The research findings show that, in search for better career prospects young people tend to adapt to the context by accepting certain informal “rules of the game”. Young people often become part of the clientelist networks as they perceive it necessary for their future employment. In this regard, young people adopt several strategies: 1. Passive membership in political parties, 2. activism within parties (which

expands from occasional activities during the campaign to almost daily duties). 3. Volunteer in civil associations and similar initiatives in order to gain experience and connections as important job requirements. In this way, they become an important asset of political parties and civic organizations which, in return, promise them employment or career enhancement.

Here to Stay: Undocumented Young People in the USA, Political Activism and Citizenship

Ala Sirriyeh

Keele University, United Kingdom

a.sirriyeh(at)keele.ac.uk

Restrictive immigration and citizenship policies across the Global North mean that young people who arrived during a period of growth in international migration have grown up into adulthood in these nation states yet legally remain ‘noncitizens’. In the early 2000s the undocumented youth movement emerged in the USA to campaign for a pathway to citizenship for undocumented young people who had arrived in the USA as children. In recent years there has been an evolution in campaign messaging and a shift in some of the key priorities and goals. Through a southern California case study, drawing on Biographical Narrative Interviews with undocumented young activists, this paper examines young activists’ narratives of entry into, and pathways through, political activism and explores how their understandings and experiences of citizenship shape, and are shaped by, political activism. The study was informed by ‘acts of citizenship’ theory (Isin 2008) which examines how citizenship is mediated between lived experiences and formal entitlements. This paper traces how and why young people became involved in the undocumented youth movement and pathways through the movement, including branches of the movement they became active in (e.g. undocuqueer, undocublack, campus or community based groups) and how the election of Donald Trump is shaping young people’s current engagement with political activism. In doing so it examines how activism has influenced young activists’ normative understandings of the concept of ‘citizenship’ and what it means to act and be recognised as a ‘citizen’ with a focus on the notion of ‘emotional citizenship’.

Emerging Incentives for Youth Participation in Bulgaria

Boris Petrov Popivanov

New Europe Center, Bulgaria; St. Kliment Ohridski

University of Sofia

boris.popivanov(at)gmail.com

The decline of youth participation in society and politics has often been mentioned as one of the symptoms of an overall crisis of representative democracy across Europe. In Bulgaria, these trends go parallel to the difficulties of post-communist development. Policy makers have recently addressed the problem with new strategies, programmes and

initiatives. What is less analyzed are the perceptions of participation of young people themselves, their views on the forms and spaces for their engagement or alienation.

In this paper we focus on the emerging incentives for youth participation in the second largest Bulgarian city and try to outline the factors of motivation as young people see them, in multiple directions: institutional framework, public attitudes, personal commitment, foreign examples. Those are considered in relation with the forms of participation (traditional and non-traditional) which are subsequently generated as living experiences of the Bulgarian youth.

The empirical work is done under a project funded by the European Commission. In order to grasp the changes in the youth situation, we apply a variety of qualitative methods: in-depth and biographical interviews, focus group discussions, participant observation surveys, action research projects developed by the young people with the support of the research team.

Citizenship education: meanings of young activists and attitudes of youth policy makers

Airi-Alina Allaste, Mai Beilmann

Tallinn University, Estonia; University of Tartu, Estonia
alina67(at)tlu.ee, mai.beilmann(at)ut.ee

Citizenship education has become relevant within the discourse of active citizenship that has become most relevant approach in last quarter of 20 century. While social citizenship based on idea that all members of a community have the right for similar welfare and state should decrease inequalities, then active citizenship model supports development of skills that were deemed necessary for labour market participation but equally so also supporting people's civic activism. The framework for European cooperation in the youth field (2010–2018) stresses the importance of improving young people's opportunities in education and labour market as well as promotes active citizenship and solidarity. However, there is no shared understanding of how young people should acquire skills, attitudes and knowledge required.

This paper brings together views of young people and youth policy makers on citizenship education in Estonia focusing first on the meanings active young people give to their learning themselves and then discussing the standpoints of adults in charge of the topic. Empirical part of the paper is based on material collected in the framework of two large-scale European projects MYPLACE and CATCH-EyoU. An in-depth micro-level analysis on meanings young people give to their activities is based on interviews conducted in MYPLACE ethnographic case studies in youth councils and Pirate Party. The interviews conducted with the Estonian youth policy makers (incl. members of the parliament, local level politicians, state and local level officials) as the part of the CATCH-EyoU study were used as the source of information for the in-debt analysis of the attitudes of policy makers.

RN30 | Session 05a Youth cultures, consumption and social media II

“There is no privacy, deal with it”. Teenagers' challenges and strategies in using social media

Natalia Waechter, Martin Kampel
Ludwig-Maximilian University Munich; Technical University Vienna
natalia.waechter(at)lmu.de,
martin.kampel(at)tuwien.ac.at

Youth researchers agree that social media have become most relevant in adolescents' lives. The research presented (from the project “The Profiler” 2014-2016) focuses on challenges young people face when using social media and on the strategies they employ to overcome those challenges. Due to the fast-changing research field we have used the participatory concept, involving adolescents as experts already at an early stage of the project. Conducting qualitative individual and group interviews with 13 and 15 year olds, we investigated challenges and strategies regarding privacy, hate culture and peer pressure, which have shown to be the teenagers' main concerns. The project draws on transition theory and understands social media as a place where early adolescents learn how to become a teenager and how to cope with teenage life.

Regarding the issue of privacy the results reveal that teenagers have to negotiate the dilemma between acquiring as many followers as possible and maintaining privacy. Regarding hate culture, they have developed different strategies such as understating and ignoring the postings, or not interfering when others get bullied. Regarding peer pressure, teenagers have to learn to overcome high expectations of achievement and perfectionism. We conclude that adolescents employ individualized strategies much based on personal experiences and on the notion of self-responsibility.

Finally, I will briefly present the IT tool developed together with computer scientists and the teenagers researched with the goal of raising awareness and demonstrate how it provides in seconds a summary of what social media “knows” about a person based on image data.

Youth and transmedia literacy in Italy: first results and educational outputs from the “Transliteracy” European project

Simona Tirocchi, Gabriella Taddeo
University of Turin, Italy; INDIRE, Italy
simona.tirocchi(at)unito.it, g.taddeo(at)indire.it

How the young boys and girls are learning skills outside the school and how are they constructing cultural competencies and social skills? How can we translate the informal learning strategies and practices applied by young people into a tool of activities and proposals to be implemented inside school settings? Informal learning practices and mediated experiences are more and more important in the daily life of teens (Buckingham, 2008; boyd, 2014; Davies, Coleman

and Livingstone, 2014) but the school and the other formal institutions rarely bring added value to these activities. Participatory culture, social media, videogames and apps have become the most important environments for young people into the everyday life, but there is an increasing distance between these informal contexts and the traditional ones (Jenkins, 2006; Jenkins et al., 2010). The transmedia literacy concept expresses the complexity of perspectives which underlines the role of the consumer as a prosumer and the developing of strategies of critical consumption/production across different platforms and devices (Scolari, 2013).

This contribution aims to present the first Italian results of the European project "TRANSMEDIA LITERACY. Exploiting transmedia skills and informal learning strategies to improve formal education" (Horizon 2020). The project involves 8 Countries across three continents .

First, through a qualitative approach (8 workshops and 40 in-depth interviews and media diaries) the research drawn a map of the media consumptions, the transmedia skills and the informal learning strategies of youngsters.

Furthermore, the project will provide an educational output: a web-based tool, a sort of 'transmedia machine' that will help teachers (but also students and education professionals) to develop useful and easy to use didactic activities inside and outside the classroom.

Rethinking Neo-Tribes: Ritual, Social Differentiation and Symbolic Boundaries in Youth Sociality

Elias le Grand
Stockholm University, Sweden
elias.legrand(at)buv.su.se

Since the 1990s, the concept of neo-tribes has become an established, albeit contested, interpretive frame to explore forms of sociality and identity formation in youth studies and other fields of research. Critiquing neo-tribal research for discounting the role of social differentiation and overstating the inclusive and non-hierarchical aspects of neo-tribal communality, this paper attempts to extend the neo-tribe concept to incorporate processes of exclusion, hierarchy and symbolic boundary formation as well as acknowledge the continuing influence of class relations. To this end, it firstly draws on Durkheim's, Goffman's and Collins' writings on rituals and collective effervescence, to discuss how neo-tribal gatherings have a hierarchical and excluding character. Secondly, the paper discusses recent research on the role of social divisions and capital forms in youth sociality, to conceptualise how neo-tribal youth formations are mediated by classed forms of cultural hierarchy.

Intergenerational conflicts in the left-wing space of Turkey after Gezi movement

Cihan Erdal
Mimar Sinan Fine Arts University, Turkey

cihanerdal(at)gmail.com

This paper is about abilik (older brotherhood) which is a form of institutionalized hierarchy based on age, experience and gender, faced by youth who is in the left politics space of Turkey in 2000s. My observations of young people critically placing themselves with a distance to the politics, power and hierarchy led me focus on the category of abilik and the tension between younger and elder generations.

This work will be based on the experiences of young people while mainly focusing on the habitus of abilik and the reproduction processes of the concept. Abilik is approached as an accumulation of multiple capital forms and as a form of hegemony that is the production of the mechanisms of domination, in which youth is often included, and the other subjects in the field. Reproduction of abilik at the intersection set of gerontocratic dominance and masculine dominance, how it continues to exist through gerontocratic strategies and how this indicates the rooted social positioning and institutionalization in left political space will be emphasized.

On the other hand, it will be questioned how the Gezi Park Resistance influences the relations between young and old generations. In this context, the Gezi movement will be regarded as a dynamic that differentiates intergenerational interaction. I will discuss the Gezi which is described as Turkey's '68, as a kind of "I am in this game" proclamation of youth in the struggle between young and old people.

RN30 | Session 05b Youth Aspirations I

Changing aspirations – Universities and training companies as fields of self-formation

Alexandra König
University of Wuppertal, Germany
akoenig(at)uni-wuppertal.de

Life course studies show that institutionalized cultural capital profoundly influences objective chances on the job market as well as the professional status. However, little is known about the way the perception of occupational possibilities changes during vocational training or studies at a university. It seems plausible that the years of academic or professional training affect future aspirations: new possibilities appear; expectations are enlarged or scaled down. In order to understand the formation of future aspirations, or more generally speaking, the formation of self, I opt for combining an interactionist perspective with theories of structural reproduction.

My argument is based on a quantitative and qualitative longitudinal study on orientations, strategies and decisions of adolescents upon leaving school. The sample contains trainees in vocational training (hairdressers, painters/lacquerers) and university students (art, teaching/engineering). Firstly, I will discuss how status aspirations are shaped differently depending on the fields of education and vocational training. Secondly, I will show that adolescents start their apprenticeship or university

program with the idea that their future jobs will not only be a springboard for their professional status or career but also benefit their personal development and self-realization. Thirdly, my data indicates, that the possibilities for self-realization differ, depending on the social position of the adolescents as well as the field they enter. The field of education and vocational training not only provides a degree or qualification but also launch specific processes of self-formation, which encompass the future self.

Imagining the future in the neoliberal era: the turn to the self and young people's belief in hard work

Michela Franceschelli, Avril Keating
UCL, United Kingdom; UCL, United Kingdom
m.franceschelli(at)ucl.ac.uk, a.keating(at)ucl.ac.uk

In the aftermath of the 2008 Global Economic Crisis, the future of young people is often presented in a negative light, with them described as the 'lost generation' facing a 'bleak future'. Recent research suggests that these concerns are not ill founded and younger generations are increasingly more disadvantaged compared to their parents. Despite this, in a recent mixed method study with young people in Britain, we found that they tend to remain highly optimistic about their future. In this article we seek to understand what influences these views and - if previous research has focused on either individual or social explanations- here we aim to bring the two together. Hence, we explore the tensions between young people's actual opportunities and their cognitions of their personal future as shaped by a general 'turn to the self', where the responsibility of life planning shifts toward the individual.

'Picture perfect' – when perfection becomes the new normal

Mette Pless, Niels Ulrik Sorensen
Aalborg University, Denmark; The Danish Centre for Youth Research; Dept. for Learning and Philosophy; Aalborg University, Denmark; The Danish Centre for Youth Research; Dept. for Learning and Philosophy
mep(at)learning.aau.dk, ns(at)learning.aau.dk

This paper draws on perspectives from three different studies. One study, which focuses on youth life and lack of well-being (Sørensen et al 2011), and two studies on young people and school motivation in, respectively, lower secondary education (Pless et al 2015) and upper secondary education (Nielsen et al 2016). Across the different studies and the different groups of young people, we have identified a number of common traits in the young people's narratives on youth, school and everyday life. One common denominator is a seemingly increasingly narrow concept of normality, where the normal and the perfect tend to blend together. Where perfection earlier was perceived as an unachievable ideal, today it seems to have become a standard, which young people are trying to meet (Petersen 2016, Sørensen & Nielsen 2014). The studies point to developments within youth life towards a performance-culture, where

it is through performing (perfectly), that one becomes acknowledged as a young person, and where top-performances and the ability to position oneself as a 'winner' is accentuated in young people's narratives (Låftman et al 2013, O'Flynn & Petersen 2007, Jackson 2006). In the paper we ask how – and to what extent – performance-culture, and following from this, the narrow concept of normality, is something that young people in different positions relate and define themselves in relation to. At the same time, we maintain a focus on how common social demands and structurations affect and are managed by different young people in different social positions.

Imagining late adulthood: a possibility to square the circle in a context of youth uncertainty?

Valentina Cuzzocrea
University of Erfurt, Germany
valentina.cuzzocrea(at)uni-erfurt.de

Youth transitions literature has traditionally devoted great attention to identify and analyse events that are considered crucial to young people in their short term orientation to the future. Such categories as 'fateful moments' (Giddens 1991), 'turning points' (McAdams et al 2001), 'critical moments' (Thomson et al 2002) and 'crossroads' (Bagnoli and Ketokivi, 2009) have been used to explain around which events young people take important decisions in order to realise the so-called transition to adulthood. This attention is framed by a central scope in youth transition literature, namely to investigate what hinders or facilitates independence.

However, when looking more broadly at how young people imagine their future, taking a longer perspective opens revealing insights not only on the extent to which they see positive changes in society as possible in a farer future, but also on how they view themselves and their possibility to reach independence in the short term.

Despite the methodological difficulties in making young people speak about a long term future, this papers seeks to discuss how they see their late adulthood, through reflecting on how their narratives play out different temporal horizons to achieve seemingly current priorities. Empirically, it is substantiated by essays on the future written by 18 year old students based in Sardinia, and discusses in particular an emphasis that was put on 'retirement' as a moment of accomplishment of family values and ultimate identification with their context of origin.

RN30 | Session 05c Inequalities and Marginalities

Health inequalities in youth: Do relative affluence and perceived wealth matter?

Caroline Residori
University of Luxembourg, Luxembourg
caroline.residori(at)uni.lu

The increasing social inequalities in Europe challenge

societal cohesion and solidarity. In comparison to earlier and later phases of the life course, analyses for youth show rather inconsistent influences of socio-economic status (SES) on the health and health behaviour of young people. Some of these inconsistencies seem to be related to the way SES is conceptualised and the aspects of SES (material, occupational, educational etc.) that are being measured. This presentation tries to determine how relative affluence and perceived wealth compare to other measurements of SES for youth and how they relate to young people's health and health behaviour. Theoretical perspectives on youth as well as social and developmental aspects of adolescence are taken into account and challenges like the relevance of peers and school environment for youth or the link between family SES and (future) own SES are reflected. A multilevel analysis of data gathered from 11 to 18 year-olds by self-administered questionnaires (n= 7233) for the 2014 Health Behaviour in School-aged Children (HBSC) study in Luxembourg compares the relation between traditional measures of SES, relative affluence (both on national and school level), perceived wealth and health variables. For this empirical exploration, health behaviour and health are exemplified by eating and dieting behaviour as well as weight outcomes. Both the theoretical considerations and the empirical results are used for the evaluation of the usefulness and relevance of relative affluence and perceived wealth for the analysis of health inequalities during youth.

Emotion as prerogative - advocacy through experiential and affective vulnerability

Fanny Tempest Edenroth Cato
Stockholm University, Sweden
fanny.edenroth.cato(at)buv.su.se

The present abstract is an outline of a paper that critically investigates Swedish youths' online negotiations of the personality trait highly sensitive person, commonly labeled as HSP. The analysis focuses on how their narratives are rhetorically and discursively co-constructed. HSP is often approached in relations to (psycho-) social problems that they may face in their everyday lives and how to understand, explain and solve such issues. Meta-discussion about what an HSP is are debated when determining who qualifies for the personality trait, and arguing about how to address it as a social and cultural phenomenon. HSP appear as a somewhat questionable, yet to some, desirable and exclusive group membership. Furthermore, the analysis intends to elucidate youths' identity constructions, their notions about sensitivity/vulnerability and how these issues can be understood in relations to gender and social inclusion/exclusion. The testimonies of being an HSP often involve sharing your "coming out-story", disclosing your vulnerabilities and strengths and write about ones personality and mental health and illness. Narratives of identification and recognition may rhetorically be used to redress and amend experiences of deviance from prevailing cultural and

civic norms. The testimonies then address uncomprehending others and an advocacy for understanding and against prejudice notions related to their personal concerns. In conclusion, the paper aims at unfolding how contemporary discourses about sensitivity/vulnerability manifests in young peoples' narratives, and problematize the discursive practices as formations of resistance and/or compliance to taken-for-granted ideas about normality and deviance.

Paths of juveniles confronted to French socio-judicial system

Léo Farcy-Callon
Université Rennes 2/Laboratoire ESO-Rennes,
France
leo.farcycallon(at)gmail.com

Every year, almost 170,000 children and young people appear in front of the French criminal courts for breaching national laws. They are commonly registered under the category of "young offenders". Because they have become a social and public issue, a range of specific socio-judicial responses have been developed over time. Sociological studies have shown that those responses appear ambivalent: protective on one side, coercive on the other. Indeed, these populations are simultaneously considered as "in danger" and "dangerous" (Milburn, 2009). This observation was made for France (Sallée, 2016) but also for most European countries (Bailleau, Cartuyvels, 2007). Who are those children? Which path brings them within the criminal justice system? What happens during their "judicial journey"?

This paper will present fragments of children's lives in an attempt to understand with whom the socio-judicial institutions are dealing with. We will present how children start committing offenses, how they are confronted to the criminal justice system and how they progress in it. Most of the time, their vulnerabilities existed before their first justice cases. Some of them have family issues, others have scholar difficulties, and some have an immigration history. From day to day, they start living in social worlds where unlawful acts are common. Consequently, they handled by socio-judicial organizations and placed in miscellaneous institutions. And from there on, they progressively develop knowledge about the system and learn how to live with it.

RN30 | Session 06a Sexism and Sexualities

Benevolent and hostile sexism in ethnically diverse societies: survey results from Flanders

Laora Mastari
Vrije Universiteit Brussel, Belgium
laora.mastari(at)vub.ac.be

Although the position of women in Western societies

has substantially improved in several domains, persistent gender inequalities remain. Gender attitudes are thought to play a key role in the perpetuation of these inequalities. This paper builds on the distinction made by Glick and Fiske (1996) between benevolent and hostile sexism and is unique by taking into account the ethnic differentiation regarding both variants of sexism towards woman. In doing so we rely on a sample of young people conducted in 3 large cities in Flanders – the Dutch speaking part of Belgium- with a focus on young people of Moroccan and Turkish descent in comparison with autochthonous young people (N: 4688). In line with previous research our results show that girls compared to boys score higher on benevolent sexism and lower on hostile sexism. Interestingly, for both variants of sexism ethnic differences are found. Autochthonous young people show the lowest scores, although young people of Moroccan descent do not differ strongly in contrast to young people of Turkish descent. Next, and in comparison with the autochthonous group, our results indicate that it is the achieved (i.e., educational track) rather than the ascribed status (i.e., parents' education level) that plays a role in sexist attitudes for the Moroccan and Turkish group. Thus although socialisation plays a role in explaining sexist attitudes for all young people, we find that ethnic groups differ concerning which socialisation actor has the strongest impact.

Queering transitions: coming of age outside the heteronormative framework

Giulia Melis

University of Milano-Bicocca, Italy
g.melis9(at)campus.unimib.it

My contribution addresses the issue of Lgbtq young adults' lives in Italy: it explores the impact of structural conditions on people's subjectivities through the increasing difficulties of young men and women transitioning to adulthood.

The overarching fragmentation of paths is influenced by global processes, including periods of crisis and precarious labour markets, and reinforced also by national aspects, such as ineffective welfare state support. Moreover, as a matter of social integration, trajectories differ not only on class and socio-economic status but intersect also with cultural attitudes, in particular those that shape gender and sexual identities' expectations. In order to deepen knowledge of contemporary changing patterns, it is therefore useful to gain insight on the specific routes of outsider social groups and their individual experiences towards the construction of non-mainstream adult identities.

This presentation will describe the preliminary results of an exploratory analysis within two case-studies, based on an ongoing doctoral research carried on through narrative interviews. The collection of autobiographical stories highlights subjective positioning, individual strategies dealing with constraints and social expectations, and the

experiences that subsequently arise. In comparing two different realities, both in terms of economic opportunities and of cultural views, the relations between external conditions and subjective meanings arise.

Focusing on this specific phenomenon with a queer and intersectional approach it is possible to deconstruct not only conventional representations of youth subjectivities, namely those related to heteronormative standards, but also to question the category of adulthood in itself which appears to be increasingly challenged by the interplay of multidimensional dynamics.

Opening paths for solidarity, friendship and gender violence prevention among youth: the New Alternative Masculinities

Marcos Castro-Sandúa, Carmen Elboj Saso
Universitat de Barcelona, Spain; Universidad de Zaragoza, Spain
marcos.castro(at)ub.edu, celboj(at)unizar.es

Gender violence among teenagers and young people is a growing concern in European societies that has attracted the attention of the scientific community. The increasing scientific literature in related issues as dating violence is a significant reflection in this regard. But, how is it possible that young girls brought up and socialized in contemporary Eastern and democratic societies still become victims of the partners they choose for having sporadic or permanent relationships?

Research on the line of preventive socialization of gender violence has revealed attraction to violent boys as pervasive element among teenagers that can partly explain this reality. In the same vein, the research project Secondary Education Schools and Education in Values: Proposals for Gender Violence Prevention, funded by the European Commission Daphne Programme, has analysed the school and other contexts for socialization of youth and has emphasized the need of a values education that promotes models of attraction grounded on values of equality, solidarity and respect.

The New Alternative Masculinities (NAM) do not only embody these positive values, but also overthrow mainstream attraction models, since they appear, at the same time, good and desirable. By doing so, the NAM challenge and overcome the traditional masculinity models that reproduce patriarchy and the double-standard upon which it is grounded. The shift in the language of desire is the key for this transformation.

Imagining sexual futures otherwise

Mary Lou Rasmussen

The Australian National University, Australia
marylou.rasmussen(at)anu.edu.au

The principal focus of sexuality education continues to be prophylactic – designed to prevent harm or disease. Adults and young people associate sexuality education with prevention – prevention of unintended

pregnancy; gender based violence; child abuse; homophobia; HIV, and, sexually transmitted infections (STIs). While all of these issues are rightly concerns of sexuality educators, they are also embedded in the understanding that sexuality education of young people is essentially a problem of constraint. This prophylactic focus has a long history which is reinforced by chrononormative understandings of young people and sexuality. These temporal norms, reinforced by the state, reinforce the notion that young people need to follow certain scripts in relation to sex, sexuality and gender. In this discussion of young people and sexuality education the focus is on different ways of imagining young people's sexual futures. How can sexuality education work with young people to imagine sexual futures outside the constraints of this emphasis on prophylactics? What could such a sexuality education look like that upset the strictures of prevention and chrononormativity? In what spaces might it flourish? How can sexuality education work with young people to imagine different types of sexual futures? Inspired by Elisabeth Freeman's *Time Binds: Queer Temporalities, Queer Histories*, (2010: xv) my focus is on futurities which are "out of synch with state-sponsored narratives of belonging and becoming. This paper is speculating futures "...in ways that counter the common sense of the present tense" of "young people", and sexuality education.

RN30 | Session 06b Radicalization

Influencing Factors of Political Extremism in Adolescence. Right-Wing Extremism, Left-Wing Extremism and Islamic Extremism Compared

Marie Christine Bergmann, Patrik Manzoni, Dirk Baier
Criminological Research Institute of Lower Saxony, Germany; ZHAW School of Social Work, Switzerland; ZHAW School of Social Work, Switzerland
marie.bergmann(at)kfn.de, patrik.manzoni(at)zhaw.ch, dirk.baier(at)zhaw.ch

The paper analyses influencing factors of the following three forms of political extremism: Right-wing extremism, left-wing extremism and Islamic extremism. Influencing factors were deduced from disintegration theory, social bond theory and self-control theory. The analysis is based on a large sample of adolescents of the ninth grade who were surveyed in 2013 in Lower Saxony, Germany (N = 10.442). The results show that only a small proportion of adolescents agrees with extremist attitudes or perform extremist behavior. 7,1 % agree with Some factors influence all three forms of political extremism: institutional disintegration (operationalized by a negative perception of treatment by the police), belief (law-abiding attitudes) and risk-seeking (as one dimension of low self-control). regarding Islamic extremism, which due to the data is operationalized as hostility towards Germans, several specific influencing factors are identified (structural disintegration, club membership, and experiences in school).

Is the young generation from post-communist countries turning to the right?

Krystyna Szafranec

Nicolaus Copernicus University, Poland
krystyna.szafranec(at)umk.pl

When the post-communist countries entered the path of political changes, the young generation was perceived as the one with innovative and subjective power. There were not too much evidence then - mostly energy and the spirit of youth, naturally conducive the change. The progress of transition and the opening of post-communist countries to global influences began to reveal the new face of the youth, who believed in individual success and values of the new system: democracy, free market, life without borders. The global economic crisis and the insufficiency of local (post-communist) economies issued plans and aspirations of young people to the test. The generation that seemed to represent the effect of inverted pyramid of needs, has become the generation with the need for security as the dominant one. The characteristics of millennials in these countries show them as the generation significantly disappointed with political changes, confused and fearful, willing to accept authoritarian and xenophobic solution in politics. They are perceived as a better way to solve their life problems, mainly related to achieving adulthood (transition from education to employment, family life, quality of life). It is seen in changes of political sympathies, loyalties and political choices, which demonstrate a visible turn to the right. Although the trend is similar to that in the West, its background is different, and different may be its political consequences. Empirical foundations to this thesis provide analysis conducted within the international project on the youth in nine post-communist countries in Europe and Asia (currently finished). The presentation will limit the field of description to a few selected European countries, however, the discussion on the whole Eastern Block will also be possible.

Radicalism and Hate Crimes among Young People. Evidence from Bulgaria

Lyuba Dinkova Spasova

Bulgarian Academy of Sciences, Bulgaria
lyuba_spasova(at)abv.bg

The paper will present findings from an ongoing study on the process of radicalization among youth in Bulgaria that analyzes the mechanisms, factors and conditions fostering the expression of radicalism into violence and particularly into hate crimes. Influenced by a sociology of deviance perspective, a specific focus of the research are the neutralizing strategies used by the young people to justify certain radical acts and violent behavior. Empirical data on those strategies gathered via qualitative research methods – interviews and focus-groups with experts and with radicalized and in-risk young people, will be presented. Following further the empirical evidence, another main goal of the study and the paper is to

present the theoretical model of the process of normalization (Parker et al., 1998; Measham et al., 1994) of radical attitudes and their violent expression.

The unbearable lightness of radicalisation

Fernan Alejandro Osorno
University of Bristol, United Kingdom
fern.an.osornohernandez(at)bristol.ac.uk

Attempts across Europe to disrupt the conversion of non-violent radicals towards terrorism are approached with fundamental misconceptions. The first is that the transition from peaceful to violent radicalisation is a linear process. Secondly, that the need to censure all radical voices, even non-violent, is necessary for creating counter-narratives to violent radicalisation. Finally, that violence is a pragmatic choice rather than a metaphysical vision people, especially the young, are forced into believing.

Policy focused on counter narrative programmes—such as Countering Violent Extremism (CVE)—to combat radical discourse have “unintended consequences” that may lead to youth Muslim stigmatisation (Radsch, 2016). By attempting to antagonize violent radical discourse without properly distinguishing between violent and non-violent radicalisation, mass media and politicians most often censor non-violent discourses, which would otherwise be tools of integration within local communities.

In this article, I evaluate how CVE and other counter-radicalisation initiatives have isolated the youth and favoured violent radicalisation. Targeting non-violent radicals means censoring the religious, political and cultural views that may oppose the mainstream attitudinal orthodoxy (Bartlett & Miller, 2012) and stigmatizing Muslim communities, but especially the youth. This is a generation that is not only targeted by terrorist recruitment, but also by terrorist activity, creating a bitter youth versus youth scenario (Giroux & Evans, 2016). If their political and social views, radical as they may be, and their cultural inheritance are all being subject to social stigmatization, as a result the line between violent and non-violent radicalisation becomes so much thinner.

RN30 | Session 07a Transitions from Education to Work

The rise of intern economy. Internship and informalization of labor in the Italian context

Marco Marrone
University of Bologna, Italy
marco.marrone3(at)unibo.it

In recent times, the use of internship has spread worldwide across sectors, and has become increasingly present in labor policies, educational programs and recruiting strategies. Nonetheless, the explosion of intern economy has also attracted the attention of journalists and activists because of its abuses as unpaid work. Furthermore, the word internship seems to be an umbrella term to cover different job descriptions and responsibilities, thus

contributing to its relegation as one of the weakest positions in labor market.

The aim of this paper is to provide a theoretical framework to understand the reason of such an explosion, and to focus on internships as the new frontier of precarization. The lack of recognition of interns' working activities, due to historical reasons, allows employers to avoid their obligations, including, but not only, that of paying a salary. Furthermore, its educational aim not only legitimize the lack of recognition of interns' working activities, but it seems to be very efficient when used by employers to control and govern the labor force. Thus, flexibilization, moralization and feminization are some of the effects that the informal status of internship produce in the workplace. In sum, interns do not only provide cheap labor; they are also flexible, motivated and proactive. Finally, the paper argues how the rise of intern economy can be understood as part of the increasing informalisation of labor that Europe is facing in recent times.

Statistics on the use of internship in the Italian context will be presented to focus on the extent of intern economy, while interviews with interns from the province of Bologna will be used to analyze the effect of informalization in the workplaces.

'Give back to my parents, and give back to the world': Notions of Solidarity among Cosmopolitan Elite Students

Eunike Piwoni
Georg-August-Universität Göttingen, Germany
eunike.piwoni(at)sowi.uni-goettingen.de

In this paper I explore notions of solidarity among elite students who expressed cosmopolitan sentiments. Studying those who are about to make important decisions regarding their professional career and their place of residence provides a particularly good opportunity to understand not only how future elites attach to different entities at the local, national and global level but also how they ascribe significance to these feelings when projecting their future lives. In specific, I draw on data collected through in-depth interviews with 24 students at the London School of Economics and Political Science in 2014. My findings show that there were three different ways in which students made sense of their cosmopolitan identities in relation to their career plans: Individualist cosmopolitans planned their careers regardless of their countries of origin since they did not feel attached to it. Rooted cosmopolitans planned on returning to their countries of origin because they felt a moral obligation towards their fellow countrymen. Practical cosmopolitans were also planning on returning but were not motivated by feelings of solidarity with their nation. Instead, they intended to realize their cosmopolitan ambitions in an environment familiar to them and in which they could bring their skills to bear in the best possible way.

Moreover, I found that, across all interviews, students' feelings of solidarity with their immediate families were highly significant in how they projected their lives and

in how they attached meaning to different entities. My analysis thus suggests the need to go beyond considering only particular locales, the nation or the world as objects of solidarity when studying young elites' cosmopolitanism and to stop regarding individualist cosmopolitans as deracinated.

De-differentiation and Hybridization between education, work and volunteerism. Risk and opportunities for Youth.

Luca Raffini, Andrea Pirni

University of Genoa, Italy; University of Genoa, Italy
luca.raffini(at)edu.unige.it, andrea.pirni(at)unige.it

The relation between education, work and other fields of action (leisure, solidarity action, political participation) is deeply changing. The boundaries become more and more porous. Individuals, and Youth in particular, are more and more committed in practices characterized by the intersection between education, work, leisure, and social and political action. The time devoted to different kinds of activities is no longer rigidly circumscribed, as well as the codes and their rules and procedures for actions.

Together, de-differentiation and hybridization represent a challenge for political regulation. They requires a deep revision of the policy traditionally implemented in these – formerly rigidly circumscribed – fields.

Goal of the paper is to critically assess risk and opportunities generated by de-differentiation and hybridization on the life-trajectories of Youth, and the policies that deal and try to manage these phenomena. Are these policies able to provide Youth instruments to innovate and to generate forma of resilience? Or do they run the risks to passively adapt to global economic trend, i.e. institutionalizing forms of un-paid or under-paid jobs?

We Focus on the combined effect of three laws recently approved in Italy, that contribute to deeply reframe the boundaries between education, work and volunteerism: the “Jobs Act” (L.183/2014) which change the entering of youth in the job market; the School Reform (L.107/2015), that makes it mandatory the school-to-work experience, and the Reform of the Third Sector (L.106/2016), which intervene in the regulation of the relation between work and volunteerism.

Agency, choice and structure in young people's mobility. Reflections on a missing link.

Jan Skrobanek, Tuba Ardic

University of Bergen Norway; Western Norway University of Applied Sciences Norway; Western Norway University of Applied Sciences Norway
jan.skrobanek(at)hvl.no, tuba.ardic(at)hvl.no

The contribution conceptualises the relation between agency and structure in mobility research by bringing back in the issue of choice. It argues that many contributions in the field of agency and structure have clouded the concept of choice by circuiting the cliffs of rational decision-making. In our view, this has led to

an inability to explain the colourful strategies of young people manoeuvring through life course in general and concrete with respect to young people's mobility. Thus, our goal is to revitalize the issue of choice in the agency debate – here especially in the field of youth mobility – and in doing so to provide a basis for advancing our understanding of young people's mobility.

To develop and underline our argument we refer to qualitative data gathered in the context of the European H2020-project “Mapping mobility – pathways, institutions and structural effects of youth mobility in Europe (MOVE)”, which aims at contributing to the research in European youth mobility. Concretely 30 semi-structured interviews from the consortium partner Norway are used, which focus on young peoples' own experience towards the ways in which they are and can be active agents regarding geographical mobility.

RN30 | Session 07b Place, Space & Cities

Contested Bodies in a Regenerating City: Post-Migrant Youth's Disputed Leisure and Contingent Citizenship in Turin

Nicola De Martini Ugolotti

Bournemouth University, United Kingdom
ndemartiniugolotti(at)bournemouth.ac.uk

The children of migration are controversial figures in contemporary Europe, and they are often portrayed as a population to be controlled and contained, rather than citizens. At the same time, several European cities based their urban renewal on an image of vibrancy, diversity and inclusiveness to reposition themselves in a competing global scenario, and started to represent (post)migrant communities and youth as key assets in this process. In Turin, Italy, these discourses intersect each other and shape the manifold and contradictory ways through which (post)migrant youth are represented and addressed in the redeveloping city.

Through an ethnographic perspective, this paper explores how a group of twenty young men of diverse migrant origins (aged 16-21) negotiated processes of inclusion and exclusion in Turin, by daily practicing capoeira and parkour in the city's public spaces. The focus on capoeira and parkour, two informal urban disciplines, provided an embodied and emplaced vantage point to illuminate the shifting and unequal power relationships that applied on (post)migrant bodies selective definitions of belonging and rights in Turin's cityscape.

The participants' ambivalent and contested leisure engagements in Turin's public spaces highlighted an emerging contingent citizenship, as a partial, conditional and relational civic membership that is defined, and limited by, bodily markers of race, gender and class across diverse spatial and temporal urban contexts. In conclusion, I consider how the participants' disputed leisure practices enabled them to (en)counter their contingent citizenship in Turin's public life, by illuminating and negotiating the

(in)visible and unfolding hierarchies of belonging of the regenerating city.

Tracking the spatial flows and occupational destinations of elites

Michael Donnelly, Sol Gamsu, Hugh Lauder
University of Bath, United Kingdom; University of Bath, United Kingdom; University of Bath, United Kingdom
m.p.donnelly(at)bath.ac.uk, s.gamsu(at)bath.ac.uk, h.lauder(at)bath.ac.uk

In many European nation states, elites maintain their advantage through their monopolisation of socially exclusive schools and higher education institutions. Yet, little is known about their specifically spatial trajectories and elite class formation, especially in countries where deep geographic divides exist culturally, economically, socially and politically. There exists a very specific spatial and educational patterning of elite groups in the UK, with a clustering in certain geographic areas (Savage et al. 2016) and a concentration of elites in the 'golden triangle' of elite universities concentrated in London and the South-East of England (Wakeling and Savage, 2015). Drawing on the case of the UK, and contributing to the literature on the occupational destinations of elite groups, we show how there is a very specific spatial patterning to their educational and career trajectories. Our analysis uses an exceptionally detailed HESA dataset of the employment destinations for UK/EU students leaving UK universities in 2012-13, which includes the employers name, salary details and job title along with fine-grained social and demographic information on the individuals themselves. Based on a classification of elite occupations, we use logistic regression to show the spatial and educational trajectories for those who make it into these top jobs. Whilst on one level the results confirm existing understandings about the educational trajectories of elite groups, they also reveal fresh insights into the specifically spatial patterning of their origins and destinations, which we show broadly map onto the uneven economic and social geography of the UK. Our findings suggest that policies aimed at addressing intergenerational social mobility will do little if they only focus on educational participation and outcomes per se.

Youth cultural communities in a big city: an ethnic/religious dimension

Guzel Sabirova
Higher School of Economics, Russian Federation
gsabirova(at)hse.ru

Researchers agree that youth cultural contexts and peer cultures are significant factors in youth migration, but most of the attention of them is focused on social network structures rather than specific cultural preferences of young people (including subculture-related ones). The subject of this paper are the narrative strategies and practices of young people which are performed within youth cultural spaces in

order to negotiate (normalize, contest, reformulate) Muslim and ethnic identities in response to the existing stigmatisations or social pressure. In paper will be explored the range of youth cultural scenes with special focus on the examples of non-conflictual multi-ethnic communities. The object of the analyses are the Daghestani young people migrated from North Caucasus to St.Petersburg. The participation in youth cultural communities (including virtual one) helps Daghestani youth to go beyond (reach a compromise with) family kinship and gender and religious requirements, and also provides additional resources for the strengthening the social capital by expanding (maintaining) friendship or leisure networks. The paper is based on the quantitative and qualitative materials of the sociological empirical project 'Fields of positive interethnic interactions and youth cultural scenes in the Russian cities' (2015-2017, RSF project № 15-17-00078) conducted in four Russian cities: St.Petersburg, Ulyanovsk, Kazan and Makhachkala.

A journey from violence – Conversion narratives of youth desisting from crime

Anna Rypi
Lund University, Sweden
anna.rypi(at)soch.lu.se

Through the concepts of conversion and turning point this paper analyzes the narratives of some young men who were seen as "troublemakers", responsible for minor offenses, in the past but who have changed their lifestyles. The young men reflect on how their experience of desistance has made them insightful and mature. Thus, instead of primarily framing this experience as related to a stigma, they approach it as a resource. The article is based on two larger qualitative research projects. Firstly, on a project that focused on young crime victims from a foreign background that were victimized by youngsters from a Swedish background. Secondly, a project that focused on victim-offender-mediation. None of the interviewees were asked to tell their path of desistance in the interviews, but initiated this theme themselves. The article argues that the conversion narrative template, through its focus on both the internal (personal) and external (social) transformation, is a useful way to gain an understanding of the desistance process.

RN30 | Session 08a Social and Intergenerational Inequalities

From generation to generation: continuity and changes in the kibbutz

shlomo Getz
University of Haifa, Israel
getz(at)research.haifa.ac.il

'Kibbutz' is a type of rural commune in Israel, based on principles of equality between members, common ownership of the means of production, and mutual responsibility. The first kibbutz was established at the beginning of the 20th century. Today there are 270

kibbutzim (pl. of kibbutz) with a population of 150,000. This short history allows to trace the outline of generations. Those communities started as a single generation community. The second generation followed the practices of the founders, but without their ideological dedication. The third generation did not accept the kibbutz lifestyle, and many left. Those who stayed implemented changes, which ensured the continuity of the community, but at the cost of abandoning some original kibbutz values. Since the turn of the century, the youngest generation has been returning, but now to a different kibbutz, one based on principles that meet their needs while ensuring the sustainability of the community. Inter generational relations in the kibbutz may be described in terms of a pendulum. The founders radically swung away from the individualistic–capitalistic society and established a way of life based on collectivism and socialism. The second generation continued in this direction by inertia, developing a stable society with modern economic enterprises and extensive social services. The third generation lost much of that inertia and many of this generation left the kibbutz. The newest cohort (including the fourth generation in the older kibbutzim and the second generation in the younger kibbutzim) swung back towards an individualistic and capitalistic way of live.

The extended family in transitions to adulthood

Kristoffer Chelsom Vogt
University of Bergen, Norway
kristoffer.vogt(at)uib.no

Research investigating the role of family in transitions to adulthood has predominantly been limited to studying the role of parents. The role of wider kinship networks (grandparents, aunts, uncles, siblings, step-parents etc.) have received far less attention. The types of data conventionally used to study the relations between family background and child outcomes are not suited to studying the processes and experiences at the family level which contribute to affect transitions to adulthood. Recent developments in labour markets, education systems and welfare state policy suggest that intergenerational relations are only becoming more important as a source of support for young people. Demographic changes suggest that understanding the changing role of kinship networks in the transition to adulthood is of great contemporary relevance. For instance, grandparents live longer and can potentially contribute more than before. Drawing on biographical interviews with 23 three-generation families in Norway, this paper examines the variety of roles played by extended family members in young people's transitions to adulthood. It emphasizes the variety in the nature of kinship networks, and in the social support potentially provided through such bonds. Kinship networks are analysed as a layer of context within which transitions to adulthood take place.

The generational analysis risk in Iran

Gholamreza Ghaffary
University of Tehran, Iran, Islamic Republic of
ghaffary(at)ut.ac.ir

This study is investigating the attention to kinds of risk in Iran. The key question is “what differences are found in different generations of the population under study; and how are these differences associated with the occurred social changes in Iran?”

The consisted of three generations of Iran residents: the generation who has lived before the Islamic Revolution in Iran (those who were born between 1946 and 1959), the generation who has lived in the time of Revolution and the war between Iran and Iraq (those who were born between 1960 and 1979) and the generation of after Revolution (those who were born between 1970 and 2000).

Findings indicated that the attention to risk is significantly different among the generations. The first generation more emphasis on natural risks but new generation emphasis on social and political risks. Overall, it can be said that the attention to risk is different in each of generation with according sex and situation of education.

RN30 | Session 08b Entrepreneurship and Precariat

Young adults and the tuning of entrepreneurial mindset in neo-liberal capitalism

Hanna-Mari Ikonen, Minna Nikunen
University of Tampere, Finland; University of Tampere, Finland
hanna-mari.ikonen(at)uta.fi, minna.nikunen(at)uta.fi

The affective mood in current neoliberal, post-crisis capitalism can be described as ‘austerity mood’. It means not only actual politics of cutting public spending, but also the atmosphere austerity politics is using and inspiring. However, pessimism is not an overarching discourse. Instead, the governing bodies and the media offer some ways of coping with insecurity and other characteristics of austere times. The prominent alternative is entrepreneurship – both as an attitude and as a real means of getting a living. In recent policy documents, entrepreneurship is more likely offered to highly educated young people than to young people with craft skills and vocational education, or to NEETs. Thus, entrepreneurship is more pronounced in the talk about ‘youth as a resource’ for the economic growth (main figure a start-up-entrepreneur), than ‘youth as a problem’.

In our paper, we ask how Finnish young adults use the ideas of entrepreneurialism in their identity work. What does motivate them in engaging or resisting the entrepreneurial spirit and developing or rejecting the entrepreneurial mindset? Furthermore, how does entrepreneurialism resonate with other things young people expect of working life?

Our analysis is based on 40 interviews of 18–30 year old women and men from Tampere, Finland. The interviewees were recruited having the polarization

hypothesis in mind: there might be an increasing division into successful and marginalized young subjects. However, in the times of insecurity, managing one's life mentally and materially can become a challenge for anyone.

Young people in vocational education and training: in between craftsmanship and precariat

Maria-Carmen Pantea

'Babes Bolyai' University, Romania

pantea(at)policy.hu

Vocational education and training (VET) is perhaps, the most intensely reformed educational sector across Europe. It is hoped to respond to the need for technical skills and unemployment, but also to poverty and social exclusion. After the fall of centralized industry, Romania tries to reinstate VET attractiveness in an economic climate shaped by global transformations in the meaning of work. Generally, the long held notion of employment as secure, with a sense of purpose and progression, based on commitment and achievement (craftsmanship cf. Sennet) is disappearing. Stable work (in production) is increasingly shifting towards precarious work, often in the service sector. Against this backdrop, Standing discusses people's 'habituation of expecting a life of unstable labour and unstable living' (2014). Chances are that soon, many young people now in Romania's VET will have precarious jobs. Informed by the notions of craftsmanship and precarity, this presentation examines the views on future occupational trajectories held by young people. It is based on semi-structured interviews/ focus groups with over 250 young people (16-18 yrs.) from 33 VET schools in Romania. The presentation argues that despite an increasingly precarious labour market and unfriendly life circumstances, interviewed young people tell a story of agency and have rather conventional expectations related to work and family life. They seem to rely on long held notions of work as relatively stable across the lifespan, with an important element of choice and satisfaction. The findings have policy implications and are able to nuance the current debate on 'youth-to-work transition'.

From internships to unpaid works: the mass training of future young workers to neo-liberal values

Rossana Cillo, Iside Gjergji

Université Libre de Bruxelles, Belgium; Università Ca'

Foscari Venezia, Italy; Università Ca' Foscari Venezia,

Italy; Universidade de Coimbra, Portugal

rossana.cillo(at)gmail.com, iside.gjergji(at)unive.it

Since the second half of the '90s, the Italian governments' reforms have fostered the spread of short-term contracts and drastically reduced the workers' legal protection, while the Italian youth has experienced increasing precariousness and growing unemployment. Within this framework, important changes were introduced in the education and vocational training field – simultaneously with what

was occurring at both the European and global level –, leading to a real explosion of the internships phenomenon in the private, public and non-profit sectors. As a matter of fact, between 2009 and 2015 the number of people who carried out at least one internship in Italy doubled and, lately, it almost reached 900,000.

By critically analyzing the concept of employability, this paper aims at examining how the internships' spread in Italy is normalizing new forms of precariousness based on unpaid work and contributing to the construction and disciplining of subjectivities, in line with the demands of neo-liberal capitalism. The disciplining's effects could be detected in the mass training of future young workers' to self-devaluation and the socialization of the idea that obedience, competition and individualism are the only forms of relationships that could exist in the workplace.

Higher education to work transition of young people in Turkey: ambivalence, uncertainties and youth subjectivities

Ekin Bozkurt

Middle East Technical University, Turkey

ekin(at)metu.edu.tr

This paper explores final-year university students' perceptions of labour market and future work. Higher education has long been considered as a gateway to a secure future in Turkey, however, the recent economic and political changes taking place and the changing labour market opportunities, no longer promise a 'secure' future for the youth. The rate of population with tertiary education among 25-34 age group in Turkey has risen from 13% in 2005 to 27% in 2015 according to the OECD. On the other hand, according to EUROSTAT data, the employment rate of university graduates (73%), remains as one of the lowest in comparison to the EU countries. Furthermore, in 2015 Turkey ranked third among the OECD countries in terms of graduate unemployment rate, with a score of 9%. In this context, focusing on young people at the point of higher-education-to-work transition in two public universities in capital of Turkey, this study aims to address the subjective dimension of a 'transition' experience, which is increasingly becoming uncertain. By conducting in-depth interviews with students at the verge of graduation, the study aims to understand how young people locate and construct their subjectivities in relation to their ambivalent futures in the labour market and world of work. The study argues that while youth transitions involve a dimension of reflexivity and agency, the transition itself is a historically grounded subjective experience. It also shows that specific social, economic and political context of higher education contribute to the dimension of uncertainty for young people in terms of their experience of transition to labour force and work.

RN30 | Session 09a Youth Aspirations II

Framing young people' futures: adults' narratives of youth futurity.

Giuliana Mandich
University of Cagliari, Italy
mandich(at)unica.it

Youth futures are not only undermined by the diminished opportunities due to economic crisis, the growing uncertainties and the dystopian long-term climatic projection. It can be said that narratives of the future circulating within society can be seen as a sort of colonization structuring fields of discourse (Watson 2009) and as "realizing narratives" (Weigert 2014) disempowering individual's capacity to aspire (Appadurai (2009). Is there a dominant narrative of youth futures? How far does it shape adults' view of young people's futures? Within the wider frame of the iFuture research (Cuzzocrea and Mandich 2016) we interviewed a group of adults professionally involved with youth so to understand adult's representations of youth's futures. This presentation is going to analyse the narratives of secondary school teachers and social youth workers and experts in Sardinia (Italy) emphasizing two points. 1) Big narratives as circulating in media and public sphere are present as discursive topoi recurring in the interviews but not strongly shaping the emotional stance towards young people's futures. 2) Visions of youth futures reflect instead both professional cultures and the strength of the relationship with young people.

Hovering between Bright and Dark Expectations - A Review of Contemporary Young Faroe Islanders' Future Images

Firouz Gaini
University of the Faroe Islands, Faroe Islands
firouzg(at)setur.fo

This paper explores scenarios created by young Faroe Islanders envisioning the future of their local community. The tripartite objective of the paper is, (a) to outline and analyse the role of contemporary realities and values in young people's visions of coming times, (b) to examine the interplay between their personal future aspirations and their general vistas of the future, and (c) to delineate the value of the future as conception in research on young people's everyday lives, knowledge and ambitions. Based on data from a qualitative study from 2014, the paper aims to shed light on young people's hopes, fears and expectations from the context of a North Atlantic small-scale island community. Drawing on anthropological and sociological theories and discussions on the future, it seeks to illustrate how young people's creative projections not only reflect ambivalent feelings about what assumingly lies ahead, but also represent the trial of critically confronting the present state with alternative thinkable presents (futures). Young Faroe Islanders do neither predict dystopia nor utopia in foreseeable future; they are curious and expect many changes, some of them quite radical, but they do not really connect them to their own life, to their own future plans.

Constructing future expectations in adolescence: relation to individual characteristics and ecological assets in family and friends

Mihai-Bogdan Iovu, Paul-Teodor Hărăgu , Maria Roth Babe -Bolyai University, Romania; Babe -Bolyai University, Romania; Babe -Bolyai University, Romania
iovu.mihai(at)socasis.ubbcluj.ro,
tpharagus(at)socasis.ubbcluj.ro,
mroth(at)socasis.ubbcluj.ro

Required to manage multiple developmental tasks, multiple systems and processes are involved in making adolescents thinking about and making plans for the future. The current study aims at exploring the manner in which individual (optimism, depressive symptoms, anxiety symptoms, and self-concept) and contextual factors (family and peer influences) contribute to the construction of adolescents' future expectations. 1509 youth (891 females and 618 males) with different socio-economical backgrounds were questioned using an online platform. Compared with their counterparts, girls, adolescents who were not experiencing severe material deprivation, those with high self-concept, displaying little depressive symptoms, and high level of optimism have more positive future expectations. As most of the available empirical data come from Western countries, these results complement the existing data in the area of emerging adulthood.

Framing a desirable future when you are young, disadvantaged and 'at risk'

Evelyne Baillergeau, Jan Willem Duyvendak
University of Amsterdam, Netherlands, The; University of Amsterdam, Netherlands, The
e.baillergeau(at)uva.nl, W.G.J.Duyvendak(at)uva.nl

In our era of shrinking and precarious employment, many young people experience difficulties being enthusiastic about their future. This is especially true of youth living in disadvantaged circumstances, whose prospects on the labour market are often slim. But like their more privileged counterparts, they are expected to formulate and work towards future goals. How do they deal with this social expectation? Positive representations of the future have primarily been addressed within studies of aspiration, which have largely focused on educational and/or career aspirations. As such, sociologists of education (e.g. Sewell et al. 1969; Bourdieu & Passeron 1970; Kao & Tienda 1998) have addressed aspirations when analysing the social reproduction of inequality through what family and educational institutions project as respectable and achievable aspirations. What appears to be an almost singular focus on career aspirations has become even more prominent since the advent of 'aspiration politics' (Raco 2009; Spohrer 2011; Brown 2011) and agendas to broaden social participation (Hart 2012; Zipin et al. 2015; Bessant 2014; Archer et al. 2014). The focus on educational and/or career aspirations is understandable given that young people are largely expected and willing to join the labour

force. But the focus on career aspirations tends to eclipse what may be more fundamental aspirations such as gaining social status and recognition. This paper discusses the conceptual and practical implications of shifting the focus from career aspirations to social recognition, based on qualitative research carried out in the Netherlands (primarily) and some references to other European countries.

RN30 | Session 09b Employment, Unemployment and Underemployment II

Youth transitions and generations: baby-boomers and millennials

Nuno Almeida Alves
University Institute of Lisbon, Portugal
nalmeidaalves(at)iscte.pt

The youth transitions paradigm is a very useful conceptual tool to observe and understand social change in late modern western societies. However, there is a common tendency to 'pack' youth transitions from education to work in a single interpretative fashion – from the smooth and quick transitions of the baby-boomers to the long and sinuous transitions of the millennials – independently of strategic structural factors emerging from context and time.

This proposal aims to analyse the pattern of change in youth transitions in Portugal, a country which contemporary history is clearly detached from the path threaded by the majority of its partner-States in Western Europe, due to an extraordinary long autocratic rule, a fragile economy and an almost incipient Welfare State. The significantly different stage of depart of the Portuguese economy and society does not mean, however, that the pattern of change in youth transitions has been markedly different, although its effects and consequences have been probably steeper and harder for young people.

This process of change will be observed in this proposal through the analysis of a group of historical statistical series concerning several relevant indicators for youth transitions, namely on the one operated from education to work. This quantitative account will be afterwards complemented by a qualitative analysis of the young people's representations of this changing pattern of transition from school to work between the baby-boomers and the millennials generations, through the thematic content analysis of 56 interviews undertaken in the fieldwork of the research project MYPLACE (Seventh Framework Programme).

Between creative class and precariat. Individual career strategies in a (un)certtain city. A case study of Lodz, Poland.

Karolina Messyasz
University of Lodz, Poland
karolina.messyasz(at)gmail.com

The aim of the paper is to present the empirical results of a study conducted at "OFF Piotrkowska" in Lodz, Poland. The second largest Polish city, and—crucially—a postindustrial one, Lodz is plagued with a high rate

of unemployment and low wages, especially among the young. Like many other Polish cities, Lodz has embraced the idea of the creative class. Nowhere is it more apparent than at "OFF Piotrkowska", an old postindustrial space adapted and designed by the developer and municipal authorities for creative industries. Its primary goal was to rebrand Lodz as a creative city through the promotion of cultural projects, venues and output, and to boost local entrepreneurship by blending business, creative industries and culture. "OFF Piotrkowska" (named after the city's main street) provides the space for this very synthesis. This is a space where culture interacts with the economy, work with the private sphere. It is a peculiar ecosystem that uses human creativity and turns it into economic value. On the other hand, this place provides employment for a young service class, which is increasingly joining the ranks of the precariat. This combination of the precariat and the creative class is not accidental. I assume that both of these categories are the products of the neoliberal turn.

In my presentation, I would like to present some opinions, evaluations, and the consequences of this state of affairs for the careers of the young residents of Lodz. Can flexible jobs make or break professional careers? Do flexible forms of employment stimulate the development of the creative class, or rather boost the precariat? What strategies do they adopt in their professional and personal lives?

Retail shift workers: the times and rhythms of working with customers. Two European case studies.

Annalisa Dordoni
University of Milan-Bicocca, Italy
a.dordoni(at)campus.unimib.it

The aim of this research is to understand the perceptions and representations of young retail shift workers (RSWs) about times and rhythms of working with customers. The research case studies are two European shopping streets: Oxford Street in London, United Kingdom, and Corso Buenos Aires in Milan, Italy. The research methods are observation (6 months in each case), interviews, focus groups.

In the last years flexible schedules have grown in Europe, in particular in the service sector. Italy is a paradigmatic example: here shop openings are fully deregulated. The contemporary age is characterized by globalization, automatization and delocalization of industrial production. However, some working activities cannot be delocalized or automatized: working with customers face-to-face, the so called emotional labour (Hochschild 1983) in fast food restaurants (Leidner 1993, Gould 2010), hotels (Scherman 2011) and shops. There is a specific kind of alienation linked to the emotional labour.

Furthermore, this study allows us to observe a process of contraction of times and rhythms in urban contexts, that I call "immediatization". Social acceleration and immediacy (Rosa 2004, Tomlinson 2007), the demand of instant satisfaction by customers and the phenomenon of consumerism as

commodity fetishism (Marx 1867, Marcuse 1964, Bauman 2000) have consequences on the pace of work, as well as on the productive processes. The economic system of today is called Fast Capitalism, clothing companies are called Fast Fashion. The young RSWs I interviewed are influenced by these processes: they experience a condition of alienation, lack of control and powerlessness both over their emotions and over their own time, especially their "reflective time", time to think about themselves (Nowotny 1983), necessary to plan their lives as young adults.

'A question of time': school-to-work patterns and effects of a cohort of young people born in 1990

Diana Carvalho

University of Lisbon, Portugal
dianadiascarvalho(at)gmail.com

Framed by a longitudinal and life course perspective, the aims of this paper are to identify and explain differentiated patterns of school and work paths, as well as to explore the role of different levels and types of education on youngsters' work integration, quality and expectations. We draw on data from a longitudinal study (EPITeen) of youngsters born in 1990 in Oporto, Portugal, that were surveyed at age 13 (n=2160), 17 (n=2512), 21 (n=1761) and 24 (n=1092). Additionally, qualitative interviews collected at age 24 will be used as illustrations.

Ages 21 to 24 are a privileged period to assess changes in school and work spheres: at 21 years old most of these youngsters were still studying (66%), but at 24, the school-work situation reverts and most (65%) are not: 58% are working and 13% are unemployed or looking for a job. Using this information on their school and work paths, and taking into account their timing, duration, sequence and reversibility aspects, we were able to define differentiated school-to-work trajectories: Sequenced, Early, Overlapping, and Yet to come. Moreover, we found that these trajectories are distinctively socially characterised by structural and family factors. Considering the relationship between educational levels and several work dimensions at 21 and 24, we concluded that taking in account these different times can help enlighten these effects.

These findings stress, on one hand, the importance of time as an analytical tool; and on the other, the coexistence of competing perspectives of the life course and transitions to adulthood.

RN30 | Session 10a Educational Horizons

Option blocks that block options: higher education aspirations and opportunity structures in secondary schools in England

Jessie Jade Abrahams

University of Surrey, United Kingdom
jessie.abrahams(at)surrey.ac.uk

Despite the expansion of the UK higher education sector in recent years, young people from socio-

economically disadvantaged backgrounds remain less likely than their advantaged counterparts to apply or be offered a place at university, and particularly at elite institutions. Governmental approaches to narrowing this gap have tended to revolve around the need to raise aspirations amongst disadvantaged populations. Drawing upon data collected as part of my ESRC funded doctoral research, this paper challenges the governments' individualistic approach through highlighting that whilst young people have similar (high) aspirations for the future, they confront different opportunity structures within secondary schools which serve to 'block' or 'unblock' certain pathways. One of the main ways in which young people are identified as 'university material' is through their academic achievements. Their qualification type, subject choices and grades achieved are presented as illustrative of their personal hard work, ability level and commitment to a particular route. This paper provides an alternative to this narrative. Through exploring opportunity structures in three contrasting secondary schools in England (one private, one state in a wealthy catchment area and one in a socio-economically disadvantaged area), I highlight vast inequalities in access to demonstrating academic excellence. Whilst some schools provide an enhanced landscape of opportunities and immense support with making subject choices, others impose blocking systems upon subject slots which serve to restrict options and block futures. Overall this paper argues that young people's academic outcomes must be viewed in context of the opportunities presented to them.

Adolescents and their vocational choices: between exploration and authenticity

Maria Manuel Vieira, Lia Pappámikail, Bruno Dionisio
University of Lisbon, Portugal; Higher Polytechnic Institute of Santarém, Portugal; New University of Lisbon, Portugal

mmfonseca(at)ics.ulisboa.pt,
lia.pappamikail(at)gmail.com, bmdionisio(at)gmail.com

The obligation to attend school for increasing periods of time, which has transformed schooling into a crucial part of a young person's biography, underlines the importance of the institutional settings in which life trajectories unfold. At present, adolescent individuation takes place largely within the education system and is defined through various schooling options at the entry point to upper secondary education, as this transition implies the definition of a personal project.

Secondary education defies all social actors involved in this process, especially young people, but also those who try to «help» them choose, to work with a still-developing autonomous identity (of the adolescent) confronted with an "obligation" to define a future destiny – by means of a compulsory vocational choice.

In our contribution we confront this critical moment from two different points of view. On the one hand we examine the work of career guidance experts that act

within school field. We highlight the plurality of guidance models and practices, some more career-based and employability oriented, and others valuing the building of life projects through exploration and more self-accomplishment oriented.

On the other hand we will try to show how this guidance is part of a wider set of influences and sources of information that result from young people participation in multiple social spheres.

Using data from a recently completed project, we intend to explore the adolescent tension between the obligation to choose, within a frame of constraints, with the ethical injunction to pursue authenticity and self-accomplishment.

Head First into Secondary Education? - Finnish Young People's Hesitant Educational Choices

Tarja-Riitta Tolonen, Sinikka Aapola-Kari
University of Helsinki, Finland; Youth Research Society

tarja.tolonen(at)helsinki.fi, sinikka.aapola-kari(at)nuorisotutkimus.fi

In this paper, we present some preliminary results on young people's processes of making educational choices from our study 'Youth in Time'. It is a qualitative longitudinal research project coordinated by the Finnish Youth Research Network, in cooperation with researchers from the universities of Eastern Finland and Helsinki. We have interviewed 125 young people, born in year 2000, from five research sites around Finland. We aim to follow the lives of the same young people for at least ten years, charting their transitions into secondary education and beyond. In this paper we focus on selected cases.

As young people face the institutional point of choosing options for secondary education, they use various types of rationales, some of which are based on their educational achievement, others based on their family histories and various sources of knowledge about professions. Others base their choices on friends' choices and leisure time activities, and all have to take into account the local educational options available. In more remote areas, young people have to consider their resources in relation to moving to other localities in order to reach viable schooling alternatives. The students' choices are negotiated in relation to gender, parents' educational background, ethnicity and local traditions. All these aspects will be presented using examples from our data.

Models for human development of the Russian youth in the region: necessary conditions and incentives

Irina I. Kharchenko
Institute of Economics & Industrial Engineering,
Siberian Branch of Russian Academy of Sciences,
Russian Federation
kharchen(at)ieie.nsc.ru

The purpose of the study is identification of incentives and conditions conducive to successful personal self-realization and professional self-determination (mainly in education and employment) of young people in the

region on the example of students.

The empirical base consists of the data of monitoring sociological surveys in Novosibirsk region conducted by IEIE SB RAS. The latest were of undergraduate university and college students (2015/16 years, N=4670) and of senior school pupils (2014/15 years, N=1247).

The question in the inquiry about incentives to study was the most informative to identify the types of social behavior that contain the features of achievement in main spheres of students' activities. Consecutive using of methods of factor analysis (obtained 6 factors with explained variance 63.35%) and cluster analysis (obtained 6 cluster groups by k-means method): 2 of them was characterized as "achievement" model, 2 as "adaptation", 1 "avoidance", 1 – "mixed" model. We revealed the following factors that contribute to the allocation of the student in one of the 'achievement' cluster (by the binary logistic regression method): study in specialized classes, attendance of creative hobby groups during schooling, participation in almost all kinds of additional educational activities that contribute to the further entrance (usually at universities), confidence in their professional choice, focus on high quality when choosing educational institution for admission, the parents' authority in choosing of educational institution or similar parents' occupation to selected specialty, arriving for study to Novosibirsk from the cities of other regions.

Theories of human capital, human development, social inclusion and exclusion, transitions from school to work, theories of motivation and others are used in the research.

RN30 | Session 10b Social Exclusion

Staying Inside: Social Withdrawal of Young Finnish 'Hikikomori'

Hanna-Mari Husu, Vesa Välimäki
The University of Jyväskylä, Finland; The University of Jyväskylä, Finland
hanna-mari.husu(at)jyu.fi,
vesa.i.valimaki(at)student.jyu.fi

Our presentation explores socially withdrawn young Finnish people on an Internet forum who identify with the Japanese hikikomori phenomenon. We aim to overcome the dualism between sociology and psychology found in earlier research by referring to Pierre Bourdieu, who provides insights into how individual choices are constructed in accordance with wider social settings. We focus on the individual level and everyday choices, but we suggest that psychological factors (anxiety, depression) can be seen as properties of social relations rather than as individual states of mind, as young adults have unequal access to valued resources. We scrutinise young people's specific reasoning related to the social and psychological factors and contingent life events that influence their choice to withdraw. An experience of inadequacy, a feeling of failure and a lack of self-efficacy are common experiences in the data. This indicates that young adults who identify with the

hikikomori phenomenon find external society demanding and consider themselves lacking resources such as education, social networks or the personality type that they see as valued in society and as essential to 'survival'. They also feel that they cannot control their life events, which may mean that they receive little help in their everyday lives.

Assessing family risk factors as predictors of problematic behaviour of adolescents

Julinda Cilingiri

"Aleksander Moisiu" University of Durres, Italy

juli_cilingiri(at)yahoo.com

Recently Albanian society has been experiencing a worrisome phenomenon: adolescents engaging in problematic behaviours. However, little has been explored by the researchers on the causes and predictors of such behaviours. One plausible explanation would be that children carry or are exposed to different level of risk factors that influence the development of dangerous behaviours as they grow up. This study was designed to explore the prevalence of such behaviours and to assess the risk factors that predict them. This presentation shares findings related to the family risk factors, specifically: family conflicts and history of antisocial behaviour, parental monitoring, and parents' favourable attitudes to antisocial behaviours.

Participants were 1300 middle and high school-attending adolescents (783 girls, 517 boys), of grades 7 through 11, randomly selected from three of most populated areas of Albania. Adolescents' experiences, attitudes and perceptions related to a range of individual, family, school and community risk factors were assessed by in scale items, which level was calculated in percentile scores from 0 to 100, through a self rated instrument (Communities that Care Program). Problem behaviours (suspension from school, aggression, weapon carrying, substance use, gambling, bullying, gang membership) were assessed separately and were processed in a scale with higher points indicating more problems. Of other inferential statistics, logistic regression analysis was used and marginal effects showed that adolescents (and more boys) were at high risk of poor parental monitoring and family conflicts and history of antisocial behaviours.

Addressing to in-risk families, by promoting parenting programmes would be an effective area of prevention and prevention, both in local and in national level.

The Diagnosis of the "Generation of Independence": Social Exclusion of Youth in Armenia

Aram Vartikyan

Yerevan State University, Armenia

mcc(at)ysu.am

The transformation of Armenian society, such as transition from the Soviet economic reproduction system to market relations, political instability and inefficient governing, long-term consequences of the

1988 earthquake and the Nagorno-Karabakh conflict resulted in the extreme poverty and deep polarization of the Armenian population. The abovementioned is paralleled with degeneration of the society's institutional reproduction, as well as with the breakdown of social relations in different levels and of different nature. The consequence of the mentioned is the social exclusion of the separate strata and groups, when normatively desired optimal participation in broader social, institutional relations of social subject is blocked. In this respect, the youth is the most vulnerable part of the Armenian society, who in the case of the stable development of the society uses to act as social innovator and be the holder of important social relations. The social exclusion of the latter from the social benefits and their availability, from the main areas and relationships for the continuous functioning of the society has negative effect on both the youth and the whole society. The multidimensional operationalization presented in the paper allows for proposing a set of variables, which assess the availability of the public goods for the youth, participation and membership in the main areas of social existence, including wealth, income, labor, housing, education, health, political participation and etc. In addition, the article also focuses on phenomena which are acting simultaneously with the latter, such as social distrust, pessimism, apathy, irresponsibility, alienation.

And yet they have always been moving! An intergenerational account of labour mobility and precarity

Dimitrios Parsanoglou

Panteion University of Social and Political Sciences, Greece

parsanoglou(at)panteion.gr

The discourse on precarity has been developed since the early 1980s in order to encompass all possible shapes of unsure, not guaranteed, flexible types of work: from illegalised, seasonal and temporary employment to homework, flex- and temp-work to subcontractors, freelancers or so called self-employed persons. While discourses on labour market flexibility, developed during the same period, insisted on the economic optimisation that flexible working arrangements could generate within an increasingly competitive globalised environment, discourses on precarity highlighted the degrading effects of the 'flexibilisation' or 'casualisation' of labour markets on workers' lives.

In this paper, we will put precarity into a historical, more precisely into an intergenerational perspective. Our presentation will be based on empirical material retrieved from 33 life course interviews with men and women of three age cohorts (i.e. people born in 1950-55, 1970-75 and 1990-95), in the framework of the HORIZON 2020 project "NEGOTIATE: Overcoming early job insecurity in Europe". Through the interviews, albeit strong differentiations regarding the macroeconomic environment, i.e. the resounding effect of post-2008 financial crisis on contemporary

young workers, one can find persisting forms of precarity, accompanied by diverse patterns of mobility. Drawing from experiences during the early work life, linked to one way or another to structural characteristics of each respective period, we will try to provide a diachronic account of precarity and mobility in the context of the Greek labour market(s).

RN30 | Session 11c Methodologies in Youth Studies

The temporality and “historicality” of the individual: Methods and challenges of a qualitative follow-up study tackling historical landmarks and agency

Magda Nico

CIES-IUL /ISCTE-IUL, Portugal
magdalalanda(at)gmail.com

The economic crisis in Portugal can be seen as an historical landmark that affects the route of a country's collective and generational identity but the timing of life in which is strikes also changes significantly the effect in might have in people's trajectories and understandings of those trajectories.

A qualitative and biographical research on “middle class” transitions to adulthood carried out in 2009 was somewhat surprised by these historical circumstances. 52 young adults between 26 and 32 years of age were interviewed about their educational, residential, occupational and romantic lives. The crisis was not yet felt or imagined, and its effects were speculated but not experienced. On the other hand, although precariousness as a phenomenon was present in all the trajectories, its social and educational stratification was a clear predictor of different profiles of youth integration, persistence and subsistence in the labor market. The serendipity effects of the crisis and of the measures taken by the government on its behalf inspired a follow-up study that mobilizing a multiplicity of life course research instruments (biographic interview, life calendar, focus of control exercise, past reality checks) carried out a re-interviewing process to these individuals. This was developed during 2016 and 2017.

Results go the heart of the discussion of a distinction between ‘generation in itself’ and ‘generation for itself’ (Nico & Alves, 2017) and between ‘biographies of choice’ or ‘discourses of choice’ (Nico & Caetano, 2015). The apparent asocial reading of their life trajectories, which is not equivalent to lack of political literacy or participation, is discussed on the light of a critical approach to the theories of individualization.

Methodological notions around mentally disabled youth as informants of youth research

Päivi Armila

University of Eastern Finland, Finland
paivi.harinen(at)uef.fi

The focus of this presentation is on methodological challenges faced in a research project dealing with disabled youth's possibilities to participate in sports

hobbies. In this process interview data have been collected among also mentally disabled youth whose cognitive and communicative capabilities are limited. A phenomenologically orientated researcher is confused when trying to analyze and interpret this kind of data, as the hermeneutic principles of interpretation easily fracture in these meetings of two different realities and life worlds. The aim of my notions are to raise discussion about the topic very rarely explicated in methodological pondering of youth studies.

Where is the «we» in young people's unemployment stories? 211 people in seven countries narrating about unemployment and job insecurity

Ida Tolgensbakk, Janikke Solstad Vedeler
Oslo and Akershus University College of Applied Sciences, Norway; Oslo and Akershus University College of Applied Sciences, Norway
Ida.Tolgensbakk(at)nova.hioa.no,
janikke.s.vedeler(at)nova.hioa.no

In NEGOTIATE, a comprehensive EU-funded project, researchers have examined people's experiences of early unemployment and job insecurity in seven countries. Participating countries were Bulgaria, the Czech Republic, Germany, Greece, Norway, Poland and the UK – countries very different as to welfare strength and politics, as well as to unemployment rates. In Germany, seven out of 100 youth below the age of 24 are unemployed; in Greece, it is every other person. Despite the differences, we identified a few master narratives that were prevalent across the countries, categorized as the Stumbler, the Precariat, the Messy Life, and the Great Crisis Narrative. In this presentation, we examine to what extent the interviewees talk about a collective identity, a “we, the unemployed”. Preliminary analysis shows that it is only those with a physical disability as well as those with a Roma background narrating a Precariat Narrative and those telling a Great Crisis Narrative that to some extent view themselves as part of a collective as unemployed. Drawing on Nancy Fraser's social justice theory, we discuss this seeming lack of a politicised community, and offer some potential insight into why unemployed youth do not see themselves as a “we”.

<https://negotiate-research.eu/>

Minority young people's stories about tense ethnic relations in the year of 2017

Pia Nyman-Kurkiala, Henrik Waldemar Kurkiala
Åbo Akademi University, Finland; Åbo Akademi University, Finland
pnyman(at)abo.fi, henrik.kurkiala(at)gmail.com

The aim is to describe minority young people's experiences of conflicts with majority young people based on qualitative data collected in the spring of 2017. These ethnic conflicts arise due to the different languages of Finland-Swedish (the minority, whose mother tongue is Swedish) and Finnish-speaking (the

majority, whose mother tongue is Finnish) young people in Finland.

The empirical material consists of essays written in the spring of 2017 by ninth-grade pupils (15-16 years old) in Swedish-speaking upper-level schools in several cities in Finland. The cities are chosen taking into consideration different language environments. The essays are analysed by qualitative content analysis using NVivo 11.

Data have been collected over time repeatedly with this same method. In the older data one of the themes, which stood out conspicuously, were conflicts with Finnish-speaking young people. Verbal abuse was the most common form of conflict described, but also threatening physical advances and fights were described. The conflicts seem to be related to the identity work and ethnic identity of the young people. In the cities where Swedish-speakers form a minority, Swedish-speaking young people felt abused by Finnish-speaking young people and had developed a range of strategies to defend themselves against the abuse.

In the essays gathered this spring, in the spring of 2017, we'll seek for young Finland-Swedes stories about tense ethnic relations to majority young people and for the coping strategies the minority young people are constructing to handle these situations. First preliminary results will be presented at ESA 2017.

RN31 - Ethnic Relations, Racism and Antisemitism

RN31 | Session 01a Anti-Gypsyism and Representations of Roma

Infrastructure in Roma Settlements in Slovakia: Towards a Typology of Unequal Outcomes of EU Funded Projects

Richard Filcak, Daniel Skobla
Slovak Academy of Sciences, Bratislava; Institute for Research on Labor and Family, Slovak Republic
richard.filcak(at)savba.sk, danielskobla(at)gmail.com

The social exclusion of the Roma population in Slovakia is manifested in many areas of life— from housing, education, access to healthcare and services, to employment and spatial distance. More than half of the Roma live in segregated settlements, which are characterized by a lack of fundamental physical infrastructure. Although a substantial number of infrastructure projects funded from EU funds were implemented to address appalling living conditions of the Roma, the outcomes had been inconclusive. The authors suggest that significant factors affecting the projects' outcomes are power asymmetries, and rooted discriminatory social practices at the local level. Employing P. Bourdieu's theoretical concepts and building on extensive fieldwork in municipalities of eastern and southern Slovakia, the authors identify three types of EU infrastructure interventions' results. These might serve as 'ideal types' to facilitate better understanding of decision-making, and how various social agents shape projects' implementation at the local level. The authors also discuss possibilities of how to mitigate discrepancies between the declared goals of the EU funded projects and their real outcomes.

The perceptions of civil society actors in Ghent about Roma and their integration: ambiguous processes of othering within an inclusive framework

Ama Amitai, Chloë Delcour
University Gent, Belgium; University Gent, Belgium
ama.amitai(at)ugent.be, chloe.delcour(at)ugent.be

This research focuses on the role of civil society organizations in the integration process of Roma by looking at their perceptions about Roma. We argue that it is important to incorporate a focus on power relations and representations of migrants in integration research because most research only concentrates on

the characteristics of the migrants. We studied interviews of the actors in the civil society organizations and their mission statements with a category- and framing analysis. While research mostly focuses on explicit exclusion, the results show that there are excluding mechanisms within seemingly inclusive initiatives. On the one hand, the respondents emphasize the responsibilities of society in the integration process and de-essentialize Roma. The volunteers do this more explicitly than the professional actors. On the other hand all respondents express an excluding discourse where Roma are represented as "the other", opposed to society as a whole and migrants who have been in Belgium longer. Especially Romanian Roma are represented as the ultimate other. Furthermore the integration of Roma is framed in different ways: through the cultural frame and the poverty frame. Nevertheless Roma are essentialized in both frames by associating them with fixed characteristics, namely their unchangeable culture and a long-lasting poverty condition. A clear vision concerning inclusion and awareness about the subtle exclusion mechanisms is needed in the organizations. The organizations should strive towards equality of Roma based on their differences. Interpreting Roma in a more hybrid way makes it possible to de-essentialize them, yet facilitating political mobilization.

"People of Freedom and Unlimited Movement" – Representations of Roma in Post-Communist Memorial Museums

Ljiljana Radonic
Austrian Academy of Sciences, Austria
ljiljana.radonic(at)oeaw.ac.at

Remembering crimes committed against Roma in World War II has become part of a process one might call 'Europeanization of memory'. The analysis of post-communist memorial museums that re(opened) their exhibitions in the last ten years shows that dealing with the Roma is considered part of 'being European' in those museums oriented towards 'western' musealization standards. The memory of the crimes committed against Roma by Nazis and their collaborators is not internalized as part of national history. 'They' are not part of the collective and none of the museums actually has a strategy on how to put Roma in relation to the other groups. They rather reproduce stereotypes and even racist clichés. This will be shown on the cases of the Jasenovac Memorial Museum in Croatia, the Holocaust Memorial Center in Budapest and the Museum of Slovak National Uprising in Banská Bystrica. In contrast, the exhibition on the Roma genocide displayed at the Auschwitz memorial was curated by a German institution, has an individualizing approach and lets Sinti and Roma speak for themselves. This forces us to reflect the problem of German institutions acting as role models for dealing with the past and approaching the crimes committed in Nazi conquered Europe.

The hated and the ignored. Attitudes towards Roma people and Jews in the Czech Republic.

Tomáš Čížek, Martin Vávra

Institute of Sociology of the Czech Academy of Sciences, Czech Republic; Institute of Sociology of the Czech Academy of Sciences, Czech Republic
tomas.cizek(at)soc.cas.cz, martin.vavra(at)soc.cas.cz

Prejudices against Jews and Gypsies were strong and widespread historically at territory of the contemporary Czechia. Our paper shows what the prejudices are at present times (after 1989 when rapid social change started). Negative attitudes towards Roma people are still omnipresent. Roma are frequently seen as typical examples of strangeness, aliens in Czech society, despite the fact, that most of Roma people living in Czech Republic has Czech citizenship and declares Czech nationality. The attitudes are only very slightly related to age, education or other important socio-demographic variables but contact with Roma people as friends and personal values make important difference.

Jews as a group are rather ignored then hated by majority of contemporary Czech society. Prejudicial attitudes towards them are much less shared across society compared to other central European countries, but deeper analysis indicate that, at least for important part of society, some kind of ambivalent prejudice still exist. Jews are competent in education or business but egoist according to it. Relation with sociodemographic variables is stronger in case of anti Jew attitudes.

In final part of our presentation we shows the effect of "immigration crisis" (connected to strong anti-muslim sentiments in Czech public discourse) on attitudes towards Roma people and Jews.

Our analysis is based on data from questionnaire-based surveys representative for adult Czech population complemented by analysis of semi-structured interviews.

RN31 | Session 01b Antisemitism and Racism in the Media

Relief through demonization – The discursive purpose of Israel bashing in Europe's web community

Matthias Jakob Becker

Technical University Berlin, Germany
mjb(at)mail.de

The phenomenon of antisemitism has always been transferred in various shapes. Especially on the Internet, antisemitism in the shape of hostility against the Jewish state is spreading on a large scale.

In my PhD thesis, I am analyzing antisemitism expressed in readers' comments on British and German media websites related to the Mideast conflict. The Guardian and Die Zeit, two left-liberal newspapers, provide the data of my linguistic analysis. Readers of these journals mainly align themselves with the respective political position. Despite their humanistic and democratic positions, implicitly uttered

antisemitism can easily be found within the readers' comments.

What my research also reveals is that the discourse on the Mideast conflict shows a significant function of relieving the collective consciousness from committed injustices in European history. Relativizing such chapters, the legitimacy of identifying with one's own nation can be (re-)established.

In Germany, also politically moderate web users often draw analogies between Israel and Nazi Germany. Through the discursive construction of a Nazi-like regime in the Mideast, the uniqueness of that period of German history seems to fade.

Interestingly, comparing Israel to European atrocities is a phenomenon to be found also in the UK. In British discourse, web users present Israel's policies as reminiscent of British colonialism.

Through providing an overview of nowadays' most representative forms of such argumentation through a linguistic set of tools, my work aims at examining the characteristics of European debates on Israel. Different historical backgrounds guide to divergent narratives that determine taboos and tendencies of language use.

Closeness and Distance in Media Reports on the Trollhättan Attack

Marta Kolankiewicz

Lund University, Sweden
marta.kolankiewicz(at)genus.lu.se

The paper explores the Swedish media reporting on the Trollhättan school attack, in which a pupil and two staff of the school were killed and another pupil injured by a young man. The day after the attack the police declared that the attack was a hate crime since the victims had been selected because of their skin colour. I am interested in the first 24 hours after the attack—the time from when the news about the attack breaks until the moment that a hegemonic knowledge about the attack is established—and claim that the media played here a special role in installing frames, through which the audience could look at the event. Drawing on Judith Butler's theory of frames and Lilie Chouliaraki's theories of media discourses as construing sufferings as being worthy or not of spectators' pity, I identify three different frames installed by the media in this time: of the compassionate spectatorship, of threatening suburb and of a racist act. I analyse these frames and explore the possibilities they offer for audiences in terms of establishing closeness or distance to the suffering other.

Managing anti-Semitism in early postwar Germany – a content analysis of the press coverage of the 1959/60 'swastika epidemic'

Felix Knappertsbusch, Michael Hoettemann

Justus-Liebig-University Giessen, Germany; Philipps-University Marburg, Germany
felix.knappertsbusch(at)sowi.uni-giessen.de,
hoettemm(at)staff.uni-marburg.de

From late December 1959 to 1960 over 400 incidents of anti-Semitic graffiti, insults, and threats were recorded in Germany following the smearing of the Cologne Synagogue. This so-called “swastika epidemic” created massive media attention and is often considered the start-ing point of public discourse about anti-Semitism in postwar Germany (Bergmann 1990). Some even see it as a prime example of a critical examination of German anti-Semitism and the Nazi-past (Kittel 1993).

However, on closer inspection the media discourse regarding the “swastika epidemic” reveals a more ambiguous picture. We conducted a qualitative content analysis of media coverage in seven major German newspapers and tabloids (n = 308 Articles, December 28th – February 27th). We find that media discourse is strongly influenced by arguments aimed at the mitiga-tion and denial of anti-Semitism. In fact, only 9% of the analyzed articles deal with anti-Semitism as a social issue in its own right. About 45% of the coverage is instead concerned with identifying marginal groups of perpetrators (e.g. neo-Nazis, “rowdies”) and specifying immediate response measures (e.g. political education, rigorous policing). Although historical education does play a central role in the debate, it also seems strongly oriented towards tem-poral, social and spatial deflections of antisemitism (Nelson 2013).

The presentation will focus on different strategies of ‘managing’ the anti-Semitic wave as a problem that could neither be fully evaded nor fully recognized. Chief among these deflective strategies are:

- Defining narrow perpetrator-groups to contain the problem and safely assign responsi-bility
- Devising theories of instigation or conspiracy by soviet and/or right-wing organizations
- Re-framing the issue by claiming that anti-anti-Semitic critiques are used to discredit Germany in the international arena

Racist murders as a discursive event?

Georg Barthel, Helena Flam

University of Leipzig, Germany; University of Leipzig, Germany

georg-barthel(at)gmx.de, flam(at)sozio.uni-leipzig.de

Discourses about migrants affect the identity and the ethnic relations of a society. Discursive events may result in discursive shifts that modify this identity and ethnic relations. This occurred a few years after the murder of Stephen Lawrence by five racists in London in 1993. In the so-called Lawrence case, several factors led to a “mediatized public crisis that unleashed institutional reflexivity, social reforms and cultural change” (Scottle 2005: 51). The Lawrence-case will be compared to a German case. Between 2000 and 2006 a group of Neo-Nazis calling itself the National Socialist Underground killed nine migrants and exploded bombs in ethnic neighborhoods in different German cities. The reporting of three different German national presses between 2011 and 2016 will be analyzed to see whether the NSU killings resulted

in discursive changes on the topic of racism and the status of migrants in Germany. What happened after the initial outpouring of moral outrage? The presentation will highlight typical argumentation patterns which emerged in 2011 to explain the NSU as a phenomenon. It will then report on whether or not these changed by 2016.

RN31 | Session 02a Antisemitism – Case Studies

Are refugees from the Middle East importing antisemitism back to Europe?

Ben Gidley

Birkbeck, University of London, United Kingdom

b.gidley(at)bbk.ac.uk

Drawing on a five-country (Belgium, France, Germany, Netherlands, UK) European research project, and especially the UK case study, this paper explores the claim that migrants and especially refugees from MENA are carriers of hostility to Jews. What are the sources of this claim, and how can we understand it sociologically? What is the empirical basis for the claim? This paper shows the lack of evidence for widespread anti-Jewish attitudes among refugees from Syria and elsewhere, but also insists that we need to take seriously the sources of Jewish insecurity in Europe. It argues that circulating discourses of Sunni Arab migrants' antisemitism reveals at least as much about new vectors of racism within European society (including the role of what have been called “unorthodox” forms of fascism) as it does about refugee attitudes.

Comparative study on antisemitism of a macro border region in Europe

Laura Bergnach, Francesca Cavarocchi

University of Udine, Italy; University of Udine, Italy

laura.bergnach(at)uniud.it,

francesca.cavarocchi(at)uniud.it

Our purpose is to deepen the knowledge of the antisemitic social sub-culture in a regional border area distributed between Italy, Slovenia and Croatia, which extends between the Adriatic-Mediterranean and Eastern Europe. We have outlined of its size based on findings from a comparative perspective on the results emerged from two recent empirical surveys carried out in this specific socio-historical context characterised by a population ‘anthropologically’ peculiar, because ‘border’. The presence of linguistic and cultural discriminated minorities, greatly contributed to define their socialisation in a border setting means for individuals and actors the perspective “to learn” the original language, which is expressed like the contact with heterogeneity. The complex and profound social, cultural and economic relations that developed in the long period between the trans-regional areas is now influenced by profound changes occurred with the European enlargement; moreover with the intense migration flows from various national and ethnical origins, a phenomenon that forces to radically rethink

the status of foreigners in our time. Questioning the public relief of prejudice towards other cultures, we interpreted recent resurgence of antisemitic attitudes, operating on the weight of the feeling of distrust. In 'New Europe' the resurgence of anti-Semitic prejudices and xenophobia would be mainly related to the need to reorient and to defend a national identity under threat from the outside, while the anti-Zionism seems less important factor in the strengthening of antisemitic prejudice than in 'Old Europe' of the macro region.

Influence factors for engagement against antisemitism in a predominantly Muslim country – theoretical reflections on empirical results from Morocco

Kim Robin Stoller
Free University Berlin/ International Institute for Education and Research on Antisemitism, Germany
robin.stoller(at)iibsa.org

Antisemitism in predominantly Muslim countries is still underresearched. Given the fact that opinion polls are rare, the few existing studies show in general a high percentage of anti-Jewish attitudes and anti-Israel resentments. Major differences can be encountered in different language areas and socio-political contexts. But what is about people who engage against antisemitism? How comes that they get active – even if they might risk a lot?

Based on the results of a qualitative study on Civil Society activists confronting antisemitism in Morocco, this paper reflects on potential factors of influence. Who are they? What are their motives, backgrounds and political visions? How do they relate their activities against antisemitism and Israel-hatred to their general Civil Society approaches?

“One million antisemites“? Attitudes towards Jews, Israel and the Holocaust among refugees in Germany – Results from an empirical study

Sina Arnold, Jana König
Humboldt University Berlin, Germany; Humboldt University Berlin, Germany
sina.arnold(at)hu-berlin.de, jana.koenig(at)hu-berlin.de

In 2015 and 2016, more than one million refugees from Syria, Afghanistan, Iraq and other countries arrived in Germany. In the media, they were often portrayed as importing not only sexism and homophobia, but also antisemitic attitudes. But was it really “one million antisemites“ that arrived, as imagined by conservative politician Erika Steinbach in a tweet commenting on the Arabic world cheering the fires in Haifa this winter?

In a recent empirical study, we conducted qualitative interviews with 25 refugees from Syria, Iraq and Afghanistan, asking them about their views on Jews, Judaism, Israel, the Middle East conflict and the Holocaust, but also their living conditions in Germany, experiences of discrimination, and hopes and fears regarding the future.

In our analysis we focus on specific patterns of

argumentation and their links to collective identities (national, ethnic, religious, political) as well as demographic factors. Moreover, we take into account the potential role of discrimination faced in the sending and receiving countries in influencing attitudes.

In addition, we spoke with 14 experts from civil society, refugee aid groups as well as Jewish organization; asking them about contemporary Jewish fears about a rise in antisemitism, perspectives on the topic of antisemitism among refugees and best practices in combatting it.

We theoretically situate our study within current debates on „Muslim“ or „Arab“ antisemitism and put forward some methodological suggestions for the further study of antisemitic views on the part of discriminated minorities.

RN31 | Session 03a Anti-Gypsyism and Ethnic Identification of Roma

The Gypsy card- Changing forms of anti- Roma rhetoric in Hungary

Aniko Félix
Eötvös Lóránd Science University, Hungary
aniko.felix(at)gmail.com

Although the contemporary far right rhetoric in Europe is centralized by anti-immigration, xenophobic discourse cannot be separated from the other forms of hate, like anti-Roma attitudes. In Hungary anti-Roma attitudes were always on a very high level in the society, however, the political discourse was less explicitly anti-Roma on the surface for long. Scholars mostly explain the thematization of the 'Gypsy question' as one of the key factors in the success of the far right party Jobbik (Movement for a Better Hungary). The innovation of Jobbik was rather the explicit extremely racist language combined with the criminalizational discourse both at the local as well as at the country level. Moreover, although the increasing level of anti-immigration in the political discourse has seemingly displaced the 'Gypsy question', it is still there, however in different forms and with different tones. Once, Roma are used as 'cards' against immigrants and refugees, when right wing parties define them as 'problem we already have', whereby 'we do not need the immigrants'. The presentation will focus on the trajectory of the anti-Roma attitudes in the political discourse from the first period, when a far right party, MIÉP entered the Parliament in 1998. Quantitative and qualitative methods will be used to uncover the complexity of the issue, analyzing party programs and manifestos and also parliamentary speeches of the reviewed period with discourse analysis in the first and network analysis in the latter case. Thereby the whole spectrum of the changing discourse can be revealed as well as the process how Roma would be “smaller” enemy compared to the refugees and used against them in the contemporary political discourse in Hungary.

Ethnic Identification of Roma in Romania

Carmen Buzea
Transilvania University of Brasov, Romania
carmen.buzea(at)unitbv.ro

Roma represent the most vulnerable ethnic minority in Europe, facing prejudice, intolerance, discrimination and social exclusion. The current paper investigates the internal versus external ethnic identification, based on data collected in Romania, an European country with a large Roma population. An extensive field work has been conducted to identify and present the Roma communities in a county from Central Romania consisting of 58 sites (10 cities and 48 villages). Results showed that: a) external ethnic identification (identification made by others) is three times higher than the official census data and the extreme poverty is the common characteristic of Roma communities; b) according to local experts, main markers to identify Roma refer to geographic proximity, extreme poverty, poor living conditions and enlarged family size. Implications for social inclusion programs at local and European level are discussed along with directions for future research.

“Pretty normal people” – Sinti and Roma between Indifference, Normalization and Exclusion in German educational settings

Holger Knothe, Mirko Broll
Munich University, Germany; Munich University,
Germany
holger.knothe(at)soziologie.uni-muenchen.de,
mirko.broll(at)soziologie.uni-muenchen.de

Since the European Parliament passed a groundbreaking resolution in 2005 which stated “the Romani Holocaust deserves full recognition, commensurate with the gravity of Nazi crimes designed to physically eliminate the Roma of Europe” (European Parliament, 2005) it became clear that the subject of public recognition of the German genocide against Roma and Sinti resonates not only within the national but also the international public sphere. On the other hand the genocide is still widely unknown and current resentments and prejudices against Sinti and Roma are still going strong within major parts of Germany’s population. The interconnectedness between dealing with the past on a symbolic level on the one hand and current practices, discourses and attitudes towards Sinti and Roma on the other hand is also visible within the ambiguous results of our qualitative interview-based study with German teachers and pupils. Therefore the reconstruction of positioning processes regarding Sinti and Roma indicates their highly vulnerable placements between indifference, normalization and exclusion within our data. Thus the paper’s contribution is twofold: firstly in the production of sociological knowledge regarding communication about racisms and memory politics in educational contexts and secondly in its efforts to identify working strategies against Anti-Gypsyism in order to contribute to anti-racist strategies in the public sphere in general.

The Poverty Trap Pushed to its Extremes by the Poor Housing Conditions Overlapping with the Stigmatizing Representations: The Case of Urla, Sira Neighbourhood Romas

Adile Arslan Avar, Fehmi Dogan, Tonguc Akis
İzmir Institute of Technology, Turkey; İzmir Institute of
Technology, Turkey; İzmir Institute of Technology,
Turkey
adilearslan(at)gmail.com, fehmidogan(at)gmail.com,
tongakis(at)gmail.com

This study draws on a critical interpretative empirical research on Roma people living in Urla, Turkey. The research was conducted as part of a project to improve the housing and living conditions of Roma who live in a segregated, “illegal” and run-down housing area in Sira neighborhood, Urla.

The segregation, criminalization, and marginalization of Roma is common among the Roma population of Turkey. What makes the Sira neighborhood Roma unique is they are entrapped by the deepest poverty conditions compared to other Roma people living in Turkey. The poor housing conditions and locals’ stigmatizing representations of them operate together placing them in a tacit circle out of which they cannot escape to overcome their poverty.

Although they are not nomadic nor travelers, it is hard to call their houses as “house”. These are jerrybuilt shelters with various materials collected from the waste. For outsiders, including potential employers and for top officials of the town, the Roma’s housing conditions is seen as a primary indicator of their unwillingness and lack of aptness to be integrated into the local social-economic life. For the Roma, their housing conditions create practical and symbolic “reasons” of their stigmatization and criminalization preventing them from participating into the labor market. At the time of the study, they could make their living only by waste collection, flower selling, drumming during the Ramadan month, and causal agricultural works.

The study highlights that the housing conditions of the Roma people impede in and of itself their integration into the social-economic life by invoking in the discourses of locals unfavorable representations and in the discourses of Roma self-deprecating ones.

RN31 | Session 03b Antisemitism and Anti-Muslim Racism**Antisemitism in Muslim communities in the context of hatred against Muslims: The example of the UETD (Union of European Turkish Democrats) in Austria**

Helga Embacher
University of Salzburg, Austria
helga.embacher(at)sbg.ac.at

So-called “Muslim antisemitism” is a very complex and controversial phenomenon that has been instrumentalized from various sides. Using the example of the UETD, which represents successful,

well-educated immigrants or children of immigrants who emphasize their Turkish identity, has close ties to the Turkish AKP and was the main organizer of the pro-Gaza demonstrations in 2014, I will discuss the following questions:

1) What is specific about antisemitism in Muslim/Turkish communities in Austria, in what ways does “Muslim antisemitism” differ from left-wing or mainstream antisemitism, and what role does religion play? I further will emphasize the active part played by Turkish Prime Minister Erdoğan in the Middle East conflict to mobilize parts of the Austrian Turkish community for “Gaza”. 2) I will show that during the Gaza War, antisemitism was instrumentalized by various sides to whitewash the majority of the Austrian society. Focusing on the FPÖ, which only started to side with Israel in 2010, I will demonstrate that this right-wing party connected a pro-Israel stance with the message that Muslims are unable to integrate into Austrian society. Accusing all other political parties of ignorance of antisemitism and of supporting Islamism, the FPÖ stylized itself as the only enlightened, anti-anti-Semitic political force in Austria.

Finally, I want to propose an analysis of antisemitism in Muslim communities in a very broad context that includes global anti-Semitic stereotypes, the influence of countries Muslims are rooted in, as well as specific anti-Semitic traditions and debates about Islam and Muslims in the respective country which, in turn, have an enormous effect on reactions within the Muslim communities.

Muslim Anti-Semitism, Anti-Muslim Racism, and Distorted Communication

Floris Biskamp
Universität Kassel, Germany
floris.biskamp(at)uni-kassel.de

Today, any debate on topics related to Islam poses a dilemma. This is particularly true for debates on Muslim anti-Semitism. On the one hand, Muslim anti-Semitism poses a real and deadly threat, which became most obvious in the series of anti-Semitic massacres Europe has witnessed recently: Toulouse (2012), Burgas (2012), Brussels (2014), Paris (2015), and Copenhagen (2015). On the other hand, any discussion of Muslim anti-Semitism in Europe must deal with the context of racializing anti-Muslim discourses that is often articulated with liberal arguments. Accusations of patriarchy, homophobia and anti-Semitism are common topoi in anti-Muslim discourses, not only among right-wing populist parties who are themselves often prone to patriarchy, homophobia, and anti-Semitism.

Most theories of anti-Muslim racism or islamophobia are not well-equipped to confront this dilemma. They correctly address the discursive function of these topoi: Blaming the problems of patriarchy, homophobia, and anti-Semitism on a minority, these discourses exonerate the general population from these problems. However, having pointed this out, common theories of anti-Muslim racism are left without means of grasping the undeniable problems

within Muslim communities, e.g. anti-Muslim racism. The cause for this partial blindness of these theories is their type of understanding of racist discourses as mere production or construction of difference from nothing.

To address this dilemma, I propose a different theory of racializing discourses. Building on Habermas’s concept of systematically distorted communication, I start with the assumption that there are real differences that must be addressed in public discussion. However, these debates take place under distorting circumstances leading to stigmatization and discrimination. In my paper, I discuss the indicators of such distortions as well as ways of addressing them.

Anti-Semitism and Islamophobia: two faces of discrimination?

Alberto Spektorowski
Tel Aviv University, Israel
albertos(at)tau.ac.il

As Anne Norton has noted, “The Jewish question was fundamental for politics and philosophy in the Enlightenment. In our time as the Enlightenment fades, the Muslim question takes its place.” I suggest that this claim synthesizes the problem, and it is an important starting point for this article. My main argument is that integrating the Jews into the polity was an integral part and even a justification of the Enlightenment project and the democratic state. At the same time the Jew became a marker and a challenge for the enemies of the Enlightenment in all its forms. While the integration of the Jew into the polity proved the success of the emancipating role of the Enlightenment, it became a problem and an asset for anti-democratic nationalists. In contrast the integration of Muslims into the western democratic polity has set a challenge and became a problem for liberals rather than for conservative exclusionists. Paradoxically the question of Muslims integration, has contributed in enhancing a type of “civic confrontation” in liberal political thought, between liberal multiculturalists and supporters of religious freedom on the one side, and secular democratic liberal nationalists, civic integrationist, and supporters of individual equality over religious freedom on the other. The conflict over the Muslims question and the definition of Islamophobia, has shaped and radicalized these two versions of liberalism

In short, in contrast to scholars that present Jews and Muslims as similar victims of racist nationalism, I suggest that while Jews have enhanced the conflict between the racist integralist Right and liberal democratic nationalism, the question of Islam has triggered a dilemma in liberalism itself, precisely because Muslims challenge

"From "Supersession" to Interaction: Towards comprehensive Approaches regarding the Study of Antisemitism and anti-Muslim Racism

Julia Edthofer

University of Vienna, Austria

julia.edthofer(at)univie.ac.at

In my presentation, I illustrate academic debates about a "supersession" of antisemitism by anti-Muslim resentment and propose comprehensive perspectives instead.

Approaches focusing anti-Semitism mainly relate to Critical Theory and the resentments' function as "negative leitmotif" of modernity, while perspectives on anti-Muslim racism mostly take a hegemonic-theoretical stance focusing discursive shifts. Thereby, the focus on antisemitism partly blanks out that "Islamization" is increasingly constructed as major threat to crisis-torn Europe. The emphasis on anti-Muslim racism, on the other hand, does not grasp the specificity of anti-Semitism as ideology constructing sinister "puppet masters" behind "the system"; currently embodied within the trope of greedy and treacherous "elites". This—by no means superseded—structurally antisemitic "Anti-Establishment-Frame" contributed to the Brexit-vote as well as to the success of Freedom Party-candidate Norbert Hofer in Austria's presidential election 2016.

I thus propose to correlate the analysis of current anti-Muslim racism and anti-Semitism systematically. This, however, would not mean to flatten differences, but to focus on their current interaction on a hegemonic-discursive level. In light of the growing threat of Islamist terror in Europe, the "Anti-Establishment-Frame" intermingles with the "Islamization-Frame". With regard to post-factual "Politics of Fear" (Wodak 2015), this interplay can be described as "treacherous elites not protecting 'us' from the Muslim (terror-)threat". As such, it constitutes an important ideological underpinning regarding the rise of right-wing populism and the extreme right all over Europe. Stronger focus on discursive interactions would allow for a comprehensive analysis designed to challenge that. Facing a potential extreme right-wing government participation in various European countries, it is now more important than ever to strengthen this political struggle and to intervene, rather than to reproduce merely academic supersession-debates.

RN31 | Session 04a Racism and Discrimination - Case Studies

Recent surge in 'hate crimes' in the UK: political, economic and legal dimension

Bernadetta Siara

University of Suffolk, United Kingdom

bernadetta_siara(at)yahoo.co.uk

In the recent months, the substantial increase in 'hate crimes' related to race and ethnicity has been reported in the UK, and this has been closely related to the EU Referendum that took place on 23 June 2016 and the associated proposal for leaving the European Union,

i.e. the 'Brexit'. The more widespread expression of 'hatred' has been linked to migration, and especially immigration into the UK from the EU countries, including the 'newer' ones, and its apparent impact on the local communities which then supposedly led to resentment among some of their members.

