another politics (Indignados, Syriza);

- b/ Iterative democracy and voting with focus on migrant hosting (Germany, Austria); -c/ Mobilization and iterative democracy on the labor's rights and the reforms for liberalization (France, Belgium)

So can be questioned how these new formulas of solidarities are combining democracy by assembly and social redefinitions of Welfare (Butler, 2016). Iterative democracy combines the theory of social and political identities and the theories of solidarity (reciprocity, restitution). Iterative democracy involved inside European processes require to combine rights, identities and solidarities. Theses processes and theoretical formulations have to combine, the we of identities, the we of assembly, the We of solidarity.

Solidarity, participation and the notion of human rights

Márton Gerő, Pál Susánszky, Gergely Tóth
MTA-ELTE Peripato Comparative Social Dynamics Research Group, Hungary,; MTA Centre for Social Sciences, Hungary; MTA-ELTE Peripato Comparative Social Dynamics Research Group, Hungary,; MTA-

ELTE Peripato Comparative Social Dynamics Research Group, Hungary,
marton.gero(at)tatk.elte.hu,
pal.susanszky(at)gmail.com, toth.gergo(at)gmail.com

Those who emphasize Europe's duty to help refugees of the recent wave of migration often refer to the principles of solidarity and human rights as a ground of this duty. Although both ideas emphasize the importance to help those in needs, there might be a fundamental conflict among the two as well. Solidarity is often described as empathy or willingness to help the members of an in-group, while the theory of human rights implies that when someone's fundamental rights are threatened, one should help without concerning group-boundaries. The conflict between the particularity of group based solidarity and the universalism of human rights might goes unnoticed in times of affluence, while becomes harsh when resources are scarce. The question is, whether the notion of human rights is able to serve as a bridge between groups and produces universal solidarity.

In our paper we examine, how the acceptance of human rights is connected to supporting refugees. The analysis is based on a Hungarian-Greek online survey in December 2016. To measure the acceptance of human rights we applied situational questions picturing different groups (students of a Hungarian, Roma, refugee background) as exercising their political rights. The extent to which the respondents support the different groups measures their acceptance of human rights. The human rights acceptance index the is applied as an explanatory variable of activities supporting refugees (as volunteering or protesting against anti-refugee policies).

Human Rights vs. National Sovereignty: Contested Framings of the Refugee Situation in Europe

Verena Stern
University of Vienna, Austria
verena.stern(at)univie.ac.at

Cleavages within society surfaced not only, but most visibly during the so-called summer of migration in 2015 and Europe's subsequent restrictive border politics. Europe was entering an era when seemingly every citizen chose a side, the refugee situation thereby serving as a mere proxy for felt injustice and unease with the state of the world. But why do people have such fundamentally differing conceptualizations of society?

In my talk, I will use the example of civil society's engagement for or their struggles against refugees to shed light on questions of sovereignty and solidarity. First, I will illustrate their respective reference frames and examine how they perceive these topics. I state that citizens who stand with refugees weigh human rights sovereignty higher than nation state sovereignty, whereas citizens protesting against refugees highlight nation state sovereignty. Following Hannah Arendt, a person is always allowed to leave

their country, yet no country is obliged to take them in. Consequently, notions of solidarity and sovereignty are linked. By granting all power regarding asylum law to the sovereign, taking sides with or against refugees also means emphasizing your solidarity. Second, I will analyze these notions in the realm of social contract theory. Since ruling concepts shifted from one sovereign to, following Michel Foucault, a system of power, different conceptualizations of solidarity can stand next to and even oppose each other. The question is how European nation states as well as the EU decide to deal with it.

Conceptualizing solidarity amid opposed types of radicalization

Marta Soler-Gallart, Bjorn Hvinden, Esther Oliver
University of Barcelona, Spain; Oslo and Akershus
University College, Norway; University of Barcelona,
Spain
marta.soler(at)ub.edu, bjorn.hvinden(at)nova.hioa.no,
estheroliver(at)ub.edu

The economic and social crisis had an impact on the lives of European citizens related to their possibility to achieve good living conditions—such as employment, health care, educational opportunities... -- and to a growing mistrust towards current institutions and their capacity to guarantee these conditions and the related social rights. In front of this situation we witness two different social responses among citizens: excluding radicalization and a radicalization of democracy based on solidarity between citizens from below. This paper contributes to conceptualize the second type of social response. We will introduce the main theoretical contributions that guide the H2020 research project “SOLIDUS. Solidarity in European societies: empowerment, social justice and citizenship”, where researchers from twelve European countries are identifying successful solidarity actions on different policy areas (i.e. housing, health, employment, education and civic engagement). The findings are conceptualized through discussing different contributions from social theory: from Durkheim’s organic solidarity, to normative theories about goodness and justice developed by Rawls and Habermas, to the analysis of altruistic behaviours by Jon Elster, among other. The paper will also discuss the possible links between institutionalized solidarity and individual/collective solidarity in achieving social citizenship in Europe today.

A union of states or a union of peoples? Civic solidarity in the EU

Marie Wachinger
Freie Universität Berlin, Germany
marie.wachinger(at)gmail.com

Community-based solidarity (as opposed to self-interested, “economic-rational” solidarity (Börner, 2014)) is generally considered more realistic, the smaller or more homogenous a solidary group is. This is due to the widespread perception that such solidarity, as a non-enforceable principle, however

based on strong moral values, requires some common ground or identity in order to exist (see Stjernø, 2009). In this paper I aim to show that the EU as a union of states (see e.g. Forsyth, 1981) provides a basis for solidarity, if European citizens assume their responsibility as solidary agents. Why European citizens? European integration on the structural level has thus far mostly worked with European member states as ‘agents’ or ‘constituents’ of the EU. This somewhat technocratic process of forming a foremost economical, even if increasingly political and social union, has been criticized for possessing democratic deficits and is currently under attack from inside many member states (see e.g. Sangiovanni, 2013). I will attempt to argue that if solidarity is ever to be one of the fundamental European values (as official documents as the Charter claim), there needs to be an understanding that Europeans do share a common ground beyond economic gain, even though they may not possess a shared language, history, culture or identity. This common ground is based on historical experience, vicinity, as well as a shared wish to make the European continent a stable and peaceful place. It makes European citizens have special obligations of solidarity towards other Europeans – a type solidarity I take to exceed institutionalised forms of redistribution that is legally enforceable.

RN29 | Session 03a Social Theory

How to theorize? On the changing role and meaning of theory in the social sciences

Mikael Carleheden
University of Copenhagen, Denmark
mc(at)soc.ku.dk

This paper deals with different meanings of social theory, which form the basis of different answers to the question of the role of social theory. I will proceed historically. The dominating conception of social theory has shifted over time. My investigation is restricted to transformations during the 20th century. It will not be conducted in the manner of a sociology of science. The focus will be on reasons rather than causes of change. The general idea is that a historical investigation of such reasons is also the best way to be able to answer the normative question about what role theory should have today. An answer must be situated in the ongoing history of the social sciences, which in turn is related to social change in general. I will, so to say, “follow the actors”, who in this case are social scientists debating theory of science. The focus will first and foremost be on the most recent development. My primary aim is to trace what I suspect to be an ongoing transformation of the conception of theory in contemporary social science. In the end, I will make a preliminary attempt to critically evaluate this ongoing transformation

The “rehabilitation” of the “mass” in social sciences: In search of generalized definition of the concept

Stanislav Pavlovich Moiseev
Higher School of Economics, Russian Federation
smoiseev(at)hse.ru

During the first half of 20th century the concept of “mass” was used in different research fields such as sociology of crowd, sociology of mass communication and within the family of theories devoted to the analysis of totalitarian and democratic “mass societies”. In the early 70th these theories have been widely criticized by the scientific community. It led to the discredit of such concepts as “mass”, “mass society” and “mass behavior”, that is why they almost disappeared from the vocabulary of social science.

Motivation of the current attention to the concept of “mass” is related to the recent revival of the interest in sociology of crowd as one of the traditional fields of theorizing about social masses. In addition, there is a theoretical discussion about appropriate language, which could be used to describe different types of “collectivities” that are formed in the online environment. Some authors insist that there is necessity in conceptual refinement of classical and new concepts (such as “crowd”, “mass”, “public”, “network”, “swarm”, “multitude”) in order to properly describe the mass phenomena, involving interaction between people, mediated by Internet technology.

The purpose of this research is to find a possible solution to a problem of uncertainty in the interpretations of the concept of “mass”. I will present a classification of different meanings and attributes of the “mass” concept used in social sciences and introduce its generalized definition.

Social Pathologies, Experienced Suffering and the Tasks of Critical Theory

Mariana O. N. Teixeira
Brazilian Center for Analysis and Planning (Cebap),
Brazil
mariana.on.teixeira(at)gmail.com

The idea that critical social theorists must diagnose the social pathologies that affect contemporary societies has come to the spotlight in the last decades and the work of Axel Honneth has remarkably contributed to this tendency. As I interpret them, Honneth’s early writings (in the 1980s and 1990s) imply a notion of social pathology that amounts basically to obstacles to individual self-realization, which cause social actors to suffer and to struggle against it. Suffering, then, is taken as a symptom of an underlying social pathology (offering at the same time a motivational potential for resistance to it). From the 2000s on, however, a systematic blockage in the motivational connection between social suffering and resistance appears in Honneth’s writings. This is a consequence, I argue, of an elaborate time diagnosis that identifies social pathologies no longer with the sources of suffering itself, but rather with the erosion of the motivational aspect of experienced suffering.

From this viewpoint, a social situation is pathological not because it entails suffering, but rather because social actors cannot articulate their experienced suffering and, thus, cannot collectively struggle against its causes. This specific notion of social pathology suggests, then, that the complete suppression of suffering should not be the aim of social theories orientated towards emancipation. Although this more sophisticated view of social pathologies overcomes most of the difficulties posed by Honneth’s earlier formulation, it nonetheless retains a problematic feature: the downplaying of structural relations of domination that produce very different kinds of suffering among different social groups. I will indicate, finally, that peripheral social and critical theorists have developed insights and frameworks that provocatively and productively address this issue.

A Turbulent World of Great Uncertainty. Hey you social scientists! You may not know what’s going on and you may be part of the problem....

Panagiota Georgopoulou
Panteion University, Greece
pangeorgop(at)gmail.com

Why might social scientists not be aware of what’s going on? Because the social world is becoming enormously complex with a high degree of interconnectivity. As a result, uncertainty and opacity have increased. As Thomas Homer-Dixon (2010) argues “in a world of uncertainty and unknown unknowns, we are ignorant of our own ignorance; often, we don’t even know what questions to ask”.

Additionally, why might we be part of the problem of the ongoing economic, social and political crisis? Because as a group of highly educated creators of signs and symbols, we are members of the ‘power elite’ of the capitalist knowledge economy. Hence we run the risk of being out of touch with “ordinary” people such as the poor, unemployed, less-educated, immigrants etc. In this respect, revisiting Alvin Gouldner’s critique (1979) of the rise of the New Class of Intellectuals, I argue that while academic social scientists contribute to the culture of critical discourse, they are at the same time working in their own interest, bolstering their power and privileges.

RN29 | Session 03b Author Meets Critics: Living at the Edges of Capitalism

Author meets Critic: Living at the Edges of Capitalism - Adventures in Exile and Mutual Aid

Sanem Guvenc Salgirli, Andrej Grubacic, Denis O’Hearn, Saygin Salgirli
Emily Carr University of Arts and Design, CA; Fernand Braudel Center, US; California Institute of Integral Studies, Department of Anthropology and Social

Change, US; Texas A & M University, Department of Sociology, US; University of British Columbia, Department of Art History, Visual Arts and Theory sanemguvenc(at)gmail.com, agrubacic(at)ciis.edu, dohearn(at)tamu.edu, saygin.salgirli(at)ubc.ca

Andrej Grubacic and Denis O'Hearn delve into worlds of exile in their 2016 book, "Living at the Edges of Capitalism". It is the product of a long collaboration that started with conversations about anarchism and Marxism, and led the way to a new framework that merged the two introducing the concept of 'exilic space' into sociological theory. Exile, for them, does not signify a longing for a lost hope, nor a nostalgic retreat into a space induced by a sense of resignation from the world. To the contrary, they say that it is the "journey of hope for a future that has not yet been." In that spirit, they tell us three stories of three exilic communities formed in three exilic spaces: Cossacks of Russia, Zapatistas of Chiapas, and prisoners of forced exile. These are unusual stories, not because we have not heard of them before, but because Grubacic and O'Hearn subtly calibrated their conventional narratives. In their analysis, all are communities founded upon solidarity, but with endemic mechanisms of social control; all escaped from state regulation, capitalist relations, and processes of accumulation, but remain incorporated in varying degrees; all are resistances to the capitalist world system, but not in ways that we expect. Thus, it is a discussion of the dynamic process of the relations between exilic communities and the state/capitalism, including the processes that can lead to failure of the exilic project and reintegration into the state/world-system. Alongside concrete examples of collaboration and material subsistence practices, theirs is an invitation for a new politics inspired by those invented in no less than harsh circumstances, but through flexibility, mutual aid, and joy.

RN29 | Session 04a Social Theory and the Critique of Capitalism I

Updating a critical theory of needs in informational capitalism

Sebastian Sevignani
Friedrich-Schiller-University Jena, Germany
sebastian.sevignani(at)uni-jena.de

An actualization of a critical theory of needs is timely. First, although social theory has different choices to formulate a critique of capitalist societies, such as immanent critique (by confronting status quo with normative claims immanent in society), functional critique (by pointing to self-destroying crises in society), or external critique (by comparing societies with normative ideal types), I argue that any critique finally needs to be anchored in a weak notion of human essence (live immanence). I consider a theory of (basic, socially created, and productive) needs to be a sound starting point. Capitalist societies can then be criticized because they deny need satisfaction but also for subsuming need development to profits and

for cutting off potentials of human flourishing. Second, since capitalism is developing from a production oriented stage, over a consumption oriented stage, to an informational stage, where the notion of the prosumer gains relevance, a theory of need faces the task to reformulate its critique under actual circumstances of informatisation, big data, and social media. The contribution sketches main lines of need development in capitalist societies, thereby I focus on the differences of need structure in the current informational stage. Third, focusing on the notion of 'productive needs', that is the assumption that humans have phylogenetically developed a need for social provision, this contribution discusses the non-satisfaction and the defective flourishing of productive needs in the face of potentials given in the development of the (informational) productive forces.

Into the Heart of Social Critique – Let's Talk About Exploitation!

Tine Haubner
Friedrich-Schiller-University Jena, Germany
Tine.Haubner(at)uni-jena.de

There was a time when 'exploitation' formed the heart of 'social critique'. When it comes to sociology this time has passed or in some cases, it never existed in the first place. Sociology thus faces a paradoxical situation: in spite of rising social inequality the discipline still does not have an appropriate sociological concept of exploitation.

One reason is that exploitation figures prominently in Marxist social theory. Due to the academic decline of Marxist theory since the 1980s, theories of exploitation have been marginalised. Another reason is the narrow-mindedness of many contemporary Marx receptions: Exploitation is often treated as an economic term seeking to explain quantifiable "surplus" in supposedly free markets. This profit-related focus is especially problematic when it comes to the kind of work that is considered to be "unproductive".

I claim that critical sociology needs to rethink exploitation in a sociological way to understand current capitalist societies. The disappearance of exploitation leaves a gap: only exploitation describes a specific social relation when somebody takes advantage of another. Although the concepts of "closure" or "exclusion" have thus far not been able to substitute the term successfully, they point to specific challenges that any concept of exploitation has to deal with. Using care work as an example, I argue that firstly, exploitation does not have to be understood narrow-mindedly. Secondly, the yield of exploitation does not have to be conceived in terms of a "surplus". Thirdly, sociocultural factors play a significant role within exploitative relationships. And finally, exclusion is not the counter-term but a counterpart of exploitation. In conclusion, I propose a sociological approach to exploitation that binds together social exclusion and exploitation.

Colonialism and liberal class analysis

John Holmwood
University of Nottingham, United Kingdom
john.holmwood(at)nottingham.ac.uk

Central to sociological discussions of class – whether from a Marxian or Weberian perspective – is the idea of the commodity status of labour power as integral to the economic logic of capitalism. In this context, colonialism appears as a contingent aspect of capitalism and ‘race’ as a ‘social’ intrusion on a logic that is defined as independent of it. This paper will argue that the idea of labour power as a commodity derives from a moral economy of race, rather than a political economy of market capitalism. The paper will develop a Polanyian argument, albeit one that is not found in Polanyi owing to his neglect of colonialism as integral to the relations of dispossession and possession he otherwise examines. The paper will suggest that labour is not a ‘fictitious’ commodity, and, indeed, enslavement is its reality. On this understanding, the commodification of labour power which is presented as the grounding of class analysis is already a de-commodification of the labourer. Class analysis betrays an underlying racial formation which undermines the capacity for understanding contemporary events and leads to a false distinction between class analysis and the politics of identity.

Is Modernity Progressive? Notes on the continued primitive accumulation of capital

Reinhart Kössler
Arnold Bergstraesser Institut, Freiburg, Germany,
Germany
r-koessler(at)gmx.de

The paper will take a critical stance towards conceptions of modernity as a project and instead opt for a processual conceptualisation.

Modernity is considered as triggered and driven by dynamics of capital, but not as coterminous with capitalism. The chief consideration concerns the process of primitive accumulation in terms of a continuous process of separation, not only of producers from means of production, but of societal spheres (such as the home and the workplace) as well. Crucially, this process includes the valuation of ever wider realms in terms of resources and labour power. As recent debate on Landnahme has shown, this is not restricted to territorial notions and may go through cycles.

Modernity in this sense encompasses the persistent disassembling and re-assembling of social relationships, predicated on the exigencies of both value production and continued primitive accumulation.

The process of continued primitive accumulation has created and continues to re-enforce a hierarchical world market in terms both of specific production relations (including non-commodified ones, such as subsistence production) and shifting regional differentials.

Contrary to conventional conceptions of capitalism,

therefore, capital rests on diverse relations of production and on exploiting very diverse societal forms.

Moreover, within the global hierarchy such societal forms have emerged that are predicated on, though not congruent with, capitalism. At present, these are above all postcolonial forms.

Modernity therefore can be conceptualised as a social formation encompassing all these forms (to which should be added, in historical terms, Soviet type societies).

RN29 | Session 04b Social Theory and the Critique of Capitalism II**Marx and Luhmann: (re)thinking capital as communication**

Michalis Skomvoulis
Panteion University, Greece
mskomvoulis(at)gmail.com

In the theoretical discourse of contemporary society, the concept of communication has been consolidated as the absolutely central term. This attributed importance to communication does not stem exclusively from the theoretical discussion but it also stems from the real transformations that the dynamics of contemporary capitalism generates. In this paper, we preoccupy initially ourselves with the general concept of communication as this is thematized by Luhmann’s systemic social theory as the common reference of procedures that concern highly differentiated social systems. The luhmannian social theory, we argue, adopts a dialectical/paradoxical way of systematization, which divides, in a non substantialist way, the unifying dimension of communication into internally differentiated and autonomized social systems. Communication is thus presented through the prism of formation of the pertinent social semantics that will make every autonomous system inherently self-referential. According to our argument, we can criticize Luhmann’s conception of communication by introducing the Marxian concept of capital as a form of social coercive unification: conceptualizing communication, the systemic social theory excludes from its horizon the possibility of conceptualizing the unifying dimension of communication for the social totality, although it presupposes this dimension. According to our perspective, this exclusion ensues from the effort of systemic social theory to keep the concept of communication at a distance from a dimension of domination. Certainly, the Marxian concept of capital (especially in its version of value-form theory) could be a privileged perspective that highlights this domination aspect of communication. In this context, through our critique of Luhmann’s social theory, we arrive at an equally transformative perception of the Marxian concept of capital, namely towards a non-substantialist form which thematizes the reificatory effects of communicative forms in contemporary capitalism.

Social Life Beneath the Organism: On Durkheim's Two Conceptions of Anomie

Arthur Bueno

University of Erfurt, Germany
arthur.bueno(at)uni-erfurt.de

This paper addresses Durkheim's concept of anomie and its underlying social ontological tensions with a view to highlight its contribution to an assessment of the social pathologies of capitalism. Based on a reconstruction of the different meanings ascribed to this concept in Durkheim's oeuvre, it sets out by arguing that the basic intuition underlying anomie's characterization as a social pathology – i.e. a presumed similarity between social and biological processes – can be understood in two different ways: either as an analogy or as a homology. Each of these understandings correspond, in turn, to a distinct ontology of social life: the latter can be regarded either (1) as a social "organism" constituted by functionally differentiated "organs," which must relate to one another harmoniously so that society can reproduce itself, or (2) as a felt, lived totality characterized by a quality that Durkheim calls "general vitality." Each of these ontologies is, thus, oriented by a different question: while in the first the problem is if and how the social body is kept alive (with pathological phenomena consisting in threats to its survival), in the second it is rather if and how it feels alive (with pathological phenomena consisting in disturbances in its general vitality). Noting that the first of these models plays a prominent role in current debates on the subject (e.g. in Axel Honneth's recent works) while the second is less frequently present, the paper concludes with a proposal on how they can be articulated in the context of a reconstructed and critically relevant conception of anomie.

Submissive subjectivities and points of exception: toward a methodology to study the digital

Carlos Frade

University of Salford-Manchester, United Kingdom
c.frade(at)salford.ac.uk

This paper is part of a wider study on the relationship between power and subjectivity, which includes the digital, as this corporate field is often named, as one of its most decisive contemporary manifestations. The study is an attempt to develop a pathway for thought which is not captive to the digital's baits and inducements. It aims to define a theoretically grounded mode of enquiry which ensures a subjective position subtracted from, and always kept as an exception to, the assumed givenness of the digital and its presentist temporality.

Contrary to those approaches which focus on the structural or systemic dimension the digital, including its political economy, and tend to neglect its subjective dimension, the approach proposed here begins with the subjective dimension and prioritises the subjective time in relation to the systemic time – the reason being that the power of the systemic order does not lie in the first place in the system itself, but in the way it

captures the subjectivity, an operation neither governmental nor biopolitical and machinic in itself, but political through and through and thus aimed at obtaining consent and acceptance.

Analysis seeks to unravel the mechanisms of consent relied on by a form of power which offers the lures of, above all, freedom, but also participation, sense of agency and control. It is in this context that an initial mapping of prevailing submissive subjectivities, both in using and in studying the digital, will be attempted, along with the further development of the proposed approach and methodology.

Critical social theory as a counter-mapping practice

Juan-Pablo Rodriguez

University of Bristol, United Kingdom
jr14385(at)bristol.ac.uk

Drawing on Jameson's notion of 'cognitive mapping' this paper aims to explore the extent to which different styles of contemporary critiques of capitalism can be seen as counter-mapping practices involving productive political and theoretical 'efforts of totalisation'. The critical theories advanced by David Harvey, Eric Olin Wright and Luc Boltanski show how contemporary styles of critique rely on different resources –from utopianism to empirical sociology- in order to justify theoretically emancipatory projects. I will argue that there are three conditions of possibility of contemporary radical critique of capitalism: 1) an appropriate combination of explanatory and normative aspects; 2) a quest for totality and a defence of a robust notion of the social; and 3) a theorisation organically connected to practices of social criticism at the level of social movements. When these conditions are fulfilled critical theory can be seen as a counter-mapping practice able to both negatively explore the blank spots on the social (and global) space/map shaped by capital, and positively point towards feasible utopian horizons.

RN29 | Session 05a Social Theory

Social Imaginaries Reconsidered: The impact of Imagination on Social Action

Angelos Mouzakitis

University of Crete, Greece
amouzakid(at)uoc.gr

The notion of "social imaginaries" has recently emerged as a potential field of inquiry in its own right by scholars who in a post-Durkheimian manner expand on the works of Cornelius Castoriadis Johann Arnason and Charles Taylor, as well as on phenomenological and post-phenomenological currents of thought. The notion of 'social imaginary' is an elaboration of the Durkheimian concept of collective representations and the phenomenological idea of the lifeworld. It signifies a pre-theoretical, relatively structured manner of understanding the world, shared by large social groups or even whole social formations, informing practices and granting

legitimacy to actions and institutions. Central to the social imaginaries problématique are the following interrelated questions: a. the question concerning the relationship between imagination and reason, b. the question concerning the relationship between subjective and collective forms of imagination and c. the question concerning the impact of imagination on social action. Drawing primarily –though not exclusively– on the works of Castoriadis, Taylor and Ricoeur, this paper aims to provide a response to these questions. More specifically, Castoriadis’s “radical social imaginary”, Charles Taylor’s “social imaginary” and Ricoeur’s theory of productive imagination will serve as points of departure for the elucidation of the aforementioned problems. Castoriadis’s recently published exchange with Paul Ricoeur allows us to juxtapose Castoriadis’s the possibility of radical transformations of social forms and Ricoeur’s conception of socio-historical change in terms of reconfigurations and transformative ‘events’.

Generative Hermeneutics

Martin Durdovic
Institute of Sociology of the Czech Academy of Sciences, Czech Republic
martin.durdovic(at)soc.cas.cz

The paper deals with the recent interest in the study of generative mechanisms in sociology and looks at this field of interest in relation to hermeneutics. It especially focuses on the concept of generative mechanisms employed by theorists of critical realism (e.g. Bhaskar, Sayer, Archer). It shows that an overemphasis on mechanistic logic devaluates the study of social interaction that has been pursued in various branches of interpretative sociology.

There are important differences between realism and hermeneutics. While realism strives to overcome the extremes of empiricism and interpretivism with a new version of naturalism, hermeneutics bases its explanations of society on research into meanings. However, whether underlining these differences is beneficial to social theory is debatable. On the one hand, underestimating hermeneutics makes it difficult for realists to recognise fully the role processes of understanding play in generating social change. On the other hand, hermeneutical arguments in sociology idealistically identify being with significant or interpreted being. When social structures are virtualised in this way (e.g. as they are by Giddens), it is difficult to relate them to the real forces at work that may lie outside our interpretations (e.g. environment, technology, latent social structures) and to appreciate the possibilities of causal explanation. The concept of generative hermeneutics is meant to contribute to fostering cooperation between realism and hermeneutics. In my project of theoretical research funded by the Czech Science Foundation (2015-2017), I apply this view of hermeneutics to the sociological theory of intersubjectivity.

Towards a sociology of abstractions: Thinking the social beyond the conceptual/empirical divide

Rodrigo Cordero, Francisco J. Salinas
School of Sociology, Universidad Diego Portales, Chile; Social Theory Cluster, Chile; Institute of Education, University College London, UK; Social Theory Cluster, Chile
rodrigo.cordero(at)udp.cl, f.lemus.15(at)ucl.ac.uk

This paper aims to contribute to the sociological study of “abstractions” as a key to comprehending the relations between the conceptual and the empirical. Our argument is that “abstraction” is a third term that challenges the customary divorce between these domains in sociology inasmuch as interrogates their complex mediation in social life. To do so, we explore the possibilities of a sociology of abstraction as an exercise of thinking and observation aimed at: (i) comprehending the immersion of social theory’s practices of abstraction as immanent to the dynamics of abstraction of society; and (ii) deciphering the concrete movement of concepts that give form to society and durability to social relations. Drawing on discussion and criticism of three recent books (Baert’s “The Existentialist Moment”, Chernilo’s “Towards a Philosophical Sociology”, and Savransky’s “The Adventure of Relevance”), we intend to show that the project of a sociology of abstractions consists in an unavoidable reflexive retreat that displays concepts in order to reach what is beyond concepts.

Developing a practice-theoretical analysis of spatial relations in Manchester’s Northern Quarter (NQ)

Torik Holmes
Lancaster University, United Kingdom
t.holmes(at)lancaster.ac.uk

This paper considers how I am using theories of practice to investigate the relationship between an urban space and energy infrastructures. In recent years, contemporary practice theory has emerged as an important strand of social theory, aiding a number of empirical investigations of different social phenomena. I will briefly explain the sociological and philosophical lineage of contemporary practice theory before explaining how I am working with, using, and seeking to develop the theory’s heuristic devices. More specifically, I will discuss how I have designed a range of multiscale experimental research strategies, which draw on and seek to develop contemporary practice theory as a means of understanding how the circulation and spatial location of practices occurs, and how this further relates to the management and development of electricity and gas infrastructures. This discussion will be framed around my empirical work, which focuses on the NQ - a unique area that has emerged in the centre of Manchester over the past 30 years. Further to this, I will discuss how my spatial focus signifies a development in contemporary practice theory, as a practice-theoretical analysis of a particular space and its materialisation has yet to be undertaken.

RN29 | Session 05b Social Theory**Social contradictions as conflicting histories: a poststructuralist approach to the crisis of globalization and the possibility of internationalism**

Alexandru Vasile Sava

Babes-Bolyai University of Cluj-Napoca, Romania
alexandru_vasile_s(at)yahoo.ro

The events of the past few years have shown, between the refugee crisis, Brexit and rising Euroscepticism, and the nativist surge in the USA, that the (neo-)liberal grand narrative of continuing globalization as the endpoint of history has come into crisis. At a national and international level these phenomena have generated conflicts between center and periphery, both between developed, internationally-integrated, metropolitan spaces and deindustrialized national peripheries, and between developed nations and the Global South. I will show how social processes of identity formation, grouped around geographic location, regimes of labor, and social and media institutions, lead to the formation of contradictory narratives of national identity, which in turn generate conflicting models of how the world is and how it should transform, which materialize in competing histories. In order to accomplish this, I will develop a processual, time-oriented, description of subject-formation, and use it to frame the crisis of globalization. This description will draw mainly on the Althusserian theories of interpellation and of the State, on the Deleuzo-Guattarian conceptualization of majoritarian-minoritarian relations and on their theory of subjectivity, as well as recent materialist analysis of late-capitalism. Through this analysis, I will show how contradictions between nation-states in the global order lead to the formation of a multitude of trans-nationalisms together with their nationalist reactions, while contradictions within traditional nation states lead to cultural-identitarian conflicts between nativist nationalist and cosmopolitan trans-nationalist tendencies in society. Finally, I will address the questions of if and how internationalism is possible within this context.