This paper will consider conditions that may have led to this phenomenon. Namely racist and xenophobic discourses, including these spread by some politicians, right-wing organisations or right-wing media, and their potential impact, for example, on the rise of authoritarian populism and associated racism will be discussed. Neoliberalism influencing the economy (and the labour market), as well as, the process of policy making (especially regarding the welfare state) will also be considered.

The paper will look at and analyse specific examples of 'hate crimes' that have been reported in various types of media and it will also pay attention to gendered aspects of these 'hate crimes'. The paper will focus on the importance of law in delivering justice to victims of 'hate crimes' in such cases. It will consider whether and how 'hatred' and respect for diversity and equality are embedded into the British law, and the role legal institutions could and should play in this process.

The inter-ethnic relations among students in primary schools in Cyprus: Investigating head teachers' view

Arsinoe Charalambous

Cyprus Ministry of Education, Cyprus

arsichar(at)yahoo.gr

Because of recent migration, the school student population in Cyprus is changing and becoming more multicultural and multilingual. Many writers support that contact with people from different cultures in Cyprus schools is creating serious problems: nationalism, racist behaviour, marginalization of some pupils, as well as aggressive behaviour. My goal in this paper is to explore the relations among students from different ethnic groups in primary schools in Cyprus from head teachers' point of view.

For the aforementioned purpose, this research employed a case study. In-depth semi-structured interviews and focus group discussion were used as the main methods for the data collection. Five public primary schools of Cyprus were chosen. The schools were big urban schools and were randomly selected from the Ministry's catalogue of urban schools. The head teachers were interviewed in their office during school time and the focus group discussion took place outside school in the afternoon. Some teachers from each school participated to the focus group discussion. This gave a broader picture of the schools' view regarding the relations among students from different ethnic groups in each school.

This exploratory study led to some interesting findings regarding the head teachers' view of the specific theme. Those findings may reflect the perceptions of a specific group of primary school personnel in Cyprus. Additionally, this research can contribute to the field of

educational research both in terms of an example of ethnic relations in primary schools and the ongoing discussion about relations among children from different ethnic groups in the Greek Cypriot educational system.

The Black Asian Minority ethnic female nurse: racism, power, colonialism and the Future of the National Health Service

Beverley Brathwaite

Birmingham City University, United Kingdom
b.brathwaite(at)herts.ac.uk

As part of my PhD I have looked at the history of black colonial women coming to the British 'mother land' to work as nurses. It is interwoven with the National Health Service (NHS) in England. This paper considers the colonial construct of the Black Asian, minority Ethnic (BAME) female nurse which is imbedded in British society. From post war, to the 1960s, to today, BAME women chose to nurse in the NHS; an enduring presence in the modern NHS. The experiences of the BAME female nurse in the 1970s and 1980s were overt racism and lack of advancement. By the late 1980's and in to the 1990's these experiences continued, and while racism was less overt, advancement levels remained lower than their white female counter parts. In the 21st Century there continues to be significant differences in treatment compared to white nursing colleagues, with the enduring effects of the coloniser holding the power to impact on the BAME female nurse who is the colonised, stereotyped and less powerful. There are multifaceted reasons for unequal treatment of BAME female nurses. However the persistent construct of colonialism and power needs to be recognised in order to acknowledge ongoing racialized based inequalities experienced by BAME nurses in the health service. A recognition of these discriminatory actions should permit the development of equal opportunity strategies to address these unacceptable inequalities.

RN31 | Session 05a Theorizing Antisemitism

Intersectionality of Ideologies – Challenges to the Research of Antisemitism, Nationalism and Sexism

Karin Stögner

University of Vienna, Austria
karin.stoegner(at)univie.ac.at

Intersectionality focuses on the multidimensionality of inequality and oppression in modern societies and analyses how the categories of race/ ethnicity, gender/ sexuality and class are interrelated and how this relationship shapes individual experiences and identity formation. Intersectionality asks how the special interests of marginalized groups and individuals are constantly denigrated by the universal. In contrast to this approach I suggest a shift in perspective – from the level of individuals affected by socio-economic

exclusion and antisemitic/ racist/ sexist/ nationalist marginalization to the level of those who follow exclusionary ideologies like antisemitism, nationalism, racism and sexism. The question I want to address is twofold: firstly I will investigate the multifaceted relationships in which these ideologies stand to each other, how they are intertwined and how they reinforce each other; secondly I want to focus on the social function of these exclusionary ideologies – the veiling of social antagonism – and investigate the benefit they imply for their followers.

The overall aim is to open the analytical concept of intersectionality for a profound critique of ideologies and to reveal the "special interests" of those who identify themselves with the universal. This universal, however, is itself a particularity that (historically, economically, politically, socially, discursively etc.) triumphs over other particularities.

Racism and Antisemitism: Modes of Denial

David Hirsh

Goldsmiths, University of London, United Kingdom
d.hirsh(at)gold.ac.uk

The scholarly analysis of left wing antisemitism has had to develop methods for recognizing and understanding the variant of antisemitism in which the social agents who are the carriers of antisemitism are unaware of their own role; indeed often when they think of themselves as committed opponents of antisemitism and when they angrily deny their own complicity. This paper surveys some of these methods of understanding and it looks at some of the rhetorical and discursive forms that denial and counter-accusation characteristically take.

This paper draws upon this body of knowledge, and this methodological toolkit, to shine a light on the Brexit and the Trump populist movements of 2016. As some on the left do with antisemitism, the Brexit and Trump movements angrily deny that they are racist or xenophobic while at the same time mobilizing, allying with or tolerating racist and xenophobic rhetoric, discourses and demands. This paper looks at ways in which denial and counter-accusation have operated within these movements.

This paper examines how antisemitism, xenophobia and racism have been re-described by the populists (both left and right) as modes of rebellion by the oppressed - whether it be conceived as 'white working class' or as supporters of the Palestinians or as the 'left-behinds'; while antiracism has been portrayed as a mode of domination, a dishonest discourse of power which functions to silence the organic rebellion of the oppressed. Those embracing such antiracism have been de-legitimized by the use of terms such as 'cosmopolitan elite' and they have been thus cast as 'unpatriotic or even as 'enemies of the people'.

‘The Jew’ as the Archetypical Other?

Evelien Gans

University of Amsterdam, Netherlands, The
e.gans(at)niod.knaw.nl

In our recently published book (Remco Ensel and Evelien Gans eds.) *The Holocaust, Israel and ‘the Jew’*. Histories of antisemitism in postwar Dutch society (Amsterdam University Press 2016) my introductory essay has the following title: *Why are Jews more guilty than others?* In this paper I want, firstly, to elaborate on some concepts which can throw more light on this ironic but at the same time serious question. Why has antisemitism proved to be such a stubborn phenomenon, since ages ago until now – why has ‘the Jew’ remained, also after the Shoah or Holocaust, such a ‘rewarding’ object for frustrations, rancour and hatred? Briefly, why is antisemitism such an effective multifunctional projection screen. Answering these questions I will use and / or expand the notions of other academics and also discuss some concepts we introduced in our book *The Holocaust, Israel and ‘the Jew’*. Such as the idea of ‘the Jew’ as *die Dritte* (Klaus Holz) (*The Third Party*), the *Hybrid Jew* (Henri Zukier), the Janus face and the three-piece suit of ‘the Jew’ (Evelien Gans).

RN31 | Session 06a Right-Wing Populism and Nationalism**Ideology, Power and Collective Identity of the Hungarian Neo-nationalism: A Discursive Approach of Understanding Right-Wing Radicalism**

László Péter Lipcsei

University of Debrecen, Hungary
laszlo.peter.lipcsei(at)gmail.com

My presentation investigates the discursive constructions of the ideology and collective identity of Hungarian right-wing extremist community. The research follows a constructivist logic, thus the concept of ‘nation’ or neo-nationalism are not substantive categories, but they are continuously (re)constructed through performative and discursive actions. The main sources of analysis are lyrics of Hungarian skinhead bands and an anti-establishment performance (Day of Honour) are to be analysed. These texts and talks are understood in the framework of ‘imagined community’ where the notions of ‘nation’, ‘white people’ or ‘superior race’ fulfil identity-building functions characterized by a positive group image: a heroic, masculine, brave image. Integration does not only strengthens the self, but the collective identity as well, and the neo-nationalists have the opportunity to gain collective experience of belonging. The anti-establishment memorial creates an alternative canon of collective memory by constructing a heroic event of the break-out of German and Hungarian soldiers from Buda castle during the WW II. This memorial is organized annually by Hungarian neo-nationalist and neo-Nazi organisations, that attracts interest of similar groups from all over Europe. This is the globalisation

of right-wing extremism, which creates paradoxically a nationalist but also supranational narrative. Neo-nationalist discourse constructs simultaneously the positive representation of the in-group and the group of ‘they’, presenting as a dangerous foreigner or a well-known enemy, whose existence threatens them. Critical discourse analysis calls it ‘ideological square’. These discursive strategies will be explained through the analysis of texts and speeches in my presentation.

„Taking the people’s fears seriously“ vs. „threat against democracy“. Public Debates about Contemporary Right-Wing Extremism in Austria

Matthias Falter

University of Vienna, Austria
matthias.falter(at)univie.ac.at

Far-right attitudes are not limited to so-called fringe groups and the extremist political margins of society. However, as various studies show, authoritarian, racist and antisemitic ideas diffuse into mainstream political discourse, drive electoral campaigns and even shape policies. The success of right-wing extremist parties does not only depend on their specific strategies of adaptation and differentiation within democratic institutions, but also on the general political context, on civic culture and political reactions to antidemocratic, far-right arguments. Therefore, the analysis of political debates on right-wing extremism contributes to the study of the societal opportunity structures, which do or do not foster the dissemination of authoritarianism, racism or antisemitism. In my paper, I will reconstruct public debates about right-wing extremism in Austria since 2008. The analysis will focus on two specific prominent argumentative frames. First, these debates are struggles about the very meaning about democracy and its normative boundaries. Second, the discourse about right-wing extremism very often is dominated by logics of ‘law and order’. Both frames, as will be shown, entail specific effects of legitimizing, displacing or ignoring ideologies of inequality, such as authoritarianism, racism and antisemitism.

Gender and Nation: A fertile blending, manifesting in Anti-Gender Discourses

Carina Maier

University of Vienna, Austria
carina.maier(at)univie.ac.at

‘Gender’ and ‘Nation’ materialize as essential structural categories, creating identities, influencing each other, instrumentalizing each other.

In the book ‘Gender and Nation’, Nira Yuval-Davis contributes a theoretical framework by – making visible the gendered dimension of nationalism - in discourses and constructions around ‘nation’ more general and in specific relations between masculinity and femininity within national projects in particular. Using three of her elaborated dimensions, the biological reproduction of nation, the cultural reproduction and the differentiation within legality issues concerning citizenship, I analyze Anti-Gender

Discourses occurring in Europe aggravated. Especially, I am interested in how these analyses of discourses among Anti-Gender can be useful for the sharpening of the notions of 'gender' and 'nation' and their theoretical marriage. My argument, the fertile blending of 'gender' and 'nation', appears obvious, not considering 'Anti-Gender' as a new phenomena, but strongly intensifying with the rise of right wing populism and right wing extremism. These discourses occur historically specific, supported by various actors, and in particular as national projects, but they are insightful for a lot of European countries, having certain characteristics in common. Especially significant here is the recourse on natural orders, inevitable to construct national projects. Paradoxically referring to Anti-Gender discourses at a European phenomena still makes sense, in trying to construct or rather reconstruct a specific constellation of gender and nation in whole Europe – in a biological, cultural and legal way – as opposed to a European 'Other', stabilizing Capitalism and in a way 'Making Europe'.

RN31 | Session 07a Ethnic Relations and Memory

Colour Gradations and Degradations among Ethiopian Jews in Israel

Shalva Weil
Hebrew University, Israel
shalva.weil(at)mail.huji.ac.il

This paper explores changing narratives from Africa to Israel vis-a-vis colour and examines new realities as racial discrimination in Israel, perceived or real, force Ethiopian Jews to define themselves as black. It will produce the results of a pilot study on perceptions of colour in Ethiopia and in Israel. It will then discuss the results in relation to:

Israeli society
U.S. Blacks
African diasporas

It will show that in Israel the narrative of the ingathering of a Jewish tribe from the remote corners of the world (Ethiopia) has been replaced by the trials and tribulations of a black ethnic group.

The Black Atlantic as the Public Sphere of Modernity

Marcos Vinícius Lustosa Queiroz, Evandro Charles Piza Duarte
Universidade de Brasília, Brazil; Universidade de Brasília, Brazil
marcosvlq(at)gmail.com, evandropiza(at)gmail.com

The present paper intends to think the Black Atlantic as the public sphere of modernity. The hegemonic narratives describe the constitution of the bourgeois public sphere as an eminent European phenomenon, specifically from social, economic and cultural practices that emerged in the context of the great metropolis among social groups linked to the overseas capitalist enterprise. In this sense, the Black Atlantic demonstrates how the communication networks did

not only change the life of European cities and the bourgeois sectors. Instead, new networks were formed between different human societies and individuals subjected to colonialism. There was a constitution of an underground communication framework between Europe and the rest of the world. This system was formed by the arrest of European rebel leaders and their submission to forced labor in the seas and in the Americas, as well as by the reconstitution of political ties and mutual agencies between leaders of black and subaltern rebellions from various locations in the colonial space. Thus, the paper seeks to understand how the several public spheres of modernity are born in intricate relations of power, where violence has been and continues to be a constitutive element that can not be overcome by mere sublimation or oblivion.

Air Raid Sirens, Ethnic Relations and the Sonic Commemoration of the Holocaust in Israel.

Yaron Jean
Univeristy of Haifa, Sapir College, Negev, Israel
yjean67(at)gmail.com

The social practice of using the mechanical sound of air raid sirens for commemorating the victims of the holocaust in Israel challenge the fragile equilibrium between the multiple populations of the country. Subsequently it implicitly further negotiates the monopoly of the state over public sounds and their political usage. However, by targeting different audiences by the same sound the universal nature of hearing, including air raid sirens, evoking different and perhaps contradicting forms of reactions. For secular Israeli Jews the political use of the sound of the siren perceived as a further consolidation of the dominant political and national narrative of the country. For ultra-orthodox Israeli Jews, the piercing secular sound of the siren is perceived as opposing the Jewish Halacha and therefore regarded by many as idolatry. Last, for the Israeli-Arab population of the country, the political use of alarming sound for the purpose of active commemoration of the holocaust serve as a further reassurance for the distinction between the populations of the country in a way that not only divide soundscapes but also divide memories.

In elaborating the complex relations between mechanical sounds, multiple audiences and competing memories and narratives the proposed presentation will address the culture and the history of air raid sirens and their uses for the purpose public and state rituals. In addition, it will discuss the singularity as well as the problematic impacts of using mechanical sounds within the instance of polyethnic societies and the way it may fuel competing notions of citizenship.

„Subjective Hungary” in Romania: How Young Ethnic Transylvanian Hungarians Perceive the Change on National Policy in Hungary?

Valér Veres
Babes-Bolyai University Cluj-Napoca, Romania
veresv(at)socasis.ubbcluj.ro

The aim of this paper is to analyse the social, identity-related and subjective changes triggered by modifications in Hungary's national policies in Romania, among young people belonging to the biggest ethnocultural minority, using an adequate theoretical framework (Brubaker, Hroch, Smith etc.). The essence of these changes in national policies is that the question of Hungarian ethnics living outside the borders of Hungary has become a central discursive element of public policies while relationships with neighbouring nations have become more confrontational and obtaining Hungarian citizenship through a simplified procedure has been made available for Hungarians living abroad. In our research we have emphasised the analyses of changes that can be noticed between 2001, 2010 and 2015, using survey data and focus-group interviews. The results of our research show that certain changes have occurred in the nature of the ethnocultural national identity of young people from Transylvania as well. Besides ethno-cultural criteria, the role of the Hungarian citizenship is constantly increasing in experiencing and defining „Hungarianness”. In parallel with this, being Hungarian is associated with strong positive feelings (proudness), but the percentage of those who identify themselves with completely positively experiencing Hungarians decreases among those whose parents have higher educational levels. Furthermore, we may also notice that local/regional ties also get stronger and we may also sense a strong shift of balance among students coming from different parts of Transylvania. This paper was supported by the János Bolyai Research Scholarship of the Hungarian Academy of Sciences.

RN31 | Session 07b Ethnic Relations - Case Studies

Students, perceptions and differences in schools: multiple discrimination and its effects

Maria José Manso Casa-Nova, Rosanna Barros, Maria Custódia Rocha, Daniela Silva
University of Minho, Portugal; University of Algarve, Portugal; University of Minho, Portugal; University of Minho, Portugal
mjcasanova(at)ie.uminho.pt, rbarros(at)ualg.pt, mcrocha(at)ie.uminho.pt, dsilva(at)ie.uminho.pt

This paper is the result of a research project developed between September 2013 and December 2016, called “Democracy, Difference and Social and Educational Inequalities: Effects of Hierarchical Perception of Difference”. The main aim of this project was to study the perceptions and effects of inequalities that derive from difference (and inherent discrimination) in relation to school performance. One of the main issues of the project was to ascertain and understand how different school actors positioned themselves with regard to the hierarchy of differences and the complexity of its effects.

The first phase of the project consisted of the development, implementation and statistical analysis

of a survey applied to 739 students attending basic and grammar school education in four schools located in the North and South of Portugal. From this analysis we highlight the fact that 36 students mention being victims of multiple discrimination. Of these 36, 22 present 4 or more causes of discrimination. Based on the data, of 40 students' interviews, this paper highlights the students' perception with regard to the causes of the multiple discrimination they suffer and their effects, namely on behaviour and school performance. The content analysis allowed to construct categories that show that the greater discrimination is done by the peers and that the differences that appear as most striking and object of discrimination are physical appearance (being fat, ugly, small, deficient, black), psychological characteristics (being shy, fragile, having difficulty integrating into a group, being a nerd), the habitus (low class belonging and body language) and being gay or lesbian. According to the students' voices, the effects of this discrimination are visible in low self-esteem, isolation, absence from school and poor school results.

Ethnic and racial harassment and mental health: identifying sources of resilience

Alita Nandi, Renee Luthra, Michaela Benzeval
University of Essex, United Kingdom; University of Essex, United Kingdom; University of Essex, United Kingdom
anandi(at)essex.ac.uk, rluthra(at)essex.ac.uk, mbenzeval(at)essex.ac.uk

In this paper, using data from Understanding Society over the period 2009-2014, we find that ethnic minorities with lower socio-economic status and those who were born in the UK report worse mental health (GHQ). Those who report experiencing ethnic and racial harassment (ERH) also report worse mental health than those who do not. We also found that ethnic minorities living in areas with a higher proportion of co-ethnics reported better mental health. However, ethnic concentration was not protective; rather, ERH had a stronger negative association with mental health for UK born minorities living in such areas. We identified additional resilience factors: number of close friends and having certain personality traits – higher levels of Openness to Experience and Conscientiousness. We also found those who attend religious services more frequently and have higher levels of Agreeableness and Extraversion are poorly equipped to deal with ethnic and racial harassment.

Ethnic Relations and Social Boundaries among Ethno-Religious Groups in the Turkey-Syria Border Cities in Turkey

Zerrin Arslan
Hatay Mustafa Kemal University, Antakya, Hatay, Turkey
azerrin(at)gmail.com

Border illuminates the sovereignty of states and socio-cultural boundaries nations and ethnic groups.

Contemporary Turkey has multi-religious and ethnic groups. Ethnic relations and boundaries have different social, cultural, economic and political characteristics in/on cities. This study aims to understand and explain the borders and socio-cultural boundaries of national, ethnic and also religious identities and their construction processes on international border of Turkey-Syria. In this study, ethno-religious relations and socio-cultural boundaries in Hatay, Gaziantep and Mardin selected as cases of the Turkish-Syrian border cities are investigated and explained under the sui generis effects of border conflicts, international social, cultural, economic and political tensions. People in these cities lives under the effects of recent civil war in Syria and the Syrian refugee crisis of Europe. Within these contexts, this research is scrutinized the Turkish citizens' construction processes of their national-ethnic identities, belonging and ethnic relations through their everyday and consumption practices in the Turkish-Syrian border cities.

This research tries to answer these fundamental questions: How everyday life and consumption as material culture are associated within ethno-religious identities and belonging in the border cities? How everyday life and consumption practices shed light on ethno-religious identities and belonging in the border cities? How borders affect and shape national and ethnic identities and belongings? The originality of this study is that it scrutinizes the relations between ethno-religious identities, everyday life and consumption in the Turkey-Syria border cities. In qualitatively designed research, data will be provided by in-depth and spontaneous interviews, ethnographical methods such as small talks and observation in these cities between January and July, 2017 and analysed in August, 2017. The findings will be shared in the presentation.

RN31 | Session 08a Anti-Muslim Racism and Intersectionalities

Migrant Generation, Religion and Ethnicity in Community Experiences of British Muslim Women

Asma Shahin Khan
Cardiff University, United Kingdom
AsmaKhan(at)cardiff.ac.uk

This paper presents some of the empirical findings of a mixed methods study that aims to understand the economic inactivity of Muslim women in Britain; it offers a unique insight into the experiences of first and second-generation British Pakistani women in a neighborhood of high co-ethnic Muslim density. High levels of economic inactivity amongst British Muslim women and residence in areas with large number of people of the same ethnicity and religion were both highlighted as areas of concern in two separate government reports in 2016: The Casey Review and a report by the Women and Equalities Committee. Close-knit co-ethnic communities can provide valuable resources of advice, role models and support for Pakistani women, however, the community can also

be experienced as intrusive or problematic. We find that the socio-economic status of families, both pre and post migration, has an impact on the ways in which Pakistani women experience community life. Local co-ethnic community networks and kinship groups can influence the choices and constraints faced by Pakistani women and girls regarding decisions around education and marriage.

The paper will present the ways in which Pakistani women display agency and choice when negotiating their interactions with their local communities, and the ways in which migrant and British-born Muslim women can experience the same local communities very differently.

Anti-Muslim Racism in Neoliberal Ireland: Challenges from 'below'

James Carr
University of Limerick, Ireland
james.carr(at)ul.ie

Anti-Muslim racism is a reality for Muslim men, women and children in Ireland. Such experiences are informed by historical national and contemporary international racialising discourses of Muslim as 'Other' that, while similar, shift across space to permeate into the popular imaginary of what 'Muslimness' means in Ireland. Drawing on two original researches with over four-hundred Muslim men and women in Ireland this paper will elucidate the realities of how anti-Muslim racism is experienced in the contemporary Irish State. Using mixed methods research, participants reveal insights on lived anti-Muslim racism in Ireland, the role of gender, and the impact these experiences have on those targeted. These experiences are set to a neoliberal context wherein the Irish State absolves itself from caring for Muslim communities and the realities of racism. Instead of addressing anti-Muslim racism as a core function of state responsibility, the Irish State, intoxicated with neoliberalism, privatises the care for anti-Muslim racism. Those who are targeted are encouraged to be self-responsible actors caring for themselves; and/or, seeking 'care' from outsourced providers in the form of third-party civil society organisations. Thus, instead of finding support from the State, those who experience anti-Muslim racism are left to manage alone. Fore-fronting those same voices, participants share their perspectives on how anti-Muslim racism at the interpersonal, institutional and discursive levels could be challenged. The resulting insights and suggestions reveal the need for a range of interventions at multiple societal levels if the experiences of racism lived by Ireland's Muslim communities are to be challenged.

Towards a “classization of religion”? Neoliberal rationalities and the class-based dimension of anti-Muslim hatred

Barbara Dellwo

Middlesex University London / University of Lausanne, Switzerland

barbara.dellwo(at)unil.ch

Reflecting the contradictions of neoliberal rationalities and the consequent inequalities between the global North and the global South, European countries have increasingly operated a distinction between “desirable” and “undesirable” migrants. The former applies to highly skilled and mobile professionals, conceived as resources and coveted by the nation states, whereas the latter refers to labour migrants or refugees, thought of as a threat to national identity and at the heart of debates on “integration”. In the last decade, these debates have focussed almost exclusively on Islam and the Muslims. These “undesirable” migrants are undergoing a growing process of otherization, with their “culture” being presented as incompatible with “European values” (e.g. secularism, democracy, gender equality). Scholars have attempted to grasp the discriminations faced by European Muslims with notions such as “cultural racism” or “racialization of religion”. These notions seem nevertheless to overlook the significance of class, and in particular social position in the global labour market. As I could observe during my fieldwork among Muslim business elites in Geneva, Muslims are not perceived and treated in the same way depending on whether they are a refugee, an unskilled worker, a banker or a diplomat. I consequently argue that addressing the issue of discrimination in terms of “cultural racism” or “racialization of religion” conceals the class-related aspects of domination, because the very racialization of Muslims results from an implicit class ascription that reflects the power relationships inherent to neoliberalism. This communication will thus be an advocacy to explore the “classization of religion”.

RN31 | Session 09a Anti-Immigrant & Anti-Refugee Resentment

Living in the Beautiful city – Everyday racism in Central-Eastern Europe

Jaroslav Šotola, Mario Rodríguez Polo

Palacký University in Olomouc, Czech Republic;

Palacký University in Olomouc, Czech Republic

jaroslav.sotola(at)upol.cz, mario.rodriquez(at)upol.cz

Analysis of urban space and memory processes configuring a Central-Eastern European city provides the context to understand how racism occurs in everyday life. Urban space is understood as a product of a nation state imposed homogeneity and imperative economic forces. Urban landscape is in consequence constituted on the basis of two fallacies: unreal homogeneity and false neutrality. The result of such a process is an imperative isomorphism which constitutes a set of normative patterns. In this scenario life takes place and foreigners (as economic migrants or international students) are forced to

disrupt the normative landscape with their mere existence, as they break with their difference the imposed isomorphism. Participatory research gave voice to a muted experience of constructed “others” navigating and experiencing racism. Their experiences under the disciplinary gazes of locals and occasional violent aggressions give account of how the urban space remains an essential part of a mechanism of subjugation for visible “others”. In the researched city, the gendered bodies of the “others” turn at the same time into trigger and target for racism to occur. Locals perceived urban space in terms of “normality” with confirms that racism is not a marginal or accidental phenomenon; on the contrary – analyzed experiences are only possible to explain under the hidden existence of a racial hierarchy, based on locals’ performed right of belonging to the city. Such a hidden hierarchy creates a scale of power which is exercised in every day contexts and therefore constitutes a new framework to understand migration in Central Eastern Europe.

Exile: Despair and Creativity

Lars Tomas Dencik

Ass. f Jewish Culture, Sweden

lasse(at)dencik.se

After Hitler came to power in Germany until the end of WWII a number of German-speaking Jews from Germany, Austria, Czechoslovakia came as refugees to Sweden. This paper reports on their reception and adaptation in Sweden and also discusses the implications of exile in broader terms. It is found that forced to migration meant enhanced mental functioning. To many of them this meant an oscillation between despair and creativity. Many gave up the idea of a “Heimat”, some imploded psychologically by being deprived of their language and social network, and surprisingly many of them coped with their situation as exiled and immigrant by becoming extraordinarily creative, artistically, scientifically and as entrepreneurs.

Pride and Prejudice. Social, Cultural or Political Determinants of Attitudes towards Refugees in Poland?

Jakub Wyszumlek

Institute of Political Studies, Polish Academy of Sciences, Poland

j.wyszumlek(at)isppan.waw.pl

The aim of this study is to analyze causes of anti-refugee attitudes among Poles. I base my analysis mainly on the public opinion survey People in Networks 2015 conducted by the Institute of Political Studies, Polish Academy of Sciences and supervised by prof. Bogdan Mach (<https://situs.pl>). During the research, I investigate links between negative attitudes towards refugees and respondent’s ideological stands, political affiliations, new social media use, as well as, structural and economic characteristics. Additionally, data gathered in People in Networks survey allows me to check the impact of

closest friends milieu on views of individuals towards refugees in Poland. Research results show that the strongest effect on such opinions has a right-wing political affiliation supported by the "eurosceptic" attitudes, general lack of trust in people and lower level of education. Negative attitudes towards refugees are especially widespread among the young adults (18-39 years old). Moreover, the chance that one is against accepting refugees is two times higher if the closest friends are sharing this belief. Summarizing, anti-refugee prejudices in Poland have dominantly discursive and not structural or everyday practice background. Presumably it allows for quick change of public opinion on that matter, however, the study also shows how powerful reservoir of votes is still hidden among the anti-refugee voters who did not participate in the previous elections and could be mobilized in the next one.

The transnationality of attitudes towards immigrants - a case study in Hong Kong

Caroline Maria Schöpf, Matthew M.T. Chew
Hong Kong Baptist University, Hong Kong S.A.R. (China); Hong Kong Baptist University, Hong Kong S.A.R. (China)
caroline.schoepf(at)gmail.com,
mmtchew(at)hkbu.edu.hk

The attitudes towards immigrants literature has provided valuable theories contributing to the explanation of negative attitudes towards immigrants. However, very little progress has been made in explaining why attitudes towards immigrants systematically vary depending on immigrants' countries of origin, and why migrants from some destinations are met with positive attitudes in a large range of receiving societies. Analyzing in-depth interviews, this study examines Hong Kong citizens' attitudes towards four groups on migrants: Nepalese, Indians, Koreans and U.S. Americans. It is found that Hong Kong citizens tend to display negative attitudes towards Nepalese and Indians, while displaying positive attitudes towards Koreans and U.S. Americans. The perceptions that the interviewees draw on to explain their attitudes reflect (1) local differences in socioeconomic status between the groups and (2) evaluations of the sending societies and their respective cultures. Furthermore, there is a difference between the sources drawn upon. For Nepalese and Indians, Hong Kong citizens draw primarily on local news media and secondarily on own observations. For U.S. Americans and Koreans, the interviewees draw to a much stronger extent on overseas news media, cultural products and advertising, and to a lesser extent on local news media and own observations. This suggests that variances in attitudes towards immigrants are not only caused by phenomena occurring within the national context, but also reflect supranational power relations, such as differentials in global economic or cultural power.

RN31 | Session 10a Identity and Ethnicity

Ethnicity, Religiosity and Political Behavior in Eastern Turkey

Mesut Yegen
Istanbul Sehir University, Turkey
mesutyegen(at)sehir.edu.tr

Relying on a field research conducted in 2014 in 12 provinces in the Southeast and the East of Turkey, this paper aims to explore those sociological factors, which influence the voting patterns in Kurdish towns in Turkey. It examines, in particular, the influence of ethnic and sectarian identity, and religiosity as well as that of socio-demographic characteristics such as age, gender, education and economic status on voting behavior in Kurdish towns. Also is examined whether these variables generate a significant difference in the electorates' attitudes towards the main cultural and political demands endorsed by the pro-Kurdish parties and groups in Turkey.

The findings of the research attest to the fact that the ethnic identity is the key factor in determining the voting behavior in Kurdish towns and that the ethnic origin is more important than religiosity in determining one's party choices. Findings indicate that while Kurdish citizens in Kurdish towns mostly vote for the pro-Kurdish party, Turkish and Arab citizens mostly support the Ak Party. Zazas, on the other hand, support both parties. The pro-Kurdish HDP's support is more among the youngsters, well-educated and the poor. HDP also finds a considerable support from the pious Kurds and Zazas.

Another important finding of the research is that the cultural demands endorsed by the pro-Kurdish movement are approved not only by the citizens backing the HDP, but also by a great majority of the citizens supporting the AK Party.

Blackie Collar: Identity, Precarization and Class

Polat S. Alpman
Yalova University, Turkey
polatalpman(at)gmail.com

This study aims to explain the relationship between social inequality and ethnic identity. It is based on the findings of a field study which discusses the state of Kurdishness in the context of class relations and the mechanisms of domination along with urban space and spatial differentiation. The study, which deals with the state of Kurdishness in the context of informalization and precarization, presents Kurdishness as an informal identity constructed through experiences in urban space.

The inequalities and discrimination resulted from ethnic domination in class-related exploitative relations and as one of the main indicators of the state of Kurdishness, have been reproduced in the context of spatial differentiation. These, along with ethnic stratification in labour process, have reduced Kurdishness to the identity by attributing an informal nature to it. This has become one of the main signs and indicators of Kurdish identity in Istanbul which is a

metropol city. The study in the sample of Istanbul has focused on how the domination over the identity has been experienced in daily life, particularly in labour process and how these experiences have affected the state of Kurdishness in urban space.

In the study, it has been observed that housing in Tarlabası as an important spatial resort to reproduce labour for Kurdish labour force migrated to İstanbul after 2000. There is a relational connection between housing in Tarlabası and working in Beyoğlu which have been intertwined and become the reason of each other. The relationship between housing and working demonstrates the function of spatial differentiation in the reproduction of labour.

Exploring the ‘experiential grammar’ of jihadist movements: Embodied subjectivities and imaginaries in social media communications

Kevin McDonald

Middlesex University, United Kingdom

k.mcdonald(at)mdx.ac.uk

One of the most significant dimensions of Jihadist movements involves their ‘experiential grammar’, evident in the primacy of personal experience over organizational structure, a development linked to the importance of social media to these movements. This paper uses such communications to explore the experiential dimensions of contemporary jihadist movements, evident in particular in immersive experiences that both amplify and limit what can be felt.

The paper considers three pathways to jihadism. The first is the mutation of humanitarianism, associated with middle class experiences of distant, mediated suffering, where good and evil mutate into purity and impurity, and where jihadism manifests many of the characteristics of racism and hate crime. The second is a communitarian path constructed around a tension between order and disorder, associated in particular with transitions from criminality. The third is constructed around practices and imaginaries of gamification. Within each of these pathways, visceral and embodied experience plays a critical role, from the place of humour as an embodied practice of integration, to the grotesque, central to key transitions associated with jihadism and contemporary racism.

This paper considers theoretical challenges emerging from such practices, in particular the importance of new approaches to embodiment for a Sociology of experience. Methodologically, these movements underline the need to move beyond sociology’s traditional reliance on textual and numerical data, and highlight the need to construct research strategies that engage with social media as a sensory medium.

RN31 | Session 11a Conceptualizing Racism and Discrimination

Activists’ conceptions of racism and anti-racism

Minna Seikkula

University of Turku, Finland

minna.k.seikkula(at)utu.fi

In Finland, racism has moved from an ignored theme to centre of societal discussions. Reciting pan-European anti-immigration racist agenda has shaped the public debate since 2008. At the same time, concerns to recognize and condemn racism have been voiced in the same arenas.

Under recent years anti-racism has been deployed among others by people reacting to heightened presence of the extreme right, as well as by those demonstrating solidarity to newly arrived migrants and those articulating of Black, Brown and Muslim identities in the Finnish context. However, as previous academic work suggests, conceptions of racism and anti-racism are far from unanimous. How is racism conceived by people from various backgrounds and distinct anti-racist communities?

The paper explores conceptions of racism and anti-racism through interviews with activists. The focus is in particular on how racism is connected to or disconnected from the continuum of coloniality reproducing the world divided to west and the rest through racialized borders among other things.

Reincorporating the “material” for investigating racism in Western Societies. Some reflections on material dynamics of racialization.

Alfredo Alietti, Dario Padovan

University of Ferrara, Italy; University of Turin, Italy

ala(at)unife.it, dario.padovan(at)unito.it

Racism has been often seen as a mental process of discrimination called prejudice, laying in people mind, sometime into singular minds, sometime else in collective minds. This perspective called for an amount of measures aimed to cure minds affected by prejudices. Our idea is rather different. Nourished by a number of different investigation and theoretical works across Europe and North America, we think that racism has very clear material basis. It is generally aimed to exclude someone – of different origin, physical traits, language, habits than majority - from resources and services provided by different systems. Consequently, racialized practices, such as overt or covert (subtle) actions, discourses are oriented to narrow the access to certain positional goods: housing, job, neighbourhood, food, education, jobs, and commodities. It is a way, as recognised by many scholars, to organize the society (Bonilla- Silva 2014; Omi and Winant, 2009). More precisely, it is a way to manage the property of or the access to vital material resources. These configuration is a matter of contention and incessant struggle between classes and races. Our starting point follows the idea of Bonilla-Silva (2014) that racism is fundamentally organized around a material reality. Following Du Bois’ statement on the effects of racism as “material form of oppression”, the discussion will be focalized about the array of practices aimed to distribute and regulate power in the actual racialized order, practices of exclusion from crucial material resources and on practices to resist this exclusion.

How can sociologists intervene in discriminatory practices? The success of the sociological methods of situation and correspondence tests to tackle discrimination

Pieter-Paul Verhaeghe, Koen Van der Bracht
Vrije Universiteit Brussel, Belgium; Ghent University,
Belgium
pieter-paul.verhaeghe(at)vub.ac.be,
koen(at)vanderbracht.eu

Sociologists have shown structural discrimination on the labour and housing markets, using the techniques of situation and correspondence tests. This study examines to which extent these tests can be used as a method to study ethnic discrimination and instrument to tackle discrimination. It addresses the question how sociologists can intervene with their methods into discriminatory practices. Our research consists of three studies. First, we performed a unique quasi-experiment on ethnic discrimination in the rental housing market in Belgium (N = 754). We performed two waves of correspondence tests, separated by an announcement to private landlords and real estate agents that their behaviour would be observed. A comparison of these uninformed and informed tests revealed that the mere announcement of further testing resulted in less ethnic discrimination by realtors, but not by landlords. The second study examined how many correspondence tests per single realtor are needed to convincingly determine the occurrence of systematic discrimination. For this study, we conducted a longitudinal study of ethnic discrimination among 114 real estate agents in Belgium. In the third study, we applied the methodological insights of the previous study on the rental housing market in the city of Ghent. Under the supervision of sociologists, a civil rights movement tested the local realtors on their potential discriminatory behaviour through 10 repeated correspondence and situation tests. Preliminary results suggest a sustainable and significant reduction of ethnic discrimination on the housing market. In general, this research shows that sociologists can use their techniques to analyse and change society. The keys for success are keeping scientific rigor as sociologists and making coalitions with other actors, such as (local) governments and civil society.

The Concept of Racism

Vesa Puuronen
University of Oulu, Finland
vesa.puuronen(at)oulu.fi

This paper deals with the concept of racism, which is selfevidently essential in the research of racism. We have to have some working definition of the phenomenon we study in order to be able to focus the research on the issues or events or features of social reality, which can be racism. Racism is also politically sensitive concept, the definition of which may have serious political consequences. The paper begins with the notions of Robert Miles (1989) who warned of conceptual inflation referring to the extension of the

meaning of racism. Miles proposes that racism should refer only to a certain ideology not for instance to different forms of action. During last decades it has become obvious that limitation of meaning of racism only to ideological doctrines does not allow us to address new and diverse forms of racism like cultural racism (vs. biological or scientific racism), everyday racism (Essed 1991) and structural racism. It has been proposed that instead of racism we should talk about racisms. The paper ends with a provisional new definition of racism based on the critical discussion of previous research and conceptualisations.

RN32 - Political Sociology

RN32 | Session 01a (De-)Politicization in the Neoliberal Era I

De-politicization and technocracy in the European Union: a theoretical approach

Maria Cristina Marchetti
Sapienza University of Rome, Italy
mc.marchetti(at)uniroma1.it

The role of expertise and specialist knowledge in the decision making has a long tradition in the history of political thought. In the last decade we assist to its stunning growth in front of the challenges of complex socio-economic topics inside contemporary societies. This tendency brought to an opposition between “politics” and “technocracy” that has been emphasized by the crisis of representative democracy and political parties.

In the European Union this process is particularly evident. The neo-functionalist approach has laid the foundations for the following technocratic development (Booker 2011). According to Majone (1999) technocracy is the peculiarity of the European Union as a “regulatory state”.

The role of European Commission, an institution without democratic legitimation, opened the way to the rise of a technocratic power: lobbies, pressure groups, experts committees play a crucial role in the European decision making, according to the model of the European governance (2001).

On the contrary, some scholars argue that the opposition between politics and technocracy has been overtaken by the inverse process of “politicization” of European institutions with the attribution of greater power to the European Parliament and the introduction of elements of participatory democracy in the art. 11 of the Treaty of Lisbon, (Radaelli 1999, 2014; De Wilde 2011).

The way the economic crisis has been coped with reopened the debate on technocracy and de-politicization at national and European level. The role of intergovernmental bodies (Eurogroup) and procedures (fiscal Compact) the so-called troika (European Commission, IMF, ECB) accumulate powers outside political institutions, but also call for a de-accountability of political actors (Burnham 2001; Kettel 2008; Wood, Flinders 2014) as in the model of post-parliamentary democracies (Andersen, Burns 1996).

Back to Bling Bling? The neo-liberal turn, corporate board quota's and gender equality in the EU

Alison E. Woodward
Institute for European Studies, Vrije Universiteit Brussel, Belgium
alison.woodward(at)vub.ac.be

Changes in frames for equality are often attributed to the neo-liberal turn of European politics. Today, when measures are proposed, the business case often overrules arguments based on justice and equity. To what extent can transitions in gender and diversity equality policies be explained by the neo liberal turn? One of the few proactive initiatives in the Barroso Commission was draft legislation for quota's for women on corporate boards. In tandem with this launch the Commission stimulated transnational civil society activism by supporting new transnational associations such as European Women on Board. This paper hopes to examine the extent to which supporting such more elite organisations is additional evidence of the neo-liberal turn. First it examines the organisations funded around equality in the period 2008-2016 to see patterns in funding and cuts and their relation to positions on the equality agenda. Then the case of the foundation and activities of European Women on Boards is investigated. The case offers yet another illustration of the unusual role of the EC in attempting to shape European civil society, but also illustrates present paradoxes in the EU gender equality agenda, as it seemingly returns to a focus on ‘majority/white’ women’s concerns. Interviews with the founding members of the association, EU and EP officials working on the directive and wider civil society actors as well as observation form the empirical background.

Gendered embodiments of closure: Marginalization, participation, and politicization in the context of new urban poverty

Eeva Luhtakallio
University of Tampere, Finland
eeva.luhtakallio(at)uta.fi

This paper examines the gendered embodiments of the sense of closure – a lack of opportunities to fulfill personal aspirations and to enhance one’s life circumstances – in the context of new urban poverty and marginalization, explored by way of an ethnographic study in a disadvantaged neighborhood of a large Finnish city. Studies of ‘advanced marginality’ (e.g. Wacquant 2009) point out that instead of mere material deprivation, the mechanisms of marginalization have significant consequences in terms of citizenship and democracy. The crisis of representative democracy, addressed in both empirical and theoretical studies during the past decades, is thus not only a crisis of representation, but a crisis of equality that attacks the very fundamentals of the idea of equal and active citizenship cherished in these societies. In this paper, I ask how does marginalization affect citizenship on an individual and

collective, grassroots level. Gender is an important key to understanding the societal consequences as well as individual experiences of the above tendencies. Marginalization, precarization, and symbolic exclusions from citizenship and political participation have multiple gendered dimensions. In the Finnish context, the recurrent depoliticization of gendered participation and power is a crucial feature in concealing the mechanisms of inequality (see e.g. Holli 2003; Luhtakallio 2012). Furthermore, the embodiedness of these processes affect the styles of e.g. political agency so that the latter may be hard to recognize through the use of traditional tools of studying political action (e.g. Skeggs 2011). I examine how gender intersects with the experiences of closure and marginalization, as well as the experienced possibilities of participation and politicization.

Un-making 'gender' as a resistance against the neoliberal order in Europe

Eszter Kovats
ELTE ÁJK, Hungary
kovats_eszter(at)yahoo.fr

This paper seeks to contribute to the academic debate on the reasons behind the rise of transnational movements resisting "gender ideology" or "gender theory" in several European countries and on European level. On the basis of critical theories on liberal democracy and its crises the paper situates the phenomenon in a broader European and global crisis. It argues that it is a symptom of problems of a scale going beyond gender equality, and gender is just symbolic glue, a terrain on which hegemonic battles are fought. What is at stake is a re-definition of the bases of liberal democracy and of the post WWII human rights consensus.

On the one hand, these movements reflect the current tendencies of identity politics in feminist and LGBT activism, best known from the Anglo-Saxon world, but having a growing influence in continental Europe. On the other hand, as previously argued by Weronika Grzebalska, Andrea Petó and myself, attacks on "gender ideology" should be seen as part of a broader political shift, characterised by the growing popularity of illiberal parties and the populist right all over Europe and beyond. Resistance against "gender ideology" cannot be understood solely as a resistance against values of equality, or as a backlash against women's and LGBT rights. Rather these movements provide culturalist answers to the current crises of the liberal democracy and of various structural concerns, among others to the embeddedness of feminist and LGBT issues in the neoliberal order, including the depoliticised, technocratic and top-down way of policy-making.

RN32 | Session 01b (De-)Politicization in the Neoliberal Era II

The Breakdown of the Left-Right political arena: the indirect consequences of the 2008 financial crisis and 2011 Global Protests

Lev Luis Grinberg
Ben Gurion University, Israel
grinlev(at)gmail.com

The 2011 global wave of protests was a reaction to the failure of the established political parties to represent the expectations of lower and middle classes. Left and Right parties bailed out financial institutions and banks after the 2008 crisis, not the masses hurt by the crisis. The protests opened the space for the emergence of new charismatic leaders with radical discourse against neo-liberal globalization and the left-right established parties. The paper analyzes the emergence of charismatic movements as the dynamic interaction between agency, structure and institutional rules of the game. It argues that the present crisis is not the typical crisis of representation, it is rather a profound social crisis characterized by complete rupture between civil society and the State. It compares the emergence of Iglesias in Spain, Trump and Sanders in the US. Their respective "occupy movements" (15M and OWS) sparked in reaction to the failure of presumed "progressive" ruling parties (Socialists in Spain and Democrats in the US) to produce effective progressive policies following the 2008 financial crisis. Both occupy movements were initiated and framed by anti-globalization activists who opposed representative democracy, advocating direct democracy, and rejecting the option to influence representative politics. This abstention created a political vacuum later filled by charismatic leaders that adopted the anti-globalization and inequality agendas demanding an interventionist role of the State protecting lower and middle classes. Comparing the cases helps to comprehend political variations following different compositions of social constituencies, institutional rules of the game and electoral opportunities.

Identity Politics, Belonging and Otherness

Gülşen ATAŞ
Adnan Menderes Üniversitesi, Fen Edebiyat Fak.,
Sosyoloji Bölümü Aydın, Turkey
gulsen.atas(at)adu.edu.tr

Identity is one of the significant concepts that has been frequently discussed since 1980s. The visibility of identity has increased in the political sphere rather than other areas which in turn lead to the emergence of "identity politics".

Religion has become the central issue of identity politics and it has opened new belonging spheres to individual. This situation in particular, has arisen as a "Islamist Identity Politics" and has become effective in political participation period of individuals in Turkey. Within that period, individuals and political leaders tend to both defining themselves against the other and how it is perceived by others to believe that they themselves were. This situation has brought many problems jeopardising social and political integration. This study aims to reveal the relationship between voting behavior with religious attitude and preferences of AKP voters. Where individuals are positioning

themselves and their party while voting. Within this scope, has focused on Justice and Development Party and its voters that come into prominence with religious identity. Also, this study will be planned as qualitative research for collecting data.

Political parties discourses on European integration during the Eurocrisis : same patterns of (de)politicization between United Kingdom and continental Europe ?

Alban Versailles

Université Catholique de Louvain, Belgium
alban.versailles(at)uclouvain.be

Brexit has changed the way we have to look at European integration. Today, we all must recognize that it can be a highly politicized subject. That's why the study of the concept of politicization is, now more than ever, crucial. The literature in this field underlines that there is a differentiated politicization between the different spheres (institutional, public...) and the different countries (De Wilde, Leupold, Schmidtke 2015). This literature concludes in particular to the need to study intermediate factors of politicization (Zürn 2015).

This paper presents the results of a research building on a comparative and mixed-methods design. It aims for a better understanding of the differentiated politicization of European integration between the United Kingdom and the continental Europe (Belgium, France, Germany). It combines the analysis of one contextual factor, the Eurozone crisis, to the analysis of national political parties' discourses. Thus, this paper is focused on one important "shadow zone" of European integration (de)politicization process: the importance of intermediate factors of (de)politicization. In order to understand the sources of (de)politicization, national political parties' discourses are analyzed thanks to both qualitative and quantitative approaches. On the one hand, specific rhetoric and narratives in the parties' discourses are highlighted and can teach us about polarization of positions, on the other hand, a lexicometric analysis enables us to evaluate the salience of specific issues in the discourses.

This comparative work can underline what are the specific characteristics and the general trends the United Kingdom shares or does not share with continental Europe.

Campaigning in Times of Austerity. Video Statements of Candidates in the Irish General Election 2016

Isabel Kusche

Aarhus Universitet, Denmark
isabelkusche(at)aias.au.dk

The Republic of Ireland was hit especially hard by the financial crisis. The public bailout of Irish banks turned it into a sovereign debt crisis and triggered harsh austerity measures by two subsequent governments. Against this background the paper presents results of a qualitative analysis of brief video statements by

candidates in the Irish general election in 2016. The material encompasses almost ninety per cent of all candidates who ran in the election. It permits comparisons with regard to the issues that candidates chose to address, if and how they attributed responsibility and blame for austerity, and which future they envisioned for their country and its politics. The results show important differences between candidates from established parties and new political groups. Adding the information on who actually got elected gives some indication of the success certain appeals had. The results thus help to understand consequences of the financial crisis and the turn to austerity for the links between politicians and potential voters. They also point to a remarkable absence of right-wing extremist positions. The paper discusses possible reasons for this.

RN32 | Session 02a Social Resilience and/or Resistance in the Unmaking of Europe

Refugees welcome!? Proponents and opponents of solidarity with refugees/migrants in Germany

Johannes M. Kiess, Ulrike Zschache, Christian Lahusen

University of Siegen, Germany; University of Siegen, Germany; University of Siegen, Germany
kiess(at)soziologie.uni-siegen.de,
zschache(at)sozialwissenschaften.uni-siegen.de,
lahusen(at)soziologie.uni-siegen.de

This paper aims at identifying the sociological profile of the German population with highest and lowest levels of solidarity dispositions and reported activities, with a particular focus on refugees/migrants. The focus on this group is justified because it has been the most visible target of solidarity in German society in recent times, and has considerably polarized public debates. We assume that this helps identifying most clearly those population groups within German society that are more unconditionally committed to demonstrate solidarity, even under adversarial circumstances. Beyond that, we argue that social resilience and solidarities proven in this respect gives valuable insights for the general debate on transnational solidarity. Building on a unique survey comprised in the EU-funded project TransSOL, we propose a solidarity index incorporating items measuring 'social solidarity' with respect to refugees/migrants as well as items measuring the support of (national or EU-specific) 'public policies' in support of refugees/migrants. These analyses disclose how both types of solidarity dispositions (social solidarity and solidarity policies) interrelate or dissociate. Moreover, the German population is subdivided into three groups (high solidarity, intermediate group, anti-solidarity). Multinomial regression analysis unveils social factors that help distinguish these three groups. The model is built on existing research assumptions that relate variance in levels of solidarity to empathy or misogyny, collective identities, vulnerability and social class, social capital in its various dimensions, and controls for the effect of

socio-demographic variables.

Building Alliances - Solidarities and the Refugee Crisis

Martin Bak Jørgensen, Óscar García Agustín
Aalborg University, Denmark; Aalborg University,
Denmark
martinjo(at)cgs.aau.dk, oscar(at)cgs.aau.dk

Although the so-called refugee crisis is gaining a lot of attention in the global media and among politicians there are very few attempts yet to present a comprehensive analytical model to understand the role of civil society in engaging with the challenges of the crisis.

The solidarity movement, such as the welcome refugee movement has been very visible in especially European countries but we still lack an understanding of the overall role of this type of activism and of the potential such engagement may hold for alternative ways of managing the refugee crisis.

In this paper we offer a conceptual framework based on Gramscian approaches to solidarity and alliances (Featherstone, 2012; Agustín & Jørgensen, 2016) which we apply to a single case study, Venligboerne (literally 'friendly inhabitants'), to exemplify how these forms of solidarity are being shaped as a response to the refugee crisis and governments have tried to manage this crisis. Venligboerne in Denmark now numbers thousands of people across the country. The movement articulates the commonalities between people, refugees and Danes alike. The engagement of the movement is not transformative of the state's legal framework but can rather be seen as a necessary supplement based on collaboration with the authorities, e.g. reception- and asylum centers, municipalities, day centers and schools as well as a diverse range of voluntary activities. Venligboerne in this regards is an example of a solidarity network we also can recognize in other countries.

Citizen Warriors in a Post-Security State. Grassroots Militarization and the Crisis of Neoliberal Democracy in Poland

Weronika Zuzanna Grzebalska
Polish Academy of Sciences, Poland
weronika.zuzanna(at)gmail.com

In recent years, the number and visibility of paramilitary activities has risen in Central Eastern Europe. While paramilitary organizations in Poland have existed since the beginning of the 1989 transformation, they have long functioned as a rather insignificant if not obscure sector of the civil society. Recently, however, four global crises – the Financial Crisis, the Terrorist Crisis, the Ukraine Crisis and the Refugee Crisis - have accelerated their growth and contributed to their normalization in the public sphere as a key tenet of national security as well as part and parcel of Polish nationhood.

Based on interviews with paramilitary actors and a study of the militarization of citizenship by right wing political forces, the paper will trace the sociopolitical processes which enabled the growth of the

paramilitary sector and have culminated in the government's flagship project of building Territorial Defense Forces offering a monthly allowance to each citizen who enrolls.

Going beyond mainstream political analyses which derive the rise of the paramilitary sector solely from Realpolitik threats such as the Russian aggression in Crimea, the paper will reflect on the ways militarization in Poland can be understood as a resistance against the failures of Europeanized neoliberal democracy. As I will argue, by weakening the safety nets embedding people in the national polity, the latter has created a culture of insecurity in which securitizing practices could thrive. The paper will situate paramilitarism against the background of a broader right-wing counter-proposal to Europeanization and the liberal and demilitarized peace order that emerged at the alleged end-of-history. As it will argue, the gradual un-making of social Europe has eventually enabled the un-making of Europe as a polity.

Italian Recovered Factories between workplace democracy, resilience and resistance

Luca Antonazzo, Fabio de Nardis
University of Salento, Italy; University of Salento, Italy
luca.antonazzo(at)unisalento.it,
fabio.denardis(at)unisalento.it

Recovered factories are a social and economic process that presupposes the existence of a prior enterprise that worked under the traditional model of a private capitalist enterprise whose bankruptcy, emptying or unavailability prompted the workers to fight for a change and for self-management. The recent emergence of such experiences in Italy is to be considered one of the direct social outcomes of a double contingency. On the one hand, a severe global economic crisis, on the other, a progressive depoliticization of the national-States.

Recovered factories may be considered as socio-economic resilience practices and, at the same time, experiences of active resistance, aimed at re-thinking property, power relations and the growth paradigm that guides conventional capitalist economic policies.

What recovered factories propose is a model of democratization of the economy centred on the production of jobs aimed at the re-production of lives, through collective and horizontal participation. They represent an attempt to put in motion a change of the economic paradigm, focused on democratic values and on a direct relationship between work and welfare. In this contribution we work towards a theoretical analysis of the broad phenomenon of recovered factories in Italy, drawing on Fligstein and McAdams' theory of Strategic Action fields (SAF), moving from a quantitative analysis of the macro-picture to a qualitative analysis of an illustrative case study located in southern Italy. Through this case study we intend to highlight conditions, processes and mechanisms that allow the workers to assume the control of their company.

RN32 | Session 02b Politics, Identity, and Emotions**Support for emocracy: To what extent do voters consider emotions to be more important than facts?**

Sabrina de Regt
Utrecht University, Netherlands, The
s.deregt(at)uu.nl

It is known that many statements of Donald Trump during the election were (mostly) false, still he was elected the 45th president of the United States. Not only in the United States, but also in Europe you see that convincing stories and emotions seem to be more important during elections than facts and figures. This phenomenon can be labeled emocracy: a political system in which emotions are considered to be most important. Though support for democracy has been studied extensively, support for emocracy has been studied less often. This is remarkable given the recent developments in many Western societies. In this article we will first develop a scale to reliably measure support for emocracy. Subsequently, we will study the determinants of support for emocracy. More specifically the influence of education, gender, political preferences and personality factors like agreeableness and need for cognition are examined. Last, we will study to what extent support for emocracy is negatively related to support for democracy. To answer these questions data from the Longitudinal Internet Studies for the Social Sciences Panel are used.

The Democratic Personality - Theoretical Explorations of the Possibility of a D-Scale

Helen Sophie Andrea Lindberg
Linnaeus University, Sweden
helen.lindberg(at)lnu.se

We know that if morality rests upon loyalty foundation rather than the care foundation, a violent patriotism can evolve. A violent dogmatic patriotism can be hampered by actively teaching empathy and compassion. I will focus on the role of ethics, empathy and virtuous behavior for a Democratic personality. The policy implications for the rights-based welfare state are immense and also the implications for how to think new possible developments of a democratic transnational solidarity. The Authoritarian personality and Feeling-with or the affective aspects of solidarity and the need of mutual concern as key feature of solidarity have previously been explored. Empathic or solidaristic recognition which transgress national and cultural borders include a more feelingful as well as cognitive understanding of the distinctiveness of others in their concrete circumstances including an acknowledgement of the difficulties they face, and an appreciation of their agency in that context. Solidaristic recognition presupposes equal rights but goes further in recognizing some specificity of people's needs and of their social context. It embodies a caring attitude toward others and it also can help

minimize violence. This assumption goes well with research on empathy and prejudice and with the links between human development and life satisfaction. Typologies of democratic or autocratic regimes tend to omit the importance of care as a growing concern for democratic states regardless of model. I argue that social care and the social practice of empathy can be included in a typologization of the Democratic personality.

The Path of Totality: Hegemony and Nationalism

Michaelangelo Anastasiou
University of Victoria, Canada
anastasiouma(at)gmail.com

An examination of scholarly work on nationalism reveals that the nation is typically defined on the basis of positivistic understandings of human nature or society. Consequently, it is understood, not in term of its own specificity, but in terms of an underlying referent that is thought to engender it. Since the unity of the nation is attributed to a "privileged" cause, the plurality of forms that co-constitute it are underemphasized. The literature has thus failed to effectively examine how the "unity" of the nation can emerge in light of the plurality of its constitutive forms and subject positions. The present work seeks to furnish a theory of nationalism that eliminates all reliance on positivism, by utilizing Laclau and Mouffe's theory of hegemony, which sees socio-political blocs as discursive terrains of multiple overdetermined forms and relations. Nationalism is by extension understood, not in terms of privileged constituents, but as a variable set of overdetermined "family resemblances" that come to represent the "totality" of any national community. These "family resemblances" come to be dispersed variably and unevenly, as privileged nodes in the field of overdetermination, "binding" together differential identities. And since what governs any discursive formation is the uneven play of differences, it follows that a particular identity will have saturated, more than any other, the field of overdetermination and the content of nodal signifiers (e.g. "the nation") with its narratives, thereby establishing its hegemony. "The nation" can thus be understood as a privileged signifier of historically variable content that, through its general and uneven dispersion, fuses but unevenly privileges, multiple identities into a socio-political bloc.

Symbolic politics as an instrument of state-building. The case of Bosnia and Herzegovina.

Tomasz Rawski
University of Warsaw, Poland
t.rawski(at)is.uw.edu.pl

The paper concerns symbolic politics as an instrument of state-building process. On the example of the complex struggle for state symbols of contemporary Bosnia and Herzegovina (the flag and coat-of arms) in the period 1991-1998, it reveals four possible types of strategies calculated to define the symbolic core of the state.

In this way, the paper achieves two main goals: (1) it exposes a significant role of symbolic politics as one of the key dimensions of state activity; (2) it denaturalizes the classical Weberian vision of the state by pointing out that even its the most fundamental features are highly vulnerable to a radical change in the course of political action.

Authority and Power in Times of Crisis: Charismatic Leadership Versus the Trickster

Bjorn Thomassen

Roskilde University, Denmark

bthomas(at)ruc.dk

The ancient concept of charisma entered political sociology via Max Weber, in his attempt to capture leadership and authority in out-of-ordinary or 'liminal' moments. During the 20th century, Weber's concept has been applied to a range of leadership figures within religion and politics; in particular, charismatic leadership has been used to describe figures like Stalin, Hitler or Mussolini, and other more recent 'populist' politicians who build their leadership around a personal cult of power.

This paper suggests that such commonplace applications of Weber's terminology are essentially flawed and need a serious rethinking. This can be done by supplementing the political sociology conceptual canon with the trickster figure. The obscure, ambivalent, shadowy trickster figure is well-known from the comparative study of myth and was considered an archetype by Jung. While tricksters also rise to power in out-of-ordinary moments, they are in many ways the exact opposites of Weber's charismatic leaders. The paper concludes – tentatively - that the particular 'qualities' and 'ways' of the trickster help us to grasp not only the way dictators gained power in the 20th century, but also some central power mechanisms in current European politics.

RN32 | Session 03a (De-)Politicization in the Neoliberal Era III

Precarious Stateness as a Challenge to Political Sociology

Klaus Mueller

AGH-University of Science & Technology, Poland

muelacde(at)zedat.fu-berlin.de

Over the last decades, theories of social transformation did not pay much attention to the role of the state. In the western literature the state appeared as a survival of 'classical modernity' without major impact in the times of globalization. Concepts of civil society, protest movements, post-statist forms of governance, cosmopolitanism, transnationality, etc. seemed better suited to a 'fluid modernity'. In Eastern Europe the breakdown of the communist system discredited any form of state-led reconstruction. The complementary failure of the post-war welfare state and of state socialism launched a global turn to the market as organisational principle of 'reform'.

Two decades later it became obvious that neglecting the importance of stateness has a price. The reliance on markets as drivers of transformation led into a paradoxical situation: Financial capitalism survived the blow of the self-produces global crisis only with massive intervention of the states – at the cost of shifting private debt into escalating state deficits. In the post-soviet region, the anarchic disintegration of society provoked the return of an authoritarian state. The supranational integration of the EU is in danger to fall back into national segments.

A conclusive answer of the complimentary failure of states and markets is out of sight. Nevertheless, a conceptual understanding of different types of state failure helps to identify some great challenges to political sociology. Two categories are especially useful: state desertion, the retreat of the state from its responsibilities, leading to a loss of legitimacy; and state capture, the usurpation of state functions by powerful elites, as to be observed in some post-communist countries as well as the U.S.

De-politicization and de-structuration of the collective sphere: towards a thin political behavior?

Andrea Fabrizio Pirmi, Luca Raffini

University of Genoa, Italy; University of Genoa, Italy

andrea.pirmi(at)unige.it, luca.raffini(at)edu.unige.it

The paper deals with the de-politicization process characterizing contemporary society as an effect of the de-structuration of collective sphere. The assumption is that we observe a multiplication of subjects characterized by transformative identities, that contribute to produce a rarefied and pulviscular collective sphere. This novel kind of collective sphere is no longer composed by stable and exclusive groups, but by inherently inclusive and temporary aggregations.

The first section of the contribution is devoted to the framing of the conceptual and empirical tools used to explore the above mentioned processes. Thus, we analyze the factors that in our hypothesis contribute to generate this change. We focus in particular on the relationship between action and identification. Departing from the theory of Alberto Melucci (1996), we will explore the dynamics by which the relation between identification and action end up being reversed. The action no longer follows the identification. Action and identification appear rather synchronized and overlapping. As a result, the individual action, even in collective and political context become primarily subjective and its political connotation seems to weaken.

Summing up, we outline the spread of a political behavior that, even providing resources for the identification, it is characterized by a low political salience, both at individual and at collective level. Yet, in these processes it is possible to identify some "fatiguing" dynamics of ri-politicization.

De-Politicization in the Neoliberal Era. Looking for a theoretical systematization

Fabio de Nardis

CSPS - University of Salento, Italy

fabio.denardis(at)unisalento.it

The aim of the paper is to propose a theoretical systematization of the concept of de-Politicization that has been defined in several and often contradictory ways. We consider it, in short, to be a set of changes in the ways power is exercised. These modes downgrade the political nature of decision-making and, through representation, give legitimacy to actors apparently less able to bear witness to the presence of the "political". Institutional politics appears less responsible for the decisions that affect the regulation of society and the impact of their costs and failures on economic and cultural processes. Political choices conditioned by the market acquire the character of necessity and inevitability. De-politicization has been consolidated in various ways. For example, in the European context we can observe de-politicized processes in the governmental as well as in the societal and discursive dynamics as a clear strategy carried out by neoliberal actors and institutions. Very often, also the reactive actions by civil society through participative and resilient processes seem to be strongly conditioned by this new master frame ending up being consistent with the neoliberal flow. Within this picture, we try to reflect on these phenomena especially through a logical systematization of the rich literature on the topic with aiming at the identification of some research areas where scholars can gather some empirical evidence of de-politicization practices and its main consequences.

Society in global disorder: relation between (dis)integration and (de)politicization

Irina Leonidovna Nedyak, Artemy Mikhaylovich Kuchinov

Institute of Sociology, Federal Research Sociological Center, Russian Academy of Sciences, Moscow;
Institute of Sociology, Federal Research Sociological Center, Russian Academy of Sciences, Moscow
iraned(at)mail.ru, arkuchinov(at)yandex.ru

Positive reintegration turns to be a crucial issue in political agenda of current global disorder triggered by liberal globalization. There is vibrant interdependency between routes of (de)politicization and disunity across societies that is produced by disproportion liberalization vs social regulation, inequality, forced austerity, dismantling of welfare state, social citizenship and therefore democratic rights.

We identify an increasing menace of synergy of two revolts. First: deprived groups and thus "dangerous class". First in modern history it is upheld by parts of the middle class - heretofore a decisive guardian of the democratic order. Second: many faced extremism/populism that has captured political spectrum abandoned by crowded in the center establishment parties.

The presentation proposes to discuss the following

issues:

- Interaction between neoliberal marketization of political sphere and (de)politicization; arrangements to prevent erosion of the political field, public sphere and operational institutions.
- Measures to abate disunity caused by unregulated market intervention into political and social fields that has instigated the clash between republican, communitarian and liberal values for social solidarity and cohesion; ways of fostering their fusion to achieve positive integration.
- Ambiguous aftermath of empowering the citizens both in and through domains of state, market and network.
- Reshaping of social contract through embedding horizontal model into current vertical one to bargain a socially acceptable integration; enhancement of establishment parties by civil movements; assessment of such antidotes for disunity and extremism as identity values, new forms of solidarity.

RN32 | Session 03b Local Politics

Decreasing voter turnout as a threat to democracy in metropolitan areas

Guenter Warsewa

University of Bremen, Germany

gwarsewa(at)iaw.uni-bremen.de

In Germany, shrinking voter turnout seems to be a particularly dramatic tendency in big cities and metropolitan areas where the quote of non-voters raised since the end of the 1970s. This is increasingly seen as a threat to social coherence and democratic quality. Although there are different reasons for abstinence in elections on local, regional and national level, this does not give an explanation for the higher rates of voter turnout in big cities. The paper will argue, that in big cities the complexity of requirements and interests in urban all-day live and postfordistic social structures overstrains the capabilities of traditional political institutions and procedures. Therefore, the difference between steering and problem solving capacity of policy on one hand and the demand for problem solutions on the other is higher than in other types of regions. Citizens do perceive this in their all-day live and routines but, this is also the place where the conditions for their identification with the community and the commitment to democratic participation must be created. The paper will analyse the social conditions for identification, civil engagement and democratic participation more in detail and conclude, that by far not only deprived and subproletarian milieus have good reasons for refusing to vote. There is also an increasing number of average and well-situated middle-class people which from several reasons lose more and more their commitment for democratic elections. The contribution will also discuss approaches to solution, especially deliberative forms of citizens' participation.

Local political elites in Russian small industrial cities

Mikhail Manokin

Higher School of Economics (Campus in Perm),
Russian Federation
manokin.misha(at)gmail.com

Following report addresses the issue of recent changes in political practices, power structures, disposition of the agents in the political field (here interpreted within P. Bourdieu's field theory). To delve in the issue the report looks at the results of 72 anonymous interviews of representatives of the local elite in small industrial cities of Russia's Perm region such as Krasnokamsk, Chaykovsky, Kungur, Oktyabrski etc.

Interviews allow to describe power structures formed by elite groups in these small cities. Elite groups, usually comprised of local politicians, business owners and administration officials, can be divided into three major types. The first type is built of temporary political "alliances" formed among elites for achievement of specific goals, for example, for elections. The second type consists of long-term "official" structures, usually based on local offices of the largest Russian political parties, businesses or governmental organizations. The third type consists of anachronistic clan structures with informal, but strict familial and economic ties between their members. Conflicts and alliances between these forces shape political space of the small cities.

The study shows that these three types of elite groups may have probably take over the role of the main political subjects in the small industrial cities, as the interviews show how representatives of small cities elites see themselves as such. These tendencies may be result of decreasing interest of the population of these cities in politics, happening because of the general bureaucratization of political field and its high demand for cultural and social capital required for entrance. Under these conditions local elites may become the only political subject in small Russian cities or, perhaps, in country in general.

The future of local democracy: Are the demands for citizen participation changing local governance and political culture? The case study of Turku, Finland.

Ritva Salminiitty

University of Turku, Finland
ritsal(at)utu.fi

Despite the good reputation of democratic state, Finland's trend of descending voter turnouts is faster than in other Nordic countries and Finnish voter activity is within the lowest third among the world's established democracies. Public trust in politics has hit rock bottom and prior research has noted clear distinction between citizens' and decision-makers' opinions on citizen participation. It seems that demands for more direct participation have not been taken seriously and implementations of new procedures of citizen participation are proceeding in

Finnish municipalities rather slowly. Coincidentally, local democracy has been challenged by the major changes in municipal operating environments. These trends have driven participation into discussion in substantially new aspect.

My research attempts to shed light on the current discussion focused on the "participatory turn" and the future of local democracy from the perspective of decision-makers. It is based on the case study with two surveys and the recent interviews of city councilors. The survey results indicate rather clear polarization in councilors' attitudes towards citizen participation. Support for participatory democracy has grown simultaneously with the strengthening trend of minimalist democracy. To this trend I try to find some understanding from the interviews by asking where this support for minimalist democracy stems from, and how councilors' attitudes of participation are connected to their conceptions of representation.

Municipal Size and Location Matters: Diversified Characteristics and Behaviour of Czech Mayors

Daniel Cermak, Renata Mikesova, Josef Bernad
Institute of Sociology of the Czech Academy of Sciences, Czech Republic; Institute of Sociology of the Czech Academy of Sciences, Czech Republic; Institute of Sociology of the Czech Academy of Sciences, Czech Republic
daniel.cermak(at)soc.cas.cz,
renata.mikesova(at)soc.cas.cz,
josef.bernar(at)soc.cas.cz

We can find 6,258 municipalities with the average population of 1,682 inhabitants and the median of 426 inhabitants in Czechia at the present. The context of different municipal sizes is an important topic in Czechia because of the high degree of fragmentation of the municipal system. The location of a municipality on urban-suburban-rural gradient is also important. For instance, a location of a small village in a suburban area affects the attitudes, opportunities, and network placement of its mayor in a different way compared to a location in a rural area. This paper presents who the mayors are and how they operate in such a diversified environment.

We use representative data from a survey conducted among Czech mayors in the years 2015 and 2016 (N=506). Mayors representing municipalities of different sizes, from small villages with less than 200 inhabitants to cities with more than 50.000 inhabitants, are included in our sample.

Our main aim is to show the impact of the context of municipal size as well as the position of municipality on urban-suburban-rural gradient on mayors' characteristics and behaviour. We concentrate on three main dimensions in our analysis.

With respect to the above mentioned contextual effects, three key hypotheses are tested:

- 1) Socio-demographic characteristics (age, sex, education) vary in relation with size and location.
- 2) Professionalization of mayors and their partisanship vary in relation with size and location. The first one concerns the cumulation of mandates and mayoral

professionalization. The importance of mayoral partisanship is growing with the municipal size.

3) Notions of democracy vary in relation with size and location. We concentrate on mayors' perception of various democratic procedures, e.g. referendum, participatory budgeting.

RN32 | Session 04a Radical Right-wing Populist Parties in Comparative Perspective I

Populist Radical Right Parties in Europe after Brexit: Similarities and Differences

Dietmar Loch

University of Lille1, France
dietmar.loch(at)univ-lille1.fr

This proposition wants to contribute to the comparative dimension of the panel topic. How can we analyse, first, the relations between the social and cultural change in European societies (long-term change, modernisation, cultural differentiation, economic and financial crisis, migrations crisis, etc.) and the success of populist radical right parties since the 1980s, in order to find their similarities, especially after Brexit? We use cleavage theory to link the electoral success to these structural changes of European societies, which are embedded in the process of globalization and in "the (un-)making of Europe". Cleavage-related protectionist positions of the populist radical right parties towards European integration and globalization allow examining their economic ("modernization losers") and cultural (ethnic competition, cultural differences) similarities. Furthermore, they can show that - even when in certain periods the radical right focussed on criticizing global capitalism - its dominant characteristics are linked to the cultural (national identity) and also to the political sphere (national sovereignty, Europeanization of Brexit, populist democracy). Second, these similarities, which we can observe all over Europe, are accompanied by regional and national differences existing in the electoral success of these parties and its explanations. These differences can be explained especially by the persistence of national political cultures and by political opportunity structures. The comparison of selected cases (France, Austria, Germany, Hungary, et al.) will demonstrate these similarities and differences. The aim of this contribution is to bring empirical evidence in this comparative framing.

"Parties of the crisis? The populist radical right in Spain and Greece

Sofia Tipaldou

Panteion University of Athens, Spain
sofia.tipaldou(at)uab.cat

The 2014 European Parliament election resulted to the rise of xenophobic, anti-immigration, revanchist, and eurosceptic parties across the European Union. This paper explores the extent to which high levels of unemployment and political dissatisfaction (the 'crisis theories') can explain the rise of eurosceptic populist

radical right parties within the EU – parties that turn against it. It draws on examples from two similar Southern European crisis-ridden environments with opposing trends of radical right support. In Greece, Golden Dawn became the fifth biggest force, while in Spain no similar radical right formation has managed to create a solid electoral base at the national level. My case study for the Spanish case is the Catalan radical right party Platform for Catalonia (PxC), the most successful party of its kind in regional level up to this point. Golden Dawn and PxC have moderated their discourse, following the example of Le Pen's National Front, and are now resembling other Western European populist radical right parties. Both Greece and Spain account for the highest unemployment—particularly youth unemployment—percentage in the EU; receive a big number of refugees; have a dictatorial experience; and have been shaken by immense popular protests during the last years. My research aims to introduce country-specific characteristics and movement dynamics (party ideology, leadership, and strategies) in the study of the electoral success of populist radical right parties, contributing thus to the ongoing debate on the role of economic crises on the rise of populist radical right parties, as well as on their potential indirect threat to democracy and to the European ideal.

European Radical Right-wing Populist Parties challenging Judicial Powers. A Comparison between the Dutch Party for Freedom and the Swiss People's Party

Oscar Mazzoleni, Gerrit Voerman

University of Lausanne; University of Groningen
oscar.mazzoleni(at)unil.ch, g.voerman(at)rug.nl

This contribution addresses the question how do European radical-right wing populist parties (RRPPs) frame and challenge the judicial power. RRPPs tend to be ambivalent facing democracy (e.g. Mudde 2013), promoting the rule of the people, emphasizing direct democracy, and undermining the rule of the law by stressing the arbitrary role of judges, asking at the same time for freedom of speech when they are accused by judges for racist statements etc. Moreover, these parties tend to challenge the division of powers in constitutional democracies and fight against juridical elites. However, in-depth empirical analysis on this topic is lacking. Trying to contribute to fill the gap, the paper will compare two European radical-right wing populist parties, the Dutch Party for Freedom and the Swiss People's Party, focusing on party manifestos, parliamentary proceedings and public speeches by political leaders.

The new radical right and the perspective of populist democracy in Europe

Lorenzo Viviani

University of Pisa, Italy
lorenzo.viviani(at)unipi.it

This paper analyses the tension present in the reconfiguration of the political forms and players in the

crisis of representative democracy and the hypothesis of a populist democracy shared by new radical right parties in Europe. In the face of change in the social bases of advanced European democracies, politics has delayed the articulation of new cleavages characterising a society that can no longer be attributed to the perimeter of belonging and the social classes of the 20th century. The crisis is therefore not an expression of criticism against democracy as a political regime per sé, but rather corresponds to a crisis in the legitimacy of traditional political players. The democratic deficit feeding populism is not weakened by the claimed desire to broaden the participatory dimension of politics, inasmuch as it derives from the loss of collective references in a society divided in new winners and new losers of globalization and in the midst of a crisis of the concept of equality. These aspects shall be analysed further as part of the interpretation of populism as a phenomenon comprising an appeal to the people and an opposition to the élite. The purpose of this paper is to address the issue of the politicization of anti-political-establishment sentiment, where populism is considered not so much as an ideology but as a political strategy of politicization of the rift between society and politics, where political leaders and parties are the key players in shaping the disaffection of the people toward the traditional mass politics.

RN32 | Session 04b (De-)Politicization in the Neoliberal Era IV

“Solidarity is our weapon”. Social mobilisation in Scotland

Elisabetta Mocca
University of Edinburgh, United Kingdom
Elisabetta.Mocca(at)ed.ac.uk

The consensual climate of the post-political order has been recently disrupted in Europe. The mass protests staged in different European countries and the resurgences of the extreme parties in response to the multiple European crises witness the “cracks” in consensual politics. While much of the scholarly attention has been drawn onto the socio-political impact of large-scale uprisings, the contribution of bottom-up sub-national groups to the “return of the political” has been under-researched.

Therefore, in this paper, we focus on solidarity acts undertaken at sub-national level as instances of the “properly political”. We contend that these practices are antagonist political forms, containing in nuce the potential to counter-act the post-political order and to shape a new politics that makes solidarity one of its founding values.

To illustrate this argument, the paper reports the findings of a case study analysis involving four grassroots groups based in Scotland. For the groups under scrutiny, solidarity is conceived as a political value underpinning the vision of an equal and fair society, prompting their social mobilisation. Rather than challenging the political order through far-reaching disruptive actions, these organisations act to

change the status quo starting from the local level. The evidence show how the enactment of solidarity put in place by these movements is a properly political act, redefining the meaning and praxes of “the political”. By providing an empirical analysis of solidarity acts practiced at sub-national level, this paper contributes to substantiate the literature on post-politics.

It is on you now: Depoliticizing economic policy through financial education

Amit Avigur-Eshel
Hebrew University, Ben-Gurion University
amit.avigur(at)mail.huji.ac.il

In spite of the increased visibility of financial education since the onset of the World Financial Crisis, the literature on neoliberal depoliticization has not awarded it sufficient attention. This results from a neglect of the private sphere as a central sphere to which economic issues are relocated by practices of depoliticization. Scholar concerned with the transferring of responsibilities (and thus blame-ability) away from politicians to unelected bureaucrats through state institution reforms, have overlooked the possibility that responsibilities may be transferred away from state institutions to individuals and families (i.e., the private sphere). Scholars concerned with the elimination of agency and choice through public discourses that relegate economic issues to the realm of fate, have overlooked the possibility that depoliticizing discourses may encourage agency and choice on an individual and family basis.

I argue that the emerging interest in financial education in recent years among policymakers signifies the rise of private-sphere depoliticization. Responsibilities for economic outcomes are transferred to individuals and families who are encouraged to employ agency and choice, but only in a-political ways.

I use as a case-study Israel’s Department of Financial Education, and analyze the process leading to its establishment and the contents of its main project, the HaOtzar Sheli (My Treasure) website. The department was established following a mass protest in 2011 that re-politicized economic policy. Its website promotes a ‘correct’ economic behavior, focusing on thriftiness, planning household budgets and bargaining for better prices.

Speaking truth to society? Experts, Activists and Citizens in local mobilizations against big infrastructural projects

Riccardo Emilio Chesta
European University Institute, Italy
riccardoemilio.chesta(at)gmail.com

Conflicts concerning infrastructural projects often become arenas of contention where expertise crosses political and technical claims. To analyze this peculiar problem concerning both sociology of knowledge and collective action, I conducted a paired comparison on two cities, Florence and Venice – two of the main

centers of collective action against big infrastructural projects in Italy all along the years 2000.

The Florentine projects of high speed train line and station («Tunnel TAV») and the urban waste incinerator in Case Passerini, as well as the Venetian «M.O.S.E.» project to contain the high waters and the Cruise Ships, have encountered some of the most visible and sustained citizens mobilizations.

However, the levels of participation and knowledge diffusion in both cities varied significantly, depending from each type of technology.

A comparison of different levels of expertise politicization allows then to show how and under which conditions (visibility/opacity of the technological factor), in highly technical controversies, expertise gets mobilized and to which extent the «black box» of expert knowledge opens or not to a widespread citizens participation.

In this research, I tried to intersect contributions from political sociology with sociology of knowledge and expertise.

Focusing on the specific interconnection between local and national political context and looking at the role of local associations as well as at their connection with broader networks, I will illustrate the dynamics of expertise mobilization, its delicate relation with political activism and finally the peculiar interactions between experts and non-experts actors (political activists and citizens).

Neoliberalization, De-Democratization and Processes of Des-Integration in the EU

Behrouz Alikhani

University of Münster, Germany

behrouz.alikhani(at)uni-muenster.de

The pick of the development of the European Union's project and its institutions has been in the dominant era of neoliberalism. Europeanisation led, therefore, not to a strong community, based on solidarity and social equality within the EU, but rather to the increasing of de-solidarization and social inequality within and amongst its member states. To put it simply: The losers of this project have been more than its winners.

In this sense, the rise of extremist movements and parties is partially due to these processes of functional and institutional de-democratization which could strongly contribute to the final disintegration of the European Union. In this presentation, I will introduce a process sociological model of democratization and de-democratization based on which the complexity of such multidimensional processes of de-democratization and accompanying des-integration could be grasped in a more reality congruent manner. This figuration sociological and therefore empirically oriented model does not just take into account the institutional dimension of such processes, but also their functional and habitual dimensions. Out of this comprehensive diagnosis, I will also concretely talk about actions and steps which could hinder the dominance of such centrifugal processes within the EU.

RN32 | Session 05a RADHISCEE: Radical Right Discourses in Central and Eastern Europe

Metamorphosis of Populist Radical Right Discourses in the Czech Republic 1989-2016

Věra Stojarová

Masaryk University, Faculty of Social Studies, Czech Republic

stojarova(at)fs.muni.cz

The presentation follows the populist radical right in the Czech Republic from 1989 to the present day, offering insight into its interaction with the media, its place within public discourse, and its status in the context of competing parties. The author tracks the communication patterns of radical right populism in the Czech Republic and highlights different aspects of discursive opportunities. Based on the extensive literature review and qualitative analysis of the communication repertoires of the populist radical right, the main claim of the presentation is that there is a strong proliferation of populist discourses into the mainstream politics but not necessarily by radical right populist parties in Czech Republic. Miloš Zeman, the President of Czech Republic from 2013, has contributed to the mainstreaming of nationalism and xenophobia, but instead of adding voters and supporters to the populist radical right, he rather created a division of Zeman/anti-Zeman in the public discourses. In this sense, the case of Czech Republic depicts a seemingly contradictory discursive constellation in which the discursive elements of the populist radical right entered into the mainstream without the ease of the strong and longstanding media isolation of the radical right parties.

The memory as socio-semiotic resource. The case of the radical right's discourse on the Hungarian Uprising of 1956, 1990-1998 (RADHISCEE)

Gabriella Szabó

Centre for Social Sciences, Hungarian Academy of S, Hungary

szabo.gabriella(at)tk.mta.hu

The presented paper provides a socio-semiotic approach and an illustrative example of the multimodal discourse analysis of a collective memory of 1956 in the discourse of the evolving radical right in Hungary. It is argued that the collective memory of the Hungarian Uprising of 1956 has been produced by publicly and repetitively circulating signs to fabricate the political identity of the radical right politics. The focus of the examination is on mapping out their means for meaning making of 1956 during the first two election period (1990-1998) after the collapse of the communist regime. The study presents weekly journal 'Magyar Fórum' as sign-maker which shape and combine semiotic resources to establish connections between politicians and supporters of radical right. The instruments of the sign-making are examined by identifying the narratives and the visual grammar of remembering 1956. The construction of the collective memory of 1956, therefore, is considered as the key

semiotic resource in the radical right political discourses in the analysed time period.

Right-wing Populist Parties as Agents of National Culture and Welfare Chauvinism in the Post-Communist Context (RADHISCEE)

Ov Cristian Norocel, Radu Cinpoes
University of Helsinki, Finland; Kingston University
London, UK
cristian.norocel(at)helsinki.fi,
Radu.Cinpoes(at)kingston.ac.uk

This contribution is set to examine the interplay between ideas of national culture, as cues for national specificity, and welfare chauvinist proposals, aimed at providing welfare services to a narrowly defined ethnic group, in Central and Eastern Europe, as promoted by right-wing populist parties in the region. For this purpose we suggest a comparative framework to account for the various positions that such parties occupy in mainstream politics in the region. Our analysis deals with the case of the right-wing populist party as key opposition force, such as the Movement for a Better Hungary (Jobbik Magyarországért Mozgalom, Jobbik) in Hungary; the case of the right-wing populist party becoming the main governing force, such as the Law and Justice Party (Prawo i Sprawiedliwość, PiS) in Poland; and thirdly, the case of an unsuccessful right-wing populist party, such as the United Romania Party (Partidul România Unită, PRU). For the purpose of our qualitative analysis we have collected empirical material both from the latest elections for the European Parliament (May 2014) and the latest national elections in each chosen country (April 2014 in Hungary; October 2015 in Poland; respectively December 2016 in Romania). The aim of this study is to map out the various electoral strategies employed, more or less successfully, that juxtapose welfare chauvinist proposals to cultural protectionist appeals, and consequently shed light on the culture and welfare nexus in the Central and Eastern European context.

Radical Change? – Moderation Strategy of the Hungarian Radical Right Party Jobbik

Csaba Molnár, Daniel Rona
Corvinus University, Hungary; Corvinus University,
Hungary
molnarcsaba0903(at)gmail.com, daniel.rona(at)uni-
corvinus.hu

An important tendency of far-right parties is that many of them are becoming more moderate. The paper examines whether this de-radicalization appears in the case of the Hungarian Jobbik (Movement for the Better Hungary) which declared its moderation strategy in 2013 (similarly to the French Front National's 'dédiabolisation'). According to the authors, radicalism is – to a large extent – a relative concept: a party can be regarded as radical if its stance is unique and totally different from any other parties' positions. If the main conservative party adopts the policy of the far right, the far right won't be an outlier anymore.

Thus, the paper pinpoints the stances of the four most important parties of Hungary (far-right Jobbik, conservative Fidesz, socialist MSZP and green LMP) along the main policy dimensions of the Hungarian political agenda in 2010 and in 2016. The paper shall also introduce the agenda-setting effect of Jobbik: it identifies its main initiations. The research is based on the content analyses of party manifestos, media-coverage, parliamentary activities (legislative proposals, interpellations, etc.) and demonstrations of Jobbik and, to some extent, the other parties. The paper aims to assess the extent and characteristics of Jobbik's shift on ideology and rhetoric.

RN32 | Session 05b (De-)Politicization in the Neoliberal Era V

Social policy design: Psychological determinants of non-take-up in the era of digital and virtual governance

Maria da Luz Leite Cabral
Escola Superior Saúde Alcoitão, Portugal
maria.cabral(at)essa.pt

Recent technological changes have stimulated programs of administrative modernization with consequences in the formats of public services availability and in the relation citizen-state. One possible effect is the constraint on citizens' access to non-take-up benefits - namely social (e.g., Direct Social Security). The literature has focused on economic and socio-economic factors underlying non-take-up, with social stigma being one of the few psychological variables identified. Research on e-Government is incipient. However, research on information technology (IT) has suggested relevant individual, psychological and social variables in understanding the non-take-up via e-Government portals. Individual differences related to social dominance and other psychological variables have revealed impact on the adoption and use of technologies. What impact these variables may have on non-digital take-up is yet to be explored.

The theory of social dominance suggests that gender, age, and literacy may be responsible for the inequitable distribution of resources: subordinate or low status groups are less likely to access resources. Access is closely linked to administrative conditions: virtualization solutions and dematerialization of public service contact provide added value, but can raise additional barriers to access to services, particularly by the groups of citizens who are most vulnerable in digital access in virtue of individual, psychological and social attributes and that Governance will have to consider in order to remove barriers to access.

Triangulating Youth Participation and Politicization: Combining Ethnography and Data Mining

Veikko Eranti, Georg Boldt, Tuukka Ylä-Anttila
University of Tampere, Finland; University of
Tampere, Finland; University of Helsinki, Finland
veikko.eranti(at)gmail.com, georgmboldt(at)gmail.com,

tuukka.yla.anttila(at)gmail.com

This paper presents the first results of a multi-year multi-field study on youth participation and politicization in Finland. The paper focuses on different “top-down” youth participation mechanics, ranging from participatory budgeting to online idea-proposition online, from the perspective of deliberation and civic imagination. The study combines data mining (topic modeling) of large online text corpora with extensive ethnographic fieldwork and aims at answering a question about contemporary political citizenship in Finland: which kind of norms and ways of doing politics are learned through these channels? The hypothesis, supported by preliminary research results, is that the material and ideological arrangements in the participatory channels are conducive for certain kind of political participation, sometimes called “problem-solving” civic imagination, but not at all conducive for more radical styles of doing politics or being political. The constraints of participatory systems do not effectively allow for the critique of the system itself.

Combining digital methods with ethnographic fieldwork is one of the more exiting mixed methods approaches. Combining the larger data set and easier generalizability with the in-depth understanding and interpretation promises to open new avenues, both within the classical positivist-interpretative dualism, as well as within a more pragmatist, adductive tradition of reasoning. The benefits of this kind of methodological dualism are clear, when doing research on ephemeral subjects such as youth participation and politicization: it allows for building a cohesive picture of a dispersed phenomenon. Because using text-mining methods is in itself dual-natured (to be able to use text-mining methods in a meaningful way, one has to also spend considerable amount of time doing qualitative readings of materials produced within digital sphere), we can call this approach triangulation.

Traditional voters or postmodern citizens? Citizenship typology in Lithuania

Jurate Imbrasaite

Vytautas Magnus University, Lithuania
j.imbrasaite(at)smf.vdu.lt

Democracy is rather fragile, when it is based on formal democratical institutions. Support for governmental institutions and citizen participation in the process of political governance is an essential condition for the functioning and stability of democracy. Citizens are free to choose a number of ways to influence the political process. However, not all modes of political participation are equal with respect to the consolidation and quality of democracy. Support for democracy and conventional modes of participation constitute a precondition for a stable democratic system. On the other hand, participation in legal protest actions may be considered as acts of self-expression and it is not dangerous for stability of democracy.

The focus of this paper is to identify and to investigate

types of citizenship in Lithuania. What groups of citizens in Lithuania may be distinguished in accordance with their level of interest in politics, political efficacy, trust to political institutions and participation in political acts? What are the factors that determine the differences between types of citizens? What are the causes and explanations of different patterns of political trust and participation between types of citizens?

Based on the survey conducted in Lithuania and 60 semi-structured interviews, the paper draws conclusions that four types of citizens (trustful optimists, traditional voters, distrustful active, distrustful passive) may be identified and they significantly differ by their age, education, evaluations of country's economy, and evaluations of procedural justice in public sector. From theoretical perspectives of active traditional and postmodern citizenship, the characteristics of identified groups are mixed, because of socioeconomic and cultural conditions in Lithuania.

The de-politicization of refugee protection through securitization. The Italian case

Mariafrancesca D'Agostino

Università della Calabria, Italy

mariafrancesca.dagostino(at)unical.it

The de-politicization of refugees protection through securitization. The Italian case

While new political crises are generating massive population movements around the world, the chance of refugees to see their right of asylum recognized has constantly decreased in a new “humanitarian framework” of complex relationships between States, military organizations, international institutions, NGOs, local and international legal systems.

For years, this shift was mainly observable in developing regions with endemic political problems, where different agencies deliver assistance to prevent the flight of refugees, catching them into a victimhood order that tends to assume repatriation as the ideal solution. However, the growth and increasingly autonomy of forced migrations, are now outlining the transition to a “new stage” where these patterns of intervention are spreading also in Europe, becoming an emblematic example of how depoliticization assumes in this phase of “multiple crises” the character of a purely global phenomena.

Following this theoretical perspective, this presentation aims to provide important insights into the evolving situation of depoliticization in the context of the Italian responses to current refugee flows. By presenting the Italian case, the principal objective pursued by this study is to furnish a stronger understanding of the factors that are here triggering a new depoliticized asylum system and on the specific role played by bureaucracy and by non-state actors dealing with asylum.

RN32 | Session 06a Impact of European Populist Parties Success on EU-Level CSOs

EU-level Civil Society Organizations in times of populism

Rosa M. Sanchez Salgado
University of Amsterdam, Netherlands, The
r.m.sanchez(at)uva.nl

The raise of populism across Europe is not only a challenge for political parties and elites, but also for Civil Society Organizations (CSOs). The populist challenge has also stirred citizen's movements and civic organizations, contributing to new mobilization dynamics in Europe. On the other hand, well-established CSOs could also be considered as part of the elite-establishment and thus, their credibility, strategies and even their activities may have been affected by the populist anti-elite discourse. The purpose of this paper is to analyze how EU-based CSOs have altered their goals and strategies in reaction/response to the raise of populism in the domain of migration. CSOs activism in this domain is particularly susceptible to be affected by populism, since populism often constitutes a threat to human rights (particularly the rights of migrants). To this purpose, I propose an in-depth qualitative analysis of EU level CSOs involved in the protection of refugees and asylum seekers. Data is retrieved from position papers, press releases and speeches from key well-established EU-level CSOs such as Amnesty International (AI), the International Rescue Committee (IRC), the European Resettlement Network, etc.

From benign neglect to threat: The rise of populism and mobilization on gender equality in the European Union.

Pauline Cullen
Maynooth University, Ireland
cullen(at)nuim.ie

This paper will explore patterns of transnational mobilization on women's interests in Europe at a time of increasing populism. Critics of radical right populist movements point to their attack on women's rights (Emejulu,2016; Fraser,2016) . Assessments of gender equality as an EU policy issue have also confirmed its decline as a priority (Elomaki,2015). Left wing populism in turn has provided little space for women's interests (Dean, Keith and Maignashca, 2016) . This research explores how women's rights organisations at national and transnational level are responding to increasing threats and diminished opportunities attendant to the rise of populism. I will explore how women's interests are constructed by organisations including the European Women's Lobby, with a view to patterns of inclusion, exclusion and legitimacy in terms of representation and assess the relevance of EU level actors and initiatives including the proposed social pillar for mobilization on women's rights (EU-level CSOs).

Constraints and opportunities of 'judicialization': religious organizations' mobilizations and the European Court of Human Rights

Alberta Giorgi
Centro de Estudos Sociais, Portugal
alberta.giorgi(at)gmail.com

A growing body of literature highlights the increasing role of the Courts in democracy – the 'judicialization of politics'. On the one hand, the courts jurisprudence has the authority to clarify the status of controversial issues, offering a venue to potentially overcome political veto-players. On the other hand, the EU and its institutions played a significant role in the development and diffusion of the 'language of rights' for dealing with politically controversial issues. This is especially relevant for religious-related issues – and some scholars proposed the category of 'judicialization of religion' to underline the crucial role of the courts jurisprudence in defining the place and the boundaries of religion in contemporary societies. In this scenario of judicialization, the European Court of Human Rights is of paramount importance, due to its primacy over the national courts and its specific task of dealing with human rights and non discrimination. GRASSROOTSMOBILISE project explores the extent to which the ECtHR religious jurisprudence defines the 'political opportunity structures' and the discursive frameworks within which citizens act. In this frame, this contribution focuses on both EU-level CSOs and grassroots religious actors, to investigate the indirect effects of the ECtHR. How do religious organizations (and – especially – minority religions) assess the role of the ECtHR? What is the role of the judicial strategy among their repertoires of action? How does it change in light of the right-wing populism wave? Sources include key-witnesses interviews, document and media analysis.

The populist radical right, exclusionary political frames and their impact on EU-level civil society

Carlo Ruzza
University of Trento, Italy
carlo.ruzza(at)unitn.it

This presentation focuses on the reactions of EU-level anti-racist and pro-migrant organizations to a sweeping populist turn in European politics and elsewhere. The political climate of organized civil society at EU level has been radically affected by a sweeping populist turn in European politics in recent years, which has affected the funding priorities, agendas and political discourse of European institutions. This is evidenced for instance in the changing composition of the European Parliament where populist radical right parties made significant advances in the 2014 European elections. This political change has particularly affected inclusionary and anti-discrimination organizations. This presentation focuses on their reactions. Through a set of in-depth interviews with civil society representatives and EU civil servants it documents and analyzes changes in the legitimacy, strategy, funding

opportunities and more generally political opportunities of these civil society actors. (EU-level CSOs)

RN32 | Session 06b Transformations of European Welfare States I

From Care of the State to the Care of the Self: A Foucauldian Perspective on the Relations Between Neo-Liberalism and Welfare States

ayca berna gormez

middle east technical university, Turkey

gormezayca(at)gmail.com

The demise of the welfare states is mostly associated with the rise of neo-liberalism; through which the functions of the states are reduced to minimum in order to cut down on the government expenditures and enhance the market and its flourishing. However, it cannot be explained only through economic processes; these provide only one dimension of the demise of the welfare states and also neo-liberalism in general. A greater picture can be proposed; it can also be considered as part of a greater process. This process is about transformation of the rationality. It is a rationality that liberalism itself is based on. From this perspective, both liberalism and neo-liberalism can be recognized as “art of government”; as Foucault puts it, they are about governmentality. So in this paper, the demise of the welfare states will be analyzed in relation to the rationality of government, governmentality. Governmentality refers both to control and management by the state and also it refers to the self-control, management of household, or care of the self. Through governmental logic, the state has not lost its function; rather its withdrawal becomes one of a technique of government. In this paper, the transition from care of the state to care of the self will be analyzed in a sense; the logic behind it and the apparatuses through which it occurs will be explained from a Foucauldian perspective.

Policy citizenship. The impacts of neoliberalism and supranationalization on democratic linkages in Western democracies

Claire Dupuy, Virginie Van Ingelgom

Sciences Po Grenoble; F.R.S. - FNRS & Université

catholique de Louvain, Belgium

claire.dupuy(at)sciencespo-grenoble.fr,

virginie.vanengelgom(at)uclouvain.be

Across Western Europe since the 1970s, welfare states have been under considerable pressures. Over the mid-term, two main challenges surface. First, the trend toward neoliberal social policy, however varied in its shape and scope, has come to characterize most policy changes of the period. It has impacted levels of generosity, eligibility criteria, welfare providers as well as the process of benefit allocation. Second, the growing supranationalization of welfare states, by way of budget consolidation objectives and enforcement mechanisms and monetary integration, has greatly influenced, that is, reduced, Western European

governments' ability to act upon welfare states' design and reforms.

This paper takes stock of these developments from an ordinary citizens' perspective. It departs from the mainstream policy elite perspective and the political economy analysis as the paper focuses on citizens' political perceptions and experiences of both trends. It intends to theoretically lay out an analysis of the political outcomes of neoliberalism and supranationalization of European welfare states. Based on the policy feedback literature, that hypothesizes that attitudes and behaviours are outcomes of past policy, the paper suggests that both neoliberalism and supranationalization of social policy may contribute to explaining patterns of citizens' (dis-)affection towards politics in the past decades. The paper therefore investigates policy citizenship, that is how neoliberalisation and supranationalization of social policy shape attitudinal and behavioural democratic linkages (political trust, political support, loyalty, formal and informal participation). By doing so, it supplements existing research on individual determinants and contextual explanations of disengagement and disaffection towards politics.

European solidarity in times of crisis: towards differentiated integration

Hans-Joerg Trezn

University of Copenhagen, Denmark

trezn(at)hum.ku.dk

The principle of European solidarity, which was originally conceived as one of the founding values of the European Union and as a motor for social cohesion, is currently redefined. European solidarity has become one of the most contested claims in public debates turning it into a mobilization force for intellectuals, political actors and citizens' movements. By providing an analytical framework for the analysis of such solidarity contestation in times of crises, we argue that a new politics of differentiated solidarity in the EU can be distinguished, which is different from the old politics of European identity. In line with and as a consequence of the intensified argument in favour of differentiated integration, differentiated solidarity entails a shift of emphasis from the promotion of European integration aiming to establish a reciprocal relationship among equals to the promotion of flexible arrangements among EU members, discretionary redistributive mechanisms and hegemony. More specifically, during the Eurocrisis years, the following three mutations in the concept of EU solidarity can be observed: a) the exceptionality of charity: solidarity as acts of benevolence towards thirds; b) the exclusivity of egalitarian solidarity: national solidarity communities becoming more exclusive; 3) solidarity among non-equals: constant renegotiation of the costs and benefits of solidarity as a rescuing mechanism, which binds donating and receiving countries together in a situation of emergency.

Entrepreneur as a citizen-subject of the remodeling of welfare state

Miikka Pyykkönen

University of Jyväskylä, Finland

miikka.pyykkonen(at)jyu.fi

Many current governmental policies indicate that Nordic countries are moving away from their traditional state-led welfare models towards lighter versions of welfare states. This new version is sometimes referred as 'competitiveness state' or 'entrepreneurial state'. The ideal labor-subject of the lighter welfare state is entrepreneur. However, currently entrepreneur has been also labeled as an ideal citizen-subject in the discourses of this remodeling. This means that it is not just the figure of business making entrepreneur, which the programs and strategies for the remodeling of welfare state are promoting, but that all the citizens should be more entrepreneurial and adapt to the ethos of 'internal entrepreneurship'. Whereas the policy documents create discursive rationality for this new citizen-subject, education, creative sector initiatives and new economic platforms, such as entrepreneurial cooperatives and sharing economy, form the medium through which entrepreneurial ethos is made accessible and desirable to people. This paper pays also attention to the affective dimension of entrepreneurship and talks about how this promotion of entrepreneurship translates into subjective action in different kinds of entrepreneurial self-practices. I claim that the emerging discourses and practices of entrepreneurship are reflecting new modes of power and the hegemonization of new political and economic ideology, with its discourses, practices and subjectivities. In this situation, entrepreneurship can be seen as an intersectional subjectivity in which political rationalities and interests, educational conduct, new forms of economy and production and the wills and desires of an individual merge in a novel way.

RN32 | Session 07a Radical Right-wing Populist Parties in Comparative Perspective II

Populist Constitutionalism in Europe: Anti-Constitutional or Popular-Constitutional?