The Banality of Order? Purposiveness and Unintentionality in Preserving Social Status Quo

Lorenzo Sabetta

Sapienza - University of Rome, Italy
lorenzo.sabetta(at)uniroma1.it

Underlying the various aspects of the order problem, there seem to be two contrasting views of social reality, an authentic dichotomy the reconstruction of which is the first goal of this paper. On the one hand, there is the position summarised by Coleman and Goffman (respectively, at macro- and micro-level). To answer the question «why is there not a war of all against all?» (according to Coleman «the central problem in sociological theory»), researchers should approach society as «built around purposively established organizations»: social order is reckoned

as the result of a voluntaristic project, the intentional outcome of specific choices made by collective actors, fully aware of the significance of these choices. On the other hand, especially in Bourdieu and Garfinkel, it is possible to retrace an opposite framework that, adapting a concept developed by Arendt (who, to account for the atrocities committed by someone that was «an average, “normal” person, neither feeble-minded nor indoctrinated», wrote of the banality of evil), can be summed up as banality of order. Garfinkel, in fact, rejected what he defined «Goffman’s “naughty” view», disputing that social actors are moved by delicate machinations or secret plots, and Bourdieu (in his turn) held that social order is the consequence of a spontaneous orchestration, «without any need for deliberate conspiracy or coordination». From this perspective, the second goal of this paper is to investigate the theoretical implications of this “non-voluntaristic” view, whereby the actions instrumental in maintaining social order are neither made for this purpose nor felt as such.

Individual in a World of Institutes: Logic and Mechanisms of Social Construction of Reality

Denis Podvoyskiy

Peoples` Friendship University of Russia, Russian Federation
dpodvoiski(at)yandex.ru

This report views the conceptual opposition “subject (action, agency) – structure (institutes)” as one of the key problems of social scientific knowledge. The very method of describing this opposition illustrates different competing strategies of sociological theorizing (methodological individualism and holism, social nominalism and realism, subjectivism and objectivism).

Supporters of methodological individualism argue that, empirically, there is nothing but individuals and their actions and words in the sphere of social interactions. On the other hand, social realists usually state that these actions and words are produced by agents (actors) in certain contexts and situations which they hold little power over. This is why the “ways and rules of action” are enforced onto the participants from outside – this is what forms what we call social structures, institutes and/or culture. Is it possible to find a way out of this argument that would be acceptable for both arguing sides? Different branches of classical and modern social theory offer different ways of conceptualizing and “marking” the problem of proportion of individual activity and social contexts in which it takes place. The author aims to highlight approaches to this research problem. Special attention is allocated to the attempts to propose a synthetic solution for the “agency structure” problem which were included in a number of sociological theories. The possibility of combination of “constructivist” and “structuralist” argumentation is illustrated using the example of theoretical interpretation of the birth of institutional structures from the inner logic of social interactions and their autonomisation.

Communicative Reason and the Theory of Society

Patrick Joseph O'Mahony

National University of Ireland, Cork (UCC), Ireland
p.omahony13(at)icloud.com

The paper begins, in a first step, with a brief overview of what it regards as Habermas's achievement in developing a theory of communicative reason and in two major works, 'Theory of Communicative Action' and 'Between Facts and Norms', linking it to a democratic theory of society. While in certain respects this body of work has had considerable impact in various areas of scholarship, over time its influence on social theory has been limited. In a second step, therefore, the paper examines some of the disjunctures between general concerns of contemporary social theory and Habermas's approach, variously addressing sociology's general suspicion of reason and its concentration on the subject, perception that Habermas is insufficiently critical, turn away from macro-sociological intentions, and view that the theory lacks empirical applicability. It will be argued that these sociological considerations to some extent do pose a real challenge to Habermas's reception in sociology, but that they also reflect unnecessary self-limitations in a variety of ways, most notably in the present context, a lack of concern for general normative culture. In a third step, the paper explores how, by drawing on Peirce's semiotic pragmatism and contemporary critical cognitive sociology, the intrinsic merit of the idea of communicative reason and its value to social theory, especially for normative reflection and critique, can be upheld. Such a conclusion will be shown to have major implications for the development of social theory.

RN29 | Session 06a Social Theory and the Critique of Capitalism III**The Dialectic of Control: From the Past to the Future of Critical Social Theory**

Craig Alan Richard Browne

University of Sydney, Australia
craig.browne(at)sydney.edu.au

The notion of the dialectic of control has a venerable position in the history of critical theory. Hegel's formulation of the dialectical conflict of lordship and bondage is often regarded as the major theoretical influence upon Marx's interpretation of the historical dynamic of class conflict and the distorted social relations of alienation. The dialectic of control illuminated the resistance of subordinated classes to domination and it disclosed the contradictions inherent in the owners of capital's dependence on the exploitation of wage labour. In some respects, the history of critical social theory can be understood as an encounter with the vicissitudes of the dialectic of control. The Frankfurt School elucidated the complications of the dialectic of control attendant upon capitalist rationalization, but this led to conclusions that the conflicts intrinsic to capitalism were becoming

increasingly latent. Habermas argued that the grammar of social conflicts had changed in late-capitalist societies, whereas Honneth's theory of struggles for recognition sought to explain how responses to experiences of injustice precipitated progressive changes. In this paper, I will, first, suggest that the notion of the dialectic of control is relevant to each of the contrasting paradigms of critical theory: production and communication. Second, that this dialectic's contemporary expression necessitates revised conceptions of social contradictions and alienation. My analysis seeks to show the significance of the dynamics of the dialectic of control and the displacements of it to the contemporary constellation of capitalist modernity. And, third, it will suggest that explicating dialectics of control enables an effective mediation of theory and practice, particularly because it contributes to a sociologically compelling conception of social autonomy.

One view on the 'place' of capitalism among the concept of critique

Stefan Klein, Mariana Toledo

Universidade de Brasília (UnB), Brazil; Universidade de São Paulo (USP), Brazil; Instituto Federal de Educação, Ciência e Tecnologia de Goiás (IFG), Brazil

sfkstefk(at)yahoo.com,

mariana.toledo.ferreira(at)usp.br

The hereby proposed presentation aims to take up two perspectives that specifically and explicitly address capitalism, but do it under different presuppositions. On the one side it briefly discusses the idea of a new spirit of capitalism, as formulated by Luc Boltanski and Eve Chiapello, especially dedicating itself to also examining their reflection identifying new forms of social critique. On the other side it aims to incorporate the discussion on semi-periphery to be found in the approach of the sociologist José Maurício Domingues. Both these theories have (at least) two main things in common: they continue focused on capitalism, thus not giving way to the idea that although there indubitably have been changes to how capitalism organizes itself, there are still certain traits that justify seeing and interpreting it as capitalism. Simultaneously, there remains an accent on the concept of critique, although they are writing from very different perspectives and deal with different research questions. Therefore, we consider that recouping these aforementioned points should contribute to deepen the discussion concerning certain transformations of capitalism in different environment while also debating the social theory and critique dedicated to it.

"Transhumanism, post-capitalism, and "meta-veillance": perspective from critical realism

Yu-cheng Liu

Nanhua University, Taiwan

ycliu15(at)gmail.com

How does capitalism make people pursuing

transhumanism? How does capitalism make people believe that human body/human beings (species) needs to be enhanced and that it should be morally right or simply nothing wrong to look for an “always better” self and life? How does capitalism transform people's recognition of human body and its labor while developing a world without body? How does the gap between advanced industrial regimes and less developed areas in the world shape different viewpoints of human body and the meaning of its labor, and its impact on the future of capitalism, or of so-called post-capitalism? A world without body, which is probably the result of transhumanism, is also a world of “meta-veillance”. Meta-veillance is not just a reflection of our present situation in which surveillance is typical whereas sousveillance still questionable. Either of them has been not enough to offer a suitable answer for the future. Meta-veillance means people being watched by protocols that are co-created through the interaction among people using technologies, technologies in surroundings, and context where people and technologies have been located. The question 'who is watching?' and 'who is watched' can to be reframed with this concept. The equality between those watched and those being watched may exist in the idea of meta-veillance. A world without body does not mean body has been cancelled; instead, it gains a new mission in that the presence of human body reminds of its no negligible to us, and most importantly, people's communication with machines are depending more on human body, such as its figures, gestures, organs, and so on. They will also be discussed in this research.

Superfluous Legacy: The Limits of Sociology as Social Critique in a Devastated Postsocialist Society

Ivana Spasic

University of Belgrade, Serbia

ispasic(at)f.bg.ac.rs

Throughout the decades of socialism, Serbian/Yugoslav sociology was significantly characterized by a critical take on social reality, dominantly inspired by the local brand of humanistic Marxism. The legacy of critique continued into Serbia's “blocked transition” of the 1990s, with the bloody dissolution of Yugoslavia and Milošević's hybrid regime in power. The early 2000s saw important gains in democracy as well as in sociology's consolidation. Nowadays, however, the situation is paradoxical. Instead of opening up, the space for critique is shrinking. The hegemonic ideology promoted by the ruling party, with ample popular support, is extremely broad and largely contentless, spanning the almost entire ideological spectrum. Pinpointing it for critique proves hard, as well as establishing a position at all that is not already “swallowed up” by the hegemonic discourse. Moreover, it is unclear how critique ought to be framed: as anticapitalist or pro-capitalist? The former would rightly target soaring inequalities and collapsing systems of social protection. Yet it can also be argued

that there is not enough capitalism in Serbia, given the heavy-handed government intervention into the economy and the resulting unequal treatment of companies and lack of transparency in managing public resources. Growing anti-intellectualism of both the government and the general public tends to render social theory utterly irrelevant, not even worthy of political persecution like in communism. Academic integrity has been publicly derided, with a number of high officials flaunting fake degrees and plagiarized dissertations with impunity. Is Serbian sociology's critical legacy totally superfluous today? Under what conditions can it become an asset once more?

RN29 | Session 06b Social Theory and the Critique of Capitalism IV

Critique of capitalism, a call for solidarity and the inability to seize subjectivity. Theoretical strengths and weaknesses of Bourdieu's political interventions in the 1990's

Agoston Faber

ELTE (Hungary), EHESS (France), Hungary

agostonfaber(at)gmail.com

At the beginning of the 1990's, Pierre Bourdieu progressively gets involved in public issues as he starts focusing on the transmission of the insights and results he has accumulated throughout his career as a sociologist.

When considering Bourdieu's public engagements in the mid-90's defying the threatening effects of neoliberal capitalism, one can legitimately raise the question whether one has to deal with a left-wing public intellectual or rather with a social scientist who tends to ground his arguments on thorough scientific investigations. The answer here is twofold. On the one hand, most of his critical remarks on capitalism is rooted in his notion of field, as in his perspective capitalism first and foremost threatens the autonomy of different fields of cultural production (science, art, journalism). On the other hand, it would be hard indeed to assess Bourdieu's political involvement in purely scientific terms. Along with typical Bourdieuan concepts, some new slogans appear here which are in line with classical leftist topics: precarisation, insecurity, the breakdown of ties of solidarity, the model of 'struggles involving everyone against everyone' etc.

However, what he calls habitus seems to go against his will to mobilise those in particular who suffer from the ravages of neoliberal capitalism. It is likely that Bourdieu's public interventions as well as his theoretical edifice would have gained in strength if he had been more open to deal with the possibility of rational and reflexive actors.

The Sexiest Capitalism Ever: A Duckface Selfie of

a Trans-Aestheticized Market Economy

Ulla Karttunen

University of Eastern Finland, Finland
ukartun(at)student.uef.fi

“The beauty of me is that I'm very rich.” Thus spoke Donald Trump. - Zygmunt Bauman approached this success-based ethos of capitalism from another angle: we have begun to see the poor ones as criminals. If contemporary market society could take a selfie of itself, how would it look like? Duckfaced in its populism, killing in its seductive glamour, nauseating in its self-indulgent stupidity? The paper studies the ‘aesthetics of seduction’, used to fasten up capitalism, and consequences of the aestheticization of economy. According to Gilles Lipovetsky and Jean Serroy we live in the age of ‘artistic capitalism’ and the whole market society can be studied as a multiplicity of aesthetic impulses. Systems of production and consuming are entirely penetrated and remodeled by aesthetic operations. The fields of aesthetics and society/market have been linked already before by thinkers like Jean Baudrillard (The Consumer Society), Wolfgang Fritz Haug (‘commodity aesthetics’), Gerhard Schulze (‘experience society’), Gernot Böhme (‘aesthetic economy’, or Zygmunt Bauman (‘aesthetic of consumption’). The era of trans-aestheticization has democratized beauty, Lipovetsky argues. On the contrary, Bauman has warned about social division that the consumerist society brings with it: people get divided into two, to the seduced and the repressed.

Capitalism is surely seductive for those who take profit or enjoy overconsumption. In the secular market-based society, human meanings and values are no more governed by religious or ethical doctrines but by the logic of enjoyment and profit. Through trans-aestheticization of economy and businessfication of politics, also spheres like ethics, justice, and understanding of the human condition, are under deep transformation. At least, ultimate market-based values turn vulgarity into beauty.

The construction of time as meaning: Fredric Jameson and the Marxist debate on history in era of globalization

Thomas Edson de Jesus Theodoro Amorim
Universidade de São Paulo, Brazil
thomasejta(at)gmail.com

The Marxism is defined by the conceptual centrality of history as an explicative form and object in analysis, what conducts to the perpetual necessity of actualization of its elaborations and incorporation of new problematic points. The absorption of the periodizations about the “late capitalism” and the “post-modernism” seems in accord with such tradition. However, they bring doubts about the possibility of sustaining the dialectic premise of perceiving the present as potency and limitation, with triumph and loss. In other words, if such analytical categories are configured as critical arsenal or as new unhistorical and fatalistic mirages. Fredric Jameson is one of the

great responsible thinker by the appropriation of such concepts in the area of the dialectic thought, because, when correlating the contemporary aesthetic process with the new capitalist phase, formulated the first and more influent Marxist reading about the articulation between culture and globalization. His reflection about the constitution of critical mappings in such era elucidates the merits and limits of such discussion, because the author aims to comprehend the way of appearing of time today beyond the dialectical structure of globalization itself.

Capital in the Age of Capitalism: Marx-Bourdieu

Barbara Anna Markowska
Collegium Civitas, Poland
bmarkowska(at)civitas.edu.pl

Nowadays a term of capital is ubiquitous not only in the discourse of social sciences, but also in global reflection on the reasons and conditions of previous (and future) crisis of capitalism (Harvey 2010, Vogl 2015). Hence, as the dominant and enigmatic figure provokes us to raise the question on the meaning(s) of this term. It is wandering through different fields: from economy through politics to the social and cultural space. Fertility of this concept manifests in many types of capitals functioning with intriguing adjectives: “financial”, “political”, “cultural”, “social”, “creative”, or “human”. What they have in common?

Starting from Marx's definition of capital Bourdieu had distinguished the pure form (i.e meta-capital) of these capitals working in different social fields: the symbolic capital is a power of conversion of different capitals into a symbolic violence of legitimization which creates the natural Lebenswelt (1986). It means a mode of re-enchantment of the social world i.e. producing the equivalence between heterogenic elements responsible for the apparent consistency and unity of the modern world based on the instrumental reason and economization as universal force.

I would like to reflect on (following by Marx/Bourdieu's conception) how the “capital” creates an analytic framework of current thinking. Whether the capital is the core of this capitalistic grammar? The positive answer enables describing the modernity by referring to economic/political universality and social/cultural distinction at the same time.

RN29 | Session 07a Modernity (Modernities) in the Context of Neoliberalism I

Neoliberal modernity and its contradiction of the self

Marc-Dirk Harzendorf
Martin Luther University Halle-Wittenberg, Germany
marc-dirk.harzendorf(at)student.uni-halle.de

As Ulrich Beck has prominently pointed out throughout his work, modernity operates in ambivalent modes: Certainty and stability have been substituted for a variety of opportunities in life.

The narrative of modernity has transformed itself into a neoliberal imperative. One's performance in life is

being defined by his willingness to face the various demands of modern societies.

As Eva Illouz has clarified in her work *'Saving the modern Soul'*, the amount of psychological diseases in Western societies has experienced a tremendous increase within the past 50 years, not least because of magnificent modifications in its system of valuation. This finding illustrates that a significant amount of what constitutes a psychological disorder in present times used to be considered a regular emotional condition. Within that same time framework, Western societies have continued to experience an intensification of the outcomes of modernity. In his work *'The Weariness of the Self'*, Alain Ehrenberg has drawn the conclusion, that depressions appear as a result of modern times' imperative for individuality.

The aim of my presentation is to illustrate how an increasingly high level of classified psychological disorders correlates with the conditions of neoliberal modernity. Referring to Ulrich Bröckling's work *'The Entrepreneurial Self'*, in which he clarifies it is the self itself which serves as the source of failure and success and no longer can locate the source for his performance in life to outer parameters, each individual is taken into responsibility of managing the contradictions of neoliberal modernity: The paradox, that one's willingness for success or failure is not the decisive norm for an individual's performance in life, but it is continuously being affirmed as if it would be.

"Normal Anomie": A Side-Effect of Unmaking and Remaking Europe and the World

Sergey Kravchenko
Moscow State Institute of International Relations,
Russian Federation
social7(at)yandex.ru

The idea to introduce category "normal anomie" in contrast to that of anomie is based on the assumption that modern Europe and the world are changing greatly their contents under the impact of unmaking and remaking social and cultural realities. When É. Durkheim, R. Merton, E. Goffman studied this phenomenon the manifestations of anomie were limited in time and space. Since then there have appeared the realities putting an end of normative certainty: as cultural and social borders of Europe are being unmade the distinction between authentic and borrowed values is becoming blurred; the basic functions of states to protect their citizens have been unmade, so human rights are denied; the globalization has established "borderless world" of unmade realities with the domination of "nothing" in the form of non-places, non-people, non-things, non-service over "something" (G. Ritzer). At the same time the glocalization is more tired to something – made places, things, and services. Thus, in real life people deal with the something-nothing continuum consisting of diffused made and unmade realities including unmade mothers and made 'substitute mothers'. These dispersions of made and unmade, truth and untruth practically become a norm, an attribute of global uncertainty. They manifest new phenomena of

normal anomie as a side-effect of complex processes of unmaking and remaking Europe and the world. The normal anomie lacks any space or temporal concreteness, its permanent production is facilitated by transnational expansion of cosmopolitan tastes.

Modernization processes in the context of institutionally embedded neoliberalism: a theoretical perspective on post-transitional Croatia

Mirko Petric, Inga Tomic-Koludrovic
University of Zadar, Croatia; Institute of Social Sciences Ivo Pilar, Croatia
mpetric(at)unizd.hr, inga.tomic-koludrovic(at)pilar.hr

This paper discusses the characteristics of modernization processes taking place in the specific social context of a post-transitional country. The tenets of new modernization theories (Beck, Giddens, Touraine, Eisenstadt, Inglehart-Welzel) are applied to explain the trends evolving in what has been described as the "hybrid society" of Croatia after its "post-socialist transformation". The starting point of the discussion is the hypothesis according to which two modernization processes (those associated with "first" and "second" modernity) were simultaneously at work in Croatian society during the period of post-socialist transition (Tomic-Koludrovic, 2000). In a context most decisively marked by the 1990s war of independence and post-2008 economic crisis, "first" modernity trends were increasingly pushing out those associated with "second modernity", i.e. with a previously more pronounced general social reflexivity. Added to this in the most recent period should be "regressive modernity" (Nachtwey, 2016), characteristic of the pan-European "society of descent", as well as a further complication represented by the clash of by now firmly institutionally embedded neoliberalism and continued manifestations of the "egalitarian syndrome", theoretically postulated by Zupanov in the late socialist period. The paper aims to show the usefulness of a theoretical perspective based on new modernization theories in interpreting the seemingly contradictory results of recent empirical studies of the post-transitional Croatian society. Examples of empirical research, suggesting that what is at stake in this case is a "non-linear modernization", characterized by "partial acquisition of modernization values", are also provided.

Lifestyle and Hope: Weber's 'Protestant Ethic' and the Discontent of the Middle Class

Nils C. Kumkar
Universität Bremen, Germany
kumkar(at)uni-bremen.de

Weber's "Protestant Ethic" argues that everyday life in modern capitalism is, despite its high degree of inner rationality, all but self-evidently rational when judged from the perspective of a subject that aims for "a good life". Until it established itself as entangled in structural necessities to be reckoned with, this lifestyle therefore

had to rely on a religious horizon rendering its restless movement meaningful: the lifestyle was lived as oriented towards the hope for redemption. After the withering of this horizon, Weber argues, everyday life in capitalism therefore remained a *caput mortuum*, something inherently 'lacking'.

The sociological interest in lifestyles has thus far factored out this aspect of Weber's theory or has reduced it to an outdated historical diagnosis. This paper argues that redirecting attention to hope as something that is necessarily implicated in and complementing the routinized practices of the everyday opens a fruitful perspective for a critical sociology of current social discontents.

Many have wondered why the middle classes in the last decade have displayed such a high degree of frustration and insecurity, even when their socio-material living conditions have not significantly changed. Relying on the results of my dissertation on middle-class protests in the US and on preliminary findings of our current study on the lifestyles of the German middle-class, I will illustrate that this is partially due to the fact that the implicit complement of their everyday life, the hope for a better tomorrow, has become problematic in the social dynamics that culminated in the Great Recession of 2008.

RN29 | Session 07b Modernity (Modernities) in the Context of Neoliberalism II

Challenges for modern and postmodern theories: social relationality and resonance as new paradigms for analyzing societies in crisis?

Thomas Dörfler, Eberhard Rothfuß
University of Bayreuth, Germany; University of Bayreuth, Germany
thomas.doerfler(at)uni-bayreuth.de,
eberhard.rothfuss(at)uni-bayreuth.de

»Confronted with society's possible collapse, that is, with a crisis in its integration on both social and system level, significant parts of society activate morphogenetic processes that consist in creating networks of relations in which the functionalist principle is replaced by other principles.« (Donati 2015: 100)

Since more than a decade European/Western societies face severe changes in the way 'they are made or unmade' (ESA Conference announcement for 2017). This process also affects social science to acquire with modified social realities. What became apparent thereby is that contemporary (modern & postmodern) social theory does not seem to be able to cope with a fundamental shift in values, meanings and the way of living people/milieus perform while seeking alternatives to alienating aspects of capitalism, neoliberalism etc. (Donati 2011, Donati 2015, Rosa 2016).

Given that Donatis and Rosas diagnostics are true we would like to seek evidence for this thesis on the empirical level of social and spatial practices about how people accommodate with the elementary crisis of the human-nature-relation. We give insights in our

JPI-Climate Project SelfCity - Collective governance, innovation and creativity in the face of climate change showing that working together (comp. Sennett 2012) in a new, non-functionalist and appreciatory way creates new, relational networks of modified individuality. Working together and acting upon shared time and space may transform (post-)modern subjects into 'decelerated' social beings finding new awareness and new social recognition for non-capitalist life-scripts: a social resonance (H. Rosa) as a 'positive dialectic' against the particularizing tendencies of (post-)modern consumerist societies.

Trust-based exchanges as a counter-weight to neoliberalism

Laura Kollmann
University Bremen, Germany, Jacobs University Bremen, Germany
kollmann(at)bigsss.uni-bremen.de

The paper outlines core components of a Bourdieusian concept of trust, which is developed by re-assessing Pierre Bourdieu's theory of symbolic exchanges. Bourdieu's theory of symbolic exchanges and, more specifically his notion of the "gift exchange", is a prominent and re-occurring theme in his wider body of work. In his last text on the topic in the *Pascalian Meditations* (2001), Bourdieu has made some important additions to the theory, which have not yet been explored in the academic debate. In the context of his criticism of neoliberalism, he argues that practices like the gift exchange may serve as a model for strategies and institutions that can serve as counter-weight to developments of increasing economization in modern societies. More concretely, he argues that such practices can serve to produce trust and, thereby, may foster social solidarity which is needed in order to counter neoliberal developments. As a first step to explore this idea, the paper investigates the conceptual link between the gift exchange and trust by re-assessing Bourdieu's central theoretical works in the light of this novel argument. Based on this analysis, the paper outlines the core characteristics and benefits of a Bourdieusian notion of trust. As a central insight, such an approach is highly sensitive to the ways in which trust relations interact with aspects of social inequality and power relations. Depending on the context conditions, trust-based exchanges may either foster social solidarity or take on the form of symbolical domination.

Disciplinary reconfiguration of the social sciences in the context of neoliberal transformation of modernity

Ruslan Braslavskiy
Sociological Institute of the Russian Academy of Sciences, Russian Federation
r.braslavsky(at)socinst.ru

The disciplinary configuration of modern social sciences is transforming. Social sciences have developed transdisciplinary approaches largely in response to epistemological, methodological and

theoretical problems of their respective disciplines. Transdisciplinary approaches reconsiders the conceptual foundations of particular social disciplines and transform the assumptions specific to the given social science domain. Criticisms of social and cultural reductionism and determinism in favor of the principles of 'historical contingency' and 'cultural autonomy' are characteristic for transdisciplinary research programs in social sciences. These strategies result in comprehensive multidimensional models that take into account the dimensions, levels and domains of the historical-social reality traditionally studied by different sociohistorical disciplines. Civilizational analysis in sociology appears to be the most striking example of a trans-disciplinary research program. The paper examines trans-disciplinary approaches in their contrast with mono-disciplinary, multi-disciplinary, inter-disciplinary, anti-disciplinary and post-disciplinary research strategies and considers neoliberal transformation of modernity in the civilizational analytical perspective. The latter focuses on analysis on the changing interrelations between, on the one hand, human autonomy and mastery to be a twofold fundamental cultural orientation of modernity as a new type of civilization (S. Eisenstadt) and, on the other hand, liberalism as a dominant ideological doctrine and political metastrategy in the geoculture (civilization) of the modern world-system (I. Wallerstein) and social sciences having constitutive impact on the modern economical and political institutions and practices.

Social Creation in Social Theory

Mar Joanpere, Maria del Mar Ramis, Teresa Sordé
University of Barcelona, Spain; Autonomous
University of Barcelona, Spain; Autonomous
University of Barcelona, Spain
mar.joanpere(at)ub.edu,
mariadelmar.ramis(at)uab.cat,
Teresa.Sorde(at)uab.cat

Social transformations have always required social creations to be generated. From research, people who have always worked with the aim of achieving a social improvement, have developed research capable of generating a real impact on the community with which they work, creating new social realities, overcoming exclusionary barriers and promoting a real transformation of research. Beck studies the loss of safety of science and, consequently, the loss of impact and recognition of scientific work. Sociologist as Weber, raises a duality between people of action and scientists. Yet this separation, social creation needs of both characteristics to enable research investigations to get out of the offices and transfer it to specific areas of the social reality, not as ingredients or remedies but as participation processes, exchange of knowledge and creation. The basic tool to enhance those links is communicative action theorized by Habermas. In order to regain the meaning of social sciences it is necessary to create an intersubjective agreement with the world and reality. It can be observed how many scientists who pretend to play the

role of sociological watchers have a lack of communicative action to connect with social practices, assuming that the power of systems are the only way to understand reality and generate social creations.

RN29 | Session 08a Social Theory and Identity Politics

On identity politics and its discontents: between gender recognition and disembodied communities

Sofia Aboim

University of Lisbon, Portugal
sofia.aboim(at)ics.ulisboa.pt

One of most challenging debates in terms of gender identity politics revolves around the impacts of queer movements, which take a position against all forms of category-based politics for their essentialism. Such influence would undermine the possibilities of a politics targeted at specific subaltern groupings, as stressed by critical insights stating the impossibility of a politics without subjects. This problem was addressed by Spivak with the notion of strategic essentialism. For her, identity, subjectless it may be, should be nonetheless strategically mobilized for political reasons. This implies a denial of identity as the basis of politics insofar as subjects are not pre-existent to politics, and reinforces the idea that politics can construct identities as strategic positionings against the dominant. Overturning the traditional ontology of the political, embodiment is only possible if a political programme precedes subjects. On the basis of a reflection on the construction of the category transgender, we reflect on the effects of disembodied strategies for doing a politics of identity alienated from subjects. Such strategies do not elude reifications. Instead, imaginaries of disembodied communities are a powerful result of theorizations against identity, although paradoxically unable to avoid identitarian strategies. The contradictions of such disembodied forms of politics will be discussed through the example of contemporary transgender communities as political imaginaries vis-à-vis the strategies designed for representation in the public sphere. Such strategies for claiming rights illuminate the extent to which the renewed production of normativities challenges ontological formations of the political and the social.

Identity, self-deception and rationality in the XXI century.

André Folloni, Massimiliano Ruzzeddu, Mariella Nocenzi

Pontifical Catholic University of Paraná, Brazil;

Università Niccolò Cusano di Roma, Italy; Università

La Sapienza di Roma, Italy

andrefolloni(at)gmail.com, mruzzeddu(at)hotmail.com,

mariella.nocenzi(at)uniroma1.it

The object of this work is the electoral success that so-called 'populist parties' have had all across the Western world.

The most common explanation for this phenomenon is economy-related: allegedly, the middleclass and the

other social strata that globalization has impoverished, have dropped endorsing left-winger parties on behalf of state-nation centered politics; in fact, those parties claim for abandoning any supranational institution, closing the borders to any form of migration and stopping free international trade. Within this framework, the electoral behavior of European and American middle-classes appears to be a case of (economic) rationality. However this explanation shows inadequate: in fact, although populist politics, if implemented, could grant no economic growth for the middleclass; nevertheless, populist forces seem not loose consent, even when their limits become evident. Therefore, it is possible to assess the cause of the wide success of populist parties is not rationality: the hypothesis is that populism meets emotional needs rather than economic interests, boosting a process that many scholars, like Nelking, have defined as "self-deception". In fact, populist representation of reality attributes to globalization all the diseases of contemporary societies, alleviating the angst related a society turning more and more liquid.

This work will set a model of investigation for next years' social phenomena, where two different approaches to social life will be in contrast: capitalist rationality -more and more global and abstract- and the need for acknowledgment (Taylor)- more and more spread around large masses.

Cultural trauma, habitus and other traces of the past

Csaba Szalo

Masaryk University, Czech Republic
szalo(at)mail.muni.cz

Social theory includes the tradition of reconnecting understanding and explanation. I will focus on two recent attempts to reconfigure the terrain of these epistemic modes as these were articulated in cultural sociology (Isaac Reed) and critical hermeneutics (Hans Kögler). While offering distinct interpretive strategies, that of interpretive explanation respective dialogue, both perspectives stress the crucial role of our relationship to otherness in the development of human sciences. My critical reading thus problematizes the experience of intelligible difference paying particular attention to various traces of the past we have to deal with in our everyday life.