Paul Blokker

Charles University, Czech Republic

paulus.blokker(at)fsv.cuni.cz

Populist parties are increasingly part of European governments and wield governing power. One particularly significant dimension of this is populists reforming domestic constitutions or even adopting a wholly new one (Hungary). Populists ordinarily claim to represent the ordinary people and to promote their interests. It is not surprising therefore that in populist constitutionalism "the people" is a central dimension. Populist constitutionalism is increasingly upfront in the constitutional developments in countries such as Hungary and Poland, causing significant tensions in a European Union that endorses as its fundamental values democracy and the rule of law. The populist-

constitutional phenomenon spawns debates on both democratic backsliding and illiberal democracy in Europe and on the supranational monitoring of democracy. At the same time, there are good indications that one can also find important manifestations of populist constitutionalism elsewhere, including in so-called established democracies, but in a more implicit and less upfront manner than in a case such as Hungary. The paper will attempt to start conceptualizing populist constitutionalism in a more systematic way than has been done so far. While there is some literature emerging on the phenomenon (Mudde 2013; Thio 2012; Mueller 2016), a more robust and theoretical treatment of populist constitutionalism stills seems absent. The paper will provide a first step towards such an attempt by 'deconstructing' the phenomenon in a number of (interrelated) dimensions - the will of the People, majoritarianism, legal resentment, and constitutional instrumentalism - while relating the theoretical discussion to empirical case-studies.

The Appeal of the Islamic Conservative Populism of the AKP

Hayriye Ozen

Atilim University, Turkey

hayriye.ozen(at)atilim.edu.tr

Most of the existing studies on populism deal with a certain type of right-wing populism, particularly the nationalist and anti-immigration populism. This study focuses on a different type of right-wing populism: the Islamic conservative populism of the Justice and Development Party (AKP), which has been in the rule in Turkey since 2002. Specifically, it tries to understand how the Islamic conservative populism of the AKP appealed to diverse groups including those who do not have religious demands. In examining this distinct form of right-wing populism, the study draws on the perspective developed by Ernesto Laclau and the Essex School which conceptualizes populism not as contents of politics but as a particular logic of articulation that symbolically divides the social field into two antagonistic camps by interpellating 'the people' against 'the power' or 'common enemy'. It is demonstrated that the elitist tendencies that long characterized the Turkish politics provided a fertile ground for the AKP to present itself as the voice of the people, which was discursively constructed as not only those with religious demands, but all those who feel excluded from the enjoyment of political rights and socio-economic benefits by the elites in power. Although this relatively inclusionary populism gradually turned into an exclusionary and authoritarian one, it still appealed to many social groups, particularly to those who won new rights and acquired new socio-economic benefits during the rule of the AKP, by reconstructing the category of 'the power' as well as the antagonistic relation between the people and the power in different ways. This study implies that populist parties may reproduce their appeal by reconstructing the people and the power categories in different ways.

The European Commission against the rising right-wing populism: are EU values and principles put into action?

Milica Pejovic
University of Trento, Italy
milica.pejovic(at)unitn.it

The refugee crisis, together with the Eurozone crisis, has been often framed in the public discourse as existential for the future of the European Union as it has brought into question the viability of the Schengen system, one of the core EU achievements. It has also challenged the concept of solidarity between member states as a few of them refused the proposal of the Commission to redistribute refugees in order to ensure a more equitable and fair solution for the massive influx of people from Middle Eastern war zones. Moreover, the refugee crisis has spurred xenophobia and right-wing populism in various member states as a few of them refused the proposal of the Commission to redistribute refugees in order to ensure a more equitable and fair solution for the massive influx of people from Middle Eastern war zones. Already existing stereotypes and prejudices towards Muslims have been seriously exacerbated due to recent terrorist attacks and the rise of the Islamic state. However, the anti-immigration discourse of national populist politicians has been in a stark contrast to the discourse of the Commission, which has always prompted a pro-refugee agenda and stressed the importance of solidarity, tolerance and a common approach to the crisis. Against this background, the aim of the proposed paper is to examine how the Commission has reacted to the rise of extreme right-wing populism and hate speech in the context of unprecedented migratory pressures. Using interviews with civil servants working for the Commission, the proposed paper seeks to find out what practical measures have been undertaken in order to tackle the issue of populist hate speech at the national level and whether and how the Commission involved national and EU level CSOs in this process, having in mind that many of these organizations primarily fight against discrimination.

How to explain the rise and fall of ethnocentrism in Belgium between 1981 and 2009? Tracing the structural and cultural embeddedness of ethnocentrism

Ronan Van Rossem, Henk Roose
Universiteit Gent, Belgium; Universiteit Gent, Belgium
ronan.vanrossem(at)ugent.be, henk.roose(at)ugent.be

Objectives

The 1991 parliamentary elections in Belgium not only brought a major victory for the extreme right and racist Vlaams Blok but also that ethnocentrism became a central issue in Belgian politics. In this paper we trace (1) the evolution of ethnocentrism and (2) its structural and cultural embeddedness in Belgium.

Methods

For this purpose we make use of four consecutive waves of the European Values Survey (1991, 1990, 1999 & 2009). Confirmatory factor analysis, analysis of variance and regression tree analysis are used to analyze the data.

Results

We observe that ethnocentrism reached a peak during the 1990s and declined in the early 21st century, and that overall it is more prevalent in Flanders than in Brussels or Wallonia. Although the results regarding the structural embeddedness of ethnocentrism are consistent with the literature, the effects of structural variables, of which educational level and age are the most important, are too weak to really provide an explanation for the evolution in ethnocentrism. The association with cultural attitudes is weak as well and ethnocentrism shifts over time from being linked to a conservative socioeconomic attitude to being associated with institutional distrust and ethnical conservatism.

Conclusions

Our findings suggest that traditional structural and cultural models are insufficient to explain ethnocentrism in Belgium, and that for an explanation one may have to look at micro-sociological and social-psychological mechanisms.

RN32 | Session 07b (Post-)Secular Subjectivities in European Societies I

Christianity and Secularism in the (Un)Making of Europe

Ian Anthony Morrison
The American University in Cairo, Egypt
imorrison(at)aucegypt.edu

The question, and the response to the question of what is Europe always refer both to the ever-present, and the particular or contingent, and demand a conciliation of the two. In the past two decades, the question of Europe has been increasingly raised in relation to the apparent crisis of Europe's engagement with two immanent Others, in the form of the presence of Muslim migrants in Europe and the attempts by Turkey to gain membership in the European Union. In response to these Others, a dual and seemingly contradictory definition of Europe has emerged, Europe as both secular and Christian. Europe is secular in relation to its Muslim migrants, and Christian in the face of Muslim Turkey. Within this dualistic definition, no contradiction, excess or difference is permitted or acknowledged. Instead, a socio-historical paradigm in which Christianity and the secular form a necessary and symbiotic relationship is invoked.

My presentation will address this response to the imminent question of Europe and argue that the dual engagement with the Muslim migrant and the Turkish state exposes the confluence of what are portrayed as competing 'thick' and 'thin' definitions of Europe and European identity. I will suggest that Europe's engagement with these immanent Others draws attention to the difference and contradiction at the core of what are presented as unified, essential definitions of Europe. Revealing the autoimmune process at work within these definitions of Europe presents an opportunity to re-evaluate the relationship between Europe, Christianity and the secular, and

discloses new possibilities for a Europe to come.

Secular Affects in the Public Debates after Charlie Hebdo

Anna Lea Berg
Freie Universitaet Berlin, Germany
Anna.Lea.Berg(at)fu-berlin.de

In my PhD research, I explore the emergence of a "secular we" within the political communication of European public spheres. The paper I will present at the ESA conference will focus on media coverage of the attack on the editorial office of the French satirical magazine Charlie Hebdo in January 2015. It will introduce the concept of Reading for Affect as a new perspective on discourse analysis of mainstream media, which draws on ideas of cultural studies and affect theory. Applying Reading for affect to reporting after the Charlie Hebdo incident, I aim to highlight the role of affects in the production of secular subjectivities in European public spheres. I argue that a relational understanding of public discourse – as emphasized by Reading for affect – is crucial to understand how a secular "middle-ground" is devised between on the one hand religious, and on the other hand right-wing fundamentalisms. The Charlie Hebdo debate in that sense is inscribed in a genealogy of recent controversies on the role of Islam in Europe more generally, which serves as a crystallization point of emerging new political subjectivities in times where boundaries between the mainstream and the extreme rights are intensively problematized. Whilst the focus will be on the reporting of German newspapers, comparisons to the French and the British media coverage will also be drawn. Overall, the paper aims at contributing to the discussion about a "secular we" as trans-European hegemonic subjectivity, no longer rooted in nationalism, but in secularism.

AKP, Secular Dissent and Postsecularity in Turkey

Umut Parmaksiz
TED University, Turkey
umut.parmaksiz(at)tedu.edu.tr

This paper critically examines the claim that religion-society relationship in Turkey has been evolving towards a postsecular condition as a result of AKP rule, and provides an alternative account of postsecularisation that concentrates on the transformation of secular identity and politics. In the first section, I examine the predominant postsecular Turkey thesis which construes AKP period as a break from the 'secularist Turkey' tradition, harbinging the emergence of a postsecular society. I argue that this view is problematic, firstly because it ignores AKP's control over the religious sphere and the exclusionary practices that stem from this control, and secondly because the premise upon which this thesis rests, that state-religion relationship in Turkey is best understood as secularist until AKP, is questionable. I argue that the AKP period represents an attempt to change the nature of Islamonormativity in Turkey rather than a new dynamic between politics and religion. In the

second section, I focus on the secular resistance to AKP's efforts to deepen Islamonormativity. In light of the Gezi Park protests, I argue that secular identity and dissent has been going through social 'postsecularisation' by gradually moving away from a state oriented dissent to a lifestyle politics that construes everyday contexts as sites of resistance.

"Unmaking Europe: it is just God's will

Dimitra Mareta
Panteion University Of Social and Political Sciences,
Greece
dimitra.mareta(at)gmail.com

Among the several centrifugal processes showing towards the unmaking of Europe, one seems to set the tone: this of the radical right parties. Although for many years the attention was turned on the critique from the counter-globalisation movements, lately it seems that the attacks from the extreme Right become stronger and more influential.

In this paper I explore the central points of the opposition of the nationalist parties against Europe focusing on the role of the religion in politics. In order to do so, I will focus on two southern countries, Spain and Greece, and I will investigate the rhetoric of the main nationalist Spanish and Greek parties as it is expressed either at the Parliament or in their political and ideological texts.

More specifically, I will focus mainly on Alianza Nacional, Democracia Nacional, Falange Española de las JONS and España2000 – in the case of Spain - and Golden Dawn – in the case of Greece. I will concentrate on the way the critique against Europe is articulated with regard to the formation of central policies based on religious terms and affected by a religious perception of politics.

I intent to investigate their total stance against making of Europe with a specific attention on the new emergence of the religion as politics and as a source of political order and authority. By locating the commonplaces - and any differentiations there might be - of this rhetoric, I will try to interpret what this new dynamics might mean for societies and politics.

Dirigisme reinvented? French capitalism today

Andy Smith, Matthieu Ansaloni
Institut d'études politiques de Bordeaux, France;
Institut d'études politiques de Toulouse, France
a.smith(at)sciencespobordeaux.fr,
matthieuansaloni(at)yahoo.fr

Dirigisme reinvented? French capitalism today

The French model of capitalism is a subject of considerable debate. For some, dirigisme is over because the country has taken the road of market liberalism. For others, the singularity of French capitalism lives on because even if liberalizations have left their mark, the influence of the state is still strong, and this as much concerning social protection,

collective negotiations, professional training and state-shareholding. The aim of this paper, however, is to displace analysis and debate towards more interesting waters by analysing change within French capitalism via a comparison of the regulation of three of its key industries (agriculture, aerospace, arms). In each instance, we will first map out change within their regimes of public policy, then identify the mechanisms that have caused their respective modification. Our central argument is that contemporary French capitalism is still indelibly marked by a reinvented form of dirigisme that cannot simply be explained in terms of resistance to liberalization. As both an object and subject of liberalization, the state has not abandoned its quest to organize markets. More precisely, if the changing inscription of French industries in international markets has indeed eroded state capacity, many renewed modes of intervention have nevertheless enabled it to act upon and reshape industrial institutions. Moreover, driven by the redefinition and reordering of three key values (liberty, security, equality: Smith, 2016), this renewal has also reproduced many asymmetries of power that solidified in the 1970s and 1980s.

Migrant Integration through Adult Education in Finland and Greece. Redefining integrationist concepts and policymaking beyond 'Eurocentrism' with the help of historical perspectives beyond national histories

Ioana Tistea

University of Oulu, Finland

tistea.ioana(at)gmail.com

Politics rely on 'confined' national history as legitimacy for present polity and policies. Whose histories could then be included, based on an expanded historical responsibility theory?

I am using postcolonial, critical race theory and theorizations of neoliberal governance and racism to develop a critique of multiculturalism, affirmative action, diversity management and migrant integration. I am developing a postcolonial critique of Finnish migrant integration policies, examining the role adult education plays in them, and in the institutionalization of what Lentin and Titley (2011) call "racism in a neoliberal age". Integration through adult education is aimed at responsabilising migrants and creating an assimilated-enough diverse subject. Individual responsabilisation is a typical way in which neoliberal governmentality acts. This line of inquiry will allow me to explore the links between racism, the liberalisation of the labour market and the restructuring of the welfare state, since training and adult education are used also to retrain the unemployed and turn them into flexible and employable subjects.

Finland has two migrant integration acts, issued in 1999 and 2010. The law regarding reception of asylum seekers was drafted in 2010; before that, it was under the same law as the integration of migrants with residence permits. This legislative separation was motivated by the desire to reduce asylum seekers' monthly income support; it went against the welfare

state's egalitarian principles, and institutionalised differential treatment.

Furthermore, I will participate in an EU funded project on social inclusion of minorities in Athens, from February to July 2017. Greece is also a good case to study the link between neoliberal economic restructuring and institutionalised racism and differential treatment of migrants with/without (different categories of) residence permits.

An elitist elite?

Trygve Gulbrandsen

Institute for Social Research, Norway

trygve.gulbrandsen(at)socialresearch.no

One explanation of Brexit and Donald Trump's victory in USA is that large groups of ordinary citizens reacted against elites who were seen to have neglected their needs and to have treated them condescendingly.

Attacks on elites are not a new phenomenon. A narrative about the gap between elites and common men and women has frequently been a significant element of the rhetoric of populist groups and political parties. Such parties accuse regularly elites to put narrow special interests ahead of people's interests and to express arrogant opinions about their intellectual level and cultural taste.

Is there any truth to the populist image of elites as arrogant and elitist? Philosophers like Lasch (1996) and Sloterdijk (2000) have claimed that elites in fact hold overbearing attitudes towards ordinary people. Admittedly, there is a long intellectual tradition of expressing doubts about the democratic competence and will among ordinary citizens, from the interwar "aristocratic" philosophers like Ortega y Gasset (1930) and Mannheim (1940) to contemporary scholars like Brennan (2016) and Somin (2013).

In spite of widespread claims that elites hold elitist attitudes towards ordinary citizens there is, however, hardly any research which can shed light on this issue. In this paper I will contribute with new knowledge about the prevalence of elitist attitudes among elites in Norway. The discussion is based upon unique data from a national elite survey carried out in 2015 in collaboration between Institute for Social Research and Statistics Norway.

Religion and atheism in contemporary Greek society: The construction of the atheist identity within a Greek-Orthodox milieu

Alexandros Sakellariou

Panteion University of Social and Political Sciences of Athens, Greece

sociology.panteion(at)gmail.com

Until very recently the dominant perception for the Greek society was that more than 95 per cent of the population was Greek Orthodox. In 2012 an Atheist Union was founded in Greece and many people have started to discuss their atheism or non-belief

especially through the social media. The purpose of this paper is to present some preliminary findings of an ongoing qualitative research about Greek atheists. The main questions that are going to be answered in this paper are: who are the Greek atheists in contemporary Greek society? How they 'de-converted' from the Greek-Orthodox traditional religion and how their family responded to this rupture with their past? Which are their beliefs about God, religion, morality and life? The main purpose is to understand how the atheist identity is constructed in contemporary Greek society, which is a Greek-Orthodox society and the Orthodox Church still maintains powerful bonds with the state functioning as its ideological apparatus. On the other hand, the Greek state, far away from being considered as fully secularised, collaborates with and protects the Orthodox Church in case it feels threatened by either 'religious others' or non-believers, atheists and secularists. The material of the analysis is based on conducted semi-structured interviews with people who are self-characterised as either atheists or agnostics both male and female.

Contentious Politics in Transitional Societies: The Rise and (Partial) Success of the Conservative Religious-political Movement in Croatia

Antonija Petricusic, Mateja Cehulic, Dario Cepo
University of Zagreb - Faculty of Law, Croatia;
University of Zagreb - Faculty of Law, Croatia;
University of Zagreb - Faculty of Law, Croatia
apetricusic(at)pravo.hr, mcehulic(at)pravo.hr,
dcepo(at)pravo.hr

This paper explores a connection between religion and contemporary politics in Croatia by analyzing a cycle of contention in which the conservative civic initiative "In the Name of the Family" (U ime obitelji) managed to collect more than 700,000 signatures in May 2013 which served as a ground for a nation-wide referendum in November 2013 which introduced the Constitutional definition of marriage as an exclusive union of a man and a woman. This civic initiative is a segment of a broader religious-political movement that emerged in the course of the last decade and that seems connected globally to other conservative organizations and initiatives that advocate for decrease of secular influence on the family, oppose sexual and reproductive rights and argue in favor of religious freedoms. The religious nature of the Croatian religious-political movement is confirmed by an array of issues that the movement has chosen as its cultural frame: protection of a traditional family; opposition to a same-sex marriage; protection of life from an inception to a natural death; advocating the rights of parents to decide on the value-related content of their children's education. The political nature of the movement is manifested through its attempts to scrap the legislation and practices of both state and private institutions that are contradicting the value system of the Catholic majority. The religious-political nexus of the movement is confirmed by its continuous involvement in law and policy making.

Secularism in 'the State' Contested: Rethinking New 'Ideology' of Secularism in the Context of Politics of Hegemony in Turkey

Damla Ercan
Hacettepe University, Turkey
damlaercan(at)hacettepe.edu.tr

Turkey and France were used to be mentioned together to indicate extreme country-specific cases in terms of enforcement of secularism, however, now it appears that France is being left alone in discussions and criticisms. Then, what did happen to secularism in Turkey? Starting from 2012, the Constitutional Court, which is the state institution having monopolistic authority to determine meaning and content of the constitutional principle of secularism within 'state-system', abandoned its deep-seated precedent based on a particular ideology of secularism recognized with its hostility towards religion, and it adopted a new 'ideology' of secularism accentuating importance of freedom of religion, stressing its social value, and putting 'state' in service of (majority) religion. This paper problematizes the shift in the 'ideology' of secularism in a strategic state institution, and through documentary research over the judgements of the Court, it examines how 'ideology' of secularism upheld by 'the state' had transformed and discusses the change in official 'ideology' of secularism as part of 'ideological-political' project of 'hegemonic' articulation of Justice and Development Party (the JDP/ the AKP) in power. Thus, how an alternative 'ideology' of secularism played a significant role in building a social alliance in early years of the hegemonic strategies of the JDP by contesting established practices of secularism and how this new 'ideology' became integrated in 'the state' are evaluated. The paper also explores in which ways the implementation of new 'ideology' of secularism by 'the state' connects to changing strategies of hegemony and 'common-sense' sociality intended to be reproduced.

Can Political Islamists be "Moderate"? : 15th July Military Coup Attempt

Tolga Gurakar
Maltepe University, Turkey
tolgagurakar(at)gmail.com

On 15 July 2016, Turkey witnessed a non-hierarchical military coup attempt that was commanded by the members of the "moderate" Islamist community, "Cemaat", which was the fundamental ally of the governing conservative party, AKP (Justice and Development Party), between 2002-2013. In this paper the term "moderate Islam" that was once thought to "liberalize" the Muslim majority countries will be criticized in terms of the interactions between the standpoints of the AKP and the "Cemaat". Using the "field analysis" approach of Pierre Bourdieu and his conceptual tools, first the "sub-fields" within which these factions operate (e.g. targeting de-facto political power through investing in intellectual capital and placing its members in the civil and military bureaucracy versus aiming at de-jure political power

through investing in political capital via party competition) will be analyzed. Then the historical evolution paths of these movements and how the clash of different paths has led to inescapable outcomes will be presented.

The main question is: Can any type of a political Islamist movement be “moderate”? My hypothesis is that their diverse “capitals” may lead them to apply a “moderate” strategy to achieve the state power. However, this does not mean that their “radical habitus” peters out totally. Thus, in “critical” circumstances this “extremism” can be determinant like the coup attempt of the “Cemaat” and the post-coup authoritarian policies of AKP that aim to dismantle all types of checks and balances over governing institutions.

RN32 | Session 09a Changing Political Landscapes: Entrepreneurship and Social Media

ICTs and Contentious Collective Action in the Digital Age: A synthetic, comparative framework

Jun Liu

University of Copenhagen, Denmark

liujun(at)hum.ku.dk

In recent years, the scholarship on Information and Communication Technologies (ICTs) and contentious collective action – such as revolutions, riots, protests, and demonstrations – has developed appreciably as an exciting, relevant, but highly contested field in political sociology. Despite enduring interest, proliferating interrogation, and substantial deliberation on the role of ICTs in political activism and social movements over the past decade, existing literature from different disciplines still rarely achieves a consistent framework for the analysis of how ICTs transform contentious collective action for social changes. To advance the field, this study outlines a communication-centered framework that views communication as a key mechanism in distributing political opportunities, maneuvering mobilizing structures, shaping cultural framing, articulating contested meanings, and facilitating relational dynamics among these interrelated factors. Acknowledging ICTs as the context for communication and action, the proposed focus overcomes technological determinism by reemphasizing human beings – precisely their communicative practices and networks – as political agency in contention. By centralizing and sensitizing communication dynamics, the framework suggests an explicit focus on communication – including different degrees of communication and metacommunication – to dissect (technologically mediated) collective actions in different spatiotemporal contexts.

Another campaign will be tweeted: social parainstitutions and digital public sphere in electoral campaigns in Spain, 2008-2015

Josep Lobera, Victor Sampedro

Universidad Autonoma de Madrid, Spain; Universidad Rey Juan Carlos, Spain

josep.lobera(at)uam.es, victor.sampedro(at)urjc.es

Studies on offline political participation have for a long time demonstrated a deep participatory divide between those participating a lot – a minority – and a vast majority of citizens taking part to very few political activities (Gaxie, 1978 and 1993). However, according to proponents of the “(new) mobilization” paradigm (Hirzalla, van Zoonen and Ridder, 2011), the Internet would have lowered the threshold of participation and allowed new citizens to participate in political life.

Using three original post-electoral surveys, we analyze the evolution of the political uses of the Internet in the Spanish General Elections of 2008, 2011 and 2015. In 2015, for the first time in an election campaign in Spain, social media had a higher political influence than written press, radio and off-line relations. Television, nevertheless, has remained the most influential medium during the electoral campaign. Also as a novelty in an electoral campaign, in 2015 the organizations or citizen platforms managed to spread their political messages in Internet to a greater extent than candidates or political parties. Some of them have practically been institutionalized, as Internet-based social parainstitutions (Peña-López et al., 2014). We also identify the social factors associated with the political use of the Internet. On-line and off-line political participation are strongly associated, and they are mediated by the frequency of Internet use. On-line political participation is also associated with ideology.

Do echo chambers really exist? Social behaviour of internet users on the Polish political parties' Facebook pages

Paweł Matuszewski

Cardinal Stefan Wyszyński University, Poland

pawel.m.matuszewski(at)gmail.com

In the recent years, researchers noticed that there's a growing political polarization. Some of them argue that it is a consequence of social media and their machine learning algorithms that recommend content a user is likely to be interested in. As a result, social media create 'echo chambers', where people are exposed to mostly conforming opinions. The main research question is whether Facebook users really choose to seek information from one-sided sources. Two types of behaviour were taken into consideration. The first one concerns the patterns of liking, i.e. do Facebook users like Facebook posts of just one political party or do they also like content published by other parties? The diversification of likes can show how homogeneous or heterogeneous are the fans of political parties and whether they react to political information from different sources. The second question is about sources of knowledge Facebook users refer to. Do they refer to the same websites regardless of political fan page where the discussion is held or do the fans of certain political parties prefer a specific group of information sources? In the presentation, I use data on Facebook users' behaviour collected automatically from Polish political parties'

and their leaders' fan pages in 2015 and 2016.

Entrepreneurship in Finnish Political Discourse

Henri Koskinen, Arttu Saarinen
University of Turku, Finland; University of Turku,
Finland
hemiko(at)utu.fi, arttu.saarinen(at)utu.fi

In this presentation, we analyze how the political reasoning concerning entrepreneurship in Finland has changed from the late 1970s until 2015.

Entrepreneurship in the post-industrial era is increasingly seen as an attitude and a way of life rather than as solely economic action, and the criteria of an entrepreneur are increasingly associated with those of a good citizen. Entrepreneurial capabilities are seen as normative in working life and are integral components of post-industrial subjectivity that citizens are asked to adopt.

On the other hand, entrepreneurship from the political authorities' perspective is seen as a means of creating jobs, i.e. a source of employment in the post-industrial labor market. Finland's current Government has defined entrepreneurship as a crucial factor in Finland's strategy to overcome the lengthened economic recession.

In our analysis we use the Foucauldian ideas about governmentality as a general theoretical framework. In our analysis, entrepreneurship is viewed as a historically constructed discourse and we are interested in the changes this discourse has undergone and how they affect political reasoning. Empirically the focus is on the following questions:

- 1) What are the contexts of entrepreneurship in the data?
- 2) How is entrepreneurship framed?
- 3) Do the meanings given to entrepreneurship change throughout the data? If so, how?

The analysis is based on a large set of political documents (government programs, different party programs and party documents) from year 1979 to 2015. These programs summarize the policies of each government and eight different political parties. Methods of analysis are discourse analysis and quantitative content analysis. We have focused on the moral values, vocabulary (idioms, concepts etc.) and subjectivation (motivation, activation, capacities etc.).

RN32 | Session 10a Europe, EU, (EU-)Scepticism and Nation-States

The 'European Integration Paradox' - How EU practice changes MP's discourse on the future of parliamentary institutions in the EU

Anja Thomas
Sciences Po Paris, France
anja.thomas(at)sciencespo.fr

The paper investigates into the paradoxical effects of the 'Making of Europe' on the ideas of political actors about the EU's political order. Taking a micro-sociological perspective, the paper shows how the practice of 'doing EU' of national Members of

Parliament shapes the way they conceive of the future of parliamentary institutions in the EU in parliamentary debates.

The paper uses a double comparative research design to compare MPs' EU practice and discourse across two parliamentary chambers with substantially different roles in the national parliamentary systems (Assemblée nationale and Bundestag) and across two time periods with low (1979-1999) and high (2000-2013) impact of EU legislation on national parliaments.

EU practice is analysed through 'thick description' (Clifford Geertz) based on interview evidence with current and historic parliamentary actors and the study of documents and secondary literature. MPs' discourse is analysed through a systematic qualitative-quantitative discourse-analysis of parliamentary debates on the most far-reaching treaty changes in each period (treaty of Maastricht and treaty of Lisbon) with the help of the software MAXQDA.

The paper finds that with a low level of EU practice, discourse about the role of the European Parliament and the national parliaments for EU decision-making depends most on MPs' ideologies on the future shape of European integration. Only in the second time-period analysed, national parliamentary roles are of paramount importance. The paper adds a further element to understand a potential 'Unmaking of Europe': frames derived from national institutions do not lose importance, but are reinforced (unconsciously) through EU practice.

Public support or opposition to 'Social Europe': Going beyond Euroscepticism?

Sharon Baute, Bart Meuleman
University of Leuven, Belgium; University of Leuven,
Belgium
sharon.baute(at)kuleuven.be,
bart.meuleman(at)kuleuven.be

For a long time, European integration was understood as being a project of open economies and closed welfare states, in which economic growth resulting from market liberalization would preserve the autonomy of the nationally-bounded welfare states. However, the EU has started to engage more actively in European-level social policymaking that affects social welfare in the various member states. In the light of these developments and the current context of rising Euroscepticism, voters' preferences towards the social dimension of European integration are becoming an increasingly important area of interest. This study analyses public attitudes towards 'Social Europe' empirically in a multidimensional way, capturing attitudes towards current EU social policy principles or instruments (a European social citizenship, member state solidarity, social regulations) and towards a proposed future policy instrument based on interpersonal solidarity (a European social security system). A focus on specific aspects or transformations of the European integration process is essential to study input and output

legitimacy, though the question remains whether or not they are reflecting a more general overarching attitude towards European integration as such. Up to now, the relationship between diffuse Euroscepticism and specific attitudes towards European integration in social policy is not fully understood. Using data of the 2014 Belgian National Election Study, this research unravels to what extent public support or opposition towards 'Social Europe' reflects an overall evaluation of European integration. Are attitudes towards 'Social Europe' merely a reflection of diffuse Euroscepticism or do ideological and socio-economic cleavages remain important regarding the social dimension of European integration?

European Union and Nation State – An Institutional Balancing Act

Hanna Rautajoki

University of Tampere, Finland

hanna.rautajoki(at)uta.fi

European Union is in turmoil. Struggling with financial crisis, massive floods of migration and most recently Brexit has made the institutional scaffold of the union shatter. In my postdoctoral research project I am investigating governmental rhetoric in and about the EU in its contemporary challenges. I'm analyzing political discourse in documents on EU from the perspective of neoinstitutionalism and epistemic governance, taking it that political commitments are suggested, maintained and renewed by working on actors' perceptions of the world. In that respect, it is not that the current circumstances with enhanced national sentiments arising, bring into the discourse something new in relation to the foundations of the union. It's rather that the horizon of principles grounding EU as an institution is shifting in emphasis. From the start, European Union has been a special kind of political organization. It is based on a contract between nation states to sign away political power to a centralized supranational governance. National sovereignty has been traded for membership in this union. Consequently, the union has given rise to the relevance of parallel sets of institutional principles and sites for political address and identification. National engagements live on on the side of union agreements providing suggestive material for various kind of political persuasion. My project will illuminate and unravel the double standard of commitments embedded in the range of current discourse about European Union as a political organization. Explicating the constitutive rhetoric of EU aims to deepen our understanding of the controversy flaming at its core.

The Troika in its own words: Continuity and change in the dominant narrative(s) of the southern European crisis (2009-2016)

Tiago Moreira Ramalho

Sciences Po, Centre d'études européennes (CEE),

CNRS, Paris, France

tiago.moreiraramalho(at)sciencespo.fr

The terms of conditionality of the bailout programmes

in Greece, Portugal and Spain were heavily grounded on the Troika's understanding of each one of these crises. The implementation of the programmes, however, led the European Commission, the European Central Bank, and the International Monetary Fund to adjust their views throughout the period. In order to assess the evolution of the stances of each institution, this paper examines a large pool of official statements produced by the members of the Troika regarding the three southern European countries during 2009-2016. The analysis thus makes a contribution to the evaluation of the conditions of stability of the dominant narrative as well as the process of permanent re-legitimation of the Memoranda of Understanding.

Tracking Down The Rise of Euroscepticism in Turkish Media: An Analysis of Discourses on EU in Turkish Pro-Government Newspapers

Nergis Denli

Beykent University, Turkey

denlinergis(at)yahoo.com

In the light of latest developments during the year of 2016 both in foreign and domestic policy, the tension between EU and Turkish government seems to increase gradually particularly with respect to the debate of convergence/divergence in terms of EU's fundamental principles. The refugee crisis, visa liberalization deal, terrorism, the latest coup attempt in Turkey, ongoing debate on death penalty and lastly the EP's decision to suspend talks with Turkey on EU membership, triggered the criticism and skepticism toward both EU and Turkey's EU politics, especially in the pro-government newspapers in Turkey. Focusing predominantly on the narratives concerning EU's response to these controversial issues, in this paper, the reflections of the rise of euroscepticism and the discourses on divergence from EU operating in Turkish media are analyzed with a body of articles from selected pro-government newspapers published online in 2016. Speeches of Turkish government officials regarding Turkey- EU relations reflected in the press and severe criticism targeting EU and its representatives questioning and criticizing the potency, efficiency and even the existential roots of EU are analyzed interrogating how skepticism reveals itself out through the ways the news are covered on these controversial issues.

Social Mobility and Political Distrust. Cults of Gratitude and Resentment?

Stijn Daenekindt, Jeroen Van Der Waal, Willem De Koster

Ghent University, Belgium; Erasmus University Rotterdam; Erasmus University Rotterdam; Erasmus University Rotterdam

stijn.daenekindt(at)ugent.be, vanderwaal(at)fsw.eur.nl,

dekoster(at)fsw.eur.nl

Various studies have observed a decline in political

trust in Western countries. To improve our understanding of this trend, we study whether and how social mobility affects political distrust. Mobile individuals may blame/praise the system for their movement down/up the social ladder. Accordingly, we theorize that social mobility influences the way people evaluate the political system. We use Dutch survey data (NELLS; $n = 5,312$) and apply Diagonal Reference Models to study effects of educational mobility. We consider distrust of government/public authorities and of politics, and find that — controlling for the influence of social positions of origin and destination — downward social mobility results in higher levels of distrust. We argue that downward mobility is perceived from a structural rather than an individualistic perspective, and thus has a greater impact (compared to upward mobility) on attitudes towards the system and politics. These findings evidence the political consequences of social mobility and highlight that there is a need to consider socializing experiences outside the political domain and after early childhood to explain political trust. Moreover, our findings suggests that the difference between individualistic and structural narratives on social position needs to be integrated into theoretical frameworks to explain political distrust.

The impact of economic uncertainty on turnout: national differences and the rule of moderators

Dario Tuorto, Matteo Bassoli, Pasquale Colloca
University of Bologna, Italy; eCampus University, Italy;
University of Bologna, Italy
dario.tuorto(at)unibo.it,
matteo.bassoli(at)uniecampus.it,
pasquale.colloca(at)unibo.it

Turnout in Western countries has registered a sharp decline during the last four decades, reaching the lowest level in the 2014 European elections. At the same time, several studies conducted in recent years observed that non-voting has become more unequal in its social and geographical distribution. In many countries - and especially in the Southern European countries - the economic crisis, together with an unclear political setting, exacerbated the diffusion of negative feelings such as detachment, distrust, and disaffection among the most vulnerable sectors of the electorate. This climate has fostered the growth and the success of new political actors, the “anti-establishment parties”, able to occupy the space of radical protest against the forces of the “old politics” and, under certain conditions, draining votes from the abstention. However, the relationship between economic worsening, political discontent and turnout, both at individual and at aggregate level, remains unclear.

The paper, exploiting a multi-level analysis, aims to explore the relationship between turnout and different dimensions related to subjective condition (occupational status, income loss, retrospective/prospective evaluations of the national economy, etc.), vis-à-vis the potential moderator effect of the relationship present at the national level (party

system, welfare model, etc.). Data are taken from 2014 Voter Study as a part of the European Election Studies programme. This post-election survey was carried out covering around 30,000 cases, with 1,100 interviews in each European country.

Politics as Fiduciary Relationships: Catch-all Parties or Class Parties in the Political Making of a Post-crash Europe? A Comparative Study of PSOE and Podemos

Julio Martínez-Cava
University of Barcelona, Spain
juliomartinezcava(at)gmail.com

The economic and institutional crisis of the Eurozone has blown up the framework of post-war political party regimes. The polarizing dynamics crossing Europe have broken the conditions of economic-political stability that allowed: (i) the famous distribution of preferences in a dromedary form (concentrated in the centre) and (ii) the famous catch-all electioneering dynamics used by the majority parties in a two-party system. What kind of parties can survive in the new times and what kind would be desirable? Is it possible to update the old form of the class-mass party in 21st century conditions? Outsider rhetoric, funding not depending on large economic powers, close relationships with social movements or new forms of political participation (such as the election of all offices through open primary elections or the plebiscite's logic): are these features sufficient for the success of new democratic parties? This paper is a research on the transformations of the organizational models of the main progressive state-parties in Spain (PSOE and Podemos) in the light of the theory of political power as fiduciary relationships. This perspective applied to the parties conceives membership as sovereign power (trustee) and party positions or public offices as fiduciary agents (trust). Can the parties seeking a democratic solution to the Eurozone crisis solve the situation without changing the tools that led to it?

Clientelism in the Age of State Capture: A View on the Western Balkans

Misha Popovikj, Predrag Cveticanin, Marija Stefanovic
Institute for Democracy 'Societas Civilis' Skopje,
Macedonia, Former Yugoslav Republic of; Faculty of
Arts, University of Nis, Serbia (PhD); Faculty of
Philosophy, University of Nis (MA student)
popmisa(at)gmail.com, pcveticanin(at)gmail.com,
marijastefa(at)hotmail.rs

The particularistic mode of governance (Mungiu-Pippidi, 2005) and the elaborate power networks (Ledeneva, 2013) of political parties have brought the Western Balkan countries to the status of state capture (SELDI, 2016). This means that public institutions predominantly work for the private interest of the political parties in power, helping them maintain advantage and win elections mainly by establishing and maintaining client relations with the citizens. By combining quantitative research (population survey - 6200 respondents) and qualitative research (in-depth

interviews and ethnographic fieldwork), this study explores the informal parallelism that political parties establish in various segments of public service such as employment, social work, education or health care. We argue that the combination of the diverse membership of political parties, and the organizational structure brought by their developed informal network of patrons and clients, substitutes the roles of formal institutions in all these fields (Helmke & Levitsky, 2004).

This study contributes comparatively to studies of clientelism in other regions. Furthermore, it elaborates the notion of relational clientelism (Keefer, 2004; Kitschelt, 2000; Kitschelt & Wilkinson, 2007) as a long-standing relationship between patrons and clients in relation to reaching state capture. We argue that these client transactions generate pools of loyalty within many pockets of public institutions, enabling informal networks to redistribute public goods in such a particularistic manner.

This article is based on the Horizon 2020 research "Closing the Gap between Formal and Informal Institution in the Balkans" (2016 – 2019) which is being carried out in Macedonia, Albania, Montenegro, Kosovo and Serbia.

RN32 | Session 11a Open Stream II

An Organic Public Sociology Movement at South African Universities: case studies of research centre structures

David Michael Cooper

Department of Sociology, University of Cape Town, South Africa

david.cooper(at)uct.ac.za

In South Africa during 1980s anti-apartheid struggles, at some research-intensive universities in especially sociology/social sciences there was a mushrooming of academic research groups undertaking valuable research for civil society 'in struggle' e.g. trade unions, community and youth and women's groupings. Yet following the 1994 national democratic government transition, at one university some 87 emergent research groups declined to about 20, a phenomenon similar at other universities.

The paper explores reasons for the rise/decline of this 'organic public sociology' movement in association with progressive civil society organisations. It argues these structures were often (i) larger research 'centres': incorporating a director, 3-5 senior researchers each with their own project groups, underpinned by a sizeable administrative infrastructure. In contrast research groups at South African universities (following English-speaking academic 'traditions' internationally) are based around (ii) smaller 'professor-chair' groupings or what I call (iii) 'informal networks of professor groupings'. Post-1994 transformation, a set of negative factors impacted on these larger research centres: including lack of traditional research funding sources; lack of appreciation or political support for their novelty and value; competition with smaller professor-led

disciplinary groupings/networks. In-depth empirical research during 2000-9, of 11 such research centres spanning Western Cape universities, will provide core data to support the arguments.

The conclusion highlights the value in South Africa of such socially responsive research centres 'for greater justice': as engaged academic structures undertaking important research for civil society (as well as local industry and government). Their value in Europe too, with often 'fragmented capitalist solidarities and subjectivities' and inequalities within civil society, will also be suggested despite differences in context of South African location in the global South.

The qualitative sociology of political parties abroad. Comparing French and Spanish parties in Switzerland

Tudi Kernalegenn

University of Lausanne, Switzerland

tudi.kernalegenn(at)gmail.com

The multilevel sociology of political parties, and of their activists, has slowly but surely developed in the last few years. However, a "territorial" dimension of the political sociology of parties has been mostly overlooked until now: that of political parties abroad. This is a relatively new phenomenon, linked to the development of overseas voting, but also to the creation of representative institutions and of members of parliament representing directly emigrants. This extension of the democratic sphere of established nation-states has created a new arena for political activists, with the new political relevance of their political action in relation to their home country, and even, for some countries, new positions of political power to be filled.

The aim of the presentation will be to elaborate a first analysis of the sociology of political parties abroad, i.e. of parties' branches established outside the territorial frontiers of their home state. The paper will focus comparatively on French and Spanish parties in Switzerland. Based on a qualitative fieldwork, the specificities of abroad branches of political parties will be thus explained: Who are their activists? What are their paths and networks? What are the drivers of their political involvement? The comparison between French and Spanish political parties is mainly based on two variables: the different political rights (and therefore political opportunities) and the social structure of French and Spanish emigrants in Switzerland.

Politics and Informality in South Eastern Europe

Vjollca Krasniqi

University of Prishtina

vjollca.krasniqi(at)uni-pr.edu

This article is based on the Horizon 2020 research "Closing the Gap between Formal and Informal Institution in the Balkans" (2016–2019). It explores how formal and informal institutions intertwine and govern political decision-making in four countries of South Eastern Europe: Albania, Bosnia and

Herzegovina, Kosovo, and Macedonia. This inquiry takes a close look at the institutions, actors and processes of political decision-making on chosen events in each country covered in the study. Focusing on “leaders’ meetings” as a field of practice, the article will show how informal rules have shaped the outcomes of political decision-making. The article suggests that the “leaders’ meetings” as informal interventions in the political domain have a lasting impact on the legitimacy of polity and democracy nationally and internationally.

RN32 | Session 11b Methodologies for Political Sociology

The Role of Preference Falsification in the Dynamics of Public Opinion

Francisco J. León, Francisco J. Miguel, Jordi Tena-Sánchez

Universitat de Girona; Universitat Autònoma de Barcelona; Universitat Autònoma de Barcelona
francisco.leon(at)udg.cat, miguel.quesada(at)uab.cat, jordi.tena(at)uab.cat

Kuran’s models of preference falsification (PF) helped us to better understand why some abrupt social changes take us by surprise but are perfectly explainable in hindsight. In this paper, we present an Agent-Based Simulation (ABS) that allows us to overcome some of the main limitations of Kuran’s models. (1) Unlike classical mathematical models based on the assumption of utility maximization, we model actors guided by simple and cognitive feasible decision rules (heuristics). (2) ABS allows us to model heterogeneous agents whose decisions are conditioned by time, space and social interactions, something impossible in classical equilibrium models for reasons of mathematical tractability. (3) Our model captures the central role of status hierarchies in PF: the concealment of political beliefs is highly dependent on face-to-face interactions between high and low status agents. (4) We introduce a less studied feature of PF: its impact in private beliefs adaptation. Our aim is to identify a generative process that could account for the persistence of PF that seems to characterize the pre-revolutionary stages of some unexpected uprisings throughout recent history (from the East European revolutions to the Arab Spring). In our model, agents follow three heuristics: (a) a coherence heuristic that drives them to avoid cognitive dissonance adapting their private beliefs to those exposed in public, (b) a performance heuristic, leading low status agents who interact with high status agents to a cognitive dissonance-free PF (thus modelling Scott’s “hidden transcripts”), and (c) a social proof heuristic in their expression of political preferences. We show under which conditions these microspecifications can generate a PF equilibrium in the macro level. Moreover, we explore in which conditions an external “shock” can lead to a change in the equilibrium.

Pierre Bourdieu’s sociology of fields in the study of political parties

Modestos Siotos

Université Paris 1 Panthéon-Sorbonne, Centre européen de sociologie et de science politique, France

siotos.modestos(at)gmail.com

Dominant epistemological and methodological approaches in political sociology, have difficulties when it comes to grasping the diversity of political parties’ ideological configurations. The ontological comprehension of political parties as anthropomorphized actors whose functions, linkages with society or their relation with the State must be analyzed and explained, conceptualizes them as relatively homogenous entities. This paper argues that the multiplicity of meanings produced by party agents asks for a more dynamic and relational approach in our comprehension of how political parties organize their structure of meanings. In this regard, Pierre Bourdieu’s sociology of fields provides useful conceptual tools for examining the logics of thought and technics of action that determine the articulation between the structure of a party and the representation of events by its agents. The paper is divided in three sections. In the first it briefly explains key concepts in the bourdieusian sociology focusing on the notion of field as a ‘set of dissymmetrical relations’ generated by practices. In the following section it provides a synoptic review of existing literature in French political sociology inspired by Bourdieu’s work and in particular the works of Michel Offerlé. Lastly, the third section examines the applicability of the notion of field in the sociology of political parties based on my research findings on the ideological transformation of the Coalition of Radical Left (SYRIZA) between 2007-2015. The paper concludes on a critical note reflecting on the inadequacy of Bourdieu’s structuralist perspective to historicize its research objects.

Modern Interpretations of Correlations in Sociology as a Path to Mock-Scientific Results

Mikhail Basimov

Russian State Social University, Russian Federation

basimov_(at)mail.ru

In sociological science traces the exodus (intentional or subconscious) to low values of the correlation coefficient, when non-zero correlation (the hypothesis for correlation coefficient equality to zero) is sufficient to describe the statistical relations as strong.

This can be explained as a shortage of the really strong linear statistical relation with in magnitude higher 0.6 in the analysis, when studied sociological objects mostly non-linear in nature but used tools, still represented the linear models, and researchers do not want realize the synergy paradigm and non-linear models.

Let’s consider the model of exponential dependence within solving the problem of investigation of statistical relations using the author’s method for 58 parameters:

mathematical functions and regression lines for them, based on the correlation coefficient.

A dependency for a function with a single maximum (cut off on the right):

$Y=-X^2$ (left from the maximum); $Y=-0.7 \cdot X^2$ (right from the maximum)

In this case, the correlation coefficient is equal to 0.25.

Dependence of the parameter Y from the parameter X as comparative weightiness of the parameter Y for quinters on a scale X:

X-1(Y=-12902); X-2(Y=-4658); X-3(Y=-742); X-4(Y=-3362); X-5(Y=-10978)

Dependence of the parameter Y'(regression line) from the parameter X as comparative weightiness of the parameter Y for quinters on a scale X: X-1(Y'=-9616); X-2(Y'=-8328); X-3(Y'=-7196); X-4(Y'=-5730); X-5(Y'=-4866)

If we build graphics it will be apparent what a small part (21%) causation (and obviously one-sided) describes the regression line near the average value of the dependent parameter. While sociologists announce this correlation the «significant» and describe the dependence between parameters as linear.

Political Inequality among Czech Youth: How Do Classroom Discussions Foster a Sense of Internal Political Efficacy?

Aleš Kudrnáč

Institute of Sociology of the Czech Academy of Sciences, Czech Republic

ales.kudrnac(at)soc.cas.cz

Extreme politics as a consequence of wealth inequality worries many scholars and policymakers. Youth from low SES families represent one of the most dissatisfied and politically alienated groups. In this research Bandura's social cognitive learning theory provides a theoretical framework for explaining the role of classroom political discussions on youths' sense of political efficacy. Using data from 1,953 Czech students (16-20 years) and 85 civics teachers, the analysis provides insight into how classroom discussions help to enhance sense of political efficacy, which is crucial for political engagement. The results suggest that frequency of classroom discussions play a less important role than the quality of class discussions. Classroom discussions have under certain conditions different effects for youth with diverse SES. Students with low SES mixed with high knowledge peers exhibit higher levels of political efficacy. Conversely, students with high SES can benefit from an open classroom climate more than all others.

RN33 - Women's and Gender Studies

RN33 | Session 01a Gendering Methodology: Narratives, Indicators and Statistics

Women narrating migration. Role of family in their coping strategies.

Ana Maria Preoteasa

Research Institute for Quality of Life, Romania;
University Lucian Blaga Sibiu, Romania
preoteasaanita(at)yahoo.com

In the last 25 years Romanians have experienced different migration paths, especially in accordance with destination countries opportunities and visas policies. Before 2002, the migration was mainly illegal and the persons who decided to migrate have chosen different strategies in order to accomplish their intention to migrate. After 2002 and especially after European Union Integration (2007) the free movement determined larger migration flows from Romania toward different European countries. Our analysis seeks to document women's migration trajectories considering migration time, professional career at origin and destination, life stage and family connections (if they migrated together with family or not, if there are children remained at origin). The linked lives' role in migration paths or return decision will be studied considering the family (nuclear and extended) as well as other social networks. 15 life story interviews with women with diverse socio-economic background, having a considerable migration care work experience are analyzed. Our analysis takes into consideration both the biographical facts and the narrated life events as well as the feelings and attitudes migrant women express within their narratives. The data were collected using the life history interview. The data analysis followed a deductive and inductive approach in order to identify the main challenges and adaption strategies as well as the role of linked lives in explaining their decisions.

Gender Based Happiness Inequality: As an Alternative Measure for Women's Well-Being

Hilal Arslan

Jacobs University Bremen / BIGSSS, Germany
aycalalb(at)gmail.com

Measuring women's empowerment depends on data availability on key focus areas of gender inequality such as education, health, and employment. In order to tackle this issue, there is a number of initiatives

held recently by international organizations such as Data2x project by United Nations which calls for "Gender Data Revolution" to fill gender data gap by setting 'big data' by ensuring quality and standardization across countries. Moreover, World Bank Gender Data portal provides free access to gender equality statistics which are composed of disaggregated indicators by sex for example female labor force participation rate (%), share of women in wage employment in the nonagricultural sector (% of total nonagricultural employment), proportion of seats held by women in national parliaments (%), and life expectancy female years. Despite the urgent need for more data on gender indicators, there are conceptual and measurement issues with the indicators used to grasp women's well-being. For instance, most income-based indicators are measured at the household level and it is hard to estimate the allocation of household resources across female members of the family. In order to overcome these difficulties, this study suggests applying happiness inequality as an alternative measure to understand women's perception of distribution of life chances in the societies they live in. In this context, the study will seek for the determinants of happiness gap between males and females across countries by using data from 38 countries included in "Family and Changing Gender Roles IV" module of International Social Survey Program (ISSP).

Manufacturing indicators of mixedness: how statistics come to obscure gender

Marion Lieutaud

London School of Economics and Political Science,
United Kingdom
m.lieutaud(at)lse.ac.uk

There have long been debates around various forms of mixedness; binational people after the Paris attacks; "grey" weddings; the denunciation of interbreeding by far-right movements, etc.... Given the general interest, it seems peculiar that public statistics are so patchy on the topic, and strikingly inconsistent across borders. Indicators of mixedness are very country-specific, often to the point of incommensurability, and these national biases are reflected in quantitative analyses. While representations of mixedness overwhelmingly refer to gendered patterns (the terrorist men, the "traitor" women who interbreed), gender goes unproblematised in most quantitative sources and research. Inspired by feminist qualitative literature, and building on a socio-historical and comparative analysis of French and British public surveys and quantitative research, I present 5 hypotheses – I rely on a deliberately broad definition of mixedness, encompassing individuals and couples with mixed ethnic/racial/religious/national/migratory identities or status.

1. Statistics of mixedness deeply differ in France and Britain, which can be connected to diverging definitions of national belonging, and constrain analyses.

2. Statistical categories for mixedness are both refined and expanded over time, creating partial overlapping, and opening windows for international comparisons.
3. The introduction of new “mixed” statistical categories can be linked to topical and gendered representations of mixedness.
4. Yet gender in mixedness is largely masked in statistical sources, which translate gendered representations into gender-neutral statistics.
5. Statistical tools used to analyse mixedness fail to tackle gender, through models which, at best, consider it a control variable, as opposed to an identified research object.

Women's subjectivity between ethics of duty and ethics of authenticity. Discourse of agency of economically and social active Silesian women (Poland) in the era of economic and cultural change

Xymena Bukowska
Collegium Civitas, Poland
xymena.bukowska(at)civitas.edu.pl

Upper Silesia is one of the most industrialized region in Poland. It has developed since the 19th century based on mining and metallurgical industries, according to the classical model of modernization, with its strong division between the “public” and the “private” spheres, connected to the gender roles (work vs home). Even the “third sphere” – the realm of social activities outside the home and the workplace – was divided into either “female” or “male” activities. All the three areas of life (family, work, socio-civic engagement) were governed by “the ethics of duty” – a set of norms and obligations arising from the social roles, the principles of social responsibility, self-restraint etc.

Cultural changes of late modernity transform this modern (rational) subject into a reflexive one, which strives after authenticity, self-realization, self-fulfillment. The late-modern subject is guided by the “ethics of authenticity”: not only deliberation, but also emotions and passions, are necessary for the full expression of the unique “self”. In the world of liquid power structures, the late-modern subject is forced to develop strategies preserving him/her “the chance to be a subject”.

The economic changes (decarbonization) in Upper Silesia, and broader socio-cultural development challenge the “women’s subjects”. In my paper I will present the results of discourse analysis concerning the socio-economic activities of women from Upper Silesia. The aim is to reconstruct their strategies of subjectivity and types of “women’s subjects”, by answering the question, what does it mean for them “to be active”, and what are the social stakes of their various activities?

RN33 | Session 01b Gender Diversity

(Re) Making gender in the clinical context: a look into how gender ideologies shape the medical construction of Gender Dysphoria

Ana Patrícia Hilário
Instituto de Ciências Sociais, Universidade de Lisboa,
Portugal
patriciahilario(at)gmail.com

There is a paucity of research in Portugal and elsewhere on how medical and psychological practitioners construct sex and gender in the diagnostic process of Gender Dysphoria (GD) and the extent to which this constrains the attribution of GD diagnosis. The aim of this paper is to overcome this gap by exploring the ways in which gender ideologies shape the medical construction of GD in Portugal. The TRANSRIGHTS team carried out in-depth interviews with 12 medical and psychological practitioners. Whilst there are some practitioners who base their assumptions regarding the diagnostic process of GD on an essentialist model of sex and gender and privileges ‘authentic’ Trans identities over others, there is a significant number of practitioners who understand gender as a social construction and are more flexible in the attribution of GD diagnosis. The findings reveal a path towards the acceptability by medical and psychological practitioners of gender variance and a greater openness to gender self-determination in the attribution of GD diagnosis.

The construction of gender diverse identities

Sara Merlini
Institute of Social Sciences of the University of Lisbon,
Portugal
sara.merlini(at)ics.ulisboa.pt

In this presentation we tackle how gender diverse identities are constructed in/by interactions. By gender diverse identities we mean those individuals who do not fit exclusively in the categories of “Man” or “Woman”, namely non-binary, androgyny, cross-dressers, genderqueer and other gender identities. Being different from “Man” or “Woman” potentially challenge gender conventions and norms (Goffman, 1988; West and Zimmerman, 2009), for instance, in the disconnection between name-identity-gender or the use of different gender features in self-presentation (like a beard and lipstick or an androgynous clothing).

Based on a preliminary analysis of twelve biographic interviews with individuals who identify as gender diverse – a Portuguese sub-sample collected in the framework of the ERC funded project TRANSRIGHTS (<http://transrightseurope.com>) – we seek to understand how gender identities are negotiated and performed situationally. Drawing up from a biographic analysis we will focus on personal narratives, linguistic features, style and embodied performance. These are dimensions that highlight how the gender diverse identities are constructed and the possibilities for being different from exclusively “man” or “woman”. Among the repertoires found in the performance of gender diverse identities are the search for denial, exaggeration or reconversion of elements that are stereotypically associated to be exclusively male or female.

Transvestite Fetishism into Lines of Flight, or, Man Becoming-woman

Ciara Cremin

University of Auckland, New Zealand
c.cremin(at)auckland.ac.nz

In July 2015 I came to work for the first time dressed in women's clothes and have been dressing this way ever since. Wearing them, however, did not make me a woman. As Deleuze and Guattari may have put it, you do not become a woman through mimicry, but by presenting as a woman, if it is done with enough feeling, with enough necessity and composition, in other words, not for fun or any other stupid alibi, you emit particles of a molecular woman. Developing from my personal experiences, observations and reflections since dressing openly in women's clothes, I describe through Deleuze and Guattari's work how what began as a fetish became the means to cut a line of flight from the molar man.

The question, however, that motivates this presentation is why in a society in which men and woman can more or less dress as they please, is it so rare for men to introduce into their attire any aesthetic element whatsoever that symbolically connotes woman? It is a question that alights on the unequal relationships between men and women in patriarchal-capitalism and how at a molecular level we are invested in them.

True-trans or gender queer? An analysis of transnational transgender identity claims

Anna Klonkowska, Stephanie Bonvissuto

University of Gdansk, Poland; Stony Brook University, USA

wnsak(at)univ.gda.pl,

stephanie.bonvissuto(at)stonybrook.edu

The presentation is to address the opposing standpoints on transgender identity represented by essentialist medical discourse and queer theory inspired social-constructionist approach. The traditional medical-approach transgender model that understands gender identity as an amalgamative origin of biological and psychological traits and transition as a process of stabilization has been countered by a queer poststructuralist standpoint that argues for transition to be considered as an open-ended deconstructive project meant to challenge prior gender categories.

The medical approach that once exclusively defined the transgender experience has been criticized by queer theory and the social constructionist approach for fostering a gender identity and concurrent essentialist ideology that is narrow in its binary perception of gender identities and pathologizes transgender. Instead, the queer theory and social constructionist-approach creates space for transgender and gender non-conforming identities and bodies that do not fit the rigid frames of a "true transsexual" category; embrace gender as raised within and through the social domain, potentially non-binary and fluid; considers the enforced character of

the "true transsexual" as conforming to a heteronormative dichotomy.

In promoting their definitions as universal both factions have created a dialectic of formative identity claims and subsequent adversarial ideologies. To better examine the resulting tensions and influences, this research utilizes qualitative research carried out in Poland, in addition to a cultural analysis of the current transgender subgroups in a more international arena. Findings suggest a needed sustainable community model that would recognize the widest diversity of variant gender identities by productively encompassing both subdivisions.

RN33 | Session 02a Gender, corporeality and the body

Masculinity, corporeality and technology: the embodiment of 'technodesire' in higher technology education

Andreas Ottemo

University of Gothenburg, Sweden

andreas.ottemo(at)ped.gu.se

In this paper, I explore masculine subjectivities articulated in a computer science and engineering (CSE) program at a Swedish university of technology. I focus primarily on norms that articulate masculinity with technology, and consider student culture a particularly important arena to explore in order to understand how certain notions of 'technomascularity' are produced. Theoretically and methodologically, I adopt a post-structural perspective primarily based on discourse theory, as developed by Laclau and Mouffe (1985) and further within 'the Essex School' (see e.g. Glynos & Howarth 2007). I also draw on cultural studies, feminist technoscience research and on Butler's (1988, 1990, 1993) notion of gender, performativity, and the heterosexual matrix. Empirically, the discussion is based on a recently concluded ethnographic dissertation study within a Swedish university of technology. Drawing on a critique that has suggested that gender and technology research often fails to address such aspects, I call attention to the role of passion, desire and (hetero)sexuality in the articulation of masculinity with technology (cf. Henwood & Miller 2001, Landström 2006, Mellström 2004, Stepulevage 2001). I argue that such articulations are particularly salient in the student culture where a 'passionate student' subject position is shaped. I argue that technology, corporeality, desire and embodied computer interest are here configured in a manner that derives intelligibility from the heterosexual matrix and contributes to the CSE program's hetero-masculine connotations.

The pretext of veil. A research on the conceptions of gender and mixed relations of Islamic young women and men living in Italy

Gaia Peruzzi

Sapienza University of Rome, Italy

gaiaperuzzi(at)gmail.com

Migrant families and second generations play a key-role in present European change concerning gender orders. Their efforts whether to adapt themselves to western mentalities and lifestyles or to preserve their own traditions and identities unavoidably overlap and impact on the struggles on opening or closing gender relations, by reintroducing rigid identities and dichotomies in continuously transforming societies, by contrasting the blurring of boundaries, by proposing new meanings and perspectives in conceiving women and men. So, today several gender images reflecting many different cultures and historical temporalities confront each other in the public sphere.

Very often the women body is not only the symbol but also the physical “place” of these struggles.

This paper presents the results of an empirical qualitative study aimed at exploring the conceptions about gender relations diffused among young people of Islamic origin living in Roma (Italy), in the conviction that it is strongly necessary to know how cultures often perceived as a threat are concretely transforming in everyday relationships with our practices and institutions. The idea is that of using the Islamic veil as a pretext: during semi-structured interviews to a group including both young Islamic women and men, a first question about the habit to wear/not to wear the veil is the pretext to investigate strategic themes, like power of religious precepts in Islamic youngsters lives, parental influence, gender conceptions and stereotypes, meanings of freedom, perception of western women and men, attitudes to mixed relations, feeling towards hosting societies.

Hymen ‘repair’ and male circumcision: a comparison of bioethical and cultural perspectives

Sawitri Saharso, Gily Coene
University of Humanistic Studies, Netherlands, The;
Dept. of Philosophy and Ethics, Free University
Brussels, Belgium.
s.saharso(at)uvh.nl, g.coene(at)vub.ac.be

Hymen reconstruction and male circumcision are both interventions in the body that are not (somatic) medically indicated. Yet, while hymen repair is a contested practice, condoned in the Netherlands, but not allowed in Sweden, this is hardly so for male circumcision. We will first discuss both practices from the perspective of bioethics, investigating whether there are relevant bioethical reasons to approach the practices differently. We conclude that there are some differences that are relevant in a bioethical perspective, yet all in all there is not that much ground to treat them differently. Why then is hymen repair more problematized than male circumcision? We suspect that this is due to social and cultural background factors and risks that are not strictly medical. Both hymen reconstruction and male circumcision are related to cultural and religious notions about the gendered body. We will therefore, secondly, discuss the practices from a cultural perspective and also discuss the perspectives of those directly involved – the people requesting the

operations and the one’s on whose bodies they are performed. Thus we aim to explain why both medical interventions are approached so differently and get new insights in how cultural and religious notions on gendered corporealities interpenetrate with bioethical perceptions of the body and what implications this could have, if any, for the bioethical judgement of these practices.

The Usage of Women Body as Sexual Objects in Weather News

Arda Umut Saygın, Şeyda Sevde Tunçbilek
Gazi University, Turkey; Gazi University, Turkey
ardaumutsaygin(at)gmail.com,
svdtnckblk.gsu(at)gmail.com

Media are treated women with certain traditional patterns and masculine perspectives. We see under-representation and misrepresentation of women in the media. Moreover, in media products it is quite often that women are represented as sexual objects. However, as a media product, news are much more important than the other media products because of its truth claim which creates opinions and shapes perceptions.

This research focuses on the topic of representation of women as a sexual objects in weather news in online media. The problematic of the study is to discuss how come female body has been eroticized and presented with a masculine and voyeuristic view in weather news which are relatively less important in comparison to “hard news” and actually based on scientific and rational sources. The point makes the study important is that we are not discussing women representation in “summer themed” weather news which are identified with half-naked woman body and become obvious for a long time; on the contrary, we are focusing on “winter themed” weather news which reports cold weather, rain, snow and wind through erotic photos of women who are unaware of the photo taken.

The theoretical part of the study focuses on feminist theory, concept of gender and women representation in the media. Data for this research will be collected from the “winter themed” weather news from the mainstream online media of Turkey. In conclusion, misrepresentation of women who are exposed to the masculine view will be discussed in the context of tabloidization of news.

RN33 | Session 02b Women's Movements and Organizations

The debate of ‘difference’ and the feminist category of woman in Turkey in the late 1990s

Demet Gulcicek
University of Warwick, United Kingdom
d.gulcicek(at)warwick.ac.uk

Since 1995, the feminist movement in Turkey has been actively rethinking itself in relation to different minorities or discriminated groups. That rethinking has been prompted particularly by the Kurdish women’s movement, the lesbian and gay movement, and some

Muslim feminist groups' challenges against discrimination. This was a new process for the feminist movement of Turkey, especially compared to the 1980s, which is generally referred to as the beginning of the second wave feminism in Turkey and which is the notion of difference among women did not actively referred.

I claim that these encounters are not simply adding other categories to gender; rather, the categories of the ethnicity, sexuality, and religion has changed the normative area of the feminist movement in terms of the way of describing of womanhood or the way of thinking about politics or feminist politics. To be able to understand the effect, I will focus on the volumes of the Magazine of Pazartesi: Newspaper for Women (Kadınlar Mahsus Gazete). It can be claimed that the most prominent initiative of the feminist movement is the feminist Pazartesi Magazine for the period of 1995s to 2000s in Turkey. The magazine also aimed to be a newspaper trying to cast feminist eyes to the agenda of Turkey; thus, it is an important source to understand the transformation. In that framework, I would like to make a presentation about transformation of the feminist category of woman in Turkey in relation to the notion of difference between the years of 1995-2000 through Pazartesi Magazine.

“Meanwhile, it isn’t disastrous to affiliate men” – Investment Clubs and the Role of Gender on the Financial Market

Lydia Welbers
University of Bremen, Germany
welbers(at)uni-bremen.de

In my research about investment clubs, which are associations of small investors who pool their money and decide together where to invest it on the financial market, I combine the research of small investors with research of gender relations. During my ethnographic observations the division of so called women's investment clubs and “mixed” clubs, where women were beautiful mirrors, attracted my attention. Therefore, I will focus in my presentation on gendered processes of decision making and learning in investment clubs. Indeed, several excluding mechanisms have an impact on these group, wherefore the analyzed clubs can be described as homosocial groups, who have different - and similar - orientations, practices and conversational structures. In contrast to male-dominated clubs, all women's clubs mentioned gender relations. The usage of gender stereotypes and self-perceptions can provide guidance due to idealized images as well as orientational knowledge, but on the group-level it also heightens the cohesion of the group. Moreover, Gender is made relevant by them because the exclusion of men enables in their view the function of investment clubs, which is imparting financial literacy and empowering women. To achieve this, women's investment clubs exclude males to foster women to gain financial literacy. In all-female clubs new practices are tried out and as regards hegemonic masculinity non-traditional orientations get stabilized.

The on average older, middle class women do reflect here their deviation from hegemonic gendered behavior. Furthermore, different kinds of femininity are reflected in presentation methods within investment clubs. In the sum, femininity and gender order became contested topics. Especially for women, investment clubs offer opportunities to participate on the financial market and the homosocial group is a cornerstone of the empowerment.

How it is to be bodypositive woman? The identity construction of the members of the “Bodypositive” Russian social movement

Oxana Mikhaylova, Karina Ereemeeva, Victoria Shelepina

National Research University Higher School of Economics; National Research University Higher School of Economics; National Research University Higher School of Economics
oxanamikhailova(at)gmail.com,
karryfox555(at)gmail.com, shelepinav(at)gmail.com

This study explores the identity construction of the members of the “Bodypositive” Russian social movement. Bodypositive in Russia has significantly transformed since its initial emergence in the USA. Russian Bodypositive community hasn't been studied before, although it has more than 60 000 followers in the social network Vkontakte. Structural and cognitive approaches in symbolic interactionism were combined (Stryker and Burke, 2000; Burke and Stets 2009) and utilized as a theoretical framework of the study. We inferred a hypothesis that depicts the process of identity construction by the Russian Bodypositive community adherents, relying on semi-structured interviews with bodypositive women (involved in Bodypositive for 1-10 years).

The identity (I and Me) is constructed within internal and external contexts. Internal contexts determine the bodypositive identity of the bodypositivists, while external contexts reflect the stability of bodypositive identity of the bodypositive women herself. Behavioral component is flexible. For instance, clothing practices of bodypositivists are usually hidden due to the dresscode in the workplace. Cognitive component of the identity is the stablest one, and one of the most remarkable findings concerning it is interviewees' ambivalent views on beauty: some bodypositive women believe that every body is beautiful. However, others neglect the concept of beauty, because it leads to inequality as women who are considered beautiful by society, get unfair benefits. Bodypositive women defend their views aggressively in social networks, because they find persuasion unfruitful. In real life they regard themselves as unremarkable and believe that contemporary Russian society is too conservative to accept bodypositive ideology.

Gender based violence and women's activism: Women's activism against honour-based violence in Turkey

Bingul Durbas
Institute of Development Studies, United Kingdom

bd42(at)sussex.ac.uk

There are a large number of published studies in the field of gender studies describing the role of the women's movement against gender based violence. A growing body of literature has also emphasised the intersectional aspect of this issue, arguing for an approach towards the oppression of women, in terms of gender, race, class, ethnicity, etc. However, there are few studies that have investigated this area in Turkey. My paper addresses the women's movement against domestic violence in Turkey with special attention to the issue of honour-based violence. Specifically, in my paper, based on one-to-one, qualitative semi-structured interviews with the representatives of seven women's organisations based in Istanbul, Trabzon and Diyarbakir, I will be examining their conceptualisations of honour-based violence, factors that they identify with which reproduce these forms of violence against women, and the activities and strategies they develop and employ in relation to women who escape from violence in the private sphere. Drawing on theories of intersectionality, to the issue of domestic violence, I argue that an intersectional approach could be useful in order to provide a better understanding of violence against women and as a way of advancing collective responses to domestic violence. In conclusion, this paper, offers some important insights into the way in which the strategies that are developed by women's organisations are influenced by their conceptualisation of domestic violence.

RN33 | Session 03a Gender, Crime and Violence

Questions of worth, gender and subjecthood in narratives of women imprisoned for violent crimes

Satu Venäläinen

University of Helsinki, Finland

satu.venalainen(at)helsinki.fi

My presentation focuses on ways in which women imprisoned for violent crimes constitute gendered identities against a socio-cultural backdrop that mainly offers them positions of otherness. The analysis is based on narratives produced in interviews (N=11) and written accounts (N=14) that were collected in prisons in Finland during the years 2012-2014. Drawing upon insights from feminist poststructural approaches, critical discursive psychology and Sara Ahmed's theorization on affect(s), the analysis of these narratives discerns various selves that are enacted through acts of accounting for violence. In these narratives, gendered vulnerability entwines with agentic portrayals of action in complex ways. In addition to being described as a context for doing violence, vulnerability is also frequently distanced from one's self and thus marked as troublesome. By focusing on ways in which these identity enactments relate to normative notions about subjecthood that valorize individuality and rationality, I put forward a view of them as efforts to attach worth to one's self and thus to subvert one's status as a faulty subject. I

discuss, in particular, how the complexity of these identity enactments links to the genderedness of meanings that the research participants negotiate with, and the affective ambivalences that these meanings are enlaced with.

"I resurfaced and I learned to be proud of myself": Deconstructing the mainstream victim model

Greta Meraviglia

Università degli Studi di Padova, Italy

greta.mrv(at)gmail.com

How is a women supposed to face violence in current years? In the Italian context women are confronting with an hegemonic narrative distinguished by backlash (Faludi, 1991), victim blaming and apologies for the assaulters, translated in politic actions as drastic reduced funding for shelter services and vehement oppositions to any programme promoting the culture of respect.

I started this explorative research in two shelter services and an association for women survived from different forms of gender based violence in 2015, interviewing twenty women with the aim of learning more about their construction of womanhood: how the abusive experience have been integrated in their biography, how they position themselves and how they define the labels of "victim" or "survivor".

Considering these premises I selected a qualitative methodology: the texts have been analysed in a biographical perspective (Merrill & West, 2012), paying attention to the specific construction of their reality (Gergen, 1994).

The "Victim-status" is mainly defined by negative features: the victim is supposed to be pleased with her ability to stand in the violence and does not face her life after ending abuses. Conversely, the "Survival-Status" is mainly described as a trophy: it's a dynamic situation in which the woman feels free from violence and able to build relationships with other supportive people.

With this work I deepened the "victim-survivor" dichotomy, analysing its declination in the participants' experience and discovering its limits, welcoming women's agency and their new definition aimed to deconstruct a mainstream, essentialist model built over their own identities.

Overcoming gender-based violence by approaching Second Order of Sexual Harassment

Ana Vidu, Mar Joanpere, Maria Angeles Serrano

University of Barcelona, Spain; University of

Barcelona, Spain; University Rovira i Virgili, Spain

ana.vidu(at)ub.edu, mar.joanpere(at)ub.edu,

mariadelosangeles.serrano(at)urv.cat

Sexual harassment is a reality still present in our society, our institutions, even our universities. Many steps forward have already been done to tackle this issue from several perspectives. On the struggle against gender-based violence there is a wide agreement that supporting survivors and empowering them constitute one the most effective mechanisms of

prevention and response. Indeed, for combating this enormous problem, actions are required for protecting not only the direct victims of sexual harassment but also the victims of Second Order of Sexual Harassment (SOSH); whose people who take a clear stand on the survivors' side and always protecting them; despite of the fact of being likely to suffer hard criticism and attacks for doing so. These retaliations against the brave people who speak out in favour of the victims are making others not to take any stand, which is contributing to perpetuate the harassment, keeping the silence unbroken. The victim's support needs to be protected as well, as being crucial for the struggle and for the victim to go forward. Aiming at addressing this approach broadly, the present paper pretends to shed light on the importance of approaching SOSH, providing not only concrete situations in which SOSH may happen, but also actions for preventing and overcoming it. Considering the aim of protecting primary victims of sexual violence, actions based on solidarity and peer-to-peer networks shown to be successful on supporting survivors and also protecting the second order victims of sexual harassment; both are necessary in order to make visible the problem and contribute to overcome it.

Gender-Sensitive Women Lawyers' Perceptions and Positions in Handling Cases of Violence Against Women in Ankara

Cansu Okan

Ankara University, Turkey
cansuokan(at)gmail.com

Violence against women, a type of violence based on gender inequality, cannot be taken separately from the law as there is an inseparable relation between violence and law. The law, as it describes the form of execution, opens an area for preventing violence against women as well as providing punishment for it. It is lawyers who provide individuals with the access to law in necessary situations. Thus, lawyers' mediatory position makes them important actors of the system who claim to defend the rights of individuals and also have a possibility to participate in the lawmaking process, therefore it is significant to understand their positions in approaching the issue of violence against women and bring it into discussion. At the same time, acknowledging the fact that violence against women is a gender-based form of violence, the following question arises: as women lawyers are part of this legal system with their gender identities of being a "woman" besides their identities of being a "lawyer", how do they approach the issue of violence against women?

Based on 15 in-depth interviews and 5 courtroom observations, this study elaborates on how gender-sensitive women lawyers define their own positions, both professionally and personally, within the legal boundaries that they have to work in. This study argues that the women lawyers who were interviewed in this study, by adapting a feminist perspective and as defenders of women's rights, perceive law as an

instrument for carrying out their struggle. With their mediatory positions between the law and the individuals who seek legal guidance, they criticize and attempt to transform the existing legal procedures, regulations, attitudes of other professionals and legal parlance.

RN33 | Session 03b Masculinities

Opponent Masculinities in the Struggle against Sexism

Naz Hidir

Ankara University, Turkey
nazhidir(at)gmail.com

Coming to the fore that the masculinity has not been a particular construct and different masculinities in some context -social, historical and cultural- has been adopted, give us a lead to see individual masculinities not to be located similarly in patriarchal regime. Therefore, while some men are at the limits of normative masculinities, others are tend to erode these limits. It is important to make out how those who try to erode normative limits position themselves in struggle with sexism and heterosexism, and how they are in relation with feminisms. It is to be regretted that masculinity researches in Turkey focus on "hegemonic" masculinities at large. Very few studies comprise different experiences about masculinities and their relations with feminist ideologies.

The main aim of this study (conducted by the method of feminist standpoint) is to point out that how do those who refuse to mode of dominant masculinity construct their own identity? I conducted semi-structured profoundly interviews with eighteen men who define themselves as opponent; such as socialist, anarchist, communist, animal rights activist, conscientious objector, social democrat and pro-feminist; in an attempt to seek answer questions mentioned above.

I try to analysis expressions and actions, which are against sexism, of men with which I interview since I intend to trace relations between "opponent men" deciding to build an opponent masculine identity and feminisms. As a result of this study, I can say that even though "opponent men" have a potential to transform hegemonic modes of masculinities, they can continue to collaborate with patriarchal regime in some cases. For this reason, it is vital to realize "opponent men"'s sexism and their position with regard to struggle against sexism.

What are the possibilities of working home-office for new masculine identities?

Ece Erbug Sanli

Eskisehir Osmangazi University, Hacettepe University
Turkey
ecee(at)hacettepe.edu.tr

1980s witnessed the collapse of welfare state and the rise of neo-liberal capitalism. Both globalization and the rapid growth in the Information Technologies resulted in the decentralization of administration and

individualization of labour (Castells, 2013). The rigid structure of Fordist era has replaced by flexibility and as a result atypical employment models came in sight. The changing nature of work undoubtedly changed the gender order as well. Masculinity, which needs to be proved by various and repeating performances had shaken by insecure neo-liberal markets, by increasing number of women entering the workforce and by flexibility. In fact working is one of the basic elements that establish masculine identity. Traditionally, the man is the breadwinner and to a large extent he owns his authority at home to this breadwinner role. Additionally, home is the sanctuary for a working man. However, home-office, which is a sub model of telework as a flexible employment type, blurs the boundaries between home and work; between private and public.

In this study, I want to gather the limited research done on this subject in literature. I will analyze the secondary data and resources to answer some questions i.e. is working at home making any changes in the domestic division of labour? Is spending more time at home making any changes in father's parenting? Is it possible to talk about a "new masculinity"? Does this situation bring out a hybrid area where men are becoming more sharing and caring?

Then I would like to discuss if these could possibly create new masculine identities.

Paternal Leave and Part-Time Work: Challenges and Future Perspectives

Gerlinde Mauerer

University of Vienna, Austria

gerlinde.mauerer(at)univie.ac.at

Based on my previous research results on caring fathers on parental leave and challenges met by their partners, in this research presentation I focus on long-term paternal involvement in family work in Austria (Mauerer 01-04/2017, Mauerer 2016).

European data show a huge gender employment gap at the expense of women caused by parenthood. I analyse the personal and employment conditions of fathers' on leave in comparison to maternal part-time work, which is common in European member states (Eurostat 2015). The interview questions focus on working conditions and contracts, career development during and after parental leave and part-time work.

I analyse these qualitative data co-reflecting quantitative (inter)national data on gender employment rates and research on gender at the working place (Fagan/ Norman 2013; Magaraggia, 2013). Furthermore, I analyse and present qualitative research data on fathers on parental leave and parental part-time work focussing on gender at the workplace and family arrangements based on the theoretical framework of feminist theories, gender and family studies (O'Brien/ Wall 2016, Musumeci/ Naldini/ Santero 2015, Tofoletti/ Starr 2016).

Methods: Guided interviews with fathers on paternal leave, guided interviews with part-time working parents and personal managers.

RN33 | Session 04a Gender at the Workplace

Blogging as a form of gendered work

Katariina Mäkinen

University of Tampere, Finland

katariina.makinen(at)uta.fi

In Finland, the tightening austerity politics, the precarious position of women in the labour market, and the culture of intensive parenting have rendered home-based micro-entrepreneurship a viable and even desirable option for many women with young children. The recent monetization and commercialization of lifestyle and family blogging, for their part, have opened up possibilities to blog for living, especially for highly educated women who have experience in media-related work.

Mom or family bloggers create social networks that center on the sharing of intimate accounts of everyday life, peer support, good feelings and friendship, but these networks can also be used for commercial purposes. Different products can be branded and advertised through the blogs, and the bloggers, who might also themselves become 'personal brands', can earn money through different forms of co-operation with commercial agents. Importantly, the social networks built in blogs are not only social and affective but also leave a digital trace: every download, every followed link can be counted and monetized.

Blogging as a form of work merges the 'feminine' intimate with the public, the practices and spheres of work with those of family and home, and thus marks a reorganization of the gendered relations that structure both work and family life. In this presentation, I ask how blogging as a form of gendered work shapes and organizes everyday life and social relations, especially for the bloggers and their families. My approach to blogging is based on Finnish mom and family bloggers' interviews.

The Micro-ethics of Au-pairing relationships

Gesthimani Moysidou

Edinburgh Napier University, United Kingdom

gesthimani.moysidou(at)napier.ac.uk

A successful relationship relies heavily on the construction of a common moral framework between the two parties and hospitality can play a big part in the establishment of a new relationship or the reinforcement of an existing one (Selwyn, 2000). This research is aiming to uncover how this common moral framework is created and negotiated, through open or tacit communication in Au-pairing relationships. The ethics of Au-pairing encounters are identifiable by various elements such as the spatial and emotional boundaries during their stay (Stubberud, 2015; Cox and Narula, 2003), the interactions with the family in general (Hess and Puckhaber, 2004) and with the mother in particular (Mellini, Yodanis and Godenzi,

2007) as well as the 'parenting' approach taken by the host parents, namely a 'personalising' or 'positioning' approach (Cox and Narula, 2003). The 'family relationship' narrative in Au-pairing tends to be used to de-emphasise servitude and highlight mutual responsibility, while creating fictive kinship (Anderson, 2014; Sollund, 2010). Further aspects of the exchange argued to determine the social control imposed by the host, the type of the relationship created and the negotiation of the encounter, include living arrangements, home rules, food, free time, visitors and social interactions as well as personal hygiene (Cox and Narula, 2003; Hess and Puckhaber, 2004). Through the use of semi-structured interviews with both au-pairs and their employers, that will take place in spring 2017, this research explores the ways in which the boundaries, home rules and customs are negotiated and agreed upon through the establishment of a common moral framework as well as how both sides respond to micro-ethical dilemmas that arise during the encounter.

From "Traditional" Office to Activity Based Office. An ethnographic analysis of work spaces

Merja Kinnunen, Virve Peteri, Kirsti Maria Lempiäinen
University of Lapland, Finland; University of Tampere;
University of Lapland, Finland
merja.kinnunen(at)ulapland.fi, virve.peteri(at)uta.fi,
kirsti.lempiainen(at)ulapland.fi

The paper studies how work spaces shape working and employees. The analysis bases on feminist research of space (Elizabeth Grosz, Kirsi Saarikangas) and Henri Lefebvre's theory on social space in which the focus is on critic of capitalist society, embodiment of actors and materiality of spaces. We will ask how space creates things, engenders practices and makes up possibilities to think and act. The material is obtained by ethnography which has been done in office environment in 1980's, 1990's and 2010's. The analysis shows that the openness of new office space asks for a new sort of managing and performing embodiment. The authors suggest that the aim to increase and apply informal encounters, typical for women workers in industrial office, to post-industrial office may paradoxically decrease direct meeting and communication.

Why and How do the Formal Regulations Increase the Risk of Precarity Within Migrant Care Work

H. Sibel Kalaycioglu, Kezban Celik, Helga Rittersberger Tilic
Middle EAsT Technical University, METU, Ankara
Turkey; Ondokuz Mayıs University, OMU, Samsun
Turkey; Middle EAsT Technical University, METU,
Ankara Turkey
ksibel(at)metu.edu.tr, celikkezban(at)hotmail.com,
helgat(at)metu.edu.tr

Guy Standing defines precariat in his book "The Precariat: The New Dangerous Class" as a child of globalization. His definition encompasses seven different dimensions of "labor security. These include

not only one's security in employment but also the security of job descriptions and career paths, the safety and regularity of working conditions, the ability to gain and employ new skills, the security of income over the life course, and "representation security"—that is, the right to a collective voice in the labor market, especially through labor unions. Considering these dimensions of precariat, regular/irregular migrant women workers in care work in Ankara are the subject of this paper. For discussing these subjects the qualitative, descriptive study draws upon 20 in-depth interviews with migrant women care workers to analyse and compare the reasons behind the labour migration of these women and the conditions of employment they are confronted with. The paper argues that on both sides of receiving and host countries different dimensions of precarity are prevailing. The paper focuses on understanding the growing demand for the domestic care sector in Turkey in the last decade, especially in elderly care, which attracted mass migration flows from Georgia and other post-Soviet countries. After the description of the structural pull factors leading to women migration towards Turkey, an analysis of the conditions of employment on the side of host country, will be conducted. A critical analysis about attempts towards formality, including some legal regulations towards regularization of migrant labour within the context of new welfare and migration regime of the country, will be made.

RN33 | Session 04b Gender Relations in Academic Institutions

Feminist Experiences about the Compulsory Course of Gender Equality in a Rural University in Turkey

İlknur Meşe, Nezihe Başak Ergin
Giresun University, Turkey; Giresun University, Turkey
inurmese(at)gmail.com, nbasakergin(at)gmail.com

Rural universities in Turkey had been established in accordance with neo-liberal economic aims since 1990s. Since 2007, this became widespread as a means of political and socio-economic policy of the government whose nationalist, conservative and religious components are shaping these rural universities. This takes place in three ways: Firstly, the rectors are directly appointed by the President. Thus a direct organic relationship has been established between the university and government. Secondly, the mindset predominating the university reinforced by the academic staff and course curriculum is being continual. Thirdly, the students are not too stranger to this rural habitus of the university related to the socio-economic classes they belong to and places from where they come. Within this habitus, to teach the course of gender equality that was decided to be given as a compulsory course throughout the university in 2015 became quite different, challenging and backbreaking experience. Since to work for affecting students and creating a feminist classroom by going over the deep cleavage resulted from the

inconsistency between feminist pedagogy and the language of feminist literature was demanding quite an endeavor. We are teaching this course for hundreds of students in several departments of the Faculty of Education for two fall semesters of the years 2015 and 2016. The first year that we taught this course, we prepared an evaluation form composed of nine questions to be replied by students towards the end of that semester. This presentation is based on two sources: Firstly, the replies and evaluations of 327 students and secondly our two-year teaching experiences. The theoretical -and practical- framework of the study will be grounded on feminist pedagogy and feminist literature.

“Doing masculinity” in the neoliberal university: the construction of academic masculinities in Estonia

Kadri Aavik

Tallinn University, Estonia

kadria(at)tlu.ee

This paper focuses on understanding gender inequalities and privilege in the context of the corporatisation of higher education. Specifically, it seeks to understand how academic masculinities are constructed in contemporary universities as work organisations and sites of knowledge production.

In recent years, a significant body of critical work has emerged documenting the processes of neoliberalisation in higher education and the effects of this on academic life. While some of this work has paid attention to ways in which academic subjects and knowledge production are gendered, the focus has largely been on women, leaving men in the status of an unmarked group whose privilege and roles in reproducing hierarchies and inequalities in university settings remain mostly invisible.

In examining how masculinities are constructed in the academia, I take an intersectional approach, considering also how other categories, such as ethnicity and age interact with gender to shape men's experiences and manifestations of male privilege in universities.

My analysis draws on interviews conducted with male academics and university leaders in Estonian universities. The findings suggest that academic men are constructed as vulnerable, resonating with the broader discourse of “boys and men as victims” of the education system in Estonia. This conceptualisation of academic masculinities has important implications for efforts to build solidarities around developing gender equality in the corporatised university.

Changing Gender Relations at Austrian Universities

Nina-Sophie Fritsch, Christina Liebhart

University of Vienna, Austria; University of Vienna, Austria

nina.fritsch(at)univie.ac.at,

christina.liebhart(at)univie.ac.at

The situation of women in the academic world is

characterized by multidimensional segregation. Nevertheless slight progress – especially in terms of leading positions – has been observed recently in Austria. Therefore female academic activism is central to advance grassroots struggles for a better world while bridging the scholarly, political and community realms. In Austria various reforms have been carried out in the last decade and the academic sphere has undergone perceptible change, with redevelopment and reshaping at different institutional levels. These reforms have had an effect on gender relations, especially within the past several years, with an increasing proportion of female academics now in leading positions. This paper investigates the ways in which female activism is influencing institutional settings and how academics reach leading positions. The analysis is based on qualitative (semi-structured, problem-centred) interviews conducted with the most successful women at Austrian universities, focusing on the obstacles these women encountered and how they managed to overcome them.

The paper presents different patterns of career development exhibited by female academics in leading positions, the role of these patterns in the advancement of female faculty and different strategies of academic activism. The analysis yields three main patterns of career development, consisting of the following characteristics of academic activism: (1) individualistic, output-driven, (2) political-sustainable and (3) adaptive-flexible. The most important theme within those patterns of career development consists in a sustainable improvement for women in academia. Above-average engagement is seen as necessary contribution for initiating and promoting further change in gender-specific, segregating structures.

RN33 | Session 05a Gender Relations in Post-Socialist Societies

Gender division of domestic labour in the ‘post-post-socialist’ Europe

Daria Ukhova

Bremen International Graduate School of Social Sciences, Germany

dukhova(at)bigsss.uni-bremen.de

Although the infamous women's double burden and overwhelming responsibility for domestic labour was often considered by gender scholars as one of the key gender-related injustices of state socialism, since the fall of the Soviet bloc, the issue has been discussed increasingly less frequently. The underlying assumption has been that unequal gender division of domestic labour has persisted or even worsened, due to women's mass withdrawal from the labour market and the state's retrenchment from the provision of childcare services that happened during the 1990s. In this paper, I argue it is time to revisit this notion.

Theories explaining gender division of domestic labour suggest that a number of processes that characterised economic and social development of post-socialist countries in the 2000s (so-called ‘post-post-socialist’ period), e.g., women's increased labour force

participation, and a relative increase in public and private provision of childcare and other care services, could have led to redistribution of care work between men and women, as well as between families, states and markets. Taking Bulgaria, Poland and Russia as my case studies and drawing on three waves (1994, 2002, 2012) of the International Social Survey Programme, I analyse to what extent such redistribution has actually taken place and what factors have contributed to/detracted it. Initial findings of my research point out the persistence of and – in case of certain groups – even further growth of inequality in gender division of domestic labour despite relatively favourable socio-economic developments. Preliminary analysis suggests the centrality of the category of 'class' for understanding these trends in the 'post-post-socialist' context.

Gender Habitus of Working-Class Men and Women in Russia

Alexandrina Vanke, Irina Tartakovskaya
Russian Academy of Sciences, Russian Federation;
Russian Academy of Sciences, Russian Federation

lucia.richardson(at)gmail.com

The paper presents the analysis of masculine and feminine habitus of working-class people of Soviet and post-Soviet generations doing service and physical work. Following Pierre Bourdieu, we understand habitus as schemes of thinking, perception and appreciation inscribed in the body of an individual and producing sets of social practices. In such a way, habitus as a system of stable dispositions determines social agents' ways of behaviour, life styles, manners, postures, tastes, etc. Building on a Bourdieusian approach, Cornelia Behnke and Michael Meuser formulate the concept of gender habitus meaning that social gender is always connected to the specific habitus which generates masculine and feminine practices. In our empirical research, we combine approaches of genetic structuralism and intersectional analysis trying to reconstruct masculine and feminine habitus of individuals belonging in particular class and generation. The paper is based on 85 semi-structural interviews conducted in five Russian cities in 2015 under the project "Intergenerational social mobility from XX to XXI century: four generations of Russian history". The preliminary findings of our research are the following. A feminine habitus of working-class women implies an early marriage and having children that results in domination of a family project over other life spheres including professional self-realization. A masculine habitus of working-class men is characterized by pursuance of self-realization in public sphere rather than in family. Holders of this habitus try to play the roles of breadwinners and financially successful men without paying attention to their social status or job prestige.

Internalizing the 'New Socialist Woman': State-prescribed gender roles and their traces in Romanian society

Sorana-Alexandra Constantinescu
Babes-Bolyai University, Romania
sorana.constantinescu(at)yahoo.com

In the Romanian communist regime, women's status and emancipation were recurrent themes. Women's representation in official propaganda was mainly conceived as the cultural component of the Party's policies of social engineering, promoting the communist ideal of womanhood, which was both heavily burdened with multiple tasks that were necessary to the state, and shifted the aspects it emphasized and nuanced as the needs of the state changed. These needs had to be balanced with the P.C.R.'s ideological commitment to gender equality, according to which women have to be presented as equal citizens. However, between women's issues that needed addressing, sexist attitudes and prejudices within the Party leadership and rank-and-file, and the demands the State made on women, their citizenship ended up being heavily gendered. As we see both in the pages of *Femeia* magazine and in official speeches, despite its egalitarian pretense, the Party was dominated by a set of assumptions about womanhood, about women's roles at home and in the workforce, and about motherhood as essential to being a woman. In this presentation, I will analyze *Femeia* from 1965 until 1978 in order to map the State prescribed models of womanhood, which I will then confront with data drawn from interviews with two generations of Romanian women (socialized both during the communist regime and the post-communist transition), in order to see how these models have been internalized and what cross-generational traces they have produced.

Gender roles in the families of war veterans in Serbia

Olivera, S. Markovic-Savic, Jasmina, S. Petrovic
University of Kosovska Mitrovica, Serbia; University of Nis, Serbia
markovic.olivera(at)gmail.com,
jasminafilak1(at)gmail.com

Since there is a clear dichotomy between civil and military spheres in modern society, and there is an unbridgeable gap between civil values and those that are related to armed conflicts, it was assumed that this division is reflected in gender roles and gender relations in the families of war veterans in Serbia. More specifically, we were interested in whether there are general examples of abolishing the distinction between traditional gender roles, even in such a way that there is a genuine spousal communication about war and participation in the war. The study found that there is a tacit agreement between the spouses that the events of the war are not discussed. This consensus was explained by the respondents with a lack of understanding by the female spouse, which the backbone of the division of gender roles: men fulfill

their duty to society with participation in the war, with the power to cope with the violence, hide emotions, show strength, resilience and determination; the women's responsibilities are reproduction and care for the offspring and household, the expression of feelings and vulnerabilities, as well as the support of the group morality that nourishes such a division of gender roles. The data we report are part of a broader study of the social position of war veterans in Serbia (Marković-Savić, 2012). The data were collected in in-depth interviews with 30 respondents who had acquired their veteran status through participation in the recent war activities on the territory of SFRY (Socialist Federal Republic of Yugoslavia) and FRY (Federal Republic of Yugoslavia). The study was carried out using in-depth interviews.

RN33 | Session 05b Gender, Politics and Power

Changing gender orders in European welfare states

Ilse Lenz
Ruhr-University Bochum, Germany
ilse.lenz(at)rub.de

The paper will argue that presently the gender order in European welfare states is moving towards a flexibilised gender order. Main actors driving this transformation are global capitalism with its increasing economisation and flexibilisation of workforces, gender movements mobilising for equality and diversity of gender and political actors in the global multilevel system.

According to Raewyn Connell, modern gender orders are constituted by core structures and institutions organising gender relations: gendered power relations, and divisions of labour, hegemonial norming of sexuality and bodies. Birgit Pfau-Effinger emphasized the meaning of the gender culture in legitimating the gender order.

Using comparative empirical evidence, I will argue that in European welfare states, the division of labour in paid work and employment has been flexibilised (and precarised) and that gender power relationships have changed with autochthonous higher class women gaining voices. I will follow an intersectional approach looking at gender, class, migration and desire. Gender has become a reflexive category and gender culture is shifting from gender dualism to diversity. These trends suggest the emergence of a flexible gender order which is based on a pluralisation of gender and flexibilised gendered employment and life forms, as various forms of sexuality.

I will show, however, that the different gender welfare regimes are shaping the varying trajectories and forms of the emerging flexible order. In socialdemocratic regimes, equality norms and regulations are visible whereas in liberal and conservative regimes, employment flexibilisation and precarisation of diverse groups of men and women have increased rapidly.

Feminist and LGBT movements in Slovenia in the context of anti-gender campaigns

Milica Antić Gaber, Roman Kuhar
University of Ljubljana, Faculty of Arts, Slovenia;
University of Ljubljana, Faculty of Arts, Slovenia
milica.antic-gaber(at)guest.arnes.si,
roman.kuhar(at)gmail.com

The struggles over marriage equality in Slovenia (started in the early nineties, intensified in 2000s) have recently become a catalyst for an organized and increasingly powerful anti-gender movement, which targets issues beyond marriage equality; reproductive rights, sexual education, gender equality are all being questioned. Moreover conservative opposition to equal rights for gays and lesbians, in the recent years developed into an organized (transnational) movement, extensively supported by the Catholic Church. In 2016 Slovene opponents to same-sex marriages turned into a new political party with a program (an interesting mixture of socialist, liberal and conservative ideas), gathered under the umbrella of anti-elitism and populism. All these creates a new political context in which the process of what used to be an increasing (and unquestioned) progress in gender equality is again questioned and possibly reversed. All these have created tensions and redefined relations not only between proponents and opponents of marriage equality (feminist and LGBT movements included), but also among them.

In this paper we will take a look at how these new contexts shape and inform policies produced and proposed by feminist, LGBT and anti-gender movements in Slovenia. Using critical frame analysis of policy documents produced during and after the above mentioned debate we will show how diversification of the movements influence the re-definitions of the basic orientations of these movements, their inter-connectedness, solidarity and effectiveness of their activities. We will conclude our paper with the findings about new directions and questions that all these complex relationship brings to the forefront of all these organizations and what are the consequences for the basic feminist orientations on the concepts of gender dichotomy, heteronormativity and gender order as such.

“The Invisible Wombs of the Market: Waged and Unwaged Reproductive Labour under Capitalism

sigrid vertommen
king's college london (from may 2017), ghent
university, belgium (until may 2017)
sigrid.vertommen(at)ugent.be

Since the reconfiguration of the capitalist world economy in the late seventies, the reproductive labours involved in care, nurturance and pleasure have increasingly been commodified and a global army of female workers including nannies, cleaners, surrogates and sex workers has developed in both the global North and South.

Recent social scientific and feminist scholarship has therefore focused its attention to studying the

immorality and exploitation behind the supposedly “new” sexual division of labour, with its exuberant marketization of bodies, intimacies and sexualities, while downplaying or even ignoring the structural inequalities of power (race, class, sex, gender) that underpin the unwaged forms of reproductive, affective and emotional labour, such as in sex, childbirth and housework.

In this presentation we would like to suggest that a feminist Marxist understanding of capitalist social relations requires a combined attention to and organisation of both forms of labour - namely, waged and unwaged reproductive labour. Through a critical analysis of recent debates on altruistic (unwaged) versus commercial (waged) surrogacy, we posit a feminist Marxist account of the politics of motherhood, care and reproduction that transcends false dichotomies of waged-unwaged labour, gift-commodity, nature-social, market-non market.

The priorities of women's rights in Iran

Pardis Asadi Zeidabadi
Newcastle University, United Kingdom
p.asadi-zeidabadi(at)ncl.ac.uk

While there are some researches detailing Islamic and secular feminist in Iran, there is hardly any research focusing on how women activists including secular, reformists and conservative women prioritise women's rights in the contemporary Iran. Here I describe respondents' views on how and why different types of women activists prioritise some women's rights in Iran and goes to discuss their views about the ways in which they justify their priorities. My discussion is divided into three major sections. Firstly, I will examine why and how secular women activists and some reformists believe in equality between men and women and give priority to some rights such as testimony, polygamy, employment and age of marriage for women. On the other hand, I will discuss why at the same time these laws are neglected for other women activists. Secondly, I will explore why and how some reformist and conservative women activists emphasis on participation of women in political arena, and also I will explain why other participants fail to highlight this right. Thirdly, I will examine how and why, despite the importance of some laws such as the right of divorce, wearing hijab and women's rights in different ethnicities, the majority of women who were interviewed does not prioritise these.

RN33 | Session 06a Femicide In Europe

The different dynamics of femicide in a small Nordic welfare society

Freydis Jona Freysteinsdottir
University of Iceland, Iceland
fjf(at)hi.is

In this study, all cases of femicide in Iceland, during a thirty year period were explored. A total of sixteen women and girls were killed during the years 1986 - 2015. Femicide was defined in this study as a murder

of a woman by a partner, former partner, or related to passion. Eleven femicide cases occurred during this time period according to this definition. The data analyzed were verdicts and news of the incidents. Qualitative methods were used for analysis. Interestingly there was a different dynamic related to femicide cases which included 1) sex femicide, 2) former partners and 3) current partners. Alcohol consumption and the willingness of the victim to end sex seems to be a dangerous mixture according to the results of the sex femicide cases. Alcohol consumption was involved in all current partner femicide cases in addition to low SES status. Empathy was lacking and patriarchal views were prominent in some of them. Jealousy and possessiveness were major themes in former partner femicide cases, but not alcohol consumption. It is important to study such dynamics and contextual factors in more details in larger studies.

From “honour killing” to “criminal love”: an analysis of media representation of femicide in Italy in the last decades.

Valentina Cremonesini, Stefano Cristante
University of Salento, Italy; University of Salento, Italy
valentina.cremonesini(at)unisalento.it,
stefano.cristante(at)unisalento.it

This research focuses on media representation of femicide in Italy.

In the last decade violence against women has gradually become a distinct theme in both crime news and public speeches on Italian issues.

Compared to the previous decades, such growing attention has represented a positive element that was able to unify and highlight violent acts while they were previously disconnected and marginalised among the media.

However, the media portrayal of femicide still shows representative and narrative elements that are ambiguous. On one hand, the use of an emergency rhetoric is preventing focus on the social gender relationships typical of the Italian society, concealing the constituent dimension of the phenomenon and producing an emotional stimulation towards media consumption. On the other hand, the general portrayal by media of violence against women often restates the common sense typical of gender relationships and links the exceptional nature of the crime to stereotypes in line with the patriarchal mindset that still influences the process of social construction of the Italian male identity.

Our sociological observation aims at analysing this continuity through historical comparison. In particular, the research is focused on the analysis of the extent to which violence against women has been covered in two of the main Italian newspapers – La Repubblica and Il Corriere della Sera – in the last decades (1980-2016).

Through a qualitative analysis of the main journalistic production, the research aims at rebuilding parts of the Italian collective imagination, looking for continuity of representation and breaking points.

Estimating the Prevalence of Honor-based Violence: The Utility of Media-sourced Databases

Mariel McKone Leonard, Cynthia Helba, Theresa Koenig

University of Mannheim, Germany; Westat, USA; Westat, USA

mleonard(at)mail.uni-mannheim.de,

mleonard(at)mail.uni-mannheim.de,

mleonard(at)mail.uni-mannheim.de

Honor-based violence (HBV) is an extreme form of gender violence in which violence is used as a mechanism to maintain or restore a family's honor by intimidating, punishing or killing individuals, most frequently girls and women, whose actions are considered improper or disobedient. HBV is difficult to track and measure because victims rarely contact law enforcement officials or service providers. And, as HBV occurs across many cultures, religions, and ethnicities and involves an array of threatening behaviors and acts of violence that are connected only by the motive of maintaining familial honor, it is not readily profiled as a form of violent crime. Surveying or otherwise directly measuring the experiences of victims of honor-based violence are thus tremendously challenging and potentially dangerous, meaning that the majority of information currently available about HBV is qualitative, rather than quantitative.

This paper is part of a series exploring the use of media-sourced databases for honor-based violence surveillance. In this paper, we will introduce the use of capture-recapture as a means to statistically estimate the prevalence of honor-based violence. We will do so using two databases that describe characteristics of German honor killings: a 2010 study conducted by Oberwittler and Kasselt for the German police, which found 78 honor killings between 1996 and 2005; and, the website Ehrenmord.de (<http://ehrenmord.de>) which tracks honor killing cases reported in the media as far back as 1981. We will discuss the characteristics of these source databases as well as efforts toward making a translation of the databases available for non-German speaking researchers. Additionally, we introduce limitations inherent in using media-sourced databases, which have implications for the surveillance of honor-based violence.