Narcissist Ironic Nostalgia and Pseudo Meta Reflexivity. The Hipster Figure as a Post-Theoretic Projection in Late Capitalist Culture and Theory

Pär Engholm

Uppsala University, Sweden; Stockholm University, Sweden
par.engholm(at)soc.uu.se

This paper examines the fugitive and now waning character of the hipster as emblematic of some central contentious aspects of contemporary forms of identity formation, both individual and collective. As a figure of both highbrow aesthetic elitism and of quasi-plebeian irony, occupying a cultural frame in which a quest for

authenticity is anxiously pursued, she impersonates the dilemmas of a late modern, yet neo-traditionalist world, characterised by the coexistence of ironic awareness of the social and cultural situatedness and arbitrariness of identity and cultural values and the rise of nostalgia and neo-traditional social and political sentiments. The hipster, or, generalised: the ironist, stands as the epitome of the hyper-reflexive postmodern man, at the same time ironically embracing as well as seriously rejecting the labelling process in which (s)he is both the subject and object.

In order to understand this contemporary paradox, we need to reject relativist postmodern theories and formulate a realist constructionist theoretical framework, an integrated perspectivism, in which intersubjective forms of narrativity and individual tales and forms of internal conversation are situated within a practical order. Contemporary identities must be seen as continuous dramaturgical accomplishments, but in setting where the backstage is missing, where the scripts are constantly changing and the narratives are full of lacuna, discontinuities and ambiguities and the plays are cast in a neo-narcissist society in which cognitive and practical dissonance has become normalised and institutionalised; transgressing the differentiated modern social space with multiple personalities and opening for a generalised compartmentalisation of the self as a collective form of coping with the simultaneity of irony and seriousness, detachment and commitment.

RN9 | Session 09a Social Theory

Metamorphosis of Risk Society—Are we heading towards a Risk-taking Society?

Jens O. Zinn

University of Melbourne, Australia
jzinn(at)unimelb.edu.au

In recent decades risk studies (e.g. Slovic 2000, Renn 2008, Fischhoff & Kadavy 2011) and risk society theorizing (e.g. Beck 1992, 2009) have focused on the prevention and minimisation of risk and the management of the side-effects of technological advancement. This presentation suggests that new developments in the relationship of humanity to nature have started to change human engagement with risk. Building on the insight that the notion of risk constitutes a paradox which amalgamates risk minimisation and risk-taking, the presentation suggests that in a number of domains such as climate sciences, economics and environmental sociology the understanding of nature is shifting. It is no longer conceptualised as external to humanity and to be protected but an entity which is increasingly consciously shaped. With this transformation of the understanding of and engagement with nature the comprehension of risk is changing as well. Nature is no longer understood as requiring merely risk protection, risk prevention and risk minimisation. Instead, with growing (uncertain) knowledge and potentially catastrophic outcomes the balance leans increasingly towards risk-taking. Considering all the

difficulties with generalised concepts of society and hypotheses of social change such as the hypothesis of the risk society, it could be argued that risk society (Beck 1992, 2009) undergoes a metamorphosis towards a risk-taking society (Zinn 2016).

The modern European community: how to integrate complicate and multiform without destroying the wholeness

Vladimir Igorevich Ignatyev
Novosibirsk State Technical University, Russian Federation
ighnatiev.v(at)inbox.ru

The historic experience in the post-communist countries of Eastern Europe showed that many of them couldn't pretty much "join" in, first of all, from the point of view of cultural identity in the west-european model development of society. Obviously, the modern situation in Europe might consider as the system of a few groups of Eastern European countries one of them successfully realize west-european model. European community represent the aggregate commonalities in that every country or group of countries represent relatively self-sufficient formation with it's own but although and European identity, but is reproducing the historic legacy in the form of surviving types of economic activities and specialization and so in the form of its own national cultural system and practices. The community of European countries - is the community with different local history in that there are variety identities. The problem that have to decide to the European Union is consists in the quest of methods and mechanisms of conservation of specific characters of particular countries and in the same time of elaboration the optimal scrips of its convergence for the intensification the whole system of participants of European Union. That's why the methodology of analyze the problems of European countries should based on the understanding its as complicate societies are in the process of self-determination. As recent practice showed of destruction its sociocultural and economic complex by joining in European Union - rejection of local specific of its development creates for the all European countries instability and permanent crises. Makes the Europe stable - means to find for every of its country its own place according to tagging in the context of European community.

Acting like a teacher? Conceptual frameworks in Critical Theory related to critical theorist's educating activities.

Eva-Maria Klinkisch
University of Hohenheim, Germany
eva-maria.klinkisch(at)uni-hohenheim.de

A common way to study developments in different research branches is analyzing the scientific oevres of their members. However, most of these works emerged while the authors also acted as teachers at universities or became involved in public intellectual discussions. Moreover they pass(ed) themselves

educational processes which were important for the evolvement of their conceptual views as well as for their practical acting. These aspects are often understudied. The main aim of the presentation is to sketch out changing theoretical frameworks within the research tradition of the Frankfurt School of Critical Theory by elaborating on this „educating“ perspective. For this, it first compares statements about and activities in education as they are expressed through, e.g., interviews, pieces in newspaper, lectures or speeches. The focus will be given to utterances of Theodor W. Adorno and Max Horkheimer for a classical approach of Critical Theory and recent comments on education by Axel Honneth for one contemporary representative. Second, the contribution elaborates how far those reflections elucidate the issue of mediation, which can be said to be a central point also in recent debates about Critical Theory. I will show by the way of example of education that mediation between social theory and social praxis can fully been grasped solely by also taking into account the practical experiences of the authors. The presentation concludes discussing the role of “educating critical theorists” in terms of current challenges concerning educational systems, individual participation, social emancipation and social critique. Eventually, it outlines shortly implications of this discussion for further theoretical advancements in Critical Theory as well as for understanding societies today.

Democracy as a ‘form of society’. Claude Lefort's post-foundational approach

Spiros Makris
University of Macedonia, Greece
smakris(at)uom.gr

According to the well-known French political and social philosopher Claude Lefort (1924-2010), democracy is not just a political regime but first and foremost a special ‘form of society’ (Lefort's expression). To put the matter differently, democracy, in the sense of democratic revolution (1789), is the metonymy of modern society or modernity in general. As far as Lefort is concerned, the question of democracy in modernity is by definition the social question per se. In Lefort's terms, ‘democracy (...) proves to be the historical society par excellence’. This Claude Lefort's Tocquevillean-inspired social theory of democracy is too crucial today because brings into focus the relevant question of right-wing populism in Europe and theoretically the question of Totalitarianism in contemporary political and social political theory. In accordance with the France philosopher, democracy is a form of society that is characterized from the phenomenon of disincorporation. This means that the locus of social power becomes an empty space. In other words, democracy as the main political form of modern society is an empty space. From this specific perspective, it is worth noting that democracy, as an open social space, includes within its ontological possibilities the ontological threat of Totalitarianism.

So, democracy is always in a state of risk due to this ontological openness. Authoritarianism and Totalitarianism are always ante portas. Lefort's democratic approach builds an agonistic theory of democracy, where citizens (here especially European citizens) should not take democracy for granted, but they need to constantly perceive it as a crucial stake or, in Jacques Derrida's terms, always as a 'democracy to come'.

RN29 | Session 10a Social Theory

Society in a relational perspective

Yasemin Niephaus

Goethe-Universität Frankfurt, Germany

niephaus(at)soz.uni-frankfurt.de

Society is the most general topic sociology has. In consequence we should be able to regard every fact sociology is concerned with as a societal fact. In this sense the (un)making of Europe is a societal fact. The financial crises and the crises of whole economies are societal facts. The raising power of popularism is a societal fact as well as the rising power of religious fundamentalism, the new migrant flows, new social movements and the other topics the 13th ESA-Conference is concerned with are societal facts.

It should be possible to bring all these developments together. What we therefore need is a conception of society which is able to bring together societies' objectivities as well as subjectivities and the different contexts of society. In short: What we need is a relational conception of society which is capable to deal with the horizontal (between contexts) and the vertical (between objective and subjektive level) differentiations within societies. Such a relational conception of society has to be embedded in a relational social theory.

The first aim of my paper is to show that the genetic structuralism of Pierre Bourdieu may be regarded as such a theory. The second aim is to show that such a relational conception of society may give us an insight in the causes of the contemporary crises and their inherent potentials for ongoing social change. For this purpose I will focus on the social cohesion within the European Union.

What Can Friedrich Kittler Contribute to Contemporary Social Theory: the theoretical implications of the concept "technical media"

Po-Fang Tsai

Taipei Medical University, Taiwan

pofang(at)tmu.edu.tw

Since Talcott Parsons, contemporary social theorists have tried to elaborate a theoretical position for the idea of "media", which is often problematized as the concept "generalized symbolic exchange media", but they still do not have a satisfying answer. The crucial point may lie in that the social theorists start from "the problem of social order" or "how is society possible" with their underestimated or underdeveloped media theories. In modern society, social order is

constructed in terms of media and mediated social communication more than face-to-face social action. Therefore, social theorists need to find their theoretical resources from media theorists. This paper attempts to introduce an important German media theorist, Friedrich Kittler, and examines his theme of "modern media is technical media". According to my scrutinizing from Gramophone, Film, Typewriter (1999) to Optical Media (2002), Kittler's theme has at least three implications for social theorists: the evolutionary process of, the functional characteristic of, and the departure from everyday life of "technical media". First, Kittler provides a trinity-narrative of modern media: from artistic to analog to digital media accompany with direct-visibility to indirect-visibility to override visibility principle respectively during the 14-15th century, the 16-17th century, and the 18-19th century. Second, Kittler defines technical media by three syncretized functions—storage, transmit, process—and views Turing machine as the first creation of yet PC as the last betrayal of technical media. Third, Kittler's analysis of programming language emphasizes two dimensions departing from human language, which means technical media has already decoupled from everyday life in ontology and time-axis. This paper concludes with a reflection on the possible connection between social and media theory by setting Kittler as a crucial bridge.

Performing Citizenship Transnationally. Political Action Beyond Representation

Mareike Gebhardt

FAU Erlangen-Nürnberg, Germany

mareike.gebhardt(at)fau.de

The representationist paradigm of liberal democracy is in crisis. The rise of right-wing populism in Europe is a symptom of this erosion. Facing a complex, globalized world, right wing populists are re-simplifying 'Europe' by binary and phantasmagoric notions of 'us' and 'them'—Muslims, Jews, gays, women, the abnormal monstrosities of otherness in general, are being targeted by this rhetoric of simplification. How does this sociocultural phenomenon correlate with the crisis of representative democracy? The relationship between the rise of populism and liberal democracy, the paper argues, is that of a family affair: Populism parasitically thrives within liberal democracy. Hence, populism is not an external phenomenon invading liberal democracy. Rather, populism is part of liberal democracy and, therefore, only vital within its frames. The first part of the paper analyzes this relation from the viewpoint of radical democratic and social theory. Referring to Isabell Lorey's, Judith Butler's and Birgit Sauer's works on presentist democracy, the "right to appear", and affect theory as well as identity politics, the paper puts forward the thesis that liberalism's disregard of affective dimensions of identity formation creates 'voids' and blind spots that populism 'fills' with ethnicist motifs of homogeneity by an emotionalized rhetoric of unity. Accordingly, the second part of the paper outlines a performative mode of citizenship that differs first from the liberal's private autonomy, second

from ethno-nationalistic “Volk”, and thirdly from cosmopolitan versions of citizenry. Instead the paper introduces an alternative sociopolitical conception: the transnational citizen— a presentist performer of radical and democratic citizenship beyond the confinements of representation and thus an antagonist of the populist affect management.

RN29 | Session 11a Social Theory

Study of Society: between methodological atheism and theological approach

Svetlana A. Sharonova

St.-Tikhon's Orthodox Humanitarian University,
Russian Federation; People's Friendship University of
Russia

s_sharonova(at)mail.ru

The growth of social, political and even economic problems on the basis of religion has acquired great importance in the world. Theoretical constructs built before do not work practically: they do not explain the nature of the emerging social facts, generated on the basis of religion or with the involvement of religion; they do not measure the processes that accompany these social facts; they cannot build a platform to address the problems generated by these social facts. An example of this is the situation in Europe, which arose under the pressure of mass migration from Africa, mostly Muslims.

The main factor of the scientific slip is the principle position of the scientific atheism. It was good to measure the religion away from it as from the outside, at the time when dominated thinking, based on the ideals of the Enlightenment (Durkheim, Weber and their followers), when religion is lived within itself and has lost its social activity in all spheres of society. Global imperialism rationalism has acquired a different nature, with respect to religion, it became more cynical and irresponsible aggressive. Now we can see an understanding that the old tools are not sufficient to measure the ongoing religious processes. Researchers have begun to include theological concepts in the questionnaire and interviews. But such a position is not so much help, how much harm because the fundamental point cannot be solved - a change of methodological bases of assessment of the results and their interpretation. We will try to give examples of methodological discrepancies in the presentation.

Description of New Age Spirituality in motion pictures and TV series as public's reflection to this phenomenon

Mikhail Dobrovolskiy

Higher School of Economics, Moscow

mdobrovolskij(at)hse.ru

New Age/Holistic Spirituality came into existence in the last third of the twentieth century. Scientific research on New Age Spirituality is complicated because of the unclear nature and the lack of organizational structure of the groups. Holistic

Spirituality is pertaining to Late Modernity, for example, as “client-oriented cult” (Stark and Bainbridge 1985) or “postmodern religion of consumption society” (Paul Heelas 1995). Spirituality is a subject matter of sociology of religion, but this research proceeds from the assumption that it can be explored as a specific socio-cultural phenomenon close to religion. The paper presents empirical research on attitudes to New Age Spirituality expressed in modern TV-series and movies. This kind of sources have appeared to be the most informative, appealing to a broader audience than books, journals or scholar articles do. Conversation analysis and visual analysis are being used as research methods. The findings show strongly negative perceptions of spirituality which can be reduced to the contrast of ‘common sense’ and ‘abnormality’. It may be presumed that Spirituality is marked as ‘abnormal’ because its existence affects two main social groups?. Screen players and directors of such movies present point of view of educated people who reject Spirituality as an anti-intellectual movement. Meanwhile, the other significant group associates Spirituality with new social agenda, including some specific stressful changes for habitual lifestyle. In this context, Spirituality is perceived among other new and controversial phenomena, but, at the same time, it may be socially acceptable object of critique, especially in comparison with gay marriages or minority rights. Thus, sarcastic portray of New Age Spirituality may be politically correct form of expression public's resentment over Late Modernity.

Crip posthumanism and Amerindian postanthropocentrism. Keys to a bodily perspective in science.

José Ángel Bergua, Laura Moya

University of Zaragoza, Spain
University of Zaragoza

jabergua(at)unizar.es, lmoya(at)unizar.es

The dominant thought in the Western Culture has created distinctions in which the spiritual or immaterial aspect was considered to be above the body and the material aspect, but the bodies have not allowed themselves to be reduced to these hierarchies. Queers discovered the body but returned to the plane of immateriality in which identity lies. Crips have completed this gesture distorting categories such as impairment or disability and interpreting the body as radically interdependent. However, to solve our lack of tradition in dealing with the body we get our inspiration from other cultures in order to go in search of the body that the Western Culture lost.