RN33 | Session 07a Gender and the Global Care Chain

Care, Time and Labour: Economic and affective surplus value in global care chains

Lena Margareta Näre, Elisabeth Wide

University of Helsinki, Finland; University of Helsinki, Finland

lena.nare(at)helsinki.fi, elisabeth.wide(at)helsinki.fi

There is a rich international literature that uses the concept of global care chain coined by Hochschild in 2000 to analyse the ways in which care has become globally commodified. Hochschild argues that emotional surplus value is transferred along the care

chain. The original conceptualization has been developed further, but what has been somewhat overlooked is an understanding of the implications of Hochschild's move away from the notion of surplus value as economic, rather than emotional, profit. We argue that in order for the global care chain-concept to maintain its explanatory power in illuminating the demand for outsourcing child care within contemporary societies, even in countries with extensive child care provision, we need to analyse the ways in which economic surplus value is transferred along the chain. The analysis requires a move away from descriptive accounts of global care chains, focusing on supply, towards analyses of what drives the demand. Such analysis accounts for classed lifestyles and understandings of good care, parenting and relationships, as well as the welfare, employment, gender and migration regimes. Drawing on an empirical case study of Finnish employers of child care workers, we analyse the value of time and its different dimensions. Further, we develop the concept of affective surplus value in order to go beyond the idea of emotions as individual forces to emphasise the relational production of affects in care work. In sum, we analyse the ways in which economic and affective surplus value are entangled in global care chains under contemporary capitalism.

Traveling Ukrainian Egg Donors as Precarious Labor Migrants

Polina Vlasenko

Indiana University Bloomington, United States of America

pvlasenk(at)umail.iu.edu

Anthropological research in different settings suggests that the globalization of assisted reproductive technologies (ARTs) and "reproductive tourism" associated with it reinforce global and local inequalities. In particular, scholars have demonstrated how class, gender, racial and national hierarchies are reproduced by the growing tendency in the North America and Western Europe to offshore egg donation beyond their borders. The present study is the first to analyze the transnational practices associated with the emergence of Ukraine as a new market of reproductive materials and bioavailable workers oriented specifically toward (West) European purchasers. In this paper I discuss tissue donation as a new form of embodied and intimate care work, as well as a form of trade in bodies of economically disadvantaged women. On the one hand, rich scholarship has shown how the neoliberal restructuring of economy results in the emergence of the transnational feminized service industries, such as domestics, nurses, wives, and sex workers. On the other hand, reproduction also becomes repositioned within capitalist mode of production when biomedical technologies are developed to extract latent value implicit in human biological products and processes through inducing their vital self-reproducing properties for the purposes of profit. The process of recruiting egg donors from the underprivileged sectors of society

to intensify vitality of wealthy consumers from across the world reveals how this valorization process relies on an unacknowledged reproductive labor force exposed to unpredictable risks of medical interventions. This paper analyzes the reproductive travel of the Ukrainian egg donors who participate in international egg donation arrangements as a form of gendered labor migration that becomes a refuge for precarious populations of women. It is based on the interviews with 7 egg donors from Ukraine who travelled to India, Thailand, Nepal, Georgia, and Russia to donate eggs for the international recipients. Their economic conditions force them to embody desirable reproducers and travel across borders of nation states to sell their eggs to the international couples and, thus, utilize their fertility, whiteness and beauty as valuable assets to be exchanged for money. This paper documents multiple forms of non-recognition they encounter, including the neglect of their health, feelings, and bodies. It aims to explicate the ways in which transnational egg donation (re)produces particular formations of the global political economy that exercise control over the labor of Ukrainian egg donors through attaching them to the broader context of social differentiation, exclusion and inequality. By exploring the ways in which embodied intimate labor of Ukrainian egg donors is rendered precarious, this study will demonstrate how capitalism mines workers in the marginal spaces and makes the economic, political and social conditions on which they depend uncertain.

'I'm not really looking at myself as staying here in the care home forever' - Migrant care workers' strategies of resistance and adaptation and agency in dealing with complex belongings'

Georgia Spiliopoulos

University of Nottingham Ningbo China, China, People's Republic of

joy.spiliopoulos(at)nottingham.edu.cn

This paper examines strategies of resistance and adaptation and agency of Filipino nurses who have migrated to the UK or who are considering repeat migration after returning to the Philippines in the current climate of the global financial crisis and rising anti-immigrant sentiment. Drawing on the work of feminist and migration scholars such as Collins and Bilge (2016), Ehrenreich and Hochschild (2003), Fraser (2014), George (2005), Kingma (2006), Parreñas (2001, 2005, 2008), Skeggs (2004), Yeates (2009) and others on 'global care chain' and on social inequalities connected to race, gender and class, we provide a critical discussion on the migration, social mobility and settlement of mainly female, highly skilled migrants from developing to developed countries. We present some of our findings from two different countries and time periods: rural northern England between 2008-2010 and the Philippines in 2016. While the Philippines is one of the major 'exporters' of health care workers on a global scale, the aftermath of the 2007-2008 global financial crisis has and continues to impact Filipino nurses' trajectories.

Qualitative research methods – ethnographic observations and semi-structured interviews – and data analysis – thematic and narrative analyses – revealed some common themes between the participants in both contexts, such as (im)mobility, return, settlement and a sense of precariousness and uncertainty. Despite their challenges and pressures, they used their own agency in dealing with these everyday tensions and complex belongings. The case of Filipino migrant care workers highlights broader issues of social justice and of redistribution, recognition and representation for female migrant workers.

Transnational adoption as a global care chain: the making and unmaking of families

Riitta Anneli Högbäck

University of Helsinki, Finland

riitta.hogbacka(at)helsinki.fi

Although transnational adoption has rarely been investigated in the context of global care chains, it clearly fits the definition of such chains provided by Arlie Hochschild. According to her, global care chains refer to 'a series of personal links between people across the globe based on the paid or unpaid work of caring' (Hochschild 2000, 131). My paper looks at both ends of the chain: it identifies not only the happy occasion when a family gains a child, but also the sorrow and loss of the child to its family of origin. I address questions related to the dynamics giving rise to both the adoption and the relinquishment of children, and their interrelations. I also investigate actual contacts between adopters and birth mothers. Transnational adoption is firmly situated in the context of the Global North-South divide and linked to global inequalities and colonialities of power. The paper is based on my recent book entitled *Global Families, Inequality and Transnational Adoption: The De-Kinning of First Mothers* (Palgrave Macmillan), for which I interviewed 30 Finnish adopters, 35 South African birth mothers and 10 South African adoption social workers. I focus specifically on adoptions between Europe and Africa, as in the current climate of declining numbers of 'adoptable' children the Global North increasingly turns to Africa as a provider of children. Juxtaposing the narratives of the differentially positioned mothers, I illustrate how the practices of transnational adoption may not only reproduce but also change the structures that gave rise to them.

RN33 | Session 08a Gender and the Refugee Movements

Media Portrayals of Unaccompanied Child Refugees - Exploring the security/migration nexus through the gendering and racialization of risks in Sweden.

Katarina Giritli Nygren, Anna Olofsson, Susanna Öhman

Mid Sweden University, Social sciences, Sweden; Mid Sweden University, Social sciences, Sweden; Mid Sweden University, Social sciences, Sweden

katarina.giritli-nygren(at)miun.se,
anna.olofsson(at)miun.se, susanna.ohman(at)miun.se

The aim of this paper is to develop a theoretical understanding of how the discursive construction of risk in relation to the migration/security nexus is entangled with processes of othering. Within the Swedish discourse about unaccompanied refugee minors, and its relation to masculinity, racism, and nationalism, risk framing practices are playing a central role. In the Swedish context the word 'immigrant' is frequently discussed in terms of risk, and is often associated with discourses of integration, segregation, and 'Outsiderhood', especially for people with an origin in Asia, the Middle East, and Africa. This type of discourses act through moral norms; however, the imperative of security measures as a response to risk is carried out in relation to collective subject positions of dangerous 'others' and/or (un)precarious lives.

Drawing on Hunt's argument (2003) about the hybridity of moral discourses and discourses of risk, we argue that morally infused discourses of risk are central in order to understand the migrant/security nexus, used as a means to create difference and distinction. By analysing how risk is intertwined with the processes whereby age, gender and race, are constructed in relation to unaccompanied child refugees our analyses show how logics of risk are intersecting with discourses of the immigrant to produce a particular framing of these children as 'at risk' and/or 'risky'. Unaccompanied refugees (boys) are constructed as potential threats, as terrorists among other things, while unaccompanied girls are seen as at risk of being abused among other things. The migrant/security nexus has specific gendered conceptions that gives rise to particular strategies designed to profile and manage those labelled as 'risky' and at risk which also reproduce the racist formations in the Swedish society.

Educating the male Other? Negotiating gender and difference in socio-pedagogic projects for male refugees in Austria

Paul Scheibelhofer
University of Innsbruck, Austria
paul.scheibelhofer(at)uibk.ac.at

In Austria, as elsewhere, the media and political discourse on refugees has recently become increasingly negative. In these debates, it is particularly young male refugees who are deemed problematic and in need of discipline and education. Against this backdrop, the proposed paper analyses how masculinity and difference are negotiated in the context of socio-pedagogic projects aimed at young male refugees.

The paper presents data from a qualitative research project which studies motivations, notions, experiences and reflections of professionals and participants of selected pedagogic projects for young male refugees in Vienna, Austria.

Integrating theoretical approaches from masculinity

studies, postcolonial theory and critical pedagogy, the paper asks, how dominant gendered and racialized representations inform these pedagogic projects but also, in how far these projects can be sites for emancipation, empowerment and help overcome dynamics of exclusion.

RN33 | Session 09a Gender in Imagery and in Everyday Practices

'Kitten Heels': Everyday Footwear Practices and Cultural Representations of Public Femininity

Victoria Robinson
University of York, United Kingdom
vicki.robinson(at)york.ac.uk

Within the study of beauty and fashion cultures, footwear, as both a discursively constituted symbol of particular types of femininity and as an everyday embodied practice, has hitherto been a neglected area of study (see Robinson, 2013). Data from a recent three year UK ESRC case study on footwear, identity and transition, revealed the gendered choices, practices and performances by the male and female shoe-wearers in the study, in family, leisure, work, and relationship sites. The 'doing of gender' as female participants transitioned across and within these spheres, revealed much, for example, about how femininity and women's identity is constructed, normalised, resisted and transformed (see Robinson, 2015).

The concept of aesthetic labour is currently being used as a way to explore and conceptualise how employers control embodied work practices, through employees being expected, implicitly or explicitly, to adjust their looks or personal persona in order to present a desired occupational image. However, here, by attempting to refine this concept, I expand on the project's earlier insights around women's shoe practices through a case study of the much debated and cultural representation of UK Prime Minister, Theresa May's, historic choice of 'kitten heels'. This story made global media headlines again in 2016, when she was urged by trade unionists to wear 'flats', so that women did not feel compelled to wear potentially damaging high heels to work. Thus, I argue that a consideration of femininity, footwear, and transition across both public and spheres, allows for cultural representations of a 'public', political femininity, to be both deconstructed and challenged.

The Portrayal of Women in the news: an analysis of Portuguese print media

Maria Joao Cunha, Carla Isabel Cruz
University of Lisbon / ISCSP/ CIEG, Portugal;
University of Lisbon / ISCSP/ CIEG, Portugal
mjcunha(at)iscsp.ulisboa.pt, ccruz(at)iscsp.ulisboa.pt

Given feminist role in society, on the one hand, and women increasing participation in public life at all levels on the other hand, it should be expected that news items reflected the same participation level and promoted a general idea of gender equality. Drawing

from the idea that representation, and especially media representations, constitute a normative function of the language that reveals or distorts what is taken as true about gender issues, our approach combines a quantitative content analysis with qualitative discourse analysis to explore the way women are being portrayed in Portuguese print media.

Media's capacity of setting the agenda has been affecting the construction of a certain vision of the world and although digital media have been developing its audience coverage, people still turn to print media to deepen their knowledge on news facts. Content analysis is designed so as to characterize the relevance and highlight of news on women, but also reading how protagonists are characterized, news sources, to whom main "voices" in the news belong and news direction. Discourse analysis focuses on major arguments for a positive or negative direction in the news. Our corpus of over 5300 news items comprehends major print media in Portugal, including daily and weekly newspapers and information magazines for a whole one year period (2014).

A deeper knowledge of media representations as social outputs on women's role may contribute to rethink activist strategies and academic stances.

The Role of Gender in Active Ageing: a Literature Review

msat(at)polsoc.uc3m.es,
roci.schettini(at)cchs.csic.es,
mgomez(at)polsoc.uc3m.es

Introduction: Active ageing is the process of optimizing opportunities for health, participation, security and

learning in the course of life, in order to enhance quality of life as people age. In this model, gender is a cross-cutting determinant for understanding and promoting active ageing (WHO, 2002; Faber, 2015). The sociologist Arber and Ginn (1995) pioneered the contribution on the relationship gender/ageing.

Objective: To analyze differences in active ageing, from a gender perspective, considering the dimensions established in its definition: health, participation, security, long life learning, and other dimensions where elder women are major participants, e.g. caregiving.

Material and method: Scientific literature as well as public policies documents will be reviewed to analyze the role of gender in active ageing and in other frameworks of ageing (healthy, productive, successful, positive,...). A bibliographic database developed by the authors will be used, with references dated between 2001 and 2016. Content analysis will be applied using Atlas.ti program.

Results: Negative characteristics of ageing in the group of women (living more years in solitude, with poorer conditions in the dimensions of active ageing) could drive to results that corroborate a worse active ageing. In addition to the influence of the variable sex, the gender dimension (social perception of the older adults, roles attributed according to sex ...) can also introduce relevant differences among women vs men in their active ageing.

This proposal underlines the need of evaluation, and conveys the existence of the gender gap by considering social factors in the context of active ageing.

RN33 & RN34 | Session 11a JOINT SESSION: (Un)Making Europe: Religion and Gender

Multiple agencies and in/visibility of British Muslim women

Hengameh Ashraf Emami
University of Northumbria, United Kingdom
hengameh.emami25(at)gmail.com

This paper will offer an insight into intergenerational identities of British Muslim women in two cities of Newcastle-upon-Tyne and Glasgow. Multi-sited ethnographic research will explore in/visibility of Muslim women in post secular space in Britain. Therefore, the politics of inclusion and exclusion will be examined through research participants in this studies. Oral History interviews were used to interview thirty research participants to explore multi-dimensional of identities of Muslim women with diverse backgrounds. The fluidity of identity will be examined through intersection of gender, ethnicity and religion in intergenerational context. The paper will discuss the dynamic of agency is influenced by knowledge and Self actualisation. A double consciousness emerged through the narratives in the research and explains the relation between knowledge and gender autonomy. Muslim women's agency and its complexity due to the geopolitical situation in Europe have significant impact on constructing and

reconstructing identities. This paper explores multiple agency of Muslim women through veiling and unveiling in intergenerational context. It will illustrate the intersectionality of ethnicity, gender and religion and explore the ways that British Muslim women create 'safe space' in a secular space. Thus paper will provide a critical insight on British women who identified themselves as Muslim.

Is religion a feminist issue? The Italian Burkini debate.

Elisa Rapetti, Caterina Peroni
University of Milan, Italy; University of Padua, Italy
rapetti.elisa(at)gmail.com,
caterina.peroni(at)gmail.com

The use of Burkini by Islamic women during the Olympic games in Rio and the ban on its use in several French municipalities were relevant issues of the European and Italian summer newspapers and blogs editorials concerning women's freedom and the relationship between secularity and religion. This reveals that the women's body is still the cultural and political battlefield of the conflict between secularism, neo-fundamentalisms and different perspectives of feminism.

Focusing on the current feminist debate, the paper analyses the different opinions emerged after the publication of an interview on the Burkini ban to Lorella Zanardo, a popular feminist blogger engaged in the critical analysis of women's representation in the mass media. Zanardo agreed with this prohibition in the name of women's freedom and secularity, provoking a relevant number of reactions of feminist journalists and experts in gender issues and women rights.

Following the Critical Discourse Analysis methodology, we analysed 25 articles published in different Italian feminist and women blogs, websites and online journals, which are exemplary both for the public recognition of the authors as feminist exponent, and for the diffusion of the articles in the social media. From the analysis emerge two main positioning, one reproducing a neo-colonialist rhetoric and one moving from a post-colonial perspective. Despite their different perspectives, they share, meaningfully, a common secularistic frame, both removing religion from women's agency issues.

Women's Migration and Gender Empowerment? The Case of Polish Religious Activists in Belgium.

Sylwia Eliza Urbańska
University of Warsaw, Poland
urbanskas(at)is.uw.edu.pl

Since the late 1980s there has been a growing interest in women's migration, which led to the emergence of intersectional analysis as a main focus of gendered studies of mobility. However, intersectional research of global migration processes rarely includes the analysis of religion in the experience of migrants, not asking about the possible role of religion in the gender revolution and sources of

empowerment. Studies focus primarily (and often only) on the gendered division of care work, new forms of maintaining transnational families, and caring for children from abroad.

In the presentation I will show that the inclusion of religion in the analysis helps to answer in a more complex way, how the shifts in gender roles during the process of migration takes place in conservative communities. Thus, the main aim is to answer the question of which gendered patterns of social practices of migrant women (in relation to the men) are produced and reproduced in the organizations of the Polish Catholic Mission in Belgium. The starting point for analysis is the assumption that the high level of secularization and egalitarian gender regime in Belgium (Global Gender Gap ranking) seem to support the more egalitarian perception of the role of women in the religious organizations in this country in comparison to Poland. Therefore, I would like to discuss the impact of different environment – the socio-cultural context of pluralistic and multicultural Belgium – on construction of gender patterns and practices in a religious organization.

Mobilization of masculinity in the religious and transnational contexts. Gender practices of men in the parishes of Polish Catholic Mission in England.

Katarzyna Leszczyńska
AGH University Science and Technology, Poland
kaleszcz(at)agh.edu.pl

The main aim of the paper is to answer the question of which patterns of masculinity are produced and reproduced in gendered practices of men, involved in the varied religious groups in the organizations of Polish Catholic Missions (PCM) in England. In my presentation I place particular emphasis on the experiences of lay men and clergymen involved in the religious groups of "The Men of St. Joseph", very active community in parish organizations of the PCM, oriented on the mobilization of the traditional and conservative patterns of masculinity.

The masculinity patterns in religious organisations of PCM needs to be sought as a social institution; it means that it acts as restriction and facilitation to social actions and manifests itself through formalized as well as non-formalized rules, social practices and their interpretations through social actors. These rules within the social institution are isomorphic. This implies that they depend on the environment which constitutes the context for the functioning of that institution of masculinity. I interpret these patterns of masculinity as dependent on the institutional context – position of laity and men in the Church structures in Poland and England context, access to resources in the Church institution and relation of the Church structures with cultural, religious and social environment. Particularly important in the paper is issue of renegotiation of institutional rules on masculinity in the context of transnational relations.

The paper is based on the results of qualitative research: especially 20 in-depth interviews with

biographical elements which I carried out in January 2017 with religiously active lay men and clergymen involved in migratory organisations of Polish Catholic Mission in England.

Identity Experiences of Kurdish Alevi Women in the Public Sphere of Turkish Society

Seçil Aslan

Galatasaray University, Turkey

secila(at)sakarya.edu.tr

Although Turkish society includes different religious and ethnical identities, for the Turkish state the national identity is formed as ethnically Turkish, religiously Muslim and sectarian Sunni. Therefore, the first reflex is to repress, discriminate and assimilate non-Turks, non-Muslims and non-Sunnis in case of potential harm against national unity. However, despite this official unrecognition; people can feel differences and can easily develop discriminative attitude to "others." Hence, in the public sphere although the main attitude is assimilation; people have tendencies to dissimilate the differences. Gender could also be taken as a discriminated identity and we can call women as subaltern groups in a patriarchal society.

In this situation, what is the meaning of being Kurdish Alevi women in patriarchal Turkish Sunni society? They belong to a minority group both in terms of their religion and ethnicity and might be discriminated in triple ways (ethnicity, religion and gender). Taken as a minority of minority group; they are different from Turkish Sunni community, Turkish Alevi community and Kurdish Sunni Community and they have strategies against Kurdish and Turkish (Alevi) men. This study aims to analyze one subaltern identity (Alevi identity as religion) within the other (ethnicization of it as Kurdish Alevism) with a reference to gender-based discussions (how women experience it). Focusing on relation between society-individual, society-inner communities and inner dynamics of community in terms of "inclusion" and "exclusion"; it investigates whether one of these identities can be the most visible one in the case of co-existence/intersection of identities and understands whether we can take gender as signifier identity which intersects others.

N34 - Sociology of Religion

RN34 | Session 03a Perspectives on Secularisation and Public Religion

Religion and Religiosity in Death Announcements, 1950-2009

Murat Ergin
Koc University, Turkey
muergin(at)ku.edu.tr

Rituals around death reflect and reproduce social differences and inequalities. A significant textual space for examining social boundaries in death experience is death announcements. This presentation reports a research project that conducted a content analysis of all (N=296,483) death announcements published in the Turkish daily newspaper *Hürriyet* between 1950 and 2010. For each announcement, 26 variables are coded, ranging from demographic information about the deceased to the characteristics of the announcement, including size, the presence of symbols of cultural capital, religious representations, and definitions of death. The genre of "death announcements" in Turkey is different from "obituaries" in the West as they do not depend of editorial decisions; they are also not indiscriminate lists of all death, and thus contain exclusivity. Results show that: a) the representation of different religious groups in death announcements mirror historical shifts as Muslim groups slowly replace non-Muslims; b) strategies to express religiosity are contingent on social categories, such as gender and religion/ethnicity; c) changes in secular and religious textual strategies are indicative of the culture wars being fought in the country with the rise new, more conservative and religious, middle classes.

There is no educational secularisation

Simon Gordt
University of Bamberg, Germany
simon.gordt(at)uni-bamberg.de

The formation of national education systems during the 19th century marks the beginning of modern schooling in Europe (Green 1990). Originally, education was part of the churches domain for centuries (Davie 2000) but became a fundamental feature of the modern state (Mann und Schinkele 2005). Because "the religious and the secular are inextricably linked throughout modern European history" (José Casanova 2009, 227), the educational institutionalization must be considered as part of a

general secularisation (cf. Wilson 1982; Berger 1973). In a comparative-historical perspective this paper will analyse the religious influence on modern schooling and will inquire to what extent the religious impact differs within the school systems. Finally, this analysis offers a typology of the Western European school systems based on their degree of secularisation.

Secularisation is defined as a multi-dimensional concept (Casanova 1994) and will be used in an institutional perspective, i.e. secularisation refers to a decrease of religious authority (Chaves 1994). I argue that together the three dimensions' administration, religious education, and private schools are capable to captures the change of religious authority in the educational field.

Historically, the main dimension administration dominates the other two because the state replaced the churches from their responsibility eventually. Therefore, the secondary dimensions', religious education and private schools, determine the differences of each path of institutionalization.

That leaves logically five potential types which illustrate the different degree of educational secularisation and which form a continuum from a confessional school system to a secular school system. Between those two poles three types are possible which are a combination of the two secondary dimensions, and which display different paths of educational institutionalisation differentiated by their degree of secularization.

Is Secularization Bringing back Religion? A Public Policy Analysis

Fabio Bolzonar
Fudan University, China, People's Republic of
fabio.bolzonar(at)cantab.net

The process of secularization has contradictory outcomes. Although it provokes the declining religiosity of people and weakening authority of churches, it also leads a minority of the population to rediscover the reasons for its faith and promote religious values in the public sphere in largely secularized societies. This paper studies this return to religion from a public policy perspective by investigating the impact of Catholic values and French Catholic-inspired organizations on two key policy questions that have recently occupied a prominent space in the political agenda in France: housing policy and gay marriage. By integrating the theories of secularization with the conclusions drawn from public policy analysis and social movement studies, this paper individuates two paradigmatically different scenarios through which religious regain a greater role in the public sphere in post-secular France. The first one is characterized by greater cooperation between Catholic-inspired actors and public authorities. The increasing social engagement of Catholic associations promotes the establishment of new forms of collaboration between public authorities and religious-inspired groups in the interest of citizens, particularly the most socially vulnerable, and with the aim of strengthening social cohesion. The second scenario is

defined by the re-emergence of strong ideological conflicts between state authorities and religious-inspired actors. In this case, Catholic-inspired social movements and public authorities do not recognise the full legitimacy of the other, their contrasts can provoke the reactivation of past social cleavages and single-issues movements can become the agents of anti-system politics.

RN34 | Session 04a Theoretical Approaches and Applications

Multiple Religiosities, Entangled Modernities, and Gender: What is different about gender across religious cultures?

Heidmarie Winkel

University of Bielefeld, Germany

heidmarie.winkel(at)uni-bielefeld.de

In this contribution religion is introduced as a social sphere that mirrors and seizes on basic cultural gender codes like any other social field. In this perspective, religion is understood as a part of the social life-world structured by a commonly shared system of social categorisations and typifications. Consequently religious agents experience and act in the religious sphere according to these general patterns of cultural meaning as they do in any other parts of their life-world. Against this background it is possible to approach the worldwide plurality of religious gender sociality in a distinct way. Accordingly, I focus on a selected theoretical approach: Following Shmuel Eisenstadt's multiple modernities paradigm I conceive the plurality of religious gender cultures as expression of multiple religiosities embedded in varying structural and institutional environments. Theoretical key dimension is the cultural frame of basic cultural codes. The central question is how far allows the multiple modernities perspective an approach to cultural comparison in a gender conscious way and how can we conceive of multiple religiosities as gendered social realities in this regard? These questions concern the epistemological question how to include contextually contingent historical experiences and cultural backgrounds. Empirically, I relate to selected discourses on gender relations in Arab-Muslim societies against the background of the European bourgeois gender philosophies based on dimorphism. Additionally, Islamic Feminism is considered as a third case of multiple gendered religiosities.

Is Francis Effect Real? - Analyzing the Pope's impact on the US debates on homosexuality

Varvara Chinenova

University of Bremen, Germany; Paris 8 University, France

varvara(at)uni-bremen.de

Pope Francis became the first Latin American head of the Roman Catholic Church and he proclaimed his aim to unite people and to promote world peace. He also became known as the first gay-friendly Pope,

provoking a lot of discussions in both conservative and liberal circles. Mass media literally made a sensation of him, calling him a phenomenon, a mystery and a revolution. In the present paper, the author has a closer look at the Pope's views on homosexuality and same-sex unions, to find out whether or not they influenced the US debates on the topic. After a short overview of the situation of Roman Catholics and LGBT movement in the USA, the author chronologically analyses the main mass media reports and the Pope's quotes on homosexuality and same-sex unions. Using frame theory introduced by Goffman (1974), the author shows how Pope Francis framed the main ideas that he wanted to drive people's attention toward. The Pope's influence on the US debates on homosexuality is then studied with the help of Google Trends, Google Adwords, as well as mass media analysis. The author shows that the Pope created a powerful gay-friendly frame which had a positive effect on the debates. The paper also suggests that Francis' frame had great symbolic value as it showed that the Church is ready to start over a conversation about the place of gay people in the Catholic world.

With God on Our Side: the Casualties of Religion in Welfare Capitalism

Tina Magazzini

University of Deusto, Spain

tina.magazzini(at)deusto.es

In 2014, a United States landmark decision by the Supreme Court of Justice allowed closely held for-profit corporations to be exempt from providing certain types of healthcare (such as contraception and abortion) based on their (alleged) religious beliefs. Possibly, the most interesting feature of the *Hobby Lobby v. Burwell* sentence was that it interpreted the Religious Freedom and Restoration Act (RFRA) in such a way as to consider closely held corporations as 'persons'. It is noteworthy that "closely held" corporation defines the number of stakeholders, not the size of the company, which in practice means that this can apply to very large corporations, and because of the economic consequences that this entails, the issue of the difficulty of ascertaining the "religious beliefs" of the corporation is all but irrelevant. A third relevant characteristic of the United States' Supreme Court ruling is that it disregards the fact that its implementation affects disproportionately female employees over male employees. This paper proposes to carry out a mapping of different regulatory frameworks in Europe, Canada and the United States in which religion is an important (albeit not always explicit) component of capitalism. The focus is on the repercussions of religiously based claims brought forward by private companies on their employees, with special attention given to the gender dimension of such repercussions. I attempt to situate the mapping of the effects of religiosity in (or rather 'of') the workplace in Esping-Andersens' influential *The Three Worlds of Welfare Capitalism*, from a 'religion as market' and 'market as religion' perspective.

Accounting for “Religious Emotions” and Possibilities for Affect in Studying Religious Traditions

Nur Yasemin Ural
Freie Universität Berlin, Germany
nur.ural(at)fu-berlin.de

In recent years increasing importance started to be given to moral injury as a conceptual tool with the aim of understanding and potentially preventing the non-physical injuries that are caused by insult, hate speech and defamatory utterances. Within the framework of the boosting scholarly attention, the injury of the “religious emotions” (and/or feelings) occupies a particularly privileged position due to its capacity to trigger massive controversies within the public sphere. It is therefore commonplace to refer to religious emotions of individuals or groups not only in the public debates but also in the scholarly and legal spheres. But what is actually implied with religious emotions within the actual context? In this paper I will try to scrutinize the dominance and the assertion of certain understandings of “religious” and “emotion” and demonstrate that historical development of their coupling with respect to other relevant concepts such as self-reflexivity, consciousness as well as rationality. I will therefore refer to the concepts of emotion and feeling not as tools of analysis but as products of their epoch utilized by the scholars, thinkers and theologians alike in order to comprehend these usages, which contribute to the construction of a historically specific conception of religion and of sensing self. I will then try to seek recent theoretical alternatives to this scientific narrative on feeling/emotion and religion in light of affects studies, while trying to posit the strengths and weaknesses of the affect studies concerning religion through the example of the political implications of an affect-based research on religion in the specific context of German Muslims.

RN34 | Session 05a Religion, Integration and Solidarity

Iconic multi-religious buildings and the politics of collective memory in Europe

Mar Griera, Marian Burchardt, Avi Astor
Universitat Autònoma de Barcelona (UAB), Spain;
Max Planck Institute for the Study of Religious and Ethnic Diversity; Universitat Autònoma de Barcelona (UAB), Spain
mariadelmar.griera(at)uab.cat,
burchardt(at)mmg.mpg.de, avi.astor(at)uab.cat

This paper investigates the histories, memories and projected futures of interreligious encounters attached to emblematic multi-religious buildings. Empirically, we focus on two such buildings: the Mosque-Cathedral of Cordoba and Berlin’s House of One. Although the two iconic structures vary significantly in a number of respects, they both symbolize plural religious heritages, and are presented as models for “political pedagogy” (Mukerji, 2012) that conjure particular

visions of the past while also offering specific imaginaries for possible futures. Both structures have also been subject to controversy in recent years, as a range of actors have questioned the framings, meanings and practices that underpin their celebrated status as symbols of interreligious dialogue and coexistence. This paper provides insight into how notions of religious diversity and multi-religious coexistence are materially represented, shaped and contested around controversies over multi-religious iconic buildings.

An Ecological Perspective for Exploring the Integration-Radicalization Nexus

Fabio Introini, Giulia Mezzetti
Università Cattolica del Sacro Cuore, Milano, Italy;
Università Cattolica del Sacro Cuore, Milano, Italy
fabio.introini(at)unicatt.it, giulia.mezzetti(at)unicatt.it

The phenomenon of jihadist radicalization has gained center-stage in public debates around the integration of Muslims in Europe, as it raises the issue of the motivations driving young people - who are overwhelmingly of immigrant descent - to adhere to Jihadism, questioning the process of migrant integration and the treatment of Muslim minorities in Europe. It appears that socio-economic integration can only partially explain the success of Jihadism; more profound fractures linked to Muslims’ “symbolic integration” (Césari, 2015), i.e. how they are accepted and perceived by European receiving societies, better account for the success of this form of violent extremism. The literature agrees that it is impossible to identify the “profile” of would-be jihadists; it also seems hard to define univocal “pathways” or “models” of radicalization (McCauley & Moskalenko, 2008). Based on Latour’s Actor-Network approach (2005), we contend that an ecological perspective is well suited for grasping the appeal of the “jihadist endeavour”, whose “plausibility” emerges from the empirical analysis of a number of biographies and first-person accounts that we carried out. This allows us to disentangle apparently contrasting evidence: on one hand, identitarian cleavages occurring in European societies (e.g. in France or Germany), which result in the spread of Salafist countercultures (specularly reflected in the growth of fierce anti-Muslim sentiments); on the other, the in-existent or very low levels of religiosity frequently reported in the accounts of jihadists’ lives, which also include people with no Muslim or migrant background.

The impact of Interactive Groups on creating interreligious friendship ties and reducing prejudices

Roger Campdepadros, Lena de Botton, Ana Burgues
University of Girona, Spain; University of Barcelona, Spain; University of Barcelona, Spain
roger.campdepadros(at)udg.edu,
lenadebotton(at)ub.edu, ana.burgues(at)ub.edu

This communication presents some outputs of the research “Multicultural laicism and the management

of religious diversity within educational spaces” aimed to identify those conditions under which the educational community can develop interactions that would decrease prejudice and foster coexistence within a multicultural, multiethnic and multireligious context. Intolerance, aversion and rejection towards religiosity and some religious minorities as Jews and Muslims in Europe keep on the spotlight, as they increase in certain contexts as economic recession, international geopolitics and the rising of populist politics. We are living several of these contexts, and the management of the diversity is clue to revert or to increase all of these exclusion forces. So we focus our analysis in the management of the diversity in two schools that implement Successful Educative Action as Interactive Groups, which provides the conditions in a multicultural context under which interactions can reduce prejudices and foster coexistence, so promoting the interreligious dialogue and reducing conflicts. The analysis revealed that conditions as egalitarian dialogue where solidarity, equality of differences and the arguments validity prevail allow the development of friendship ties among students, teachers, families and volunteers that are clue in reducing prejudices.

Religion and the Matter of Solidarity

Dick Houtman, Anneke Pons- de Wit
 KU Leuven, Belgium; KU Leuven, Belgium
 Dick.Houtman(at)kuleuven.be,
 Anneke.PonsdeWit(at)kuleuven.be

The Durkheimian tradition in sociology understands religion as a major source of solidarity, celebrating what people have in common to mark and re-affirm moral group boundaries. Nonetheless, processes of religious privatization and religious change have often been understood as resulting in individualized religious outlooks that are basically incapable of forging and sustaining moral ties. In this paper, we will challenge this assumption that individualization goes hand in hand with an erosion of solidarity.

Our argument is based on biographical interviews with 10 ecumenical and 10 conservative Protestants in the Netherlands. While ecumenicity proves indeed individualized and open to religious diversity, the interlocutors who identify with it do nonetheless embrace and appreciate solidarity. This solidarity differs from its conservative Protestant counterpart, however, because whereas the latter foregrounds a narrowly defined conservative in-group, the former embraces a wide range of religious and non-religious others. These differences can be traced back to the religious creeds of the two groups, not least their different understandings of the divine. Unlike conservative Protestants, those who identify with ecumenicity conceive of the divine as immanently situated in social relationships rather than as a transcendental personal God. In doing so, they reject the notion of a particularistic in-group of ‘true believers’, which gives rise to much further-reaching understandings of solidarity.

What our findings demonstrate, in short, is that

religious individualization and privatization cannot simply be taken to entail an erosion of solidarity, but rather signify a transformation of solidarity, with extended in-group boundaries replacing narrowly defined particularistic ones.

RN34 | Session 06a Religion and Rights

Athens, Jerusalem and China: Rationalism and Nationalism in Contemporary Chinese Intellectuals’ Conversion to Christianity

Chen Jiang
 School of Government, Nanjing University, China,
 People's Republic of
 jiangchenpoli(at)163.com

Based on in-depth interviews and participant observation conducted in Nanjing, China, this article develops a model which incorporates macro and micro level explaining factors of contemporary Chinese intellectuals’ conversion to Christianity. The author argues that the supply-side theory cannot fully account for the conversion of Chinese intellectuals, instead attention should be paid to these intellectuals’ identity struggles over religious belief, rationality and nationalism in the broader social and political context where human rights are violated. The radical anti-tradition ideology inherited from the May fourth Movement, the nationalist discourses and freedom-restricting policies of Chinese Communist Party, and the cosmopolitan tendency of Christianity, join together to mitigate the potential conflict between the Christian belief and the national sentiment. On the other hand, the time-honored moral superiority of Chinese intellectuals and their open-mindedness to unknown things combined to trigger them to abandon rationalism and embrace Christianity. The mutually strengthening effect of intellectuals’ Christian belief and their political stance in the context of an authoritarian political system is also discussed. Additionally, the analysis of the interactions between different identities from an “insider-outsider” perspective also contributes to understanding recent large-scale intellectuals’ conversion to Christianity in China.

Fighting for Religious Human Rights and Democratization in Gray Zone : House Church Study in Current China

You Li, Chen Jiang
 Max-Weber-Institut für Soziologie, University
 Heidelberg, Germany; School of Government, Nanjing
 University, China
 fiona.heidelberg(at)gmail.com,
 jiangchenpoli(at)163.com

Researches on the religion and sociology focus primarily on the spirit and social function of religion but pay less attention to human rights, state power and democratization.

A house church is a label used to describe a group of Christians who regularly gather for worship in private homes. House church is a special kind of organization

in China, which is not controlled by government but under the intensively monitoring of government, placed in the “gray zone” of religious field. Members of house church are mostly intellectuals and middle class.

We conducted field research studies in China to explore the origin, current situation of house church and relationship between human rights and state power within the house church. We interviewed members of house church in Nanjing, China, consciously aimed at the intellectual and middle class members.

Intellectuals and middle class in China have stronger consciousness for human rights, state power and are the mainstream in the society. Interviews with intellectuals and middle class in house church suggest that, relative to seeking for human rights and democracy, house church is the place where people fight for human rights.

Consequently, the form of house church gives intellectuals chances to fight for human rights and fight against unreasonable intervene of state power. House church as a kind of religious organization will witness and promote the procedure of democratization in China.

The Gülen-Movement in Germany – A Religious Movement within Transformation of the Welfare State, Discrimination and Social Inequalities

Thomas Dr. Geier, Magnus Frank, Josepha Bittner, Saadet Keskinilic

Martin-Luther-Universität Halle-Wittenberg, Zentrum für Schul- und Bildungsforschung, DFG-Projekt “Die Pädagogik der ‚Gülen-Bewegung‘”, Germany; Martin-Luther-Universität Halle-Wittenberg, Zentrum für Schul- und Bildungsforschung, DFG-Projekt “Die Pädagogik der ‚Gülen-Bewegung‘”, Germany; Martin-Luther-Universität Halle-Wittenberg, Zentrum für Schul- und Bildungsforschung, DFG-Projekt “Die Pädagogik der ‚Gülen-Bewegung‘”, Germany; Martin-Luther-Universität Halle-Wittenberg, Zentrum für Schul- und Bildungsforschung, DFG-Projekt “Die Pädagogik der ‚Gülen-Bewegung‘”, Germany
 thomas.geier(at)zsb.uni-halle.de,
 magnus.frank(at)zsb.uni-halle.de,
 josephabittner(at)gmail.com,
 saadet.keskinilic(at)stud.ph-karlsruhe.de

The so-called Gülen-Movement is renowned worldwide for its transnational educational network. It was founded in the 1960's by Turkish Muslim preacher Fethullah Gülen in Turkey. Recently, its originating institutions (e.g. universities, schools, centers for tutor-ing, media companies) were closed or nationalized by force as followers of the Movement are suspected to be responsible for the attempted military coup in Turkey. People associated with the network were dismissed or imprisoned. First evidences for a diaspora to the European Union are visible.

Especially in Germany, the movement is highly engaged through children in second or third generation of former “Guestworker-migrants”. Schools

and religious conversation circles in the private sphere were founded to mediate and discuss the networks social-religious message hizmet (Turkish for “service”). Activities specifically become meaningful against the background of educational inequalities and discrimination for Gülen-Movement's mostly addressed clientele. Social inequality in Germany particularly is a topic for Turkish Muslim children. From our point of view Gülen-Movement's activities in Germany emphasize the networks role in a transformed welfare state, which expects readiness and willingness for private initiatives to guarantee social solidarity. Coincidentally they are assisting in structures, which can be described as an ethnicized “quasi-educational market”. This thesis we wish to discuss in our presentation, based on empirical results of our project, which is promoted by Deutsche Forschungsgemeinschaft (DFG).

Islam and ethnicity. The Polish Tartars case.

Katarzyna Warminska

Cracow University of Economics, Poland

kwarminska(at)o2.pl

The interconnections between Islam and ethnicity could be described in the context of different theoretical and empirical reconsideration. In my paper I am going to analyse the processes of permeation of religious and ethnic elements in the case of the Polish Tartars identity project. Being a small Muslim community of immigrant provenance, during their stay in Poland, Polish Tartars have faced a lot of challenges which come from their need to sustain their religious and ethnic separateness as well as to be accepted in their social surrounding.

I will focus my attention on the two main problems. First of all, I will show how religion/Islam has been used as the main ethnic separator in the context of relationships with other Poles and has been functioning for years as the foundation of the feeling of belonging to Tartar community. Secondly, the processes of ethnicization of religion will be discussed. In this respect, I will show how the Tartars/ethnic component of group identity works in social interactions as the factor delineating its religious characteristics. The ethnic character of Islam (called “our own, Tartar Islam”) is an argument used in the context of contacts with other Muslims to communicate both religious affinity and cultural otherness to them. As well as in relations with other country members Tartars Islam is shown as culturally close/familiarized to European culture not, to Muslim one as general. It is a kind of response to current anti Islamic discourse.

RN34 | Session 07a Religion, Migration and the Refugee Crisis**Diversities Reconsidered: Religion, Identity and Belonging of Young Muslim People with Migration Background in Germany**

Vladimir Kmec

University College Dublin, Ireland

vladimir.kmec(at)ucd.ie

The purpose of this paper is to provide a perspective on the identity formation of young Muslim people of Turkish migration background in Germany. While presenting how the second- and third-generation people with Turkish background in Germany perceive their religiosity, ethnicity and nationality, the paper investigates how these young people negotiate the narratives of belonging and citizenship. The paper observes different trajectories of young people's identity formation. Some young people distance themselves from their migration background, while others are passionate about exploring their ethnic and cultural background. Some young people become religiously active and devoted while emphasising their German citizenship. Others embrace secular ways of live while identifying with Islam in ethnic terms at the same time. The paper thus argues that these young people construct multiple and hybrid identities, combining different, and sometimes even contradicting identities, into one. The paper observes that this process of identity formation is influenced by both social and contextual factors, and individual decisions. Young people of Turkish background in Germany seek to overlap their Turkish identity with their German identity, and at the same time their secular lifestyle with their Muslim religiosity. The societal context influences the modes of young people's identification. At the same time, the individual agency of young people in the formation of their identities is equally important; young people decide by themselves who they are - whether and how they identify with Islam, their ethnic background and Germany.

The Heart City. Solidarity as transformative dialogic process between collective actors: the case of the religious movement in Catania

Anna Maria Leonora

University of Catania, Italy

leonora(at)unict.it

From the very beginning of the recent migratory emergency in Southern Europe, catholic religious movements and church public lay associations – as the community of Sant'Egidio – intensified their cooperation involving homologous groups from other confessions and religions [Italian Ministry of Interior 2013; 2015]. This experience fosters many issues about the potential of the bottom-up integration process and cooperation between groups and association belonging to different religion realizing a multi-ethnic and inter-religious community still effective in managing the increasing migration crisis

[Kymlicka 2015].

This work is focused on solidarity dynamics analysis of religious movements activity in Catania between 2013 and 2017 taking as framework of reference the 2017 joint return of solidarity and brotherhood among Christians, Muslims and Hindu of the city. The research design started from the reconstruction of the first-aid presence into the city territory (the Heart City); a campaign of semi-structured interviews to key informants of three main religious movements. The presentation synthesizes results from two work packages, covering a period of activity from 2013 to 2017: 1) First interpretation of archival research providing analytical categories for the further narrative interviews phase; 2) Semi-structured interview campaign administered to the representative members of the religious movements and solidarity associations involved in the process.

One aspect of this peculiar cooperation between religious movements seem to trigger a specific social space of dialogue related to solidarity practices [Ferrante e Zan 1994] managed by different religious movement in Catania, realizing a sort of “elective integration” about this interreligious and intercultural symposium among their members.

The Role of Serbian Orthodox Custom Slava in the Lives of Serbian Immigrant Families in Sweden

Sabina Hadzibulic

Uppsala University, Uppsala Religion and Society

Research Centre, Sweden

sabinica602(at)gmail.com

This paper aims to present an ongoing research dealing with Serbian immigrant families in Sweden and the role religion has in their identity formation. The primary focus is on a unique Serbian Orthodox custom called slava, which, besides Christmas, is one of the most important celebrations in the life of each Serbian Orthodox family. It represents family's annually celebration of its patron saint. The goal is to analyze how slava is practiced and interpreted by Serbian immigrant families in Sweden. Additionally, the ways in which slava affects the identity formation, and the consequences of it for the integration into Swedish society will be analyzed. The two key research questions to be studied are: How is religion entering the lives of Serbian immigrants in Sweden? How is slava custom transmitted and incorporated into Swedish society by Serbian immigrant families? The research is based on in-depth interviews conducted with 15 Serbian immigrant families in Sweden in their mother tongue. In addition to that, appropriate ethnographic work based on observation and participation is done.

Socio-Cultural Relations and (Im)migration in the Greek Orthodox Christian Community in Hatay, Turkey

Sonyel Oflazoglu, Sule Can, Zerrin Arslan, Ugur Akgul

Hatay Mustafa Kemal University, Hatay, Turkey;

Ethnic minorities were recognized as official "minorities" when the Republic of Turkey got established in 1923 through Treaty of Lausanne, which recognized Greeks, Armenians and Jews as minorities. The Greek Orthodox Christians in Turkey are also a substantial part of the country's minority population. Most of the Greek Orthodox Christians live in Istanbul, Dardanelles: Imbros and Tenedos, Adana, Mersin and Hatay. This study focuses on the socio-cultural and political transformation among Greek Orthodox Christians in Hatay by examining social and institutional discrimination in the context of Islamization in/of Turkey.

Hatay, which was annexed by Turkey in 1939, is located on Turkish-Syrian border. Ethnic combinations, demographic characteristics and socio-cultural relations have been transformed after the annexation. Currently, the Greek Orthodox Christians inhabit Antioche, Samandağ, Altınözü, İskenderun and Arsuz districts and their population is approximately 6 500- 7 000. The community's religious practices take place in Arabic and partly in Turkish in recent years due to cultural and linguistic assimilation. Furthermore, this community has experienced several mass (im)migration waves and the community's population has dramatically declined following the mass migrations. All these historical and cultural issues have created new socio-cultural and economic context, strategies and (im)migration. This research aims to determine the community's struggles; strategies to solve current problems, (im)migration patterns since the annexation of Hatay and the impact of the turmoil in Syria on the community.

The qualitatively designed research's data has been provided from in-depth (37) and focus groups (3) interviews with the community members in different ages and observation in these districts between November, 2016 and February, 2017. Data will be analysed using ethnicity and ethnic relations theories.

RN34 | Session 08a Islam in Europe

iERA and the Da'wah Industry in the UK

Mira A. Baz
United Kingdom
baz.mira(at)gmail.com

The question surrounding the role of Islam in modern Europe has been at the center of debates, particularly related to terrorism and political activism. However, the da'wah industry (Islamic missionary work) hasn't received enough academic analysis from a social perspective. This paper addresses this gap through the example of the controversial charity iERA in the British context and its use of Facebook. Its flagship project Mission Dawah has over 1.1 million Facebook followers and has raised up to nearly €1 million

annually from donations and events. I explore how iERA has standardized and monetizes Islamic street proselytism, how it builds solidarity by countering widespread atheist narratives, and how it aims to become a da'wah mass movement. With dozens of inspired groups and collaborations worldwide, it is on its way to achieving this goal. Additionally, iERA occasionally addresses pressing political issues; but while it holds that Islam is compatible with British values, it is also critical of secularism and promotes Orthodox Islam as normative. I argue that, more than a missionary organization, iERA seeks to attract Muslims (and non-Muslims) to a unifying, conservative interpretation of Islam, and gives young Muslims renewed confidence in their faith by showing it to be modern, compatible with science, and relevant. Through encouraging Muslim youths to undertake da'wah, it fulfils in them that urgent need of our times: a sense of greater purpose. In conclusion, by focusing on iERA's work, this paper contributes to a better understanding of the role of the da'wah industry in Europe.

Instant Islam: use of new technologies by second generation Muslims

Viviana Premazzi, Roberta Ricucci
Università di Torino, Italy; Università di Torino, Italy
viviana.premazzi(at)unito.it, roberta.ricucci(at)unito.it

Within a multi-cultural, multi-religious, "wired" society, the use of the Internet for religious purposes has potentially important implications for inter-ethnic and inter-religious relations, policy making and education. Furthermore, Internet has, over the past decade, provided a new platform for religious groups as a new approach and avenue for proclamation, communication and interaction, with both members and non-members of their faiths.

There is an emerging literature on the ways in which the Internet intersects with religious faith, with many scholars postulating that the Internet may have potential significance in altering the conception and the practices of religious faith, in "modernizing" and "decentralizing" element in fundamentalist religions which could potentially undermine them, and promoting secularization.

In this framework, little attention has been paid to the use of social network among second generation-Muslims. The paper will be focussed on how young Muslims living in Italy use Internet, social networks and instant messaging services for developing, managing and discussing their religious belonging and on the effects of this process on the relationship between first and second generation. Their use is in fact transforming religious practices because it can bring to the development of bottom-up interpretations of the Islam, of a kind of "cut and paste" Islam, where people can take according to their religious preferences with the risk of radicalization.

These issues will be discussed using interviews and considering experiences and new practices developed by second generation Muslims in Italy and by Muslim associations online and offline.

Welfare society in crisis - the religious map in change

Irving Palm

Uppsala University, Sweden

irving.palm(at)soc.uu.se

During the last decades the Swedish society has developed into a modern welfare society. A conformity to the global, capitalistic system of the world has occurred. Some characteristic indications are the increased digitization, individualization, marketization and secularization. The country has periodically received refugees from different countries in war and there has also been labour migration. The migration of a large number of people to Europe in recent times has also affected Sweden. Several refugees are coming from Muslim countries in The Middle East and the north of Africa. How is the population looking at this new situation? How do they experience the meeting with people with another religious and cultural background? Islam has gradually been established as a religion in Sweden with many followers. Organized activities occur for example through associations, schools and mosques. The increased immigration strengthens the presence of Muslims and Islam. With help from different examinations about the population's attitudes towards ethnic diversity in the society and about the extension of Islam, the changed situation will be elucidated. There are some elements in Islam and in the cultural context that a majority can not accept. It is above all the situation for the Muslim women and the problem with honour-related violence. The generous attitude and the attitude of solidarity towards other cultural and religious behaviours and manifestations is exposed to big strains as a result of the presence of violent actions and deviant behavior in the name of the religion.

Towards the community organizing ? Ecology as a lever of pious subjectivation and political participation of Muslims in a suburb of Paris.

Alexandre Piettre

EPHE-CNRS & University of Lausanne, France

a_piettre(at)yahoo.fr

This communication present a mobilization of Muslims from a suburb of Paris in favor of the vegetarianization of school canteens. Facilitated by the actors of a mosque, through (1) preaching and conferences inviting Muslims to reform themselves by an ethic of ecologically consumption, (2) an association of parents to promote the intercultural dialogue, 3) the Muslim representatives of a communist municipality seeking to incarnate the minority fractions of the popular classes, it appears that this mobilization is similar to community organizing, aimed at promoting political participation of the Muslims in the social space of the city through their religious participation. Indeed, with the contribution of the Association of Awareness, Information and Defense of the Muslim Consumer (ASIDCOM) and Muslim actors defending an "inner ecology", the actors of the mosque make the ecological stake as a lever of a process of religious

self-reform, as well as a lever to build alliances with other religious and secular actors, in order to promote an eco-friendly diet for all the people and the "equality in the plate" between the different communities of belief. So much so that, for the Muslims of this mosque, it is a matter of making community only to surpass it. However, in doing so, these actors are confronted with the opposition of the municipality which considers this claim of vegetarianization of the canteens as a manifestation of "communitarianism ". This highlights the extent to which Muslims are confronted with the difficulty of emphasizing the issue of plurality alongside that of equality, when only the latter is given as legitimate in the language games of politics.

RN34 | Session 10a Methodological Challenges in Researching Religion

Ritual-making and care-proving in time-budget of modern Orthodox priests

Tatiana Krihtova

Saint Tichon's Orthodox University, Russian

Federation

krihtova(at)gmail.com

There is no single concept of Orthodox priest in modern Russian society. There is no one particular description of his job and which tasks have priority for him. Priests, parishioners, and the media will give very different answers to this question. Thus, in order to understand the role and place of priests in the modern world, it is necessary to study their activities "as they are" through direct observation of priests' everyday life and their participation in it. In this research, our working group observed 23 Orthodox priests from different regions of Russia. For the observation, we used the technique Shadowing, time-budget diaries and biographical interviews.

Obviously, the time budgets of priests will vary depending on many factors (the place of the parish and its type of location, the specific character of additional activities of the priest, his obedience, etc.). Therefore, our task is not to build up an average indicator for all priests, but to construct a typology of their actions.

One of the main aspects this issue is that modern priests need to observe a constant balance between care-providing and ritual-making. In this presentation will be described how the priests themselves find a balance between these two practices, and how they perceive and explain their methods of resolving the contradictions that arise. Will be described some strategies of such combination: ritual making as a care-providing, care-providing during the ritual making, both practices as a part of parish-schedule.

The conception of time and freedom of being in nowadays societies. Case study in the field of the novaerista spirituality

Salomé Marivoet

CPES - Lusophone University, Portugal

smarivoet(at)sapo.pt

At the present stage of radicalised capitalism, the analysis of the management of time becomes central to the deepening of the new forms of late modern alienation imposed by the technological and consume contemporary societies. Starting from the notion that time is the allocation of action in space, and from the assumption that human existence is endowed with free will, we aim to know to what extent the people sense of time determines their ways of life? We choosed for a exploratory study believers of the emergent novaerista spirituality, in particular 10 facilitators and 10 patients of Quantum Radionic Tables. As far as we can observe, our interviewees have a multidimensional conception of time, being aware of their action, their choices, and how they affect different time spaces of their existence in the past, present and future. As social agents, on the one hand, they tend to act with great autonomy face the current social structures and with a critical attitude and, on the other, they show a strong resilience to the adversities, material precarity and emotion fragility of the existential conditions of nowadays. For a Sociological understanding of the phenomenon, I considered the necessity to transcend the traditional dichotomous paradigms in the Social Theory, in particular associated with the structural functionalism vs critical theory, and deepen a new holistic approach of desire of change for a better condition of freedom of being.

Being a member of an atheist society in Switzerland. Methodological background and first results

Christophe Monnot, Pascal Tanner
University of Lausanne, Switzerland; University of Lausanne, Switzerland
christophe.monnot(at)unil.ch, pascal.tanner(at)unil.ch

This paper will present a total quantitative survey among the 2000 members of an atheist or a "laicist" organization in Switzerland. The individual questionnaire survey was lead from May to November 2016, in the three national languages, among the Freethinkers, the Sceptics, and the other associations aiming to defend an atheist or a secular view of the society. We will present the methodological background and first results of this survey in order to draw a general picture of the profile of these members and understand if they compose a specific milieu in Switzerland.

This survey is part of a 3 years study supported by the Swiss National Science Foundation hold by the universities of Bern and Lausanne.

Empirical results concerning religion without a theory are dumb

Krzysztof Kosela
University of Warsaw, Poland
kkosela(at)is.uw.edu.pl

A sociologist who intends to explicate the role that religion is playing in societies that handle multifaceted

crisis has to renounce the construct of secularization - unstoppable, irreversible process, which causes the decline of religion and the formation of progressively irreligious society. Survey data collected in Poland in sixties and seventies of the past century reveal the society more secular than it is now. Religion resumes to some social domains and withdraws from other fields but we barely understand these progressions without insights of a theory. It is so despite of abundance of empirical findings. Martin Riesebrodt's theory of religion conceived as the promise of salvation allows predictions regarding the role of religion in turbulent times. But what we need are e.g. notions to describe tensions evoked by religious education in public schools. Niklas Luhmann's theory of functional differentiation, namely theory of processes occurring in society composed of systems such as religion, polity, economy, science, education, mass media, and psychic systems look like plausible tool to elucidate some changes of relative importance of motivational structures enhancing religious commitment. Change of mutual functionalization of religion, polity and economy resulted in Poland in decreased importance of protective motivation to endorse religion (take the side of God against barbarians). Visible presence of religious revival communities shows the fueled meaning of admiration of deity, which the theory of social systems identifies as an internal communication of religion system.

RN35 - Sociology of Migration

RN35 | Session 01a Social Mobility I

“Brain drain” or “brain gain”? A macro-typology on youth mobility for EU/EFTA countries focussing on the creation/exploitation of human capital

Karen Hemming, Frank Tillmann
German Youth Institute, Germany; German Youth Institute, Germany
hemming(at)dji.de, tillmann(at)dji.de

Youth mobility is seen as a driving force for Europe. However, some countries benefit more than others and the constellation of interests differ. On the one hand, countries profit from long-term incoming mobility leading to a higher economic value creation. On the other hand, sending countries lose human capital, especially when highly qualified young people move abroad, the so called “brain drain”. Additionally, national economies benefit from returning youth who gained skills and competences abroad. The frequently used centre-periphery-model (Wallerstein, 1979) does not cover the full complexity of the phenomenon. Thus, we will present a country typology focusing on the creation/exploitation of human capital (Becker, 2009).

The study is based on descriptive analyses of secondary mobility macro-indicators (2004-2013) as part of the EU-project “MOVE” which has received funding from the EU-Horizon 2020 programme under grant agreement No.649263. Due to a lack of youth mobility macro-indicators for Europe, individual datasets from the EU Labour-Force-Survey (accessed via EUROSTAT) were aggregated per year/country.

To represent the ambivalent meaning of youth mobility, the typology is based on two patterns: A) mobility episodes deploying/exploiting human capital (e.g. long-term-incoming-mobility), and B) mobility episodes creating human capital (e.g. short-term-incoming-mobility). Given that each pattern can have a high- or low-value (average for observed period), a combination of both patterns results in a four-panel-table reflecting four types of mobility: mobility-promoters (low AB), mobility-fallers (low A, high B), mobility-beneficiaries (high A, low B), and mobility-utilisers (high AB). Almost all EU-28/EFTA countries could be allocated to one of the panels. The typology will be presented and discussed emphasising policy recommendations.

Making Mexican masks together – collaborative

methods as a way of doing research together with unaccompanied minors in Finland

Anna-Kaisa Kuusisto-Arponen, Kristiina Korjonen-Kuusipuro, Jaakko Tuominen
University of Tampere, Finland; University of Tampere, Finland; University of Tampere, Finland
anna-kaisa.kuusisto(at)uta.fi, kristiina.korjonen-kuusipuro(at)uta.fi, jaakko.tuominen(at)uta.fi

The year 2015 brought a sudden increase in numbers of unaccompanied minors when more than 3 000 unaccompanied minors claimed asylum in Finland. The new social situation has revealed that unaccompanied refugee minors are exposed to the fragility and limitations of nationally standardized solutions of institutional care, schooling and social services provided for them. Several social integration measures and schemes take too simplistic, territorially restrictive and objectifying a stance on these children’s and youth’s daily realities. In this presentation we argue that in order to support solidarities and subjectivities in the processes of the making, unmaking and remaking of Europe, recognition of the lived transcultural and translocal sense of belonging and selfhood among unaccompanied minors is needed.

Empirically we draw on ethnographic field work conducted with unaccompanied refugee minors (age 14-16 years) in Finland, autumn 2016. We participated five art workshops organized by two artists to make Mexican paper masks. The workshops were carried out in the school’s art class and the aim of these workshops was to increase contacts between Finnish pupils and unaccompanied minors who normally study in preparatory class. Our research materials consist of field work notes, photographs and videos. Through these we analyse practices of transcultural belonging and the emerging social dynamics among the youth. We also discuss the ethics of collaborative methods and what kind of research material being and doing together are produces.

Muslim Religion – Bridge or Barrier to Labor Market Integration?

Linda Esther Hennig
University of Münster, Germany
linda.hennig(at)uni-muenster.de

The Muslim minority in Western Europe is supposed to have lower rates of labor force participation. Especially with regard to women it is not clear whether discrimination (i.e. because of the headscarf) or religious values (that are expected to encourage traditional role patterns) negatively affect employment. The presentation will be based on qualitative data of an ongoing doctoral thesis focusing the role of Islam in professional biographies of women in Germany and France who grew up in families of migrant workers and who are professionals in the health and social sector.

First, I would like to discuss factors that reinforce exclusion on the one hand or enhance integration and upward social mobility on the other hand, and how

they correlate with religion, class, gender, and ethnicity. There are “hard” factors like economic resources and networks of migrant families, and there are “soft” factors like the expectation of chances on the labor market and the individual coping with discrimination as well as attitudes towards work shaped by religious values.

Second, I would like to shed light on conflicts arising in different national working environments of pious Muslim women and how they are dealt with. Conflicts mainly occur because of an existing climate of distrust towards (visible) Muslim belonging and practice of religion, because of the role expectation to represent a minority group or to be an expert who is able to provide information about detailed theological aspects. We can argue that the development of personal ways of dealing with conflicts occurring in working environments because of Muslim belonging and religious practice may be crucial in order to achieve a successful career.

Capitalism and subjectivities in the ‘making of a migrant’: the role of intermediaries in young Bulgarian’s decisions to study and work in the UK

Elena Genova

University of Nottingham, United Kingdom
lqxesgen(at)nottingham.ac.uk

After years of European integration, Favell’s (2008) ‘Eurostars’ have been joined by many, who perceive the freedom of movement as a right, rather than a privilege. The young Bulgarians born shortly before or after the democratic changes in 1989 are no exception. Often referred to as the ‘children of transition’, while these young Bulgarians have grown up in a context of turbulent socio-economic changes, they have also been some of the first to benefit from the rights granted by European citizenship.

Drawing on 37 semi-structured interviews, this paper explores Bulgarian university students’ and young professionals’ decisions to pursue their education and/or professional realisation in Britain. More specifically, a meso level analysis of the data indicates the key role intermediaries such as family members, friendship circles, secondary schools and consultancy agencies play in shaping young Bulgarians’ migratory projects. Thus, the latter are underpinned by the ambitions and dissatisfactions of family members, peer pressure, earlier educational choices and the ‘business with education’, epitomised by the abundance of consultancy agencies and fairs that facilitate the university application process. Ultimately, the paper argues that scrutinising the role of intermediaries in shaping migratory projects offers an insight into complex interplay of capitalism and subjectivities in migration, allowing the in-depth understanding of young Bulgarians’ pre-migratory experiences.

RN35 | Session 01b A Global Discussion about

Migration, Integration, Identity and Education I

Breaking Down the Walls of Sheltered English Immersion Through Translanguaging

Elizabeth A. Robinson, Tian Zhongfeng, Aybahar Qarqeen

Suffolk University, United States of America; Boston College, United States of America; Suffolk University, United States of America
erobinson(at)suffolk.edu, tianza(at)bc.edu, aqarqeen(at)suffolk.edu

This exploration of translanguaging takes place in unprecedented times in the United States. The new president has signed executive orders discriminating against immigrants and refugees, most notably Muslims, by harshly restricting their travel to the United States. It has never been more important than now to bring the stories, experiences and languages of all the people who make up this country into our classrooms. As academics, teachers, and students, our study aims to explore the pedagogical and theoretical implications of implementing translanguaging in an undergraduate course originally designed as an Sheltered English Immersion (SEI) course. Translanguaging differs from SEI in important ways. Instead of focusing on English-only instruction, translanguaging centers on the natural communicative practices of bilinguals. It acknowledges their language resources and creates a safe space for them to strategically draw upon any linguistic features from their linguistic repertoires to acquire, understand, and demonstrate their knowledge. Through multilingual/multimodal resources, positioning teacher as co-learner, and scaffolding, translanguaging facilitates students’ understanding of new language and content. These practices support the development of bi/multi-lingualism and bi/multi-literacy, but also have the transformative power to challenge the hegemony of English. The questions we ask are: How does teaching translanguaging in a TESOL certificate course impact learning and teaching?

1. How does purposefully shifting comfort levels through translanguaging impact teachers and students’ perspectives of language and culture?
 2. How does translanguaging transform pedagogy based in SEI and traditional monolingual approaches to language learning?
 3. How do students implement translanguaging as pedagogy to work with international students?
- Implications from this study will be used to inform new socially just practices desperately needed in the current social and political context.

Migrations, intergroup friendships, cultural and social integration

Gabriele Di Francesco, Cinzia Pica Smith, Rina Manuela Contini

“G. d’Annunzio” University - Chieti-Pescara, Italy; Assumption College - Worcester, MA, U.S.A.; “G. d’Annunzio” University - Chieti-Pescara, Italy
gabrieledifrancesco(at)gmail.com, pica.cinzia(at)gmail.com, rm.contini(at)unich.it

Globalization and transnational migration are creating an increasingly multicultural social context all over the globe and in Italy. Communities and, therefore, schools are increasingly multilingual, multiracial, multiethnic and religiously diverse spaces. Therefore, helping youth create and maintain intergroup friendships is more important than ever as they have been proven to decrease prejudice and increase social/cultural competence/skills: skills young people will need to succeed in this diverse social/economic context. Hence, the proposal introduces intergroup friendship literature in the Italian context. First we ask what does the Italian school already offer to support this goal of this area of social emotional development? The proposal addresses the mission and goals of intercultural education, and how these are supported by institutional policies and practice. Further, the proposal discusses the tradition of creating connected spaces for young children in the primary grades, and connects this tradition to intergroup contact theory and research or intergroup friendships. The proposal builds an argument for creating initiatives that promote intercultural connections and relationships in schools and beyond the school context. Lastly, the paper discusses findings related to a research study conducted in Italy on cultural and social integration.

Enacting Scripts Before Solidarity: Asylum System in a Transit Country

Dunja Poletić Cosić, Tamara Petrović Trifunović
Faculty of Philosophy – University of Belgrade, Serbia;
Faculty of Philosophy – University of Belgrade, Serbia
dunja.poletic(at)gmail.com, evena304(at)gmail.com

In this paper, we examine the asylum system in Serbia, being a transit country on the so-called Balkan route, since its initiation in 2008 until today. The construction of an independent asylum system in Serbia was initiated within the process of Serbia's ascension to the EU; therefore it has largely been harmonized with the EU legislative. Our primary goal is to identify the causes of unsatisfactory performance of the system by exploring the relations between three levels of research: 1) strategic and legal framework, 2) institutional level and 3) real migration practices of the asylum seekers. Findings of the qualitative research "Enhancing Access to Education and Preventing Gender-based Violence of Asylum Children in Serbia" and other reports indicate that strategic level, while overly vague, is more adjusted to the perspective of the host countries within EU than to that of the transit countries. This is reflected on the institutional level too, while none of the two has been taking into account the real needs of refugees, particularly during the „refugee crisis“ when the system became unresponsive, if not completely inapplicable. In accordance with the new institutionalist analyses of the policy imitation and diffusion in a world society which produces decoupling between intentions and results (Meyer et al. 1997), we show how copying world models to establish legitimacy among peer states without considering contextual factors can lead

to inefficient system inside which institutional actors enact unadjusted scripts instead of providing substantial support, protection and integration to asylum seekers.

Challenging stereotypes: How participation in education can promote valued ethnic identities

Berenice Scandone
University of Bath, United Kingdom
bs339(at)bath.ac.uk

Ethnic identity is known to be crucial to the definition of one's self-concept and well-being. Holding a positive image of one's ethnic 'group' acts for young people as a buffer against discrimination and other stressors, and facilitates academic 'achievement'. Yet, minority ethnics often suffer from the imposition of stereotypes, which are likely to be internalised and have a strong impact on both well-being and the capacity to achieve educationally and in employment. This presentation draws on interviews conducted with 21 British-born young women of Bangladeshi ethnicity attending university, to show how participation in education can contribute to the shaping of ethnic identification. Acquisition of social and cultural capital through higher education, in particular, appears to encourage a 're claiming' of ethnic and religious identities, both by raising awareness of structural inequalities, and by favouring exposure to new, and valued, interpretative frameworks of 'what it means to be Bengali / Muslim'. This suggests the potential value of initiatives and discourses directed at exposing the structural factors underlying individual's and group's differential socio economic positionings, and at getting those within as well as outside the ethnic 'group' to engage with 'positive' interpretative repertoires of minority ethnicities. I additionally consider the importance of exposing students to examples of involvement of traditionally underrepresented categories in different areas and levels of employment, in order to expand their capacity to see themselves as potentially pursuing certain education and employment routes by challenging perceptions of what people of a given ethnicity 'do' or 'do not do'.

RN35 | Session 01c Expectations and Attitudes

The Second European Union Minorities and Discrimination Survey (EU-MIDIS II): surveying immigrants and minorities in the EU today

Rossalina Latcheva
European Union Agency for Fundamental Rights
(FRA), Austria
rossalina.latcheva(at)fra.europa.eu

Despite the continuing demand for data on immigrants and ethnic minorities and an increasing availability of socio-economic migration statistics, a considerable lack of data comparable across the EU on fundamental rights issues concerning immigrants and ethnic minorities persists. The reasons are manifold such as diverging definitions of the target groups and difficulties to properly cover the target population with

traditional data collection methods. One of the main challenges faced when surveying hard-to-reach groups is the lack of sampling frames or their incompleteness. A cross-country and/or cross-cultural survey design introduces additional complexity in surveying immigrants and ethnic minorities. The paper discusses these challenges by outlining the approach of the second European Union Minorities and Discrimination Survey (EU-MIDIS II), which the EU Agency for Fundamental Rights (FRA) conducted in 2015-2016 to assess progress over the past seven years since the first EU-MIDIS survey was carried out in 2008.

This EU-MIDIS II survey gathered comparable data in all 28 EU Member States to assist EU institutions in developing evidence-based legal and policy responses to respect, protect and fulfil the rights of persons with immigrant or ethnic minority background, including Roma. It covers topics such as experiences of discrimination in different areas of life, criminal victimisation (including hate crime), social inclusion and societal participation.

Expectations, hopes and fears among migrants and refugees in Germany – a longitudinal perspective

Stephanie Fleischer

Criminological Research Institute of Lower Saxony (KFN), Germany

Stephanie.Fleischer(at)kfn.de

Every year around 100,000 people move to Lower Saxony, a region in Germany, from abroad. Especially in summer, 2015 Europe was challenged by a heavy increase of refugees. It is known why these people decided to take this step but we are unaware, which fears and hopes are connected with their decision to leave their country and live abroad. In addition we do not know what kind of expectations the migrants have or how they estimate their own situation in Germany and how their fears, hopes and needs change over time

To answer those questions the Criminological Research Institute of Lower Saxony (KFN) is currently conducting a longitudinal study among migrants in Germany. Data stem from the "Welcome to Lower Saxony" study. The study focus on migrants from Europe, Turkey, Serbia, China, Syria, India and Africa. The study collects information about socio-demographic characteristics, language skills, income, housing situation, fears, attitudes and opinions. 2,334 immigrants participated in the first survey.

The presentation is based on the first survey, which is carried out in September 2015, and the second survey, which was realized six months after the migrants arrived in Germany. The presentation gives an insight about the migrants' expectations, hopes and fears, especially about the change that has arisen in their attitudes. At the same time the presentation examines the question if immigrants of different origins vary between their fears, attitudes and how they describe their situation.

On symbolic and economic threats: attitudes and perceptions of Greeks and Immigrants towards immigration, at a time of economic and refugee crisis

Angelo Tramountanis

National Centre for Social Research (EKKE), Greece
atramou(at)ekke.gr

Over the past few years, Greece is struggling to cope with a double crisis. On the one hand, the economic crisis and the harsh austerity policies pursued since 2010, which have resulted to unemployment rates of 23% (44% for young persons under 25). On the other hand, Greece is facing the aftermath of the refugee crisis of 2015-2016, when over 800,000 migrants and refugees entered Greece on their way to other European countries, whilst following the closure of the Western Balkan route, over 60,000 people are stranded in the islands and on the mainland. Within this context, we aim to investigate how attitudes and perceptions toward immigrants vary among the native and migrant populations of the country. Of particular importance is the extent to which individual socio-demographic and economic characteristics can be used as valid determinants of people's attitudes towards immigrants. The empirical part of this paper relies on research conducted in April 2016, with a sample of 1,332 individuals (505 migrants and 827 non-migrants), by means of a questionnaire based on the respective questionnaire of the European Social Survey (ESS).

Methodological challenges in migration research

Laura Treskow

Criminological Research Institute of Lower Saxony, Germany

laura.treskow(at)kfn.de

Since 1970s migration studies are an important topic in social science. The focus of the scientific investigations is mainly on labor immigrants and the second generation of immigrants. Official statistics indicate that Germany is a country with a long tradition of immigration. Especially since the years 2014 and 2015, refugees have been increasingly finding a new place to stay in Germany.

In 2016, the Criminological Research Institute of Lower Saxony (KFN) started the research project "Everyday experiences and settings of refugees in Lower Saxony (ALFiN)". The study aims to compile a picture of the situation among refugees recently arrived in Lower Saxony. Important topics of the study are: motives for the immigration, the journey to the west, and the consequences of flight for refugees. Refugees were asked about their expectations for the future and about their values. A further major focus is the everyday experience of refugees in Germany. A key point of attention in this regard is refugees' social setting.

This presentation is based on a quantitative survey about refugees in Lower Saxony (Germany). It is especially focused the motivation of interviewees who are asylum seeker, hence not yet officially accepted

and how this uncertain status seem to influence the willingness to participate (or the participation in generally). In addition, the presentation will inform about the accomplishment of a standardized survey in collective accommodations and the challenges social scientists have to expect. A particular note is the proper handling with different reading and writing competences. The presentation informs about possible ways to deal with these challenges.

Ethnic Diversity and Its Effects on Social Capital in Germany

Sarah M. Ludwig-Dehm
 Pennsylvania State University, United States of America
 sml379(at)psu.edu

Many countries in Europe have seen considerable increases in immigration and ethnic diversity during the last few decades. The immigration wave during the years of 2015 and 2016 in particular led to heated debates about immigration policies within the EU states. Europeans are concerned about the integration of immigrants into their societies, which spurs new interest in the consequences of ethnic diversity. In this study I want to examine how ethnic diversity affects general trust, volunteering, and participation in Germany, and how these effects differ between subpopulations, e.g. between age groups, natives and foreigners, and rural and urban populations. Theoretically I rely on assumptions from constrict, conflict, and contact theory. The research questions will be examined with the restricted Allbus dataset from 2008. To examine the influence of ethnic diversity on several outcomes, sensitive regional identifiers will help to link these data to contextual data from the German federal office for statistics on the Gemeinde level. This will be a huge advantage compared to other studies in Germany that had to use higher level variables to calculate ethnic diversity, because it will be closer to the concept of "neighborhood". The analysis is done using logistic regression models and spatial models. The main independent variable will be ethnic diversity on the Gemeinde level. Two separate dependent variables will be used: a variable on general trust and an index of several items on membership, participation, and volunteering. The models will control for several variables like age, gender, citizenship, and socioeconomic status.

RN35 | Session 02a A Global Discussion about Migration, Integration, Identity and Education II

The image of Ancient Greece as the tool for Europeanisation: tourism and migration

Liubov Klepikova
 Moscow State University of Railway Engineering,
 Russian Federation
 klepikova.liubov(at)gmail.com

The tourism is one of the most profitable economic sectors in Greece. The country has not only the

perfect climate and many holiday resorts, but also the very rich history and the antic sights. Greece is considered to be the Cradle of Western Civilization, while "Western" is the synonym for "Europe", which is associated with The European Union. In this case the couple of questions arise: if the history and the heritage of Ancient Greece builds the Greek or the European identity, if this identity belongs to Greece or to all Europe, and who exactly constructs the image of Ancient Greece as the origin of the European civilization. We will research it on example of the tourist infrastructure on Crete. In the cities such Rethymno or Chania there are diverse "authentic" entertainments like the restaurants, where the "authentic" food is served, the souvenir shops, where the clients can find the specialties and the symbols of Ancient Greece, and the touristic agencies, which purpose to travel to the ancient places. Nevertheless, in these branches, which present themselves as "authentic" Grecian, are working the migrants from another countries including Albania, Russia, and the Ukraine. The article consists of the interviews, that were taken while field research on Crete in 2014-2015. We will use the concept of Crypto-Colonialism (M. Herzfeld), the social imaginary (A. Appadurai), the cultural identity (S. Hall) and the stage authenticity (D. MacCanell).

Between the narrative of return and diverse forms of circular migration in Southern Transylvania

Ovidiu Oltean
 Babes-Bolyai University, Romania
 ovidiuoltean(at)fspac.ro

While the migration of ethnic Germans from Romania has been coined as an unidirectional ethnic migration, that would lead to the depletion of an entire ethnic group, recent processes taking place in Southern Transylvania show quite the opposite. Transylvanian Saxons that once saw no future available for them in Romania are now coming back. Some of them travel back to their former homeland in search for their roots and seeking restitution of their rich historical heritage and built properties. Others move back endeavouring in entrepreneurship activities and searching for alternative lifestyles in an economically diverse region. Some are building transnational social spaces between Germany and Romania while travelling seasonally back and forth between their summer residence in Transylvania and their regular residence in Germany. Some are coming back in order to enrol in university programs in Romania, while others are taking institutionally mediated and temporary employment in German ethnic organizations and in German companies that are opening new branches in Transylvania. Such processes of mobility are doubled by the participation of the local German speaking population, which is most of the time non-ethnic German, in organizations and institutions of the German minority, contributing to the remaking of the German culture and social life in southern Transylvania.

Second generation immigrants and sport: elements from a local study

Nico Bortoletto
Univ. of Teramo, Italy
nbortoletto(at)unite.it

Second generation of immigrants are traditionally the most problematic to integrate in host societies. The (even relative) remoteness of society of origin, the socialization process fulfilled in a society that frequently do not recognize a full citizenship for these persons, could lead to deviant behaviour due to the value conflicts and mismatched perceptions of these persons. Sport practice could, partly, fix this situation. Here is presented a small local study, led in Modena, a 185.000 inhabitants Italian town, where second generation immigrants are studied in organized sport setting. It is concluded that organized sport could lead to a higher level of integration in local society and could trigger a positive imitation mechanism among the peer group.

Czechs in capitalistic foreign country – to the analysis of migration, assimilation and ethnicity in context of global capitalistic metropolis Chicago

Dusan Luzny, Daniel Topinka, Jana Koreckova
Palacky University, Czech Republic; Palacky University, Czech Republic; Palacky University, Czech Republic
dusan.luzny(at)upol.cz, danieltopinka(at)gmail.com, koreckova.jana(at)email.cz

Mass migration from Czech lands has started in 1848 and was pointed into larger American cities. New York City was just transition point, the Czech immigrants mostly headed to settle down in industrial Chicago. As Czech citizens settled down in Chicago, they have become successful businessmen. Consequently the assimilation of Czech citizens occurred, as well as abandonment of the typical city neighborhoods such as Czech Plzeň (Czech Pilsner), Czech California, Nový Tabor (New Tabor), Vinohrady and others. These territories are later inhabited by Mexicans, which is then followed-up by establishing of mostly Mexican city districts. Our conference contribution analyses the process of assimilation in the environment of industrial capitalist metropolis and the impact of successful assimilation into capitalistic system of production on the community of Czech immigrants. It seeks an answer to the question, how there was a relatively quick and easy assimilation of Czech immigrants into American society, especially in the second generation. Although these immigrants come in varied generational situations and different historical contexts, the assimilation process is carried out according to the “traditional” theoretical assimilation schemes that already lost legitimacy in the academic discourse. Extraordinary role in the assimilation played the dynamics of the capitalist market. Report summarizes results of empirical research conducted in Chicago in 2014 - 2017.

Overcoming Temporariness: A temporal approach on Moldovan migration to Italy

Olga Cojocaru
Center of Migration Research Warsaw, Poland
o.cojocaru(at)uw.edu.pl

Even if intended to be only temporary, the majority of migration trajectories of Moldovans in Italy prolonged years after the projected duration expired. The proposed paper is intended to illustrate the experience of protracted temporariness of labour migrants, often in a precarious if not irregular status. More precisely, it seeks to document how legal status and certain work conditions under the framework of a certain migration regime produce specific temporalities and affect migrants' agency/capacity of decision-making. Based on ethnographic fieldwork in an Italian city with a large concentration of Eastern European migrants, this paper will address the time management of those who are not always in the position to “own” time, have a clear vision of what lies ahead and make informed decisions. In particular, this research examines migrants' strategies to cope with uncertainty and potential time pathologies (e.g.: asynchronies, free time deficit, long working hours, boredom, waiting etc.) resulted from irregularity and work conditions (high dependency on the employer), their practices of resynchronization and maintenance of togetherness with the family back home as well as their negotiation between multiple temporalities.

RN35 | Session 02b Migrations of Scholars in Europe. Westward and Eastward I**South Asian scholars in the age of globalization: international mobility as precarization**

Vinicius Kauê Ferreira
Ecole des Hautes Etudes en Sciences Sociales,
France
vinikaue(at)gmail.com

While a growing number of South Asian scholars are attracted by European universities and research institutions, a pervasive process of precarization of academic labor takes place in both South Asia and Europe. But what are the connections between the discourse of international mobility and the prominence of a model of short-term contracts driving the administrative practices of academic institutions nowadays? This paper draws on an ethnographical research on South Asian social scientists who build an academic career in Europe in order to understand not only how “mobility” is signified and lived by these researchers, but also how these dynamics are related, and how these lives are tied, to globalization and neoliberalism. More precisely, I explore some narratives gathered during my fieldwork in England and Germany in order to address sociological and anthropological dimensions of life, such as professional projects, self-representation as intellectuals, senses of belonging, as well as kinship and conjugality in the construction of familiar projects. Narratives by heads of departments are also important

for my analysis, as they allow us to put in perspective different vantage points of the same dynamics. Besides globalization and neoliberalism, this research takes into account historical processes, namely the traditional intellectual circulation between South Asia and Europe, but in order to decrypt the continuities and reshaping of these traditional circuits into new forms of mobility. Besides the idea of precarity, the concepts of project, as elaborated by Gilberto Velho, and politics of survival, coined by Marc Abélès, are important heuristic devices in my analysis.

From a foreign student to a worker abroad

Gordana D. Vuksanovic
Novi Sad Business School, Serbia
gordanavuk(at)uns.ac.rs

The Bologna Declaration has become a synonym for the reform of higher education. Although the mobility of students is singled out as a separate principle of this declaration, its realization is enabled by the acceptance of other principles (adoption of a system of easily readable and comparable degrees; establishment of a system of credits – such as in the ECTS system; etc.). There should be no doubt that the coordination of curricula enables student mobility but the question is to what extent the differences in sociocultural systems, primarily with respect to the economic and political stability, condition the differences regarding the motives for becoming part of the international educational events. The question that arises is if students who stay at foreign educational institutions become familiar with the conditions of living and working in the country they would like to see as their future destination. Is studying abroad the first step towards working abroad?

These questions are answered in two empirical research studies. The first one was realized in the period 2006-2010 and the second in the period 2015-2016. The research included the first generation of sociology students who started their studies according to the reformed curriculum, the so-called Bologna. Their attitude towards the reform of higher education and going abroad has been continually followed during their studies and five years after their graduation.

The data was collected via a semi-structured interview and a biographical interview.

Value Orientations of Highly Educated Members of Serbian Diaspora

Jelena Dinic
Faculty of Philosophy, University of Nis, Serbia
jelendzi(at)hotmail.com

International migration of highly educated has always been a characteristic of academia, but today it is a characteristic of the modern world (Brown, 2002, Massey & Aysa, 2005, De Haas, 2008, 2010, Meyer, 2012). Specific circumstances in the Balkans in recent years additionally contributed to a large outflow of highly educated people from Serbia. While economic and political reasons of migrations are often analyzed,

personal impact has only been rarely assessed. Living in extremely complex social situations, having to speak two or more languages and being adapted to living in different cultures, different political and social environments influence migrants' value systems (Schwartz & Bilsky 1990, Schwartz 1992, 2008, Inglehart & Baker 2001, Inglehart & Wesel 2003, 2005, Benet-Martinez et al. 2002, Benet-Martinez & Haritatos 2005).

The aim of this study is firstly to identify types of value systems among the highly educated migrants from Serbia and secondly to determine which set of values enables better adaptation in the new environment. For this purpose, a questionnaire has been constructed consisting of standardized scales that measure traditional authority versus rational-legal authority, materialist values versus post-materialist values (Inglehart, 2000), individualism versus collectivism (Triandis, Gelfand, 1998), and social distance (Bogradus, 1933). Participants included 250 highly educated migrants from Serbia who responded to an online survey. The research is conducted in the framework of the Horizon 2020 project "Closing the Gap Between Formal and Informal Institutions in the Balkans" (№ 6935237).

RN35 | Session 03a Migrations of scholars in Europe. Westward and Eastward II

The perception and usage of EU-instruments to enhance mobility by PhD students

Gregor Schaefer
University of Siegen, Germany
gregor.schaefer(at)uni-siegen.de

EU-initiatives in higher education promote migration and free movement within the borders of the EU for young scientists. This is a try to build up bottom-up solidarities among young researchers from different EU countries in order to 'make Europe'. Such EU-initiatives to make cross-border movements and work for individuals more practical are Marie Skłodowska-Curie Actions or EURAEXX, based in the program of Horizon 2020.

The main research question of this paper is, what kind of relevance the above-mentioned EU-initiatives have for the individual researcher and his/her decision for going abroad for his/her PhD.

For that question my research considers the theory on internationalization and Europeanization on the macro-institutional level as well as transnationalism and transnational migration and capital theory on the micro-individual level.

Empirical data is collected through autobiographical narrative interviews from graduates of the Humanities, Arts, and Social Sciences, who completed their studies at German universities and are working as PhDs at Dutch or French universities at the time of the interviews. The focus is limited to these disciplines, because graduates from non-STEM disciplines share similar challenges regarding career and work opportunities and are thus better to compare. For data evaluation, the Documentary Method and Grounded

Theory will be applied to develop categories of people that use EU-instruments and to gain perspective on the subjective awareness and meaning for themselves. My empirical results will give an extended view of transitions in educational and professional biographies and the impact EU-programs on these transitions.

Migratory trajectories and labour insertion processes of Spanish scientists in the United Kingdom

Erika Masanet, Anna Giulia Ingellis
University of Valencia, Spain; University of Valencia, Spain
erika.masanet(at)uv.es, giuliana.ingellis(at)uv.es

Skilled migration of scientists has become increasingly important in the European context. In Spain, the increase in the emigration of scientists is related to the transformations in its scientific employment market over the last few decades and these have been aggravated by the economic crisis: reduction in the demand of academics-scientists and the increase of precarious work among this professional group. In addition, academic careers in Spain are conditioned by clientelistic relationships, non-meritocratic selection criteria and a scientific policy with no long-term objectives. The United Kingdom is one of the main destinations of the emigration of Spanish scientists. The purpose of this proposal is to present some results of the project "Spanish emigration of scientists to the United Kingdom: evolution, profiles and trends", related to their migratory trajectories, migration projects and their strategies of labour insertion at the destination. The methodology used in this research is qualitative by carrying out 22 in-depth interviews with Spanish scientists who emigrated to the United Kingdom. The preliminary analysis of the interviews allows us to identify two profiles: those who emigrated to do their PhD or postdoctoral fellowship in a British university, with a high level of English because of their previous training in international schools that provided them with access to international networks, and those scientists with PhD who were forced to look elsewhere because the lack of opportunities in the Spanish scientific system. In the latter case, the search for employment generally starts from Spain and the existence of a job offer in the United Kingdom, usually as a lecturer, is decisive.

From academic mobility to the long-term emigration: lessons from Portugal

ramgomes(at)gmail.com, pp(at)fe.uc.pt, jmteixeiralopes(at)gmail.com, henrique(at)fpce.up.pt, lcerdeira(at)ie.ulisboa.pt, rui.brites52(at)gmail.com, b.cabrito(at)ie.ulisboa.pt, rafaela.ganga(at)gmail.com, mmachadotaylor(at)gmail.com, silvia.m.martins.silva(at)gmail.com, patrocínio.tomas(at)gmail.com

Emigration is a chronic structural process of the Portuguese society. The discussion and key arguments raised in this chapter are mainly focused on data from a research project (Bradramo) on Portuguese skilled emigration; based on the outcomes of the Bradramo project it can be suggested that recent phenomena in general, and the crisis that began around 2008 in particular, profoundly transformed the patterns of Portuguese emigration. Nowadays, the country faces a brain drain dynamic that is dramatically altering the profiles of national emigrants, emigration destinations, self-identity, and the strategies of those who leave the country. Academic mobility, mainly that promoted by the European Union (through grants from the Erasmus Programme), created and fostered mobility flows that reinforced a latent mobility phenomenon. Once engaged in academic mobility programmes, Portuguese higher education students tend to stay in the country of destination or, upon returning temporarily to Portugal, to evince a very strong predisposition to move to a country of the European Union. The profile of Portuguese high-skilled emigrants reveals a trend towards a permanent and a long-term (as opposed to a temporary or transitory) mobility, an insertion in the primary segment of the labour market of the destination countries, a predominance of professionals connected to the academic/scientific system and to professions requiring high skills, and a latent mobility (after a period of study in the country of destination) rather than direct mobility flows (after having entered in the employment system of the sending country).

RN35 | Session 03b Migrants in Rural and Peripheral Areas of Europe I

Individual outcomes of migration in agriculture: a comparison of two trajectories from rural Romania to Spain

Alexandra Deliu, Georgiana Toth, Monica erban
Romanian Academy, Romania; Centre for Migration Studies (CeSMig), University of Bucharest; Centre for Migration Studies (CeSMig), University of Bucharest; National Institute for Research and Development URBAN-INCERC Bucharest; Romanian Academy, Romania; Centre for Migration Studies (CeSMig), University of Bucharest
alexandradieliu(at)yahoo.com, georgiana.toth(at)gmail.com, monica_serbanus(at)yahoo.com

Romanian migration to Spain is a vast phenomenon. Apart from the almost 700,000 Romanian residents in Spain, according to data from the Spanish National Statistics Institute, since 2002, when a bilateral agreement between the two states was signed, numerous Romanians obtain seasonal jobs in the Spanish agriculture sector. The bilateral agreement lasted until 2007, when Romania became a member of the EU, and (temporary) working abroad became easier in terms of costs/investments and mediation process.

In this context, we use a comparative approach to explore the individual outcomes of migration for work in the agriculture sector in Spain, as well as its community effects by analysing two distinct migration trajectories that have developed within the same rural community in Romania: migration through formal recruitment at the origin, and migration through informal networks and informal recruitment at the destination. We propose a threefold comparison of the two types of migrants, before, during and after their work experience abroad, with an emphasis on the period after return and the changes occurred in their social status (within the community, on the labour market) as a result of migration. Our findings show that there is no overlap between these two trajectories in terms of potential migrants, and that they are associated with different types of outcomes at individual level.

The qualitative interviews we analysed were conducted within the framework of the FP7 TEMPER research project, with migrants and former migrants, in December 2016-January 2017.

Precarities and mobilities in rural Greece: Taking stock of migrant labour trajectories in a period of economic downturn

Loukia-Maria Fratsea, Apostolos G. Papadopoulos
Harokopio University of Athens, Greece; Harokopio University of Athens, Greece
fratsea(at)hua.gr, apospapa(at)hua.gr

The long presence of migrant labour is well documented in the last three decades. Their impact upon the rural economy and society of Greece is of immense importance. Their role in the rural/local social structure is often underplayed and/or considered as marginal. However, there are many issues which need to be taken into consideration when appraising their contribution and integration into the receiving society.

More particularly, migrant labour has been of pivotal for increasing agricultural productivity in labour intensive agricultural systems, while its impact in local societies and economies has been highly disputed. The hierarchy of migrants, the ethnic division of labour, the employment conditions and the increasing antagonisms/ conflicts between migrants and employers are major issues which will be discussed in the paper.

The paper will uncover the existing diversity among migrant labour on the basis of employment relations

(permanent, seasonal, cyclical, casual), their precarity status (regular, semi-regular, irregular), the migrant divisions of labour and their education. The main focus of the paper is on the various relationship(s) between precarity and mobility, which are significant facets of migrant labour strategies of survival.

The paper will include a literature review on migrant labour precarity in Greece and southern Europe in general. Secondly, there will be an analysis of the various aspects of the relationship between precarity and mobility. Thirdly, the available statistical data (from various statistical sources) will be analyzed and commented upon in order to draw a wider picture of the interconnections between precarity and mobilities in rural Greece. Finally, the conclusion will stress the need for further research on the aspects of migrant labour precarity.

From visiting an island to living on it. Recent migrants to the Croatian island of Korčula

Marica Marinović Golubić, Geran-Marko Miletić
Institute of Social Sciences Ivo Pilar, Croatia; Institute of Social Sciences Ivo Pilar, Croatia
marica(at)pilar.hr, geran(at)pilar.hr

During the last three decades the overall population of Croatian islands has grown raising many questions about what drives migrants to peripheral areas. This presentation aims to clear some of these questions by focusing on a recent group of permanent migrants on the Croatian island of Korčula. We identified three groups of migrants based on their previous relation to the island: a) return migrants, b) marriage migrants and c) newcomers without prior family or marital connections to the island. Although diverse, these migrant types share common views on the positive aspects of living on the periphery. These are mostly connected with security (personal, food, environmental and safety for their children), business opportunities (finding and filling previously unoccupied small business niches, starting their own business, more balance between business and work) and living in close connection to nature. Further questions have been raised concerning a) the relationship between different migrant groups themselves and between "older" islanders all in the context of a small island community and b) the permanence of their stay.

RN35 | Session 03c Labour Market Trajectories of the Descendants of Immigrants in Europe

What Works: Positive Influences on Occupational Aspirations and Attainments among Descendants of Immigrants on the Swedish Labour Market

Pinar Aslan, Nader Ahmadi, Stefan Sjöberg, Eva Wikström
University of Gävle, Sweden; University of Gävle, Sweden; University of Gävle, Sweden; Umeå University, Sweden
pinar.aslan(at)hig.se, nader.ahmadi(at)hig.se, stefan.sjoberg(at)hig.se, eva.wikstrom(at)umu.se

In this article we examine positive influences on

occupational aspirations and perceptions of occupational attainment among descendants of Middle Eastern immigrants who are in employment. Using a qualitative approach, we conducted twenty-one semi-structured interviews followed by a thematic analysis of the results. Parents' migration biographies and influences from other family members played an important role in creating high occupational aspirations and shaping positive perceptions of occupational attainment among these descendants of Middle Eastern immigrants. Moreover, collectivist features within the family and the parents' embeddedness in the ethnic community resulted in higher involvement in descendants' educational and occupational attainments.

Labour market trajectories of the descendants of Chinese immigrants in Portugal

Sofia Gaspar
CIES-IUL - ISCTE-IUL, Portugal
sofia.gaspar(at)iscte.pt

Chinese migration to Portugal has been growing consistently since the 1990s, and in 2015, the Chinese community was already the fifth most important in the country. A central question to analyze in this context is which are the labor market trajectories developed by the Chinese community (first immigrants and descendants) in Portugal. Previous research has suggested that there are different labor pathways developed by first and second generation immigrants, since immigrants' descendants have an educational and professional socialization closer to the residence country. The aim of this paper is to analyze professional trajectories of Chinese descendants settled in Portugal. Quantitative (Census 2011) and qualitative (semi-structured interviews) data will be used in the analysis, as to understand which factors intervene on their labor pathways in comparison to first generation Chinese. The results obtained have shown a relationship between social integration and the professional strategies developed by Chinese descendants. Those whose social integration is mostly confined to ethnic Chinese enclaves have professional trajectories more similar to those of their parents (e.g., entrepreneurial activities linked to sales trade). By contrary, those descendants whose social integration involves a closer contact to host society perform professional activities that function as a tool in articulating Portuguese and Chinese communities (e.g., translators, teachers, real estate agents, touristic guides, etc). These results shed light not only to social and professional reproduction practices developed by Chinese descendants when compared to their parents, but also to their strategic role as an intermediary social group within first generations and Portuguese society.

Experiences of discrimination and coping strategies of second generation academics during the career-entry phase in Austria.

Margarita Verena Wolf, Lena Seewann, Roland Verwiebe

University of Vienna, Austria; University of Vienna, Austria; University of Vienna, Austria
margarita.wolf(at)univie.ac.at,
lena.seewann(at)univie.ac.at,
roland.verwiebe(at)univie.ac.at

This presentation addresses discrimination as experienced by young academics with a migrant background in the Austrian labor market. Focusing on the descendants of Central Eastern European and Turkish migrants we explore two major issues. First, we ask whether their career-entry and everyday professional life entails origin-specific discrimination. Second, we concentrate on how this group overcomes these experiences. We utilize recent literature that addresses the diversity of individual experiences, with concepts such as "multiple" and "subtle discrimination". This distinguishes us from a long tradition of research, which deals with motives of discrimination, but less often considers the effects on those concerned and the coping strategies applied.

21 problem-centered interviews are the empirical foundation underlying this study. The results indicate a variety of discrimination experiences ranging from barely perceptible disadvantages to overt marginalization. The spectrum covered stereotypical suppositions at job interviews, the disavowal of competencies, symbolic or social exclusion by new colleges, restricted professional participation (e.g. customer contact) and non-recruitment due to religious or ethnical markers. The influence of the education level, networks, or competences seemed to be minimal, as negative prejudice on the basis of visible "social markers" operated "ex-ante". The coping strategies identified are: an increased emphasis on effort, avoidance of potentially marginalizing situations, direct resistance and dismissal of negative experiences by ignoring or ironizing the situation. In some cases the academics drew into their specific competences, such as an intellectual approach of studying specialist literature. Our analysis further suggests a distinction between reactive and preventative strategies of coping.

"Per aspera ad astra": how children of immigrants cautiously climb up the social ladder

Rosita Fibbi, Robin Stuenzi, Philipp Schnell
University of Neuchâtel, Switzerland; University of Neuchâtel, Switzerland; University of Vienna, Austria
rosita.fibbi(at)unine.ch, robin.stuenzi(at)unine.ch,
philipp.schnell(at)univie.ac.at

This paper examines the educational and occupational trajectories among second generation of Turkish and Western-Balkan origin in Switzerland using both quantitative and qualitative methods. The analysis of a representative sample of more than 1100 respondents in Swiss urban areas show that descendants of Turkish and Western-Balkan immigrants have reduced chances to follow a constant successful educational trajectory. Yet their occupational situation shows that they manage to follow upward mobile path more often than the

majority group. Further qualitative enquiry of young adults in the labor market digs into this apparent paradox by mapping out their paths and strategies to achieve this result. We conducted 25 in-depth interviews with immigrant as well as native-origin workers active in the business sector which is the first choice of upper secondary training for second generation. Children of immigrants have a distinctive way from native origin youth of navigating the Swiss educational system which is characterised by an early selection and, at the same time, by a significant degree of permeability between tracks in tertiary education. They pursue an incremental strategy of assertion by further leveraging on-the-job training opportunities to achieve a higher position while securing acceptance in their work environment. They thus manage to profit from specific features of the business sector which appears to be fairly open to upward social mobility.

Spatial opportunity structures and youths' transitions from school to training—varying effect patterns between immigrant and native German youths

Alexandra Nonnenmacher, Alexandra Wicht
University of Siegen, Germany; University of Siegen, Germany
alexandra.nonnenmacher(at)uni-siegen.de,
wicht(at)soziologie.uni-siegen.de

Previous research has shown that school-to-work transitions depend on spatial opportunity structures, that is, the probability of finding a training position is influenced not only by the number of offers in the direct vicinity, but also to a significant extent by the respective number in non-local regions. We now pose the question whether these effects differ between immigrant and native German youths.

In Germany, like in many countries, migrants have smaller opportunities of finding a training position than non-migrants. This disadvantage could be compensated by widening the search radius, but it is known, at least with respect to the working age population, that migrants are less mobile. If this holds for school graduates also, migrants would suffer more from a poor supply of local training positions than non-migrants.

In our presentation, we compare the effects of spatial opportunity structures between immigrant and native German youths, following intersectional theory. We use data on youths' transitions from school into firm based vocational training from Germany's National Educational Panel Study, which enables us to merge regional time-series data about local as well as non-local training conditions. We found that the pattern of spatial opportunity structures considerably varies by ethnicity: Immigrant youths are virtually restricted to the local training market, while native German youths also profit from the training market situation in remote districts. Immigrant youths, whose opportunities are already poor compared to native German youths, seem to be not able to compensate poor local conditions by being mobile.

RN35 | Session 04a Naming and Framing Migrants and Refugees - Processes of Inclusion and Exclusion I

Wither AVR? Detention and its discontents. Problematizing the removal of AVR from detention centres in the UK through the lens of punishment and compliance

Sarah Walker
Goldsmiths, University of London, United Kingdom
swalk002(at)gold.ac.uk

Detention centres and return programmes have become increasingly important instruments of border control across Europe. Drawing on empirical data from interviews with welfare staff in a UK Immigration Removal Centre as well as Home Office senior managers and voluntary sector workers, this paper analyses the Home Office rationale behind the withdrawal of Assisted Voluntary Return (AVR) in detention and what this tells us about the framing of detainees and wider understandings of punishment within immigration control. It reveals how through a responsabilization discourse inherent in Home Office policy the subject of the 'detainee' is criminalised and framed as non-compliant and thus undeserving of 'privileges', such as AVR. In response, both detention welfare officers and voluntary sector workers frame detainees in a more nuanced, sometimes contradictory, manner; recognising the role of the state in creating vulnerabilities and the potential value of AVR for detainees. By examining how dominant forms of discrimination are held in place by the banal ways categories are repeated in everyday discourse, this paper highlights the increasing pathologization of deviance and framing of detainees as criminal 'other'. Mirroring the language of the UK prison service's Incentives and Earned Privileges system, their containment and exclusion from programmes such as AVR, now construed as privileges for those who are compliant, is normalised.

Spain and the U.S. in Comparative Perspective: Media Framing of Unauthorized Immigrants' Rights to Health Care

Anahi Viladrich, Sònia Parella, Alisa Petroff
Department of Sociology, Queens College, The City University of New York, United States of America;
Departament de Sociologia, Universitat Autònoma de Barcelona, Spain; Departament de Sociologia, Universitat Autònoma de Barcelona, Spain
anahi.viladrich(at)qc.cuny.edu,
sonia.parella(at)uab.cat, petroffalisa(at)gmail.com

Passage of the U.S. Affordable Care Act (i.e., Health Reform) in 2010 excluded all unauthorized immigrants from any kind of government-sponsored health insurance. Spain followed suit in 2012, right after the enactment of the Spanish Royal Decree that barred the undocumented foreign born from most publicly supported health services. This reform, driven by the Popular Party, became a turning point in health policy by eliminating universal access to health care —

which up to that point was unique in the world.

This paper relies on frame analysis to examine the discourses that support main agenda-setting arguments concerning unauthorized immigrants in Spain and the U.S. We particularly analyze the media's "frames of inclusion" used to support the right to health care among the undocumented on both sides of the Atlantic. While most research has focused on the exclusion of unauthorized individuals, our approach addresses immigrants' inclusion into the health care safety net. Our comparative results underscore frames that sustain the protection of the nation's health by providing health care to all immigrants, regardless of their legal status — as when promoting vaccination to prevent the spread of infectious diseases. However, while in Spain the media also argues for universal health care access as mandated by the constitution; in the US, it is mostly a market rationale (e.g., the economic benefits of insuring the undocumented) what drives the media's support for inclusion. In the conclusions, this presentation discusses the implications of our research findings and provides suggestions for future research and policy.

The Displaced People of the Middle East in Turkey: An Evaluation of Changing Attitudes towards Syrian Refugees

Serdar Ünal, Kayhan Delibaş

Adnan Menderes University, Turkey; Adnan Menderes University, Turkey

serdarunal(at)adu.edu.tr, kdelibas(at)adu.edu.tr

The issue of Syrian migrants or refugees today is at the forefront of the social, economic and political agenda of the world and especially of Turkey and Europe. As a result of the developments in the Middle East and Syria, the mass migrations that started in 2011 reached nearly 6 million today (2017) according to UNHRC official figures. Turkey has followed the open door policy and took 2.8 million of the Syrians who had to leave their homes. The total number of Syrian refugees in Europe is less than one third of the total number of Syrians in Turkey. In this sense, Turkey has become the country that has hosted the most Syrians among the Middle East and European countries. Also, Turkey is both a host country as well as a transit country for Syrian seeking to reach Europe. There has been a growing academic interest on the issue of Syrian refugees in Turkish academia. The number of Syrians who take refuge in Turkey increases day by day. A significant number of Syrians who want to use Turkey as a transit country to reach Europe are become permanent after a while. According to various empirical studies, negative attitudes towards the refugees, who started to become increasingly permanent in Turkey, began to appear. In this respect, it is important to grasp the socioeconomic and political factors which have been contributing to this negative attitudes. Drawing on current published research on the levels of social inclusion and exclusion of Syrian refugees, this paper aims to grasp the social dynamics of this changing perceptions and

growing negative attitudes towards Syrian refugees.

The outsiders of health care

Mervi Elisabeth Leppäkorpi

University of Eastern Finland, Finland

mervi.leppakorpi(at)yahoo.com

My PhD research "Irregular migrants, alternative Structures and Services" takes place Hamburg, Stockholm and Helsinki, where I look at the position of irregular migrants (third country citizens without residence permit or on-going asylum process in the country) within the supporting structures, such as NGOs, activist groups and religious communities as well as political processes ran around the irregularity. The irregularity is often characterized by the exclusion and lacking implementation of migrants' rights within the state of factual residence. The lacking access to health has been the most discussed way of excluding the migrants without residence permit from the group of insiders. In each city the irregular migrants have been granted some care after political processes. The group of the "undocumented" people who could receive care has been defined differently in each local context and the definition has always been based on a list of descriptions about who is "undocumented" migrant.

I will look in to the inclusion and exclusion in health care before and after the local policies (in Swedish case national law and it's implementation). How has the group of "undocumented migrants" been defined? When the defined group of undocumented migrants get an access to health care – who are still left outside? How does the idea of "deserving migrant" change when the new definitions are put into practice? I am specifically interested in analyzing the city as a difference machine and the concrete places, such as health care centers, as places of inclusion or exclusion.

RN35 | Session 04b Social Mobility II

Downward mobility of Chinese and Indian migrant workers in Sweden

Chia-Ling Yang, Denis Frank

National Kaohsiung Normal University, Taiwan;

Gothenburg University, Sweden

chialingyang0302(at)gmail.com,

denis.frank(at)socav.gu.se

Sweden introduced a new immigration policy in 2008 that encourages labour immigration from countries outside EU. After the immigration policy reform, the largest numbers of migrants comes from Thailand, India, and China.

The migration from China and India is primarily economically motivated. Their different pathways into the Swedish labour market are as the following: (1) being transferred between different sites within a multinational company during a limited period of time; (2) arriving in Sweden under a permanent employment contract; (3) firstly as international students and then into the labour market.

Nevertheless, a significant share of migrants in our study is experiencing downward social mobility in Sweden. Although they are with higher educational background and are aspiring to high-skilled jobs, they are forced to do jobs in the lower segments of the labour market, such as helpers in restaurants, newspaper distributors or self-employment of catering business such as sushi bars.

Based on qualitative semi-structured interviews of Chinese and Indian migrant workers, this study will analyse these migrants' backgrounds, their understanding of their situation and the strategies they have used to try to fulfill their aspirations. With key concepts of social inequality and downward mobility, this article intends to explore the impacts of Swedish immigration policy change on Chinese and Indian migrant workers' life. Moreover, the authors will link their choices and situations in migration processes to local social and economic contexts in both China and Sweden and to global economic contexts. By doing so, this article aims to have further dialogue with migrant studies.

Contribution of South Asian migrant doctors in the UK

Ghazala Yasmin Farooq

The University of Manchester, United Kingdom
yasminfarooq(at)hotmail.com

This paper examines the empirical findings from a doctoral study that involved in-depth interviews with 27 overseas-trained South Asian doctors in three geographical locales in the UK. The study set out to explore how this group of highly skilled elite migrants integrated into the UK society, perceived their identities and whether they had acquired a sense of belonging to Britain.

The driving force for migration was described as the obtaining of post graduate qualifications, acquiring a fellowship and gaining professional experience in UK hospitals, with a view to enhancing career development.

Experiences of blocked social mobility in hospital medicine led to their entry in General Practice. Spatial accessibility to jobs in negotiating entry into General Practice was a further structural barrier as they were only able to access jobs in the least desired practice areas of Britain, that is ex-coal mining towns and inner city deprived areas which had been abandoned by the UK qualified doctors in pursuit of better opportunities elsewhere.

The findings show an interesting intersection of elitism, professional socialisation and overlapping experiences of marginalisation. Their accounts draw attention to the positivity of a negative outcome. They provide a unique insight into the complexity of the relationships in their everyday experiences with white working class patients with whom they developed a close bond. Through entrepreneurial activity and innovation, the doctors were able to embed themselves in the social structure that produced opportunity and while they drew value from the local structure; they simultaneously added value to the

structure.

“I have a bad job and I’m alone here, but I’m not even thinking of going back home!” The Impact of Entrapment in Precarious, Low-Status Work and the Shattering of Familial and Community Networks of Solidarity on the Decision of Migrants to Return in their Origin Countries via the Assisted Voluntary Return and Reintegration Programme: Pakistanis, Bangladeshis and Afghans in Greece in Times of Crisis

Theodoros Fouskas, Fotini-Maria Mine
PhD, Sociologist, Lab. Assistant, Department of Social Work, Technological Educational Institute of Athens, Greece; MSc in Sociology of European Law, Lund University, Sweden
tfouskas(at)teiath.gr, tin_mhn(at)hotmail.com

Why do migrants stay in precarious, low-status/low-wage jobs for extended periods? Can they leave these jobs and enter the formal labor market? If not, do they want to return to their origin country? Since 2010, the Assisted Voluntary Return and Reintegration (AVRR) programme implemented by the International Organization for Migration in Greece has provided various forms of support to individuals wishing to return to their origin country including social and labor reintegration in their country. Focusing on results of in-depth interviews, the repercussions of entrapment in precarious, low-status/low wage jobs of migrants and how these affect their decision to return to their origin countries via the AVRR programme during the economic crisis in Greece are examined. Regardless of the socioeconomic conditions in their origin country, Pakistani, Bangladeshi and Afghan workers' decision is negatively affected due to prolonged stay and isolation in such jobs and specific occupations with low or zero social and labor mobility, thus promoting their entrapment in precarious working conditions and their identification with the characteristics of these occupations. Prompted and entrapped by ethnic, racial and gender division of labor, interviewee migrant workers are alienated from primary and secondary solidarity groups and ties related to their origin country, i.e. family, community associations and compatriots, and develop indifferent attitudes towards them. They act in an atomistic manner, form materialistic beliefs, have low self-perceptions and expectations for social advancement and feelings of pessimism for themselves and deal with their social and work related problems alone, yet are not willing to participate in the AVRR programme.

Post-crisis migration? Dispositions, capitals and positions of Italian migrants living in the UK

Simone Varriale

University of Warwick, United Kingdom
s.varriale(at)warwick.ac.uk

A growing literature is quickly emerging on the relationships between the 2008 economic crisis and the transformation of intra-EU migration fluxes, with particular attention to new emigrations from South

European countries - like Spain, Greece and Italy - to North European countries (e.g. Triandafyllidou and Gropas 2014, Bygnes 2015, King et al. 2016). This literature shows that graduates and professionals represent a significant proportion of such migrations. This paper contributes to this literature with a study of Italian migrants living in the UK, particularly in the West Midlands and London. Drawing on 30 in-depth interviews and on participant observation (and on further interviews to be carried out between February-May 2017), this paper argues that recent Italian emigration to the UK is significantly diverse in terms of occupation, family background, age, gender and race, and that in considering professionals and graduates as a homogeneous category, most studies underestimate significant lines of inequality and social division within the same national group - a problem that affects studies of intra-EU migration more generally. Similarly, the migration projects of people with high school diplomas or compulsory education have been underestimated (despite emerging, via ethnographic enquiry, as sizable groups in the West Midlands and London). The paper thus explores how intersections of class, age, gender and race, as well as differences in economic, cultural and social capital, shape why and how Italians migrated to the UK. Theoretically I combine post-Bourdieuian class analysis and intersectional theory, and explore how social differences manifest through cultural practices, classifications and discourses.

RN35 | Session 05a Making Europe?

Erasmus Mobility in the Making and Unmaking of Europe

David Cairns

ISCTE-University Institute of Lisbon, Portugal
david.cairns(at)iscte.pt

This presentation discusses the results of a research project conducted on the Erasmus undergraduate exchange programme in Portugal between 2015 and 2017, with the aim of understanding the challenges faced by Portuguese universities in maintaining socially inclusive access to mobility opportunities. Conceptually, rather than follow the norms of neoclassical migration theory, the paper argues that Erasmus is a form of reflexive mobility that acts a possible preliminary stage in an internationalised career trajectories, with the simultaneous aim of contributing to intercultural understanding between European Union member states. In this sense Erasmus can best be understood as a form of proto-migration for students and a contributor to the realisation of the dream of free movement for the European Commission. Using material gathered from 24 mobility professionals at eight different universities, it is possible to appreciate some of the challenges entailed in the realisation of these aims in Portugal, particularly enabling students from families affected by the economic crisis and austerity to participate in the programme. In conclusion it is argued that an inability to maintain inclusive access due to the underfunding

of scholarships and the on-going impact of the economic crisis on families limits the possibility of Erasmus becoming a generalised experience for Portuguese students, thus contradicting the overt policy goals embedded in the programme that emphasise the need for a higher level of intra-European circulation.

European mobility rights and national welfare states' protectionism: the end of the European project?

Elaine Moriarty

Trinity College Dublin, Ireland
elaine.moriarty(at)tcd.ie

The 2004 EU Directive on Free Movement extended the right to free movement and residence in the EU from the free movement of workers to the free movement of persons. Currently Europeans can travel, work, study, access and transfer their social welfare protections across the EU, no longer bound by residence or work permits and regardless of nationality.

Having witnessed increased EU integration since the 1990s, individual EU member states have increasingly expressed concerns about 'legitimate means of movement'. A disconnect between the perceived legitimacy of the social-security system understood as based on solidarity with one's own community and the entitlement of mobile European nationals to social protection in their place of current residence, regardless of their sense of belonging has focused debates.

This paper examines the formal transfer of welfare benefits from the UK and Ireland to other EU member states drawing from Department of Social Protection (Ireland) and Department of Work and Pensions (England and Wales) records on social welfare transfers 2000–2010. It analyses UK and Irish welfare policy adjustments since 2004 along with the EU's interventions in relation to such adjustment policies.

The study highlights an increasing focus by the political framework of the European Union on protecting the individual rights of European nationals in a unified labour market. It also reveals national welfare systems attempts to qualify EU social rights with the introduction of a series of social-policy adjustments based on residency during the 2000s, particularly attempts to 'adjust' access to what often continues to be deemed 'national' entitlements and finally the UK's ultimate response, the withdrawal from the European Union.

Social networks of mobile people and migrants in South Tyrol, an autonomous territory in Northern Italy: A sociological research on integration processes

Daniela Gruber

Innsbruck University, Austria
daniela.gruber(at)gmx.com

With regard to the increasing international mobility of people and the new challenges for European

countries in the admission of refugees, the aim of this paper is to show how mechanisms are operating in societies, on the basis of integration processes in South Tyrol, an autonomous territory in Northern Italy. South Tyrol, on the border of Italy and Austria is characterized by three official language groups. In addition, questions of identity and belonging are very strong because of the specific historical background. My qualitative research on ego-centred networks is giving insights into immigrants' access to resources and how their cultural and social capital (according to Bourdieu) is valued in the specific context. In the consequence the analysis of concrete networks at the level of the living environment of immigrants should explain how social inequality influences social developments. In the public discourse and also in media and politics there are tendencies to stress differences, primarily with regard to cultural differences. Responding to this, the aim of the paper is not to view integration through a cultural essentialist lens, in which the notion of culture is seen as something fixed or given, but rather to deal with integration as concrete practices over a long-term period. A comparative approach examines the creation and transformation of social networks by mobile people and migrants from Germany and from Pakistan, which build two majorities of the foreign population in South Tyrol.

RN35 | Session 05b Naming and Framing Migrants and Refugees - Processes of Inclusion and Exclusion II

Citizenship of young migrants: an ethnographic study in Belgium

Rachel Waerniers, Lesley Hustinx
Ghent University, Belgium; Ghent University, Belgium
rachel.waerniers(at)ugent.be,
lesley.hustinx(at)ugent.be

In Europe exclusionary discourses on migrants go along with inclusionary discourses emphasizing their vulnerability and conditional discourses pointing to their individual responsibility to integrate. These political discourses produce a complex and ambiguous enmeshment of political rationalities and concomitant categorizations of migrants, which go beyond the conventional deserving/undeserving binary. Yet little research so far has scrutinized this complexity, in particular from the perspective of the 'lived experience' of the migrants themselves. In this study, we start from the Foucauldian assumption that political discourse can be considered an instrument to govern marginal groups. Concentrating on the citizenship practices of migrants themselves, we aim to investigate how they react towards these discourses. We focus on young migrants who comprise a huge part of the current migration flow to Europe but are often disregarded during the asylum procedure of their parents and are frequently approached as vulnerable and politically mute, also in scientific research. To go beyond this reductive approach, we combined a discourse analysis of the

migration policies in Belgium with an ethnographic study of a project of a Belgian NGO which aims to learn young refugees "to express their story". In line with critical theories of citizenship we approach citizenship not solely as a legal status but also as a dynamic process of negotiating one's belonging and identity within society. In this paper we provide insights in this process, by focusing in particular on young migrants' identity work in relation to public discourses, revealing how they strategically adopt or resist categorizations.

Displaying displacement: Humanitarian representations of refugees' living environments in Europe and the world

Giorgos Kandylis
National Centre for Social Research, Greece
gkandyli(at)ekke.gr

Shelter provision to refugees and internally displaced persons due to conflicts and disasters has been a crucial and controversial stake in the wider global international protection regime that has developed under the UN system since the early post-war era. UNHCR, the UN Refugee Agency, asserts (UNHCR 2014) that refugees' access to secure settlements and shelters are parts of a 'holistic approach' that wishes to 'foster an integrated social and economic way of life' and is meant to apply both to refugee camps and 'out of camps' populations. This paper is about the visualization of refugees' shelters and settlements in photographic material included in official documents and web pages of the UNHCR and other organizations that participate in the humanitarian response to the current 'refugee crisis'. Inspired by Ilana Feldman's (2015) suggestion to understand refugee camps as humanitarian, political and emotional spaces and to analyze the competition between these different kinds of represented refugee lives, I examine the appearances of refugees' settlements/shelters as places of humans in need, places of humans that claim and places of humans that feel. To do so, I apply a combination of visual content analysis and visual social semiotics methods, while published images are also juxtaposed to their textual framing. The outcome of the analysis is a summary of the ways refugees' living environments are either positively or negatively imagined by humanitarian actors, allowing for a comparison of different perspectives among the latter, as well as for a comparison of different approaches between European and non-European environments.

The local governance of immigration and asylum: policies of exclusion as a battleground.

Maurizio Ambrosini
University of Milan, Italy
maurizio.ambrosini(at)unimi.it

The so-called refugee crisis in Europe has highlighted the importance of local societies and local governments for the reception of new immigrants. The paper will focus the case of Northern Italy. Here

many mayors, local governments and political actors have mobilized against the reception of asylum seekers, giving new salience to the concept of "local policies of exclusion". The political debate in the last years has focussed mainly on the issue of asylum, obscuring the fact that many other immigrants settle and work in local societies, holding regular permits or not.

The paper would like to discuss: 1) how local policies frame asylum seekers and immigrants, in particular emphasizing the local dimension of political exclusion of immigrants: 2) how different types of migrants are actually categorized and received in local societies, 3) how different kinds of actors, native and coethnics, favour the settlement of different types of immigrants in local societies, often navigating and also circumventing policies of exclusion.

The governance of immigration, especially at local level, can be defined as a battleground, in which different actors take part, according with various economic interests, social bonds, moral values and political beliefs. The practical governance of immigration and asylum is influenced by these different interests and visions.

The paper is based on several years of studies on irregular immigration, asylum seekers and local policies.

The Migrant Body and What Makes It Strange(r)

Greti-Iulia Ivana
Uppsala University, Sweden
greti-iulia.ivana(at)soc.uu.se

Globalization and global mobility have been vastly researched and discussed topics in sociology over the last half a century. The last decade has particularly seen an increased interest in micro level studies on the experience and meaning of global mobility for those who are living it first hand. The image of the well dressed, tech savvy and wealthy global elite has been questioned by rich ethnographic data on well educated travelers with insecure short-term jobs, as well as highly trained professionals who come from various class and ethnic backgrounds and are faced with a series of challenges in both their home countries and their adoptive ones. However, one of the issues which has drawn little attention in relation to highly skilled migration, is the construction of "at homeness" (Ahmed 2000). Thus, focusing the case of highly skilled migrants in the Stockholm area, I will look into the experience of feeling at home and the ways in which it relates to recognizability. While these topics have been mostly important in theorizations of race, the body out of place, body consciousness and other indicators which make strangeness recognizable are fundamental for understanding processes of inclusion and exclusion of migrants beyond their physical features. Living in a new unfamiliar environment and the suspension of one's feelings of at homeness in the world and in their own body are present for highly skilled migrants and the addition of this category of subjects allows us to problematize the relation of exclusion with ethnicity, gender and class

belonging in new ways.

Naming emotion in an immigration office: the borders of empathy as the borders of national community

Kaja Skowronska
Sciences Po Paris, France
kaja.skowronska(at)sciencespo.fr

The agents of immigration-related "street-level bureaucracies" (Lipsky, 2010) can be seen as front-line gatekeepers. The work of those agents responsible for the implementation of legal provisions consists of daily application of categories to people through the granting (or refusal) of a status to individual immigrants. Besides the categories established by law, more subtle forms of categorization take place in the everyday contacts between the administration and its immigrant public. Emotion plays a crucial role in this process, both as a product of the interaction and as an object of interpretation. How the immigrant's emotion is read and what emotion their behavior produces in return will have a crucial impact on the treatment they receive.

This paper is based on a case study of one such local-level agency in Poland. A three-month long participant observation was conducted in the summer of 2014, later completed by a series of interviews with civil servants.

While the study was conducted before a significant rise in hostile attitudes towards foreigners could be noted in Poland in 2015, a careful examination of the role of emotions reveals a series of latent ideas and attitudes that can throw a light on those overt forms of enmity. Thus, the aim of this paper is to use a case study of a street-level bureaucracy to gain a better comprehension of the preconceptions present in everyday interactions between immigrants and administrative personnel, but also in society at large.

RN35 | Session 05c Participation and Reception

The experience of the integration process in destination countries: the Romanian returnees' perspective

Georgiana-Cristina Rentea
University of Bucharest, Romania
georgiana.rentea(at)gmail.com

The evolution and recurrence of migrants' decision to return to the country of origin and also their patterns of the reintegration after returning are influenced by various factors related to the context in the home country as well as the integration experience in the destination country. Thus, it is useful to understand the perceived integration experience in the destination country as a possible explanation for their post-return experiences and reintegration process.

In case of Romanian returnees, their number is unknown since the legislation is not enforcing such an obligation on the individuals. We have conducted a qualitative research to find out how they perceive

upon return their socio-economic integration experienced abroad (working and living conditions, skills formation, work environment etc.) including the relationship with their own migrant communities. The findings are obviously bringing to the fore the comparison between country of origin and country of destination that the returnees are making when describing their perceived integration experience abroad. The integration in the destination country is reported by Romanian returnees as being a more positive experience than the reintegration in the country of origin. This is reported to be due to the lack of support from Romanian government that the Romanian returnees reported to have experienced upon their return to the country of origin. On the other hand, the Romanian migrant community abroad is described by comparing it with other migrant communities and considering the support offered during the settlement process.

**Postethnic Activism in the Nordic Region:
Between Inclusionary Strategies and Separatism**

Suvi Päivikki Keskinen
University of Turku, Finland
suvkes(at)utu.fi

During the last decade, retreat from multiculturalism and othering narratives of Muslims and non-western minorities have characterized media and political discussions in many European countries. Racialized minorities have been framed as problematic outsiders claimed to separate themselves in 'parallel societies' and enhance illiberal cultures. Simultaneously, profound changes have occurred in conditions for political action. Neoliberal political rationality implies an emphasis on individualization and entrepreneurialism, but has also brought fore a call for civil society actors, such as NGOs and political subjects seen to embody diversity, in the public sphere.

This presentation examines postethnic activism in which people mobilize on basis of their racialized minority position in the society rather than on ethnic group membership. Based on interview, observation and media data gathered in Sweden and Denmark, the presentation explores the different choices that activist groups have made regarding organization and participation, as well as the motivations and effects of different strategies. Several newly established networks and social media platforms especially in Sweden have adopted separatist strategies, restricting participation and commenting on the platforms only for women and transpersons and/or racialized minorities. These sites have become extremely popular among the younger generation of racialized minority persons. However, in the (white dominated) public sphere, these groups have been harshly criticized and perceived as a threat. Simultaneously, other minority activist groups promote inclusionary strategies that provide space for differently racialized minorities and majority members, and seek for ways to deal with the rising tensions and power relations.

Between the market and human rights: the use of public procurement to provide for reception and protection needs in the context of the refugee 'crisis' in Greece

Lena Karamanidou, Katharina Sarter
Glasgow Caledonian University, United Kingdom;
University of South Wales
lena.karamanidou(at)gmail.com, sarter(at)gmx.de

The governance of services provided to asylum seekers and refugees in the context of European asylum and reception systems has undergone significant changes over the last few decades. Mirroring broader developments of marketization (Bode 2009; Pollitt and Bouckaert 2011), these services have been increasingly provided through the use of public contracts (Darling 2016; Lethbridge 2016). While the European Commission holds public procurement - the purchase of services by public sector bodies - as a suitable mechanism for satisfying 'adequately and speedily the most immediate needs of the asylum seekers' (2015:2), market based provision of services for asylum seekers and refugees has been argued to undermine the quality of services provided as it prioritises profit (see Darling 2016; Gledhill 2016; Welch 2014).

Against this background, we present the results of an empirical study on market-based tendering of services for asylum seekers - namely interpretation and catering - in Greece, one of the countries most affected by the rapid increase in refugee arrivals and EU asylum and migration policies. We analyse key features of the calls for tender - such as contract specifications and award criteria - which indicate the importance given to price relative to the quality of contracted services. Our findings point to a prioritisation of costs over service quality and safeguarding appropriate standards of services. They also raise doubts about the appropriateness of current procurement practices to ensure essential services and to safeguard the human rights of asylum seekers in rapidly changing conditions characterised by acute humanitarian and protection needs.

Are Movers More Egalitarian than Stayers? An Intergenerational Study of Financial Decision-Making amongst Turks in Turkey and Western Europe

Sebnem Eroglu
University of Bristol, United Kingdom
S.Eroglu(at)bristol.ac.uk

This study seeks to examine the role of international migration in shaping the financial decision making behaviours of married couples through a comparison of three generations of Turkish migrants to Europe (i.e. movers) with their counterparts who remained in Turkey (i.e. stayers). The research base for the study is the 2000 Families Survey, which located men who moved to Europe from high migrant-sending regions in Turkey during the guest-worker years of 1961 to 1974 and those who stayed behind, and charted their families in Europe and Turkey up to the fourth

generation. The data is drawn from a subset of 4215 personal interviews performed randomly with married individuals nested within 1713 families. International migration is shown to have an effect through a) enabling more intense acculturation of younger generations within less patriarchal contexts and b) weakening the transmission of financial decision-making behaviours and associated gender ideologies across family generations.

RN35 | Session 06a Refugees between open Reception and Social Closure: Xenophobic Rejection and showing Solidarity in Civil Society and Social Movements in the EU

The role of citizen initiatives in providing housing alternatives for refugees

Hanne Wiegel

Wageningen University, Netherlands, The
hannewiegel(at)t-online.de

Publicly provided accommodation for refugees has in recent years received much criticism for segregating refugees socially and spatially from wider society, and thereby preventing their inclusion into society. Focusing on the case of the Netherlands, this paper looks at citizen initiatives that counteract the shortcomings of the public system by enabling alternative (temporary) housing options for refugees in the private homes of Dutch citizens. These private housing arrangements that can provide refugees with access to social networks, language practice and job opportunities, thereby potentially enhancing their social emplacement. I argue that studying the participating Dutch citizens with a focus on their personal drives, expectations and interpretations of facilitating such housing alternatives can provide us with important insights into the means citizens have in contesting the marginalization of this group through bottom-up initiatives, specifically in the light of the increasingly discouraging national housing policies for refugees. Based on empirical research among the facilitators of such private housing arrangements for refugees, an important aspect to discuss in this paper is the thin line such initiatives face between on the one hand challenging the public refugee accommodation system through the provision of bottom-up alternatives, which can be interpreted as Rancièrian disruptive politics by overcoming state-imposed segregation of refugees; on the other hand, enabling the retreat of the state by taking over inclusive responsibilities towards refugees, which many research participants consider as lying with the government rather than the citizens.

Moral ideologies in civic aid for refugees in Hungary

Margit Feischmidt, Ildikó Zakariás

Hungarian Academy of Sciences Research Center for Social Sciences, Hungary; Hungarian Academy of Sciences Research Center for Social Sciences, Hungary
feischmidt.margit(at)tk.mta.hu,

zakarias.ildiko(at)tk.mta.hu

The presentation focuses on moral principles and ethical reasonings of volunteers providing civic aid for refugees in Hungary, active during the 'crisis' of spring-autumn 2015. The paper would contribute to understand the working of the humanitarian perspective when surrounded by the overwhelming presence of securitization discourses.

Based on 32 qualitative interviews, carried out among volunteers, ideologies of universal human responsibilities, professional obligations, active citizenship, political motivations, moral responsibilities related to class position and resources, religious ideologies, particularistic solidarities and solidarity based on gender/family roles will be revealed. Qualitative results on volunteers would be contextualized using nationally representative survey data focusing on population attitudes implying or hindering support for civic aid for refugees.

Our analysis would complete qualitative inquiries already existing in France, Germany, or Greece on pro-refugee activism and volunteering with the Hungarian case; and also would contribute to the Europe-wide missing literature on the magnitude and characteristics of support for refugees based on quantitative nationally representative data.

By analyzing the working and structure of moral reasoning, we also aim to expand theoretical descriptions of the "humanitarian reason" (developed by Fassin, Ticktin, Boltanski, Calhoun among others) with insights from a semi-peripheric society, to contribute to understanding humanitarianism as embedded in a complex net of local and transnational relations.

Between subversive and professional humanitarianism: on civil support for refugees in Brussels, Calais and Dunkirk.

Gert Verschraegen, Robin Vandevooort

University of Antwerp, Belgium; University of Antwerp, Belgium

gert.verschraegen(at)uantwerpen.be,
robin.vandevooort(at)uantwerpen.be

In the late summer of 2015, many European citizens expressed and enacted their solidarity with the newly arrived forced migrants. Almost overnight, thousands became civil humanitarian aid workers or political activists, while many more dropped off food, clothes, medicines and tents in refugee camps where the state remained remarkably absent. By drawing on the cases of the Brussels-based Citizen Platform and the refugee camps in Dunkirk and Calais, this presentation seeks to develop an understanding of on the tensions and challenges these acts of solidarity have faced over time. While these acts have generally been subversive to a ruling political consensus centred on discouraging forced migrants to enter Europe, some of the structural tensions they encountered have tended to annul their subversive character. We discuss four such tensions in particular. First, between addressing needs that were singular

time, space and objects (e.g. hunger and cold of particular persons) addressing structural needs (e.g. hygiene and access to medical rescoures). Second, between the effectivity of vertical professional humanitarian aid and the voluntary nature of horizontal civil support. Third, between addressing the lack of action from their national governments and large NGOs, and functionally legitimating their policies by fulfilling their responsibilities. Fourth, between initially subverting exclusionary subject categories (e.g. immigrant vs citizen) and ultimately re-inserting a distinction between refugees and undocumented migrants.

Diaspora on the Wane? Uses of the Diaspora Term in Recent Scholarship

Agnieszka Ewa Legut

Pedagogical University of Cracow, Poland

agnieszka.legut(at)gmail.com

Since the late 1980s, the term diaspora has enjoyed – and so have its derivatives - an exponentially growing popularity among researchers. Diaspora came to be seen as 'the exemplary community of the transnational moment' (Tölölyan), since it proved to be well-fitted to the new transnational lens of analysis that challenged the container model of society. The term appeared in a number of contexts and across an array of disciplines. It was used to refer not only to ethno-national collectivities, but later also to other dispersed categories such as e.g. queer diaspora. In the result of this semantic stretching, it became too inclusive and thus some theoretical efforts followed to develop the term's conceptual underpinnings. The paper aims, firstly, to trace the diaspora concept in its various uses: either as (a) descriptive typological tool referring to essentialised communities, (b) a trans-state social and political movement, or as (c) an identity idiom. Secondly, by analysing recent literature in this respect, the paper attempts to show how - in terms of quality and quantity - the concept is used nowadays; to finally reach a conclusion on whether the diaspora term, once so popular, is still a tool with heuristic potential.

ansapoun(at)psed.duth.gr

This paper draws on public deliberation discourses on

a new citizenship law in Greece and discusses the lines of argument identified in the ways in which citizenship is negotiated in the context of 'the current situation in Greece' – the financial situation and ensuing political consequences internally and in the EU, and the refugee and migration issues, heightened since the beginning of 2015. The law, which included for the first time provisions for jus soli access to Greek citizenship, was uploaded for public deliberation on the online platform www.opengov.gr. We analysed the posts submitted to the platform focusing on the ones addressed to the article which concerned citizenship provisions for the children of immigrants. These were analysed based on the premises of rhetorical and critical discursive social psychology. In the posts throughout, commentators commonly introduced their comments on the citizenship law with an etymological definition of 'ithageneia' ('directly descended'), followed by a distinction between 'ithageneia' and 'ypikootita' ('subject of'). This distinction did not necessarily culminate into arguments in support of granting Greek citizenship to the children of immigrants. Rather, commentators also commonly mobilized nature or the laws of nature and institutional law, and drew a distinction between the two as incompatible, arguing that ithageneia is not reducible to institutional laws. In doing so, nevertheless, commentators drew on institutional laws and constructed the citizenship law as illegal and/or unconstitutional, appealed to universal laws on national determination, constructed immigrants as illegal or distinguished the people from the state and called for a referendum. We discuss the ways in which these arguments are implicated in processes of othering and inclusion in the context of current immigration debates.

Everyday Nationhood on the Web: An Analysis of sentiments & Discourses Surrounding Romanian & Bulgarian Migration to the UK Using Twitter Data

Bindi V. Shah, Justin Murphy, Jessica Ogden

University of Southampton, United Kingdom;

University of Southampton, United Kingdom;

University of Southampton, United Kingdom

B.Shah(at)soton.ac.uk, J.M.Murphy(at)soton.ac.uk,

J.R.Ogden(at)soton.ac.uk

On 1st January 2014, restrictions were lifted on the migration of Romanians and Bulgarians to the UK. Leading up to this date and since then, heated debate has ensued about the impact of this migration. Discourses and images of the country being swamped by this new 'other' have proliferated. We employ a mixed-methods approach to investigate how these debates were discursively constructed over the micro-blogging platform Twitter between October 2013 and March 2014. We first explore differences among users with a high degree of network centrality (mostly but not only popular British media outlets) and the far more numerous isolated users with low network centrality. Drawing on the concept of everyday nationalism, we then ask: how do individuals, those with low network centrality, rather than politicians or

the media shape ideas about who can belong to the nation on an everyday basis; and what kind of nationalisms do micro-blogging platforms enable in relation to debates about immigration. Discourse analysis of the tweets reveals the presence of both anti-immigrant and pro-immigrant discourses. However, the former conveys a cohesive set of narratives of exclusive nationalism, while the latter are too diverse and complex to promote an inclusive idea of Britishness. Further quantitative analysis on sentiments and ideology embedded in the tweets confirm these qualitative findings. Our findings suggest that micro-blogging platforms provide a convenient vehicle for those promoting heightened exclusive nationalisms.

Out of the Shadows: Refugee Policy in the Time of Crisis

Adriana Mica, Anna Horolets, Mikołaj Pawlak, Paweł Kubicki

University of Warsaw, Poland; University of Gdańsk, Poland; University of Warsaw, Poland; Warsaw School of Economics, Poland
a.mica(at)uw.edu.pl, anna.horolets(at)ug.edu.pl, mikolajpawlak(at)uw.edu.pl, pkubick(at)sggwaw.pl

The so called European refugee crisis of 2015 placed refugee policies at the centre of heated public debates in the whole Europe, including the countries in which the public awareness of refugee policies was very weak despite the fact that such policies existed. In this paper, we analyze how public attention to an issue impacts its framing in public policies by comparing three countries: Hungary, Poland, and Romania. Each of them reacted differently to the European crisis: Hungary openly refused to accept the relocation scheme, Romania accepted the scheme, while Poland was trying to avoid accepting the relocations, although did not openly announce so. The paper is based on the analysis of Hungarian, Polish, Romanian, and European level policy documents (acts, ordinances, strategies etc.); opinion polls on attitudes towards refugee policies; and media coverage of refugee crisis and policies; and interviews with actors relevant to the refugee policy-making and implementation.

Our research shows that the upsurge of public attention impacted framing of the refugee policies. The policies run earlier in a technocratic mode under significant influence of European Commission became the subject of 'hot negotiations', which in turn opened the door for the production of new framings, e.g. the one suggesting that these policies primarily address the issues of security of a host country and not the protection of the refugees.

Social Inclusion of Indian Punjabis in Germany: From Refugees to Citizens

Arani Basu, Amrita Datta

KIIT University, Bhubaneswar, India; KIIT University, Bhubaneswar, India
arani.basu(at)kiss.ac.in, amrita.datta(at)kiss.ac.in

This paper focuses on the Indian Punjabis who

migrated to Germany in mid-1980s due to Khalistan movement and consequent political turmoil back in the country and eventually settled in the host society. Most of them belong to the Sikh community and are easily identifiable due to their distinct headgear. The authors met quite a few of them during the pilot study on Indian diaspora in Germany in cities like Berlin, Cologne and Frankfurt. Now in their mid-forties, most of them arrived in Germany in the early or mid-twenties. The peculiarity of this profile of Indians in Germany lies in the fact that these Punjabis came to the host society as refugees but eventually became citizens through matrimonial alliances with native Germans or political asylum. Initially surviving on low-skilled jobs, most of them are presently engaged in the Indian culinary industry in Germany. In this paper, the authors' aim is to capture each of their journeys in Germany from being irregular migrants to German citizens within the larger context of assimilation, social inclusion and socio-political integration of migrants in the host society. The paper would chronicle case studies of such refugees-turned-citizens of Germany from India within the larger context of recent refugee crisis in the host society and the challenges of social inclusion and integration of them in the mainstream German social life.

Willy Nilly Belonging: The Fears and Exclusionary Practices of/against Greece Turks and Anatolian Greeks after Population Exchange

Ozlem Akay DINC, Bayram Unal

OHU, Turkey; Research Affiliate, FBC SUNY B
akayozlem(at)yahoo.com, bg21015(at)gmail.com

The French Revolution at the end of the 18th Century was an important milestone in shaping political structure of Europe through the next two eras. By the 19th Century nationalism dramatically spread all over the Europe including the Ottoman Empire. Then based on the Lausanne Convention thousands of people had to expulse simultaneously between Greece and Turkey for the sake of the nationalism requires homogeneity by its own nature.

However, this expulsion had caused exclusionary paradoxes since both the Christian Greeks in Turkey and Muslim Turks in Greece have been framed through ipso facto culture unique to their former habitus. Therefore the population exchange had not been in line with the expected cohesion based on the national and religious patterns at both sides. On the contrary, the exchange program has further caused the social exclusion and in turn their marginalization in their new homes along with the fear against their de facto habitual societal values.

In this study, we aim at historical comparison of the fears and exclusionary experiences of bilaterally exchanged people of Greeks in Corfu and Turks in Yesilburc Village at Nigde Turkey. Additionally we aim to underline the patterns and dynamics of solidarities at both communities since they developed a communal identity based on the solidarities. The findings will be gathered through the in-depth interviews and narratives at both sides.

Social Innovation and Local Welfare Practices in Vulnerable Areas of Southern Italy

Fiammetta Fanizza, Carlo Colloca

University of Foggia, Italy; University Catania, Italy
fiammetta.fanizza(at)unifg.it, carlo.colloca(at)unicat.it

The paper regards social innovation in local welfare practices in the South of Italy. In particular the focus concerns areas involved in agricultural productions where migrants are farmhands. Their main problem are job exploitation and dwelling conditions.

The rural landscape of Southern Italy is a constellation of slums and ghettos, reminiscent of the experience reported in the social novels and in the first socio-demographic surveys (Engels). So migrants cannot establish social relations neither with Italian population nor with territories in which they live: as a result they can be considered as a space in between.

Even if a real integration with local people is the main goal of many local welfare systems, in Italy politics lacks of an effective way of operating and, over all, a multicultural approach to the problem solving.

Recently Puglia, Calabria and Sicilia try to realize the right of citizenship for migrants and the end of social conflicts. These regions are elaborating generative welfare measures. These latest are founded on the right to sustainability in favor of both individuals and the territories. To support this right, what is very useful is the partnership among migrants, local people, public administrations and social partners. The point of view of this partnership is solidarity even to delete the word "emergence" from welfare policies and to encourage inclusive processes. Moreover, solidarity is the good approach to assume rights and social duties as activities for the building of shared territorial scenarios and, not last, to increase the development of multicultural lifestyles

Mobilities around wine growing areas: the cases of Napa in the United States and Ribera del Duero in Spain

Martha Judith Sánchez Gómez, Inmaculada Serra Yoldi

Universidad Nacional Autónoma de México, Mexico;
Universidad de Valencia, España
mjudith(at)sociales.unam.mx,
inmaculada.serra(at)uv.es

Since the mid-twentieth century there has been a growing mobility of day laborers to work temporarily or permanently in various wine-growing areas around the world. We will focus on analyzing the different mobilities that have been generated by the boom in wine consumption and the emergence of new wine-growing areas, as well as by the transformations that have been experienced in the traditional areas of wine production. We will analyze two cases: Napa County in the United States and Ribera del Duero in Spain. Both areas are world famous for their wines. In a growing market of global wine competition both areas have undergone various changes. In this paper we will analyze the mobilities of day laborers attracted by the work in the vineyards. The characteristics of the work

have led to both the settlement of migrants and the temporary and circular mobilizations of workers. The comparison between the two places will be of great interest to understand the characteristics of the mobilities in two wine-growing areas that are explained by several factors. The paper is based on the qualitative information that has been collected over the last three years in the two wine-growing areas mentioned. Interviews have been conducted with different actors: immigrants and migrants of diverse national origins, sex, and temporary and circular migrants. A number of key actors have also been interviewed.

Neo-rurality, crisis and social change in Europe. Ethnographic fieldwork between the Muse and the Roya Valleys

Luca Giliberti

University of Genova, Italy
lucagiliberti(at)hotmail.com

The phenomenon of neo-rurality concerns migration processes from the city to the rural contexts. It is a recent trend that manifested in the last quarter of 1900 and is directly related to the outcomes of globalization. It is a global phenomenon, present in different areas of the world, and it emerges more strongly precisely where the processes of industrialization and urbanization have occurred in a more relevant and accelerated way. Neo-rurality concerns complex and various types of experiences and the phenomenon is characterized by elements such as diversity and variability.

Contemporary Europe is experiencing a moment of general crisis. It is an economic and financial crisis, that began in 2008, to which the crisis of political representation and the migration crisis, in more recent times, are associated. In this sense, some authors speak about a crisis of Europe, rather than a crisis in Europe. The phenomenon of a growing neo-rurality fits into this scenario and it contributes to social change in certain rural areas -for example in the new peasantries and alternative agro-food networks- through relational processes, sometimes dialoguing and other times conflicting, between natives and neo-rurals.

In the neo-rural contexts of this ethnographic research -the Muse Valley, in the southern French hinterland, and the Roya valley, in the Maritime Alps in the militarized border between Italy and France- these different dimensions of the crisis are intertwined, underlining the close connection of these phenomena. The present communication explores the relationships between natives and neo-rurals and the processes of social change in action in the analyzed territories, stimulated by the presence of neo-rural subjectivities.

RN35 | Session 07b Naming and Framing Migrants and Refugees - Processes of Inclusion and Exclusion IV

"In/visible migrant children: bureaucratic 'offshoring'; internal(ised) borders and the state"

Nando Sigona, Rachel Humphris
University of Birmingham, United Kingdom; University of Birmingham, United Kingdom
n.sigona(at)bham.ac.uk, r.humphris(at)bham.ac.uk

Amid security 'crises,' states use geography creatively to undermine access to legal representation, human rights, and avenues to asylum. Enforcement operations reach offshore, moving the border to the locations of asylum seekers and carrying out detention in places between states. This paper presents how a further technique of governance is to place migrants not physically offshore, but bureaucratically outside state protection. We argue that these strategies have a dual aspect for migrant children, rendering some hyper-visible and others invisible. This paper first presents the case of trafficked and unaccompanied asylum seeking children (UASC) analysing how data is used across Europe to create a 'hypervisible' political narrative around these children. Concurrently, we draw on the UK to illustrate how this process masks children who do not claim asylum. The article then moves to present the case of undocumented children in the UK, especially UK-born children, and their invisibility in public and political debate on children rights. It also shows the ways that legal status and age intersects to 'make visible' their precarious legal status as they come to age. Thirdly, we present how Roma children act to make the family visible in Europe, revealing their precarious status leading to administrative removals. These three cases demonstrate how assessments of characteristics interact revealing shifts of border enforcement that are tied not only to physical peripheral zones but also bureaucratic peripheries in liberal democratic states. It also investigates the outcomes of in/visibility from the perspective of affected children.

Two Migrations, Two Decades Apart: Bosnian and Syrian refugee migrations and the rationality of temporality

Maja Muhic, Maja Halilovic-Pastuovic
South East European University; Trinity College
Dublin, Ireland
m.muhic(at)seeu.edu.mk, halilovm(at)tcd.ie

2015 and 2016 have been marked by the Syrian refugee crisis which is the greatest refugee crisis Europe has seen since the Balkan conflict in 1990s. Since the beginning of the crisis more than half of the country's population have fled their homes, resulting in 12 million refugees. This recent wave of refugee migration from Syria to Europe took Europe by surprise and has resulted in a discourse and a series of actions that are attempting to survey, control and manage this migration.

The aim of our paper is to compare the current

European discourse towards Syrian refugees to the European discourse towards Bosnian refugees two decades ago. Like the Syrian refugee migration, Bosnian refugee migration resulted in serious and unpredicted major refugee movement. The conflict that happened in Bosnia was the bloodiest conflict in modern European history and, as in the case of Syria half of the Bosnian population was displaced by the conflict.

Our paper argues that despite the two decades between the two crises the European discourse towards the refugees has not changed, rather it has become more radical in conveying strongly anti-immigrant rhetoric and xenophobic tendencies. In the paper we discuss two different ethno-cultural and ethno-religious contexts of power relations, as they exist with regard to the Bosnian and Syrian cases, but argue that what continues in both cases is a misplaced understanding of Europe as white and Christian. In particular we discuss the rationality of temporality that is used as a mechanism of control in both cases.

Subverting legal norms: migrants' claims and their interpretation of human rights

marco perolini
Goldsmiths College of London, United Kingdom
mpero002(at)gold.ac.uk

Migrants who mobilise in social movements often lay claims formulated in terms of human rights' wrongs. Some scholars have interpreted human rights as a cosmopolitan body of principles on the basis of which everyone, including non-citizens, could pursue an emancipatory agenda towards the state. However, international human rights law offers little opportunities for sub-citizens and un-citizens (Nash, 2009) to claim and exercise rights.

Migrant-led social movements could contribute to constructing human rights "from below" and to propose subversive interpretations of existing legal categories. For example, they could blur the dichotomy migrant/refugees and dispute the different regime of rights associated with each of those categories under international law.

Non-citizens mobilizing in social movements engage in acts of citizenship (Isin, 2008) that are symbolically subversive as they question liberal notions of citizenships. However, they may also more concretely open up interpretations of existing legal norms that could lead to new opportunities for claiming or exercising rights, including for those who do not fit codified legal categories, such as migrants who do not qualify as refugees.

This paper seeks to investigate the framing of the claims laid by migrants who mobilize in social movement, the role played by their legal status in collective identity-formation processes and the meaning they attach to human rights.

The paper critically analyzes the concept of human rights by exploring how migrants may interpret and rely on them to frame their claims while participating in social movements. It is purported at illustrating how

migrant-led initiatives can build innovative notions of human rights “from below”.

Ethnic others, migrant mothers. Construction of moral boundaries in French and Finnish immigrant integration policies

Linda Haapajarvi

École des hautes études en sciences sociales, France
linda.haapajarvi(at)ehess.fr

When interested in the moral conditions of belonging, scholars have previously concentrated on analyzing the sexual boundaries of the nation and the family as a significant site of state intervention in immigrant integration policies. Based on an analysis of a corpus of French and Finnish policy documents instituting gendered immigrant integration policies this article shows that it is not the only sphere on which the moral deservingness of migrants is evaluated. It starts by asking three interrelated questions: What kind of moral boundaries are drawn in immigrant integration policies? How are such boundaries drawn? What kind of social inequalities are produced by these boundaries?

By articulating the theoretical perspectives of situated intersectionality, cultural processes of producing social inequalities and moral regulation of social bonds I first show that domestic moral conditions migrant women's belonging to the national collectivities in both countries whereas professional morals play a more prevalent role in Finland as do civic moral norms in France. I then move on to discussing two types of social inequalities the definitions of the nation's moral boundaries produce. Categorical social inequalities are the result of boundary work and amount in the exclusion of groups like postcolonial migrants, men and non mothers. Individual inequalities are produced by the standardization of certain moral norms and exclude individual who do not exhibit certain moral characteristics, i.e. participation, autonomy, responsibility, sense of equality. I conclude by comparing the moral conditions of belonging that Finnish and French gendered immigrant integration policies produce and the groups and individuals in risk of exclusion in each national context.

RN35 | Session 08a Religiously Active Migrants in an “(Un)Making” Europe?

Communicating Through Food in a Mosque: Making Lahmacun Eating Doner Kebab

Irmak Evren

Middle East Technical University, Turkey
irmakevrenn(at)gmail.com

The value of eating conflates multiple meanings and gender relations addressing who, what and where to eat. Regarding Turkish Muslim migrants in France, in one of the associations of DITIB Paris (Turkish-Islamic Union for Religious Affairs); Association Amicale Franco-Turque in Carrières-sous Poissy, mainly called as ‘cami’ (mosque) by community members in daily discourse, there are two distinct activities held

regularly by men and women, separately. On Fridays, women are gathered in the kitchen area to make and sell ‘lahmacun’ to the community members, passersby and other Muslim communities in the district. On Sunday afternoons, men and sons (when their Quran instruction course is finished) are gathered for having ‘doner kebab’ in the ‘lokal’(café) organized by the members of the Youth Club of the community, preparing, selling and serving the doner kebab. Bearing the ‘traditional’ marks in Turkish food culture, herein, they crystallize Turkish identity. In addition, even though meat is constructed as a masculine food (Sobal, 2005) its preparation, serving and consumption process is also gendered. On the other hand, these activities are voluntary, social events, connected with responsibility and duty. The money is collected for the relocation and improvement of the complex, aimed to have various facilities open to women, men and children according to their needs, stressing their subjectivities in French society while proposing a way to reconstruct gender relations. An ethnographic study of the relevant association, in the periphery of Paris, is held in 2016, by using multiple qualitative methods; participant observation and semi-structured in-depth interviews to highlight the ways of women’ participation in the community through food by ‘doing-gender’ while men remain as the original, legitimate members.

Intersections Between Religious Beliefs & Practices of Migrant and Minority Peoples and Religions and Socio-Political Challenges in Contemporary Societies

Pat Cox, Thomas Geisen, Nettie Boivin

University of Central Lancashire UK, United Kingdom;
University of Applied Sciences and Arts, Northwestern Switzerland, Switzerland;; Nazarbayev University, Kazakhstan.

pcox2(at)uclan.ac.uk, thomas.geisen(at)fhnw.ch,
nettie.boivin(at)nu.edu.kz

In the 21st century globalization, widespread immigration and the return of religion as a contested set of beliefs and practices to the public sphere, have led to reconsideration of concepts related to citizenship, religion and secularism. Especially in some western countries, previously civic education, while respectful of religious beliefs and practices in the private sphere, endorsed secular perspectives in the public sphere. In other countries the role of religion varies; religious life may play a crucial part in both private and public spheres. Migration impacts upon existing multicultural societies; migrant and minority peoples retain interdependent relationships with families and communities in their places of origin while making new lives characterized by networks; social integration; relationship ties of family, neighbourhood, religious faith or combinations thereof.

Diversity and multicultural education frequently correlates with introduction into new political and social systems in the country of immigration, whereas religious education often is established to maintain social and cultural ties with families or communities in

places of origin. Individual, family and community religious practices and how these intersect with civic demands, are significant.

Drawing from reviews of recent literature on both religious and civic education (2012-2016) in each of three nations - Kazakhstan, England and Switzerland – the authors examine how and in what ways the religious beliefs and practices of migrant and minority peoples shapes their responses to socio-political challenges and how and in what ways their religious communities contribute to religious diversity in contemporary societies. (241 words)

Bags of faith. Religious minorities in Galicia

Montserrat Golias

University of A Coruña, Spain

montserrat.golias(at)udc.es

The immigration explosion in Spain at the beginning of the millennium has played a decisive role in the visibility and growth of religious pluralism. However, when we refer to Galicia, a region located in the Northwest of Spain, it is returning emigrants that have been responsible for these new forms of living and expressing faith in a hostile context towards diversity. And it is this particularity that adds value to this work. With the arrival of migrant returnees from America and later on from Europe, Galicia opened up to new evangelical denominations and other Christian doctrines. But they had not only arrived to stay, this importation of non-Catholic confessions, has had its importance throughout Spain, since some of these communities have built their church around the life story of a Galician immigrant, becoming the gateway to religious diversity in Galicia and later expanding to the rest of the Spanish territory. The bonds of these pioneers of these minority confessions with Galicia, have also been one of the factors that have favoured their integration and subsequent expansion, accepting what is different when it is represented by one of our own, a native.

The origins of Galician religious diversity and subsequent establishment have been built thanks to qualitative methodology, from the interviews of up to 96 believers and representatives of various religious denominations in this community.

Kurdish migrants in Istanbul as members of religious minorities

Karol P. Kaczorowski

Jagiellonian University, Poland

karol.kaczorowski(at)gmail.com

Treaty of Lausanne recognized in, then newly established, Republic of Turkey only minorities based on religious affiliation, therefore excluding Kurds who in majority are Muslims. Excluded were also Alevi who were treated as part of adherents of Islam. The organization of the religion in the country – inspired by French laicism – limited religious influence to the state institution of Presidency of Religious Affairs (often referred to in Turkish, shortly as: Diyanet), which promotes Hanafi school of Sunni Islam. Majority of

Kurds are adherents Shaf'i school of Sunni Islam. Moreover numerous among them in the country are Alevi and some (mostly those living outside of Turkey) are also adherents of minority religions that are often treated as native to Kurdish culture, e.g., Yezidism and Ahl-e Haqq. The presentation will examine the experiences and opinions of Kurdish migrants in Istanbul in regards to their religious differences. These differences were described as appearing during everyday interactions with other inhabitants of Istanbul. Examined will be attitudes of Young Kurdish migrants, towards religion, religious affairs in Turkey and negotiations of their cultural identity connected with religious otherness. The findings are based on 50 interviews with young migrants, who mostly migrated to the city in the 21st century with relatively less insecurity driven internal migration wave. Supplementary to these results will be additional interviews with representatives of Kurdish organizations in the city and group interview with conservative young Kurdish women living in the city.

Turkey Origin Islamic Immigrant Organizations in Germany in the (Un)making Europe

Aslihan Coban Balci

Omer Halisdemir University, Turkey

ascoban(at)gmail.com

In the last ten years, Muslims have been getting organized very fast around political, social and economic rights in Europe. Parallel to this, a proliferation of public discussions and academic writings on Islam is observed in Germany. In academic writings there are two groups of approaches to the issue. First group criticizes state policies about Islam in relation to several concepts such as, minority rights, integration, public recognition of Islam, multiculturalism, citizenship and exclusion. Second group on the other hand critically emphasizes the Islamization of all Turkey origin immigrants, or critically approaches the production of Islam image in the media, or questions the integration discourse associated with Islam. Particularly the last set of ideas are very significant in that, Islamic immigrant organizations tend to see themselves as a part of Europe through adopting an alternative modernity, which for them, complies with the European ideals. When we observe the practices and discourses of them, Islamic organizations squeeze German state in adapting their values into integration policies, thereby render their subjectivities recognized by the state. Also they have widely organized and more in solidarity in Germany since ten years. Based on the empirical data derived from in-depth interviews conducted with the chiefs or active members of the Islamic immigrant organizations in Germany, this paper presents how the subjective ideals of Islamic organizations have become dominant discourse in integration policies; how the discourse of multiculturalism is built via Muslim immigrants and how this cooperation meets the needs of neo-liberalism since the value of solidarity and the field of social policy are satisfied by the Islamic immigrant organizations.

RN35 | Session 08b A Global Discussion about Migration, Integration, Identity and Education III

Aspects of and services for the social integration of migrants

Vincenzo Corsi, Sabrina Speranza, Simonetta Secondini

Università "G. d'Annunzio" Chieti-Pescara, Italy;
Università "G. d'Annunzio" Chieti-Pescara, Italy;
Università "G. d'Annunzio" Chieti-Pescara, Italy
vincenzo.corsi(at)unich.it, s.speranza(at)unich.it,
simonetta.secondini(at)tin.it

The correct identification of population transfer on a territory as a 'migration' is a central problem both in the analysis of the flow of people and in the understanding of the issues related to the social integration of the migrant.

The first step toward the inclusion of the migrant in the economic and productive network of a country is achieved through the integration in the economic, cultural and social environment. Among these elements, an important role is played by the access to the job market, housing, learning and linguistic proficiency, education and health services.

This work describes the concept of migratory movement, identifying the spacial and temporal aspects of the phenomenon and the main issues of the social inclusion of the migrant in the hosting society. The different approaches to integration allow to contextualise the subject with a specific focus on the aspects of the social services within local planning.

The study focuses on the analysis of service planning aimed to the promote the intervention of the local welfare on zones in need, within a specific territory and within a specific aspect of the social integration of the migrants.

Improving the Integration of Migrants in the Labour Market by Recognising Foreign-acquired Certificates

Alexandra Mergener
Federal Institute for Vocational Education and Training, Germany
mergener(at)bibb.de

This paper focuses on employment opportunities of skilled workers in the German labour market holding a foreign certificate. Due to demographic change and anticipated shortage of skilled labour, the German Government pursues a strategy of attracting migrant workers to work in tight occupational fields. By the Federal Recognition Act, a legal claim was published in April 2012 to standardise procedures for the evaluation of foreign vocational qualifications. This is particularly helpful for both European and Non-European immigrants. For the first time they have the right to get an individual assessment concerning the equivalence of their foreign qualification to a German reference occupation. This should enhance the transparency of foreign diploma, especially for companies' decision-makers, and thereby improve the

integration of immigrants in the labour market.

Up to now, influences of this legal claim on employment opportunities of migrants with qualification from abroad have not yet been analysed. Hence, using a quantitative representative employer survey including more than 5000 companies (Human Resource Managers) in Germany, I have analysed these effects by different logistic regression models. My analytical focus is on the effects of both the current and future employment probability of migrants with foreign certificate.

By this, I am able to present new results in a previously sociologically unexplored field. Furthermore, next to the findings' applicability for the German labour market, they are also transferable to other European countries with similar structures.

Food and migration between identity and innovation

Paolo Corvo
University of Gastronomic Sciences, Italy
p.corvo(at)unisg.it

The relationship between food and migration is very complex and difficult to explain. In effects there are many different situations in the world about this theme. In some circumstances prevails the attention to traditional food, with the attempt to cook always the recipes of original country. In other cases there's more consideration for the mixture with local products, even if remains always the importance of traditional ways of cooking. Food is a very significant element of identity and relationship with the past experiences of life. But food represents also a great possibility of integration between different people and cultures, because it's not necessary to know a specific foreign language, it's enough understand the language of taste and flavours. In this perspective we studied some specific ethnic groups of migrants in Italy (Pakistanis, Moroccans) analysing their models of cooking, the recipes, the use of products, the restaurants. The results are very interesting and show an articulated landscape. Probably a fundamental role can be taken by canteens of primary and secondary schools, where there are young people of all the different ethnics groups.

Becoming Non-European - The Experiences of Eastern European Master Students in Denmark

Mette Ginnerskov Dahlberg
Aarhus University, Denmark
metteg(at)cas.au.dk

There appears to be a widespread assumption that people migrate because of economic advantages. Undoubtedly, this discourse is less dominant when it comes to international student mobility. First of all, there resides a general acceptance that international students move temporarily because they seek to advance their education – rather than migrate permanently. Secondly, international students are often portrayed as a privileged group when it comes to economy. There are, however, an exception when it

comes to Eastern European students. In Denmark, this group of students is frequently discussed in relation to economic issues in national media and by Danish politicians. During the last years, it has been heavily debated whether international students from especially Eastern European countries come to the country with the purpose of taking advantage of the Danish educational system. Drawing on a long-term ethnographic fieldwork among master students as well as 60 qualitative interviews at Aarhus University in Denmark, I will present how Eastern European students reflect on their life in the context of such hostile public discourses. My findings show that many students initially viewed education as a part of a more permanent migration strategy to the country. Yet, some reevaluate such aspirations during their stay after experiences of negative categorisations and the realisation that life in Denmark is less desirable than they imagined in their home countries. I will furthermore discuss how the experience of living in Denmark affect the students geopolitical understanding of a unified Europe and their own positioning in the European landscape.

RN35 | Session 09b Figuring Migrants and Migration

Fluid populations: “flows,” control and the migration crisis in Greece

Giannis Gkolfinopoulos
Panteion University, Greece
y_golfin(at)hotmail.com

Migration, already an expressly critical issue for both the Greek nation-state and the European Union, has acquired an even more prominent position in public discourse since 2015, elevated to the status of a crisis with Greece as its epicenter. Framed either as “migrant”, “refugee” or “humanitarian”, this crisis feeds into the ubiquitous crisis-discourse inscribing unauthorized human mobility in the securitized field of problems (threats) that need to be urgently managed, such as the (vulnerable) economy, poverty, crime, unemployment and terrorism.

As part of a wider project aiming to unravel the meaning of migrant crisis through discourse analysis, this paper focuses on its “official” (state and EU discourse) and “popular” (media) representations in contemporary Greece from the spring of 2015 to the present. Taking the hydraulic/managerial discourse of “flows” as point of entry, the paper maps the specific form of the challenges migration is seen to pose to the established social and political order and seeks to elucidate the very perspective from which contemporary migration emerges as crisis. Drawing from a body of work that grasps state power and the law as constitutive of the form of migration, the paper argues that this crisis comprises a social process inextricably intertwined with the nation state and the European Union project and critically addresses the hierarchical separation between illegal(ized) migrants and refugees.

Transnational Relations and Classical Integration

Ilona Pap, Julia H. Schroedter, Jörg Rössel
University of Zurich, Switzerland; University of Zurich, Switzerland; University of Zurich, Switzerland

Contemporary societies exhibit an increasing level of transnational transactions in different areas of social life, i.e. migration, social relations, economic and cultural exchanges. Especially in migration research it has been argued that classic forms of migration have been replaced by transnational forms of migration, where firstly, migration itself is not a one-way process of relocation, but characterized by forms of commuting and return migration. Secondly, integration is not perceived anymore as a linear process of assimilation into the autochthonous population, but strongly shaped by transnational links between migrants and their countries of origin. Most of the empirical research up to now has focused on the prevalence and extent of such transnational relations of migrants.

In our contribution, we focus on the relationship between migrants’ transnational relations in different dimensions (economic, political, social) and classical indicators of integration. Often this relationship is depicted in a stereotypical way, assuming that more transnational relations are linked to less integration into the host society. In our paper, we want to disentangle this relationship and show its complexity. Our empirical study is based on a recent sample of migrants from six different countries in Switzerland and on an added sample of Swiss people. Since this survey contains a differentiated set of measurements of political, economic, social and cultural forms of transnational relations and also a broad set of indicators of integration (structural, social, cultural), we are in an excellent position to disentangle the relationship between transnational relations and integration empirically.

Making migrant individuals and migrant population: Population register as a state technology of governance in Finland

Marja Alastalo, Riikka Homanen
University of Eastern Finland, Finland; University of Tampere, Finland
marja.alastalo(at)uef.fi, riikka.homanen(at)uta.fi

This article explores the welfare state enactment of migrant populations as a process starting from local register offices and ending in the national statistical institute. The population register common to Nordic welfare states is discussed as a device that brings together the state, individuals’ social rights and knowledge production. The register administratively births migrants as individual data subjects and gives them visibility in the eyes of various government and business actors. We argue that the registration and statistics compilation enable state power over migrants in line with the constantly changing and tightening migration policies: the register apparatus treats migrant groups in an inequitable way which is

then partly hidden away by the register based statistics. Our study is based on an ethnographic fieldwork conducted in three local register offices, Central Population Register and Statistics Finland in Finland

Fifteen days. The journeys of Iraqi asylum seekers to Finland through Europe

Saara Koikkalainen

University of Lapland, Finland

saara.koikkalainen(at)ulapland.fi

Since 2014 hundreds of thousands of asylum seekers have arrived in EU territory via the so-called Eastern Mediterranean sea route. People looking for safety and a brighter future risked their lives at sea from Turkey to Greece, traveled through Croatia, Serbia, and Hungary and from there onwards to Austria and other European destinations. Some continued through Germany, Denmark, and Sweden to file an asylum claim in Finland. In 2015 a total of 32,478 individuals applied for asylum in Finland and 20,485 (60%) of them originated from Iraq. This presentation is based on the interviews of 25 Iraqi asylum seekers residing in Finland and it examines their experiences before, during and after the long journey towards the North of Europe. It questions why thousands of Iraqis decided to embark on this journey especially at this point in time and what kind of networks did they use to learn about the destination and the route to get there. Why did they choose to head to Finland, even though many had contacts also in other European countries? What kind of life did they imagine and what kinds of dangers did they meet on the journey? Migration scholars have explained migration by focusing on economic motivations and cost/benefit analyses, push and pull factors in sending and receiving regions, transnational networks, the role of migration industries, and historical contexts that have created migration flows to foreign destinations. My analysis draws from the concept of cognitive migration, i.e. the process of visualizing oneself in a future time and place prior to making the actual physical move (see Koikkalainen & Kyle 2015 article in JEMS).

Searching for emigrants: A combined method and a comparative study in a European youth mobility survey

Victor Sanz Suárez-Lledó, Victor Fernandez Araiz, Lorenzo Javier

ICN Colegio de Ciencias Políticas y Sociología de Madrid, Spain; ICN Colegio de Ciencias Políticas y Sociología de Madrid, Spain; ICN Colegio de Ciencias Políticas y Sociología de Madrid, Spain

vssllledo(at)gmail.com, victor.ar aiz(at)colpolsoc.org, jlorenzo(at)polsoc.uc3m.es

It is known that none of the migration statistical sources separately contain exactly the information required to analyze migration flow. Among other limitations, we find that sources of migration statistical do not always bring the difference between national and regional levels, or in case to do so, this

information is not completely reliable due to specific limitations. In addition, longitudinal sources may present another limitation as they undergo registration modifications, hindering the longitudinal study of the phenomenon. On top of that, arise new sources and statistical variables contributing with new information. Through the study of the emigration phenomenon of youth spanish migrants to other european countries, we propose a specific working method based on information provided by spanish public statisticals sources such as PERE (Padrón Españoles Residentes en el Extranjero), the CERA (Censo Españoles Residentes Ausentes) or the Estadística de Migraciones (Statistics of Migrations), among others. And combining these ones with statistical sources from UK, Germany, France, just to estimate the true amount of youth people from Spain living abroad. This methodology allows to renew the method of quantification of the migratory phenomenon, assuming an update with respect to other previous studies in this field (Ferrer, 2013, Navarrete et al., 2014).

In short, a course of study is proposed on the different statistical sources that help to know and analyze the data on this phenomenon in the last five years. Moreover, information will be provided on the migratory trends of people from Madrid. As well as the numbers of new migrants, countries that choose as destination, and other relevant characteristics of the migratory phenomenon of this spanish region.

Men's migration, adulthood and the performance of masculinities

Ionela Vlase

Lucian Blaga University of Sibiu, Romania

ionela.vlase(at)ulbsibiu.ro

This chapter examines the ways migration shape male migrants' adulthood roles and transitions, as well as their performance of masculinities during migration and upon return. The study documents the socially constructed nature of adulthood and evidences the ambivalences and ambiguities men migrants experience with regard to adulthood and manhood as a result of their long-term migration. The context of high uncertainty generated by the prolonged stay abroad and the contact with different cultural norms may unsettle migrants' prior beliefs and goals of age and gender identities. The evidences are based on a qualitative research encompassing life story interviews with a number of 15 Romanian men who have lived on average 12 years in different European countries, especially in Italy, Spain, Germany, Netherlands and UK. Regardless of the age they have first migrated at, their education, marital and family status, their destination country and their length of stay abroad, men migrants have experienced many life events that have impacted their sense of adult identity and their enactment of masculine identity. Upon return, migrants critically assess their life course and the fulfillment of their adult roles while taking into consideration a broader and mixed socio-cultural frame encompassing elements of both destination and origin societies. Some men migrants find themselves

in situations of outperformance of adulthood and masculinity, while others struggle to cope with the threatened masculinity upon a series of life transitions or lack thereof (e.g. divorces, childlessness) triggered by their migration.

From Europe to America. General Characteristic of Contemporary Processes of Overseas Migration

Anna Fin

Pedagogical University of Cracow, Poland
annafin(at)interia.pl

The presented paper is devoted to the issue of the newest emigration from Europe to the United States and is a consequence of the need to bridge the gap in the reference literature. With the decline of the influx of Europeans to the US territory and defining the identity of white minorities in the categories of "symbolic ethnicity", interest in processes of European migration to the USA has diminished. Simultaneously; over the past four decades have changed the mechanisms of overseas migration of Europeans. Although the United States of America ceased to be the first choice of immigration; the influx of newcomers from Europe does not stop. It shows especially in the case of New York, where some European immigrants continue to be in the top twenty ethnic groups coming to the city after 2000. In such situation it is extremely important to answer the question about the scale of migration processes, socio-economic status of migrants as well as ethnic structure of inflow from Europe to the US. This paper provides an introductory look into the topic of. At present, in the era of vivid changes, mobility movements and social transformations: American and European, information on the subject will supply information on transformations in the international mobility in the transatlantic dimension. In other words, it is an attempt to understand the contemporary processes of overseas migration.

Towards a better understanding of migration: adaptive policies of integration in Romania and innovative approaches for inclusion

Ionela-Maria Răcățău, Dan Chiribucă
Babes-Bolyai University Cluj-Napoca, Romania;
Babes-Bolyai University Cluj-Napoca, Romania
ionela_racatau(at)yahoo.com,
danfloreantin(at)yahoo.com

Known mainly as a country of emigration, in the last few years Romania has faced different status shifts varying from „country of origin”, „transit country” to „destination country”. These rather rapid changes have brought new challenges for the public authority representatives who need to handle immigration and to define, adjust and implement integration policies in such a way as to best meet the needs of immigrants. Likewise, the civil society members have to learn how to embrace this new phenomenon and how to become active agents of integration and inclusion. Focusing on

the increasing number of asylum seekers, refugees and other non-EU citizens coming to Romania in search for a new home, this paper aims to investigate the national strategies meant to encourage integration, the main needs of immigrants in their process of integration, and the efforts that immigrants themselves make towards integrating in this country. It will discuss the role of legitimate policies on housing, healthcare, education, citizenship and social protection, offering an in-depth insight over the attitudes that the public authority representatives and the civil society have over the process of migrant integration, as compared to the perspectives of the immigrants themselves. By using qualitative and quantitative data collected through interviews and structured questionnaires as part of a national study, the results offer powerful tools for understanding immigration in Romania and its particular features pertaining to integration and inclusion, pointing to people's subjectivity in perceiving this phenomenon.

RN35 | Session 10a Migration Trajectories

Setting up a business in Albania: Experiences of return migrants

Kalie Kerpaci, Martin Kuka
Aleksander Moisiu University, Durres, Albania;
Aleksander Moisiu University, Durres, Albania
kkerpaci(at)gmail.com, kuka.mart(at)gmail.com

In this paper we deal the phenomenon of Albanian return migration. We focus on the category of return migrants from Greece, who own a small business in the city of Tirana, the capital of Albania. Tirana is the most developed city in Albania, and provides more occupational alternatives for the returnees. Using the snowball method, we have conducted semi-structured interviews with return migrants turned entrepreneurs, who have been living in Albania for over a year. Our research is focused mainly on the occupational trajectories of the migrants in Greece and back home. Specifically, we intend to underline, first of all, their initial motives and aspirations for leaving Albania, and if they changed during their stay in Greece. Secondly, we want to see how their experiences as migrants influenced their decision to return. In Greece they occupied themselves in different job profiles, and gained different experiences. It is mainly on these experiences that they based their decision to return to Albania and take the risk of starting a small business. However, being an entrepreneur in Albania is much more difficult than expected. They face many challenges related to the workings of the market, the relations with their employees, partners, and local authorities. These challenges have influenced their attitude towards their decision to return. It is our final intention to understand how they feel about their return, and what their future intentions are.

Challenging the container-model-view of society: Faroese women's migration trajectories between the Faroe Islands and Denmark

Karin Jóhanna Leitisstein Knudsen
University of Faroe Islands, Faroe Islands
karinj(at)setur.fo

The aim of my paper is to unpack the social dynamics and relations in which Faroese women's migration is practiced. At present, there are, approximately, 1,600 fewer women than men living on the Islands. Concerns are voiced locally as to what the impact of this 'women deficit' might have on Faroese society in the long run. This is to be viewed in the light of the population having fluctuated between 48,000-49,000, in recent times.

Drawing on Pierre Bourdieu's field analytical approach to migration practices of Faroese women, my study challenges a conventional container-model-view of society. Faroese women's life-story migration narratives demonstrate how the Faroese women's migration field, on the one hand, crosses national boundaries and yet, on the other hand, is defined into migration trajectories. Four different migration trajectories have emerged from the narratives: the preservers, the brakers, the vacaters and the strivers. A crucial finding of my study is that there are migration trajectories within fields which break with the conventional container-model-view of society. These migration fields are not general, globalized and without direction; quite the contrary. They are very specific migration, or mobility, fields involving particular social groupings in specific socio-spatial configurations such as, for instance, the Faroese-Danish connection. These migration, or mobility, fields are characterized by recurring patterns where people struggle for the same thing; in my study, women who struggle for improving their capital composition in an institutionalized migration field.

Gendering North-North Migration: Icelandic Labour Migration to Norway in Times of Crisis

Guðbjört Guðjónsdóttir
University of Iceland, Iceland
gug42(at)hi.is

Feminist scholars have stressed that gender should be a central concept in migration research, as gender shapes the migration process and the lives of migrants in crucial ways. Studies on gender and migration have predominantly focused on people migrating from low or middle-income countries to more affluent countries. Less gender research has been done on migration between affluent countries of the Global North. The paper addresses this gap by concentrating on migration between two Nordic countries that are often presented as gender equal in cross-national comparison. My focus is on how the gendered division of work shapes the experiences of Icelanders who migrated to Norway in the wake of the financial crisis in Iceland in October 2008. The results are based on semi-structured interviews with 20 Icelanders who migrated to Norway both with and

without their families. In my analysis I show how the gender-segregated labour market and gender norms lead to different positions and opportunities for men and women at times of economic crisis and migration. For participants of the study who migrated with their families, the relocation was often organised around the labour market position and opportunities of the men. Those who migrated without their families emphasised their roles as providers for their families. However, only the women described how their absence was perceived of as a failure to fulfil childcare responsibilities. The findings highlight the resilience of the ideas of men as providers and women as primary parents within "the gender equal Nordic", and indicate how these roles may facilitate or discourage the migration of men and women.

Use of Skilled Migrant Workers in Japanese Companies – Case of Vietnamese Workers in IT and Engineer Sector

Aimi Muranaka
Duisburg-Essen University, Germany
aimi.muranaka(at)stud.uni-due.de

Facing with the accelerated drop in working population, the provision of necessary labor force is crucial issue both in Europe and in Asia. Experiencing the accelerated deficiency in labor force, Japan has been proposing different measures to tackle this issue by the inclusion of women and seniors in the labor market and the increase of automation in certain sectors. However, migration policy has not been an option to tackle this issue for this country. The government only allows the entrance of the high-skilled foreign workers and denied the employment of the low-skilled workers in the Japanese labor market. Nevertheless, despite the absence of concrete migration policy, companies began to actively recruit the skilled foreign workers against labor shortage from Asia. In particular, Vietnam is large provider of labor for Japan nowadays, especially in IT and engineer sector.

Previous studies have concentrated on analysis of the employment conditions of the foreign skilled workers and firms' recruitment of foreign new graduates from Japanese universities, but little research has been conducted regarding the firm's other strategies to provide necessary foreign workers. How do Japanese companies seek the qualified foreign workers outside of Japanese university, and what are their strategies for the recruitment?

This paper attempts to answer the above-mentioned questions based on interviews conducted in Japan and in Vietnam. By using this case, this research contributes to demonstrate a larger picture of the transnational labor market by focusing on activities of companies, which play important role in the recruitment of necessary labor force.

RN35 | Session 10b Care**The transformative role of digital literacy and monetary flow on Polish migrants' parents aging in place**

Lukasz Krzyzowski
AGH University/Humboldt-Universität zu Berlin,
Poland
lukasz.krzyzowski(at)agh.edu.pl

This paper presents two empowering mechanisms within care culture(s): the transformative role of digital literacy and the active role of monetary flow. By focusing on positive aspects of both mechanisms, I will present their influence on migrants' elderly parents' increasing independence, sense of agency, and the possibility for them to age in place. Research was carried out within the framework of two multi-sited research projects in Poland and various host countries. On the basis of qualitative interviews with Polish migrants, their elderly parents, and relatively immobile members of a transnational family, as well as on quantitative research, an analysis was conducted of alternative methods that migrants employ to respond to expectations regarding care for elderly parents. The provision of alternative forms of caring for elderly parents is leading to outcomes at the microsocial level and within the context of intergenerational relations, most notably an increase in elderly parents' independence. However, a process is also occurring that is translating outcomes from a micro to macro level, effecting changes in the Polish familial elderly care culture.

North-South transnational solidarity: When associations of migrant women mobilise to develop care in their country of origin

Catherine Delcroix
Université de Strasbourg, France
catherine.delcroix(at)misha.fr

While the development of international modes of communication and travel makes for the fast growth of transnational activities, the latter are usually thought of as either economic (remittances, commerce...), cultural or political activities performed by men rather than women and driven by individual or family interests. In contrast with this representation stands our discovery, in the Flemish part of Brussels, of an association of women from Moroccan background that have been very active during the last twenty years in developing care of the most marginalised and excluded categories, and their access to rights: lone mothers, their children taken from them and put in orphanages; the handicapped; remote villages... Its multiple activities in Morocco meet dire needs left gaping by the underdevelopment of public policies in this country, de facto challenging authorities to move in and fill these gaps; and when they do, the association's managers immediately move to other needs. Another feature of this association's philosophy is that exchanges should work both ways; and indeed, as an example, some nurses in Morocco

who were taking care of children with diabetes found some innovative practices that were subsequently tested and reproduced in Belgium.

An interesting comparative finding is that in France, where the 'universal' (read: assimilationist) model of integration precludes the formation of single-origin associations (immediately branded as 'communitarist'), such associations mobilise women with migrant background from various countries and develop projects concerning several 'Southern' countries.

Professional Greek migrants in London: Belonging and integration in the time of financial crisis

Venetia Evergeti
University of Surrey, United Kingdom
v.evergeti(at)surrey.ac.uk

This paper will explore migration patterns of professional Greeks in London in the context of the Greek and wider European financial crisis. Previous work in this area has revealed how transnational links and long-distance caring are affected and in turn affect the interrelationship between local and global chains of caring (Evergeti, 2008). Historically, Greece has been an emigration country with established Diaspora communities all around the world. Since the 1990s this movement reversed and the country transformed to a major destination for immigrants initially from the Balkans and more recently from countries with predominantly Muslim populations (Evergeti and Hatziprokopiou 2013). However the ongoing financial crisis has created new patterns of emigration. Unlike earlier mobility which involved mainly unskilled migrants from predominantly rural areas, this new phase of migration consists mainly of highly skilled professionals (Labrianidis, 2011; Triandafyllidou and Gropas 2014). This has created new forms of transnational relations and care responsibilities in both ends (with older parents moving back and forth to support working children by looking after grandchildren) and once again financial and other forms of remittances are emerging. Based on a qualitative study of personal narratives with Greeks who moved to London in the last 5-6 years the paper will explore the importance of utilising ethnic and friendship networks during the settlement period as well as the significance of sustaining transnational links in negotiating family care needs. The aim of the paper is to provide an insight into how family care and responsibilities are negotiated between the adopted country and the homeland amidst the ongoing financial crisis.

Participatory & Mobile Methods in social research with migrant mothers

Erene Kaptani, Maggie O'Neill, Umut Erel, Tracey Reynolds
Open University, UK; York University, United Kingdom; Open University, UK; Greenwich University, UK
erene.kaptani(at)open.ac.uk,

maggieoneill5(at)hotmail.co.uk,
umut.erel(at)open.ac.uk,
T.A.Reynolds(at)greenwich.ac.uk

Our research project combines walking methods and participatory theatre to create a space for exploring, sharing and documenting phenomenological processes of belonging and place making that are crucial to understanding 'enacting citizenship'. Launched with a week long training programme in using participatory theatre with migrant groups for PhD students, art practitioners, public sector professionals and researchers, the research team has completed two phases of research with i) migrant mothers and migrant girls and ii) migrant mothers with no recourse to public funds. Our previous research shows that migrant groups and families' cultural, linguistic and social marginalization can be reduced through participatory methods that bring into dialogue participants and policy, becoming a citizenship practice in its own right (Erel and Reynolds 2014; Erel 2011; O'Neill 2011; Kaptani 2008;).

This presentation will explore how the combination of walking and participatory theatre methods connect the personal to the public realm and vice versa given the biographical, performative, spatial and visual material emerging from each method. We will also show how walking and participatory theatre as embodied, sensual methods can mutually reinforce each other and can be used to create more textured and rich data. This presentation shares the aims, methods and process of the research and how this project advances methodological knowledge and understanding, as well as contributes to capacity building and crucially policy and practice at this time of increasing austerity and hostility to migrants in the UK.

RN36 - Sociology of Transformations: East and West

RN36 | Session 01a Social Transformations Studies

Understanding social transformations through measuring functional differentiation

Matej Makarovic

School of Advanced Social Studies (SASS/FUDŠ), Slovenia

matej.makarovic(at)fuds.si

Functional differentiation of societies in (semi)autonomous subsystems as a trend of modern social transformations has a long history in sociological thought – not only ranging from H. Spencer and T. Parsons to N. Luhmann but also including comparable insights based on different concepts, such as life orders or social fields. Post-communist paths of Central and Eastern European societies can be assessed in terms of functional differentiation as a process of increasing autonomy of functional subsystems. Particularly the functional differentiation from political (as autonomy from political interference) and from economic subsystem (as autonomy from capitalist market principles) are relevant in this regard. However, theories dealing with functional differentiation have often suffered from certain shortcomings. One is the lack of clearer relationships with other types of social differentiation, such as stratification/inequality, and with segmental divisions, based on ethnicity or nation. Another, and even more important one, is the lack of clear operationalisation for the purposes of empirical research and testing the basic theoretical assumptions. Based on series of indices, we develop indicators to measure functional differentiation (as autonomy of selected functional subsystems) from politics and from economy, and test them in comparative perspective with the emphasis on post-communist Central and Eastern European countries.

Europeans' Values: Peak Secularization (?), Persisting Materialism, Lack of Convergence

Zoltan Lakatos

Budapest University of Technology and Economics, Hungary

zlakatos(at)eik.bme.hu

An influential research paradigm going back to Ronald Inglehart's postmaterialism thesis and more recently expounded by Christian Welzel conceives of religion

as part of a parochial worldview that also includes authoritarianism and thus inhibits human empowerment. Further, the thesis also claims that fading existential pressures drive societies toward a de-emphasis of materialism. Accordingly, measures produced by this school conflate certain aspects of authoritarianism with religiosity, and others with materialism, and describe the "rising force of emancipation" as going hand-in-hand with a retreat of these values.

Building on previous work using correspondence analysis, a non-linear method that clearly separates out religiosity, authoritarianism and materialism, I present an ecological analysis of recent data from the World Values Survey that contradict the Inglehart school on several points. First, there is no evidence of a continued secularization trend: in most European nations, religiosity has not significantly declined beyond the early 1980s level. Second, there is indeed a general retreat of authoritarianism, but -- against the predictions of the postmaterialism thesis -- it often goes together with a surge in religiosity, and this trend is not restricted to East European publics where religion is also a carrier of national identity in a postcommunist context. Third, the clear-cut positive association posited between materialism and per capita GDP is not borne out by the data: above-average materialism is more typical of affluent societies than it is of nations with high poverty rates. Finally, there is no convergence of East and West European nations in the space defined by these three values.

The postsocialist transformation of gender relations: the case of Croatia

Inga Tomic-Koludrovic, Mirko Petric, Ivan Puzek, Zeljka Zdravkovic

Institute of Social Sciences Ivo Pilar, Croatia, Croatia; University of Zadar; University of Zadar; University of Zadar

inga.tomic-koludrovic(at)pilar.hr, mpetric(at)unizd.hr, ipuzek(at)unizd.hr, zzdravko(at)unizd.hr

The starting point of the discussion is the implicit calling into question of the general notion of re-traditionalization of gender relations in the post-socialist period, presented in a recent analysis of the changes of attitudes and values of the inhabitants of Croatia between 1985 and 2010. Namely, in contrast with the usual narratives of re-traditionalization brought about by the end of the socialist gender regime, Sekulic (2012) concluded that "gender conservatism" was actually decreasing throughout the analyzed post-socialist period. In light of this conclusion, the paper attempts to disentangle various notions of gender regime change in Croatia during and after the post-socialist transition. Our interpretations are based on the primary data from nationally representative surveys carried out in 1999, 2005, and 2015. References are also made to qualitative research carried out in Croatia in 2015, as well as to selected results of research on gender relations in other post-Yugoslav countries. The

theoretical background includes Walby's theorization of patriarchy and selected tenets of new modernization theories (Inglehart-Welzel, Norris, Touraine). The analysis suggests that the levels of public patriarchy in Croatia remained relatively low even in the crisis-ridden 2010s, while the levels of private patriarchy have fallen in relation to those recorded at the end of the 1990s. Following an attempt to describe the constituents of the post-socialist gender regime in Croatia, a tentative conclusion is that re-traditionalization pressures of the transition period have resulted in at best "partial acquisition of traditional values", in the same way as we have concluded before that the socialist period had resulted in a "non-linear modernization" and "a partial acquisition of modernization values" (Tomić-Koludrović, Petrić, Zdravković, 2015).

RN36 | Session 01b Migration: Experiences and Perceptions

Acquiring human capital through international migration. The case of young Romanian returnees

Georgiana Toth, Alin Croitoru, Monica Serban
Centre for Migration Studies (CeSMig), University of Bucharest ; National Institute for Research and Development URBAN-INCERC Bucharest; Centre for Migration Studies (CeSMig), University of Bucharest ; "Lucian Blaga" University of Sibiu; Centre for Migration Studies (CeSMig), University of Bucharest ; Research Institute for Quality of Life (ICCV), Romanian Academy
georgiana.toth(at)gmail.com,
alin.croitoru(at)ulbsibiu.ro,
monica_serbanus(at)yahoo.com

During the last 28 years Romania experienced a massive emigration. Over three million of Romanian citizens are living in Italy, Spain, Germany, UK or other European countries. Many others have now returned home after living and working for a while in other countries. The paper is based on about 50 in-depth interviews conducted with Romanian youth who lived for at least 6 months in another EU country and who returned. The data are part from a larger sample of qualitative data collected during 2016 within the research framework provided by the Horizon 2020 – YMOBILITY project. The analysis sets out to address a series of questions. Firstly, which are the main skills, competences and work values that young migrants perceive they gain through migration? Secondly, which were the main mechanisms of accumulating human capital abroad? Thirdly, how useful is this stock of human capital after their return? We selected only those migrants who were employed in typically 'unskilled' jobs in the destination countries, especially in the field of construction, agriculture and domestic service. We compare these groups of migrants in the broader context of their educational background, experiences of work abroad and of (re)integrating on the labour market after returning to Romania. Our findings show that the type of jobs performed at the destination provides different opportunities for

acquiring new skills and competences; after return some of these do not automatically translate into an advantage on the labour market for all migrants.

The lived experiences of Bulgarian migrants - transforming contexts, changing subjectivities

Siyka Kostadinova Kovacheva, Boris Petrov Popivanov
New Europe Centre for Regional Studies; Paisii Hilendarski University of Plovdiv; New Europe Centre for Regional Studies; St Kliment Ohridski University of Sofia
siyakovacheva(at)gmail.com,
boris.popivanov(at)gmail.com

A major ingredient of the transformative processes in present-day Bulgaria is the increased mobility of human capital. The dominant interpretation in public debates is not that of restoring the right to movement suppressed during communism nor that of enhancing European integration. Rather emigration is seen as contributing to the depopulation of the country and its economic decline. While the increased migration flow after the accession to the EU does pose challenges to the democratic reforms in the country, its consequences cannot be understood without capturing the complexity of motivations and choices of the actors in the process. What are the individual factors which influence migrants' decisions at all stages of migration: from the initial consideration of making the move, through the stages of preparation, travel, and adaptation in the new context? Why do different groups of migrants use different channels of migration and which of them serve for successful integration?

This paper provides answers to these questions based on country results from a comparative study of migration funded under Horizon2020. Based on 38 interviews-in-depth with prospective and actual migrants from Bulgaria in four EU countries and 10 expert interviews with staff in public and private employment agencies it examines the motives and expectations, formal and informal channels for mobility and people's changing subjectivities. A crosscutting focus is placed on the inequalities in terms of gender and skills levels in mobilizing different types of social ties.

Unexpected changes in immigration status amongst Czech and Slovak migrants post Brexit: Gender perspective on pre and post 2004 immigration to the UK.

Katarina Zajacova
University of Surrey, United Kingdom
k.zajacova(at)surrey.ac.uk

The Central and Eastern European (CEE) pre 2004 immigration to the UK is an understudied and highly gendered phenomenon. The EU enlargement of 2004 completely changed the migration dynamics between the two regions and the current political situation is often referred to as a direct outcome of those migration related decisions made by the Labour

government of the time.

This paper examines the sudden changes in the immigration status of Czech and Slovak migrants post Brexit. It highlights some concerns amongst Czech and Slovak communities and debates the differences between migrants who arrived to the UK before the EU enlargement and those who entered the country after 2004. The focus of the debate is on the gender element and how immigration policies affect men and women in a different way. It also evaluates the idea of return migration and the sudden loss of the notion of fluidity that we got used to over the last decade. The concept of transnationalism is re-evaluated by taking into consideration the new political climate in the UK and in other regions.

Ethnic Distance of Students in Serbia

Uros Vojislav Suvakovic

University of Pristina, Faculty of Philosophy, Kosovska Mitrovica, Serbia
uros-s(at)eunet.rs

The paper is based on the results of empiric researches of ethnic distance of students in Serbia regarding the members of the former Yugoslav nations and national minorities, as well as regarding certain number of great world nations. Ethnic distance was measured several times among Serbian students in the north of Kosovo and Metohija (K&M) and twice among students in Belgrade from 2009 to 2016, as well as for the first time among Albanian students in Pristina in December 2016/January 2017. Adapted Bogardus scale was used as the instrument. The biggest result of ethnic distance is measured towards Albanians, similar in surveys from the Yugoslav period. The highest distance among Albanian students is in regard to Serbs. Comparison with the results of similar researches from the Yugoslav period shows a significant increase of level of ethnic distance.

Findings of this longitudinal research have confirmed that: a) there is a connection between increase of ethnic distance and involvement in war actions in which Serbs were one of the sides; b) high distance has been noticed regarding some of great European and non-European nations, which is possible to explain by attitudes of their governments to the Yugoslav crisis, with exception of the relation of Serbian students to Russians and Greeks; c) positive correlation between ethnic and confessional distance also has been established; d) war breakage of Yugoslavia has left a strong potential for conflicts, expressed by high ethnic distance, particularly in K&M.

RN36 | Session 02a Social transformations: East and West

The Divergence of the Post-Communist Welfare State. The Growing Differences Between the Welfare State in CEE and the Rest of the EU

Gavin John Rae

Kozminski University, Poland
gavinrae(at)alk.edu.pl

This paper builds upon previous research carried on welfare state models in Central Eastern Europe and analyses how they are connected to other social indicators. Most studies looking at the post-Communist welfare states in CEE tended to find that they do not fit with the Esping-Andersen typologies (Deacon 2000; Fenger 2007; Rys 2001; Sengoku 2004) Our previous analysis has tested to what extent convergence has occurred and/or whether a distinct post-Communist welfare typology is discernible, over 10 years after the eastern enlargement of the EU. (Piotrowska and Rae, 2016) We did this through carrying out a cluster analysis at two dates: 2004 and 2014, following as close as possible the method and choice of variables used by Saint Arnaud and Bernard (2003) and replicated by Fenger (2007).

Contrary to previous hypotheses we have found no evidence of the post-Communist EU states converging with the Esping-Andersen models. Also, we have found a distinct post-Communist welfare model, with its own identifiable features, which has actually strengthened over the past decade.

In order to further this research we have carried out an analysis of how the post-Communist welfare model in the EU coexists with chosen social and economic indicators. This allows us to expand our understanding of the post-Communist welfare state as we can include data that does not fit into a cluster analysis. These socio-economic indicators include such things as social well-being, outcomes of welfare policy (e.g. health and education); infrastructure and its possible degradation; and universal access to benefits and services (decommodification and stratification).

Social capital in the Eastern European peripheries

Tomasz Zarycki

University of Warsaw, Poland
t.zarycki(at)uw.edu.pl

First, the paper will try to present an overview of a broad range of criticisms of the theory social capital, including its highly normative nature, cultural biases and questionable assumptions about its nature, sources, and effects, in particular in the economic life. Moreover, the paper will refer to the institutional and political contexts of the rise of the notion of social capital as a popular policy notion in recent decades. These broader questions will be then linked to the well-known issues of the low levels of its indicators in countries of the region, in particular in Poland, which will be seen as a peripheral area in the context of the world-system theory. As it will be argued, the measurements of the social capital in the region and discussions on its inadequate levels in most of the countries of the Eastern and Central Europe may be seen as an element of its orientalization and as a tool of legitimization of its dependence on the Western core. These issues will be related to the problems of measurement and interpretation of levels and nature informality in the region, which have been recently discussed in diverse venues. As it will be argued, these critiques of the application of the theory of social

capital as well as the standard models of informality and corruption in Central and Eastern Europe may appear useful in reflexive development of these approaches on the global level and at the same time point to important normative restriction on reconstruction of the nature of social relations in the region.

Cultural Political Economy of East European Capitalisms

Borut Rončević

School of Advanced Social Studies, Slovenia
borut.roncivic(at)gmail.com

Almost three decades since the beginning of historic transformations in a vast East European space provides us with ample empirical evidence to study mechanisms and processes of emergence and continuous transformations of a variety of East European capitalisms. In our analysis, we will employ the Cultural Political Economy (CPE) approach, focusing on semiotic mechanisms of their discursive constitution and material reproduction. In CPE, an instance of (national) capitalism can be identified as a successful materialization of economic imaginary, a semiotic order of specific discourses and resulting set of social practices. The first mechanism is the variation of discourses and practices, providing alternative paths at critical points in time. The second is the selection of particular discourses, a process of privileging some discourses over the others by interpreting and legitimizing key aspects of relevant social phenomena. The third is the retention of resonant discourses, a process in which those discourses and practices are included in individual and collective routines and identities, in widely accepted strategies, state projects and are even materialized in physical environment. The fourth is the reinforcement of these discourses, by filtering out inappropriate alternatives and promotion of complementary discourses. Finally, these mechanisms are enhanced by selective recruitment, inculcation, and retention of agents that correspond with dominant discourses. In our comparative analysis we recognize that for most East European countries past three decades are not a single period, but rather a comparatively rapid succession of relatively distinct phases, shaped by both geopolitical challenges and opportunities, and volatile internal processes.

RN36 | Session 02b Migration: Representations, Identities and Discourses

"Attitudes toward refugees in the "Visegrad" countries"

Mirosława Grabowska

University of Warsaw, Poland
grabomir(at)is.uw.edu.pl

Attitudes towards migrants and refugees were investigated in Poland – although not systematically - from the early 90s. However, it was not politically or socially sensitive issue. With one exception, the

refugees from Chechnya (according to the Polish Office for Foreigners, from 2003 to 2014, 73 000 citizens of the Russian Federation applied for refugee status in Poland; most of them were Chechens), the refugees from other regions have not applied for refugee status in Poland.

The intensification of armed conflicts in the Middle East countries and the war in Syria triggered migration processes to EU countries on the unprecedented scale. The Office of the United Nations High Commissioner for Refugees reported that industrialized countries recorded the highest number of refugees over the last 20 years. Most refugees arrive illegally, mainly to the southern countries of the European Union. The EU was trying to tackle the situation devising various relocation plans of incoming refugees in all member states.

The political crisis concerning refugees affected not only southern EU countries but also Visegrad countries, including Poland. Four research centers - Czech CCVM Sociological Institute, Slovak Focus, Hungarian Tárki and Polish CBOS – were tracking attitudes toward immigrants and refugees. The analysis of comparative data for the four countries will be presented, including determinants of attitudes toward immigrants and refugees. More comprehensive analysis will cover Polish case, for which the data are richer.

Anticipating the future in an insecure present: discourses of migration in contemporary Serbia

Tanja Andić

University of Minnesota, Twin Cities, United States of America
andic004(at)umn.edu

The state transition from the former socialist Yugoslavia to contemporary Serbia has had many consequences for young Serbian workers. Among them are the privatization of the economy, the destabilization of full-time long-term employment, high unemployment rates, and an overall insecure outlook on the economic future. Young people and their families have responded in varied ways, from a strict adherence to the Foucauldian ethos of the management of the self, to the prolonging and delay of life course events such as completion of college, introduction to full-time work, independent living, marriage, and children. In short, while for some Serbian youth time has sped up rapidly, and become more precious through intensive investment in one's own "human capital," others are left behind in the waiting room of post-socialist (yet pre-EU) economies. However, despite disparate practices, the majority have the same goal: an aspiration to leave the country in search of better economic opportunities. How are people with such radically different practices hoping for the same outcome of international migration? What fuels the hegemonic aspiration for migration out of Serbia? This presentation looks at four discourses of migration prevalent in Serbia and seeks to understand how migration aspirations and young people's subjectivities are transformed by both structural

factors and everyday speech about how one should proceed towards the future while living in an uncertain present. I further work to show that migration discourses are used as both a practical economic response and a way in which to critique a socio-political landscape young people feel they have no voice in.

Japanese Perspectives on a Changing Polish Society: Cultural Identities of Contemporary Japanese Residents in Poland

Yasuko Shibata
Polish-Japanese Academy of Information Technology,
Poland
yshibata(at)pja.edu.pl

The paper aims to discuss the cultural identities of today's Japanese residents in Poland, as seen in their reaction towards the Polish reception of Japanese global culture.

Since the 1990s, reasons for Japanese people choosing Poland as their place of residence have become varied. Not only musicians and artists, who formerly comprised the majority, but also an increasing number of those seeking fresh business chances and life perspectives unattainable in Japanese society decided to live in post-1989 Poland. Today, while Japanese otherness (as represented by such global cultural products as sushi, comics/anime, tea ceremony and Zen) has been offering different ideas and values for Poles' renovation of cultural identities beyond the traditional framework of Polishness, Japanese residents in Poland are facing the globalized meanings of Japaneseness peculiarly practiced in Polish society, in the process of their reconstruction of Japanese cultural identities.

What are the attitudes of Japanese residents in Poland towards the Polish reception of global Japanese products, especially of cuisine representing "sacred" Japaneseness? What values of Japanese culture do they find "correctly," "improperly," or "interestingly," received by Poles? Are there, or what are, "useful" Japanese cultural values for positively changing Polish society in their opinion? How do they see the possibility of popularizing "authentic" Japaneseness in Poland? These and other questions inquiring into the "Polish variant" of Japanese cultural identities will be examined through analysis of the narrative of Japanese residents in Poland collected by the author through in-depth interviews.

Crimean Tatar representation in the context of reframed Ukrainian national narrative

Alina Zubkovich
Södertörn University, Sweden
alina.zubkovich(at)sh.se

The Euromaidan protest brought tremendous changes to the political, social-cultural and everyday life in Ukraine and abroad (Yekelchik 2015, Onuch 2014, Kappeler 2014). The military invasion by the neighbor country, annexation of the Crimean peninsula, marked the appearance of new discourses, identities and

cultural practices in Ukraine (Miller and Wert 2015, Otrishchenko 2015, Kasianov 2015), which have arisen as an ideological conformation to the Russian postcolonial politics (Miller and Wert 2015, Grant 2015, Sakwa 2015, Hillis 2015).

Due to the violation of human rights, general unsafety at the peninsula and other reasons, many of the Crimean Tatars were forced to leave Crimea and settle into Ukrainian mainland territories. Displacement, restructure of the ethnic composition of the regions and the new symbolic connotation that Crimea has acquired in both Ukraine and Russia have shifted the reconfiguration of Ukrainian national narratives towards an inclusion of previously marginalized discourses on Crimean Tatars.

The present study aims to analyze the nodal points of such newly reconstructed national narratives with focus on its Crimean Tatar component. Recent (2014-2017) film production, music and cultural events that deal with the Tatar topic serve as material for the empirical analysis.

RN36 | Session 03a Transformations and Solidarity: Ideas, Agents, Changes

New agencies and transient solidarities in the Turkish civil society: the anti-Capitalist Muslims.

Leyla Önal
Middle East Technical University, Turkey
leyla.onal(at)gmail.com

The aim of this paper is to look at how new forms of agency emerge within civil movements and to explore what forms new solidarities are formed by these agencies, through the case of anti-capitalist Muslims in Turkey. The anti-capitalist Muslims group formed a registered NGO under the name of 'Association for Fighting Against Capitalism' in 2012 and became one of the most publicised supporters of the anti-governmental protests in June 2013. The group established a link between the Turkish Left and the hegemonic political Islam. Political Islam in Turkey emerged within the context of electoral democracy and civil society and rather than radical action, its discourse has been centred on the establishment of an 'endogenous form of democratization' focusing on lifestyle and everyday practices. This democratization created a shift from demands regarding social injustices on the basis of gender, class and ethnicity to religious sentiments. The discursive shift was paralleled by the changing composition of civil society as Islamic groups proliferated. Paradoxically, the same shift made possible the emergence of other dissident groups and the formation of new solidarities. The anti-capitalist Muslims emerged within this context to create a 'climate of togetherness by approaching the problems of the age through the ancient values of the society' around their slogan 'Allah, bread, freedom.' They present a critique of the rising Islamic bourgeoisie 'from within' and of the neo-liberal system that confine Islam to be exercised only in the mosque while turning a blind eye to the class based social inequalities.

Post-communist Solidarity and Attitudes towards Redistribution

Laura Ravazzini, Michael Ochsner
University of Neuchâtel; FORS, University of Lausanne; FORS, University of Lausanne; ETH Zürich
laura.ravazzini(at)unine.ch,
michael.ochsner(at)fors.unil.ch

The European Union is characterised by a set of values shared by all European Member States. The establishment of this set of values implies a common ground that should support principles such as pluralism, non-discrimination, tolerance, justice, solidarity and equality. Solidarity in particular might have different meanings depending on the social context of the country. Previous research has demonstrated that citizens living in post-communist countries attribute the government a larger role than citizens living in other European countries. Support for the welfare state is hypothesised to pair with positive attitudes towards redistribution. Citizens in post-socialist countries are indeed found more open to redistribution and therefore more solidary towards the poor. This general support for the welfare state is supposed to come from the authoritarian egalitarianism sponsored during communism. The historical and institutional context in which people grew and formed their political attitudes appears therefore determinant for their following support for the welfare state. In this semi-static attitudinal setting, increasing globalization and migration challenge the stability of these mechanisms. Using a theoretical framework that distinguishes between self-interests and ideals, this paper empirically investigates the link between personal experiences and attitudes towards redistribution. The analysis examines the persistence of a post-communist ideology identifying people with a post-communist background living in Europe and in Russia. Multilevel models and multivariate regressions based on the ESS 2008 highlight differences and similarities between countries and between individuals. Preliminary results show that people with a post-communist background living in other European countries have more negative attitudes towards redistribution than natives.