Made more explicit through the contrast between humans and non-humans, with Amerindians established, They suggest there is a unique culture with multiple

natures, they live with within this diversity. Amerindians have invented a “multinaturalist perspectivism”. Getting our inspiration from this, we suggest calling perspectivist this variety of science

which manifests material influences. When it comes to politics a field in which this perspectivism is applied, would be the different feminisms and queer or crip positions.

**“Society - iron cage” or “game (playful) society”?
What turn will be next?**

Margarita Kalashnikova
St. Tikhon's Orthodox Humanitarian University,
Russian Federation
m.v.kalashnikova(at)rambler.ru

Max Weber believed that the history develops in the way of rationalization of all spheres of human activity, and as a result people become prisoners of the “iron cage” of rationality. According to Weber rationalization in turn leads to the “disenchantment” of the world.

On the other hand, to the opinion of the famous English philosopher Ernest Gellner now the metaphor of “iron cage” should be replaced by the metaphor of “rubber cage”, because segment of rationality and rational activities in the world becomes more and more compressed.

In modern society the process of gamification and virtualization expands to almost all spheres of social life and therefore a range of issues can be raised.

What is the vector of civilization development? What will be the future society? “Society-iron cage” or “game (playful) society” with playful forms of thinking and behavior?

What is the content and heuristic potential of «homo ludens» model (Johan Huizinga)?

Does process of gamification mean an attempt to bring back the enchantment of the world: enchantment – disenchantment - re-enchantment (Ernest Gellner)?

We can see a lot of different turns in social science, especially in the science of the twentieth century: anthropological, historical, linguistic, cognitive, rhetorical, theological, medial, pragmatic, etc. Have we any reason to assert that some kind of a game (or playful) turn takes place in modern social science and reality?

RN30 - Youth and Generation

RN30 | Session 01a RN KEYNOTE SESSION with Ann Nilsen: Youth, Intergenerational Solidarity and the Crises in Europe

Youth transitions in times of inequality:

Ann Nilsen

University of Bergen, Norway

ann.nilsen(at)sos.uib.no

Youth transitions in times of inequality:

'Private troubles and public issues' in discussions of intergenerational solidarity and conflict

Abstract

The current time of increasing social inequalities, cutbacks in public spending and high youth unemployment in many European countries, is a challenging period for young people making their transitions to adulthood. On the other end of the age spectrum, the demographic circumstances with an ageing population are also a source for concern in many countries. In the public debate and in some social science research, the demographic situation is put forward as a major reason for the plight of the young as public spending on pensions and care for the elderly far outweigh the economic transfers to the younger strata of populations in social protection budgets. The unequal distribution of social protection expenditure by age has increasingly been discussed in terms of an intergenerational conflict. Others have maintained that a social contract between generations is the basis of all societies and highlighted how the upholding of intergenerational solidarity is a cornerstone for peaceful co-existence across generational divides. An overarching aim in this paper is to examine the wider implications of the standpoints in this debate with a particular emphasis on young people's transition phases. The origins of the 'generational equity debate' will be traced and addressed within a wider framework that includes an historical contextualisation of the ideas and concepts involved. C.Wright Mills' approach and concepts form the main theoretical frame of reference. Empirical evidence will include relevant statistics, and interview material from a three generation life course study of intergenerational transmission processes.

RN30 | Session 02a Multiculturalism, Ethnicity, Migration

Youth in times of invisible –isms

Carsten Yndigegn

University of Southern Denmark, Denmark
cy(at)sam.sdu.dk

The paper delivers a discussion about how to contribute to develop analysis and theory about major trends in societal thinking among contemporary youth. Like Mannheim and Inglehart theorised, major historical trends have shaped the mind-sets of generations in the 20th century. The outcome of WWI represented the break-down of the bourgeois-colonial nation-state and its power structure and gave way to currents represented by both democratic and fascist social movements; the outcome of WWII gave way to rapid modernisation, post-colonial conflicts, and environmental challenges.

The current conditions appear as the culmination of two currents that emerged after the end of WWII and now have become key sources of conflict. The first was the multiculturalist transformation of western societies initiated partly by post-colonial migration, partly by the industrial and economic boom in the 1960's. The second was the neo-liberal economic policy, initiated by Thatcher and Reagan, that created what is now seen as 'the roots of all our problems' (Monbiot 2016).

The purpose of this paper is to scrutinise interviews with Danish young people made as part of the MYPLACE project (cf. <http://www.fp7-myplace.eu/>) to analyse how current key trends related to the multicultural and neoliberal transformation of societies can be traced in the discourses of the young people. The methodology applied will be a critical discourse analysis that will take into consideration the special nature of the interview material, i.e. its non-representativeness and its pre-determined thematically structure. The analysis aims at establishing the multidimensionality in the approaches taken by the young people, and it seeks to identify the oppositional character of attitudes and to anchor them coherently in their respective socio-cultural frames and mind-sets.

The individualization contradictions: the second generation immigrants in Italy

Mauro Giardiello, Rosa Capobianco

University of Roma Tre, Italy; University of Roma Tre, Italy

giardiel(at)uniroma3.it, rcapobianco(at)uniroma3.it

In Italy, in the last decade, the increase of second generation immigrants has turned immigration from temporary to permanent, reaching in the age group (0-19) the number of one million people. This assumes a central role for the development of a theoretical approach based on the category of the systemic individualization contradiction in the studies on second generations. The paper shows that the themes of the individualization contradiction and of the epistemological fallacy of modernity, even if they have been widely discussed within the youth studies, they are not yet much used in the analysis of young immigrant conditions.

The second generations are involved in the difficult

management of processes of insecurity produced by the contradictory nature of individualization. If, on one hand, second generations in Italy experienced the possibility of a biography of the choices, adhering to the models of Italian young people, on the other, the unequal distribution of objective resources and the lack of subjective resources may hinder the efficient management of an individualization process which provides a continuous design of lifestyle choices. This generates regressive processes, more acute than those of the previous generation, since subjected to an anticipatory socialization that pushes them into very large opportunities exposing them to difficult situations. More specifically, the contribution aims to show how the individualization is a contradictory process, not without consequences in terms of social integration mechanisms, as it can represent the structural condition from which phenomena of fragmentation, marginalization and radicalization emerge.

Young descendants migrants in transnational space – challenging the use of categories in research on children of migrants

Tatiana Ferreira

Institute of Social Sciences, University of Lisbon, Portugal

tatiana.mjferreira(at)gmail.com

Transnationalism is not a one generation phenomenon as the socialization process occurs in a transnational space which has influence and an important impact on identities and life trajectories across generations. The generational experience is not a linear process, national embedded but rather an imagined experience across borders. This paper is part of ongoing PhD project, named “Gender and generations: processes of transition to adult life of young descendants from Portuguese speaking African countries”, which adopts a comparative methodology between young descendants from PALOP and their parents in what concerns representations and transitions to adulthood. The aim of this paper is to contribute for the discussion around the categories commonly used in the research on children of migrants, for example, second generation migrants, and how transnational approach can help overcome some of these epistemological limitations. This paper also aims to discuss the boundaries of transnational approach, going beyond the dichotomy between country of origin and migration country, has most of the transnational families interviewed have at least one member newly migrated. For one hand, some of this young adults have migrated to other European countries in the context of the Portuguese economic crises who lead to a massive youth emigration cycle in the recent years. On the other hand, some parents have recently migrated, returning to their country of origin. Their children, most of them young adults, have stayed in Portugal. Finally, the paper intends to contribute to the discussion of how transnational experience can be very different from one generation to another and how this can cause generational

differences that are significant and must be acknowledged.

”I have seen it as a new life phase”- international student mobility as turning point or transition? Credit and degree student mobility – two different perspectives.

Emilia Kmiotek-Meier

University of Luxembourg, Luxembourg

emilia.kmiotek(at)uni.lu

Transitions into and from higher education have been widely discussed. However, research on international student mobility (ISM) has paid little attention to ‘transition’ and ‘turning points’ within mobile students’ trajectories. I will discuss different meanings of the move abroad for degree (whole programme abroad) and credit (short stay abroad) mobile students.

For degree students “a new life phase” starts simultaneously on two levels: entrance into higher education and move into another country (incorporated by definition). For credit students, start and end points of those two levels are disintegrated.

Both degree and credit mobile students describe study abroad as influential in their lives. While degree students do it always in positive terms, credit mobile students are ambivalent. They relate to loss of autonomy after moving back to parental home. This reversed transition leads to frictions, with the self and parents, as once being autonomous credit students have to give it up or shift their aspiration to become “fully” autonomous for later.

The paper discusses student mobility as turning point and transition, thus, contributing to life course research. While degree mobility follows the standardised life course: school -> study -> employment and can be seen as transition, credit mobility is rather a turning point. In terms of ISM and youth policies: potential disadvantages of short academic stays abroad should be addressed, especially in the light of ERASMUS-hype.

Analyses are grounded theory driven, based on 12 qualitative semi-structured interviews with students from Luxembourg. The fieldwork took place between October 2015 and April 2016.

RN30 | Session 02b Youth in changing societies

Young people in the city: redefining urban space through art practices

Nadezhda Vasileva, Yana Krupets

National Research University Higher School of Economics in St.Petersburg, Russian Federation;

National Research University Higher School of Economics in St.Petersburg, Russian Federation

nvvasileva_2(at)edu.hse.ru, krupets(at)gmail.com

A lot of big post-soviet cities in Russia have urban political regime, which may be called “growth machine”. It means, that the crucial role in decision-making process and formation of the urban fabric is played by local authorities and business elite. In such conditions urban landscape becomes more hostile,

digital and controlled, that does not reflect young people's requirements and makes them find alternative means for transforming city space, which can take the form of different art practices. This research examines sticker-artist community in Saint-Petersburg (community, which is represented by teenagers and young adults, who create images on small sticky papers and put them on different objects in the city) and answers the question how participants implement their "right to the city": how they experience and change the city through their practices, and how their practices influence on their city perception. The study was carried out in framework of the project «DIGITAL YOUTH IN THE MEDIA CITY: Urban Ethnography in the Streets and Stations of Helsinki and St Petersburg», supported by Kone Foundation (2016), and based on ethnographic data (collected from June till October 2016), which includes in-depth interviews with 13 young men and 3 women, observations and participation in the youth activities. Findings suggest that stickering is not only the way to domesticate the urban environment, bringing a unique, personal in often anonymous, alienated technological system, but also a practice, which effects on the artists' sense of belonging, urban identity and citizenship.

Social Inequalities in Rural Britain: Impacts on Young People Post-2008

Niki Black, Karen Scott, Mark Shucksmith
Newcastle University, United Kingdom; Exeter University, United Kingdom; Newcastle University, United Kingdom
niki.black(at)ncl.ac.uk, K.E.Scott(at)exeter.ac.uk, mark.shucksmith(at)ncl.ac.uk

This paper investigates the impacts of the 2008 economic crisis and its aftermath on young people through a case study of a sparsely populated rural area of England. A dominant theme in youth studies is the concept of the youth transition, from childhood to adulthood, from school to employment, from the parental home to independence, and so on. An important element of this paper will be to understand the main sources of welfare and how the relative contribution of each of these (the welfare mix) is changing. These sources are generally considered to be the labour market, the family and the state (Antonucci et al 2014) and different national mixes of these are often referred to as 'welfare regimes' (Esping-Anderson 1990). This paper explores, for example, the flexibilisation of labour markets, with insecure jobs more common, often with part-time or variable hours of work (e.g. zero hours contracts); further and higher education policies; changes to housing markets; diminished social welfare support and welfare conditionality; centralization or withdrawal of services including public transport; digital inclusion; and sources of advice. This paper asks how place, distance, transport and sparsity of population mediates opportunities. What spaces are available to young people, and what freedoms and responsibilities? What is the role of institutions? And

how have these changed during the economic crisis and since?

Youth and 'Geneo-cid': Greek National and European Union Factors Contributing to the Lost Generation of Greece

Sotiris Chtouris, DeMond Miller
University of the Aegean, Greece; Rowan University, United States of America
sxtou(at)aegean.gr, millerd(at)rowan.edu

Karl Mannheim's conceptualization of "generation as a social structure" provides a framework for understanding the structure of social and intellectual movements of our time. The destruction of the economic basis and work socialization processes are the factors that a generation is losing its social existence. We refer to this phenomenon as 'geneo-cid,' or a form of massive deconstruction of generation succession. Data from the IN4Youth study in Greece provides evidence that 'geneo-cid' is a result of the ongoing decline of the social and educational institutions, youth unemployment, and the decline in ability to transact intergenerational reciprocity and exchange (parents and grandparents are losing their saving (real estate, pensions etc.). Combined with a political system that fails to adequately respond to external forces from the European Union to mitigate the social, cultural and economic impacts of the impact of austerity on the youth population, young citizens question the government's ability to perform its fiduciary responsibilities to support future generations. Hence the political elite's actions that negatively impact the future of youth, or in some cases inaction in an era of economic crisis impact negatively on youth self-identity. The goal of this paper is to understand the forces that serve as a catalyst to bring about 'geneo-cid' and make recommendations specific to youth policy in Greece that can also be applicable across other similar contexts.

Italian youth in trouble: between 'new' life-stages and 'old' intergenerational relations

Sebastiano Benasso, Sveva Magaraggia
University of Genoa, Italy; University of Milano-Bicocca
sebastiano.benasso(at)gmail.com, sveva.magaraggia(at)unimib.it

In this paper we reflect on the intertwining of the redefinition of the life-stages, the 'new' patterns of adulthood transitions and the intergenerational relations.

Thus, our first questions are: how does the radical transformation that invested the transition to adulthood change the ways we define adulthood itself? and how does it interfere with the processes of mutual recognition amongst different generations? Indeed, intergenerational relations acquire even more complexity, in a framework in which a) structural factors like the precarisation of the labour market and the aging population heighten reciprocal

interdependence and b) changes in the life-courses patterns distance the different generations, especially in terms of biographical sense-making and 'biographicity' (Alheit and Dausien 2000; Stauber 2007; Walther 2016). Which effects on the generational order (Alanen 2009) are produced by these complexities? and how intergenerational relations contribute to the inequalities reproduction? Seeking to address these questions, we reflect on possible ways to reconceptualise adulthood and the intergenerational ties that should guarantee solidarity and wellbeing in everyday life.

These theoretical reflections are grounded on two empirical works done in the Northern part of Italy, with thirtysomething people who are still struggling with a prolonged and de-standardised transition process (Cavalli and Galland 1996; White and Wyn 2008), thus negotiating new 'adult roles', with particular reference to parenthood. This complex transition is significant and widespread in the Italian context that, as part of the Southern group of welfare states (Ferrera 1996), has low levels of welfare provision and high reliance on the family as a form of support.

RN30 | Session 02c Solidarity and Trust

Transitions to activism: young people, politics, and solidarity

Ilaria Pitti, Paolo Zurla
Örebro University, Sweden; University of Bologna, Italy
ilaria.pitti2(at)unibo.it, paolo.zurla(at)unibo.it

In combination with the upsurge of the different crises that have invested Europe in the last decade, many grass-root initiatives of solidarity have been started all over the continent by extra-parliamentary political groups with the aim of proposing alternative answers to the increased difficulties affecting vulnerable populations. These projects commonly share a critical opinion on the institutional management of social disadvantages and, in most cases, they see young people occupying a leading role in providing help to underserved social groups. The proposed contribution is based on the analysis of different initiatives of solidarity toward migrants, refugees, and homeless people carried out by youth leftist groups in two medium-large cities in Italy and Sweden. Data have been collected in 2016 through observations in different participatory settings and biographical interviews with young activists and will be analysed in order to explore the emerging combination of social volunteering and political activism in young people's alternative styles of engagement. Underlining differences and similarities between the two local contexts, the presentation focuses on the role that solidarity initiatives acquire in the groups' political action and in the young individuals' paths of activism. Far from being detached from political struggle, social volunteering assume a series of key functions, becoming a mean of recruitment and formation of new members at the group level, and a space for the progressive acquisition and experimentation of the

identity of activist at the individual level.