Solidarity practices in the context of patriotism in Russian society

Yury Volkov
Southern Federal University, Russian Federation
infoipk(at)sfedu.ru

Currently the analysis and evaluation of «normal patriotism» arises; it includes great power statehood tradition as the collective experience of the past and social participation as the focus on the present and the future. Solidarity practices get a big boost for the development on condition of creation of unity of social attitudes to the value and meaning of patriotism in Russia. The analysis of solidarity practices associated makes possible to determine the state of patriotism as an integral factor of various social strata and groups of Russia. The understanding of patriotic activity,

associated with a variety of patriotic actions and knowledge of patriotic culture of Russia is very important. Patriotism can not be free from value judgment, and at the same time it can not be involved in solidarity practices where the effect of social use can be measured. We may talk about the reflexive stage of patriotism when it is not just a “habit” and becomes a constructive action aimed at creating a new social reality. Patriotism causes active presence of past experiences, guarantees the accuracy of practices and compliance of formal rules. The efficiency of solidarity practices confirms that the belief in patriotism, the emphasis on the uniqueness and originality of Russian society are compatible with the inclusion of Russia into the global socio-cultural space. The concept of normal patriotism, determined by the transition of the Russia, based on the production solidarity practices, takes great demand. The study is supported by the State order, project № 28.3486.2017.

“Our intentions were crystal clear”. Transformation narratives of “Solidarity” Citizens’ Committees’ former members.

Marta Magda Mieszczanek
Polish Academy of Sciences, Poland
marta.mieszczanek(at)gmail.com

„The lost treasure of revolution”, a phrase coined by Hannah Arendt, is often used in Poland in the context of „Solidarity” movement’s heritage and its absence in present day politics. It also appears in discussion on winners and losers of 1989’s transformation. Endless, abundant and still indecisive as the discussion itself is, it’s striking that most of the time it doesn’t mention one of the most important civic actors of Polish transformation - the Citizens’ Committees movement. This net of organizations on local level helped immensely in winning the first free elections and in reviving self-government in Poland. Interestingly, though they are not operating anymore, the Committees and their political philosophy lately begun to be an important point of reference for Polish city-movements. Is therefore „the lost treasure of revolution” a justified phrase to use in the discussion? Is it even used by Committees’ activists nowadays? Twenty-eight years after transformation, how do people who built Polish democracy from the scratch shape their narratives about this time and about present political situation? Do they see more profits or losses, and what are their grounds? The paper will attempt to answer these questions by analysing in-depth interviews conducted by the author among Citizens’ Committees activists on the local level.

RN36 | Session 03b Time Dimension and Generations

Personal time capital as a social stratification mechanism

Triin Vihalemm, Marju Lauristin
University of Tartu, Estonia; University of Tartu, Estonia

triin.vihalemm(at)ut.ee, marju.lauristin(at)ut.ee

Hartmut Rosa, in his theory of social acceleration, considers the ways in which people use their personal (free) time to be important indicators of the transformation of the social order. The aim of this paper is to explain empirically personal time use capabilities as transformative forces in society. The authors use the approach of Marian Preda's concept of individual time capital, which is composed of personal life expectancy and the quality of time "spent" in life performing various activities that have influences on individual mood and health. Individual time capital is convertible into other forms of capital, such as economic capital (i.e. salaries for working time) or social capital (i.e. networking time) and, vice versa, people who are more "capitalised" in terms of money or social relations can, by buying services or asking for others' help, increase extra (quality) time. The authors will explain empirically how the capability of converting individual time capital differentiates social groups in the Estonian transformation society, which offers an alternative look at stratification. Besides such traditional capitals as wealth and education, the technological capabilities possessed by younger people and networking capacities possessed by older people appeared to be easily convertible and supported agency. The authors introduce a time-bound social stratification model based on two dimensions of social agency: the capability of converting individual time capital, and whether the conversions are used to maintain acceleration or to slow things down.

Looking Back from Today's Perspective: Older Generation on Social Changes in Poland

Danuta Zyczynska-Ciolek

Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland

dzyczynska-ciolek(at)ifispan.waw.pl

In 1988, before major political, economic and social changes in Poland, researchers from the Institute of Philosophy and Sociology of the Polish Academy of Sciences (IFiS PAN) initiated a panel study of social structure that continues until today. In the years 2014-2016, on the basis of the method developed by Fritz Schütze, we conducted 44 biographical interviews with POLPAN respondents aged 71 or more. The interviews are available in the Archive of Qualitative Data at IFiS PAN.

Apart from being a rich and valuable source of knowledge on individual experiences and choices of POLPAN respondents, related to their position in social structure (e.g. career paths) the biographical interviews contained sharp insights and deep perceptions regarding social changes in Poland. Aged participants of the biographical study compared the years before the transformation – when they were young or in their middle years – with the life they and their (grand)children led at the time of the interview. In my paper I use thematic analysis to extract and present the most distinct and meaningful topics –

comparisons of „yesterday” and „today” – that have been expressed by POLPAN respondents. In addition, based on quantitative data, I present essential findings concerning the way aged Poles perceive the past.

Ongoing Differences and Ongoing Transfers? The Role of Labour Market Conditions in Pension Entrances in East and West Germany

Judith Anna Czepek

Georg August University of Göttingen, Germany

judith.czepek(at)gmail.com

The case of Germany is a textbook example for investigating the impacts of the adoption of welfare capitalist rules by a former socialist society. In this contribution, we asked which distributional effect on pension income can be ascribed to the political responses to the German Reunification and the subsequent changes to the German labour market. The empirical analysis focuses on the distinct impact of the Reunification process on different cohorts and patterns of gender inequalities.

For instance, because of the support for women's employment by the socialist legacy in East Germany, eastern women in old age are better provided than their western counterparts. In contrast, the promotion of the male-breadwinner model in West Germany led to lower pensions of most western women. Even though western women's labour market participation is rising, part-time work and their disadvantages on the labour market are directly transferred into lower pension entitlements. However, high rates of unemployment limit the effect of these culturally shaped institutional arrangements for eastern women and men.

The current labour market conditions in East Germany and ongoing differences between West and East Germany are shown to be a result of political decision-making and self-perpetuating processes after Reunification: The specific developments in East Germany still create winners and losers.

The structuring role of generations in a transforming society: Reflections from within the paradigm of social acceleration

Veronika Kalmus

University of Tartu, Estonia

veronika.kalmus(at)ut.ee

Generation as a social category designates, according to Karl Mannheim, location in the social structure in two ways: by positioning individuals or groups on the historical axis of the social process and in the social hierarchy. The Mannheimian generation approach, thus, serves as a viable alternative to Marxian class perspective for the understanding of social stratification: generations are constituted according to their relation to historical and cultural time, and to the respective lifestyles underlying status-based stratification. This paper revisits this classical sociological argument in the contemporary paradigm of accelerating time and life. The paper employs an assumption that social acceleration, by intensifying

transformation, has affected different social groups to a varying degree, bringing about emergent patterns of social stratification. As generations differ, due to dissimilar locations on life span, in their speed of adapting to rapid social changes, age has become one of the most significant markers of social inequality. In this context, time as resource, capital and commodity, and agentive control over time use, are especially meaningful. The paper will present generalizations of, and reflections upon, the analyses of the representative population survey "Me. The World. The Media" (N=1,500), conducted in the fall of 2014 in Estonia. The results reveal significant differences between generation groups with regard to "time wealth" and time use capability. The paper concludes that generations structure the transforming society on the vertical as well as horizontal dimension, and tend to desynchronize the progression of age groups in social time-space. Some counter-tendencies (inter-generational similarities and intra-generational variety), nevertheless, exist.

**RN36 | Session 04a Europeanization,
Modernization and Social Transformations**

The Impact of Intercultural Dialogue on Social Transformations

Rashid Dumalichevich Khunagov
Adyge State University, Russian Federation
nisadgu(at)yandex.ru

The beginning of the 21st century is marked by the global transformational processes affecting all areas of life. Parameters and content of social changes under the influence of globalization are changing, new elements of social structure are emerging and root alterations in values of local communities are taking place. The increasing dynamics of these transformations surpasses their re-evaluation by contemporary social science. Moreover, they occur within public organization which becomes more complex, that makes the modern world system less predictable. In this regard, there comes the increase in demand for timely adequate and relevant scientific expertise – the tool not only of an explication and monitoring, but also management, prevention of the crisis phenomena, challenges and risks of new social reality. On the one hand, the movement to uniform mankind, all-planetary civilization is a non-alternative way to solve the current global problems. On the other hand, westernization in globalization, especially in culture, and imbalance of forces between technologically and militarily strong countries of the West and traditional societies of the East, lead to assimilation of local communities, destruction of cultural traditions. Thereof, an opposite trend called 'localization' emerges, which strengthens influence of local cultures and values. This leads to the crisis phenomena, local conflicts, xenophobias, re-actualization of ethnic problematics and radicalization of religious consciousness worldwide. In these conditions the largest potential of removal of the designated contradiction is the cultural dialogue which

is based on recognition of equality of dialogue participants, mutual respect and desire to listen and be heard.

**Transformation, Europeanization, Nationalism ?
Macrostructural changes in Central Europe from
the perspective of local studies.**

Dariusz Wojakowski
University of Rzeszow, Poland
darek.wojak(at)wp.pl

The presentation shows the local dimension of social transformations that occurred in Central Europe in the last 25 years. It refers to research carried out during that period in local communities on the Polish-Ukrainian borderland. Theoretical background of that analysis concerns Clifford Geertz's idea that the great social issues could be understood by the explanation of the particular local phenomena, and Pawel Rybicki's statement that the macrostructural transformation is decided by microsocial changes. The research of the Polish-Ukrainian borderland show that transformation processes resulted in diverse consequences for local communities. On one hand, the state factor is vital, because in Ukraine local relations were based on social structures that were present during the USSR times. In Poland the former structures have been relatively quickly abolished. On the other hand, the implementation of Western patterns of social life in Poland between 1989 and 2004 was very diverse. Locally perceived differences have relevantly influenced to the process of Europeanisation, understood as acquiring social and legal rules of public life organisation and individual identification with the European Union. The fundamental difference concerns two kinds of communities: ones that effectively (practically) accepted European values of social life, and also those which refer to such values temporarily, motivated by external factors. Macrosocial processes such as nationalistic tendencies in Poland and pro-European aspirations in Ukraine overlap on that situation since 2014-2015. In my presentation I try to point at the early consequences of those tendencies for the everyday life in local communities.

Transformation. Modernisation. Europeanisation.

Cristina Boboc
Gent University, Belgium
cristina.boboc(at)ugent.be

„Progressive Europe or reactionary Asia”, a professor in Geography launch the debate in a classroom in Baku at the beginning of twenties century. This is how the novel of „Ali and Nino” starts. The novel was published for the first time in 1937, however the debate is still alive in political narratives and everyday life of nowadays Azerbaijan.

Due to natural resources, especially oil and gas, and a favourable geopolitical position, Azerbaijani economy grows fast, changing the social landscape of the country and its social stratification. Part of the revenues from the extensive oil exploitation in the last

two decades and the controlled economy are oriented towards the 'modernisation' of the country and create new aspirational values to its citizens. The narrative of the modernisation discourse is a barrister's speech for consumption, technologisation and urbanisation. Azerbaijani authorities invests money in schooling the middle class in overseas top universities, making the new funded students the agents of modernisation by bringing western standard education back to Azerbaijan.

The ethnographic data collected between February 2016 and February 2017 in Baku, the capital city of Azerbaijan, draws the need of modernisation of the country and its citizens, where the modernisation is viewed as an importation of the western goods, manners, education applied on local/eastern values (Watenpaugh, 2006).

The paper explores the fictional representation and political narratives towards modernisation of 'the country and its citizens' (Rumyantsev, 2015) and moreover, it looks to gain an understanding of what modernity means in a country with a constantly negotiated geographical position.

Trends of civilizational changes in contemporary European societies

Vladimir Kozlovskii

Sociological Institute RAS, Saint Petersburg State University, Russian Federation
vvk_soc(at)mail.ru

Contemporary European societies after a relatively quiet second half of the XX century, which ended with the disappearance of the most countries of the socialist bloc from a world map, became the leaders of civilizational process. European capitalism have given a powerful impetus to economic growth, that provided an attainment of a high level and quality of life, access to education, welfare state, mass consumption, and culture. An apotheosis was the integration of Western and Eastern European countries in a political, administrative, economic and fiscal union. Thus, a cosmopolitan society was formed. According to German sociologist U. Beck, it is gradually eliminating the national state and its institutions. Meanwhile, their original own social, institutional and cultural differences that constitute the civilizational specificities of different national societies have not disappeared. Paradoxically, the contingency of historical changes on the Eurasian continent at the beginning of XXI century has exacerbated differences and turned them into unpleasant contradictions. Some countries and citizens of the European Union faced with a choice to find their own path appropriate to their contemporary culture, traditions and everyday life. In general historical process of civilization developed several notable trends, such as: 1) uncontrolled population growth; 2) cyclical nature of development of contemporary capitalism balancing between (trans)national forms; 3) acceleration and digitization of scientific, technological and productive advances; 4) expansion of mass consumerism; 5) climate change; 6) unlimited migration, urbanization; 7)

collision between individualization, multiculturalism, transnationalism, nationalism, as well as between religious movements; 8) delicate balance between dominant state institutions and fragile civil society institutions. These trends require from new generations to act independently, actively and search resources to build adequate modernity and civilizational order.

RN36 | Session 04b Local and International Aspects of Social Developments

Bringing agriculture to its knees: food production between EU regulative and the peripheral capitalism's neo-feudal face

Reana Senjković, Ines Prica

Institute of Ethnology and Folklore Research, Croatia;
Institute of Ethnology and Folklore Research, Croatia
reana(at)ief.hr, ipricas(at)gmail.com

The paper represents results of a case study research on effects of the EU regulations on Croatian agriculture and rural life, conducted for the Horizon 2020 project Closing the Gap Between Formal and Informal Institutions in the Balkans.

Media conducted fierce public debate over consequences the EU accession would have on domestic production of food concentrated mostly on the examples of reputed eradicating of traditional food and food production processes. Seemingly banal examples of traditional practices that would allegedly disappear were used to symbolize either sacrificing of a „wild“ folklore culture or cleansing from the socialist system's residues on the transitional path to the project of Europeanisation, grandiose come-back of Croatian national culture to Western Civilization, where „it always belongs“. After the implementation process was finished it became evident that actual changes were smaller than expected and that they focus mainly on satisfying of the EU economy's overall functioning, professionalization of the amateurs' roles in agriculture and on some instructions concerning animal welfare that did not significantly affect previous practice. On the other side, however, these minimal interventions in a highly sensitive area of „everyday culture“ enabled the transfer of public attention from structural processes that determine national agricultural economy within the EU: legitimizing of practices that favour certain groups and individuals, formation of „neo-feudal“ relations, class and social differentiation of producers and mass exodus from traditionally agricultural areas.

From infrastructure investment to social change: local cultural centers and the development of social capital

Wojciech Kowalik

AGH University of Science and Technology, Poland
wojtekkowalik(at)tlen.pl

The aim of the paper is to analyse social capital in the context of substantive activity of local cultural centres. A local cultural centre is an excellent exploratory field as it is the place where the activities of self-

governments and those of social partners converge. It is here that local cultural policies turn into a substantive programme, which is largely developed at the juncture of local activity and the priorities of broadly understood 'local authorities'. In the new paradigm which is currently the general conceptual framework for cultural policies in Poland 'culture is to be understood as one of the generators of social capital, a laboratory of new forms of communication and common and individual lifestyles, a kindergarten of critical independence and a forge of self-organisation. Well-managed cultural institutions may not only safeguard heritage or design cultural events, as it has been assumed heretofore, but also contribute to the above mentioned development of citizens' major competences which determine the level of the society's well-being. The paper is based on the research conducted in nine urban-rural communes in Poland and nine local cultural centres which have invested in infrastructure, extending their premises using EU funds under the Regional Operational Funds in recent years. Each of those infrastructural projects may be considered as public intervention, and local policymakers are obliged to justify how its implementation will contribute to increase the potential for development, as major investment into the cultural infrastructure may and should be used by commune administrators to raise the quality of activities in culture and support social development.

Local Dimension of International Cooperation in Central European Countries

Agata Nijander-Dudzińska, Demetriusz Wojakowski, Artur Wolek

Jesuit University Ignatianum in Krakow, Poland; University of Warsaw, Poland; Jesuit University Ignatianum in Krakow, Poland

anijander(at)gmail.com, demek.wojak(at)gmail.com, wolekak(at)kr.onet.pl

The article presents the results of a research project concerning international cooperation of local government units in Central European countries (Poland, Slovakia, Czechia, Hungary, Romania) in the years 2004-2014.

Since 1989, there has been an increase in political autonomy of local communities in Central Europe. As a result, the communities are not only self-governing subjects, but also may commence mutual relations, even with foreign partners. Local governments contemporarily can be perceived as subjects of international cooperation. Our research confirm such thesis and show that in the processes of cooperation, local governments act as initiators and coordinators of activities regarding other subjects of social life engaged in international relations, such as NGOs, cultural institutions, schools, etc.

The results of the research show a transnational network of connections and determinations between local governments and local communities in this part of Europe. This cooperation is the most visible and effective in the field of culture, although it is also present in education, sport, tourism and economy.

The vital factor that supports the cooperation is the possibility of participation in the EU projects. Another factor that determines the intensity of cooperation is the geographic distance, as transborder cooperation has a significant impact on international cooperation of local communities.

The Agricultural Taxation Reform of the Chinese Communist Regime: The Integrated Perspective from State Building, Institutionalism and State Capacity

Ssu-Chin Peng

National ChengChi University, Taiwan

aegis146(at)gmail.com

The transition of the Chinese agricultural taxation system has been seen as one of the examples of market transition during the 1990s. However, this transition of agricultural taxation system has caused many problems in the rural area in China. This makes many scholars wonder what is the causes of such problems. And this article follows their questions to the situation and tries to use the integrated perspective from state building, institutionalism, and state capacity to give a more plausible answer. This article argues the integrated perspective basing on following reasons: First, to understand the problems after the transition, the institutional origin matters. As some institutionalists argue, the institutional origin matters because it can define the direction of institutional transformation. Hence the problems after the Chinese agricultural taxation system's transformation may have a certain relation to its institutional origin. Second, the concepts of institutional origin may connect to the concepts of state building. Both concepts discuss how the original design may influence the institution or the state. Finally, the state building process and the institutional design may influence the state capacity. Those process may constrain the state's ability, especially in taxation extraction. With such perspective, this article will discuss the process of how the Chinese agricultural taxation system is established, how it be transformed, hence to the implication of the question why the Chinese communist regime goes through the market transition.

RN36 | Session 05a Political Behavior in Transformative Context

Social factors shaping Russian civic culture

Mikhail Feodorovitch Chernysh

Institute of Sociology, Russian Academy of Sciences, Russian Federation

mfche(at)yandex.ru

The Russian civic life is often presented as a contradiction between the majority of support and the minority of protest. However a closer and a more grounded look based on representative data (2501 respondents of an All-Russia sample of the adult population) shows that the Russian civic culture is shaped by a number of key factors that belong to the past and to the present. Attitudes incorporated into the

Russian civic culture are a mixture of procedures that are born out of the Soviet past and the new political reality born out of conflict-strewn recent history. Most Russians believe in elections and regard elections as a procedure that they must take part in. They have been convinced that elections are an important legitimizing process that keeps the state going. However their participation in elections has an element of a ritual. The procedure is regarded as a confirmation of candidates rather than a competitive choice. There is a clear difference in attitudes towards elections between village and town populations, between educated classes and workers. Most Russians regard various agencies of the state as potent actors in their daily life, but at the same time they view themselves as largely unable to have any influence on the decisions taken by the authorities. It does not mean that they are positively disposed towards these decisions. The data show that they have been discouraged from formalizing their critical attitudes. Patterns of civic conduct are different in formal and informal spheres. A conflict between formal procedure and informal attitudes bear a key conflict of the Russian civic culture.

How are place-specific voting preferences sustained? The case of Czechia after 1989.

Tomáš Kostelecký, Renata Mikešová
Institute of Sociology CAS, Czech Republic; Institute of Sociology CAS, Czech Republic
tomas.kostelecky(at)soc.cas.cz,
renata.mikesova(at)soc.cas.cz

The analyses of voting patterns in Czechia revealed that voting behaviour has been increasingly linked to the spatial variation in social and economic composition of voters after 1989. It was found, however, that this general rule is broken in some specific places (micro-regions, cities) where voting behaviour tended to be rather persistent despite deep economic and social changes through which the post-communist society had undergone. We therefore performed detailed field research on voting behaviour in selected number of places where voting behaviour tended to be place specific. We selected eight model territories that represent various modes of voting behaviour of local populations (namely different ideological preferences of voters as revealed by the results of parliamentary elections).

In model territories we performed background analysis of demographic, social and socioeconomic characteristics of local populations, detailed study of local political history, one focus group discussion with representatives of local voters in each of the eight model territories and interviews with local political representatives that were aimed at exploring potential causes of both change and stability of electoral preferences in their town/micro region. We concentrated namely on analysis of factors and mechanisms through which the stability of voting preferences were maintained. These factors and mechanisms included political socialization in family, political socialization outside family, the influence of

territorially specific structure of various institutions, the influence of territorially specific activities of various institutions, long-term patron-client relations between particular political parties (or politicians) and voters in particular territories.

Understanding Democracy in Poland: changes in support over time (1992-2016) and understanding by the ordinary people

Tadeusz Szawiel
University of Warsaw, Poland
szawiel(at)uw.edu.pl

The context of the proposal is the recent wave of "crisis of democracy" discourse. P. Schmitter listed frequently mentioned symptoms of the crisis: "citizens have become more likely to abstain from voting, less likely to join or even identify with political parties, trade unions or professional associations, more likely not to trust their elected officials or politicians in general and much less likely to be satisfied with the way in which they are being governed and the benefits they receive from public agencies"; P. Mair in his last book (2013) writes about "hollowing of Western democracy" and announces: "The age of party democracy has passed". One of the recent reactions to the crisis, and its another symptom, is the challenge by populist leaders and movements. „Support for democracy” is a multi-level concept. David Easton made a distinction between diffuse (generalized attachment) and specific (performance of institutions and political authorities) support. Others (e.g. Pippa Norris et al) claimed that there exists rather a continuum from very general to very specific support. In empirical research various indicators of general support for democracy were used, but the one most frequently used, was a degree of affirmation or negation of the statement: "democracy may have problems but it is better than any other form of government". When analyzing the general support for democracy almost invariably emerges the question: what do people really mean by "democracy" when approving it or disapproving? The patterns of understanding democracy will be reconstructed based on the analysis of transcriptions of 6 focus group interviews. The interviews were conducted in 2012 in 4 different region of Poland, separately with younger (18-30) and older (30-65) people.

Institutional problems of Russian transformation: a view from political sociology

Ludmila Philippova, Tamara Pavlova, Sergey Patrushev
Institute of sociology, Russian Academy of Sciences, Russian Federation; Institute of sociology, Russian Academy of Sciences, Russian Federation; Institute of sociology, Russian Academy of Sciences, Russian Federation
ludmila_filippova(at)hotmail.com,
tamarapavlova(at)mail.ru, servpatrushev(at)gmail.com

The presentation aims to show that analyzing Russian transformations within a framework of conventional

oppositions, such as “archaic vs. modern”, “liberal vs. illiberal”, oversimplifies the reality - an alternative, non-linear, multivariant approach is required.

A long-time research by our department (as well as by other researchers) has identified a set of features of Russian socium, which simultaneously are its essential problems, acting as obstacles to changes; they constitute the problematique of transformation. These are:

- a cyclical causality: a deficit of social differentiation which hinders a differentiation on political grounds, and vice versa; hence a lack of strategies, whether of modernization, stabilization, or conservation;
- an incomplete institutional design as an essential feature or as a situational problem;
- a fragmented social and political order;
- a persistent deformatization of norms and rules;
- an unfinished construction of political institutions of representation, participation, action, and economic institutions of property, market etc.;
- a reproduction of institutional “traps” as a result of agents (elites / counter-elites / citizens / masses) implementing habitual practices.

We propose to analyze the prospects of overcoming those problems, and the possibilities of institutional transformations in Russia as seen by various agents.

It is required to reveal agents’ perceptions of social and political reality and the ways of its possible transformation in two dimensions: “horizontal” (their identification with specific projects of country’s development and with normative-value-sets) and “vertical” (their evaluation of ability to influence changes and outcomes).

RN36 | Session 05b Transformations and Personal and Social Lives

Shadow Price of Social Changes and Its Evaluation

Vladimir V. Karacharovskiy
National Research University “Higher School of Economics”, Russian Federation
vladimir.karacharovskiy(at)gmail.com

The shadow price of social changes is the core category of our analysis. For the first time, an attempt was made to determine the approaches to measuring this value with regard to non-market phenomena and processes, and the attempt to apply these approaches in the empirical analysis based on the materials of the representative survey in Russia using the method of experimental situations.

The basic method we used consists in quantitative estimate of divergence between the real and ideal structure of the individuals’ time budget in the main areas of life. The indicators of “non-optimized” (in social terms) product of labor and “non-optimized” product of leisure are suggested and designed. For example, “non-optimized” product of labor means the part of the labor which individuals produce without desire or, vice versa, the part which is underutilized by the society in spite of the individual’s willingness to create it. We demonstrate the need to rethink the

approach to the perception of the role of labor and leisure in the processes of social transformations, given the existence of socially non-optimized parts of labor and leisure.

Aggregated estimates of these values show the part of social welfare (e.g. share of GDP or GPI) which could be optimized via redistribution of population time budget according to ideal social preferences.

*** The research is funded by the Russian Science Foundation (project No. 16-18-10270). ***

Becoming an Entrepreneur in Post-Communist Poland: the Influence of Money, Friends and Family

Weronika Boruc
Graduate School for Social Research at the Polish Academy of Sciences, Poland
wboruc(at)sns.edu.pl

In post-communist economies entrepreneurs played an especially significant role and are often considered to be among the winners of the economic transition processes. Different determinants of becoming an entrepreneur have been described in previous studies, e.g. personal motivations and attitudes, family influence, or financial situation. This study compares for the first time the role of family, friends and potential financial resources in shaping future Polish entrepreneurs in later stages of economic transition. The purpose of the study is to analyse not only the separate, but also the combined effects of these factors, in order to determine their relative importance. The author uses panel survey data from years 1993–2013 from POLPAN study conducted every five years on a large random sample of adult Poles. The panel aspect of the study allows to observe the consequences of different determinants in time. The results show that originating from an entrepreneurial family has a paramount importance on running a company in the future. Also the fact of being surrounded by entrepreneurial friends in 1993 and being able of acquiring investment capital in 1993 are significant for becoming an entrepreneur 5, 10, 15 or 20 years later. The most interesting conclusions come from the analyses of combined effects of independent variables. The results suggest that social resources influence career entrepreneurial choices stronger than potential financial resources.

The Transformation of the Czech Suburban Countryside

Helena Kubátová, František Znebežánek
Palacký University, Czech Republic; Palacký University, Czech Republic
helena.kubatova(at)upol.cz,
frantisek.znebejanek(at)upol.cz

This paper will aim at explaining how everyday social practice came about on the basis of major historical and political events. This will be carried out from the perspective of interpretations from everyday participants.

The contribution depicts the transformation of the

Czech countryside over three time periods (the first up to the year 1948, the second between the years 1948 and 1989, the third from the year 1990 up to the present). This transformation took place on two levels. On the first level, through radical institutional changes particularly in the political and economic sphere and on the second level, by changes in the sphere of everyday life which occur slowly as a result of cultural inertia.

We present in this paper a model of transformation of the countryside obtained through an analysis of time lines on the basis of selected data from the Czech Statistics Office and our own qualitative data acquired within the framework of 150 qualitative semi-structured interviews. The central category of the model is a pattern of obtaining sustenance which markedly influences the pattern of home life including its material framework. The transformation to the material framework of home life is an important sign of the transformation of the countryside. Our explanation follows the transformation of the pattern of obtaining sustenance and home life in industrial modernity in the pattern obtained in post-industrial modernity. The model indicates that the developments in the first modernity are intervening conditions of the transformation in the second modernity.

RN36 | Session 06a Social Transformations and Stratification Trends

Recent Trends of Class Division and Inequality in Baltic Countries

Vaidas Morkevičius, Zenonas Norkus
Kaunas Technological University, Institute of Public Policy and Administration, Lithuania; Vilnius University, Faculty of Philosophy, Lithuania
vaidas.morkevicius(at)ktu.lt,
zenonas.norkus(at)fsf.vu.lt

Among post-communist countries Baltic countries (Estonia, Latvia, Lithuania) are reputed as exemplary cases of neoliberal semi-peripheral capitalism, most diligently implementing the recipes of neoliberal think-tanks how to succeed in the catching-up growth and meet the challenges of the adaptation to the external shocks. During the recent economic crisis (in 2008-2011) they implemented in the resolute way the "internal devaluation" policies, and were recommended as examples for the Southern European countries. After very deep recession, the gross domestic product per capita output rapidly recovered to the pre-crisis level, displaying above the European Union average annual growth rates. However, social dimension of the reputed Baltic success in coping with crisis remains underresearched. We explore the impact of crisis on the class structure and class-based social inequality in the Baltic countries. Neo-Weberian class model is used as analytical framework for this exploration, grounded in the European Social Survey (ESS) data. The trends of change in class division and inequality are identified by synchronic and diachronic comparisons, focusing on the stability vs. change in

the market and work situation, life chances, ideological attitudes and voting behavior across different classes. The neighbour Finland is used as contrast and control case in these comparisons, selected for this role because of its reference state status for the post-communist Baltic countries.

Subjective stratification in the transforming society: factors and outcomes

Marju Lauristin, Peeter Vihalemm
University of Tartu, Estonia; University of Tartu, Estonia
marju.lauristin(at)ut.ee, peeter.vihalemm(at)ut.ee

The paper presents results of our long-term research on restructuring of Estonian society during the last three decades. In the focus of our study is subjective stratification as an indicator of personal capacity to accommodate with changes in society. Regression analysis of correlations between the subjective position in the social stratification system and the other indicators of personal well-being, life-style, level of political and cultural participation, evaluation of changes in society has brought us to conclusion, that self-assessment of position in society could be interpreted as expression of social habitus, a generalized disposition of personality, reflecting his or her capacity to cope with the changing social, political and technological environment. In the course of transformation the importance of various resources for coping has been shifting from more material (money, access to the new technologies) to more intellectual factors (education, life-style, capacity to make more complicated choices). The lower or higher self-positioning does not directly reflect the objective economic or professional status, but rather positive or negative differentiation from the perceived average level of social success. Comparing those self-assessments with opinions about the changes in transforming society, we can see strong correlations. As an outcome, if in transforming societies the political class as a major decision maker represents only those who are better equipped and feel themselves well-fit in the situation of rapid changes, the system of governance is not capable to prevent widening of the gap between 'winners' and 'losers', between establishment and 'people'.

Russian Society within the Context of Internal and External Factors of Crisis Reality

Mikhail K. Gorshkov, Irina O. Tyurina
Institute of Sociology of the Russian Academy of Sciences, Russian Federation; Institute of Sociology of the Russian Academy of Sciences, Russian Federation
tiourina(at)rol.ru, irina1-tiourina(at)yandex.ru

Paper deals with a multidimensional contextual analysis of the status and dynamics of Russian society in a new reality mediated by external and internal threats and risks overburdened with the current economic crisis. It is based on the results of the national sociological survey (N=4000) conducted

in 2014-2016 by the Institute of Sociology RAS. Particular attention is given to adaptation capabilities of Russians, models of their economic and political behavior during the crisis. The report indicates deterioration of mass assessments of transformations took place in 2015-2016 as a result of population unfinished hopes for defusing the crisis. The paper highlights typical for Russians self-awareness of co-dependency between internal and external factors affecting socio-economic conditions within the state as well as the social development issues. At the same time it identifies basic effects of the crisis on daily lives of Russians together with the adaptation strategies used by different professional groups' representatives and residents of different types of settlements largely determined by their average income and nature of employment. The authors conclude that Russian society is moving dynamically towards the modern consumer community in which dependence of population on authorities shows a progressive decline, and personal interests start to prevail over the public ones. Russians' choice for the "great power" institutions is verified, and this makes it possible to characterize institutional trust that exists in the society not only as a hierarchical, but also as a holistic one. Stability and variability of attitudes and vital priorities of Russians as well as the resources for social integration in a poly-ethnic and religious space of Russia are analyzed.

Corruption and Inequality in Schools in Central and Eastern Europe: Prevalence and Structural Patterns

Ilona Wyszumlek

Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland

ilona.wyszumlek(at)ifispan.waw.pl

In this presentation, I analyze the scale and sources of views on corruption prevalence and bribe-giving experiences in the educational sector in Central and Eastern Europe. In my analysis, I use Global Corruption Barometer and Quality of Government Survey, which are cross-country public opinion surveys. My goal in the presentation is twofold. First, I address the questions of how corruption level in educational institutions in Central and Eastern Europe compares to the situation in other European countries. I also elaborate on the changes of opinions about corruption prevalence in schools during the last decade of transformative years. Second, my goal is to investigate the effect of individual level predictors of perceiving schools as corrupt, with special attention to structural determinants and previous bribe-giving experience of respondents. I investigate which groups feel excluded and who bear additional costs of participation in the system. Members of these groups can seek to bribe as compensation for their maladjustment or be forced to bribe as a weaker and "less dangerous" group that is not likely to report. In the second part of the presentation, I concentrate on the specific case of Poland. The results reveal that in Poland relatively few respondents experience recent

bribe-giving in schools and perceive educational institutions as corrupt. However, there is a structural pattern behind the sources of negative opinions. The effect of socio-economic determinants on corruption views in Polish schools is strongly pronounced and opposite in direction as compared to other developed countries in Europe.

RN36 | Session 06b Precariat and Vulnerability of Careers

Precariousness in Russia: Experience of Young Adults with Higher Education

Elena Gasiukova, Sergey Korotaev

Laboratory for Comparative Analysis of Development in Post-Socialist Countries, National Research University Higher School of Economics; Laboratory for Comparative Analysis of Development in Post-Socialist Countries, National Research University Higher School of Economics

lena-gasyukova(at)yandex.ru, sergey_a.k(at)mail.ru

The purpose of the paper is to show how today Russian workers with higher professional education who have precarious employment and live in big cities perceive the lack of stability in their employment and life, as well as their career prospects, and what influences their decision-making. The underlying method applied is consensual qualitative research (CQR). In line with the method requirements, a small number (10) of semi-structured in-depth interviews has been conducted. The members of the sample have common key characteristics: they do not have a stable job; they are engaged in skilled work that requires theoretical knowledge, experience and necessary training; they have higher education; their income flows are unstable and may vary; respondents' age is 25 to 45 years; work experience 5+ years; respondents live in big Russian cities and metropolitan areas.

2 general categories - pursuit of interesting jobs and short-term vision of their employment and life goals - have been distinguished. Most of the respondents reject the possibility of standard employment. They appreciate the lifestyle made possible by flexible employment. They feel fully responsible for their lives and resort to professional development tactics that are not oriented at career promotion at one particular company. The respondents seldom plan employment and life activities for more than six months or a year; they have little idea about what they will do after the current project ends taking on a job without expecting to stay longer than a few months; they often make spontaneous decisions regarding important issues.

Sociocultural factors of labor market exclusion in Ukraine and the countries of Western and Eastern Europe

Olga Balakireva, Iryna Loktieva

The Institute for Economics and Forecasting of the National Academy of Sciences of Ukraine, Ukraine; The Institute for Economics and Forecasting of the National Academy of Sciences of Ukraine, Ukraine

bon(at)ief.org.ua, iryna.lokteva(at)gmail.com

The paper presents the results of the analysis of labor market exclusion sociocultural factors in Ukraine and the countries of Western and Eastern Europe. For comparison with Ukraine were chosen Germany and Poland. The selected countries have different systems of value orientations and the welfare models. The research source is database of the World Values Survey (2011-2012). The method of analysis is the logistic regression. The results of the analysis showed that the nature of relationships between a labor market exclusion and its socio-cultural factors is culturally dependent. The analysis of binary logistic regression demonstrated that in all countries the interpersonal trust, level of education, frequency of Internet using and subjective evaluation of health are statistically significant factors of labor market exclusion. In Ukraine and Poland an extension of the settlement size reduces chances of labor market exclusion. But the results of multivariate logistic regression analysis showed that inclusion of other factors to the model eliminates the aforementioned effect in Poland. A judgment concern successful strategy of behavior within labor market is the statistically significant factor for Germany and Ukraine. But, in Germany, for those who believe that "hard work doesn't generally bring success – it's more a matter of luck and connections' chances of being excluded from the labor market are increased. In Ukraine this factor has the opposite effect: those who agreed that the 'luck and connections' are needed for getting success have less chances of being excluded from the labor market.

The moral aspects of class disaffiliation: the experiences of intersecting inequalities in the biographies of young precarious workers in Poland and Germany

 adam.mrozowicki(at)uwr.edu.pl, seehaus(at)zedat.fu-berlin.de, mateusz.karolak(at)uwr.edu.pl, vera.trappmann(at)ovgu.de

This paper contributes to the analysis of the moral significance of class (Sayer 2005) taking into account the perspective of young precarious workers in Germany and Poland. In the biographies of both young Poles and Germans we can observe a common

tendency of absence of class identification. Simultaneously, narrators' stories involve both the rich narratives of the experiences of inequalities related to employment status, income, ethnicity, gender, age and other factors combined with at times strong, morally laden judgements. In this context, the main questions asked by the paper are how the experienced and intersecting inequalities are translating into a concept of identity? DO we see forms of expression of collective identity that refer to the experienced inequalities? Further we ask how do class locations manifest themselves in biographical narrations in the context in which class language is strongly underdeveloped and devalued? How does the reflexivity of precarised workers interact with the ethical dispositions they refer to in making sense of their lives? The paper will present the first results of ongoing analysis of biographical interviews with young people (aged 18-30), employed in various types of precarious jobs or unemployed, collected within the framework of the DFG-NCN funded PREWORK project in 2016-2017. Its main part will focus on the intensive analysis of the selected, exemplary biographical cases demonstrating similarities and differences in the categories used to describe the experiences of social inequality by young informants in Poland and Germany.

Vulnerability of social carers: Norway and Latvia case studies

Liga Rasnaca
 University of Latvia, Latvia
 liga.rasnaca(at)lu.lv

Vulnerability of social group could be linked with socio-demographic aspects and situation in labour market. Home-based care is one of the vulnerable sectors in sense of workers protections. Social solidarity means a mutual responsibility at the level of society, but it can also be expressed at the level of social and professional groups. Social carers are professional group of growing importance in ageing societies in Western European and post-communist Eastern European countries. At the same time the importance of this group could be underestimated by employers, society and even care takers. Author has chosen Norway and Latvian case studies as comparable in geographical, socio-demographic senses, but different from viewpoint of capitalism development, welfare state models, professional and workers protection traditions and economic, financial possibilities. The ageing society and increasing mobility are factors in growing importance of social care for older persons. The aim of proposed paper is to analyse vulnerability phenomenon among older people's social carers in Latvia and Norway in comparative perspective. The qualitative methodology was applied. Vulnerability of professional group partly could be explained by New Public Management approach in social care in both countries. The data analysis shows occurrence of the involuntary part-time contracts and self-employment in both countries. To recruit carers from rural areas or other countries is

common practice in Norway and Latvia. The workplace relocation intensifies possibility of social and professional risks for this vulnerable professional group and endangers relations with their clients – older persons.

RN36 | Session 07a Europeanization: Perceptions and Discourses

Belonging to Europe, Returning to Europe or Behaving like Europeans? Semantic aspects of Memory and Space of Self-Thematization of the Baltic States

Liena Galeja

Latvian Academy of Culture, Latvia

liena.galeja(at)gmail.com

The beginning of 2017 marked a minor battle of thematization of the Baltic states, reflected both in political debate and public discourse level. Three significant benchmarks should be mentioned: first, an open request by the ambassadors of the Baltic States pleading for discarding thematization of the Baltic States as post-Soviet republics in German media, second, the debate about the classification of the Baltic States as Northern European countries – although regionally still belonging to Eastern Europe – by the UN (although stated as early as in 2002), and finally, the following discussion in public media suggesting that Baltics could perhaps be regarded as a unique case not attached to any region (Cepurītis, 2017). This discussion, like Bloomberg View columnist Leonid Bershidsky has suggested, might signify an issue of self-identification, or at least an upcoming tendency of reassessing certain aspects forming historical master narratives of the Baltic States, particularly those linked to interrelations of memory and space and the thematization of these aspects. The proposed paper traces structural changes of these aspects in the Baltic States with a specific attention to how these changes are influenced by nationalist – post-nationalist – neo-nationalist tendencies in both political and public discourse.

Between an Alien and a Citizen. “Fuzzy” Citizenship in the West and in the East

Daria Łucka

Jagiellonian University, Poland

daria.lucka(at)uj.edu.pl

The concept of a “fuzzy” citizenship appears in two different contexts. The first one refers to the situation of immigrants, who are long-term residents in particular countries, exercising more and more rights, which makes their status – as the so-called “denizens” – close to the status of citizens. The second context refers to people living outside their home states, who are granted privileges and benefits by these states, in some cases enjoying numerous rights even without a formal citizenship. Such a special treatment is based on the ethnic links of these compatriots with their countries of origin.

In the paper, these two types of a “fuzzy” citizenship

will be analysed as related to modern and postmodern transformations. Their reference to the classical division between Western and Eastern Europe will also be examined.

Performing Europeanisation in Georgia: What do Political and Popular Discourses Reveal?

Lia {Lika} Tsuladze

Tbilisi State University/Center for Social Sciences, Georgia

l.tsuladze(at)css.ge

After persistent attempts, Georgia signed the Association Agreement with the EU in 2014. Georgia's persistence can be explained by various factors roughly divided in the utilitarian and identity ones and revealed in Georgians' political and popular discourses on Europeanisation.

The research project: “Performing Europeanisation - Political vis-a-vis Popular Discourses on Europeanisation in Georgia” supported by Academic Swiss Caucasus Net (ASCN) and led by the author (2014-16) aimed to analyze the abovementioned discourses in a comparative perspective focusing on such utilitarian factors as the country's security, economic growth and a new experience of doing politics, as well as the perception of national identity as affected by Europeanisation.

In-depth interviews with the political and intellectual elites and focus groups with the population residing in different regions of Georgia reveal that on the declarative level, the participants offer socially desirable narratives on the EU and Europeanisation that are in compliance with Georgia's foreign policy course. In particular, they depict the EU as a safeguard of Georgia's security, a guarantee of its economic prosperity, and a means of reinforcing its political institutions. However, their ambivalent attitudes are revealed behind this façade reflected in the fears that the EU might pose a threat to the country's sovereignty, that its economic performance might be measured merely by formal characteristics, and that Europeanisation might represent a part of political image created by Georgian politicians for the domestic audience. Furthermore, Europeanisation is perceived as both a safeguard of and a threat to the Georgian identity. Thus, the research shows that Georgians mix their strong support for the EU with a significant concern about what outcomes EU integration might bring to the country.

Social attitudes of Belarusians towards integration: between the European Union and the Eurasian Economic Union

Aleh Kabiak, Iryna Andras

Belarusian State University, Belarus; Belarusian State University, Belarus

aleh.kabiak(at)mail.ru, iryna.andras(at)gmail.com

After the disintegration of the Soviet Union, Belarus defines itself as a strategically significant junction between East and West, in geopolitical terms. In this context, the Belarusian Government aims at a well-

balanced foreign policy. The periods of Belarusian foreign political activity based on the government forms (People's Republic, Union Republic, Parliamentary Republic, Presidential Republic) have been defined. Each period is characterized by various proofs of the Republic's ability to exist independently. However, Belarus has always demonstrated high geopolitical valence, by making part of certain unions, such as the USSR, the Commonwealth of Independent States, the Union of Belarus and Russia, etc. At present, European integration within the European Union is brought as closely as possible to the Belarusian borders. Yet, public opinion is in favour of integration with Russia in the first place (75.1%), according to the republican opinion survey Belarus-2030 conducted by the Institute of Sociology of National Academy of Sciences of Belarus (Minsk) in 2014. Belarusians refer to historical background (57.6%), shared language (38.1%) and culture (35.6%) as key factors for the unification of Russian and Belarusian people. Belarusians see main advantages of becoming a member of the Eurasian Economic Union in domestic goods market development (49.8%) and financial support of manufacturers considering economic instability (44.6%). Thus, a high level of social expectations in terms of integration with Russia is marked by a greater number of Belarusians supporting economic cooperation.

RN36 | Session 08a Europe: Issues of Periphery and Protectionism

Field of Law in the Central European Semi-Periphery

Tomasz Warczok, Hanna Dębska
Pedagogical University of Cracow; Pedagogical University of Cracow
tomaszwarczok(at)gmail.com,
hannadebska86(at)gmail.com

The presentation shows the process of legal professions' formation from the fall of communism in 1989, until the present. The core theoretical framework of the analysis is Pierre Bourdieu's field theory, applied in particular to semi-peripheral conditions.

We claim that in (semi)peripheries, under the conditions of general weakness of states as „ordering” meta-institutions, particular social fields (i.e. scientific, legal, political, administrative) are poorly differentiated and overlapping – contrary to states of the world core. Because of this, agents are realising their practices in various contexts, combining resources from different fields. It is particularly visible in professional legal practices, where combining a purely scientific capital (professor of law) and professional capital (solicitor, barrister) is very common. These practices were already visible in social realism, but became most prominent under the conditions of (semi)peripheral capitalism, when the status of being an academic, together with the cultural and social capital connected to this position facilitated (and still does) the

occupation of dominant positions in the local field of legal counsel with regards to a myriad of matters, especially the lucrative advisory services rendered to global corporations. The high status of cultural capital (and intellectualists) is in turn caused by an absence of local bourgeois, characteristic for the (semi)periphery.

The above presented situation alters the grounded sense of inter-professional conflicts, monopolisation processes, as well as the very concepts of „profession” and „professionalization”. Instead of a narrow specialisation in a specific area, the (semi)peripheral conditions cause a constant game of multiple inter-strengthening capitals.

Europe's closest periphery: analyzing Ex-Yugoslavian transition processes from a post-colonial perspective

Edma Ajanovic
University of Vienna, Austria
edma.ajanovic(at)univie.ac.at

Tough it is contested to speak of colonialization in the context of inner European relations (Ruthner 2001: 1) my presentation proposes a post-colonial approach in order to analyze the transition processes of the Ex-Yugoslavian states.

After Stalin broke with Tito in 1948 the latter introduced a 'third way', strategically refusing to take either the 'Western' or 'the UdSSR' side. His alternative path however ended in tragic wars and the disintegration of the Socialist Federative Republic of Yugoslavia. The transition processes that began after (and are still ongoing) in the successor states replaced this alternative socialist system with a capitalist system.

Looking at these processes from a post-colonial perspective I want to show that with the transition of Yugoslavia the 're-conquering' of its successor states by 'the West' began. By contextualizing the transition processes in the history of Austro-Hungarian rule and the Ottoman rule in the region of 'the Balkans' as well as the current (dis-)integration of the European Union I a) discuss the re-establishment of 'Western European' centrality in Ex-Yugoslavia in reference to the historical colonial/monarchic relations b) discuss current ruptures of this 'Western Europe's' centrality in Ex-Yugoslavia as new 'players' emerge.

A post-colonial perspective will enable an analysis of "centrality of [Western] Europe in the new constellation of global power and its place in neocolonial modes of production and capitalist accumulation" (Gutiérrez Rodríguez 2007: 62). This will shed light on racist and 'othering' processes as well as the inequality in inner European relations. It will furthermore analyze transition processes as embedded in global and inner European power relations.

Economic patriotism – between the free market and protectionism (cases of Poland and Russia)

Piotr Binder, Oleg Oberemko
Polish Academy of Sciences, Poland; Polish Academy

of Sciences, Poland
pbinder(at)css.edu.pl, o.oberemko(at)gmail.com

Broad and popular concepts of the free market, globalization or Europeanization understood as development of a European polity and identity do not appeal to the imagination of the key participants in public debate as they have throughout the last decades. There are many causes of the shift that we can currently observe including: consequences experienced by European societies as a result of the global financial crisis, various aspects of inefficiency of all-European governance, as well as the European migrant crisis. These phenomena (among others) created an environment where ideas of national identities and polities (re)gained a significant position. As a part of this symbolic and ideological reconfiguration the notions of patriotism and especially of the vague and contentious economic patriotism became an important part of mainstream politics within various European countries. Within the proposed paper we would like to focus on the cases of Poland and Russia, two countries where for various reasons the category of economic patriotism has started to play an important role in public debate. Based on selected vivid examples of its use within two very different national contexts we would like to (1) elaborate on how the key definitions of economic patriotism are constructed; (2) identify dominant ways of understanding this ambiguous concept; (3) juxtapose national specificities of its applications.

RN36 | Session 09a Changing Discourses and Role of Intellectuals

Interests and resentments of the Polish intelligentsia as the objects of morphogenetic analysis

Piotr Weryński
Silesian University of Technology, Poland
p.werynski(at)interia.pl

The main thesis of the paper is that social and political activity of the Polish is conditioned by the intelligence-circle origin (post-gentry – republican and bourgeoisie – liberal) of their civil habitus, from which both patterns of citizen participation derived. Those patterns structurally and culturally predispose the intelligentsia as an active, historically delegated group with a mission to represent the nation. The author analyzes the conditions functioning of the public sphere, identified barriers to its development in the context of existing in Poland emergent social structures (interests) and culture (resentments, values). Theoretical basis of the analysis will provide Margaret Archer's theory of morphogenetic of structure and agency.

Simultaneously, the author claims that the search for origins of modern public attitudes and behaviour of the Poles should be performed in socially generalized historical resentment. The paper assumes the definition of resentment as put out by Max Scheler. If existent political and economical conditions, as well as

those being a result of tension in the structure of the society, it may be assumed that resentment (unsettled trauma), affects the whole class or stratum. It is a structural conditionality which permanently influences social attitudes and behaviours of those who are affected by that resentment. Furthermore, an analysis is made on the correlation between collective traumatic experiences of both objective and subjective nature that affected the Polish people in the last 200 years and the structural conditionality. The author presents eight resentment mechanisms and illustrates them with examples from the social life.

Locally or Worldly? Sociological Dissertations in a Diachronic Perspective

Grażyna Woroniecka
University of Warsaw, Poland
gworoniecka(at)wp.pl

Paper presents results of my study on two sets of scientific reviews of doctors' dissertations and habilitations in sociology: the first collection of 98 reviews from 1999-2002, and the second one of 78 from 2014-2016. These two sets illustrate a big difference in reviewers' expectations, what can be seen both in the works themselves and in their evaluations, as well. The first set appreciates an extensive monographs with widely circled research field. A monograph was obligatory for habilitation. The second set illustrates focus on interdisciplinary work, series of papers instead of monographs, strictly presents theoretical background, empirical studies results rather than theoretical works. Studies on reviews show how far the research procedure has been standardized. It has been adapted to requirements of education written in Bologna process: appreciates parametric valuation and managing competence in place of traditional intellectual work in humanities. New strategies of 'games in the field' (Bourdieu) lost their previous exclusiveness, they allow more and variously educated players to take part in the 'game' so that boundaries of sociology are more and more unclear and sociological narration stops to be an obligatory reference horizon for candidates to be sociologists. Studies on reviews of sociological works written for a promotion add one more argument that the thesis about imitative character of modernization in Polish realities after 1989 should be taken seriously.

Post-Soviet Modernity in Russia: Ideas, Orientations, Interpretations

Yulia Prozorova
Sociological Institute of Russian Academy of Sciences, Russian Federation
y.prozorova(at)socinst.ru

Since the "end of history" has not yet arrived and post-communist countries demonstrate a variety of democratization trajectories and responses to the Western modernity project, the Russian experience of the post-Soviet modernity deserves a special attention. The post-Soviet version of modernity

originates and unfolds in the context of a large-scale societal transformations inspired by an attempt to assimilate and implement Western ideas and practices after the failure of the communist project in Russia. The paper focuses on the reception of the Western project of liberal democracy and examines ideas, interpretations and representations that arise in political discourse and appear to be constituent to the resultant patterns of the post-Soviet modernity in Russia.

The universality of the Western-type democracy has been problematized in political discourse since the early 2000s, the vision of its relevance for contemporary Russia is strongly associated with the dynamics of civilizational discourse and conceptions of Russia's civilizational identity dominating the political discourse. The critical reaction and reflection on the Western project revived traditional orientations and representations (e.g. statism, paternalism, missionism, "collective forms of life", "Russian world" etc.) and evoked its original interpretations ("sovereign democracy") with ideas such as "strong state", integration, centralization and personification of power, which are in dissonance with the pluralistic conception of the Western modernity and suppose a modification of the Western models. Retraditionalization and restoration of the symbolic and ideological repertoire of the recent non-democratic past redefine and reshape the political realm in an authoritarian manner.

The problem of civilizational gap: past, present and future in Polish discourse on transformation

Agnieszka Kolasa-Nowak

Marie Curie-Sklodowska University, Poland
ag-kol(at)wp.pl

In times of new uncertainties and weakening of European project the „latecomers” are rethinking their position. In Polish public and academic discourse there is a search for new interpretations. Main question is what happened to Polish society in last 25 years and how to grasp this experience in times of new disturbing challenges. There has been a generational change in Polish sociological debate on this fundamental issues. Scholars have been doing a critical assessment of distance traveled since 1989. There is an emphasis on diagnoses of fractured, deeply divided society and the process of closing channels of social mobility and life chances for the young. The omissions and mistakes of designers of transformation have been discussed, which leads to rediscovery of the role of the past. Disillusionment with big projects turns the sociological agenda towards the idea of development gap and center-periphery model. The explanations of contemporary problems range from the path-dependency scheme to the structural factors of new unequal hierarchy of globalization. My goal is to show new trends of research in Polish sociology through the prism of this division which I think is now important. It also connects to public and critical functions of sociological interpretations.

RN36 | Session 10a Transformation Discourses and Representations of the Past

Processes of De- or Re-Sovietization

Ana Kirvalidze

Ilia State University, Georgia

ana.kirvalidze(at)iliauni.edu.ge

In this paper I try to outline the major trends in the transformation of the landscape of Post-soviet Georgia and how a particular Western/European identity was deliberately accentuated while, at the same time, the Soviet/Russian influence was denigrated and (partially) erased. After the 2013 democratic change in government in Georgia, questions immediately arose as to what political path the new administration would take: pro-Western, pro-Russian, or some amalgam in between. At the same time, debates about how to contend with the Soviet past, Stalin's role in Georgian history, and Stalin's current place in Georgian society intensified. Stalin monuments were installed in several villages in Kakheti, and more vocal calls were made for the return of the Stalin monument in Gori is development aligned with public admiration of the Soviet dictator. In a survey of 4 post-Soviet countries, Georgia had the highest positive evaluation of Stalin (de Waal 2013). Commentators in the West viewed these developments as problematic and difficult to comprehend. Despite this recent attention, few scholarly attempts (beyond the anecdotal) have been made to better explain this phenomenon.

This paper focuses on contemporary Georgian understandings of the Soviet era. In particular, I turn my attention to Joseph Stalin and the narratives and opinions people have about him. Narratives about the past and opinions about historical figures can reflect the tenor of political stances in the present. I want to highlight the role of Soviet history and memory in contemporary Georgia. In order to provide an in-depth analysis of the issue I use an integrative methodological approach, combining both quantitative and qualitative methods.

Representations of communism among high school students in Romania

Andrei Gheorghita

Lucian Blaga University of Sibiu, Romania

andrei.gheorghita(at)ulbsibiu.ro

The way contemporary teenagers represent the communist past to themselves is entirely a matter of political socialization. In the absence of any direct experience with the communist regime, their perspective on communism is expected to develop exclusively in relation to school, family, mass media or other agents of socialization. This paper aims at exploring Romanian teenagers' representations of communism more than two decades after the 1989 regime change. Particular attention is dedicated to experiences shaping such representations at various levels: school (history classes, communist nostalgia

among teachers), family (nostalgia among parents or relatives, educational background, various deprivations, travel abroad experiences), community (winners/losers of the transition period), and media. For this purpose we work on data from a survey study on 5.861 high school students (aged 14-19) and their class masters in 86 Romanian high schools, collected as part of the Romanian Election Studies program (2010).

The grey zone is shrinking. Media discourse about transformation in Poland.

Marcin Kotras

University of Lodz, Faculty of Economics and Sociology, Poland
mkotras(at)uni.lodz.pl

The Round Table is still considered as a symbolic beginning of the social, political and economic transformation in Poland. However its results and especially positive or negative attitude towards the character of transformation are determining public disputes and social divisions. Different and antagonistic narrations about transformation which are being created by the symbolic elites (including journalists and politicians) strengthens the social cleavages. Nowadays, Polish society is being described as a deeply divided. Citizens who want to access the political arena should declare which side of political dispute they belong to. Now it is challenging to remain in the grey zone outside the two narrations which organize the public debate. Building political community is based on exclusion, instead of inclusion and debates are strongly related to up-down defined political identities. It can be assumed that political actors, including media, are organizing permanent, secondary socialization of citizens (media recipients). The outcomes of this process are social cleavages. This paper presents the research data focused on argumentation strategies applied in Polish weekly opinion magazines. The strategies were identified with usage of discursive and rhetoric analysis (e.g. the social representations theory, membership categorization). One of an important aims of the research was to distinguish discursive practices which were used in the process of framing or re-framing the narration about transformation in Poland. The choice of public discourse as a research object was brought about by the fact, that: discourse is a proper, and actually the only, area of power exercising by symbolic elites.

Concept of capitalism according to comic book relations between Donald Duck and Scrooge McDuck

Arkadiusz Swojak

University of Warsaw, Poland
swojak.a(at)gmail.com

Depictions are fundamental to the way we perceive. As Berger and Luckman proved this is the way one internalises e.g. moral imperatives. In case of children such an internalization is often called socialisation,

where the role of an explainer is performed by a parent.

But what happens if parents are thrown into reality as unknown to them as it is to their children (like during the transformation)? In that case, presumably, significance of other explainers is increased.

In this paper the key concepts associated with capitalism found via analysis of Gigant - comic book series popular in 90's – will be presented. Donald Duck and Scrooge McDuck are two protagonists, who can be accurately described as antithesis of each other. First of them is a constantly unemployed failure drowning in debt. Second one is a dynamic entrepreneur and the wealthiest duck in the world.

Both of them perfectly fit into the discourse that widely took over the debate regarding capitalism and polish transformation: the division into losers and winners of the free market.

Following the principles of semantic analysis and narratology inspired by Russian formalism I inquire how comic stories depict those two crucial figures of modern capitalism:

- What is the most notable difference between them?
- Is being a loser a loser's fault?

and therefore what is an implicate definition of capitalism itself. Moreover I also try to answer a question: what positive lesson can be deduced from this particular depiction?

RN36 | Session 11a Youth Practices and Communities in Change

Adapt or Perish? Survival Strategies of Czech Youth Organisations during Post-Communist Transformation

Inna Bell

Graduate School for Social Research, Polish Academy of Sciences
irybalko(at)sns.edu.pl

In this era of radical social upheaval, there is great debate over how organisations, such as civil society organisations (CSOs), survive changes in their environments. Yet, most research on organisational survival has been focused on organisations in stable democratic environments, while studies of CSO survival in the context of radical political and economic changes, like those in Central and Eastern Europe, are scarce. As countries across the globe undergo regime changes and political instability, we need to look more closely at the interplay between CSOs and rapidly changing environments. I explore how two CSOs with a communist past (Junák and Pioneer) survive post-communist transformation in the Czech Republic. Specifically, I examine the factors that influence the organisational choice of adaptation or continuity as a survival strategy in a radically changing environment, and how 'new' societies treat 'old' organisations. The paper draws on neo-institutional theory concerning organisational survival, and transformation theories. The data (archival documents and in-depth interviews with the CSOs' members) are subjected to a three-level discourse analysis: textual,

contextual, and interpretive. The preliminary results show that CSOs survive the instability of transformation via both strategies of adaptation and strategies of continuity. A CSO's choice of survival strategy is determined by (a) external pressures, such as perceptions of communist ideology, (b) subtle and large changes in politics and the level of state interference, and (c) the creation of new actors that become organisational competitors.

The religious/confessional distance and the place of religious identification in the structure of students' identities in Kosovo and Metohija

Jasmina, S. Petrovic, Olivera, S. Markovic-Savic
University of Nis, Serbia; University of Kosovska Mitrovica, Serbia
jasminafilak1(at)gmail.com,
markovic.olivera(at)gmail.com

Assuming that religious identification has an increased importance in shaping identities in environments that have long been in the atmosphere of 'frozen conflicts', the level of importance that students in Kosovo and Metohija attribute to it was examined. It was assumed that, regardless of the way students identify themselves religiously and the place of religious identification in the identity matrix, they exhibit a considerable distance towards the religious "other", because they live in an area in which there is a politicization of churches and religious feelings, where religion becomes a means, an instrument of empowerment of national identity. The significance of religious affiliation as a segment of identity of the test population is seen through a comparison of students' self-assessments of the importance of an array of identity markers (both those related to the traditional elements of identity structure, such as the ethnic, religious and family background, and the markers characteristic of modern identity, such as the sub-cultural, professional, regional affiliation). The religious/confessional distance was examined using the Bogardus scale, adapted to the studied population. The survey was conducted in December 2016/January 2017 on the proportional quota sample of the students of the Albanian State University in Pristina and the Serbian State University in Kosovska Mitrovica. The survey was conducted using the interviewing technique.

Youth, Place Identities and Changing of Social Space Structures: The Case of Post-Soviet Armenian Rural Communities

Harutyun Vermishyan, Sona Balasanyan
Yerevan State University, Armenia; Yerevan State University, Armenia; Caucasus Research Resource Center- Armenia
harutyunvermishyan(at)ysu.am,
sona.balasanyan(at)yahoo.com

After 1990s, the collapse of the Soviet Union and the "importation" of democratic and liberal ideologies in line with fundamental social and political transformations led to the change in the discourse on

the Armenian rural lifestyle, in the place identities and in self-governing systems. Reform, directed to the development of self-government system in the Post-Soviet Armenia, the social programs meaning to overcome the social issues of the Armenian rural communities, formed a new geopolitical situation, that simultaneously tremendously changing local realities of rurality. Social problems linked to land use, family welfare, migration, place attachment and attraction with urban lifestyles have been actual up to present day especially among the young people. Observation of place identity as a locally and spatially conditioned phenomenon is common presently in the study of social issues of local communities. According to contemporary sociological approaches, place identity has social prefixes and is reflexive towards social space. The aim of the research is to reveal the changes in place identity and place attachment features within the Armenian rural communities through examination of day-to-day narratives emergent around the rural lifestyle. Relying on secondary analysis of the research data, in-depth interviews among representatives of the local governing bodies and focus group discussions (8 FGD among village youth) the paper will discuss the dynamic interrelation of place identity, place planning and changing social practices in the Armenian rural communities.

(This research was supported by the RA MES State Committee of Science, in the frames of the research project №16YR-5D021)

Youth of borderland of Central and Eastern Europe - educational aspirations, the labor market aspirations and life aspirations in times of crisis.

Hubert Kotarski
University of Rzeszow, Poland
kotarski(at)ur.edu.pl

The article presents the results of research into youth conducted with the use of the survey method in the borderlands in Poland, Ukraine and Hungary. The gathered data indicates that the attitudes and life aspirations are formed by three factors. The first one is connected with the type of the borderland, and the "borderland effect" is observed here. The second one regards socio-economic differences between countries. The most commonly observed differences between youth's attitudes are observed on the West-East line. The third factor is of cultural character and mainly it is formed by psycho-cultural trends resulting from the processes of globalization and the specificity of being young. In this case we observe a global teenager, who aims at fulfilling their needs beyond borders.

RN37 - Urban Sociology

RN37 | Session 01a RN KEYNOTE SESSION with João Teixeira Lopes: Urban Public Spaces and the Uses of Conflict

Urban Public Spaces or the uses of conflict

João Teixeira Lopes

University of Porto, Faculty of Arts, Portugal
jnteixeiralopes(at)gmail.com

The control of public space has emerged as a major dimension in the reconfiguration of metropolitan regions. Public spaces are a key issue in the renovation of historic centres, the attraction of affluent social classes to the city (which plays a strategic role in gentrification processes), the expansion of global tourism, and the production of a cosmopolitan image in competition with other cities. They are also the sites of class struggle and contestation of neo-liberal programs and policies that have dramatically changed the lives of millions of persons. In addition, the use and representation of public space is shaped by the prominence of public spaces in everyday life, routines, celebrations and rituals. Public spaces demonstrate the importance of spatial anchors within the city, showing that these are something more than a geometric concept or a simple container without contents.

RN37 | Session 01b Homelessness in the City

About the criminalization of the homeless in the public space

Maria Jose Rubio Martin

Universidad Complutense de Madrid, Spain
majrubio(at)ucm.es

The objective of this paper is to know the social representations about the homeless people in Spain. Starting from a qualitative methodology, a compilation and analysis of the press was made. The theoretical framework started from theories about the new strategies of criminalization of homelessness. Among the main findings, we can highlight the following: 1. Criminalizing tendencies, which insist on depict the homeless through stereotypes and stigmatizing. 2. Images and ideas that point to homeless as subjects who are potentially dangerous to the rest of society. So the hygienist and segregating foundations remain largely present when the homeless are warehoused in shelters located in the outskirts of the city or in industrial areas with scarcely any services, or when

insisting on the continued creation of “bounded spaces”. 3. In that same framework, the measures and regulations that punish the homeless are framed in favor of their criminalization and prohibit the access to and exercise of their rights. 4. Thus, the old norms that ordered the forced rounding up of beggars and penalized the alleged threat posed by vagrants, now take the form of anti-homeless laws (civic ordinances), that under the guise of supposedly protecting of the quality of life of citizens, again stigmatize and criminalize the homeless as dangerous subjects that threaten the coexistence and prosperity of the city. 5. A struggle for the control of a public space. In this, the logic of privatization and commercial profitability prevails and from which are generated spaces of exclusion and privilege according to the type of citizenship.

“Me and the City”. Social and Visual Representations of Homelessness

Veronica Polin, Michele Bertani

University of Verona, Italy; University of Verona, Italy
veronica.polin(at)univr.it, michele.bertani(at)univr.it

In our paper, we present a socio-economic analysis of the relationship between urban space and homelessness. The empirical work has been realized in Verona, a middle-size town in Northern Italy, during seven months in 2016.

Our research gives voice to people with different profiles of homelessness (from people sleeping in the street to women victims of domestic violence living in protected houses) and involves them as active social actors in the fieldwork and in the data collection. 13 participants has been selected with a mandate to photograph things, people and significant places in their daily lives. Thereafter, the collected photos have been analyzed jointly by the research team and by the participants, using two qualitative techniques: photo-elicitation and focus groups.

Preliminary results suggest that the emotional, relational, symbolic and material aspects of the city clearly emerges in the various meanings that it assumes from the photos and from the words of the participants. The city is seen as a symbol of the need of work, as a special place that could offer peace and serenity in a period of troubles, as beauty, as aid received by the associations and voluntary organizations, as need for ‘home’ and security about their future, as a place where to implement effective survival strategies, as a place in which to assert their rights as citizens and to make their voices heard in the design of public social policies.

Interrelationships between enhanced safety orientations and the trajectories of street careers among homeless youth

Karina Fernandez, Otto Bodi-Fernandez

University of Graz, Austria; University of Graz, Austria
karina.fernandez(at)uni-graz.at, otto.bodi(at)uni-graz.at

The centers of large cities have always been used by

different groups in different ways. Till today class- and group-specific forms of appropriation and use of public space compete with each other. Increasingly, the demand for control and regulatory measures such as video surveillance or increased police presence is getting louder. This paper is based on a study on homelessness among young people in a midsized city in Austria. The aim of the study was to explore the trajectories of juvenile homeless and develop a model, which describes street careers. The chosen research methodology was a Grounded Theory Ethnography, which included a six-month participatory observation, 45 interviews and a pedestrian questionnaire. This contribution highlights the relationship between the shift in society towards an enhanced safety orientation and the processes of street careers. Special attention is paid to the appropriation of space by young people and to subsequent expulsion strategies by public authorities. In comparison to studies of the 90s, the analyses showed that due to social transformation processes these young people have to deal with more exclusionary mechanisms today. This has strong effects on their trajectories. For example due to the increasing expulsion from the public space that has been increasing in Austria within the last 10 years, they have become vulnerable because they are no longer reachable for the institutions of social work. The strategies this young people apply to assert themselves on the street and the reactions of the urban society will be discussed.

RN37 | Session 02a Reinventing the City: Urban Resilience and Participation Processes

Hidden islands in the city: urban exclusions and sociabilities from a community intervention project of arts and culture in the “islands” of Porto, Portugal

Lígia Ferro

University of Porto; CIES-IUL, University Institute of Lisbon, ISCTE-IUL; FCT
ligia_ferro(at)hotmail.com

The islands are a specific housing typology spread in Porto especially in the second half of the XIX century. Its morphological feature is highly connected with the city of Porto structure and is very different from the housing settings created for the working class during the explosion of industrialisation all over Europe. This housing typology persisted across time and space, as the poverty persisted in the city as well. A big number of “islands” is located in the city center. So the access to the city (places and services), or the “right to the city” as Lefebvre stated, is valued by the people of the “islands” as the space they occupy in the urban map provides them an “urban capital” that they do not want to drop.

Starting from the results of an evaluation process of an arts and culture community based project, “Portraits of the Islands”, carried out in the city of Porto, two dimensions will be explored. Firstly, the possibilities of urban ethnography as an evaluation tool in the context of the city will be discussed.

Secondly, the results of the community based project will be highlighted, focusing the concept of “island”, including the social representations on the social and spatial relations established between the islands and the city of Porto (closeness and/or openness), the developed work of involvement of the islands’ inhabitants through the arts, its relevance and effect on vicinity sociabilities in the context of an urban requalification process. Participatory photography and community theatre were used to grasp the urban exclusions, the memories, the feelings of belonging and the sociabilities involved in the daily construction of these urban spaces, promoting simultaneously urban participation processes.

(Re-)making the city in, against and beyond ‘austerity urbanism’: Self-management and social solidarity initiatives in Greece.

Lazaros Karaliotas, Konstantinos Roussos
School of Environment, Education and Development, Hallsworth Research Fellow, University of Manchester, United Kingdom; Department of Government, University of Essex, United Kingdom
lazaros.karaliotas(at)manchester.ac.uk,
k.roussos(at)essex.ac.uk

Everyday life in Greek cities is undergoing profound transformations in the midst of the so-called “Greek crisis”. The repercussions of six years of dogmatic neoliberal austerity policies mark the urban landscape through multiple lines of exclusion and precarity. While these policies and their implications have been widely discussed and criticized, however, relatively less attention has been paid on the emancipatory everyday politics unfolding in Greek cities. From makeshift markets ‘without middlemen’, through social solidarity health clinics, to co-operatives and self-managed workplaces, a multitude of urban socio-spatial experiments contest ‘austerity urbanism’ and trace alternative ways of collectively organising urban life. While decidedly localized, they articulate multiple, virtual and material, local and trans-local, links with other initiatives forming multi-faceted solidarity networks. Grounding our analysis on Athens and Thessaloniki, in this paper we seek to explore this incipient re-imagination and re-organization of urban everyday life through participatory collective action. We argue that such grassroots ventures and initiatives are (re-)making a city of solidarity and emancipation in, against and beyond the austere city. Drawing from a reading of politics as a process of political subjectification that unfolds in and through the opening of spaces, we explore the solidarities that are forged in and through these novel forms of collective action and trace the transformative dynamics that they foreground. In parallel, we unpack some of the challenges and limitations they face in moving beyond the dominant ordering of the urban.

**People Resists Against Capitalistic Interventions:
A Sociological Review of an Urban Movement in
Ekbatan, Tehran, Iran**

Hossein Imani Jajarmi

University of Tehran, Iran, Islamic Republic of
imanijajarmi(at)ut.ac.ir

Ekbatan town was one of mass housing projects that planned and developed by Iranian, American and European companies as a joint-venture project for nearly 70000 inhabitants during 1960's after first Tehran development plan was implemented in 1968. The development of housing towns was a part of policy response to rapid urbanization problems such as informal settlement, mass immigration from rural areas to urban centers and traffic jams that gradually appeared in the same decade. Ekbatan had a peaceful life until the first half of 2000's and was one of favorite places for middle class people of Tehran for its modern apartments and culture. Unfortunately the policies of municipality of Tehran for commodification of city and put price for breaking the urban regulations changed the Ekbatan forever. The municipality replaced the land use of a 19.5 hectare land from green space to commercial and erected a Mega Mall, it allowed to build a private hospital in a land that was allocated for a public hospital. These interventions shocked ordinary people of the town and gradually they shaped a kind of resistance against municipal interventions. This article wants to study the objection and resistance of Ekbatan ordinary people and tries to answer three main questions:

- How ordinary people changed their usual life and established collective actions for common goals?
- What are the reasons and specifics of those actions?
- What are the obstacles and complications for urban movements?

**Multigenerational (co)housing between urban
governance and self-empowerment:
Intergenerational community building and
solidarity**

David Scheller, Susan Schroeder

University of Applied Sciences Potsdam, Germany;
University of Applied Sciences Potsdam, Germany
d.scheller(at)fh-potsdam.de, susan.schroeder(at)fh-
potsdam.de

The demographic shift towards an increasingly aging society in the global north has become a governance problem. The breakdown of traditional family networks has produced societies of individualized, fragmented and isolated subjects. In this 'caring crisis' the elderly are particularly precarious and under threat of falling between the cracks of society. Accordingly, multigenerational cohousing has become a promising model to solve these problems, especially in the socially condensed urban realm.

Our paper will present preliminary findings from a participatory action research project: 'Multigenerational cohousing in high-rise buildings'. Conducted in Potsdam and Frankfurt (Oder), Germany, the project began in May 2016 and will

conclude in April 2019. We will draw on qualitative research, involving interviews data and focus groups, to examine intergenerational community building and solidarity.

From a governmentality perspective of urban governance, we compare the capacities of self-empowerment and solidarity in a self-organized house project and a high-rise building owned by a communal housing company. The questions addressed are: How are intergenerational communities discussed and organized from various perspectives? What and who is addressed by the concept of multigenerational cohousing? Who is excluded? Which aspects of multigenerational cohousing could be interpreted as solidaric subjectivities and sociabilities?

Themes identified include: the exclusiveness of multigenerational cohousing; networks of mutual support; (self-)governance of multigenerational cohousing; and, the production of heterotrophic common spaces. We argue that open common 'spaces of encounter' are crucial to self-empowerment, intergenerational community building and solidarity in both self-organized house projects and high-rise buildings. However, the specific possibilities and constraints encountered are shaped by the property forms, the planning processes and the engagement of residents.

RN37 | Session 02b Policing Urban Lives

**The city as a state of exception: Drug users and
urban exclusions in Athens during the current
financial crisis**

Maria-Christina Vogkli

London School of Economics and Political Science,
United Kingdom
m.vogkli(at)lse.ac.uk

The purpose of this paper is to explore the drug users' experience of the urban space in Athens from their subjective perspective and the techniques employed in order to produce urban space in a way that facilitates their control and surveillance. The Athenian urban space is heavily affected by the consequences of the current financial and humanitarian crisis, while the precariousness and vulnerability of the users' bodies is further increased due to a harsh austerity regime. The analytical repertoire that is deployed here derives from Agamben's theory and the main employed methods are urban ethnography and interviews, as well as mapping techniques to understand issues of coerced immobility and relocations. Initially, I briefly discuss how the urban space of Athens is experienced on the micro-level by drug users as stigmatised urban homines sacri, namely deprived of basic human rights and the right to the city. Additionally, I contend that the urban space is produced in a way that facilitates the users' control and surveillance through the assertion of biopower by the police and the state. Specifically, a segregated space is produced shaping this part of the city as a camp of exception, where law is suspended. There, biopower is asserted on the meso-level on the users'

bodies in the form of coerced immobility by the police increasing the precarious nature of their dwelling. the macro-level, biopower as part of state policies is exercised through coerced relocations within the camp of exception and from within to distant areas in order to discipline the bodies of the user.

Three dimensional cities: vertical security and the politics of visibility

Elaine Campbell
Newcastle University, United Kingdom
elaine.campbell(at)ncl.ac.uk

This paper draws from recent theorisations of vertical space to reimagine the politics of urban securitisation. Vernacular expressions which talk of controlling areas, managing borders, and marking ground, are commonplace within security discourses, and perpetuate two dimensional (horizontal) visualisations of city spaces. How might these visualisations change if we were to think of securitisation in vertical terms - that is, as entangled within, across and through the height and depth of space instead of, or as well as its surfaces, margins and centres? Foucault argued that 'the vertical is not one of the dimensions of space, it is the dimension of power' (2007: 170). This paper unpacks the detail of this claim through a critical reading of urban infrastructures, specifically those which support the harnessing and circulation of digital information and data. Through such technologies, practices of surveillance, containment, exclusion, monitoring and mapping work through three dimensional space, generating alternative ways of visualising the city in both its everyday and emergency modes of existence. The paper takes stock of these new visibilities and argues for a critical reckoning of the vertical politics of urban security. More ambitiously, it opens up an interdisciplinary dialogue at the intersections of sociology, human geography, criminology, security studies, and STS.

Urban as the Theatre of War: Autopsy of Cizre

Sibel Bekirođlu
Middle East Technical University, Turkey
sibelbekirolu(at)gmail.com

Today, cities in the Middle East constitute a black hole. Through the destruction of the urban fabric, they absorb people, their daily lives and their history. This study is an attempt to understand the urban with relation to destruction, war and death of city. Urban, in that sense, could be read as the theatre of war. The case of Cizre, a district of Şırnak Province of Turkey, after four main curfews in 2015 and 2016 will be analyzed with respect to this understanding of urban, mainly the urbicide literature. In other words, this analysis will be an attempt to perform autopsy of Cizre. It is an autopsy because such an analysis after the destruction could only be called as a search for cause, the type of death, the instrument(s) used and lastly guidance for the possible murderer. It will be an effort to examine the case of Cizre with reference to urbicide literature by using the reports, interviews and

news about Cizre. In that sense, this study has three main sections. The first part will deal with how we understand the concept urban. After discussing the urbicide literature, I will conclude with the case of Cizre.

RN37 | Session 02c Community(ies) and(in) the City

Between Structure and Agency: Towards New Perspective on Urban Communities in Postmodern City

Marta Klekotko
Jagiellonian University, Poland
marta.klekotko(at)uj.edu.pl

Having the latest findings of community studies regarding "Community Question", as well as current trends in urban sociology and urban policies as points of departure, the paper addresses the problem of contemporary urban communities' production and reproduction processes, as well as cultural mechanisms and factors of these processes. Rejecting both the ecological determinism and cultural reductionism of community studies, I assume that postmodern city is a space of structuration of diverse urban communities that go far beyond the traditional concept of neighbourhood, personal networks or imagined communities. I assume that culture in general and symbolic meanings of territory in particular, play crucial role in the process of structuration of urban communities, and that structuration process takes place in collective cultural consciousness and is mediated by territorially embedded cultural practices of individuals. I will argue that spatial segregation of diverse cultural practices reinforces their capacity for community structuration through symbolical construction of social boundaries. The paper aims to answer the questions on how various cultural dimensions of urban space impact communal symbolic practices of individuals and what kind of cultural mechanisms shape various urban social forms. The paper provides a new theoretical and methodological perspective to analysis of cultural mechanisms of processes of urban community structuration, in which cultural practices of individuals and symbolic dimensions of urban space interact, leading to emergence, reproduction and reconstruction of a given type of social entity. Some preliminary research data will be provided in order to exemplify and support the arguments of the paper.

Neighbors online: Internet communities of neighbors as a form of micro-urban solidarity

Anna Strelnikova
National Research University Higher School of Economics (HSE), Russian Federation
astrelnikova(at)hse.ru

Neighborhood is a significant social phenomenon and a type of relationship. On the one hand, when individual thinking someone its neighbor, he or she decides to invite (include) or isolate (exclude) him to

nearby space. On the other hand, communication with people who live nearby is a way to set up familiar social space in huge unfamiliar city.

With the dynamic nature of the Internet, the neighborhood phenomenon now transfers to special online communities. Online neighborhood communities are websites where participants communicate informally with others who are living nearby or plan to live nearby in the future (especially people whose house is under construction). In our research, we analyze online neighborhood communities as a form of solidarity – activity with common goals, motivations and practices.

The methods of data collection consist of online observation (20 neighborhood communities in Moscow city), and secondary data analysis (local and international surveys with questions about neighborhood, i.e. World Values Survey).

Data analysis shows 2 main features of constructing micro-urban solidarity via online neighborhood communities: 1) social ranking of potential or current neighbors (as people as city objects), i.e. categorizing neighbors as preferable or undesirable to live nearby, 2) ability to demonstrate and growing up level of social capital – a certain kind of resource available to the individual and makes their actions easier inside the social structure.

Reinventing the community

Victoria Gomez
University Carlos III, Spain
mgomez(at)polsoc.uc3m.es

The term community is trendy topic. People mention community when talking about common goods, the social economy or the experiments in alternative economies. At the same time, sociologists are paying renewed attention to the character and nature of social ties in different fields such as integration of diversity, struggle against exclusion and particularly, urban regeneration studies. The debate about the decline of social capital is open, as is the discussion on the present and future of the community. Paying special attention to the urban sphere, the presentation will show how the community is not a type of association of the past, rather the contrary, because it has undergone processes of retreat, rediscovery and rehabilitation that has led us to the present moment, a point in time of reinventing the community.

Urban Community Participation in Post-Soviet Space: Community Organizing, Urban Governance and Urban Conflict in Lithuania

Jolanta Aidukaite, Kerstin Jacobsson
Lithuanian Social Research Centre, Lithuania;
Gothenburg University, Sweden
jolanta.aidukaite(at)lstc.lt, kerstin.jacobsson(at)gu.se

Active citizenship through community involvement has become an important tool to address place-specific problems in cities. On the one hand community organizations have been seen at the centre of urban protest as they deliberately focus on the role of local

government in relation to urban-public space. On the other hand, community organizations have been found prone to co-optation and de-politicization, precisely because of their close relationship to local authorities and their focus on practical problem-solving. Thus far, most research on community mobilization has been conducted on 'Western' cities while it is less known what role community organizations play in post-Soviet urban space. This paper examines the development of community organizations and their relationship to local authorities in two major Lithuanian cities: Vilnius and Kaunas. Community organizations have emerged in response to market-oriented economic growth to resist the privatization of public space and public infrastructure. However, despite the similar national context, Vilnius and Kaunas have developed distinct urban governance models since the 1990s (progrowth urban governance vs. corporatist governance model), thus creating different constraints and opportunities for community participation. The paper compares the activities, collective action strategies and patterns of community mobilization in the two cities. It shows how local political priorities and policy choices of local elites generate different forms of urban governance resulting in different patterns of community mobilization. The analysis draws on qualitative interviews with community activists and local and national state officials as well as official statistics.

RN37 | Session 03a Migrants and(in) the City

Appropriation and representation of space in the rehousing neighbourhood of Quinta do Mocho in the Metropolitan Area of Lisbon.

Anna Ludovici
Institute of Geography and Spatial Planning -
University of Lisbon, Portugal
ludovicianna(at)campus.ul.pt

We believe that the way as a territory socially produced influence the behaviour of social actors in the space, generating a new process of appropriation and representation of it, is one of the fundamental components of the processes of appropriation and representation of space.

In this perspective we analysed a residential urban territory in a context of migration focusing our attention on a specific group of Bissau-Guinean immigrants, chosen according to their time of arrival in Portugal and their gender, in consideration of the rich cultural and ethnic background of Guinea-Bissau, particularly related to symbolic and sacred meaning of the territory.

With this aim, we analysed the constitutive process of the rehousing neighbourhood of Quinta do Mocho, in the Metropolitan Area of Lisbon, whose history gave us important clues regarding the spatial evolution of the city in the critical years of the post-revolution, underlining the role of its suburbs, the needs and orientations of its housing policy and the importance of the presence of migrants in the current territorial configuration. This research was based on a qualitative reflection, favouring a theoretical approach,

applied experimentally through the conduction of semi-structured interviews and participant observation. We tried to contribute, even from a small database, to question the traditional conceptual categories used in social and spatial analysis of residential areas of immigrants, and also to develop an alternative thinking about the relevance of the inclusion of different perspectives in the epistemological validation process.

Mechanisms of urban migration control

Margit Fauser

Ruhr University Bochum, Germany

margit.fausser(at)rub.de

Today, ever more, local authorities and other local agents play an important role in the control of mobile persons, foreigners, and those considered strangers and outsiders. We observe the growing involvement of local authorities and local non-state actors in checking residence statuses of persons in relation to eligibility for social services, a growth in police controls and identity checks in many cities as well as evictions and deportations of “unwelcomed” migrants.

The literature on migration and cities has thus far contributed to our understanding of urban diversity, the role of migrants in the making of contemporary cities, and in general the urban policies and practices of inclusion and multiculturalism. As sites of exclusion cities have been investigated mainly in terms of their segregation patterns. However, urban migration research has so far not been concerned with the ways in which cities are now becoming places for the exercise of immigration control. Recent scholarship in border studies, in turn, has revealed the fundamental transformations and respatalization of the border away from the state’s territorial margins, including a multiplicity of new sites into immigration control. The key border changes that concern cities and urban space have hardly received attention here either, in particular not in Europe.

Based first results from an ongoing research project investigating this vastly unexplored field this contribution asks how local authorities and other local agents engage in the control of immigrants and immigration and identifies several established, renewed and new mechanism of urban control across European cities.

The Ambivalent Dealing With Diversity

Nina Berding

Research Center Shaping the Future at the University of Siegen; University of Cologne, Germany

nina.berding(at)uni-siegen.de

Migration and the ensuing diversity are integral parts of urban societies. However, engaging with the urban society and its diversification is rarely perceived as something trivial but rather as a difficult task and a major challenge. Based on exploratory field research in a German inner-city neighborhood, it is aimed to show that the discourses about migration and diversity are completely contrary to the everyday life actions of

the urban society. The results of the study demonstrate that the current discourse about the challenges of migration seems to legitimize interventions beyond humanist approaches where migrants serve as collective scapegoats for social problems and affected by different discrimination and criminalization processes. On the one hand, everyone takes advantage of the super-mobility and super-diversity in their daily lives and on the other hand, powerful stakeholders and designated authorities operate a sort of retro-nationalism and identity collectivism. Political players, the municipalities and other stakeholders then follow an urban public policy that takes actions (increasing police presence, concepts and activities for special groups, exclusion from active social life, preventing participation etc.) towards different “groups” of residents, produced along ‘ethnic’ lines. The results also show that, despite the obstacles and adversities placed in their way, the excluded residents perpetually relocate and re-position themselves and attempt to empower themselves by redefining their identities in their neighborhood.

RN37 | Session 03b Urban Transformation & Gentrification Processes

Practicing solidarities through urban regeneration. A critical analysis of an innovative urban regeneration and refugees welcoming project in the city of Bologna

Giulia Allegrini, Umberto Mezzacapo

University Of Bologna, Italy; University Of Bologna, Italy

giulia.allegrini2(at)unibo.it,

umberto.mezzacapo2(at)unibo.it

Urban areas face multiple and interconnected challenges related especially to employment, migration, demography and environmental crisis. As for migration, it has to be underlined that flows are ever more increasing all cross Europe, putting under pressure mainly Mediterranean countries, such as Italy, which are geographically more exposed to such flows.

This trend requires a new systemic and structural approach able to go beyond the current reception model, quite often scarcely integrated in the urban context, sometimes creating new ghettos and urban social conflicts between local inhabitants and newcomers immigrants.

European Union set up programme called UIA (Urban Innovation Action), an Initiative that provides urban areas throughout Europe with resources to test new and unproven solutions to address urban challenges.

The municipality of Bologna has been selected among others for its project “S.A.L.U.S. ‘W’ SPACE - Sustainable Accessible Liveable Usable Social space for intercultural Wellbeing, Welfare and Welcoming”.

The project consists of a requalification of a dismissed building and the surrounding area to create a reception center, and it’s based on the following main milestones: urban regeneration, social innovation and

active participation of the various urban stakeholders - migrants, civil society, social enterprises, and public institutions as well. In this framework our contribution, as researchers of Ces.Co.Com (University of Bologna), involved the project UIA, consists, of a critical analysis of the participatory process, implemented according to the action- research principles, featuring the first part of the project, thus providing some insights on the emerging integrated approach and urban social innovation process.

Rethinking Gentrification-Gender Nexus

Bahar Sakizlioglu

University of Leicester, United Kingdom
nbaharsakizlioglu(at)gmail.com

Gentrification _'the transformation of space for more affluent users' as defined by Hackworth (2002, p. 815) _ refers to a changing class composition. Yet, gentrification is also a gendered process (Bondi 1991). It alters the ways places are gendered and by doing so it reflects and affects the ways gender is constructed and experienced. The ways places are gendered as well as changes in gender notions also affect the occurrence of gentrification. Despite the expanding literature on gentrification, our knowledge on its relation to gender constitution is limited.

In this paper, I present a critical review of the existing literature pinpointing the gaps in our knowledge regarding gentrification-gender nexus. I call for a comparative and intersectional approach to investigate gendered geographies of gentrification. I conclude by underlining the need for a feminist engagement with knowledge production about gentrification as well as for feminist praxis to contest gendered inequalities and dispossessions involved in gentrifications. This conclusion is totally in line with Peake's argument (2016) that urban theory in the twenty first century still lacks the knowledge of and inspirations from feminist theory and praxis. Inserting a feminist understanding of gender and the urban (in relation to rural) and undertaking the complexity of gender (putting its relation to class, race/ethnicity, sexuality, age etc.) in our analysis of gentrification will not only enhance our understanding of gentrification as gender serves as a critical tool to grasp and theorize on inequalities involved in production of space. Such a perspective also will help eliminate the disciplinary boundaries between urban and gender/feminist studies.

An Aspect of Change in 2017: Gentrification and Lansbury Five Decades On

Elliot Snook

Newcastle University, United Kingdom
E.Snook2(at)newcastle.ac.uk

Within 'London: Aspects of Change', the 1964 book which achieved widespread fame for containing the first published use of the word "gentrification", there is a far less-cited chapter titled 'A Profile of Lansbury', which is an account of a long-term study by Ruth Glass and John Westergaard of the residents and

dwellings of the Lansbury Estate and Chrisp Street Market in Poplar, east London. The estate and market had been built for the 1951 Festival of Britain and was the showpiece exhibit of a new philosophy of how to improve living conditions for the poorest residents of London. However, following decades of divestment in council properties, and the transfer of stock from councils to "Registered Social Landlords", today the Lansbury Estate and Chrisp Street Market are managed by the Housing Association Poplar HARCA. They currently propose a complete redevelopment of the site, with eventual plans to sell off the remaining original Festival structures and planned newbuilds almost entirely at rates far beyond the means of the residents that these estates were originally supposed to provide homes for. Based on my on-going doctoral study, this paper considers the irony of the gentrification which is first highlighted in 'London: Aspects of Change' spreading to an example in the same book of the new plan of housing for the poor in the city, and also delivers an account of the processes which have seen these utopian ideas of housing disappear, while speculating what the future may hold for current residents facing displacement.

Mobilization(s) against gentrification in Lisbon: mapping discourse and action

Patrícia Pereira

CICS.NOVA, Faculdade de Ciências Sociais e Humanas da Universidade Nova de Lisboa, Portugal
patricia.pereira(at)fcsh.unl.pt

Lisbon, March 2016: as tourist numbers continue to grow, MacDonald's announces the opening of a new restaurant in the historical city centre. Around the same time, the nightclub Jamaica and two other longstanding downtown nightlife venues announce that their closure and replacement with a 5-star hotel. These announcements spark a chain of reactions: blog posts, opinion pieces, webpages and profiles advocating for the preservation of Lisbon's authenticity and describing a city cracking under tourist pressure, a night vigil for the nightclubs, a petition to prevent the opening of the restaurant. June 2016. A group of citizens organizes a debate focusing on tourism and resident displacement, and around 400 people show up. Tourism, and gentrification read as its consequence, become increasingly part of everyday conversations, of news in the mainstream media and debates in the associative, cultural and academic universes.

These are only a few examples. Since the beginning of 2016, different and contradictory interests and perspectives about the present and the future of Lisbon's historical centre have surfaced to the public sphere. Diverse ways of acting and voicing demands have risen.

Recent literature advocates making resistance to gentrification an explicit object of study (Brown, 2016) and exploring how people fight for their right to place in the gentrifying city (Slater, 2008) as an interesting direction for gentrification scholarship. In this paper I identify several actors/collectives that have been

mobilising around these issues. Analysing interview and participant observation materials, I seek to make sense of their discourses and actions and of the different city visions underneath.

RN37 | Session 03c Housing Policies, Actors and Processes I

(Un)making solidarities for housing rights in post-crisis Bucharest

Ioana Florea

University of Gothenburg, Sweden

ioana.floreaa(at)gmail.com

In the past two decades, the municipal authorities decided and regularly declared that social housing would not be built in competitive and growing Bucharest. Moreover, the municipal administration of state-owned property sold/ privatized part of its properties on the real estate market. But as the post-socialist transition unequally dispossessed and fragmented the working classes, as the real estate market became increasingly unregulated since 1990, and as the global economic crisis hit Romania's largest city, thousands of people found themselves vulnerable to housing precariousness and excluded from their housing rights (it's estimated that 10,000 homeless persons live in Bucharest, in addition to thousands at risk of eviction). Many of them are Roma, facing a long history of institutional racism and exploitation. In this context, the paper investigates how solidarity networks and social mobilization are currently being built around housing rights, aiming to bring the issue on the public agenda, with heterogeneous framings. At the same time, the analysis shows how housing struggles are systematically excluded from other forms of social mobilization and protest series taking place in Bucharest since 2008. Trying to understand this dynamic of double exclusion sheds some new light on the emerging/ restructured/ deepened inequalities and their discursive framings in post-crisis Bucharest, with its intensified neoliberal urban policies.

Urban Precarious Workers: Intersecting Labor and Housing Market Insecurities

Ladin Bayurgil

Boston University, United States of America

ladinb(at)bu.edu

This research studies a recent wave of tenant-led urban transformation in Istanbul's upper-middle income neighborhoods and its impacts on doormen, most of whom are internal migrants from Anatolian Turkey and live rent-free in the basement with their families in return of their minimum-wage paying work of providing daily services to tenants. By studying a rather uncovered trend of transformation, this research exposes doormen's "double precariousness", more specifically, precarious occupational and residential structures that are intertwined with each other by the fact that doormen's residence in their basement apartments is tied to their labor. As the new building

managements in transformation areas outsource services formerly provided by the doormen to private security and cleaning companies, doormen simultaneously experience job loss and involuntary displacement, and hence are pushed to more precarious job lines and peripheries of the city or the country. With an ethnographic study of doormen and their networks with other precarious laborers, this research examines the historical mechanisms behind and contemporary impacts of market forces in urban contexts, mainly transformation of urban space through privatization and standardization of informal work. Although scholarly recognition has been given to individuals' precarious positions separately in employment and housing markets, rarely has the relationship between different forms of precarity been studied with respect to labor and housing markets. By examining intersecting forms of precarities, this paper locates social-historical processes that (re)produce precarity and recognize that it is more than an insecure position in separate market realms, and instead is a fundamental existential position in the neoliberal era.

Urban rent speculation, uncertainty, and strategic unknowns in housing market policies in Istanbul.

Ebru Soytemel

Aston University, United Kingdom

e.soytemel(at)aston.ac.uk

In recent years, scholars of urban research have expressed their concerns about the emergence and consolidation of a new urban post-political and post democratic condition where urban politics is reduced to the administration and management of processes through 'the consensual socio-scientific knowledges' (Swyngedouw 2009). The making of the neoliberal city not only provides a stage for these new post political processes, but it also involves policy making which creates uncertainties in order to deal with possible tensions. Those whose lives are affected by these policies try to find different solutions to develop counter actions of resistance so as to acquire a way around the increasingly complicated everyday problems.

This paper examines the Fikirtepe Urban Transformation Project (FUTP) in Istanbul –the so-called 'Manhattan Istanbul' Project – as a case study of how urban policies and strategies of public/private institutions/companies create uncertainties in housing markets, and how they succeed in speculative gains through the social construction of ignorance and exclusion of uncomfortable knowledge. This paper explores how local dwellers develop counter actions to resist or to adapt to the consequences of these neoliberal place making processes. It will discuss the role and functioning of 'mobilizing unknowns' and 'strategic ignorance' (McGoey 2012) for different groups, as well as scrutinize how different 'tactics' and 'strategies' are developed by different actors during the neoliberalization of the city space.

Comfort and housing inequalities in France: What sustainable housing policies changes ?

Yankel Fijalkow

Centre de Recherche sur l'Habitat, France
fijalkow.yankel(at)gmail.com

1- Increasing housing inequalities and criteria

While the right to "appropriate housing" is stated in article 25 of the Universal Declaration of Human Rights, statistics, which summarize housing issues (overcrowding, equipment deprivation, absence of a bathtub or a toilet, a roof leaking inside the dwelling), show there are 5.5% vulnerable households within the EU (2009). Housing fragility can include also energy precariousness, which has yet been condemned by numerous authors. In France, nearly six million people can be considered as bad housed regarding these different criteria.

2- Comfort as a policy concern

The discrepancies between law and official statistics show how difficult it is to define housing conditions despite more than 150 years of thinking within the states. Much historical research shows that the evolution in cultural values geared towards industrial progress as well as to medical and architectural doctrine. Sociological studies include technology trajectory in daily housing habits. Therefore, comfort need to be studied as a macro and micro policy.

3- From policies to practices: new standards and inequalities

In this presentation, I will give a qualitative definition of the Housing Regime in France explaining what are the planning instruments for comfort (I) how they have evolved within structures of various stakeholders (II), and how, through a survey on 1000 owners and qualitative interviews, French households' behaviours regarding to the new sustainable housing standard, illustrate new housing inequalities (III).

RN37 | Session 04a Urban Cultures and Identities

A day at the museum: inclusive technologies and the cultural fruition of the city

Antonietta Mazzette, Camillo Tidore, Sara Spanu
University of Sassari, Italy; University of Sassari, Italy;
University of Sassari, Italy
mazzette(at)uniss.it, tidore(at)uniss.it,
saraspanu(at)uniss.it

In Europe, the transition to the post-industrial city has been characterized by the key role played by culture as policy instrument and resource for regeneration and attraction.

This paper reflects on the conditions of access to cultural goods within pervasively digitized urban environments, arguing that the increasing role of technology can potentially both shift social dynamics from places to flows (Castells 1996) and determine new rules of inclusion and exclusion.

Culture does not escape the ambivalence of such conditions: on the one hand new technologies open up wider opportunities for cultural access, but on the other can intensify forms of exclusion which further

reduce the "right to the city" (Lefebvre 1968).

In other words, our aim is to understand which technological and material conditions can reshape environments so as to effectively allow inclusive and accessible use of cultural resources.

The physical and digital environment should be considered as closely and mutually connected dimensions within which social practices are situated. Social sciences and the ICT disciplines need to rethink the concept of the smart city towards a reading of the social morphology as a blend of physical and virtual practices. In this sense, some preliminary results of an in-progress interdisciplinary research into the museum experience in Italy will be presented. A combination of quantitative (online survey) and qualitative methods (semi-structured interviews) were selected in order to give evidences of the complexity of the mix between real and digital environment and practices.

Castells M. (1996), *The Rise of Network Society*, Blackwell, Oxford

Lefebvre H. (1968), *Le droit à la ville*, Anthropos, Paris

Transforming urban homes and construction of identities. Symbolic meaning of home design in intercultural partners' experiences

Kristel Siilak, Katrin Paadam

Tallinn University, Estonia; Tallinn University of Technology, Estonia
siilak(at)tlu.ee, katrin.paadam(at)ttu.ee

The research introduced in this paper aims to understand the transforming nature of contemporary urban homes upon the study of home design practices of intercultural partners – an increasing experience in especially the cities, regarding cross-cultural European and global mobility. With a specific focus on interconnectivities forming between the symbolic aspects manifested in the materiality of design and the construction of identities, the research draws on biographical narratives of individuals in an intercultural union between Estonians and partners either of Northern or Southern European origin. The analysis clearly shows that the present practices of home design and decoration are informed by individuals' earlier biographical experiences in diverse cultural contexts and the symbolic connotations in the materiality of things are of significance at deconstruction and (re) construction of identities. The analysis indicates a complexity of dimensions embedded in this process which relate to both the uniquely personal and societal experiences. Lifestyles, individual tastes for home design, partners' perceptions of and dispositions towards gender relations, economic capacity and individuals' capacity to adapt to a particular intercultural relationship, interlinked with a sense of solidarity in the community and structural conditions in the society at large, appear as advantageous or disadvantageous at negotiating the home space and enabling identities. The paper discusses the intercultural experience of home creation and construction of identities upon the typology of home design practices: 'equal

representation of cultural origins', lifestyle-driven supra-cultural practices', 'single-culture dominance', 'neglected cultural origin', 'necessity-driven practices'.

Social Street and territorial development: analysis on local communities, public spaces and urban governance

Giulia Ganugi
University of Bologna, Italy
giulia.ganugi2(at)unibo.it

The Social Street is a new form of neighborhood communities: it aims to facilitate relationships, trust and collaboration among neighbours, in order to strengthen their sense of community. Adopting the paradigm of Social Innovation, the Social Street may be seen as an alternative practice of territorial development.

Cities are struggling between global and local pressures: at the one hand, technologies and mobility make people connections around the world easier, the space of flows seems to take advantage of the space of places; at the other hand, urban governments are changing toward forms of participant and horizontal governance in dealing with local-scale issues. Public spaces have lost their traditional socialization function, the global processes delete the territorial identities and, consequently, the identification between populations and the places to which they belong. The life is more individualized than in the past and the urban territory is not anymore a factor conducive to the establishment of a social network.

In this context, Social Street groups, born to answer the sociability need of citizens, then refocus the attention on the territory's value and the important relationship between the community and the local area. The public spaces, both in the physical meaning and in the socio-political one, are considered as a common good, while the citizens empower their capability of caring and managing it, in a perspective of active citizenship and urban governance.

The methodological perspectives for the analysis of the phenomenon in reference to an ongoing doctoral research project will also be presented.

Social Street phenomenon: an innovative answer to sociality need and urban regeneration

Niccolò Morelli
Università di Bologna, Italy
niccolo.morelli2(at)unibo.it

This abstract is aimed to present the research done on Social Street phenomenon, born Fondazza road, Bologna in September 2013. At the moment, there are more than 455 Social Street worldwide (www.socialstreet.it). Social Streets are defined as "streets where neighbors aim to create or re-create proximity sociality, using Facebook as communication tool" (C.Pasqualini, 2016).

Thus far, the Social Street phenomenon has not been a widely researched topic, with the tiny exception of social street in the context of technology and social networks. The study of this phenomenon, both locally

and internationally, has elucidated the diffusion of Social Street in urban metropolis as well in smaller contexts. Social Street are inclusive and potentially accessible to everyone, and they are also able to create social and technological innovation. Social Streets take care of social control, and about information, they participate to events that occurs in the neighborhood, promote sociality, take care of common goods of the city, especially in the neighborhood context.

The research, based on the Mixed Methods Research Theory (Burke Johnson, J. Onwuegbuzie, A. Turner, 2007) has investigated the Social Street phenomenon with on-line surveys, qualitative interviews to Social Street founders and ethnographic (and web ethnography) observations in the Social Street activities.

RN37 | Session 04b The Production of Urban Space

Architecture and City Branding: Istanbul, the City of Phantasms

Nese Oztimur, Elif Oztimur
Free Researcher, Turkey; Free Researcher, Turkey
noztimur(at)gmail.com, eoztimur(at)yahoo.com

At the post-capitalist global times, consume branded items is the popular way to get an identity. Just as other branded products, architecture became the branding phenomenon for the cities. Tall, glass covered, extraordinary facade having buildings are the places in where the idealized post-capitalist social relations and its related commodities are fictionalized. Istanbul, the city of history and natural beauty, became the global capitalist city in the last decades, due to its strategic geopolitical location. International capital flows, huge internal and external migration, increasing population, tourism are the major factors affecting on the new planning of the city of Istanbul. New industrial regions, new airport, new bridges, new residential districts are popularized as the spaces of global modern urbanization as well as spaces of hope for the city dwellers, to work and housing. Branded architectural projects for new residential districts, shopping malls and hotels are the signs of transnational capital flows and neoliberal urban politics. As well they are the phantasms to merge local and global dynamics.

In this paper, we will try to discuss the dilemma or coincidence between the relationship of architecture and neoliberal urban politics by focusing on Istanbul as a global city with its local dynamics. The specific architectural projects will be analysed to answer following questions: How branding architectural projects affect the everyday life of people in Istanbul? How are they affective on the establishment of phantasm that encompasses both global and local values? Are the branding architectural projects serving the idea of Henri Lefebvre's "right to the city"?

Endogenous (un)making of the region. The regional innovation regime and its stakeholders

René John, Philip Boos

Universität Gießen, Germany; Institut für Sozialinnovation, Germany
rene.john(at)haushalt.uni-giessen.de,
philip.boos(at)isinova.org

While metropolises are believed to represent spatial and social incubators for innovation, agglomeration-distant regions symbolize an antipode to this. These structurally weak areas came into existence during political and economic upheaval in the 1990s. Mostly in East-Germany this included the deindustrialization of large regions, the city-ward migration of large population parts and a strong demographic change.

These processes have also been observed in the shrinking cities debate. Within these discussions, it is argued that urban and regional planning cannot approach the development of these regions with the means of conventional top-down and purely growth-directed methods. Moreover, this requires integrative bottom-up and community-focused strategies. This approach is generally applicable to agglomeration-distant regions as well.

An ongoing research project focuses on broadening the shrinking cities debate. This leads to the following research questions: Which factors characterize the innovation regimes of successful agglomeration-distant regions? Which stakeholders formulate which needs in a way stressing and incorporating endogenous development potentials? These questions are not only focused on success stories but also on the partial processes of failing and learning on the way to success.

By comparing two exemplary regions in Germany we investigate spatial and social dimensions. The spatial dimensions focus on criteria leading to the formation and reproduction of negatively afflicted spaces. By integrating local stakeholders and project initiatives the social dimensions focus on the research and evaluation of endogenous development processes. The identification of regional innovation-driving as well as innovation-inhibiting factors forms the basis for developing strategies to overcome the latter.

Reputational value and city consumption at contemporary Lisbon

Maria Assunção Gato, Pedro Costa

Instituto Universitário de Lisboa (ISCTE-IUL), Portugal; Instituto Universitário de Lisboa (ISCTE-IUL), Portugal
magoo(at)iscte.pt, pedro.costa(at)iscte.pt

The use of spatial representations based on distinctive features and labelling has become a strategy to generate and increase value to urban areas seeking to attract investment and promote themselves as an objects of consumption in the domestic context of cities. However, this differentiation does not stop only on economic factors linked to the territories. The historical and architectural features, social experiences, affective relations and symbolic

representations that are generated around these territories are elements equally or more important to understand how they can be valued, how they are promoted and consumed by creating reputation and how that same reputation can be used to enhance social inequalities in accessing certain urban territories.

Taking the example of Lisbon, in Portugal, we intend to demonstrate how the city circumvented the crisis through a process that not only involves the production of differentiated areas - in terms of meanings and uses, as well as in terms of exchange values, users and consumption patterns – but also by the legitimisation of built reputational value.

Urban Marketing and Representations in Print Media: The Case of Turkish Cities

Reyhan Varli-Gork

Cankiri Karatekin University, Turkey
reyhavgork(at)gmail.com

This paper is a part of an ongoing broader research aiming to investigate how Turkish cities are represented both in local and international printed media in order to attract the globally circulating capital into their local units. In this paper, the concept of urban marketing is defined as the growth oriented development strategies of cities in the context of changing spatial economy of global capitalism. Supported by civic and business organizations growth promotions are generally strengthened by the local media. Since the key objective has been to attract local and foreign investors in cooperation and partnership with the other developmental organizations in the city beside the tourists and residents, many cities advertise themselves in major business and travel journals. In addition, the concept of urban representation, a kind of duplicitous metaphor encapsulating the unity of the city in its present and prospective images, is defined as the acts of naming, mapping, figuring and picturing of cities along with their written and spoken descriptions.

Including all issues between 2010 and 2016, as the sample of local media the most read newspaper and business journal in Turkey; and as the sample of international media the Turkish Airlines Travel Magazine (Skylife) and Europe Edition of an international business journal have been chosen. Based on content analysis method (quantitative and qualitative), the research is to analyze the various urban representations of Turkish cities in the news and advertisements in abovementioned printed media. This paper primarily focuses on the data gathered from Skylife.

RN37 | Session 05a Using Public Spaces & Building the City I**Public gaze and uses of the city: the (in)visibility of territories in parkour and slacklining.**

Fabio Bertoni

Università degli Studi di Padova, Italy

fabio.bertoni.1(at)phd.unipd.it

A multitude of different subjects and groups experiences urban spaces, that make them continuously open and in realignment (Amin, 2008). Planned activities coexist with more unexpected and unpredictable practices. Different kind of uses, aims, ideas of space are linked to practices: they modify the city, both materially and symbolically, becoming a contended terrain. The urban is broken into territories, constituted and defined by social thresholds, physical boundaries, and norms to be considered as "in place" (Cresswell, 1996). Every territory is maintained by some practices and challenged by other, in a daily struggle between order and resistances, in a continuous process of (un)making the city and public space in definitions, aesthetics, temporalities.

I will present the preliminary result of a multi-sited and visual ethnography, developed starting from Padua, in the Northern Italy and following practitioners' networks and their movements in other cities and regions. The aim of the paper is to deepen the understanding the strategies to legitimate ephemeral uses of the urban space, starting from the modalities utilised by practitioners of two urban sports, slacklining and parkour.

More specifically, I will focus on the role of public gazes: considering visibility as an ambivalent concept, within "spectacle", recognition, and control (Brighenti, 2010), what is shown and what is hidden of the practice is a key element of tactics of re-appropriation of spaces (Karrsholm, 2007). Taking place and making spots, liners and traceurs create an interstitial territory (Eisenman, 1998) managing (in)visibility in their practices, through the choice of spots, timing, type of performance, and trying in this way to legitimate their use of space as in-between through other activities.

Redefining public spaces as an answer to urban crises in Medellin.

Anna Bednarczyk

Jagiellonian University, Poland

ankabebe(at)gmail.com

Medellin is the second biggest cities on Colombia and for years was rated as one of the most dangerous places in the world, based on the homicide rate. The city faced the industrial crises, the period of massive population growth caused by civil war and internal displacement, the domination of drug cartels and urban gangs and finally social and spatial disintegration. The answer for those multilayered crises was a self-organization on the level of local communities and building the movement that demand civil rights. In 2004 the independent candidate Sergio Fajardo was elected for the mayor and started

introducing demands of the civil movement. One of the priorities of the urban movement and local government in that time was to create new public spaces, especially in marginalized districts inhabited mostly by internally displaced people. In my presentation I will show how the understating of public spaces has changed in the case of urban transformation of Medellin and what role the space itself plays in urban policies. Based on my research conducted in Medellin in 2013 I will elaborate on meanings and functions that public spaces have in the context of post-conflict city and how it relates to the problems of modern European cities. The theoretical framework of the research derives from the critical urban theory and idea of the Right to the City, developed by Henri Lefebvre and David Harvey. The presentation will also correspond with the methodological aspect of my research – the usage of visual methods and maps as a tool to describe relation between spatial and social dimensions of the public spaces.

The Child in the City revisited: Children's urban encounters in two European cities

Christos Varvantakis, Sevasti-Melissa Nolas,

Vinarassan Aruldoss

University of Sussex, United Kingdom (All authors);

University of Sussex, United Kingdom (All authors);

University of Sussex, United Kingdom (All authors)

c.varvantakis(at)sussex.ac.uk,

S.Nolas(at)sussex.ac.uk, V.Aruldoss(at)sussex.ac.uk

The term 'child friendly cities' is an adult term. This paradox prescribes the complex set of exclusions that children experience with regards to urban life. Children are largely excluded from public spaces as well as from the policies that inform their design - but, they are also excluded from the theorization of urban life and indeed Urban Sociology has only marginally been interested in children's views of city life. This omission has both epistemological as well as political implications given that children are in a constant critical process of making and unmaking the urban environments that they inhabit. Children, in their everyday, have to make sense both of the complex urban realities that they inhabit, as well as the restrictions they encounter therein. For this presentation, we draw on data from Athens and London from the ERC-funded Connectors Study, a longitudinal comparative ethnography, which investigates the relationship between childhood and public life, in order to explore precisely these meaning-making processes in urban childhoods cross-culturally. We have implemented a range of creative methods in order to closely explore children's everyday realities and understandings of being in the city. The close, multimodal and reflective study of children's lived experiences in urban realities reveals elements of transgression, imagination and critical projections of desires, which we will be discussing in our presentation, and which prescribe a constructive set of critical (un)makings of the city. However, our analysis of children's perceptions and critical and

creative views of cities, is not only aimed at informing child-oriented policies. Instead we are also interested in widening, enriching and informing urban theory through the inclusion of urban encounters and experiences across the life course.

Public baths and the right to water: past, present and perspectives from the Parisian case.

Claire Levy-Vroelant, Lucie Bony, Sophie Fesdjian
 Université Paris VIII Saint-Denis, France; UMR Lavue
 CRH 7218; UMR Passages 5319 CNRS; UMR Lavue
 CRH 7218
 clevyvroelant(at)gmail.com, lucie.bony(at)cnrs.fr,
 sophiefesdjian(at)hotmail.com

The research aims to creatively approach the evolution of cities and social policies, from welfare and regulated capitalism to the “enabling state”, reframing the place, powers and capacities of local authorities. The research started from the study of the 16 still in function Municipal Baths in Paris. The expectations regarding Public baths in terms of social integration vary significantly through time and space. In the current context of the welfare state’s transformation, increasing poverty and blossoming of pooling of resources initiatives, they appear to be a potential laboratory for technical and social innovation.

The research aims to increase knowledge about uses and the users of public baths starting from France (several cities are included in the Project). The idea is to extend the research to Western Europe, specifically Italy (Torino), Belgium (Brussels), England (London; Birmingham) and Scotland (Glasgow), in order to identify the various functions – and destiny - of these institutions.

The project is multidisciplinary, from sociology and anthropology, to history, geography, and architecture. It mobilizes various methods: archive, observation, interview, and questionnaire. In the ESA conference, the paper will present a focus on the French case, developing the first results of a representative Survey on users of the Parisian establishments (1000 questionnaires) in collaboration with INED (Paris). We also propose to discuss the relevance of the research vis-à-vis current sociopolitical events (migration crisis, access/right to water, new solidarities; energy transition).

RN37 | Session 05b Living the City & the Neighbourhood

Interethnic capital(s): Social capital and inter-ethnic relations in eighteen European multi-ethnic neighborhoods

Rui Carvalho
 Brown University, United States of America
 rui_carvalho(at)brown.edu

European cities have been receiving growing stocks of international migrants and facing important challenges related to an increasing ethnic diversity. This has generated a sprout in the number of works trying to

uncover the effects of this diversity for urban livelihoods and, particularly, its influence for the establishment of social interactions at the urban (from the neighborhood to the metropolis) level. I will try to contribute to such scholarship by exploring how inter-ethnic contacts are established in eighteen multi-ethnic neighborhoods, located in six European cities, with three neighborhoods per city: Bilbao (Basque Country, Spain), Lisbon (Portugal), Rotterdam (the Netherlands), Thessaloniki (Greece), Vienna (Austria), and Warsaw (Poland). Using comparative data from a common questionnaire applied to both migrant and native residents of those neighborhoods, I reveal how inter-ethnic contacts are established in those areas. Using various regression models predicting inter-ethnic contacts of different levels of intimacy, I found that: (a) one’s migration background is the single most influential socio-demographic predictor for the establishment of inter-ethnic contacts; (b) perceptions of neighboring relations and the neighborhood seem to matter more for the formation of non-intimate inter-ethnic contacts than for more intimate relations; (c) the ‘neighborhood’ plays a more relevant role for migrants than for natives; and (d) statistically significant differences between neighborhoods were found in all the models, signaling the presence of important ‘neighborhood effects’ affecting the establishment of relations across ethnic boundaries. A detailed analysis of the potential causes and implications of these, and other, results for those urban areas will be presented.

Social groups and urban space: representations and intergroup relations in Athenian neighbourhoods

Prodromos Tzanetakos
 Panteion University, Greece
 tzanetakosm(at)gmail.com

The research in Metaxourgeio, Kerameikos and Gkazochori neighbourhoods in Athens has indicated that belonging and self-identification are factors of separation from other groups. The criteria of separation are mainly based on issues of aesthetics, political ideology, free time management and sexual orientation. The analysis of semi-structured interviews has shown that there is a clear differentiation between immigrants and refugees by most interviewees, expressing more negative opinions about the first, despite many interviewees having a migratory and/or a refugee background in their families. The individual’s status within the neighbourhood (e.g. habitant, employee, visitor), ideology, sexual orientation and the robustness of the district a visitor or an employee comes from, are factors that influence representations for immigrants, in contrast with locality, age and level of education. Other social groups lack visibility. The representation of sexual cultures are limited only in homosexuality and not in the broader spectrum of sexual expression. Non mainstream music cultures are also invisible due to the fact that social interest is less stimulated by music preferences, compared to sexuality. Moreover, it is rather interesting that interviewees are careful to express a more politically

correct speech about sexual issues, in contrast with music. The research concludes that the identity of a neighbourhood is not formed by its members, but by its groups or subsets and their relations. Sexual cultures “provoke” the aesthetic standards of heteronormativity, while music cultures are not considered equally “dangerous” for deregulating normativity. These aesthetic standards are the main “fear of overlordship” in space, which determines the group relations.

Territories of Social (Dis)Order: criminal landscape and spatial dynamics of St. Petersburg 'neighborhoods'

Alexander Lukoyanov, Marianna Muravyeva
National Research University Higher School of Economics, Russian Federation; National Research University Higher School of Economics, Russian Federation
lukoyanov414alexander(at)gmail.com,
mmuravyeva(at)hse.ru

Problems of social order, improvement of territories and social organization have been always acute all over the world. Scholars have provided enough evidence to talk about significant correlation between cues of social disorder and deviance and crime contextualized within certain historical and spatial environments. In this paper we will focus on the transformations of social (dis)order in connection with crime and landscape over time using St. Petersburg as a case-study.

Using empirical data from police reports and various characteristics of municipal territorial units of St. Petersburg we would like to verify the main hypothesis of the theory of social disorganization theory, that is, that the environment, in which the individual lives, has a significant impact on their behavior contextualized within normative models of social order. The paper analyses the spatial distribution of crime by GIS and environmental determinants of deviations in various areas by OLS.

The paper consists of some parts. The first part deals with analysis of the spatial distribution of crime and mapping to highlight serious differences between the historic centre and more modern areas. The second part of the paper is dedicated to connection between crime rates and the set of variables such as socio-demographic characteristics of residents, socio-economic development of districts, access and density of infrastructure objects, transport or entertainment venues.

Social mix Policies in the French Eco-districts: Discourses, Policies and Social effects

Elise Machline
Ben Gurion University, Israel
elise.machline(at)gmail.com

Since the 1980s, the issue of social mix has become a public policy aim in France. Included in legislation, yet remaining controversial, it represents a major issue on which housing policies have been redesigned. The

concept of social mix is mainly based on who lives where, but it is also raised in the context of urban renewal schemes for social housing estates, as well as in relation to new-build developments. Nowadays, projects of sustainable neighborhoods called “Eco-quartiers”, driven by the State and local authorities, are implemented. Social mix and social cohesion represent mandatory components in the Eco-quartier framework. A study of the bases of social mix policies conducted in France through the Eco-quartier framework shows the fundamental role of social housing stock. In most eco-quartiers, the share of social housing is above 30 %. However, there are some doubts and contradictions between the objective of social mixing and others objectives of the projects. One of the goals of the eco-quartier framework is creating high quality of life neighborhoods thus creating spaces which are more attractive than the rest of the city. As a result, the implementation of eco-quartier may create segregation in the access to housing. The objective of green marketing is opposed to the aim of social mix. That study will aim to investigate whether local authorities managed to establish social mix in a context of increasing attractiveness of the neighborhood for the living environment, which causes gentrification.

Politics of Space from Engels to Lefebvre: the Condition of Romani Community in Fevzipasa Neighbourhood

Recep Volkan Öner, Selçuk Çetin
Gazi University, Turkey; Gazi University, Turkey
rvolkan86(at)gmail.com, selcukcetin06(at)hotmail.com

In “The Condition of Working Class in England”, Engels tried to understand the social and political consequences of the condition of working class. Since then, there has been many changes both epistemological and factual. Concerning the epistemology, we can say that historical materialism left its place to the postmodern approaches that focus on detecting cultural and other kinds of differences. The methodological reflections of this situation are the rise of descriptive studies. Concerning the factual changes, we see that cities today and their function are different than Engels’ time. According to Lefebvre capitalism eases its internal contradictions by occupying and producing space, and “the urban crises” is the most essential one among all crises.

From Engels’ theoretical point of view, this paper focuses on a Romani Neighbourhood named Fevzipasa (Canakkale-Turkey) in Lefebvrian way. Fevzipasa is situated in the historical centre of Canakkale. Due to its location and the bay bridge project across the Gallipoli Strait, the land prices in the neighbourhood are getting higher. Besides Romani people are amongst the first groups suffering from discrimination. So, there is a gentrification process to displace the Romani community from Fevzipasa.

Therefore this is not a descriptive study. We are going to study on the political struggles of Romani community such as creating “Solidarity Group For Fevzipasa” (which later became

The Assembly of Fevzipasa working under Canakkale City Council) to protect their property rights. We believe that this study is going to be helpful to anticipate the future cases in similar Romani settlements.

RN37 | Session 06a Urban Inequalities, Conflicts and Mediations

Challenging neighborhoods: a cross-cultural perspective on violent behavior and violence-related norms

Sebastian Kurtenbach, Simon Howell, Muhammad Zaman

Bielefeld University, Germany; University of Cape Town, South Africa; Bielefeld University, Germany
sebastian.kurtenbach(at)uni-bielefeld.de,
simon.howell(at)uct.ac.za, zamanwwf(at)yahoo.com

Violence, both as an act and symbol, is underpinned by and legitimated through a raft of norms and beliefs and implicit prescriptions generated both as a result of individuals' relationships with others and the social structures which frame the context in which they live. This paper provides a snapshot of results derivative of an ongoing cross-national research project that specifically focusses of the violence-related norms of male juveniles between the ages of 16 and 21, who live in 'risky neighborhoods' in three countries – Germany, Pakistan and South Africa. In particular, the discussion focusses on outlining some of the factors that makes neighborhoods risky.

The purpose of such a focus is twofold. Firstly, to discuss the theoretical issues which inform understandings of the interplay between local structures and implicit 'street codes' that young men use to position themselves, and to provide an account of the role of space in settings the parameters on violent behavior. Particular attention is paid to the term 'risky neighborhood' as a useful analytical concept. It is explained and developed to an analytical framework. Secondly, the methodological challenges of cross-cultural comparison of often dissimilar examples of violence and space will be discussed.

The presentation is divided into four sections. Firstly, the state of the art is presented briefly, before an overview of the research designs and analytical framework is discussed. Thirdly, the preliminary empirical results are presented, before finally an outline of further analytical work is provided.

Conflicts in urban development - visions, values, participation

Karolina Thel

Academy of Fine Arts in Warsaw/ University of Warsaw, Poland
karolina.thel(at)gmail.com

In development of modern cities dilemmas related to networking, dispersion of power and conflicting interests of different social groups become more and more apparent. Key reference points for those

dilemmas are the concepts of quality of life, sustainability, equality, creativity and freedom. Main objective of my research was to analyze visions and values carried by different actors/stakeholders engaged in conflicts regarding urban development, especially in the context of public space. I'm interested in hot conflicts, being manifested by collective actions, protests, riots etc.

My first argument is that spatial conflicts should be analyzed in three dimensions: not only as interest conflicts or structural conflicts, but also value conflicts. Social perception and understanding of the concept of urban development, with the values hidden behind, influence process of shaping of urban space. Spatial transformation of the city tells us much about the social values and the society in general. As Hannah Arendt stressed, „the way we define public space is related to concepts of: human, nature, society and type of political community that we desire”.

In my paper I'm also trying to argue, that engagement in conflicts can be seen as an act of “organic” participation, that could be interpreted not as a threat to development, but as potential contribution of the civil society in constructing and reconstructing the cities.

I use cases from Poland and Slovenia. Research is based on 45 IDI and participant observation. Theoretical background refers in particular to Butler, Arendt, Lyotard, Urry, Mouffe and Habermas.

Spotting emerging disorders and conflict management in urban public spaces

Lionel Francou

Université catholique de Louvain, Belgium
lionel.francou(at)uclouvain.be

The attempts of this paper is to develop some observations over the issue of the disorders and conflicts occurring from social interactions in urban public spaces, on the basis of an ethnography conducted during a period of three months among a team of social mediation professionals whose a significant part of the job consists in the spotting of social disorders, current or in the making, and reacting in order to find solutions and end the problem. My paper will focus on the Belgian “gardiens de la paix” (peace keepers), who are not “law enforcement officers” but are parts of these new professions created during the last twenty years in Western Europe and Canada to ensure prevention and social mediation. They act at the local level by walking, providing a visible presence supposed to be reassuring and trying to discuss with the population, in order to prevent and solve conflicts, to “create social links,” to “reduce insecurity”, etc. I followed different teams on the field, wandering through territories and various temporalities, collecting their testimonies and analyzing a corpus of 800 reports (two full years) by which these peacekeepers reported to their superiors some events they considered as being problematic. By combining these methods, I was able to access both the ordinary dimension of experience (by participating in their walks) and the rather exceptional

events which play an important role in the way these actors define their role. Acting on the basis of the identification of disturbing events, they are particularly concerned with the upkeep of the conditions necessary for the Goffmanian "interaction order", both "moral" and "public" order, they seek to guarantee.

Study of Inequalities in Urban Regions with Census Data of 2011: The Spanish Case

Juan_Jose Villalon_Ogayar
UNED, Spain
jvillalon(at)poli.uned.es

This paper discusses whether the "Urban Region" concept improves the analysis of inequalities in our European cities and towns. An Urban Region is a cluster of towns and a city with strong fluxes of communication and people that produces commuting areas.

We know many people live in a town or village but work in another. Labour, leisure and housing markets of a post-industrial city are bigger than a municipality. Then, we should consider "Urban Region" as a better concept than "city" or "town" to understand the inequality structures and their consequences.

In my paper, I ask if the stratification system of an urban region could be a better example of the inequality structure today than its cities and towns.

I have analysed the data of Population Census, 2011 in Spain to study occupational stratification. I have compared cities and towns with their urban regions to find out whether the pictures are different. With the results, one can decide what level gives a clearer idea.

RN37 | Session 06b Urban Encounters & Everyday Life

Disappointing Encounters in the Urban Life of London and Berlin

Sebastian Juhnke
Humboldt-Universität zu Berlin, Germany
sebastian.juhnke(at)hu-berlin.de

Encounters with difference in the city - the 'micropolitics' of everyday social contact (Amin 2002) - are deemed significant for new and meaningful forms of belonging. Simultaneously, processes of urban change disrupt the possibilities of such encounters through the economic and symbolic displacement of poorer residents. These dynamics come together in Dalston (London) and Reuterkiez (Berlin), two ethnically diverse and gentrifying neighbourhoods that are home to the creative industries. This growing sector is celebrated by policy-makers and place marketing and takes part in the representation and making of the city. Based on semi-structured interviews and ethnographic observations in the two capitals, this comparative paper argues that predominantly white and middle-class creative professionals - e.g. artists, designers and media workers - have a desire for difference and diversity that is tied into discourses of creativity and a self-

understanding of 'being creative'. However, which forms of diversity (and creativity) are valued is highly selective.

Investigating how creative professionals experience and understand ethnic, social and cultural difference, findings show an awareness of the marginality of encounters that occur in these neighbourhoods. A pronounced search for diversity is the reason why these marginal encounters with difference are experienced as unrequited, challenging or disappointing; judgements that are explained by the attribution of minority ethnic communities as self-segregating and lacking of 'openness'. Adding to predominantly positive conceptualisations of encounters in the literature, an exploration of encounters with diversity that are experienced as disappointing sheds light on the multiple ways in which difference is made sense of. Doing so then reveals a complex relationship between a desire for living with difference, gentrification, and old and new forms of exclusion.

From Strangers to Strangers: (Non)Migrant Encounters with Difference in Café Spaces

Byeongsun Ahn
University of Vienna, Austria
byeongsun.ahn(at)gmail.com

In this paper, I revisit the concept of conviviality (Gilroy, 2004, 2006a, 2006b) and its much-romanticized use in understanding encounters with difference in everyday urban life. In contrast to the tendency to privilege daily interaction with difference in semi-public spaces as cohabitation of difference, or 'indifference to difference' (Amin, 2012, 2013), I see that the concept overlooks the evident asymmetries of so-called prosaic negotiation of difference, as it fails to answer how individual experiences of so-called unremarkable difference at a micro-level can translate into group-experiences at a macro-level to the same degree. In critique of the concept that celebrates encounter with difference as an ordinary feature of urban multiculturalism, I stress that the individual moments of prosaic interaction shall not be mistaken as moments of cultural transgression, where cultural, ethnic, racial and/or religious differences become unruly and unremarkable. Rather, I argue that the concept, of which strength is said to do away with the patronizing principles of 'European, white normativity' (Valluvan, 2016), fails to register how habitual encounters with others can go beyond individual moments into 'respect for difference' (Valentine, 2008). For this, I introduce my observations on encounters with difference in three café spaces in three different neighborhoods in Vienna, Austria to demonstrate whether low-level sociability witnessed among my participants from each site translates into a normative urban multiculturalism.

**(Im)possibilities of (urban) (food) autonomy.
Everyday life struggles in the city of Athens.**

Ines Morales Bernardos
University of Cordoba, Spain
inesemeve(at)gmail.com

New forms of struggle on the everyday life are emerging where heterogeneous radical protesters are challenging the deconstruction of the capitalist relations against life that last phases of global capitalism have reshaped. In this way, as a turn into radical politics that enforced this trend, autonomy its being claim and practice by radical protesters in the city of Athens. Furthermore, they are having the city and social reproduction processes as decisive sites of confrontation where directly connect to new everyday concerns and basic needs resulted by last capitalist crisis. Hence, Food, among other basic needs such as water, housing or education, are new spaces of confrontation but also of affinity and affection. After two year ethnographic research 2014-2016 (observatory participation and in-depth interviews) and having as departing point the 2008 December revolts in Athens in this paper we aim to explore the everyday life struggles for the reconstruction of food autonomy triggered in this city. Furthermore, we embrace agroecology, eco-feminism and radical geography as analytical frameworks to better understand the (im)possibilities of the urban (food) autonomy that these radical protesters propose and practice. To conclude, that through the reconstruction of urban food autonomy these radical protesters they got to transform Athens socio-spatiality integrating "ruralities" and thus, to challenge the limits of the urban. Yet, they have also created new forms of relation to tackle dignified life reproduction by engaging the collective, the neighbourhoods, as main new actors.

Lessons from the experiences of the city residents in a marginal perspective

Caterine Odile Reginensi
Universidade Estadual do Norte Fluminense, Darcy Ribeiro, Brazil
creginensi(at)gmail.com

This work, based on an ethnographic research in a half Brazilian city, Campos dos Goytacazes, located in the Northern Fluminense region, seeks to establish a relationship between the ways of living and acting in the margins of the city and perceptions about everyday life. The first hypothesis is that residents' readings of where they live - both the conditions of their physical structure and the dynamics of the internal organization of space - are strongly related to their subsequent life trajectories. These trajectories are sometimes structured within the limits of poverty, between risk and vulnerability, and in the absence of social rights and guarantees. But they also show that in the struggle they consolidate diverse activities, artistic expressions and, with them, the hope of a decent dwelling can be realized. The second hypothesis is that the favela as a margin is a center of material and symbolic production that facilitates the

constitution of everyday objects and shows how the role of subject is permanently renegotiated despite the violence exercised in these places. Three questions arise in this interpretive line: 1) what does it mean to live in the favela? 2) how to interpret the process of change from the experience of the residents themselves? And 3) With what methods to approach the socio-spatial dynamics that impose the routines in the locality after the change of address?

RN37 | Session 07a Post-Industrial Cities

A Public Realm in Post-industrial City. Some reflections on restoring public spaces in Katowice city center.

Paweł Pistelok
University of Silesia, Poland
pistelok(at)gazeta.pl

The paper aims to discuss the case of public spaces in Katowice – now post-industrial city, the heart of upper-silesian conurbation, with history defined greatly by coal mining and metallurgy. Only ten years ago, its center was a rejected area, even referred to as "a nightmare" – defined rather by the lack of typical city center qualities. A communicational node at its best, but certainly not the "place" capable of fostering social relations. Ironically, Katowice lies in a region of unique local culture and folklore.

All of the above has undergone a significant alteration over the past few years. Degraded sites, left by shut-down coal mines, now change their meanings and functions, being implemented with malls and institutions of culture and arts. In a way, Katowice started over – as UNESCO Creative City of Music and a host of multiple international film or art festivals.

The change is also being reflected in the city's public spaces. They've been regenerated by introducing small architecture, means of interaction and a completely new main square holding fairs, seasonal markets and cuisine festivals – finally an enchanting place, with "a hum of conversation". Simple, but significant modifications unveiled how even the most rudimentary qualities were always needed by those who live and work in Katowice. However, said improvements have also met some criticism. Consequently, following works of Lyn H. Lofland and Stephen Carr, an attempt will be made to settle, whether the new city center holds its social functions, and how it addresses our needs and rights regarding city's public space.

Inequalities of the quality of life in the post-industrial city. The case of Lodz

Marta Petelewicz
University of Lodz, Poland
m.petelewicz(at)gmail.com

Lodz, the third largest city centrally located in the Poland is often called Polish Manchester or Detroit. The collapse of the textile industry after systemic transformation in Poland left the city and its citizens in very difficult situation. High level of the structural long-term unemployment followed by increasing scope of

the social problems influenced the functioning for the next decades. What is more, the accumulation of poverty and social exclusion, as well as the intergenerational transmission of inequalities is present in the particular districts of the city, contributing to severe spatial segregation.

The presentation will be focused on the inequalities in the quality of life of the adult population in Lodz and their determinants. Quality of life is treated as the multidimensional construct covering different spheres (health, relations, leisure, productive activity, etc.) measured by objective and subjective indicators. The most important questions addressed in the presentation are: which social divisions: gender, age, neighborhood, socio-economic status influence the level of the quality of life? How deep is the gap in the level of the quality of life between particular categories? How different categories are structured considering the level of well-being? Is spatial dimension important variable in the analysis of the quality of life in Lodz? Answer on those questions will help to discover and understand different faces of social divides in the city, processes of segregation and possible ways of overcoming them. The findings are based on the empirical research conducted in 2012 on the representative sample on Lodz inhabitants using CAPI (N=1000).

Post-socialist city and the new class divide

Gabriel Troc

Babes-Bolyai University, Romania
gabrieltrroc(at)socasis.ubbcluj.ro

The paper investigates the post-socialist urban changes of Cluj-Napoca, the second-largest Romanian city, focusing on the recent class divide and its spatial counterpart.

Its development after 1990 encountered the predicaments specific to other post-socialist, industrial cities (Stanilov, 2007), being limited by its socialist past (Szelnyi, 1996). After an episode of nationalist movements in the 1990s, the city entered, after 2002, the global circuits of capital. Looking for the cheap labour force of the former socialist workers, flagship multinational companies like Nokia and Emerson settled in the city. Following them, but this time targeting the younger, well educated labour force provided by the city's six universities, other companies (of national or international capital, making business in communications, finance, services and especially in IT) settled in the city in the last ten years. Finding a proper place for value production, accumulation and extraction, these companies provide opportunities for some categories of labourers to get higher incomes and to reach or aspire to a middle class status. Like elsewhere in Central and Eastern Europe after 1990, middle class aspirations came along with spatial reconfigurations (Bodnár, 2007; Fehérvári, 2012), especially at the level of house and neighborhood.

Analyzing public data, Internet forum discussions and ethnographic material, I analyze how this new class under formation is reshaping the city of Cluj-Napoca (privatizing spaces, raising suburbias, excluding the

poor, requesting quality public services and leisure spaces etc.), following common trends specific to the neoliberal development of urban spaces everywhere (Baldassare, 1992; Low, 2001), and more particular developments specific to CEE (Nedović Budić: 2006; Polanska, 2010).

Bilbao: the search for a new city model

Patricia Campelo

Universidad Del Pais Vasco (UPV/EHU), Spain
patricia.campelo(at)ehu.eus

As is the case in other European industrial cities, Bilbao has suffered the impact of successive economic changes to its urban structure. The crisis in the naval and steel industries in the 1980s turned the industrial jewel in Spain's crown into a city in decline. However, the dull and foggy city began undergoing tremendous changes as of 1992. This change has been labelled a success in contemporary writing on urban analyses. However, the economic crisis which came into full force as of 2008 meant yet another new period and, whilst the city is continuing to complete projects, the factors which, at the time, made its transformation possible have now changed.

The aim of this paper is to describe the city's current structural reality and specify what social agents and actors are saying about this charged and uncertain future. Based on this, two analysis procedures have been drawn up. First of all, definition of the city's vulnerabilities based on socio-demographic and economic secondary data. Secondly, bringing together the various players' discourses using in-depth interviews as a qualitative technique. This has provided us with interesting conclusions on the urban activities which have an impact and the situation in Bilbao neighbourhoods and its metropolitan area.

Industrial City Development towards Citizens Participation

Tomasz Herudziński

Warsaw University of Life Sciences - SGGW, Poland
tomasz_herudzinski(at)sggw.pl

The paper describes problems of the development of modern (post)industrial cities, whose emergence and development were connected with industrialization. Article firstly describes the crisis of the industrial city in societies which are called as a postindustrial. Secondly is characterized mutual relations exist between urbanization and industrialization of the post-war period and the problems of industrial cities of the period political transformation in Poland. The third part describes the role and importance civic participation in the process of forming future vision of the city. This part is the presentation of the project implemented by a grant Trust for Civil Society in Central and Eastern Europe and the results of empirical research. The research program envisaged undertaking both quantitative and qualitative research. First quantitative Research, a questionnaire survey amongst the citizens of Konin, conducted on a sample of 620 people. Secondly, qualitative research, individual in

depth interviews on a sample of 20 people. Residents of the city have initiated and actively participated in the creation of civic development strategy.

RN37 | Session 07b Urban Crisis & Austerity

Lessons from the Greek public debt crisis: The indebted subject as the paradigm of a new urban dweller

Eleni Ploumidi, Maria Markou
National Technical University of Athens, School of Architecture, Greece; National Technical University of Athens, School of Architecture, Greece
eleniploum(at)hotmail.com, mmarkou(at)arch.ntua.gr

This paper delineates the manifestation of the subjectivity of the debtor as the new sovereign paradigm of the urban dweller in the context of the Greek public debt crisis. In Maurizio Lazzarato's approach, debt represents both an ethico-political activity of constructing the subjectivity of the debtor, morally devoted through guilt to repay debt, and an adaptation of governing policies to the austerity dogma. Following that scheme, we examine the shift in the self-representation and behavior of the urban dweller in Greece through a binary process. On the one hand, the incrimination of house and land ownership as a main factor for the increase in public debt through various semiotics, result to the construction of a guilty subject introjecting responsibility to repay his personal share of it. On the other hand, the implementation of austerity measures that concern heavy house and land taxation and strict mortgage regulations, result to the alteration of housing practices from a social security mechanism — established in the context of the welfare system that the country developed throughout the postwar period, constituting the fundamental tool for the social mobility of Greek urban populations— to the unattainable management of a heavy financial burden. The indebted subject, deprived of his —prior to the crisis— strategies of social reproduction, manifests his existence —as trapped— in urban space through rapid growth of homelessness, generalized energy poverty and insufficient maintenance of the building stock, contributing to vast changes in the social geography of Greek cities.

The Louvre-Lens between urban transformation and social transition

Hanane Idihia
Evry val d'essonne, France
hanane.idihia(at)gmail.com

In 2012, the first regional branch of the Louvre opened in Lens, former coal mining town in the north of France. As was the case in Bilbao (Guggenheim Museum), Metz (Beaubourg) or Manchester (Imperial War Museum North), among other cities, this “cultural” decentralization in a de-industrialized and pauperized city stems from a policy of “Territory development” and “urban renewal” which is imposing itself everywhere in post-industrial Europe.

After more than a century of mining which shaped and strongly marked the city of Lens and its surroundings - both economically and socially, both architecturally and culturally - after two decades of deindustrialization and massive unemployment, the arrival of the Louvre was announced to the residents as an opportunity to relieve themselves of this heavy past and to take a new start.

On the basis of an urban ethnography carried out in an old mining yard in Lens, I would like to analyze the frictions, the antagonisms between the logics of neoliberal developments and local identities.

Solidarity in crisis? Exploring the conditions for place-based solidarities in diversity.

Stijn Oosterlynck
Department of Sociology, University of Antwerp, Belgium
stijn.oosterlynck(at)uantwerpen.be

This paper starts from the observation that both formal and informal solidarities are challenged by increasing ethnic and cultural diversity in Western cities. While institutionalised mechanisms of redistribution are under pressure of welfare chauvinism, direct and personally motivated acts of support and solidarity encounter may not bridge ethnic and cultural lines if others are perceived as a ‘cultural threat’. In this paper, I build on previous work on innovative forms of solidarity in diversity in cities and argue for a focus on the concrete and everyday practices through which urban citizens take joint responsibility for places they share with diverse others to identify new forms of solidarity in diversity. On the basis of large-scale collaborative research on 31 in-depth case studies of place-based forms of solidarity in diversity, I explore the conditions under which place-based solidarities transcend ethnic-cultural lines. Firstly, I show how place-based forms of solidarity in diversity often move beyond the social cohesion perspective that is still the dominant approach in governing urban diversity. Instead, they require the transformation of existing social structures and group dynamics. Secondly, the case studies suggest that encounter and conviviality, which have received much attention in the urban studies literature recently, are useful but insufficient sources of solidarity. Moreover, contrary to the neo-assimilationist turn in urban diversity governance, the research shows that imposing pre-existing norms and values is less effective to nurture solidarity in diversity. Thirdly, because citizenship understood as a formal status often fails to include migrants and newcomers as equals in society, the latter take recourse to citizenship as something that is practiced in urban (semi-)public spaces.

RN37 | Session 08a Urban Planning & Gentrification

Planning and exclusion, when the city is on sale. A new vision for Buenos Aires.

Marcela Riva de Monti
Universidad Politecnica de Madrid, Spain

rivamonti(at)gmail.com

With the new access to international financing, Buenos Aires is strongly working on an update in the infrastructure (mainly in mobility) that had been neglected for several decades.

The current (liberal) government, in its quest of building the desired urban fabric of a world class creative city, is re-shaping Buenos Aires with the release into the market quite a few number of former brown fields plots of public-owned land to endow the city with the desired spaces of representation (consumption?) the new service knowledge economy requires.

The consequence of the first action is an increase on the land and housing unit's prices within the core of the city forcing a vast part of the population, including middle class families, to live in the marginality of the inner-city slums or to move far away from the city centre.

The consequence of the disposing of the public land in this manner produces dramatical changes in the uses and appropriation of the city, now limited to that statement of the society able to fit, and afford, this new spotless and secure new environment.

The economic effort to achieve these changes is socially constructed, as its finance with public debt. The benefit is enjoyed by a small percentage of the selected ones.

Focusing on the results of two recent competitions (Parque de la Innovation y Eco-parquet Buenos Aires) this paper emphasize the strong process of gentrification and expulsion the city is facing, with these array of interventions when compared with other experiences of urban intervention in Latin America.

Access to urban green space and the gentrification of gardens

Christopher Young, Nicole Bauer
Swiss Federal Institute for Forest, Snow and Landscape Research WSL, Switzerland; Swiss Federal Institute for Forest, Snow and Landscape Research WSL, Switzerland
christopher.young(at)wsl.ch, nicole.bauer(at)wsl.ch

As a growing majority of the world's inhabitants live in cities, urban green spaces become ever more important. They act as resources for social interaction, belonging, psychological restoration etc. Gardens are an important part of urban green, with much research dedicated to community gardens. In our case study city, Zurich, Switzerland, community gardens are new and receive a lot of attention, but the number of people who use them is very small compared to those with residential or allotment gardens. We ask who has access to which gardens in the city, how the social landscape of garden use is changing and how this is connected to the current political economy of Zurich, with its central position in the global financial industry. We base our findings on a survey of gardeners and non-gardeners (n=850) conducted in Zurich in 2016, on qualitative interviews and document analysis. The three garden types are used by distinct social groups,

regarding their migration biographies and social class. While (as yet) allotment gardeners generally belong to a (broadly conceived) working class, many community gardeners are part of to a highly-qualified, mobile urban middle class. This urban middle class is increasingly entering allotment gardens – and to some extent replacing more traditional owners of residential houses and gardens.

So parallel to more typical residential gentrification, we identify a gentrification of garden spaces. This is not only a question of displacement, but also of cultural struggles. In particular, new gardening practices seem to give rise to new, neoliberal forms of community. The changing social landscape of gardens connects of more general questions of the right to the city and commodification of the urban (Lefebvre).

Middle class education strategies and segregation processes in mixed neighbourhoods in Athens

Penelope Vergou
University of Thessaly, Greece
pvergou(at)uth.gr

This paper focuses on the explanation of different forms of middle classes education strategies centered on school choice in the city of Athens. The competition for education advantages and social mobility creates more class struggle and multiplies social racism especially in working-class areas of the city, with high mixture of groups with diverse socio-economic and ethnic and cultural differences.

In a period where financial crisis diminishes the financing of public goods, the powerful neoliberal economic relations makes the competition for education advantages more class oriented. Moreover, cities became the central issue of socio-spatial debate as the main units of receiving refugees either in state camps or in social housing. At present, refugees and asylum seekers are facing major problems especially in housing and education where local policies, bureaucratic practices and blocking strategies of 'gatekeepers' play an important role in segregation.

To this end the paper attempts to answer questions, such as: Which are the different educational strategies of middle class social strata and how their choices empower segregation? How the institutionalization of difference and inequality through education processes reproduce social segregation? How local policies and the institutions respond to 'diversity'?

The empirical material is based mainly on data collected from secondary schools (grades, drop-out rates, transfers etc.) that are further supported with data from semi-structured in-depth interviews with parents, teachers and key actors. The result of the empirical research presents a closer examination on different forms of middle classes education strategies and focuses on the explanation of social segregation.

Middle classes and gentrification in Paris : Overpassing the dichotomy "gentrifiers" / "gentrified" people

Lydie Launay
Université Champollion Toulouse, France

lydie.launay(at)univ-jfc.fr

The metropolis of Paris has been facing to gentrification of its working class neighbourhoods for the last decades. The scientific literature tends to analyse the cohabitation between the different groups in gentrifying neighbourhood and its socio-spatial effects through the dichotomy “gentrifiers” / “gentrified” people (Lees, Slater, Wyly, 2008). But these both categories gather populations very diverse socially, ethnically, economically, with differentiated positions in residential and familial trajectories, who are animated by social logics that cannot be envisaged solely in the perspective of a socio-spatial reconquest of the centre, leading to the eviction of the working class people and ethnic minorities (Smith, 1996).

In this paper, gentrification is understood as a “social (unequal) relation to the appropriation of space” (Chabrol and al. 2016). This approach takes into account the properties of the populations that coexist, local contexts, but also temporalities. Then it allows to reinterrogate the dichotomy by emphasizing its unstable nature: the “gentrifier” inhabitant of a day can be “gentrified” inhabitant a few years later.

It will show it by placing the focal point on a Parisian neighborhood, Saint-Georges. From 2011 to 2014, we conducted 40 interviews with middle classes inhabitants in order to investigate on the residential choice and their ways of living local space. It will underline that if these inhabitants have participated to gentrifying the neighbourhood, they are also confronted to its changing. They try to develop resistance strategies to stay in the centre, by mobilising local networks, doing adjustments and accommodations in their everyday life and also creating solidarities to reduce the exclusion of the most fragile populations.

RN37 | Session 08b Reinventing the City: Urban Resilience and Participation Processes I

Public dialogue – it’s sense and possible forms in the context social inactivity and social conflict

Aleksandra Winiarska, Agata Gójska
Institute of Applied Social Sciences, University of Warsaw, Poland; Institute of Applied Social Sciences, University of Warsaw, Poland
aa.winiarska(at)gmail.com, agata.gojska(at)gmail.com

One of the challenges of contemporary urban life in Poland is a general indifference when it comes to engagement in constructive city-making and community-based processes on the one hand, but a range of social conflicts concerning local interests on the other. Strategic policy documents at the local government level are beginning to acknowledge the significance of dialogue in decision-making processes and the importance of negotiating differing social interests. We define public dialogue as every form of bilateral social communication between local public administration and city residents (both individual actors, as well as non-organized and organized collectives) in contributing to city-building actions. We

will focus on the case of Warsaw – Poland’s capital, where a public dialogue program has recently been initiated.

The aim of our paper will be twofold. First of all we will discuss the idea and importance of public dialogue and present a diagnosis of its challenges based on various existing data. We will also debate possible indicators of the presence and effectiveness of dialogue as well as overview its possible forms and specific manifestations. Next we will present a case study based on a participatory process aimed at developing a strategic policy on public dialogue in Warsaw. We will focus on the process – its establishment, practical realization, difficulties and outcomes. In our case study the perspective of urban policy and local governance will be combined with the everyday point of view of city residents and implications will be drawn for the role of dialogue in the ‘making of the city’.

Urban diversity and the everyday: Shaping a research agenda

Jessica Terruhn
Massey University, New Zealand
j.terruhn(at)massey.ac.nz

Over recent years, migration researchers have become increasingly interested in examining how people in (super-)diverse environments are ‘living-with-difference’ (Valentine 2008). In large measure this is a response to the growing diversification of many major cities in Europe and beyond. Crucially, however, it is also an attempt to counter the concurrent phenomena of growing nationalism, populist movements, and panicked policy discourses centring on the notions of ‘social cohesion’ and ‘integration’ that are in evidence across the globe. Much of this research hones in on urban locales – from cities more broadly to neighbourhoods and concrete micro-publics such as parks, libraries, or public transport – as spaces where everyday multiculturalism is produced and lived and where difference is negotiated in mundane encounters with fellow city dwellers. Now spanning a large number of different geographical contexts from Europe to Oceania, this burgeoning body of work calls for a systematic review in order to take stock of current knowledge. In this presentation, I provide an analysis and synthesis of international qualitative and ethnographic studies of urban diversity published over the past ten years, from 2006 to 2016. Applying a comparative lens, I outline key findings that illuminate processes of sociability and solidarity but also processes of contestation and exclusion and the conditions that enable them. Tied to this discussion of findings I examine the research questions and theoretical lenses that researchers have employed in order to make suggestions for shaping a research agenda.

Relational Cities and Resilience: Why do some Cities Adapt to Global Change Better than Others?

Catherine Mei Ling Wong

University of Luxembourg, Luxembourg
catherine.wongml(at)gmail.com

This presentation is concerned with two related issues. First, it explores the appropriateness of the concept of “relational cities” as a frame of research in global urban studies. Relational cities are relatively small in size but, nonetheless, play an important role in facilitating, managing and “housing” global flows of money, services and artefacts of wealth. Given their size and connectedness to international networks, relational cities could be more vulnerable to changes in the global economy. Cities typically categorized as relational, however, have proven to be more resilient and agile in responding to macro-structural changes in the global economy. The second issue of concern, therefore, is whether there is a relationship between a city’s “relationality” and “resilience”. Drawing on a comparison between Luxembourg, Geneva and Singapore, this presentation examines the role of history, niche sovereignty, local political conditions, and global connectivity in fostering relationality and resilience.

RN37 | Session 09a Housing Policies, Actors and Processes II

Rental housing – availability and access in two Estonian cities. Experience of university students and prospects for young professionals

Liis Ojamae, Katrin Paadam

Tallinn University, Tallinn University of Technology, Estonia; Tallinn University of Technology, Estonia
liis.ojamae(at)tlu.ee, katrin.paadam(at)tlu.ee

Societal changes across Europe are saliently displayed on the transforming urban residential markets and thus individuals’ opportunities to acquire or rent housing, and acknowledged to affect young adults’ access and affordability of housing particularly in cities.

The recent quantitative study of university students (2013) in two Estonian cities, Tallinn and Tartu, clearly demonstrates that there is a high demand, in particular, for the rental housing during the study years as well as at entering the labour market as young professionals. The primary assumptions behind the formation of this demand are a preference for renting in the phase of studies or shortly after the graduation as well as unaffordability of homeownership, which is though aspired for in a long-term perspective. The more in a cultural situation of ‘society of homeowners’, which Estonia became after the 1990s’ ownership reform with owner-occupation rate of 79 percent. Students’ assessments of the current and prospective conditions uncover a number of problems: scarce availability and limited choice of location of public rental housing which tend to be concentrating in segregated and relatively stigmatised districts, and respectively, low housing quality against

high rental costs and insecurity of rental contracts in the private rental sector. It is argued, that in order to attract the young highly educated professionals to settle down and, hence, to ensure resilient futures of the cities under observation, complex interventions into the supply of rental housing are due on the levels of urban planning and social policies and in partnership with private sector.

The House of Weaving Logics: The Institutional Work of Social Housing in Taiwan

Chih-Hua Tseng

National Taiwan University, Taiwan
christ0ph3r77(at)gmail.com

The housing problem is the spatialization of the governance power in Taiwan. In the early years when KMT government moved to Taiwan, over millions of servicemen and citizens were immigrated to the island and sought existing places to live, followed by urban-rural migrants and the rise and fall of real estate market, government put out different policies to promote public housing, basically the main purpose is to encourage citizens to buy house instead of rent. In 2014, NGOs found ‘Housing Movement 2.0’, one of the demands is to ask government to broadly construct more social housing only for rent, and raise the percent of social housing from 0.1% up to 5%, under the right to adequate housing. Meanwhile, Democracy Progressive Party(DPP) which latter became the ruling party respond with the policy “200,000 units of social housing in 8 years”, but it also has its drawback.

The article will be based on urban sociology, with the political economy such as “the growth machine” and regime theory, and the questions of citizenship and “right to the city”, also with the complement of institutionalism and organization sociology. I will use historical literature, fieldwork and interviews, to show following three dimension of institutionalization. Firstly, from National Housing to Social Housing, I will trace the origin of policy change to the rise of social housing. Secondly, I will point out the different relationships between government sectors, non-government organizations and firms, and affected citizens, and how do they shape and constantly reshape multiple understandings of the institution. Lastly, I will compare the different institutional work of social housing under different local government, and how does it produced different outcome.

The meaning of housing from the social mobility perspective: reflection on research methods

Elizaveta Polukhina

National Research University Higher School of Economics (HSE), Russian Federation
liza.polukhina(at)gmail.com

The presentation is based on the data from sociobiographical project “Intergenerational social mobility from XX to XXI century - four generations of Russian history” (www.smxxi.ru). During this study, we used 3 main data sources: first, a questionnaire

(Russian nationwide survey, 5081 respondents), secondly, a biographical interview (78 semi-structural interviews) and, finally, a projective technique titled “a diagram of life path”. The data were collected in 2015 and contained the materials about trajectories of the individuals, their housing conditions and experiences as well as the social positions of the previous generations (parents, grandparents). In this presentation I plan to focus on the evaluation of the gathering data from these sources and on the revelation of the main advantages and limitations of our research instruments (a questionnaire, a biographical interview and a projective technique). The dwelling/house based on Pierre Bourdieu theory is an indicator structuring the social space. One of the research goals in our sociobiographical project is to reveal the meanings of dwelling from a social mobility perspective. The main research questions are the following: how do the housing status / experience determine the trajectory of social mobility? In some contexts, “dwelling” creates social opportunities, is it a cause of social advancements? And in which contexts is it a cause of social barriers? Basing on my analysis I try to realize a methodological reflection and to evaluate what kind of data we collected with the help of each of our 3 sources and how they enhance each other.

Planning diversity – Housing policies and spatial planning in German cities

Christian Jacobs

Max Planck Institute for the Study of Religious and Ethnic Diversity, Germany
jacobs(at)mmg.mpg.de

In my work I investigate the influence of city planning on spatial structures of diversity in German cities. Analyzing this field becomes especially interesting, as the composition of cities – through the diversification of urban societies – as well as the structures of urban planning have changed significantly in recent times. Politically, the recognition of difference and explicit ‘diversity’ policies have gained more prominence. And yet, it remains unclear which implications this has for spatial planning and thereby for the life chances of diverse groups within cities.

In my presentation I will focus on specific interventions of public and private planners towards diverse groups as well as the underlying ideas of those planners. Main aspects here will be that planners try to support social cohesion and counteract ‘ghettoization’ by means of creating a ‘good social mixture’ within the city, while mainly trying to implement these ideas through planning on the neighbourhood level.

The empirical basis for the presentation are expert interviews within public administrations and housing associations as well as insights from a large-scale project in German cities investigating how urban actors in Germany and in France respond to diversity (further information about the project can be found under:

<http://www.mmg.mpg.de/en/project/citydiv/about/>).

The project started in 2014 and involves a large

survey of urban actors in forty major German and French cities. After presenting empirical findings I will critically address the general possibilities of action and the assumptions behind the introduced ideas and strategies of planners.

RN37 | Session 09b Urban Segregations: Territories & Actors

Racial Inequalities in Continental European Cities: Expanding Diversity

Giovanni Picker

University of Birmingham, United Kingdom

G.Picker(at)bham.ac.uk

Since 19th century's massive processes of urbanisation following industrial development, diversity has unfolded along with socio-economic stratification and inequality. In the current global order, where non-citizens or just-citizens are overrepresented within cheap-labour market niches including low-skilled jobs, a major marker of urban inequalities in the Global North is skin colour and generally physical appearance. A large body of research has shown how racist assumptions and thinking behind policy and actions keep “others” on worse socio-economic conditions than the (white) majority. From such a global perspective, this paper questions the virtually complete absence of racial inequalities in the burgeoning diversity scholarship on continental urban Europe, and theoretically expands the concept of diversity to include racial inequalities as constitutive of hyper-diversification processes in this part of the Global North. Drawing on my long-term ethnography (2007-2013) of the housing conditions of Roma in Italian and Romania cities, the paper shows the pivotal role of racial thinking behind state policy and civil society discourses and actions. It historically and ethnographically dissects key economic, political and cultural factors behind residential inequalities between Romani people and the majority in Pescara (Italy) and Cluj-Napoca (Romania). It shows how local political economy concerning social housing (Pescara) and land (Cluj) merge with electoral interests, capitalising on the racist everyday and local media discourse on Roma based on racial assumptions and thinking. In order to expand the concept of diversity, the paper theoretically builds on the scholarship highlighting the need to acknowledge racial inequalities in continental Europe (e.g. E. Fassin; D.T. Goldberg; A. Lentin), and complements this literature with an accent on cities as key sites for scrutinizing diversity.

The Mechanisms of Gendered Segregation of Urban Space in Case of Ankara

Aysu Kes Erkul, Canet T. Saritaş

Hacettepe University, Turkey; Hacettepe University, Turkey

aysukes(at)hacettepe.edu.tr,

canet.eldem(at)gmail.com

Since the second half of 1970s, the theoretical and methodological turning point considering urban space

as a social construction has provided a path for looking socio-spatial relations from a gender sensitive approach. Although early approaches focused on women's exclusion from urban public space through public sphere – private sphere dichotomy, especially since 1980s with women's increasing labour force participation rates, the analysis on gendered segregation of urban space with regard to gender roles has become a dominant endeavour. This endeavour enables us to question the binary approach to public-private sphere and to focus on dialectical relations between them which, restrict women's access to opportunities and their transformative power over urban space.

Within this scope, this study aims to analyse socially constructed barriers in front women in accessing social, economical and political opportunities in urban space and examine the mechanisms reproducing these barriers. Study questions the factors determining women's relations with urban space, the impact of their reproductive responsibilities on their in/visibility in urban public space, their access to public services, their relations with local administrations, their representation and participation to local planning and decision making processes. This analysis is based on qualitative research and a data set collected through 40 in depth interviews conducted with women living in Ankara, capital of Turkey. In the context of study, the woman is not considered as a homogeneous category. Instead, by considering the impact of education level, household composition, marital, motherhood and employment statuses, this study aims to reveal the factors that differentiate women's experiences with urban space.

Ethnic Diversity and Change in the Neighbourhoods of the Accra Metropolitan Area, Ghana, 2000-2010

George Owusu, Samuel Agyei-Mensah
University of Ghana, Ghana; University of Ghana,
Ghana
geowusu(at)yahoo.com, sagyeimensah(at)gmail.com

A combination of historic, socio-economic and cultural conditions results in areal concentration of ethnic groups in cities, a phenomenon described as ethnic residential segregation. However, studies on ethnic segregation in Sub-Saharan African cities in general and Ghana in particular are far in between. This situation is partly blamed on the negative use of the ethnic question by people in authority during national crises, which in some instances has resulted in conflicts in many African countries; absence of data for any meaningful analyses and; the view that ethnicity in Africa represents a vestige of traditional society which will disappear with modernization. Consequently, the subject of urban ethnic residential segregation has engaged the attention of social scientists in Europe and North America than Sub-Saharan Africa. This paper examines the changing ethnic geography of Accra, Ghana's national capital, for the period, 2000-2010 – a period noted for unprecedented urban growth, economic liberalization,

globalization and social change. Using the census data of 2000 and 2010, and location quotient results, the paper examines the patterns of ethnic residential segregation by assessing the extent of concentration and mixing of the populations of the city of Accra over the decade. It also examines the drivers of changing ethnicities in the Accra Metropolitan Area, and their implications for ethnic co-existence as well as the future development of the country's varied and diversified ethnic groupings.

Does context Matter? Governance networks and urban regeneration, a view from Andalusia (Spain)

Manuel Fernández-García, Clemente J. Navarro
Pablo de Olavide University, Spain; Pablo de Olavide
University, Spain
mfergar1(at)upo.es, cnavyan(at)upo.es

The study of the processes of interaction between governmental and non-governmental actors in order to influence local political decisions is a classic field of study of urban sociology. In addition, recent studies have showed how different policy domains generate different governance networks. In that sense, urban regeneration initiatives represent a particular policy area that produces specific governance networks that involve a plurality of actors, given that, urban regeneration projects operate specifically on the consequences derived from the effects of urban segregation rather on the social inequalities between individuals. These processes of collaboration are developed in particular contexts that, from an analytical perspective, configure specific interaction systems delimited by at least two components. On the one hand, by the presence of different actors who have specific resources, interests or beliefs. On the other hand, contextual elements that configure specific opportunities structures in which it is possible to develop a certain courses of action or not. The objective of this paper is to analyze the different networks of collaborative governance that are developed in the implementation of urban regeneration programs in the region of Andalusia (southern Spain) considering the particular context in which these are developed. To do this, governance networks will be analyzed in six case studies in neighborhoods of different cities in which urban regeneration and housing rehabilitation programs have been implemented. Three neighborhoods belong to historic centers and three to peripheral neighborhoods. In this way we will be able to see if the different urban contexts or the existence of previous institutional collaboration networks, form different coalitions of implementation and different patterns of relation between the actors involved in the processes of urban regeneration.

Faces and urban geographies of solitude in current Spain

Antonio D. Cámara, Felipe Morente, Inmaculada Barroso, Carmen Rodríguez-Guzmán
University of Jaen, Spain; University of Jaen, Spain;
University of Jaen, Spain; University of Jaen, Spain

adcamara(at)ujaen.es, fmorente(at)ujaen.es,
ibarroso(at)ujaen.es, cguzman(at)ujaen.es

The rise of solo living in Western societies is a vivid reflection of several processes which eventually partake of the momentum of sociological change. Increasing numbers of people live alone as a consequence of longer (and more autonomous healthier lives) once separation, divorce or widowhood occurs. Also, individualization is taking over many dimensions of society which necessarily influences residential choices. And, finally, some structural determining factors do not invite to family life as it used to be in past times. These processes are expected to derive in different sociological profiles among one-person households which, we hypothesize, are attracted and clustered as a function of different needs and/or expectations. In turn spatial patterns of solo dwellers may fuel social dynamics with important implications for diverse realms of social welfare. This might be the case of urban areas in particular.

In this work, we aim at defining and examining sociodemographic profiles of one-person households in large urban areas of Spain as well as its spatial distribution. For this purpose, we use two types of data from the Spanish census held in 2011: aggregate data at census-district level and microdata at province level. Among the key individual variables of our analysis we have age, sex, educational attainment and labor status. As for the main contextual variables, we have information about the sociodemographic composition of census-districts and provinces all of which is supplemented with economic indicators from the local authorities in the case of big towns. All this information is mapped by using official digital cartography from the National Statistics Office.

Urban Governance in Serbia – the Case of the Megaproject “Belgrade Waterfront”

Jelisaveta Petrovic, Mina Petrovic
Faculty of Philosophy, Belgrade University, Serbia;
Faculty of Philosophy, Belgrade University, Serbia
vukelic.jelisaveta(at)gmail.com, mipetrov(at)f.bg.ac.rs

“Belgrade Waterfront” is the largest urban revitalization project initiated in the post-socialist Serbia. Funded through the public-private partnership arranged between the Serbian government and the investors from the United Arab Emirates (Eagle Hills, Abu Dhabi), this kind of project typically challenges democratic procedures and demands for a high level of public expenditure. The aim of this paper is to explore the process of decision making from the perspective of the urban regime theory (Stone, Stoker). Special attention is given to the interplay between the government and the civil sector, whose resistance is articulated through the “We won’t let Belgrade d(r)own” initiative.

Our analysis is informed by the semi-structured

interviews (N=20) conducted with the relevant stakeholders: representatives of the civil sector, local and national government, and the experts in the field. The research findings show that the project develops as a typical neoliberal gentrification, lacking a clear policy agenda to decipher the urban regime type. The civil sector is generally against the project due to the prevailing command power in decision making (and not against the project per se). The expert community (e.g. urban planners, architects, environmentalists etc.) argues against the project as being unsuitable for the local context. However, these arguments are, in great part, disregarded by the local and national authorities, who assume the “priority lane” approach to the investors. While the government representatives perceive their mode of governance as an expanding urban regime, the civic actors consider it as a threat to the national and local interests.

Peculiarities of the Turkish Construction Drive

Melih Yeşilbağ
Ankara University, Turkey
melihyesilbag(at)gmail.com

This paper analyses the political economy of built environment production in Turkey under the rule of Justice and Development Party (2002-2017). It offers an analytical framework that addresses the extent, causes and consequences of the construction drive by situating the Turkish case into a comparative setting. To begin with, the vital signs of the construction sector demonstrate an aggressive growth performance similar to recent cases of construction booms such as Spain and Ireland. The underlying factors making the boom, however, reveal the impact of certain dynamics peculiar to Turkey. In this respect, the Turkish construction boom bears the distinct stamp of the strategic interventions of successive JDP governments into built environment, most notably through a persistent stream of mega projects. The investigation of the leading motivations behind this strategy highlights the political requirements of JDP’s efforts to implement a novel hegemonic project that combine neoliberalism and Islamism. On that score, accumulation patterns in construction, which are marked by the disappearance of well-established firms from the domestic market and the rapid rise of a new generation of firms with organic links to the party, demonstrate that the sector has been functional in consolidating the power of the Islamic capital fraction within the dominant class. These findings suggest that the JDP’s construction strategy is not merely a reflection of the rising importance of built environment production in contemporary capitalism, but has also been shaped by the political-ideological requirements of the struggles within the power bloc.

From the City to the Sahara – Shantytown Resettlement and the Right to the City in Casablanca

Raffael Beier

Ruhr-Universität Bochum, Germany; Erasmus

University Rotterdam, The Netherlands

raffael.beier(at)rub.de

In the wake of the 2003 suicide bombings in Casablanca city centre, the Moroccan state decided to eradicate all shantytowns within the country. Shantytowns were stigmatised as densely populated breeding grounds of crime and extremism. Within the national urban 'worlding' visions, shantytowns were framed as a housing form of the past that would threaten Morocco's development achievements and endanger future (urban) prosperity. As a policy solution, the government designed a countrywide resettlement project, called Villes sans Bidonvilles (VSB, Cities without Shantytowns). In Casablanca, Morocco's largest metropolis, the VSB programme transferred approximately 6.000 household from Morocco's 90-years-old and historically most significant shantytown, Carrières Centrales, to the new satellite neighbourhood Lahraouiyyine – more than ten kilometres away. On the one hand, households wishing to remain were forcedly evicted – without existing alternative housing options. On the other hand, the innovative resettlement scheme also enabled vulnerable households to become owners of a new apartment in a proper house. Indeed, many households appreciate the new housing comfort, however, a large majority also reports strong feelings of isolation and deracination. Especially women and young men suffer from a lack of jobs and activities, as well as from the loss of their previous social networks. Deprived from their individual 'right to the city', many feel exiled to a place they – symbolically – call the beginning of the 'Sahara'. Thus, the paper aims at critically analysing the social aspects of this internationally honoured resettlement programme and builds on four months of empirical field research in Casablanca.

The NLC or why culture led development haven't worked even if Frank Ghery was there...

Jacek Gądecki, Łukasz Afeltowicz

University of Science and Technology AGH, Poland;

Nicolaus Copernicus University, Poland

jpgadecki(at)agh.edu.pl, afeltowicz(at)gmail.com

We present the results of a half year long ethnography of newly built cultural institution EC1 - located in the former power plant. The ethnography of that particular institution and area, so called New Łódź Centre, allow us to demonstrate how: 1) the Bilbao effect was used to mobilize the mega-project and public subsidies 2) how the starchitects (Ghery and Krier) help to create the vision of the city' future, and - finally - 3) how the idea failed and was taken over by the managerial staff...

The analyzed case bring us to the Melanesian "Cargo Cult" model - where the material and spatial factors

were recognized but the local infrastructure is unable to fulfill assumed functions and local hopes. In the best case the NLC can repeat the Bilbao effect with all the consequences, i.e. the gentrification and commercialization of the area...

Overcoming the gap: how processes of self-organization establish new forms of urban integration

Eberhard Rothfuß, Thomas Doerfler

University of Bayreuth, Germany; University of

Bayreuth, Germany

eberhard.rothfuss(at)uni-bayreuth.de,

thomas.doerfler(at)uni-bayreuth.de

»avant-gardes [...] depart from [...] functional (monetary) equivalence« (Donati 2015: 100)

The urban crisis that is stated in various works due to 'neoliberal' processes of marketization, tourist gentrification or austerity politics (to name only a few) has recently been identified as by-product of »planetary urbanization« (Brenner & Schmid 2015). This means that the commodification of urbanity and the production of urban space (Harvey 1989, Lefebvre 1974) has reached a globalized level, letting no region and no part of society unaffected. It is thus not our aim to prove or reject this strong thesis of Brenner & Schmid, but to give examples how bottom-up urbanism may work as a counter strategy to that scenario. We should neither condemn the concept of the city as outdated, nor try to 'revive' it as an analytical category, but rather treat it as a category of practice (see Wachsmuth 2014).

Self-organized urban initiatives like the transition town movement, urban gardening or similar activities function as a new »integration machine« (Häußermann) by overcoming the limitations classic participatory approaches face: by establishing social and material structures anew these self-organized initiatives reach unexpected and intrinsic levels of collective autonomy, emancipation and re-appropriation of social and natural goods without 'sticking to the rules'. We illustrate our argument with presenting an empirical case study, which is part of our JPI-Climate Project "SELCITY - Collective urban governance, innovation and creativity in the face of climate change".

The impacts of participatory decision-making within urban contexts in crisis. The case of Lisbon

Roberto Falanga

Institute of Social Sciences, Portugal

roberto.falanga(at)ics.ulisboa.pt

The search for new mechanisms of public participation in policymaking has become a case in point worldwide. In the last two decades, the wide range of participatory initiatives implemented at local level scales has compelled a more structured understanding of their impacts.

This contribution aims to discuss the challenges experienced in the measurement of the impacts produced by the participatory Programme BipZip - acronym of “Bairros de Intervenção Prioritária / Zonas de Intervenção Prioritária” (Areas and Zones for Priority Intervention) - implemented by the Municipality of Lisbon since 2011. The Programme provides annual funding to local partnerships constituted by local NGOs, Parish governments, and civil society, which are demanded to implement urban regeneration-oriented projects in 67 identified ‘priority areas’ of the city. Priority areas have been classified through a consultative process enacted by the Municipality of Lisbon with civil society in 2010, and have been characterized on the basis of a threefold analysis concerning socioeconomic, infrastructural, and environmental conditions in the city. The Programme has attracted growing interest at both national and international levels, as it was awarded in 2013 as ‘best participatory practice’ by the International Observatory for Participatory Democracy. The contribution will point out the main challenges of measuring the impacts of the first five editions of the Programme, and focus on the intersections with the impacts of the financial crisis in the country. Finally, a critical understanding of the evaluation shortcomings will be addressed within the framework of urban governance in Lisbon.

Urban conquistadores (re)making the city: forms of solidarity and resistance among social groups “excluded” from urban renewal projects

Catalina Santana Bucio
 Université Le Havre Normandie, France
 catalina.santana(at)gmail.com

In a context of high level of acceptance to the projects of urban renewal in a city suffering of population decline, how are there some groups of inhabitants resisting to these projects? Under which conditions have they succeeded or failed?

In the last two decades, Le Havre, invests through ambitious urban projects the working-class neighborhoods. We intend to illustrate the opportunities and challenges through three cases. The first one raises the question of the gentrification promoted by local elites; the second case is the struggle of the residents of a hostel for migrant workers, fighting against the demolition of their home. Finally, there is a residents’ association, against the renewal of a part of the housing stock. Our work therefore tries to show limits of this consensus to the current urban renewal. How these local urban struggles show us alternative options of urban development.

We use urban conquistadores to highlight the symbolic component of urban reconquest. It may be related to “urban entrepreneurialism” (Harvey 1989), both emphasize that the action is undertaken in a context of uncertainty. We are interested on the ability of certain groups to oppose and propose alternatives to the projects promoted by these conquistadores.

The fieldwork was based mainly on a qualitative

approach, with a quantitative component. We conducted a survey of new residents from the “Saint-Nicolas” quarter, trying to understand their practices and representations. Meanwhile, through the activist network we got in touch with the Brindeau Hostel. We conducted direct observations during meetings, attended several events, and conducted interviews with residents. For the Aplemont neighborhood, we made direct observation of this first public consultation, and observed the protest that followed.

Right to Shelter Struggles as Justice Claims against Neoliberalism

Oznur Yardimci
 Lancaster University, UK
 oznurerdemli(at)gmail.com

The deepening of neoliberalism has led to proliferation of not only wealth inequality but also forms of marginalisation. In this process, cities have been the locus in terms of reconfiguration of power. While in the Global South, state-led gentrification has undertaken regulation and securitisation of space at the expense of dispossession and loss of housing rights of affected residents (Lees et. al., 2016: 16-17), in Turkey through promotion of obedient citizenship to the squatters, their participation is targeted. State antagonism has conversely led to formation of housing struggles, through which claims from grassroots to right to the city as well as right to have rights, i.e. recognition, were expressed.

In this presentation, I will evaluate the right to shelter struggle in Dikmen Valley, Turkey. It started in 2006 when eviction was enforced by the initiation of urban renewal in the valley. The squatters most of who were without title-deeds of the land/house refused to leave collectively demanding to participate the decision-making processes about where they “illegally occupy”. By doing so, they enabled themselves as right claimants. Based on their narratives about “learning to become a citizen”, I analyse the struggle as an act of citizenship (Isin, 2009), contrary to the dominant tendency to evaluate it as anti-capitalist working class struggle. I argue that focusing on the potential of enabling justice claims offers better tools to put forward its anti-neoliberal character within the context of growing criminalisation of struggles of right by the progressively more authoritarian understanding of governance.

RN37 | Session 11a Using Public Spaces & Building the City II

Negotiating public space for animals: An examination of politics of dog-(un)friendly policy in Hong Kong.

Pak Hin Chau
 Hong Kong Shue Yan University, Hong Kong S.A.R. (China)
 135092(at)hksyu.edu.hk

Animal rights is an emerging topic in different academic fields. One critical discussion is the politics

of negotiating a division between animals and human beings in public space. Specifically, the legitimacy of using and accessing public space by animals is constituted by and constituting of the process of defining and redefining the extent to which animal rights are recognized. Scholars have applied “actor-network theory” to call upon the animal agency to rethink their positions in public space. However, public space for animals, like dog parks, in international cities are usually sited in marginal areas that help constitute a power relations between human beings and animals (the former dominate; the latter are ruled out or given sanctioned access). Besides, the policy designs of public space for animals are made in a human-centred approach, or anthropocentrically that disregards the needs of animals. Based upon an analytical framework integrating Foucault’s theory of power/knowledge, and conceptual notions of political/animal geography, by illustrating the case of dog-(un)friendly policies in Hong Kong, this paper aims at examining the power relations behind the politics of (re)defining the line between animals and human beings in the public space. Through field studies of public space available for dogs, interviews with dog owners and activists, this paper answers a research question: how do government policies reinforce the constraints of animal to the access to public space? The major argument is the urban planning policies for animals to access public space have undermined their agency. Furthermore, the negotiation power of dog owners to strike for dogs’ rights to access public space is so minimal that they resort to “everyday resistance” to adapt to the dog-unfriendly policies.

"A Public Space for All Seasons: The "Religious" Beach of Tel-Aviv

Yona Ginsberg-Gershoni
Bar Ilan Ramat-Gan Israel, Israel
ginsby(at)biu.ac.il

The “religious” beach of Tel-Aviv is a “gated beach” surrounded by walls dividing it from the adjacent shores, while rubber curtains hang on its entrance. Contrary to other public beaches, this one is regulated according to gender; three days it is open for women, and three days for men.

This study is based on participant observation of women on this beach during summer and fall. The majority of beach goers in the summer are Ultra-Orthodox women. They are accompanied by many children; girls of all ages and young boys. Most live in a nearby city and use organized public transportation. The only men present are lifeguards.

Ultra-Orthodox women are different than the general population in their attire and behavior. They arrive on the beach in long dark dresses; do not wear bathing suits, and are dressed in cotton robes that cover their knees. Their heads are also covered. Only little girls wear bathing suits. Most bathers cannot swim and concentrate close to the shore. In contrast to the long open seashore, to an outsider this beach looks very crowded and noisy.

The beach looks different in the fall. There are no children and the place is calm and uncrowded. Religious and non-religious women patronize the beach. Many are fully dressed, while others are wearing bathing suits or even bikinis. All women feel comfortable and enjoy the relaxed atmosphere. They take it for granted that the “right to the beach” is for all women, regardless how they dress and behave.

Demands for public space to become visited

Evija Zača
University of Latvia, Latvia
evija.zaca(at)lu.lv

Everyday citizens are experiencing the city. But most of them experience the city only in the way of cars, public transportation, work place, way home, home. Those are very specific places where communication lacks some kind of improvisation and where networking is quite limited. In addition, a feeling of need to survive in complicated economic and social system of the city makes citizens more ignorant to the places and urban elements that are not involved in their practice of earning and consuming. So there arises a question: if relaxation takes some place in persons everyday life, what place will be used for this purpose?

Based on the ideas of everyday urbanism, aim of this article is to understand, what makes people to enjoy outdoor public space* purposefully – not during a move from point A to point B, but visiting the outdoor public space with purpose.

The research will be based on results of multiple methods that were made to complete case study in Riga (capital city of Latvia):

- 1) Survey;
- 2) Mental maps;
- 3) Participator diaries.

As a result will be two things developed:

- 1) theoretical and visual material to understand everyday experience of Riga citizens with the outdoor public space;
- 2) understanding of demands that Riga citizens have to the outdoor public space so they would visit these spaces purposefully.

* In this paper, the object of interests will be outdoor public space as most democratic and to more people available type of space.

Metropolies as laboratories for a post-modern conception of public space

Florence RUDOLF, Didier Taverne
Insa Strasbourg, France; STS, FRANCE
florence.rudolf(at)insa-strasbourg.fr,
sts3(at)wanadoo.fr

The expression of Public space counts as an important sociological concept for understanding societies. It is an crucial stake for modern constitution and democracy. The concept of Public space occupies an central place in the theories of the rising of an emancipated consciousness and therefore for an emancipated society, collective and city. Metropolies

are contemporary phenomena of late modernity which offer less and less space for performances which produce a meta entity, a big leading collective in which everybody recognize itself. They offer at contrario spaces for small collectives without densities. Liquid collectives grounded one the sense of present, where past and future less count then the collectives performed during the XIX and the XX century. We follow this hypothesis from different researches on artistical performances to show how cities performs themselves less as places for dialogical concerns and intersubjectivity as places of an eco-socio-system where dialog, reason and speeches aren't in the center of the contemporary sociability. Choregraphy would may be a better metafor for this new kind of performance as a agora, a salon or a cafe as Habermas as theorised for modernity. This observation is articulated with the diagnostics of modernity and post-modernity as a possible interpretative background for this change. Which meaning will public space takes in a post-modern constitution ?

“Parkinghood”: Practices of parking in post-socialist urban housing estates

Marta Smagacz-Poziemska, Karol Kurnicki, Andrzej Bukowski

Jagiellonian University, Poland; Jagiellonian University, Poland; Jagiellonian University, Poland
 marta.smagacz-poziemska(at)uj.edu.pl,
 karol.kurnicki(at)uj.edu.pl, contraab(at)wp.pl

The presentation concentrates on practices of car parking in large Polish urban housing estates. Social practice of parking is understood as routinized, patterned and recurring action related to social structuration of territorial communities. Our analysis is based on two case studies conducted in Kraków: modernist 1970s estate in close proximity to the centre and a neighbourhood built in stages from late 1990s on the south-eastern outskirts of the city. This allows us to investigate differences and similarities between various cases.

Practices of parking are influenced by the condition of post-socialist city, which in the last years increasingly grew car-dependent. Number of cars in Polish cities is much bigger than in Western Europe. This means that for inhabitants parking is one of the major everyday needs. In consequence in many housing estates public spaces are transformed into parking spaces. The scarcity of parking spaces results in new, often informal, practices of taking over, appropriation or privatization of public spaces. Another effect is proliferation of various sorts of gates, barriers and parking prohibitions directed at cars from the outside of an estate. Along these practices, new spatial tactics, such as parking or anti-parking coalitions of inhabitants and other stakeholders, emerge. Our research shows that these new practices of parking are related to, and characteristic of, the general processes of structuration of post-socialist urban societies.

In our presentation we argue that neighbourhoods can

currently to a large extent considered “parkinghoods” because parking practices are one of the major spheres in which collectives are formed within housing estates and nature of community is organized around new interests and struggle for rare good, namely parking space.

RN37 | Session 11b Reinventing the City: Urban Resilience and Participation Processes III

Heterotopias of democracy. Urban-sites that invert the concept of citizenship

Ewa Zielińska

University of Warsaw, Poland
 ewazielska.net(at)gmail.com

“There are also, probably in every culture, in every civilization, real places—places that do exist and that are formed in the very founding of society— which are something like counter-sites, a kind of effectively enacted utopia in which the real sites, all the other real sites that can be found within the culture, are simultaneously represented, contested, and inverted. Places of this kind are outside of all places, even though it may be possible to indicate their location in reality” - the best description of ‘heterotopias’ was made by Michel Foucault, the author of the concept itself. Foucault indicated several examples of existing heterotopias: cemeteries, psychiatric hospitals, gardens (especially those from the antiquity, seen as sacred spaces) and vacation villages among others. What they have in common is their specific complexity – “accumulation of time” and cultural layers, features that turn them into distorting mirrors of the existing society or world.

In my PhD thesis I reconsider the concept of heterotopias with reference to urban autonomies – places in some way excluded from urban areas and organized collectively. I am focused on specific cases that fulfill the idea of better democracy, of an open and engaged neighborhood that is about to come in the undefined future. Thus, I decided to distinguish them from two other kinds of urban autonomies: those based on anarchistic foundation, represented by Christiania in Denmark, and those established as creative centers in optimistic confidence that art and design can solve all urban problems. I limit my field research to Polish cases, nevertheless I place them in broader international context of urban activists networks (such as re:Kreators and Transition Towns).

Social-polarisation mechanisms in the Hungarian new towns’ regions

Adrienne Csizmady, Zoltán Ferencz

Centre for Social Sciences at Hungarian Academy of Sciences, Hungary; Centre for Social Sciences at Hungarian Academy of Sciences, Hungary
 csizmady.adrienne(at)tk.mta.hu,
 ferencz.zoltan(at)tk.mta.hu

Our presentation attempts to provide a picture of the spatial characteristics of Hungarian new towns and their urban areas, and of social polarisation

mechanisms, while comparing it to similar aspects of more traditionally developed Hungarian urban regions. It is well known that new towns organised on (or built for) heavy industry have followed a somewhat different path of development compared to traditional cities. The question is whether they are still on a different path in East-Central Europe even after the economic changes related to the political transition, or if we can now see tendencies that are similar to those in other traditional cities.

The presentation is based on the results of a previous study, showing how the social and spatial structure of traditional urban areas had transformed in 10 year, and how the relationship had changed between centre and periphery. From these studies it became apparent that the scrutinised traditional cities and their urban areas do fit into European trends; among others by the fact that spatial social differences have increased here as well. The study's empirical background is provided by the results of a survey conducted in 2015 on 11 Hungarian new towns and their regions, and the results of another survey conducted in 2005 and 2014 on nine traditional urban areas. To highlight a broader (Central-European) context we compare our results with two case studies from Poland and Slovakia, concerning a similar new towns.

The (un)making of city in L'Aquila after the 2009 earthquake.

Rita Ciccaglione

Università di Roma La Sapienza, Italy
rita.ciccaglione(at)uniroma1.it

This work analyses the social life of the historical centre of L'Aquila after the transformations that the 2009 earthquake and the emergency management entailed in the city's living practices. The management of the emergency produces a combined effect, establishing the creation of new urban areas and the institution of a "red zone" in the historic centre. It follows a proliferation of new, single-purpose centralities, both residential and commercial, which generate a new morphology of the city, giving rise to new mobility and consumption practices. Furthermore, today's historic centre is a gentrified space characterized by the specific regime of consumption of the nightlife, strictly connected to the current condition of degrade, neglect and lack of control.

Starting from a material culture analysis, we consider the urban space as a non-human subject and we examine it through the qualitative method of the street ethnography. The aim is to grasp the practical and representative relations that this space has with its residents.

While disaster management uses the crisis of the inhabited spaces as a destructive moment on which to build neoliberalization processes, an alternative form of creativity is born in the "red zone". Teenagers enact specific forms of appropriation of that space, as it becomes a place of desire due to its illegality. Violating the ban to use the public space, occupying temporarily the houses to be rebuilt, writing on the walls of buildings helps to "feel at home in the narrow

streets", while rap helps to narrate this relationship with the city.

RN37 | Session 11c Urban Centers & Peripheries

The Old Town in Warsaw - consequences of combining modernism, socialism and capitalism.

Ewa Majdecka

Institute of Applied Social Sciences, University of Warsaw, Poland

ewa.majdecka(at)gmail.com

The Old Town in Warsaw, the UNESCO World Heritage Site, is a special place of many opposing interests. At the same time it is an essence of Polish and Warsaw history and identity, a symbol of socialist power in rebuilding the whole Polish country and nation destroyed during II World War and a partly modernist real estate for comfort living for working class. Unfortunately this was actual in the fifties last century when the Old Town was just rebuilt.

The communist party were announcing their success in rebuilding and creating a place for living with social, cultural and educational institutions. In the process of time main use of the Old Town was changing without any support and plan.

A symbolic ownership of that area changed a lot until present times. The real estate became more like an open-air museum, but borders between „owners” is not only between inhabitants and tourists. An exclusion is there much more complex and complicated. The lack of urban policy caused that capitalism was becoming strong power that rule the Old Town. The historical area that was built with money of the whole nation and was owned by the local government was bought up in more than 50%.

What went out of the combination of modernist architects, socialist politics and capitalism? In order to show consequences of breaking the first "agreement" with inhabitants I would like to present results of my qualitative research where I used techniques of mental maps, maps of symbolic ownership, biographical interviews and everyday urbanism techniques.

Two perspectives on urban life through workplace categories

Viorela Ducu, Áron Telegdi Csetri

Babes Bolyai University, Romania; Babes Bolyai University, Romania

fviorela(at)yahoo.com, telegdi_a(at)yahoo.com

The paper will analyse family practices unfolded by migrant members of transnational families with a Romanian member, from the perspective of their access to the „high-skilled” or „low-skilled” worker category. Not aiming specifically to apply these categories, we did encounter them as such while on field research in 2016, when our team members took interviews with low-skilled migrants in London, UK, and high-skilled migrants in Bruxelles and (both rural and urban) Mons, Belgium.

The level of urban life is different depending on the

workplace category these family members belong to: from living in houses shared with other families as against houses with a high level of luxury and domestic workers; from having children without the parents being married, in order to access the social welfare category of a single mother, as against freely choosing among elite institutions for their children.. Another important differentiating aspect is the maintenance relationships with family members at home: the difficulty in hosting a family member coming to visit due to restrained space available to the LS as against the ample family reunions in the large houses of HS migrants; rare or necessity-only visits home to save money or free, frequent visits. This paper will show how the life of transnational families is differentiated depending on the work status of migrant members and will help us understand why, for some, working abroad is a necessity, and living in a foreign town becomes a way of survival, whereas for others, the same work abroad brings a life of luxury, and life abroad is, in a way, viewed as a long vacation, be in a rural or an urban area.

Analysis of The Metropolitan Municipality Law: Rural-Urban Transformation in Turkey

Gulce Olgun Susta, Bulent Gulcubuk
Ankara University, Turkey; Ankara University, Turkey
golgun(at)ankara.edu.tr,
Bulent.Gulcubuk(at)agri.ankara.edu.tr

Many significant reforms have been made in metropolitan government including administrative, fiscal changes and municipal service delivery with the law no. 6360, which came out in 2012 and ended up with changes on a number of laws in Turkey. The term "village" having existed before was removed and villages turned into neighborhoods and became part of urban areas. The Law no. 6360 made such reforms, that they concern not only urban areas, but also rural areas. After the law, descriptions of rural area and rural population were changed quantitatively and qualitatively which leads to a chaotic situation. As a result, rural population rate which was 22,7 % in 2012 decreased to 8,2 % in 2014, while urban population rate increased to 91,8 % from 77,3 %. The effects of these changes on demographic structure in Turkey have a meaning beyond numbers. They have also many sociologic, economic and political impacts. While the rural population keep their lives and agricultural occupation where they have been all along, urbanization within only administrative context (!) causes a vagueness and many problems. Extension of Metropolitan Municipal boundaries by adding some new rural areas they were not familiar with, raises concerns about how to provide rural services timely and adequately because of large metropolitan districts. This paper aims to handle harmony of the law with urban and rural textures bilaterally. Firstly, economic, social and environmental impacts of the reforms on rural areas then, compatibility of the transformed rural areas with characteristics of the existing urban areas will be investigated. This issue has been named as "Political

Urbanization" in this study as any suitable term or definition in urbanization theories could not be found for the situation occurring after the law.

Business in the power structure of the Russian urban community

Valeri Ledyayev
National Research University Higher School of Economics, Russian Federation
valeri_ledyaev(at)mail.ru

Business in the power structure of the Russian urban community

The paper is based on the outcomes of the research project "Power in the small Russian town" executed in 2011-2015. The basic material was obtained in the course of 76 in-depth face to face interviews with local politicians, public officials, businessmen, local and regional experts in five small towns in three different Russian regions.

In all the communities the power potential of the large (by the standards of a small town) business is comparable with the resources of local administrations. However, in most cases the latter played the leading role in urban politics; only in the mono-industrial company town with a city-forming enterprise the leaders of the main enterprise had the reputation of the major power influentials in the community.

Political mobilization of business is relatively weak. Therefore its direct impact on the urban politics is weaker than its resources allow. Businessmen prefer to solve their problems not in the public space but on the basis of personal relationships with local and regional officials. Small business is also poorly integrated and organized; but unlike big business, it is more vulnerable because more dependent on local administrations which have a broad set of formal and informal tools to put pressure on potential and real opponents.

Therefore, coalition-building with the public sector actors on the part of businessmen is not always voluntary. This limits the possibility of urban regime formation (in terms of C. Stone) in the Russian urban communities.

RS01 - (Un)Making Europe

RS01 | Session 01a (Un)Making European Citizenship

German and Greek Citizens Talking Politics: The Eurocrisis and Political Participation

Anastasia Garyfallou
Vrije Universiteit, Netherlands, The
a.garyfallou(at)vu.nl

The financial crisis affected European countries to a diverging extent. Southern European countries were hit hard and had to resort to economic assistance from the EU and the IMF on the condition that they apply harsh austerity to their constituents. Northern European countries appear to have survived the crisis, yet citizens were obliged to provide credit to crisis-hit countries and receive increased immigration flows. Citizens' political responses to the crisis differ as well. Social movement formation and voting for the left was the response of southern Europeans, while northern Europeans voted increasingly for the (populist) right. Why is this the case? The present paper attempts to answer the question by focusing on the protagonists of the crisis, i.e. Greek and German citizens, examining their experience of the crisis and their consequent political strategies. Eighteen focus group discussions were conducted in Germany and Greece with lower and higher educated citizens of various age groups as part of the ERC-funded research programme POLPART (<http://www.polpart.org/project/>). Grounded theory analysis of the discussions indicates that the financial crisis politicized different issues in the public agenda in these two countries. The economy and generalized political disenchantment at the national and European level were the fundamental issues in the Greek discussions, whereas immigration and European integration monopolized the discussion in Germany. With Greece facing a simultaneous crisis of democratic representation, citizens turned their backs to the political system, by participating in the Indignant movement and by punishing the centrist parties that mishandled the crisis. They voted instead for the left, which mobilized around anti-austerity demands. In Germany citizens primarily rewarded the (responsible) governing coalition that kept them out of the crisis, expressing though their discontent by voting for the populist right, which voices demands for control over immigration. The European question was politicized as well. Even though the European ideal remains strong, citizens in both countries were critical of the

EU perceiving it as a distant technocratic institution. Yet Greek citizens were more disapproving addressing what they perceive as a structural inequality between powerful and weak countries in the EU, with the former calling the shots and the latter mere accepting what was decided for them. Thus the financial crisis contributed to a politicization of the European question and led to a radicalization of political strategies, but was articulated differently in the two countries based on their democratic experience, the severity of the crisis, citizens demands and the supply of political organizations.

Direct democracy in Europe - empowerment of citizens or instrument of populist elites?

Max Haller
University of Graz, Austria
max.haller(at)uni-graz.at

The European crisis is also a crisis of democracy: Turnout at elections is decreasing, the established parties are losing ground, populist and right-wing parties and leaders are winning elections, new social media blur the distinction between information, defamation and propaganda, business corporations influence politics through tax evasion and lobbying (Barber 1994; Crouch 2008; Preiss/Brunner 2013; Merkel 2015). In this situation, direct democracy seems to offer a new way to strengthen citizens' political participation. Yet, many recent referenda about the process of European integration have shown that referenda can also be used by the elites as an instrument to advance their ambitions for power and influence and to legitimate specific (often problematic) political aims and measures. An outstanding example was the Brexit which led to a deep split between the peoples and regions of the United Kingdom and which was and is used by rising populist and right-wing parties all over the European Union to gain more support for their positions. Already in 2005, the rejection of the Constitution for Europe by the French and Dutch shocked many in the EU (Haller 2008). How can we interpret the outcomes of these far-reaching votings? Were they a true expression of citizens fears and wishes, or have they been used as instrumental, even demagogic tools by the elites?

In my presentation, which touches issues of SP06, SP07 and SP08, I first investigate citizens' attitudes toward direct democracy, distinguishing three theoretical models: new politics, political disaffection and egalitarian theory of democracy (Wirnsberger/Haller 2015). I will show that only the third is able to explain the high approval of direct democracy among the population. Second, I will investigate elites' stances toward direct democracy. Three strategies will be distinguished: avoidance, instrumental strategies, and abuse by populist and authoritarian regimes; examples for all of them are given from European history of the 20th century and recent European integration and politics. Third, I will discuss institutional prerequisites which can ensure that all citizens will become interested in and able to participate in an informed way in referenda. I will also

discuss arguments which say that many political issues are improper for referenda, either because they are too complex, or because they overrule minorities or concern fundamental human rights (see, e.g., Dalton 2001; Donovan/ Karp 2006; Bowler et al. 2007; Bengtsson/ Mattila 2009). Here, experiences from Switzerland which are most instructive will be used to show how direct democracy can be applied in a way to ensure a balanced political process of European integration, that is, a process which empowers people and keeps in check economic elites (banks, capital interests etc.) and populist political leaders and elites. M. Haller (2008), *European Integration as an Elite Process?* Routledge; S. Wirnsberger/ M. Haller (2015), *Attitudes toward direct democracy in Austria* (in German in *Österreichische Zeitschrift für Politikwissenschaft* 44).

(Un)Making Turkey's Way to Europe: Democracy, Solidarity and Refugees

Ekmel GECER

Sakarya University, Turkey

ekmelgecer(at)sakarya.edu.tr

Turkey's relation with European Union is longer than a half century. Since the country had the potential candidate status in 1999, the links between EU and Turkey has been hanged on by a hair. Although it won't be fair to ignore the developments rooted in this weakening relation; the political culture in the country, the nationalist approaches, the vulnerable democratic structure and the issues regarding the refugees caused by the inhumane war along the borders seem to make the long process to have an "unhappy end". Despite all problems in the country and the ups and downs in diplomatic relations, those who are aware of the positive influence of the EU accession process in Turkish democratic process want the accession process to be kept alive as the sensitive political culture seems to take this as a driving power through a better democracy and rule of law. However, the controversial issues which look like the bleeding wound and has stayed unsolved for decades, such as the Kurdish Issue, press freedoms, human rights, freedom of expression and taught and the recent refugee crisis make those positive perspectives to turn into a hopeless case.

Therefore, based on theoretical literature and political perspective, this paper aims to look at (a) history of EU and Turkey relations, (b) why this relation has that many ups and downs, (c) the current democratic situation in the country, (d) how so-called "refugee crisis" and the conflict around the Turkish borders influenced the EU and Turkey relations, (e) and how and why these relations need to be developed for a more peaceful and democratic common future.

RS01 | Session 02a (Un)Making The European States

Growth, Capitalism and the Progressive State: new contradictions, renewed theories.

Eric Pineault

UQAM, Canada

pineault.eric(at)uqam.ca

The sociological critique of advanced capitalism must be renewed and redeployed. This is forcibly a collective and plural endeavour with many points of entry: from the political sociology of neoliberalism, to the cultural theory financialization, to the reconstruction of theories of class and the economic sociology of really existing markets and firms. It also shakes and questions our great theoretical traditions, by it the paradigm of Modernization, Marxisms, Governmentality and Constructivisms. My proposal would be to examine how a sociology informed by Degrowth can contribute to this renewal

The foundation of "Growthism" and the Progressive State rests on a constantly reenacted separation between formally productive and non-productive social labour, questioning growth implies a critique of this process. Furthermore, the relationship between growth and stagnation in advanced capitalism can be examined by revisiting mid-twentieth century theories of "over-accumulation". From this perspective advanced capitalism has a constant surplus absorption problem, rather than a surplus production problem. Whether it is on a high growth or low growth trajectory, advanced capitalism's stability rests on the articulation of overproduction to overconsumption through waste of matter, time and labour, and the socialization of subjects culturally adapted to this deep treadmill effect.

Restructuring EU's Statehood in times of Crisis

Teresa Pullano

University of Basel, Switzerland

teresa.pullano(at)unibas.ch

The hypothesis this paper makes is that European integration is better analyzed as a qualitative transformation of statehood and territory as the product of changing social, legal and political relations. Strategic and relational theories of state have begun to conceive the state differently as a set of social relations which do not need to be neither depending upon a unitary power center nor limited to a defined and uniform territory (Brenner 2004; Jessop 2007). In the relational approach to statehood, restructuring statehood is defined as a set of strategic and power relations embedded into a given social and material context (Brenner 2004; Jessop 1990; Jessop 2007). Up to date, there is no in-depth and complete analysis of EUrope as an integral moment of statehood and space restructuring in the relational sense, that is considering social, legal and political relations as the main factors of statehood.

Given the political crisis that the process of European integration is facing and acceleration in the

interdependencies among states within the EU, new and more fitting explanatory frameworks are much needed. The Eurozone crisis that started in 2008 and recent developments of the Greek crisis within it during the summer of 2015 revealed at least three elements that classical theories of EU integration fail to explain: (1) European integration is a highly political and strategic field, within which lines of fracture among governing institutions, be it European, transnational (such as the International Monetary Fund) or national, have emerged in a powerful manner, and this was especially clear during the Greek crisis of 2015 (Biebricher 2013; De Wilde & Zürn 2012; Fawcett & Marsh 2014); (2) The use of Memoranda of Understanding during the Eurozone crisis and in particular during the Greek crisis puts seriously into question both intergovernmental and post-national theories of European integration, since it shows that the limits of statehood are not anymore confined into the national borders. On the other hand, reshaping of statehood (Pullano 2014a) at different scales that takes place during the management of the crisis shows that there is a need to investigate restructuring of state power at the level of the continent, at least (Durand & Keucheyan 2015). Critical theories of the state that underpin the relational approach (Jessop 2007), such as Poulantzas' concept of "authoritarian statism" (Poulantzas 2000), indicating an intensified state control over socio-economic life in a context of intense political crisis, are useful to explain the present state of Europe (Bieling & Gallas 2011; Bruff 2012; Sandbeck & E. Schneider 2014). (3) The political and economic crisis of the Eurozone showed also a different map of Europe, one in which there is a differential positioning of some states and regions with respect to others. Various terms can be used to describe this dynamic: uneven development, regional and state rescaling, territorial restructuring (Agnew 2001; Hadjimichalis 2011; Hudson 2003).

Without reconceptualizing Europe as a process of statehood and territorial restructuring, which is the aim of the proposed presentation, we will not be able to fully understand these phenomena.

(Un)Making Europe: Anomie in Intelligence and Operational Police and Border Guard Work in the Baltic Sea Area

Goran Basic

Linnaeus University / Faculty of Social Sciences,
Sweden

goran.basic(at)lnu.se

Émile Durkheim's sociological term 'anomie,' which indicates normlessness or a state of norm resolution, is the theme of this ethnographic study. The purpose is to analyze how intelligence and operational personnel in the various border authorities in Sweden, Finland, Estonia, Latvia, and Lithuania describe the category "Russian criminals" and which discursive patterns cooperate with the construction of the category "norm-dissolving Russian." Multiple forms of empirical material were analyzed in this study:

observations and photographs taken during the field work (718 field hours), interviews (73), documents produced by intelligence and operative personnel, and media coverage concerning intelligence and operative actions. This ethnography explains how police and border guards in the Baltic Sea area reinforce in-group bonds, develop a professional identity, and come to understand the moral aims of their work: by contrasting themselves against the constructed threat of Russian criminals, spies, and military invaders. Intelligence and operational police and border guard work is a practice in which the work from the first moment is characterized by an abstract threat, justified by considering that the stability of society can be transformed into instability if crime is not fought. Police officers and border guards in this study are constructed as key figures in the struggle to prevent the resolution and preserve the current state of society, which is portrayed as stable and better – at least if we speak with intelligence and operative police officers and border guards. From time to time, a "criminal" from Russia has a key role in the performance of law enforcement's fluctuating morality, with the threat of norm resolution coming from Russia and attenuation of the threat based on the representation of effective law enforcement. The media reporting on intelligence and operations, as well as the documentation that was created by the authorities involved in the fight against crime in the Baltic Sea area, call out the "criminals" from Russia by their absence. The media report on syndicates from Estonia, Latvia, and Lithuania who commit crimes in Sweden and Finland. In documents created by the intelligence and operational personnel, it is reported that more than 700 individuals had been suspected or convicted of a crime in any of the European countries. Most are citizens of Estonia, Latvia, and Lithuania. The picture presented in the interviews is different. Actors in this study produce Russians as the leading criminals in the Baltic region. Russian criminals are represented as organizers and leading figures in various types of crime. An informant's story is constructing a symbolic reality where law-abiding and conventional actors strive to maintain stability in the normative order, in this case referring to the crime that comes from Russia. This reality is partly an expression of fear and solidarity against norm resolution in the form of crime from Russia, and expressions of social development that raise the need for a contra-group to strengthen feelings of solidarity in the norm-stable societies. The identity-based symbolism that informants are constructing in their stories is based on the current and stable normative state of society.

Europe as Continent of Balanced Tensions

Karl-Siegbert Rehberg

Dresden University of Technology, Germany
karl-siegbert.rehberg(at)tu-dresden.de

The lecture will relate today's debates over the European status and position on a global scale plus the growing resistance against transnational

structures in the European Union to different historical imaginations of “Europe”, that have been developed, transferred and institutionalized throughout the continent's history, starting with the ancient myth of the abduction of a woman whose name already has been used in the sense of a territorial term in the writings of Ovid. In order to describe some of the most characteristic conflicts influencing the European development, it will focus on the main division lines between concurrent institutions and their specific interlacing-forms. Even though despite all the criticism towards the European Project seem to be inevitable, there is still lack of commonly shared European identities. For a better understanding of the various tensions within European Integration it might be useful to look on the history of Europe and its decisive institutional interdependencies.

After the decay of the increasingly just upon fiction based Roman Empire into an Eastern and a Western unit in 395 and the alongside coming segmentation into two separately operating churches (however it not has formally been executed until 1054), there broke out a fight for a new kind of unity in the occident. The Roman Church claims to universality brought it into competition with secular powers that led to significant armed conflicts and compromises between ecclesiastical and secular rulers and their representatives, creating and institutionalizing a peculiar tension between imperium and sacerdotium that has never been conclusively pacified.

This was more kind of a framework definition than an ultimate tension-resolve that grew and catalyzed new supremacy-claims followed by inevitable deconstruction-attempts on both sides: The highest priests were treated with secular honors while worldly rulers have conversely been sacralized at the same time. A new conflict climax that required even more efficient balancing struck on Middle-Europe with its upcoming Reformation and its transition into confessionalism.

Nevertheless it was not the claims of the church, the operations of warrior elites or the upcoming establishment of national states that efficiently contributed to the later on developed unification-ideas and –perspectives. They have foremost been catalyzed and empowered by a common opposition against the rest of the world, manifesting itself over the martial and militarily executed colonialism. It led to the formation of a continental self-awareness that formed itself around the belief that considers the occident as birthplace and cradle of the modern world: the starting point for the worldwide spreading Work- and Rationality-Processes as they were described by Max Weber.

Those development lines determined the European history of conflict and unification for a long period and shall bring into awareness that a union of differences can indeed result in orders and arrangements, regardless of whether it may be a future as European federal state or – as Charles de Gaulles once said – a “Europe of fatherlands”.

RS01 | Session 03a (Un)Making The European Identity

The Making and Unmaking of Europe, and the Promise of New Sociological Imagination

Dariusz Gafijczuk

Newcastle University, United Kingdom

dariusz.gafijczuk(at)ncl.ac.uk

This paper reflects on the dynamics of making and unmaking of Europe from theoretical, cultural, and historical perspectives. I argue that it is precisely in the process of such making and unmaking that the promise of the idea of Europe is to be found. In other words, unmaking is not simply a challenge but a potential opening, not only for Europe as a cultural and political project, but also for Sociology, as the science of the contemporary moment. Just as Europe needs to renew the way it imagines itself, its identity and its many senses of belonging, so too Sociology must reinvigorate its sociological imagination. These two projects must overlap, where the power of sociological imagination feeds into a sense of a collective identity that is flexible and resilient in the way it deals with diversity, adversity, and uncertainty. Europe is not so much a place, as it is a trajectory – historical, cultural, and political. Always fleeing somewhere, Europe is a perpetual migrant – in its myth, its geography, its history. That mythological Europe, begins with kidnapping and refuge. Europa, a Phoenician princess is carried off to Crete by Zeus. On Crete she gives birth to Minos, thus begetting the Minoan civilization, the cradle of ancient Greece, and eventually an entire continent. The Myth of Europa is about trauma and refuge – two defining characteristics of European history, and a theme that will be repeated many times over. But it is also about new beginnings, about re-making the foreign and initially hostile environment, at its very core. Europe is born in transit. As such, it is an ‘unfinished adventure’, according to Bauman, that is ‘allergic to borders – indeed to all fixity and finitude. It suffers limits badly’ and transgresses them, as soon as they are imposed.

How far is contemporary Europe from the one that reinvented itself continually with every blind turn, culturally, politically, even geographically? Closer than it might seem. Most immediately, it is visible in the figure of the stranger, whose identity, as Simmel observed already in 1908, is a special blend of attachment and detachment. The stranger, like the citizen of Europe today, is someone who stays, but has not given up the freedom of coming and going. In this formulation, the stranger is a hybrid, intimate figure that embodies ‘the union of closeness and remoteness involved in every human relationship’. It is precisely here, in this general logic of estrangement and mobility, where we can start searching for a European identity and a Sociology for the present and the future – where the rehabilitation of movement as the core logic of community building points a way towards a new sense of belonging. Thus, as I conclude, the renewal of sociological imagination that can serve as the base for how we grapple with the

vertigo of modern Europe and its identity in an increasingly hostile political environment, must address 'estrangement' not as a negative thing, but an enabling force; a kind of emotive logic that governs any identity building project.

The Existential Crisis of the European Union

Sophia Kaitatzi-Whitlock

Aristotle University of Thessaloniki, Greece

sophiakw(at)otenet.gr

This paper addresses the existential crisis of the European Union, consisting, on the one hand, in incapacity, unwillingness or failure to resolve long-standing, corrosive socio-economic problems, or even major destruction and crises. The existential crisis is marked, on the other hand, by astounding lack in solidarity between European peoples and by the glaring absence of a common European vision. There is no European narrative for EU citizens to believe in for their future, nor to create hope or trust.

Conversely, revelations of corruption cases tarnish the image of European élites and EU leaders. Is it a wonder that European societies have reached unprecedented levels of euro-skepticism, euro-hostility and, indeed, were led to phenomena like 'Brexit'? Citizens wonder what the 'European citizenship' holds for them in reality? Whatever happened to the ideal of the 'European Citizenship' of 1993?

A number of strategic decisions and omissions lurk behind failures and the ensuing mass-deceptions. Implicit in these decisions and omissions are also acute problems of ethnocentrism and plain nationalist acts. These include cases of favouring particular interests against the general EU interest. Implicit to such acts were undue cases of boosting 'the global industrial champions' in order to dominate in exports at any cost. Consecutive corruption cases have however proved these also to be dead-end strategies. Moreover, despite early warnings about the dangers implicit in the democratic deficit practices, these were mocked or not considered. Consequently, the EU syndromes of today amount to the a most challenging, perhaps, insuperable existential crisis for the EU project.

Federation, Empire and Independence: The contest over the interpretation of the European project

Gerard Rosich

Helsinki, Finland

gerard.rosich(at)helsinki.fi

The history of Europe is constituted by the tension between two political forms: Federation and Empire. The creation of the European institutions after the Second World War aims at breaking this logic and building common institutions committed to the respect of human rights, democracy and economic solidarity. However, the present institutional architecture of the EU is indeterminate and unstable due to the different interests of its members and to the absence of a "European" people. Moreover, the political impact of

the current economic crisis has triggered a new divide between North and South and the expansionist logic of the EU policy of regional integration puts into question the normative principles that instituted the Union and it suggests a revival of past imperial trends. The paper explores the progress/regress that can represent for the democratic reconstitution of the EU and for the promotion of a European federal project the current processes of internal formation of new states derived from independence movements. In sociological terms, it aims at disentangling the different discursive layers in the debates about Catalonia's independence against the background divergent interpretations of the European socio-political project. The paper investigates how they are mobilized in the public sphere for political action and for the promotion of different political projects at the regional level, which may have an impact on the ongoing transformation of the EU.

The Coming Europe

Gallina Tasheva

University of Muenster, Germany

gallina.tasheva(at)uni-muenster.de

The question now is: How to rethink the idea and the concept of "Europe" in the context of the processes of globalisation, where Europe can be understood neither as essence of roots, traditions and shared values of belonging, nor as cultural dispositions, self-understandings, self-interpretations, nor as normative orientations, nor can it be reduced to the anti-essentialist constructivist version of a pure selfreferential generation of differences?

When we reconsider in particular the historical periods of Europeanisation and their corresponding steps of Cosmopolitization, we will not be very surprised to find out that the extension of the idea of Europe is a result and at the same time a presupposition of the successful development of global centers of economic and political power and of cultural and technical influences. We can say that the historical process of Europeanisation is one and the same as the process of iteration of centers of worldwide expansion of economic and political power. This long process of constituting, integrating, and centralizing, of Europe, is a process of a "Cosmo-Europeanization" or "Westernization," grounding in human rationality and its juridical forms of contracts. Even the idea and the gesture of hospitality, being one of the greatest achievements of the European Enlightenment and an expression of European mind and identity, formulated by Kant in his famous work "Perpetual Peace" (1795) it remains still a juridical law concerning only the fellow-citizen of the different national communities. But what about those without a state, the people "sans papiers," the "stateless and homeless," the "displaced persons" without identity that comes with belonging to one or another society —the kind of minority, mentioned by H. Arendt as by J. Derrida, who give an example of the ancient autonomous city of refuse, open for all people who live beyond the law in general? Based on the ethics of the Other (Levinas-

Derrida) this paper demonstrates how Kant restricts the cosmopolitan law of hospitality only to the right of visitation ("Besuchsrecht"), eliminating in fact any possibility of hospitality in its existential meaning. Kant's law of hospitality excludes even the possibility of hospitality as a right of residence and makes the right of residence an object of a particular treaty between nations and states, dependent on state sovereignty, controlled by state laws and the state police as the problems of the refugees now are treated. Further more in the paper is arguing for an existential idea of hospitality from the Heideggerian conception of "Being-with" (Mitsein) as the core of the European mind and identity.

RS01 - (Un)Making Capitalism

RS01 | Session 04a (Un)Making Capitalism 1: Rediscovering and Critically Rethinking Capitalism

Making and unmaking of capitalism. A systemic therapy approach

Steffen Roth

La Rochelle Business School, France

strot(at)me.com

The Ancient Greek term *banausoi* denoted people predominantly devoted to the making money as manufacturers, traders, or financial investors. The pursuit of those banausic activities was taken for a token for poverty because it marked the need for money and the absence of leisure time (Canovan, 1977, p. 61; Finley, 1985, p. 60). While esteemed citizens of the Hellenic polities devoted their leisure time to respected activities such as art, politics, education, or philosophy, thus obtaining further honor, “the economy was properly the exclusive business of outsiders” (Moses I. Finley, 2011, p. 52). It hence was noble ignorance of economic realities that defined the Ancient Greek worldview, which might well have been true for more contemporary Greek worldviews, too. The humor involved in that bad joke shows that things have changed. Today, Western societies are typically considered economized (Alexander, 1985; Blumler & Kavanagh, 1999; Çalışkan & Callon, 2009, 2010; Chomsky, 1999; Fournier, 2008; Habermas & McCarthy, 1985; Lash, 2007; Latouche, 2012; Polanyi, 1957; Smart, 2003; Urry, 2010; Wallerstein, 2004). This circumstance can be and has been criticized ever since its discovery. Yet, critiques of the capitalization of society have ever since remained confronted with the paradox that they co-create the problem they criticize, too.

In this article, it is our ambition to think out this well-known argument and demonstrates that anti-capitalism sustains rather than helps to overcome the very problem it aims to overcome. To improve the situation, we draw inspiration from key techniques of systemic therapies such as the externalization of problems and the shift from problems to resources or solutions (Carr, 2000; McNamee & Gergen, 1992; Paritsis, 2010; Sluzki, 1992). As the observation of the economy inevitable refers to the observation of functional differentiation (Roth, 2015, 2016), however, we are able to demonstrate that solutions for the unmaking of capitalism are not in an ever-sharper focus on the traditional problem of more versus less

(political control of the) economy, but rather in a strategic marginalization of the economy. We furthermore show that and how the higher goals of anti-capitalism may be achieved by such a strategic disinterest in the economy if it is complemented by a re-cultivation of interest in other function systems such as art, religion, education, or science.

We conclude that the most consequent way to keep capitalism alive is to defend our banausic focus on economic issues, whereas the most promising strategy of unmaking capitalism clearly is to engage in the making of a society in which the economy is neither highly regulated nor highly promoted, but rather strategically ignored. We also present prototypes of multifunctional tools that may be used to this end.

Sanctifying money, (un)making capitalism

Emil André Røyrvik

Norwegian University of Science and Technology

(NTNU), Norway

emil.royrvik(at)sintef.no

I argue that the financial space and 'spirit' of casino capitalism is constituted through distinct and recognizable practices of reification, rational technical and (il)legal procedures, and performativity that combined works like magic (in the sense that it makes a lot of money) for the few, but whose effects are tragic for the many. To substantiate this argument, we need to scrutinize the crucial, but to a large extent ignored role of money in the (un)making of contemporary capitalism.

The paper shows how in casino culture the social and moral relations of money have been subverted and transformed to unilateral creditor dictate and commandment. With an emphasis on the situation in Spain and Europe, I argue that the payment of debt has been sanctified to a status above all other concerns. Hence, rather than individuals and groups of people making sacrifices to secure the endurance of life and society, and the better off persons making the most sacrifices, in the global casino ordinary people and society are through euphemisms such as 'austerity measures' sacrificed on the altar of money (debt), quite literally so, to make increasingly more money for the owners and controllers of money.

"Linking Braudel's "capitalism" to Marx's "capital" via Veblen's "business"

Ahmet Öncü

Sabancı University, Turkey

aoncu(at)sabanciuniv.edu

In this article I suggest putting the term capitalism on a pedestal higher than ever by clarifying what it stands for as an analytical construct rather than getting into a theoretical scrutiny whether it is meaningful or not in the analysis of present-day organization of material production and reproduction on the world scale. I begin with Braudel and suggest conceiving capitalism as a "mode of governance," and not a "mode of production." The discussion thus evolves into a critical

engagement with Marx's place in debates on capitalism. I argue that a sound analysis of present-day capitalism as a mode of global governance must seriously take into account Marx's elucidation of different forms of capital as money, production and commodity, introduced in *Das Kapital* throughout the three volumes. Of these three forms of capital, money as capital is especially central for today, in that it is the only one that is always mixed up with what he calls "fictitious capital" in volume three – a concept of his which has been mostly tangentially taken up in the Marxian debates on capitalism until recent times. Then I make a strong claim that all forms of capital can indeed be rendered fictitious if they come under the ownership of a "business" concern. I use the term business as an analytical construct, which is, by and large, poorly conceptualized in the critical political economy literature. My construction of business as an analytical category is derived from the works of Norwegian-American political economist Thorstein Veblen.

Capitalism can be conceived as a particular mode of governance by which unearned wealth, i.e., fictitious capital, is protected as a legal right.

RS01 | Session 05a (Un)Making Capitalism 2: The Critique of Digital Capitalism's Political Economy

Targeted Advertising and the Deception of Users

Bahar Ayaz, Kamile Elmasoğlu

Gazi university, Turkey; Gazi university, Turkey

bharayaz(at)gmail.com,

kamileelmasoglu(at)hotmail.com

Social media is a vehicle that makes profit for powerful groups in society, causing capitalism to become even stronger. One of the important pillars of this is advertisements. With targeted advertising, new products are being marketed to social media users on an ongoing basis. Targeted advertisement benefits from multiple scientific disciplines that provide knowledge and information about the personal features and preferences of the individual users. Capitalism can create individual differences through the internet media and have control over these differences. In this sense, what individuals perceive as liberty is actually something needed by capitalists for making profit. It is much easier for the media owners to reach the sale success by these targeted ads, which are created on the bases of users' likes and the pages they visit. Within this study, it will be discussed how targeted advertising strengthens capitalism by discussing different targeted advertisement examples and practices of different companies.

New Fictitious Commodities in the Capitalism of Networks and Flows

Dmitry Ivanov

St.Petersburg state university, Russian Federation

dvi1967(at)gmail.com

The recent expansion of capitalism to new areas and levels of commodification demonstrates both

relevance of Karl Polanyi's classical concept of fictitious commodities and necessity of its extension. Now postindustrial commodification is extended to elements of consumption – images and time. They also are not 'things produced for market' but become sources of capitalist accumulation as consumers are constructing their sociocultural identities with use of brands and trendy goods.

The first wave of postindustrialization has resulted not in the 'information society' based on knowledge-intensive production but in virtualization of society based on an image-intensive consumption. Virtualization here means replacement of things and real actions by images and communications. People's social life since the late 20th century is immersed in virtual realities of branding, image making, and communications through digital media. Commodification of images takes form of branding that generates enormous market value in current economy.

The second wave of postindustrialization is related to the shift from logic of virtualization towards a logic of glamour. Glam-capitalism becomes a next phase of postindustrial economy as producers in hyper-competitive markets have to glamour consumers and products must be aggressively beautiful to be attractive for targeted groups. Market value generated by trends is accumulated in flow structures, which penetrate institutional boundaries and allow glam-capitalists and glam-professionals to exploit enthusiasm of consumers involved into the trendy communities. Counter-movements like 'copy left' and 'pirates' violating 'intellectual' property rights challenge regime of glam-capitalism. Counter-movements challenge the glam-capitalism not only in economic domain but in politics and culture as well. N

cristina.sciannamblo(at)m-iti.org

We would like to attend the conference's main questions by presenting the relations between theory, subjectivities, and research practice in an action research project called 'PIE News'. In particular, we intend to discuss how the project can provide a valuable contribution for envisioning how and where a sociology that matters can evolve. PIE News addresses the contradictions of platform capitalism (Bauwens, 2009) by reconsidering the relations between labor and social cooperation on digital platforms (Fuchs, 2013). The project is rooted in the critique of social media platforms that change over time to extract more and more economic value from social cooperation of unpaid subjects (van Dijck, 2013), thereby leading to "accumulation by dispossession" (Harvey, 2014).

As action research, PIE News aims to contrast poverty

and social exclusion by creating a digital platform, Commonfare.net, involving several actors in Croatia, Italy, and The Netherlands (bottom-up organizations, social sciences researchers, hackers, and ICT research institutions with an interdisciplinary profile). The platform will allow people and social groups to be informed and to inform through storytelling about available welfare measures and grassroots initiatives, and to find support in networking activities able to bring use value to their everyday life. The overarching ambition is to foster the emergence of the Commonfare (Fumagalli, 2015), a form of welfare based on grassroots initiatives and equitable democracy that promotes social solidarity.

RS01 | Session 06a (Un)Making Solidarities I

Citizens of the World: Globalization and Transnational Identity Formation

Yunus Kaya, Nathan D Martin
Istanbul University, Turkey; Arizona State University
yunus.kaya(at)istanbul.edu.tr, ndm(at)asu.edu

This study assesses if globalization has led to the adoption of transnational identities over national and regional ones. Utilizing multilevel modeling and the data from the last two waves of the World Value Surveys and the last wave of the European Value Studies, which were conducted between 2005 and 2014 in 105 countries covering more than 90 percent of the global population, it examines the country and individual level determinants of perceiving self as a world citizen. The results of the analyses reveal that higher levels of globalization at the country level, measured through the flows of capital, goods, information and people, and increasing income education and professional and managerial class status at the individual level are positively associated with self-identification as a world citizen. Therefore, this study joins the scholars and studies that point out to the asymmetrical and contradictory effects of the globalization process.

Promoting the urban social sustainability: environmental movements, social media and civic participation

Lucia D'Ambrosi, Vale Polci
University of Macerata, Italy; University of Macerata, Italy
lucia.dambrosi(at)unimc.it, valepolci(at)yahoo.it

The new forms of relational nature, which nowadays often come up in real urban contexts and afterwards spread out in virtual no-places, or are an expression of "movements" created in the Internet (blogs and social networks), transform already existent models of sociality and create innovative social connections. Users who set such "digital connections" feel themselves protagonists of nets of personal relationships and links which give sociality, support, information, sense of belonging and social identity which they show in public places through new forms of expression (Wellman, 1997). The idea of place as a space where social interaction develops, a space border and source of sociality, becomes a space community, a no-place which is an expression of the

social organisation (Meyrowitz, 1985). Such relational modalities don't exhaust themselves in a sum of practices and usual rituals but join with attitudes and behaviours meant to start profitable and constructive occasions of sociability as civic participation (D'Ambrosi, 2017).

Starting from this perspective, research aims to examine the new forms and practices of sociability fed in the public squares and which find continuity in virtual platforms; there is a particular reference to sharing of literary, cultural and political contents about civic participation and urban liveability and to its repercussions on social ground. The starting question of our research is to understand how the increasing availability of cultural experiences, through and outside the Net spaces, can influence the urban public places. We refer, for instance, to the "Transition Network", a movement of communities coming together against the urban deterioration spread through the Web; it started from dialoguing modalities and confronting on certain topics, and it has stimulated the users to discuss directly and personally in the city square. This is an actual case of how even sharing literary and cultural contents can influence the process of creating a civic sense, investing different people with responsibility towards concrete actions and initiatives. Using a mixed methods approach and integrating quantitative and qualitative data analysis (like web survey, interviews, etc), the research aims observing already existing national and international forms of public participation, inside and outside the Net, in order to verify its effects on society related to environmental issues and places liveability.

Solidarity as a Form of Life – Normative Ideal and Empirical Problems of Solidarity

Bastian Ronge
Humboldt University Berlin, Germany
bastian.ronge(at)hu-berlin.de

Liberté, Égalité, Fraternité were the famous keywords of the French Revolution. Modern philosophy reflected intensely on the concepts of freedom and equality, but neglected fraternity or rather solidarity. Hence, solidarity remained a 'wishy-washy concept' (Jaeggi 2001, 287) until today. In my presentation I would like to suggest conceptualizing solidarity as a form of life. That means: I will put forward the thesis that solidarity should be understood as a bundle of social practices, which pursue a particular goal and which are based on particular judgments about the (social) world. Solidarity as a form of life can be performed in two ways; as 'lived solidarity' within a social group or as 'sympathetic solidarity' with regard to other individuals or social groups. Both forms of solidarity aim at the same normative goal, namely to establish social relationships, in which people fulfill other's needs and desires by fulfilling their own ones, i.e. social freedom. Both forms are based, however, on various moral judgments and imply different social practices. While 'lived solidarity' encompasses practices like 'fighting together', 'helping each other out', 'avoiding hierarchies', 'making decisions consensually',

'performing sympathetic solidarity' etc. and is founded in having common moral judgements about the (social) world; 'sympathetic solidarity' (with other individuals or groups) entails practices like 'supporting other individuals or groups in a material or nonmaterial way' and 'risking something without payoff' and is based on sympathy, i.e. affirming the other's way of acting and his or her moral judgements about the (social) world. Conceptualizing solidarity in this way allows to describe the normative ideal of solidarity as well as to identify the main empirical problem, which hinders the practical realization of this ideal. According to the given account, the normative ideal of solidarity consists in social freedom, i.e. to fulfill other's needs and desires by fulfilling one own ones. This ideal binds us to perform sympathetic solidarity, that means to support those people, who fight for the realizing of their social freedom. We often fall short to do so, however, since the sympathetic interaction with those, who fight for their lived solidarity, is distorted. Hence, the question of how to realize the normative ideal of solidarity cannot be separated from the empirical and sociological question how political-affective discourses can be established, which increase sympathetic relations within our own social group as well as to other individuals and social groups.

RS01 | Session 07a (Un)Making Solidarities II

Western promises of solidarity: the objectification of Russian LGBTIQs in neoliberal times of post-homophobic identity formation and homonationalism

Maria Neufeld

Dresden University of Technology, Germany
neufeld.maria(at)gmail.com

Ever since the introduction of the "anti-propaganda laws" and the controversies over the Sochi 2014 Winter Olympics, LGBTIQs are at the epicenter of tremendous international attention to the human rights abuses in Russia. Organizations like the "Russian LGBT Network" or "Выход /Coming Out", along with several Russian-speaking initiatives in Europe and North-America like "Quarteera" or "RUSA LGBT" enjoyed broad media coverage across the world, which has boosted their image and impact within the local scene.

Echoing the international outcry against LGBTIQ rights violations, North/Western LGBTIQ groups launched various solidarity campaigns to support their Russian peers. Unarguably well intentioned, many of the these solidarity initiatives, however, tended to adhere to a developmentalist rhetoric that constructed Russia as increasingly falling behind the Western (= "European") ideals of Enlightenment, democracy and tolerance. The discursive creation of these different geo-temporal entities of an enlightened and tolerant Western Europe vs. a backward and homophobic Russia (and Eastern Europe) did not happen in a vacuum, but was reinforced by historic notions of Russian backwardness in matters of sexuality, freedom and civil rights as well as new tropes of

repression and isolation when discussing "Putin's Russia". Some solidarity initiatives formed newly on the basis of their political stance towards LGBTIQ issues in Russia, for instance the European-wide network "To Russia with Love", which was created to inform the public about the situation in Russia, but had little other political inclinations beyond this points. Other much older initiatives took the Russian events as an opportunity to revive their activities and/or to radically re-politicize themselves as in the case of the Berlin Pride festival, which has come under strong criticism because of its increasing neoliberal, consumerist, racist, single-issued "just gay" orientation in the past. In both cases "solidarity" became a buzzword, often and willingly used by different groups, but rarely discussed in terms of its meaning and scope.

In my paper I analyze some major examples of solidarity actions that happened in Western Europe between 2013 and 2014, their visual language and rhetoric as well as the public and political discourse around them. I focus on solidarity campaigns launched in germanophone and anglophone countries and read them against the broader background of their local context, most importantly the formation of a local consumerist, de-politicized and commercial "gay culture" and its complicity with homonationalism. I argue that some North/Western initiatives took the situation in Russia as an opportunity to "infuse" its political urgency and impetus into their own context: an attempt to re-politicize their local activist scene under the pretext of a global struggle for LGBTIQ rights. In this sense, the production of a Western post-homophobic subject happened through the incorporation of "the Eastern others", but also through a clear division between the different geo-temporal contexts. Finally, I try to pose questions of agency on the receiver's end of solidarity and to reflect on missed opportunities of less objectifying and less hierarchical forms of solidarity in the case of Russian LGBTIQ struggles.

Making Solidarities in the Context of Precarity. Grassroots Organising among Low-paid Migrant Workers in London

Davide Pero

University of Nottingham, United Kingdom
davide.pero(at)nottingham.ac.uk

Despite migrant workers' social and economic significance their organizing practices have been overlooked due to disciplinary fragmentation. Through an interdisciplinary and intersectional approach, this paper examines the innovative organizing practices that low-paid and precarious migrant workers in the UK have been articulating to promote their interests and combat their exploitation and exclusion. In examining practices of representation and self-representation of migrant workers, this paper addresses the following questions: What do the organising practices of new migrant workers look like? What do they provide that traditional trade unions approaches do not? What is the role of identity, emotions and non-material rewards in such practices?

It will do so by drawing on semi-structured interviews supplemented by informal conversations, participant observation and virtual ethnography conducted with organisers from Latin American workers and community organisations and British civic and labour organizations.

The paper will contribute original insights into contemporary industrial struggles in the service sector revealing how existing 'opportunity structures' of representation can be inadequate for these workers who then often have to develop bottom-up alternatives to be better represented. Indeed, the paper will outline how migrants' labour initiatives can have crucial representational functions that mainstream British unions are not always able or willing to provide. It will illustrate how migrant workers' industrial agency and organizing practices can be rewarding both in material and non-material terms providing a sense of how identity, subjectivity, culture and emotions all play a key role in labour organizing practices.

Solidarity by social entrepreneurship

Nesrien Abu Ghazaleh, Eltje Bos
University of applied sciences Amsterdam,
Netherlands, The; University of applied sciences
Amsterdam, Netherlands, The
n.abu.ghazaleh(at)hva.nl, e.bos(at)hva.nl

In recent years, the government of many European nations has been shifting from the notion that welfare services are the responsibility of the state to the responsibility of more local development or private enterprises regulated by the state. Kisby (2010) calls it a shift of "smaller government" and "bigger society". This is mostly due to the cut in public sector budgets caused by the financial and economic crisis, cutbacks in governmental spending, the governmental decentralization processes and political ideology (e.g. Healey, 2015). Since the arrival of refugees, authorities have also tried to manage the influx through changes in governmental (central and local) strategies, policies and guidance in the already changing state.

Consequently, with the arrival of the refugees and the government withdrawing, in many cities such as Amsterdam, local citizens have decided to set up social initiatives to have impact on refugee settlement and social community cohesion. Not much research has been conducted that focuses on the interaction of members of different backgrounds, such as refugees, and the experiences at a community level (Daley, 2007). Therefore, this contribution explores the relation of citizen initiatives and the refugee settlement in Amsterdam. We investigate how these initiatives grow into social entrepreneurs and how they influence the refugee integration. It contributes to the existing knowledge on social entrepreneurship as well as knowledge on refugee integration, which results in benefits for society and the creation of public value.

RS01 | Session 08a (Un)Making Solidarities III

Solidarities against the borders, States against solidarities. An ethnographic gaze from Calais and Val Roya

Luca Queirolo Palmas, Luca Giliberti
University of Genova, Italy; University of Genoa, Italy
luca.palmas(at)unige.it, lucagiliberti(at)hotmail.com

Europe is going through a long period of multiple crises: in the economic field, in the mobility regimes, in the political legitimacy of its institutions, in the very idea of a supranational collective belonging. Migratory turbulences and severe borders controls are shaping new and often unpredictable trajectories for migrants and refugees. Policies of border externalization are multiplying walls and internal borders that openly contrast with the principle of free mobility at the heart of the European construction. These internal borders from margins become the core of contemporary political debates, conflicts and interventions.

Inside a scenario of countered mobility, the anti-migrant popular reactions are just one of the phenomena. Everywhere gestures of concrete solidarity are carried out by civil society supporting border crossing, as well as accompanying migrants in their routes. During the so-called refugees crisis of 2015-2016, the massive emergence of no-border practices and actors - subjects who radically differ from the industry of illegal migration - are assumed and punished by States through the lens of smuggling and trafficking. During Calais dismantlement in October 2016, an event we could document ethnographically, the only presence of no-borders in the field was equated to a terroristic threat.

The no-bordering movement connects a multiplicity of subjectivities: ordinary people and activists. These practices put together the dimension of direct action and the humanitarian support, joining different political and religious traditions. At the same time, no-borders contribute to the construction of a counter-map of Europe which challenges anti-migratory policies, providing shelters, safe routes, social relations and concrete opportunity for mobility and escape. States often respond introducing the crime of illegal immigration and new law enforcements against solidarity toward migrants and refugees. Where States develop muscular agency against citizen solidarity, no borders assume illegality and disobedience as necessary practices. No bordering is often a silent and invisible act, an art of resistance, in order to avoid State's enforcement; sometimes border-crossing solidarity comes to a more political visibility, allowing debates on free mobility, the right of disobedience and on the cultural foundations of the State, as in the case of France where the Republican principle of fraternity is mobilized in order to legitimize actions framed as illegal by authorities.

This contribution analyses from a theoretical point of view the generalization of such kind of solidarities at the internal borders of the EU, as the counterpart to State and popular racism. The empirical basis of our arguments is based on an ethnographic multi-sited

research, carried out during 2015/17 in the camp of Calais, between France and England, and in the Roya Valley, in the Maritime Alps, between France and Italy. Both are liminal zones, where conflicts between no-bordering practices and migration prohibitions become crucial and framed by a media narrative. On the one hand we will describe States' strategies against free mobility and the courts' application as charge of solidarity crimes, on the other we'll introduce a cartography of tactics of resistance in migrants' trajectories, and their connections with no border solidarities promoted by EU citizens.

Inclusive and excluding communitarization processes in Europe: enacting different modes of citizenship on people living in hardship

Juan Carlos Revilla, Araceli Serrano, María Paz Martín

Universidad Complutense de Madrid, Spain;
Universidad Complutense de Madrid, Spain;
Universidad Complutense de Madrid, Spain
jcrevilla(at)cps.ucm.es, araceli(at)cps.ucm.es,
mpaz.mart.mart(at)gmail.com

Research on poverty has shown the importance community involvement, for resilience and coping with difficult economic situations. However, the economic crisis, started in 2008, has contributed to socially and economically weaken the networks that articulate communities. This could be expressed in Putnam's (1995) terms as a declining social capital, which goes hand in hand with a general understanding that in our societies the individual is at the centre of social life and collective ties and identities are more difficult to sustain.

Nevertheless, the individualization thesis does not account for the whole picture. There is still room for collective identities amidst the fragmentation of former more cohesive communities, although they will certainly be of a more fragile character. As a matter of fact, our society is not strange to neo- or re-communitarian dynamics, even if they are surely diffuse and somehow ambivalent. Firstly, many new social movements are proposing and enacting communitarian alternatives to dominant individualistic social processes. Some of these alternatives are of a profound political nature and state that "a different world is possible", while others are more of a solidarity kind, aiming to foster processes of equal inclusion for all members of society without further questioning the system. Finally, the fragmentation of social bonds is leading to the building of excluding communities in some groups, either of a national or local, religious or ethnic character.

An interesting question would be then to what extent these different re-communitarian dynamics are fostering distinct ways of social bonding through the enactment of different concepts of citizenship.

This work is part of the RESCuE project, which addresses "patterns of resilience during socioeconomic crises among households in Europe", and focus on the practices of resilience of families in situations of difficulty, based on a qualitative

methodology that examines two urban and rural contexts in nine participating countries.

The analyses show the emergence in several conceptions of communitarian bonds, both restrictive and inclusive ones. The restrictive conception of community is mainly articulated through religious, cultural and neighbourhood's groups (and in occasions through political ones), which includes a sense of shared identity built on opposition to others (also, in our cases of study, respondents associate their community to the 'natives' of one village, region or country in confrontation to immigrants, which are seen as a threat). In these cases, group cohesion is achieved by a competitive cleavage from the different ones. On the other side, the inclusive conception of community is based on integration, enhancing the common space, the 'hybrid us' which can be shared with the similar and the different ones, through collaborative activities. Both perspectives produce socio-communitarian resilience, but their different approach promotes competitive solidarity (restrictive socio-communitarian resilience), in the first case, and cooperation and universal solidarity (inclusive socio-communitarian resilience), in the second one.

An enactive approach to social life. Towards a Contemplative sociology framework.

Vincenzo Mario Bruno Giorgino
University of Torino IT, Italy
vincenzo.giorgino(at)unito.it

The enactive approach in the social sciences intends to contribute to what has been called the "Great Transition" in world societies. The term originally referred to the changes occurring with dramatic speed and impact in the environment resulting from climate change, and the necessity of modifying our behavior and lifestyles to reverse the process. After the 2007-8 financial crisis, it assumed a wider meaning: scholars from across the social and human sciences disciplines concluded that underneath the economic crisis lies a structural and cultural crisis and the search for new forms of social order. An irreversible change in our social and economic system also emanates from the technological revolution: a new society and economy in which traditional hierarchical organizations are made obsolete by new networked peer-to-peer organizations (Benkler, 2006; Castells, 1996; Rifkin, 2014).

A relevant reason for its emergence is also due to the individualization process to which it is usually given little attention. Its disruptive strength makes much easier to understand why the individual is at the center of possible whirlpools for which our culture – including in this term our institutions - seems no more able to offer safe harbors (Beck & Gernsheim-Beck, 2001). In an experiential dimension, the continuous changes in everyday life, that we have to deal with in almost any sphere, exert an enormous pressure on sentient beings.

In recent decades, scholars have included the body as well as emergent communities, or lifeworlds, in social research.

Contemplative inquiry focuses on emerging understandings of being, questioning existing theories of self,

mind, culture, and society. The integration of the traditions of wisdom with social sciences under the umbrella of contemplative research and practice implies the understanding and transcending of religious contexts in which contemplative knowledge is usually born and cultivated.

Contemplative social sciences are intended to help us be aware of our pre-judgmental attitudes and to have a more open-minded approach for the benefit of all. They place these processes at the core of their inquiry: a wise and pragmatic methodology to develop and nurture a fresh approach to social interactions.

Contemplative practices are a way of approaching the crises of understanding brought about by the continued fragmentation of learning with the aim to contribute to the construction of a new paradigm that can be grounded in an embodied and non individualistic model of knowledge.

The production of knowledge is neither subjective nor objective, but a commitment characterized by "dwelling in" (Michael Polanyi 1958). There is a sense of astonishment that captures us when we put ourselves in a position of openness toward those kinds of social practices and see them for what they really are designed: to transform ourselves, overcoming the set of patterned values and behaviors that characterize our selves. This is a surprising social invention to desocialize and resocialize through previously unseen "breaches in the wall" of social research. Within this emerging framework, we may deal effectively with economic and social suffering, and promote wise social innovations, which will liberate human potential and enhance well-being.

"Capitalism, Solidarities and Unmaking Europe: Dismantling "European" Social Policy during the Greek crisis

Dimitris Venieris

University of the Peloponnese, Greece
dvenieri(at)otenet.gr

This work provides an account of un-making Social Europe during the Greek crisis. The initial argument is that the austerity international plan enforced is at odds with the very idea of Europe and threatens the remaining principles of the European Social Model. Its first objective is to identify the stark imbalances of the residual Greek social policy system and to provide a narrative for the urgent reform imposed. Its second one, is to highlight the huge social implications of this violent change and its alarming discontinuities with the notion of European solidarity. Its third one, is to signify the uncontrolled inherent contradictions of deregulated capitalism which promote inequality and devalues labour. The neoliberal 'rescue' plan imposed by the EU/IMF/ECB concentrated upon cutting budgets by abolishing social and squeezing political rights. In the country with the highest European unemployment and poverty rates, this plan strongly contradicts the notion of remaking Europe.

In particular, the paper provides an interpretation of the European role in institutionalised solidarity in Greece during the current crisis and focuses upon the social consequences of the austerity plan. The retrenchment strategy imposed highlights a sharp (and, for many, unjustified) contradiction between the policy choices made by the EU in response to the Greek economic crisis and the values embraced by 'Social Europe', including the Europe 2020 strategy. These choices enforce social devaluation and deprivation. Post-war Europe, an economic cooperation founded on political and social rights, focused on a commitment to full employment and social security. This appears not to be the case for remaking Europe today. Notably, we have to be concerned by the tendency to use 'Europe' as a metonym for the EU. The same applies for the use of the term 'European Social Policy' as a metonym of the 'Social Policy of the EU' -thank God, there are several other manifestations of supranational social policy within Europe.

The residual Greek welfare state has failed to tackle inequalities and to challenge market outcomes. The value deficit embedded in socio-political relations reproduced clientelism and commodification in welfare provision. But, the social policy agenda imposed because of the fiscal crisis contributed to a set of violent changes, which minimized social provision and maximized social deprivation. The 'aid plan' is based on overall devaluation in terms of income, welfare protection and labour rights. Austerity emerged as the standard policy response to boosting social need.

At the national front, loss of jobs, income and provision became the norm during the Greek crisis and produce huge and unjust social implications. At the international front, the austerity recipe prescribed for Greece aims at macroeconomic restoration at the expense of European welfare rights. The emerging inconsistency between economic austerity and social welfare threatens Europe not less than 'Brexit' and reproduces not only 'Euroscpticism' but also conservatism, populism, nationalism and, after all, racism all along the continent.

RS01 | Session 09a (Un)Making Solidarities IV

Social Clinics and Pharmacies of Solidarity (SCPS)

Chryssa Kousoulenti, Georgia Petraki
Panteion University, Greece; Panteion University, Greece
lou_valou(at)yahoo.gr, geopetr(at)panteion.gr

Social Clinics and Pharmacies of Solidarity (SCPS) are structures developed as a rejoinder of the citizens to the austerity policies that led to the degradation of public healthcare and medical services and to the consequent creation of millions of uninsured citizens. They are voluntary self-organized structures, which, under the slogan "No one alone in crisis", operate on three levels:

A) On the provision of health and medical services to uninsured, unemployed, economically weak, migrants

and refugees, without racial, class, sexist or other discriminatory.

B) On highlighting, recording and denouncing both of the changes in the health sector and the dramatic consequences associated with those.

C) On claiming free health care for everybody without exceptions.

The so far empirical study has shown that SCPS adopt radical kinematic characteristics, since they operate with direct democratic procedures, co-decision and without formal hierarchies. They reject in practice dominant capitalistic values such as taking money or adopting sponsors, while they offer highly professional services. Furthermore, they redefine the concept of volunteering as a political act of social solidarity and offer, detached from charity. Additionally, they promote the social economy and the concept of participatory social planning, which, despite its inherent weaknesses, seems to have significant advantages. Finally, the empirical example of SCPS sets an urgent demand for structural social and political change, while at the same time sets in practice the guidelines of this change.

Constructing solidarities in the neoliberal age: mutual-aid grassroots initiatives in Spain after the 15M

María Gómez Garrido, Jorge Sola
University of Balearic Islands, Spain; University of Balearic Islands, Spain
maria.gomez(at)uib.es, jorge.sola(at)uib.es

The Spanish 15M or indignados movement –as part of a broader cycle of protest (Arab springs, Occupy Wall Street, etc.)– broke up with a trend of political apathy and opposed resistance against neoliberal and austerity policies. Following the initial protests, several mutual-aid initiatives and grassroots movements emerged with a twofold objective: to denounce the cutbacks and market-driven policies that hindered the access to basic goods (such as housing, food or healthcare) and to offer a practical support to people in vulnerable situation. This legacy of the 15M can be interpreted as a deliberate effort to (re)construct solidarities in a social landscape devastated by neoliberal individualism. This paper analyzes the features, functioning and relative success of some of these initiatives: the Anti-Mortgage Platform, the grassroots food banks and groups supporting people to get access to social assistance or healthcare. They all have in different ways built forms of solidarity operating locally that have alleviated the situation of diverse social groups and created forms of resistance against the background of austerity policies and social individualization. The paper traces back the trajectory of these initiatives, studies their interactions with other political and social actors in a broader context and analyzes the potential tensions between “users” and “activists” (with different backgrounds) participating in them. To conclude, it discusses the difficulties to overcome the individualist narratives that hinder the building of a “we” as a collective, political subject.

Crises and the Reconfiguration of Solidarity in Europe

Sebastian Koos
University of Konstanz, Germany
sebastian.koos(at)uni-konstanz.de

Solidarity has been understood as a key element of social integration and cohesion from the earliest days of the discipline (Durkheim 1893, Weber 1956). Most generally, solidarity signifies the fundamental bonds between members of a group or community. In recent years, Europe has faced a series of different crises, creating both, a threat to and an opportunity for solidarity in Europe. From the financial crunch of 2008, and subsequent financial turmoil, the recent terrorist attacks, to the refugee crisis of 2015, these crises challenge the organization and stability of societies triggering uncertainty and insecurity. In the aftermath of these events, many have started to question the viability of unified Europe as a social and political project. In addition, increasing unemployment and poverty, austerity policies, disenchantment with politics and the rise of nationalist political movements are challenging the social bonds in Europe. As a result, old and new social cleavages, both within and between countries, have become ever more salient. At the same time, the crises have opened up venues for, and helped constitute new modes of solidarity, such as help for refugees, family support, donations to the needy as well as collective protests and strikes or solidarity trade networks.

In trying to understand solidarity in times of crises, two issues stand out: the origin and the scope of solidarity. A variety of theories emphasizes different roots or explanations for solidarity, ranging from social norms, long-term self-interest, personality, ritual chains, to cultural and institutional aspects. While different theories might explain different aspects of solidarity, how can we understand the origins and conditions of solidarity during crises. The second key issue is to whom solidarity relates, i.e. its scope. Solidarity produces and reproduces boundaries between members and non-members of a group and thus is a crucial mechanism of in- and exclusion along attributes, like class, ethnicity, or nation. As membership in more particular groups seems to outrank more universal forms of belonging (Calhoun 2002), exclusion commonly becomes an integral part of solidarity. Thus, on its flip side, solidarity can advance a process of closure to outsiders (Weber 1956). The economic crisis, rising social inequality and also the recent refugee crisis have the potential to shift the salience of group boundaries and hence the scope of solidarity. Both, the recent rise of populist national movements across Europe and, quite contrary, the immense wave of solidarity with refugees might serve as examples of such reconfigurations.

After a brief discussion of different solidarity concepts and meanings, the talk will focus on the origins and scope of solidarity in times of crises. The main argument will be that the crises has enabled and revitalized certain dimensions of solidarity, like help towards people in need, both nationally and

transnationally, but has also led to a reconfiguration of group boundaries. This will be illustrated using data from different comparative surveys. I show that the making and unmaking of solidarity are closely intertwined processes in times of crises.

Solidarity in Question: Subjectivation Processes of the Precariat in Activating Societies

Claudia Globisch

University of Innsbruck, Austria

claudia.globisch(at)uibk.ac.at

What are the actual conditions for solidarity in contemporary European societies? Within governmentality studies, there has been broad research on the new making of self-responsible marketable subjects (Rose 1996; Foucault 2010). There has been less research on the effects of those techniques of governmentality on the side of the subjects. Are all subjects governable in the same way? Are they “active”-able according to the discourse of self-optimization and entrepreneurship (Broeckling 2007)? Finally, what are the effects on developing forms of solidarity?

Taking Austria’s needs-based minimum benefit system as an example, I will take a look at the effects of an activating social policy. The presentation is based on a qualitative study using narrative interviews (2013-2015) with both recipients of the needs-based minimum benefit and case managers. I reconstruct “activation” as a normative requirement and institutionalized strategy that aims to shape attitudes and behaviour in order to construct marketable and employable subjects. For answering the question, whether and how subjects are activated according to the socio-political aim of “employability“, I propose a typology of “action activation“, showing that, in general, most people are indeed “active“, though not activated through and according to the aims of “employability“.

The outcome shows ambivalent constellations between loss and gain of autonomy under the regime of activation policy. A key result is that activation policy has individualizing and not solidarizing effects and does not lead to collective action.

RS01 | Session 10a (Un)Making Subjectivities

Precariousness forever? Young people at risk of an existential crisis

Renato Miguel Carmo

ISCTE-IUL, Portugal; CIES-IUL

renato.miguel.carmo(at)gmail.com

Precariousness has become a common social situation among the young population. This generalization started before the financial crisis but with the escalation of the austerity measures in countries such as Portugal, Spain or Greece, these trends have been rising tremendously. One of the main causes of precariousness is labour uncertainty provoked by the trivialisation of non-standard job contracts (temporary, outsourced, informal or even illegal work) and low wages. Frequently this contract positions interwoven with periodical situations of unemployment. Precarious jobs are related as well to lack of control over working conditions and absence of trade unions and social protection rights.

However, the vulnerable condition of precariousness may also contaminate other dimensions of living apart from the professional insertion, particularly the difficulty of making autonomous life plans or considering long-term projects and possibilities (Carmo et al, 2014). Besides of being associated with resource inequalities (low wages, low levels of social protection, etc.), a precarious situation may involve existential inequalities (Therborn, 2013) that constrains personal autonomy in pursuit life projects. Thus, to develop a deeper analysis regarding the social and individual impacts of job precariousness in young people's way of life, it is crucial to consider the subjective and existential dimensions.

This presentation will firstly make a comparison between the European countries and then will focus on Portugal. After four years of an intense adjustment programme, there was a recent change on the Portuguese government composition which is now supported by left wing parties. This change has brought some hope within the population due to the alteration in the policy orientation, but regardless this fact, the country is still living in a vulnerable social and economic situation.

The first aim of this presentation is to characterize these trends through a statistical analysis of several indicators by comparing Greece, Spain and Portugal to other EU countries in regards to the main labour market indicators, as a way to understand the

changes happened in terms of employment, unemployment and precarious work among young people. The second aim is to analyze precariousness as a subjective and existential dimension that is conditioning the young people perceptions and feelings regarding their own future lives. For this part I will make use of a qualitative research analysis based on in-depth interviews conducted to 24 Portuguese young workers with degrees in different scientific areas, living in Lisbon Metropolitan Area (aged until 30 years old). One of the main conclusions is that the future is becoming very unpredictable, which affect not only their vulnerable economic condition but also their way of living. In fact for most of the interviewed the present labour experience incorporates some alienating aspects that constrains the autonomy and the agency of the self. They cannot foresee a path through which it is possible to change the present. The communication ends with final theoretical reflections and remarks regarding the notion of existential crisis and some policy recommendations to increase social cohesion and solidarity in Europe.

Competitive Egocentrism: Modular Individuals in a World of Institutions

Michalis Lianos

University of Normandy - Rouen, France

m.lianos(at)free.fr

This session will engage with an overall conceptualisation of the demise of the modern subject and its transformation into the vulnerable – albeit expansive – individual of our times. There have been many critiques of the impact of late modern conditions on subjectivity and selfhood, mainly inspired by postmodern, post-structuralist and risk-society perspectives. Despite their accuracy and interest, these critiques do not supply a framework that structurally explains the paradox of an ever-expanding individuality combined with an ever-increasing fragility. To do so, we need an overarching view on the transition of human sociality – from direct to institutional sociality – and its effects on subjectivity. In the context of a long effort to build that framework via a series of empirical and theoretical works, I will discuss the emergence of a 'modular' contemporary subject. The characteristics of that subject will be addressed via three converging analytical perspectives: a) the decline of direct social control and its replacement by a multitude of sociotechnical environments; b) the development of a dense institutional web and the consequent qualitative transformation of the interaction between individuals and institutions; c) the continuous dependence of the late modern subject on externally produced modules of institutional efficiency in order to build a competitive self.

The argument will then turn to the construction of the individual via the selective use of resources that he or she does not possess in an inalienable manner. Unlike social belonging, which is experienced as a 'natural' permanent link, accessing and choosing such resources is a matter of capacity and competence.

Otherwise put, there is no obvious ground for social integration and the subject starts from a point of social deficit that he or she must continuously strive to fill. This is no mere disembeddedness that leads to “tribulations of the self”. It is the beginning of a genuine structural reversal whereupon individuality becomes an appendix of organisational and institutional priorities.

Access to an adequate self can only be built via collecting and managing institutional modules ranging from educational qualifications to discount coupons and from professional experiences to online profiles of likely partners. The great proliferation of institutional modules, and the interminable options that they generate, turn individual social existence into an inward-looking competitive operation.

The consequences of this transition in terms of social identities and of the paradoxical competitive access to one's self will be then discussed via the concept of competitive egocentrism.

The Gendered Impact of the Crisis: An Autonomist Marxist Feminist Perspective

Maria Daskalaki, Maria Simosi, Marianna Fotaki
Kingston University, United Kingdom; Roehampton University, UK; Warwick University, UK
m.daskalaki(at)kingston.ac.uk,
Maria.Simosi(at)roehampton.ac.uk,
Marianna.Fotaki(at)wbs.ac.uk

The global financial crisis has triggered a dramatic transformation of employment in the weakest Eurozone economies. This is evidenced in deteriorating work conditions, limited employee negotiating power, low pay, zero-hour contracts and most importantly, in periods of prolonged unemployment for the majority of the working populations, especially the young women. In this article we focus on the gendered consequences and explore how austerity policies implemented to address the crisis have transformed the everyday lives of women including both their productive and reproductive aspects. We examine these issues in the context of Greece, the country with the highest rates of unemployment in Europe and discuss how unemployed women narratively construct their future working/non-working lives. Adopting a Marxist feminist approach, we propose Federici's thesis on reproductive work by women acting as social buffer during the crisis as a useful frame for understanding current developments in the unfolding crisis of capitalism.

From welfare to misery. The subjective experience of retirement from individuals living with “low pensions”.

Arnaud Marion
Ecole des Hautes Etudes en sciences sociales,
France
marion.arnaud(at)hotmail.com

In France as most of European societies the pension systems was built on the aftermaths of WWII and

since then it is part of the institutional arrangement defining the welfare regims of capitalist societies (Esping Andersen, 1991). But France is one of the countries where rate of poverty among pensioners is among the lowest in Europe while public pensions are the main source of income for elderly in France (OCDE, 2016). Since a few years, the question of “low pensioners” has become a public issue and a political stake in France and this official speech is assimilating low pensions (defined in France as 1200€ per month and under) with the question of poverty among elderly. Mainly built on the politician goal to gain vote of the popular classes, this statement can be criticized because of the existence of the different foresight strategies made during their life course among individual earning “low pensions”. Starting from this paradox, the study of the subjective experience of retirement of individuals living with low pensions is the main subject my researches are about.

In 2002, Daniel Beland criticized the historical neo-institutionalist approach as it did not take into account the influence of the epistemological question of ideologies and the role of private actors as part of the institutional arrangement of the welfare regime (Beland, 2002). Since then, recent works led in the field of pensions in European societies insists on how dealing with the question of lower pensioners implied specific institutional arrangement in different national pension systems that are deeply questioning the concept of solidarity (Leimgruber, 2008; Naczyk, 2015). According to the previous figures, by taking into consideration those references and by building the sociological concept of “foresight strategy” inspired by works of Bourdieu (Bourdieu, 1967; 1999; 2002) this presentation aims to present results taken both from a fine analysis of pension system architecture and from qualitative interviews made among individuals earning the lowest pensions, in order to present how individuals are making the subjective experience of retirement with low pensions.

The leading hypothesis of this presentation is to affirm that the French pension system by itself is shaping specific economical habitus according to its “conservative-corporatist” nature (Esping Andersen, 1999, Esping Andersen and Palier, 2002). This economical habitus is producing specific foresight strategies among individuals, directly linked with the minimum of contributive pension defined by the main pension regims. Adopting a neo-institutional approach and inspired both from the social bond sociology (Paugam, 2008) and works of the life course sociology (Guillemard and Gaullier, 1999; Van de Velde, 2015), a model of the living experiences of retirement with low pensions will be presented. Based upon the articulation of foresight strategies and the shape of life course, four ideal types of subjective experiences of retirement with low pensions will be presented: the welfare retirement, the frustrated retirement, the vulnerable retirement and the miserable retirement.

RS07 - Greece and the European Socioeconomic Crises

RS07 | Session 03a Greece's Prospects: Structures of Core-Periphery and the EU

Cores and Peripheries : How the management of the Eurozone crisis generated enduring structural dependencies and inequalities

Noëlle Manuela Burgi, Philip Samuel Golub, Eleni Kyramargiou

Centre national de la recherche scientifique (CNRS) - University Paris I, France; American University of Paris; Institute of Historical Research/ National Hellenic Research Foundation
golub(at)univ-paris1.fr, pgolub(at)aup.edu, eleni_kyramargiou(at)yahoo.com

Applying structural theoretical frameworks to the way in which the EU (and particularly the Eurozone) managed the global financial crisis since 2010, we argue that a new durable configuration of dependency and subordination has emerged in a Europe newly divided between dominant cores and dependent peripheries. While dependency theory was widely used in the 1960s and 1970s to elucidate the historically constructed relations between the industrialized countries of the Euro-Atlantic « North » and « Southern » postcolonial societies and states, it proves a powerful tool to understand current divergent EU patterns. A close analysis of the structural adjustment policies implemented by transnational European institutions and the most powerful EU states (e.g. austerity regimes, privatization programs, forced restructurings of labour markets and laws and so forth) brings to light a methodical effort to establish and consolidate a new system of domination. The paper examines the case of Greece, focusing on the reconfiguration of the working class municipalities and the port of Piraeus, which was forcibly wholly privatized in August 2016. Once one of the vibrant industrial and urban working class areas of Greece, whose economic activities irrigated surrounding communities and the rest of the country, the port has become an enclave comparable to the Latin American industrial enclaves described in dependency theories. Piraeus can thus be understood as a microcosm of a broader process. The consequences include a loss of sovereignty and, crucially, the dispossession of local communities.

E.U's fading lure

Angelos Kontogiannis-Mandros, Corina Petridi
King's College London, U.K; University of Athens, Greece
angeloskm(at)outlook.com, petridi.corina(at)gmail.com

Our aim in this paper is to examine the impact of the 2015 Greek referendum on attitudes towards the European project. In this broader context we pay special attention in the examination of people's perception as to the relation between E.U. membership and Greek democracy's robustness as well as the role played by the former in the unravelling of the Greek crisis. Something which brings us to public's changing attitudes with regards to the role and importance of the national state vs that of supra-national unions such as the E.U. Such an analysis will provide the basis for a subsequent evaluation not only of the depth and character of the emerging Euroscepticism but also of its implications for the inability of the power bloc to articulate a hegemonic discourse able to resolve the legitimacy crisis that currently underlies the political system.

Methodologically speaking our analysis follows a mixed method approach that combines survey data and forty interviews with individuals from both sides of the yes/no divide. This enable us to illuminate better the differences that exist between the two groups (i.e. yes voters-no voters) while keeping track of the general development of these attitudinal trends with regards to the entire population.

Greece after the world economic crisis: is there a last chance for a take-off within/without the E.U.?

Emmanuel Alexakis
University of Crete, Greece
alexakem(at)uoc.gr

In Greece we are already experiencing the seventh year in crisis and unfortunately the signs are anything but good: no exit in sight yet, although much effort has been undertaken, more so by those who are less responsible for our predicament.

In this paper it will be argued, first, that as far as the Greek economy is concerned, the crisis did not come as a result of the respective worldwide one but it preexisted, being thoroughly concealed by the political system itself. Secondly, and maybe more so important, it is urgent to realize that the Greek problem is far less economic/financial and much more a problem of political culture, that refers to the wider issue of the lack of rules and standards that generally modulate social life and action. And, thirdly, I shall try to delineate, in a most tentative manner, a possible course Greece could follow in the post-crisis era. My thesis is based on the following: a) the course of today's globalization affects each and every one; let us also not forget that its most profound characteristics are of a neoliberal origin, b) the narrower context, within which Greece is found, is that of the European Union and, more specifically, that of the Eurozone, c) nowadays global and neoliberal capitalism differs significantly compared to that existed

in the pre-1989, bi-polar world, so policies adopted to cope with it, should be accordingly different, and d) return to a situation similar to the pre-2009 state of affairs should be out of the question, both because of the wider-objective conditions as well as due to Greece's all-important need of structural change and modernization.

Foreign investors and Greece during the sovereign debt crisis: an economic sociology approach

Nikolaos Souliotis

National Center for Social Research-EKKE, Greece
nicolassouliotis(at)hotmail.com

The paper will examine a number of selected particular foreign direct investment (FDI) projects in Greece during the sovereign debt crisis (such as the privatization of the ex-airport of Hellinikon). The main research questions of the paper are:

- How the bailout agreements affected the institutional framework that regulates FDI in Greece?
- Which are the specific configurations of institutions and actors that shape the investment projects under research?

The paper will comprise two parts which correspond to the above-mentioned research questions. The first part will analyze the changing FDI-related institutional framework during the crisis as a process of "state rescaling", that is as a process of reorganization of political authorities at the national and supranational levels. The second part will present an analysis of the actors who are involved in the selected investment projects. For this purpose the paper will use socio-professional data in a Multi-Correspondence Analysis. Data used in the paper will come from official documents, the press and interviews with policy-makers.

RS07 | Session 04a Refugees and Migrants into the Economic Crisis

Mobility and Social Justice: Theorizing migrant/refugee mobilities in crisis-stricken Greece

Apostolos G. Papadopoulos, Loukia-Maria Fratsea
Harokopio University of Athens, Greece; Harokopio University of Athens, Greece
apospapa(at)hua.gr, fratsea(at)hua.gr

During the last six years Europe has been in the midst of the most severe recession since the Second World War. Migrants are amongst the most vulnerable groups and usually the hardest hit by the economic crisis. Although the impact of recession on migrant employment differs between sectors, rising unemployment rates are often accompanied by rising anxiety about the availability of labour market opportunities.

For the last couple of years migrant flows towards Europe and Greece has been escalating while an existing 'migration crisis' was recently paired with a refugee crisis leading to increasing concerns

regarding the integration prospects and challenges.

Especially during the economic downturn much of discussions and research focuses on enduring territorial inequalities in Europe and increasing social cohesion taking into consideration the various spatial levels. However the relations between territorial inequality and mobility as well as between mobility and social cohesion and spatial justice remain unexamined.

The paper attempts to provide a bridge and link between the various facets of mobility (i.e. international migration/ internal migration/ refugee migration) with the concepts of territorial inequality and spatial justice. The paper elaborates statistical data from various sources (ELSTAT, EUROSTAT) and policy documents in order to explore the socio-economic characteristics and the settlement patterns of recent migration flows. The aim of the paper is to discuss the concept of spatial justice in view of the recent migration/ refugee flows towards Europe and to touch upon the challenges posed in the design and implementation of migration policy in Europe.

Facing the refugee crisis in Greece and Hungary. /Cognitive maps, social distance and national stereotypes

Nikos Fokas, Gábor Jelenfi, Robert Tardos
Eotvos Lorand University/MTA-ELTE Peripato Research Group, Hungary; Eotvos Lorand University/MTA-ELTE Peripato Research Group, Hungary; Eotvos Lorand University/MTA-ELTE Peripato Research Group, Hungary
fokasznikosz(at)gmail.com, jelenfi(at)gmail.com, tardosr(at)gmail.com

The paper deals with images of immigration in Greece and Hungary based on a parallel online survey of MTA-ELTE Peripato Research Group in Budapest and National Centre for Social Research (EKKE) in Athens at the end of 2016.

Ingroup/outgroup foci are conceived as latent structures accessed by measures of national stereotypes, prejudices, concerns and expectations regarding immigration also implying aspects of trust and social distance. An array of attitudes and values is added by contextual variables like personal experience concerning refugees and various groups of migrants, just as various sources of news consumption.

Besides survey, a wide data-base of online dailies analysis of Peripato studies enables us to outline, applying network techniques as well a semantic web of mutual images in the contents of daily papers of various political platforms from both Greece and Hungary. The dual comparison is of special importance in the light of the attention the media of both countries devoted to the events that took place in the other one between August and October of 2015, a climax period of the refugee crisis.

As a pivotal element of our conceptual frame, trust is approached by the application of a recent idea of the measurement of trust radius. A classical comparative instrument by Buchanan and Cantril has been

adopted for outlining differences of auto- and hetero-stereotypes in both countries. Adding to conventional ways of analyses, the elaborations also involve a (2-mode) network-like treatment of the bipartite matrix of attributes and national-ethnic entities for revealing the “cognitive maps” existing under certain settings in differentiated ways.

“A Point in Time: A Refugee Plight and a Local Crisis Response.”

Joanna Hadjicostandi

University of Texas Permian Basin, United States of America

hadjicostandi_j(at)utpb.edu

As we watch the world engage in the largest population movement since WWII and the daily reports on “migration crisis” and “refugee crisis” all over the world, Syrian refugees fleeing the war remain stranded in a small European country, Greece. The plight of these individuals is unique, because they are caught in the middle without much hope at present to move on to their desired destination, to meet family or friends.

Greece, at the same time, has been facing tremendous political and socioeconomic problems through severe austerity measures, with questionable assistance from the EU. The refugee crisis has been particularly hard on the country and its people, especially over the past two years, with the possibility of getting even worse affecting not only economic conditions, but also social values and cohesion in the country.

This presentation focuses on my study of a refugee camp in the city of Kavala, Greece during the summer of 2016, to identify the issues families faced in crisis situations. Women, men and children of all ages shared life histories, dreams and challenges they faced during their travels, as well as how they dealt with everyday life, while waiting to go to their desired destination country. It further examines the intersection of refugee issues in camps with the continuous economic and social recession that local populations and governing bodies face in Greece.

Integration in an era of (forced) mobility: Ethnographic insights from the Piraeus refugee camp

George Mavrommatis

Harokopio University, Greece

georgemavrommatis(at)msn.com

The European refugee crisis abruptly changed the migration dynamics of many EU member states. As a result of this mass movement of refugees, the Western Balkan route was formed. Along this route, informal settlement camps were created to cater to the needs of people on the move. This paper is based on ethnographic fieldwork that took place at the port of Piraeus (Athens, Greece) camp. Through insights from participant observation, it brings to the fore imaginaries of movement and inclusion in Central, North and North-Western European societies along

with ephemeral acts of local integration as a result of arrested mobilities on the ground. On an abstract level, migrant/refugee integration theory is characterized by a sedentarist, normative and/or heuristic thinking. It is defined by a strong analytical bias to structure than agency and by a single-minded emphasis on a sole geographical scale/space/place that does not take into account geographical movement. Can we think of another way to theorize integration for this era of intense mobility? Can we conceptualize it not only as stasis, but also, as a fragmented process on the move, too? These are some of the theoretical and empirical dilemmas that the European refugee ‘crisis’ has thrown out on us.

RS07 | Session 05a Subjective Experiences and Emigration from Greece

Contemporary Greek emigration: professional groups’ resilience to crisis

Sokratis M. Koniordos

University of Crete, Greece

koniords(at)uoc.gr

The focus of this paper presentation is on emigration from Greece, which forms a part of the new European migration. This migratory wave entails emigration from countries suffering from economic crisis, has largely been triggered by it and is primarily oriented towards western/northern European countries.

The paper draws from a set of 230 face-to-face interviews with persons, most of which are highly educated professionals that have emigrated since the eruption of economic crisis in Greece. From this material it emerges that this migratory movement although individualized, nevertheless is patterned too. These patterns are presented and discussed.

This migration may be seen to operate in defusing some of the hardship-related tension and to alleviate economic strain that actors and their families experience. In addition, the particular migratory movement may be seen to play a rather significant role in achieving a modicum of resilience for particular categories of migrants and for their families too, both in the home country and in the host country so that they might, at a later stage, attempt to return. However, such resilience does not conform to a universal pattern. Instead, it correlates with specific social class backgrounds and levels of education/training and orientations.

New Migrations from Greece to Germany in the Age of the Economic Crisis: Biographical Perspectives

Irini Siouti

University of Vienna, Austria

irini.siouti(at)univie.ac.at

The paper focuses on the new migrations from Greece to Germany in the age of the economic crisis. In the first part of the paper the structural conditions of the new migration phenomena since 2009 will be compared with the so-called ‘guest workers’ migration

from Greece to Germany during the 1960s. In the second part of the paper, the results from a qualitative research project on new migration processes to Germany will be presented, focusing on the biographical perspectives. It will be shown that the biographical research perspective is particularly well suited to the empirical investigation of the dynamics of the new migrations because it offers a way of empirically capturing the diversity and complexity of migration phenomena through reconstructive biographical analysis. Thus, the collective trajectories as well as the subjective coping strategies which are available to the subjects as ways of dealing with social structures can be examined. In the last part of the paper the thesis will be discussed that in the context of the socioeconomic crisis new migration forms and family networks as transnational social support are constituted, in which transmigration becomes established as a way of life through transgenerational subject practices.

A Comparison of Subjective Experiences and Responses to Austerity of UK and Greek Youth

Athanasia Chalari, Clive Sealey
University of Northampton, United Kingdom;
University of Worcester
athanasia.chalari(at)northampton.ac.uk,
c.sealey(at)worc.ac.uk

This qualitative study explores the ways that the younger generation in Greek and UK have been affected by austerity policy measures. These two countries have been at the forefront of intense social, political and economic transformations that have impacted particularly on young people's current and future lives. This study aims to explore similarities and differences in young people's subjective experiences and responses as from this, it may be possible to discern whether there is a general, long-term negative effect of austerity across Europe. The data shows that there are some similarities in the two cohorts' subjective experiences and responses, but perhaps more interestingly some significant differences. The study discusses what the implications of these differences might be for young people and society in these countries, in terms of impacting on the ability of the younger generation in a way that has the potential to destabilize their personal and professional lives now and in the future.

Greece in crisis: The debt and guilt discourse and subjectivation processes

Maria Kontos, Evangelia Tastsoglou
Institute for Social Research Frankfurt a.M., Germany;
Saint Mary's University, Halifax, CA
kontos(at)soz.uni-frankfurt.de,
Evie.Tastsoglou(at)smu.ca

The aim of this paper is to analyse the impact of the large moralising media campaigns in European countries, and especially in Germany, concerning the Greek debt and imputed guilt of both the Greek people and the Greek state for the current crisis, on

subjectivation processes of Greek people. We explore subjectivation processes taking into account their complexity and dependence on class positions and downward socio-economic mobility processes set in motion by the profound economic and social crisis. Our method consists of discourse analysis of online fora emerging in the Greek online newspapers. In this paper, we present our findings from the analysis of a forum in the online publication of the newspaper Kathimerini from an early phase of the crisis, namely the year 2011. We discuss the complex processes of subjectivation by identifying (i) perceptions of the crisis and (ii) its reasons, (iii) individual and collective ways out of the crisis and (iv) identity processes visible in the contributions of the online forum. Our focus will be especially on the negotiation of the Greek national identity in relation to the arguments related to the guilt of Greek people for the generation of the crisis.

RS07 | Session 06a Employment in Crisis Conditions

Employment policies under the risk of default and their impact on vulnerable groups

Constantine Dimoulas, Despoina Papadopoulou
Panteion University Athens, Greece; Panteion
University Athens, Greece
kostas018(at)gmail.com, papadodes(at)gmail.com

The upsurge of the global financial crisis in 2008 found Greece unable to react on time and effectively in order to overcome its financial and employment deficiencies. In front the risk of default the successive Greek Governments asked three times, in a period of only five years, for the financial assistance from the European Central Bank and IMF whilst accepted very strict austerity measures which did skyrocketed the unemployment rates. Under the constraints of austerity and strict surveillance the until then dominant labour model which was based on full and stable employment is fully challenged with the widespread activation of a variety of flexible formulations and policy measures.

This paper investigates the employment initiatives undertaken by the successive Greek Governments during the long lasting sovereign debt crisis and their impact on vulnerable groups (2009-2017).

Based on the results of the research conducted as part of FP7-INSPIRES project, we investigate how the policies promoted by international organizations in the field of employment and social policy during the crisis in Greece affected the vulnerable groups. By studying in depth the origins, the development and the implementation of policies focusing on to increase flexibility, to reduce further the labor cost, to strengthen welfare-to-work incentives and to improve the administrative capacity of employment services the paper analyse those factors and parameters that determine their implementation and their failure to reduce the fragility of vulnerable groups (youths, long term unemployed, migrants, disabled) whilst accelerated the embedded trend to transforms the existed dual social model to an absolute residual.

Financial crisis impacts on Albanian construction workers in Athens

Iraklis Dimitriadis
University of Turin, Italy
iraklis.dimitriadis(at)unimi.it

Decline in the construction activity affected disproportionately male Albanian population in Greece, since it was mainly employed in this sector; until now the Greek construction industry is suffering as a result of the consequences of the financial crisis. In addition to few job opportunities, wage and welfare cuts put in higher risk migrant builders' livelihoods; collective bargaining is actually inexistent, and formal working arrangements (when exist) between employers and employees occur at individual level. In this context, migrants are at greater risk at falling into irregularity due to the rigid connection between the existence of work welfare stamps that certify formally builders' working days and the stay permit renewal. What is more, unemployed or informal workers fail to meet the criteria to issue the health insurance card. Drawing on 29 in-depth interviews with dependent and self-employed construction workers, this paper aims at shedding light on the impact of the financial crisis on Albanian workers' work and lives during the last 8 years. It also brings to the fore forms of social reaction with respect to migrants' economic situation, that is expression of solidarity to and forms of resilience undertaken by migrant workers.

Historical and biographical dimensions of resilience in Greece during the socioeconomic crisis

Georgia Petraki
Panteion, Greece
geopetr(at)panteion.gr

The research program RESCuE was designed to analyze by making research into urban and rural areas, how households were affected by the economic crisis in 8 European countries and Turkey, how the households manage to face and to cope in the adversity of the crisis. In this paper we will present the longitudinal and biographical aspects of household resilience in Greece based on interviews taken between September-2014 and February 2015 in two places (one urban and one rural).

Therefore this paper will develop insights into the longitudinal and biographical structures and processes of resilience development in families and households in Greece, by focusing on trajectories of adaptation, coping and resistance over time, and by examining how household resilience to the crisis varies according to family life stage and generational relations. It will examine similarities and differences in everyday patterns of resilience across family life transitions and stages, in different socioeconomic and institutional contexts, across the case study countries and regions. This work is very based on Elder (1994) classic article, which elucidated four central themes at the heart of the life course perspective, namely: (1) lives and historical times; (2) the timing of lives; (3) linked lives;

(4) agency. These four analytical pillars also formed the basis for the national reports from each country. Patterns of Resilience during Socioeconomic Crises among Households in Europe Site: <http://www.rescueproject.eu/>

Unemployed experiences of citizens in Europe in times of crisis

Despoina Papadopoulou, Iakovos Pelekanos
Panteion University of Social and Political Sciences;
Panteion University of Social and Political Sciences
dpapado(at)panteion.gr, ipelekanos(at)yahoo.gr

In 2013, during the financial crisis, a European research was conducted among 7 European countries (France, Germany, Greece, Ireland, Portugal, Romania and Spain), which was financed and prepared by the European Commission. The study was named "Facing the crisis. The coping strategies of unemployed people in Europe".

Some of the crucial questions that this study sought to answer were the following: Which survival policies are adopted by the long-term unemployed in the European Union, in times of economic crisis? Do unemployed Germans or French share the same feelings with the unemployed Greeks, Spanish or Portuguese? Do all countries activate the same confrontation strategies against the crisis and the long-term unemployment? Focusing on the Greek case, what conclusions can we draw?

Are institutions, such as the formal organizations for job seeking, or the family, activated in the same way in the different countries, in order to confront long-term unemployment?

What about the rupture (break-in) of the organic participative bond (one type of social bond), because of an inability to access labour - is it dealt and experienced in the same way in all European countries?

The main purpose of the study was to demonstrate the divergent ways and mechanisms with which poverty, social exclusion and long-term unemployment are confronted in the context of economic crisis.

The data for our analysis in this study have been extracted from a survey consisting of seven qualitative studies based on in-depth interviews.

RS07 | Session 07a Changing Structures and Responses in Crisis Baffled Countries**A changing media landscape in Greece: New and alternative business models**

Nikos Leandros, Lambrini Papadopoulou
Panteion University, Greece; Panteion University, Greece
nleandr(at)panteion.gr,
Lpapadopoulou83(at)gmail.com

Media industries worldwide are undergoing a process of transformation under the impact of technological, economic, regulatory and political developments of crucial importance. In the emerging information and communication environment, the traditional media

business model is considered to be outdated and media content is now produced, disseminated and consumed in a new communication paradigm that is characterized by connectivity, interactivity and convergence (Leandros, 2008; Van der Wurff, 2012). However, in Greece, seven years after the onset of the Greek economic crisis, there still seems to be no record of the ways in which media organisations are trying to respond and adapt to all these changes and challenges.

The proposed paper aims to trace, record and analyse the new and alternative media business models that emerge in the current Greek communication environment. Specifically this study aims to investigate the way the new digital players respond to all of these changes, as well as the efforts of alternative media initiatives to adapt and survive in the new digital environment. The case study of this paper is the website news247.gr, and the cooperative newspaper Efimerida ton Syntakton.

The study is based on a case study methodology and aims to map for the first time the new media landscape that has been formed since the onset of the Greek economic crisis in 2010.

Leandros, N. (2008). Corporate strategies in the media sector. Athens: Kastaniotis.

Van der Wurff, R. (2012). The Economics of Online Journalism. In E. Siapera, & A. Veglis (Eds), *The Handbook of Global Online Journalism* (231-251) Oxford, UK: Wiley-Blackwell.

In search of the Caring Collective Subject

Isabel Gutierrez Sanchez

University College London, United Kingdom
isa_gs86(at)hotmail.com

The on-going crisis and the austerity project in Southern Europe have brought about important transformations in people's everyday lives and worldviews. The long-established and recognised institutions of welfare and care provision – the state and the family – have been severely hit, intensifying a deep-rooted crisis of social reproduction. Yet, as a response to the violent attacks on people's livelihoods, a myriad of citizen-led solidarity initiatives have emerged in many cities, seeking to reorganise social reproduction on the basis of self-management and cooperation.

The institution of these multiple and diverse grassroots groups has opened up spaces of political subjectivation, stemming from the collective organisation around specific and everyday matters of survival and care. New narratives of solidarity and care displace the focus on identity, and outline an imaginary that re-orders life expectations, re-defines wealth and transforms the field of desire. Very incipiently, a "caring collective subject" emerges through/in these experiences, yet in friction and contradiction with the contemporary dominant forms of subjectivation, which lay on the myths of independence and self-realisation through competition, consumerism and private ownership.

Crisis and times of destabilisation provide often the

conditions for the prefiguration of new subjectivities that seek emancipation from the prevailing order and powers, while questioning established ones. Amidst the contemporary context of rising precariousness, break down of welfare, and socio-political turmoil, solidarity initiatives from the grassroots have started to render sensitive an emancipatory politics of care. This paper seeks to explore these emerging sensitivities drawing on ethnographic fieldwork conducted in solidarity initiatives in Athens.

The Crisis in the Parliament: A comparative analysis of the evolution of parliamentary discourses on austerity in Greece and Portugal (2009-2016)

Chrisanthos Tassis, Tiago Moreira Ramalho, Kostas Kanellopoulos
Democritus University of Thrace; Sciences Po, Centre d'études européennes (CEE); University of Crete
chritassis(at)hotmail.com,
tiago.moreiraramalho(at)sciencespo.fr,
konkanel8(at)gmail.com

The bailout programmes signed by Portugal and Greece to face the sovereign debt crisis that progressively hit southern Europe since 2009 implied the adoption of a number of structural reforms. Yet, the implementation of the policy-agenda of the Memoranda of Understanding, monitored by the Troika (European Commission, European Central Bank and International Monetary Fund), often required a parliamentary process of discussion and legislation. These successive processes that lasted for several years and were handled by different parliamentary compositions reveal the evolution of the stances of the different parties in parliament to the whole reform agenda. In order to capture different degrees of appropriation or rejection of the policy agenda and underlying crisis narrative of the bailout programmes, the paper analyses comparatively a sample of transcripts of parliamentary debates in the two countries during the period 2009-2016. Examining the discourses of political elites at their source allows for a deeper understanding not only of the processes of policy-making during austerity, but also of the changes and realignments that occurred in these countries' political systems in recent years.

RS07 | Session 08a Solidarities and Innovative Attempts to Cope with the Crisis

Commons' Movements in the Greek Crisis

Antonios Broumas
University of Westminster, UK
info(at)lawandtech.eu

In the last six years, Greece has been hit by a vicious circle of relentless neoliberal restructuring programs. During the years of the crisis, throughout the country urban and rural communities of struggle have been formed, which tend to employ instituent practices and to acquire constitutive characteristics, in order to collectively address unmet social needs / desires and

ensure their collective survival. In this context, socially reproductive commons have emerged with social and solidarity economy initiatives in their peripheries, alternative forms of life in common have been shaped and societies have been set in motion with the potential to establish the material foundations of their collective autonomy. Within this huge gap of social (re)production, the constituent power of social movements emerges in germ form as a resurgent force with the potential to address these needs and desires and, correspondingly, shape life in common. In the neoliberal era, it is this potential of a constituent counter - power that has the capacity to constitute the contending power to the dominant force of the capital - state complex.

This contribution constitutes an attempt to reconstruct the narrative of the Greek crisis from the perspective of the social movements, i.e. a narrative of collective struggle and emancipation. Its aim is to identify the constituent characteristics of the Greek movements within a society in crisis and reveal the ways through which such movements have confronted crisis-prone neoliberal policies. The contribution first offers an analysis of commons' movements and mutual aid institutions, which emerged during the Greek crisis, and then gives a description of social and solidarity economy structures and their dialectical relation to commons' movements.

“Food for thought”: Exploring new consumer-producer relations in crisis hit Greece

Athanasios Lakrintis, Sophia Skordili
Harokopio University, Greece; Harokopio University,
Greece
alakrintis(at)hua.gr, skordili(at)hua.gr

Alternative agro-food initiatives have attracted considerable attention over the last decade. This burgeoning area of the literature, which is mostly built upon empirically grounded approaches, adopts the umbrella term “Alternative Food Networks” (AFNs). AFNs are notably conceptualised as forms of food provisioning counteractive to the conventional agro-food system. However, they encompass diverse practices that redefine consumer-producer relations by reviving or reinventing the traditional route “from field to fork”. Their starting point reflects the consumers' desire for quality, healthy and affordable food with a smaller ecological footprint and fair trade terms for producers. The existing examples vary from collective and community oriented schemes (e.g. farmer markets, community supported agriculture, etc.) to innovative business models of small artisanal agro-food firms and start-ups.

In Greece, during the crisis, several alternative agro-food initiatives have flourished. Consequently, new consumer-producer relations can be identified and new “foodscapes” become visible especially in urban areas. The big picture could be compared to trends in Europe and Northern America. When taking a closer look, though, the empirical findings reveal “idiosyncratic” characteristics linked to the incentives and the spatial context of these initiatives. In some

cases, their aim is to ensure household access to quality and affordable food products and/or to create a food security safety net for vulnerable groups of the population. In other cases, they are seen as the solution for ensuring employment and income. To conclude, it is evident that the crisis has been the catalyst not only for the emergence of such initiatives, but also for the ambiguities and contradictions that characterize them.

Ventures of Solidarity in the Greek Crisis

Nikos Kourachanis, Varvara Lalioti, Dimitris Venieris
Panteion University, Greece; Panteion University,
Greece; University of the Peloponnese
n.kourachanis(at)gmail.com, blalioti(at)gmail.com,
dvenieri(at)otenet.gr

This paper explores conceptually and empirically current dimensions of solidarity in Greece during the long huge crisis. Utilizing a broad range of secondary and primary data, including interviews for four case studies, our aim is to delve into the notion and expressions of solidarity, as these are reflected in policy changes and solidarity activities in four core areas of need: health, employment, housing and education. The paper begins by identifying sociological ideas about solidarity and facets of inequality in Greece. Next, the analysis turns into the respective four core social policy areas. It is argued that while the crisis resulted inter alia in the deterioration of the services provided in the fields of health, employment, housing and education, it also enforced a range of solidarity manifestations. For each policy area the discussion of the implications of the crisis is followed by the examination of solidarity activities and one case study, that is: social clinics, as exemplified by the social solidarity clinic in Corinth in the field of health; labour market, voucher programmes in the field of employment; the 'Housing and Reintegration Programme' in the field of housing; and solidarity schools, as exemplified by the 'Mesopotamia' solidarity school in Moschato in the field of education.

The Neoendogenous approach and the resilience of Rural Greece: Looking deeper into the remedy of Rural Development

Alexandra Theofili
Harokopio University, Greece
alex.theofili(at)hua.gr

During the past two decades Greek rural areas have undergone a series of social and economic transformations, mainly in the form of population change and economic restructuring. Agriculture is no longer the backbone of rural economy, employment and income generation resulting from traditional, primary sector activities have declined and farm household members have turned to other productive sectors of the rural economy or even migrated to the urban areas.

However, the «de-ruralization» process suggested above, appears to be reversed during the long

recession that the Greek economy is undergoing since 2010. Although the austerity measures led to unprecedented unemployment rates and severe income reduction, Greek rural areas compared to the urban proved to be more «resilient». According to Greek Statistical Authority unemployment rates in rural areas remained below the national average, the contribution of agriculture sector to GDP has raised, the number of the employees in the agricultural sector remains stable and moreover an outward migration towards the rural areas has been recorded.

Taking under consideration the evolution and consolidation of Neoendogenous Rural Development (NERD) theories, which stress out the role of non-local actors in the potential of rural areas to shape their future, this paper will attempt to describe the social and economic transformations that took place in the Greek countryside, present how the long economic recession affected the «de-ruralization» process and attempt to identify any links between the counter urbanization and the implementation of LEADER initiative -a European NERD policy- in the Greek countryside.

RS08 - Memory Studies: The Arts in Memory

RS08 | Session 01a Vera Zolberg: Memory and the Arts

Vera Zolberg's Creativity and Contributions to International Sociological Networks

Jan {Janet} Lee Ann Marontate
Simon Fraser University, Canada
jmaronta(at)sfu.ca

The proposed paper celebrates some of Vera Zolberg's creative contributions to the theoretical foundations of sociology of the arts and culture, with particular attention to her formative influence on networks of international scholars working on projects related to the field of memory studies. Vera Zolberg's formative influence nurtured and mentored a diverse group of researchers, supporting and enhancing their collaborative work and fostered the formation of enduring international networks of collaborators.

The aura of museums as modern cathedrals of the sacred

Siobhan Kattago
University of Tartu, Estonia
siobhan.kattago(at)ut.ee

The historian Jay Winter argues that memorials and history museums are modern cathedrals in which individuals publicly reflect on sacred themes such as death, suffering, sacrifice and violence. They are, as he notes, 'modern cathedrals' which express 'a reconfiguration of the sacred'. At the same time, Vera Zolberg reflects on history museums as sites of social structure and theatres of spectacle. Although the growing interest in memorials, war monuments, history museums and former concentration camps sites can be understood as attempts to reflect and learn from the past, there is also a sense that rituals of commemoration might just as easily slip into choreographed routine. If Jay Winter calls our attention to the juxtaposition of the sacred and the profane in a memorial, Vera Zolberg's work on museums and the arts directs our gaze to the aura of objects such as the Enola Gay to frame how we see and understand the world.

Vera Zolberg: Her Way

Graciela Miriam Trajtenberg
The Academic college of Tel Aviv Yaffo, Israel
gtraj(at)mta.ac.il

On Tuesday, November 15, 2016, Prof. Vera Zolberg had passed away. I at first only knew her as an author but over the time, I revealed that she was both: an academic model and a wonderful person. My first encounter with her was through her book *Constructing a Sociology of the Arts*. Along with the sociology of the arts, she had other special fields of inquiry: the sociology of culture and the study of collective memory. Her outstanding academic qualities were embodied in each of them.

I met her for the first time many years ago in a Conference held in Barcelona and then few months later in Exeter. The first morning in Exeter, I was having breakfast in the hotel's restaurant when Vera came in and naturally asked if she can sit with me. I was astonished! I barely could answer yes. However, over the time, I have learned that, that was her way: Vera's gift for friendship. Her way was an unusual mixture of rigorous academic work and goodwill. We were nurtured by her presence in our life and her way will continue illuminating our present and future.

RS08 | Session 02a Urban Space and Memory

Cracovia: Ghost of the Local Past or Part of a World-Class Architecture?

Apolonia Sejkova
Masaryk University, Czech Republic
polushka(at)gmail.com

Modernist architecture in the Eastern Block has been mostly labeled as boring, ugly or uninteresting for the past decades. After the fall of communist monopoly on creating urban spaces, the pool of actors with access to shaping the face of cities has been enlarged, which also brought other kinds of "ugly buildings". This experience, together with a gradual change in the plurality of evaluations of the communist era legacies in the collective memory of East-Central European countries has made it possible to spread the expert discourse on value of (socialist-)modernist architecture. Based on cultural sociological theories of meaning shifts and collective memory in connection with French pragmatic sociology, I want to offer a way to understand the process of reevaluation the meaning of a specific building in Cracow, Poland. Hotel Cracovia, just across the street from Polish National Museum, was built in the 60's according to plans of architect Witold Ceckiewicz. It had already been planned for demolition, however an intervention by a group of architecture theoreticians in cooperation with activists brought a temporary halt of demolition. Subsequent negotiations didn't bring much hope to conservationists, until a *deus ex machina* moment, when the ministry of culture bought the building to make it into a museum of Polish design. But still, the socialist-modernist architecture critique and justification in an anti-communist discourse continues...

Bridging the boundary: Imagined city – imagined community

Elzbieta Joanna Opilowska
University of Wrocław, Poland
elzbieta.opilowska(at)uwr.edu.pl

Over the past centuries borders have continuously changed their functions, shaped by historical events, political powers, and social and cultural forces. Therefore borders should be understood as dynamic social spaces that appear and disappear and are constantly negotiated and contested in public discourses. Urban reality is created through the content and the way its residents talk about a city. The city is created and lived (meanings are awarded to what happens in the city, how it transforms and generates urban space) precisely in the narratives.

Imaginarities that can be conceptualised as coherent sets of ideas, images, symbols, emotions, beliefs and convictions are often used to legitimise political projects, and everyday projects pursued by individual agents.

The aim of the paper is to discuss the artistic imaginary project of Slubfurt that was implemented in the divided city Frankfurt (Oder) and Słubice at the German-Polish border in order to facilitate cross-border integration and to create common identity. Can the artistic performance bring the two border communities closer together? Based on the analysis of project documents and expert interviews I will try to explore the role of the artistic projects in overcoming historical trauma by creating of a new city narrative.

Live Archive: Animating Memories of Post-Industrial Spaces

Oleksandra Nenko
ITMO University, Russian Federation
al.nenko(at)gmail.com

The 'grey belt' or industrial belt is a massive territory around the historic centre of St.Petersburg and an urban representation of Soviet Petrograd. After the fall of Soviet Union the industries were closed down and nowadays are 80% underused. The industrial belt was subject to numerous foresight sessions and architectural projects, but they stayed on paper. New projects for the territory such as creative clusters were left unaccomplished due to the lack of investments. Being a blind spot for the majority of citizens, architects, investors, the 'grey' territory has a great cultural memory of the now neglected epoch as well as hosts a bunch of new residents and practices - sporadic craftsmen workshops, unregistered ethnical minorities doing unskilled labour, rehearsal and design studios. The area is full of stories that no foresighter or architect will ever know unless we let them speak through arts.

'Live Archive' is an art-science project aimed at creating a transformable archive of memories of this appealing area. It is focused on the 'Red Triangle' factory, which used to be the greatest manufacturer of rubber in Soviet Union. The research part of the

project comprises mental mapping, video-recording of personal stories of former workers and current residents, and collecting artifacts symbolizing different times and lifestyles. The artistic part is dedicated to creating site-specific games and walks, as well as visual and sound installations in the factory. In our paper we present 'Live Archive' as an approach to animating memories of neglected post-industrial areas with sociological and artistic means.

GULAG History Museum in Moscow as a reflection of traumatic experience

Ekaterina Postnaia
National Research University "Higher School of Economics", Russian Federation
e.postnaya132(at)yandex.ru

The research represents the case of GULAG History Museum in Moscow, which belongs to the category of "museums of conscience". This type of museums functions in order not only to preserve memory, but also to reinterpret tragic events of the past. The GULAG Museum sets the mission to admit the past and turn to compassion and conception by creating "the site of memory", constructing space for public discussion and involvement into socially important activities. The methodology is based on the descriptive case-study. Empirical data was collected from February to April of 2015 in museum building in the centre of Moscow, including interviewing, participant observation, analysis of visitors' books and questionnaires. The data shows a variety of ways for grasping the museum idea: such social practices as "edutainment" – obtaining knowledge using interactive technologies and "time machine" – possibility to feel authentic experience of repressed people were marked. The museum is visited by different types of people, such as professionals, students, relatives of repressed, foreigners and occasional visitors. The results show that museum is perceived as the controversial place, both sacral and public, where individuals obtain knowledge, actively communicate and experience authentic emotions of repressed people. The goal of the museum resides in bringing memory of Soviet repressions to public discussion and actualize this theme in modern Russian discourse.

RS08 | Session 04a Representing collective violence

September Events as a Sample of Collective Evil-Responsibility

Mehmet Yıldırım
Ankara University, Turkey
mehmetyildirim777(at)gmail.com

Anatolian has had distinctive characteristics as a rich geography which embodies many different cultures for years. But, it was just three decades after the proclamation of the republic when this cultural diversity started to be destroyed and Turkish-Sunni domination became clear. As a result of the minority policies of the government, minorities began to think

that the government treated them like a “step-child” and Cyprus issue, which gradually became violent in this period, affected the attitudes of Turkish-Sunni people to minorities considerably and essentialization-categorization tendency, which was defined as a result of the power of abstraction by Zygmunt Bauman, became significant. Anti-Greek discourse which was mainly expressed by the Association of “Cyprus is Turkish” and spread because of Cyprus issue expanded to all minorities on 6th of September, 1955. Expression of this statement turned into action and violent events took place, which would be called as “September Events” later. Some of the people who had been living in the same neighbourhood with the minorities for years were directly involved in these events and while some of them led the mad crowd to the houses and workplaces owned by minorities, some people were just spectators. Although there have been many claims and theories about the events and these events haven’t been completely clarified yet, there were two truths about the events: September Events took place as a collective evil action and responsibility belonged to a collective group rather than a couple of people or a small group. This study aims to analyze the September Events in terms of collective evil-responsibility using “The Question of German Guilt” by Karl Jaspers.

The AKP's New Turkey: From Present To Past

Reyhan Ünal Çinar
Ankara University, Turkey
reyhannal(at)gmail.com

Since their inception, the nation-states are designed to be homogenous, monolithic entities. The political power that constituted the modern Turkish nation state, Kemalism, has defined the modern Turkish identity as secular, positivist and progressive, excluding the religious as regressive and marking it as its “internal other.” Since 2002, Islam-oriented AKP have assumed power to express the voice of the repressed and challenge the “official” parameters of Turkishness. Especially after 2010, the AKP has embarked upon a project to deconstruct the official Kemalist discourse on Turkish identity by way of advancing “New Turkey” as an empty signifier. Accordingly, a civilizational discourse has been employed to replace the modernist/Westernist paradigm with the Ottoman/Islamic identity. The identity is rooted in Ottoman Empire contrary to the republican roots in the national independence war. Portrayed as the closure of the 90-year-old Kemalist “paranthesis,” the AKP’s New Turkey project entailed undermining the Kemalist historiography and rituals and re-narration history, re-definition of national days and re-desinging of their celebrations. This paper discusses the way in which the AKP re-narrates the history and reconstructs the past to construct the so-called “new Turkey” by borrowing from collective memory studies. In particular, this paper utilizes P. Nora’s “memory spaces” and P. Connerton’s “commemoration ceremonies” to explain the AKP’s “new Turkey” project.

The Conflict Between History and Memory: Assyrians As a Disregarded Society

Esra İnce Özer, Eda Özcan Yılmaz
Ankara University, Turkey; Ankara University, Turkey
esrain90(at)gmail.com, mirayeda(at)gmail.com

In this study, the reason of why Assyrian massacres is disregarded in the Turkish political history will be tried to be addressed within the framework of social memory and confrontation. On this point, as Michel Rolph Trouillot referred in his piece “Silencing the Past”, reasons behind historical narratives which are non-overlapping with the social memory will be subject to review. Alongside with the differentiation between normative reality and claimed reality in the historical narrative, due to several reasons, even more overreachingly than confrontation, distortion and disregarding strategies appear before us (Trouillot, 2015). As the subject of memory and reminiscence, the Assyrian society’s affliction in the Anatolia is represented scarcely any in historical documents and books. Whereas, the affliction of the Armenian society as a minority, although being distorted from reality has more coverage in the historical narrative. In this context, the emphasis put by Halbwachs “history follows a path different than the memory and leaves some occurrences out of the picture” should be taken into consideration (Assmann, 2015). This state of affair demonstrates itself at the historical narrative concerning Assyrian society and poses an example of disregard. Disregarding and trivializing the reality causes memories to be lost, therefore, after a while there would not be a memory to be mentioned about resisting to history. In this case as T.W. Adorno states, the risk of “realization of a humanity which does not remember” arises. At this stage disregard may pose a threat which may lead up to erased memories and weaken the memory-history cohesion (Trouillot, 2015). In the study within the scope of these threats, background of non-representation of the Assyrian society’s experiences with its implications will be tried to be evaluated.

Languages on the Verge of Extinction and Memory: Kirmanckî (Zazakî) Example

Nadire Güntaş Aldatmaz
Ankara University/ Faculty of Communication, Turkey
nadirega(at)hotmail.com

In this study, the language policies of the Republic of Turkey, which is built on the multilingual, multicultural Ottoman Empire territories, and the language losses created by these policies will be examined within the frame of cultural memory theory.

This frame will cover the example of the Kirmanckî (Zazakî), one of the languages spoken in a region of Turkey and one of the languages that is at risk of disappearance according to the findings of the UNESCO Atlas of the World’s Languages in Danger.

To homogenize the nation, the main objective of the repressive-assimilationist policies systematically applied to the outsiders is to erase the memory. For this, the language which is the carrier of cultural

memory has been exposed to the danger of extinction by being taken out of the public sphere and imprisoned in houses and turned into a language which only the elderly speaks in the houses. It is thought that Kirmanckî, which is the target of the policy, has experienced serious losses in the last 50 years. For this purpose, it is aimed to interview at least 10 people who had talked only Kirmanckî 50 years ago and have children and grand children today in order to investigate the level of cultural change or language loss in the period from grandparents to grandchildren.

RS08 | Session 05a Theatre, Art and Memory

Performing memory. Participatory theatre as a means of memory work

Katarzyna Niziolek

University of Bialystok, Poland

katarzyna.niziolek(at)gmail.com

Theatre has long served as a means of social engagement with the past, used by both dominant and subordinate groups. With the quite recent paradigmatic shift in the humanities, known under the label of the performative turn, theatre has become even more important as a medium of collective memory work, not to say the politics of memory. On the other hand, the present-day participatory turn in the arts is taking artistic practices from the confinement of arts institutions, to a more open space of public and community involvement. In the theatrical field, these changes have introduced a new genre, which is constituted by diverse modes of grassroots engagement in the creative process: from the provision of documentary content, through the directed use of an artistic situation, to the co-operative creation of a theatrical piece. At the same time, it is a genre that gives way to more inclusive and polyphonic discourses, narratives and histories in the public sphere. The problem that I address in the presentation is one of the relation between participatory theatre and collective memory. Pierre Nora famously claimed that memory can sustain only when it is performed, practiced, repeated. If this is the case, is participatory theatre the location of live memory in the modern, archive-oriented world? Is it, referring to the terminology of that author, a sort of a lieu de mémoire - a space where the past is collectively recalled? For answers to the above questions I search among a number of participatory theatrical (or performative) productions that deal with conflicted, often traumatic, memories of the past, question the prevailing historical frames, and/or make space for the otherwise marginalized voices.

Cultural Cold War – Realism X Idealism, in the present and in the past.

Maria Cristina Castilho Costa

Universidade de São Paulo - USP, Brazil

criscast(at)usp.br

The Observatory of Communication, Freedom of

Speech and Censorship of Universidade de São Paulo – OBCOM-USP, has been studying censorship to artistic and cultural production since 2000, building its body of work upon Miroel Silveira Archives, a set of files composed of 6137 processes of prior censorship to theater, covering the period from 1930 until 1970, in Brazil. The Observatory gathers researchers from different academic levels, who study how, within that timeframe, the State interdicted theatrical plays of political and social approach under the justification of defending order, family, childhood and morality. Those plays, bearing a tone of criticism and denounce, were modified or vetoed, and no longer staged and presented to the public.

Researchers from OBCOM-USP have also been developing researches related to the attempts of interdiction on artistic and cultural works in Brazil and abroad, after the second half of XX century, when official agencies of censorship were extinct. Based on material published on the Web in different languages, it organizes a Digital News Library (Hemeroteca), which discloses such attempts of veto to films, books, TV and radio shows. Such material is available at <http://www.obcom.nap.usp.br/hemeroteca.php> and shows that a censorship culture persists in different countries of all continents, long past the extinction of the State-bonded censorship agencies. On the other hand, our researches evidence, in studied cases, that a Cultural Cold War still lives on, just like in the past, providing opposition of quite different aesthetic models: the Critical and Denouncing Realism against the Disciplinary and Superficial Idealism.

"To re-stage the play "O Canto do Papão Lusitano" ("The Song of the Lusitania Bogeyman") by Peter Weiss - A historical document on Portuguese colonialism

Cláudia Guerra Madeira

FCSH/New University of Lisbon, Portugal

madeira.claudia(at)gmail.com

Nowadays, there are numerous Portuguese artist-researchers in all artistic areas working on (post) colonial memories, such as the Dictatorship, The Revolution, the liberation movements, the Colonial War, (post) colonialism, Returning, etc. This process, which began to expand and become more evident as the 40th anniversary of the April 1974 revolution and the end of the Empire approached, seems to contrast with the alleged lack of support for several other artistic projects emerging in the revolutionary and post-revolutionary process in Portuguese society. Portugal is hardly unique here, since post-memory studies in several European countries show the same silence regarding traumatic national events (Heinich 2011; Hirsch 2012; Madeira 2016). It is legitimate, however, to ask what transmission processes have been verified, as well as to question how some of these projects can be re-presented in our current society.

This paper aims to discuss Peter Weiss's play, "O Canto do Papão Lusitano" ("The Song of the Lusitania Bogeyman"), which was premiered in 1967 at the

Scala-Teatern in Stockholm and is now reenacted by Teatro da Garagem (with dramaturgy by Cláudia Madeira and staging by Carlos Pessoa). It is possibly the most important theatrical historical document contemporary with the Portuguese dictatorship and which, since the revolutionary process, seems to have fallen into oblivion.

Contested sites of genocide. Artistic practice against forgetting.

Lukasz Posluszny, Roma Sendyka
Adam Mickiewicz University, Poland; Jagiellonian University, Poland; Research center for memory cultures, Poland
posluszny.lukasz(at)gmail.com,
rsendyka(at)gmail.com

We would like to present first results of a research conducted in a grant Contested Sites of Genocide and their Influence on Collective Memory, Cultural Identity, Ethical Attitudes and Intercultural Relations in Contemporary Poland. The project strive to critically expand memory studies by investigating contemporary cultural and social functions of such sites of genocide located in today's Poland, that potentially could have become sites of memory (anchoring collective memorial practices) but were not granted this status. The central hypothesis is that contested sites of genocide play vital role in the processes of identity formation and in fashioning of the attitudes toward the past, being only apparently removed from social and cultural circulation as "not representative" or "redundant". Their impact is but different from the one identified within the theory of the "lieux de mémoire". These non-sites of memory are especially former killing sites located in small towns and rural areas, where victims' bodies has been lying since a violent act and resonating down the memory of living inhabitants. On the other hand, we observe spatial and material consequences of genocide, where buildings of cultural activity were adopted or destroyed, creating noticeable oddities and dissonances, such as parking lots, markets, shops, cinemas, swimming pools etc. Presentation will therefore discuss dynamic relationship between sites of memory and non-memory mediated by various (counter)commemorative and artistic practices. We will illustrate these processes by analyzing biographies of places, which include site specific installations, photographic and video projects, but also vernacular interventions of local activists.

RS08 | Session 06a Politics of memory and monuments

Solidarnosc Square in Szczecin: how to intersect public commemoration and protest through design?

Maciej Kowalewski
University of Szczecin, Poland
maciej.kowalewski(at)usz.edu.pl

Dialogue Centre Przełomy (Breakthroughs) at

Solidarity Square in Szczecin (Poland) was awarded the European Prize for Urban Public Space 2016. The Square and Centre are located underground were established to commemorate the victims of the urban revolt of December 1970 in Szczecin and served mostly as a place of official celebrations. Regardless its respectable form the space was used by skateboarders and this usage was discussed as "inappropriate" in the place of victims. At the end of 2015 local Solidarity trade union submitted proposal of the site protection: as principle, the square was to be allowed only for religious ceremonies, official and military parades. The proposal was rejected and on 3rd October, 2016 at the square Women's Black Protest took place - several thousand, multigenerational crowd demonstrated against the projects of radical restriction of abortion law. In the text I argue that the choice of the Solidarity Square as place for this protest was extremely effective, using the mediation of unique architectural design. Photos of Black Protest in Szczecin are very suggestive - curved edges makes demonstrators present themselves as a "stormy sea of human heads". Space of commemorating December 1970 victims again became a political space: recalling in the same place the urban revolt from 1970, brings back the discussion on local memory. Referring to this example I discuss the political potential of public commemoration sites design.

Eliminating to remember- The Vandalism of Chiang Kai-shek's Statues in Taiwan

Hung-ling Yeh
National Taiwan University, Taiwan
indulgency(at)gmail.com

Ever since the pioneering works of postmemory studies, many scholars have been content to explore the transmitting of the traumatic experiences in the family. The photographs of the Holocaust are often seen as a primary medium for example. This analysis of the vandalism of