The Armenian Youth in the Post-Soviet Context: Some important findings from the Armenian Youth Study 2016

Sona Balasanyan, Harutyun Vermishyan
Yerevan State University, Armenia; Caucasus Research Resource Center- Armenia; Yerevan State University, Armenia
sona.balasanyan(at)ysu.am,
harutyunvermishyan(at)ysu.am

Throughout the last 30 years the Republic of Armenia has undergone serious social, political and economic shocks (the 1988 earthquake, National movement, collapse of the Soviet Union, war in the Nagorno-Karabakh, drastic institutional transformations), the influence of which is vital in all of the spheres of the social life. The Armenian youth is one particular bearer of this reality, in particular the Armenian citizens of 14-29 (born after 1987), whose socialization process has been accompanied by the described social shocks.

The research (funded by Friedrich-Ebert Stiftung: The model and point of orientation for the study is the renowned Shell Youth Study, which is being carried out in Germany since 1953) has been conducted to reveal the lifeworld and dispositions of the Armenian youth in the ever changing contemporary Armenia through the summary of the persistent social condition. The objectives of this research are directed to the exploration of the following problems: satisfaction, trust, attachment, association, activity and integration. The research consisted of both quantitative (standardized interviews conducted, n=1200) and qualitative (16 Focus Group Discussions) methods.

The findings reveal the present-day life of youth in Armenia in the context of value clashes, contradictions in social reality, as well as the traditional cultural and national context. Findings demonstrating the existence of tendencies typical to post-Soviet societies are striking in their contradictions. The gender, age, type of residence, income, and education of the youth questioned were important determining factors of their perceptions and attitudes.

Still Troubled: Tunisia's Youth during and since the Revolution of 2011

Ken Roberts, Siyka Kovacheva
University of Liverpool, United Kingdom; University of Plovdiv, Bulgaria
kenneth.roberts18(at)bopenworld.com,
siyakovacheva(at)gmail.com

This paper presents evidence from interviews in 2015-16 with a nationally representative sample of Tunisia's 15-29 year olds. We focus on the sample's political participation and orientations during the revolution of 2011 and subsequently. We find that just 6.6 percent of those aged 15-24 at the time played any direct part in the 'events of 2011'. Political engagement then and subsequently is shown to have been influenced most

strongly by a university education and growing-up in a politically engaged family. In 2015-16 the young people were overwhelmingly pro-democracy, supported equal opportunities and status for the sexes, and endorsed self-expression values, but attached equal importance to economic security and betterment, felt that their country's traditions should be maintained and respected, and were personally religious though three-quarters wanted religion to be kept out of politics and government. Although Tunisia is the sole Arab Spring country to emerge with a still functioning (in 2016) multi-party democracy, we find that in 2015-16 the majority of young people did not trust their elected politicians. Our survey findings suggest explanations for the paradox between young Tunisians' overwhelming support for democracy alongside intense disappointment with the outcomes.

Challenges and prospects for the cross-cultural studies of the youth worldview

Nikolai Narbut, Irina Trotsuk
Peoples' Friendship University of Russia, Russian Federation; Peoples' Friendship University of Russia, Russian Federation
narbut.n(at)mail.ru, irina.trotsuk(at)yandex.ru

The Sociological Laboratory of the Peoples' Friendship University of Russia with the support of the Russian Foundation for Humanities has conducted a number of comparative studies on the representative samples of student youth in different countries. These surveys allowed identifying both the key values of the younger generations and the main challenges of the comparative analysis. We summarize such challenges as follows: applying research techniques to the sample in another country – both in translating and adapting them to different social realities and worldview; choosing 'right' respondents to question and relevant cases (cultures) to study; designing the research scheme, etc. Nevertheless, the empirical data reveal interesting similarities and differences in the youth perception of the nowadays realities, for instance, through identification of the level of the student youth social trust and distrust. Thus, there is a huge difference in the level of trust to the main governing bodies: in Russia and Kazakhstan, about 60% of respondents claim to trust the government and the president, while in Serbia and the Czech Republic, the share of such is four to five times less. However, the other data does not allow making conclusions on the similarities of the post-Soviet countries' student youth worldview as compared to the post-socialist countries of Europe for the levels of trust to social institutions are too different. This probably points not only to real discrepancies in perceiving social institutions, but also to the differing expectations for each of them, and the mismatching definitions of trust.

RN30 | Session 03a Mobility and Regionality

Structural conditions for VET-mobility: opportunities and obstacles

Tabea Schlimbach, Karen Hemming

German Youth Institute, Germany; German Youth Institute, Germany
schlimbach(at)dji.de, hemming(at)dji.de

The paper ventures into a qualitative approach to the role of structural conditions for European cross-border mobility of young people in vocational educational training (VET). Following Giddens (1984), there is a recursivity of structures and individuals acting in social systems. Understanding the VET-system and the organisation of relevant mobility programmes (e.g. Erasmus+) as structures, individual mobility decisions are strongly linked with them. We will thus analyse how social actors perceive and react to structural frameworks, with closer attention to their fostering and hindering function within individual mobility processes of German apprentices. Additionally, comparisons to the Spanish VET-system will be drawn.

The current study is based on semi-structured interviews with former German mobile apprentices aged 18-29 (n=16) and experts (n=4; teachers at VET-schools and mobility consultants). It is part of the EU-project "MOVE" which has received funding from the EU-Horizon 2020 research and innovation programme under grant agreement No.649263.

Results reveal that apprentices perceive the highly structured German mobility programmes as incidental opportunities offering "all-inclusive" organisation, and thus also enable participation by students lacking a typical "mobility-background". Amongst others, obstacles arise from the difficulty of finding a suitable time frame for mobilities within the tightly organised German VET on the one side and the strong dependence on mobility consultants on the other, including their selective acquisition strategies (e.g. personal calls for participation) as well as their time capacities in the light of enormous bureaucracy and limited project run times.

Romanian youth migration – contagious behaviour in peer networks? A case study

Mădălina-Elena Manea, Alexandra Deliu
University of Bucharest, Romania; Research Institute for Quality of Life (ICCV), Romanian Academy
madalina.manea(at)cc.unibuc.ro,
alexandradeliu(at)yahoo.com

Today, the UK is one of the main destination countries for Romanian migration and the high level of heterogeneity of motivations and trajectories of this migration has only become more complex in time, particularly with the decrease in costs of migration which accompanied the free access of Romanians on the British labour market in 2014.

Youth migration has generally been seen as an individual or family livelihood strategy, as a strategic behaviour understood as either conversion of types of capital or responses to challenges of the life context. The analysis this paper proposes is centred on circular migration to the UK for labour in agriculture, and more specifically on a recently formed network of young circular migrants from a Romanian village. Rather than focusing on the individual or the family as

a unit of decision-making, we are interested to investigate a type of migration for which the decision and the actions are taken in a peer group. We explore the mechanisms through which this type of spontaneous group migration emerges and is perpetuated, and also the impact of contingent structural factors on its development.

To address the topics, we make use of semi-structured interviews with migrants and key informants, which were conducted in December 2016 in a small village in South-Eastern Romania. The village is particularly interesting for this research, as it has recently formed informal networks which recruit young men for seasonal work in two farms in the UK.

Regionality and social class in young adults experiences

Päivi Berg, Vuokko Harma, Anu-Hanna Anttila
Nuorisotutkimusverkosto, Finland;
Nuorisotutkimusverkosto, Finland;
Nuorisotutkimusverkosto, Finland
paivi.berg(at)nuorisotutkimus.fi,
vuokko.harma(at)nuorisotutkimus.fi, anantti(at)utu.fi

The discussion on the employability of young adults emphasizes the importance of mobility. Being employable requires an ability to move from one place to another in order to find work; usually the move is from smaller, rural towns towards growing regions and larger cities. Staying in a certain place, like hometown, is considered negative albeit it is relatively common particularly for the young people from working class background. Dano-Norwegian author Aksel Sandemose's novel *A Fugitive Crosses His Tracks* (1933) introduces Law of Jante which describes a fictional town's, Jante's, atmosphere and mentality. Sociologist Susie Scott has reviewed the Law of Jante as a cultural "code of conduct" in Nordic countries in which self-assertion and attention-seeking behavior is considered as objectionable whereas humility and modesty is seen as a virtue. In this presentation, we aim to point out that the cultural code of conduct of the law of Jante is related to the social class of the individual and therefore affect their experiences in both working life and social class position.

Our data consist interview data of young adults (N=41) who live in the provincial area of Eastern-Finland or who have moved from there to Helsinki capital city region. We are particularly interested in looking at the self-employed and temporary workers' experiences of regionality and social class. This presentation will consider the meaning of social class in relation to mobility and the possible attempt to distance oneself from the working-class identity (Skeggs 2004).

Spanish vocational education and training mobility in the EU: Youth mobility narratives intertwined structure and agency

Cristina Cuenca, Lorenzo Navarrete Moreno
ICN - Colegio de Ciencias Políticas y Sociología,
Spain; Universidad Complutense de Madrid
cuenca.cristina(at)colpolsoc.org, lnavarre(at)ucm.es

Author/s: Cristina Cuenca* Lorenzo Navarrete (Ilustre Colegio Nacional de Doctores y Licenciados en Ciencias Políticas y Sociología)

*cuenca.cristina(at)colpolsoc.org

The paper focuses on cross-border mobility of Spanish young people within the framework of vocational education and training (VET) in the European Union (EU2020 Lisbon Strategy). Using qualitative data obtained within the project MOVE, funded by EU-Horizon2020 research and innovation programme under GA No.649263, which focus on youth mobility in Europe (semi-structured interviews n=204), we present the first results extracted from the Spanish case (n=19) against our case study (VET mobility) partner Germany.

Our hypothesis is that there is a basic paradox at the core of youth mobility narratives that tend to present and represent mobility itself as an opportunity and a positive resource, even when the outcomes of this mobility and the decision to go abroad are somehow imposed by the institutions. Using a specific conception of agency, which enables a theoretical tackling of individual opportunity strategies in the structural and institutional Spanish context, we approach agency as a continuum which includes capabilities and opportunities (Näre, 2014), covering new forms of action needed in situations of social change, where new ways of acting and doing are implemented.

Traditionally scholars have presented any decision to go abroad as agentic, however, in relation to the content analysis of these interviews we observed that these decisions are usually embedded in the structural institutional narratives that present mobility as "good" per se, and are usually accompanied by a non-questioning of the reason (skills acquisition), destination (the destination country is often not chosen by the young person), and motivations to go abroad.

RN30 | Session 03b Trust, Mistrust and the Risk of Marginalisation

The youth of today: Precarity, political mistrust and the collapsing welfare state

Eleni Triantafyllopoulou
Humboldt University of Berlin, Germany
Eleni.triant713(at)gmail.com

Scope of the paper is to identify the impacts of the collapsing welfare provisions on the urban youth of Athens in the era of the "public debt" crisis. During the last seven years, the all-embracing socioeconomic and spatial measures promoted in Greece have intensified economic inequality, social exclusion and socio-spatial segregation, whereas austerity budgeting in the social state has been intensively enforced.

More specifically, the current policies and the welfare state retrenchment have altered the structural conditions of labour and education, as well as the ongoing positions and locations of today's youth. Being young and urban today means to confront the

new reality of insecure and flexible working regimes, dealing with a life of increasing precariousness. In this dystopian landscape, the majority of young people have lost their trust to the role of the state and to the political system, proving that the social crisis has led to a political crisis as well.

Based on field research the paper examines to what extent do young urban residents of Athens rely on social policy and on institutions in order to cope with the social repercussions of the crisis. Furthermore, in a period where precarity seems to be the norm of the labour market, aim of the paper is also to investigate which alternative paths do young urbanities choose, what social networks and ties they create and whether they engage in some sort of collective urban action.

'You do, you feel a little bit marginalised': The political understandings of Muslim Young People in Bradford

Nathan Manning, Parveen Akhtar
University of York, United Kingdom; Aston University, United Kingdom
nathan.manning(at)york.ac.uk,
p.akhtar2(at)aston.ac.uk

Young people's relationship with politics is routinely deemed problematic by a range of influential social actors. Amidst concerns over disengagement and the potential for radicalisation the political participation of ethnic minority young people is often particularly scrutinised. In contrast to such 'crisis narratives' this paper reports on qualitative research with young Muslims in a northern English city. Consistent with research on young people in general, the findings reveal widespread cynicism and disillusionment with electoral politics amongst this group. Despite this cynicism, most respondents were politically engaged and voiced claims for a substantive representation which addressed mainstream and often national political issues. These claims were articulated in contrast to an older generation who were seen as prioritising local issues and representation much more closely tied to kinship and ethnic identity. In the face of ongoing racism and marginalisation, these Muslim young people were asserting claims for a more mainstream citizenship marked against the political and cultural orientations of an older generation.

Longitudinal Exploration of Young Greeks' Subjectivation in 'Debt Society'

Eleni Stamou
Independent Researcher, United Kingdom
Instamou(at)gmail.com

The starting point of this paper is a critical engagement with Mauricio Lazzarato's genealogical account of the 'debt society' as a milestone of the economic organisation and most importantly, as a political relation, fundamental to contemporary Western societies. Following Lazzarato the rise of the debt economy involves the emergence of new forms of regulation through the domination of debt-creditor relations, which overshadow previous economic and

social formations, such as the information society or the knowledge economy. Central to the operation of such debt economies and societies is the production of the 'indebted man', as the 'the modern notion of economy covers both economic production and the production of subjectivity'.

Against this backdrop, the object of the paper is to utilise and critically consider Lazzarato's concepts in pursuing a longitudinal exploration of young people in Greece. The paper will provide empirical insights drawing on and bringing together two sets of qualitative data: Firstly I will refer to young Greeks' narratives of the self, which were generated as part of my PhD research, just before the outbreak of the financial crisis. Additionally I will present interview data gathered through a follow-on, small-scale research with young people in crisis-hit Greece. The discussion will focus on the construction of youth subjectivities over time, within radically changing socio-economic conditions.

RN30 | Session 03c Employment, Unemployment and Underemployment I

Introducing an index of labour mobility for youth

Maria Symeonaki, Glykeria Stamatopoulou, Maria Karamessini
Panteion University of Social and Political Sciences, Department of Social Policy, Athens, Greece;
Panteion University of Social and Political Sciences, Department of Social Policy, Athens, Greece;
Panteion University of Social and Political Sciences, Department of Social Policy, Athens, Greece
msymeon(at)panteion.gr, gl.stamat(at)gmail.com, mkarames(at)panteion.gr

Undoubtedly, there has been a growing demand for quantifying evidence on labour mobility, its trends across European countries, with a special emphasis put on the youth. The present paper proposes a new index of labour mobility, which can help researchers quantify "positive" movements or transitions between labour market states. The most commonly used mobility indices take into account either the probability of staying in the same state (Prais – Schorrocks mobility index and Prais – Bibby mobility index), or all transitions among labour market states (Bartholomew index). Firstly, we question whether those indices can represent a meaningful measurement of labour mobility, where one would be more interested in measuring only the "positive" transitions, meaning transitions from unemployment or inactivity to employment. A new index is therefore introduced and it is used to compare labour mobility of young individuals, aged between 15 and 29, between different European countries based on the latest evidence from the EU-Labour Force Survey (EU-LFS) raw data.

Quality of work after graduation – The case of Poland

Magdalena Jelonek, Barbara Worek
Cracow University of Economics; Jagiellonian

University, Poland
 magdalena.jelonek(at)uek.krakow.pl,
 b.worek(at)uj.edu.pl

Most reports on the European labour markets point out that these markets need to create both more jobs and ones of better quality. Poland unfortunately, finds itself at the end of ranking of countries offering high-quality jobs. Thus, access to attractive professions can be treated as one of the factors differentiating the values of the graduates diplomas. The OECD report indicates three dimensions of work quality: the level of salary, the stability of employment, and quality of the professional environment. In our presentation we answer three questions: (1) What level of occupational attractiveness and social respect characterises the first, permanent jobs undertaken by young people and how does the level of their education determine this attractiveness? (2) What are the chances of the contemporary youths (in comparison with the older generations) to gain their first, attractive job? (3) Who can expect a rise in social status in the future, and what scale of such rise is the most probable? To answer these questions we used the data from longitudinal survey - Human Capital Study in Poland. In this study five survey series were conducted, started from 2010, finished in 2014. The whole sample size (88000) allows for selection of the representatives of the different generation and to analyse their entry into the labour market and career paths. The first results show that the situation of present graduates is worse than that of graduates from previous decades not only in terms of employment opportunities but also in the terms of the quality of work.

‘And Click. That’s All I Do’: Temporary Work Agencies and Young Worker’s Transitions into Precarious Employment

Phillip Mizen
 Aston University, United Kingdom
 P.Mizen(at)Aston.ac.uk

Temporary work agencies (TWAs) have grown in size and influence in recent years to become an established part of the contemporary landscape of UK employment. Treated as, inter alia, the symptom of a dysfunctional labour market (ILO 2010; Shildrick et al. 2012), active agents in the deepening casualization of labour (Forde 2001; Forde and Slater 2016; Standing 2011) and/or an enabling force for workers struggling in austere times (Gray 2002), there is nevertheless little research focusing specifically on young worker’s uses and experiences of using TWAs as an avenue into paid employment. This paper seeks to address this deficiency by considering questions of how young workers perceive, use and assess TWAs in the course of seeking transitions from education into (precarious) work. This includes examining the capacity of TWAs to meet young people’s aspirations for (meaningful) employment, alongside their requirements for flexible working. It further considers the capacity of TWAs to provide work opportunities that can overcome established barriers faced by young people looking for

work and explores the deeply held ambivalence that many young people feel towards agencies. To do so, the paper draws upon original and significant interview and group discussion data gathered from young workers who participated in a sub-project of a large ESRC funded project examining ‘Precarious Pathways to Employment’ for young people ((at)Paths2Work) (<http://www2.warwick.ac.uk/fac/soc/ier/research/pathways/>) in three cities in the Midlands of England.

Similar effect, different mechanisms - social inequalities in early occupational attainment in the heart of Europe

Katarzyna Kopycka
 MLU Halle-Wittenberg, Germany
 katarzyna.kopycka(at)soziologie.uni-halle.de

The presentation addresses social origin effects on early occupational attainment of young graduates in three political units in the heart of Europe – Poland, East Germany and West Germany. This threefold comparison offers a unique opportunity to prove whether a) similarities between post-socialist societies persist after the breakdown of communism irrespective of different post-transformation development paths, or rather b) characteristics of present day institutional regimes determine levels of their social openness. The results of the empirical analysis utilizing data from German Socioeconomic Panel (GSOEP) and Polish Panel Survey (POLPAN) point at interesting pairwise similarities and differences, which allow to draw conclusions with regard to mechanisms influencing social fluidity, specifically the shape of the educational system and the type of economy. Social advantage operates in Germany mainly through the educational system, which is highly stratified. After unification East Germany adopted the West German model, and therefore these two units of analysis display very similar rates of inequality of educational attainment. Data for Poland, in turn, shows substantially lower social origin effects on educational status. Instead, the main mechanism of social reproduction there is labor market allocation of young graduates. The social origin effect net of educational attainment is highest in Poland, which reflects a lower level of economic coordination in this land as compared to Germany. Nevertheless, this direct social origin effect is also substantial in West Germany, which leads to a striking result: with respect to overall social origin – social destination association similarity exists between Poland and West Germany and not between East Germany and either one.

RN30 | Session 04a Gender and Sexuality

Girls, reading and literature: a genealogy

Sara Andersson
 Stockholm University, Sweden
 sara.andersson(at)buu.su.se

This project focuses on the historically changing status of reading practices and the reading subject.

More specifically, the project focuses on constructions of 'the good reader' or – in present time's discourse, 'the avid reader' - a position that in today's Swedish society is mainly possessed by the teenage girl. In public discourse, the reading girl is contrasted against the nonreading boy, and more generally - although contradictory, - a 'nonreading' generation. By looking at contemporary girls' own stories about their reading practices, and contextualizing them through contemporary and historical texts concerned with girls, reading and literature, the project aims to study practices of self-cultivation and reading. The historical materials used in this study are advice books on reading from early 1900s, for girls and/or their parents; debate articles on the specific genre "the girl book" that was popular in Sweden during the 1900s; marketing strategies of publishing companies; official government reports on reading habits and literature; and reading promotion campaigns.

Exploring the dimensions of student youth's sexuality: the case of Russia

Liliia Sergeevna Pankratova
St. Petersburg State University, Russian Federation
liliia.pank(at)gmail.com

The beginning of the 21st century is characterized by crucial transformations in the sexual sphere of life in various modern societies including Russia, namely: tendencies of liberalization and democratization of sexual, gender and family relations, commercialization of sexuality, the rise of queer movement, etc. Thus, at the moment sexuality might be regarded as a complex mosaic of cultural forms, styles of life, traditions, communities, practices, and discourses that are spreading, confronting, competing, and co-existing at the global, regional, and local levels. One of the social groups that are mostly affected by contemporary changes in sexual and gender life is the youth, including student youth. In this paper, based on the findings of in-depth interviews with 21 young men and women aged 18-25 years old, students of different universities of St. Petersburg (the second biggest city in Russia), the main modes and dimensions, tendencies of formation and reproduction of sexuality of student youth are revealed and described. The following dimensions of student youth's sexuality are extracted and investigated in the study: axiological, normative, representational, behavioral, gender, and subcultural. The various configurations of these dimensions lead to (re)production of different modern modes of sexuality of student youth in Russia.

No Woman's Land? Gender and Generational Dynamics in thirty young women's life histories in the agro-food sector in Sardinia, Italy.

Ester Cois
University of Cagliari, Italy
ester.cois(at)unica.it

The paper traces the intertwining of the biographical and career courses of a sample of 30 female entrepreneurs in the agro-food sector in Sardinia,

whose life histories were collected between 2014 and early 2016. In a global context of regeneration of the peasant sector (Van der Ploeg J., 2008), involving to a large extent the younger cohorts who are entering in an increasingly precarious labor market, the *récits de vie* of these women who chose an unusual professional path, also in gender terms, appear very significant.

The key event that marked a "before" and "after" in their life course is the generational transition from the background family to the farm, because the way they handled this step has been crucial in the process of definition of their aspirations and their personal and professional future. The link between timing ("When you joined the farm?") and the strategic meaning of this choice ("What project did you have in mind, as a young woman?") led to outline five trajectories: 1) A linear transmission of the farm's core, from father to daughter; 2) A Back-to-the-land movement, coming from other training and professional careers; 3) A generational leap, aimed at recovering a grandfather's farm and at re-stitching a parental plot which has been suspended for a long time; 4) A biographical and career break, based on an ex-novo project in the agro-food sector, completely detached from the family background; 5) A multiple presence among different segments of the labor market, in constant search of a sustainable balance between business duties, other professional roles and private life.

What we do (not) want to tell teenagers about sex? Female and male sexuality constructing in the context of sexuality education in Poland

Joanna Dec-Pietrowska, Emilia Paprzycka
University of Zielona Góra, Poland; Warsaw University of Life Sciences, Poland
joanna.dec.zg(at)gmail.com,
emilia_paprzycka(at)sggw.pl

This pronouncement shall concern the contexts of constructing of teenage girls and boys sexuality contained in the messages in sexuality education textbooks in Poland. There will be presented the findings of the all-Polish research project "Gender in Textbooks", concerning the critical analysis of the content of Polish textbooks and core curriculum. The research was focused upon the following research issues: 1) What expectations are presented in the sexuality education textbooks as for playing gender roles within the areas of intimate life? 2) What meanings are related in sexual education textbooks with sexuality, and in what contexts the sexual behaviors defined as feminine and masculine are depicted? The concept of gender was a research perspective and, at the same time, an analytical category - the basis for the categorization key structured. The research was of a complex nature, i.e. the analysis included all the sexual education textbooks approved for teaching process by the Ministry of National Education in the years 2013-15. Quantitative and qualitative strategies were applied in the research. All together, 1113 visual forms and 11 books were analyzed. The presented constructs are

strongly connected to the traditionally defined femininity and masculinity patterns. The traditionally understood femininity and masculinity, and sexuality are valued positively and presented in opposition to the so-called liberal image - identified as contemporary one - depicted negatively. The model presented in textbooks is based on the idea of the dualism of sexes and the perspective of essentialism and shows the physicality and sexuality of young women and men in reference to the simplified images having its source in gender stereotypes thus limiting the diversity of needs and attitudes.

RN30 | Session 04b Youth cultures, consumption and social media I

Youth subcultures in Russia: 25 years between underground and pop-cultures

Elena Omelchenko

Higher School of Economics, Russian Federation
omelchenko(at)hse.ru

After the collapse of USSR youth cultural spaces in Russian cities experienced several radical transformations. We were observing the raise of subcultural activity in last part of 20th century, a mass migration of informal youth (political, musical, artistic) from underground to public urban spaces. Global subcultural images and their local interpretations has firmly fitted into the new history of Russia and became heroes not only in megacities, but also in provincial towns. Clashes between subcultural youth and "gopniki" (chavs) in the early 2000s led to reformation of youth scene in the mid-2000s, to external/internal fragmentation, to confrontation between subcultural fields. Horizontal solidarities began to appear and hence the opposition in relation to the relevant value vectors: accepted or denied gender regimes, loyalty or opposition to the authorities, which led to formation of new "subcultural underground" in present time. What is behind the radical changes in Russian youth spaces? In our studies we have observed and recorded the changes of different developmental trajectories of youth cultural spaces. Some young people loyally and pragmatically accepted the changes in the political climate, some symbolically or actually resisted. These changes are also influenced by the global and local trends and also by recent Youth Policy projects, which promote "traditional values" and patriotic education. The paper is based on the empirical materials gathered in four Russian cities (2015-2016) among students (N 3200) within project 'Fields of positive interethnic interactions and youth cultural scenes in the Russian cities' (RSF project № 15-17-00078).

To live from the scene: youth cultures and arts ofmaking a living

Vitor Sérgio Ferreira

Universidade de Lisboa, Portugal
vitor.ferreira(at)ics.ulisboa.pt

During adolescence, young people build up dense social networks of elective affinities through the

consumption of certain stylistic resources, or the development of certain leisure activities. Experienced as arts of good living, these practices put young people in scene(s), contexts of convivial sociability and identity sharing with high level of social visibility and recognition. For some young people, however, these leisure or consumption practices go further in their life, being dreamed and projected as arts of making a living. For instance, currently practices as DJ'ing, tattooing or graffiti, among many others, became seductive forms of work among young people, ensuring means of subsistence for some of them, and allowing to keep themselves fully in "scene" and doing full-time what they love to do. Based on empirical data from the research project Making dream jobs come true: transitions to new attractive professional worlds to young people (funded by FCT, PTDC/CS-SOC/122727/2010. See <http://newdreamjobs.wixsite.com/dreamjobs/home-page>), the aim of this paper is to open new angles about how contemporary youth scenes are being lived and appropriated by young people, presenting them increasingly entangled with creative industries and explored with professional conviction and ambition, invested in their employability potential.

Youth cultures, institutions and market. Beyond separation and conflict, toward complex patterns of dialectic interaction

Carlo Genova

University of Turin, Italy
carlo.genova(at)unito.it

The relationship between youth cultures, public institutions and the market is a traditional issue in youth studies and in subcultural studies. But whereas during the 1960s and the 1970s among youth cultures have often been assumed the distinction between mainstream cultures (connected with market and public institutions) and resistant subcultures (conflictually out from market and institutions), since the 1980s scholars underlined the diffusion of blurry youth cultures and the emergence of circular dynamics of escape-and-reintegration of subcultures from market and from institutions.

Aim of the paper is to reflect about nowadays complexity of these dynamics and relationships, focussing on two case studies, skateboarding and graffiti, in a specific geographical context, the city of Turin in Italy, through data collected with qualitative interviews, participant observation and document analysis.

The paper will consider the evolution of these two youth cultures in the territory, paying specific attention to the change of their relationships with local administration on the one hand and with local/global market on the other hand, trying to understand characteristics and reasons of this evolution from the point of view of the different social actors involved in the process and its influences on cultural models adopted by these different actors, and trying to propose then more complex interpretative models (being aware that we can't anymore think about these

processes through the “classic” subtraction-reabsorption perspective).

Mandatory alternative lifestyle: Everyday life of homeless youth in Eastern Finland

Terhi Halonen

University of Eastern Finland, Finland

terhi.halonen(at)uef.fi

Finland is a Nordic welfare state with a principle that each citizen has a subjective right to a flat. However, there are numerous homeless young people without a shelter, and in Eastern Finland where the winters are harsh, their situation can be even dangerous – as the society is not “open” for 24/7. This presentation is based on an ethnographic PhD research where the researcher has been taken part in homeless youth’s everyday life. The focus of this analysis is to show how the homeless youth handle their lives using resources available for them in order to survive from one day to another. Wandering on this kind of path of homelessness creates an unordinary lifestyle which forms distance to the mainstream, “normal life” with expectations of following the common time and space schedules of the society at large.

RN30 | Session 04c Social Movements and Political Action

Instrumentalisation of Youth Political and Civic Participation in Serbia

Dragan Stanojevic, Jelisaveta Petrovic

Faculty of Philosophy, University of Belgrade, Serbia;

Faculty of Philosophy, University of Belgrade, Serbia

dstanoje(at)f.bg.ac.rs, vukelic.jelisaveta(at)gmail.com

This paper deals with the instrumentalisation of political and civic participation of young people in Serbia. The social context of Serbia (and the Western Balkans, more broadly) is characterized by very high rates of unemployment (with public sector still being a major employer), low trust in institutions, party clientelism and patronage. This paper aims to shed the light on the young people’s perception of political opportunities and agency that is bounded with structural and cultural constraints. In this way, the focus of the theoretical debate on political activity of young people is moved from the “proactive political action” perspective to the observation that young people’s agency can also be instrumentally and commercially oriented.

The analysis is based on qualitative data gathered in the in-depth interviews with young people (N=30), aged 25-30 years, who are members of political parties and/or civic associations.
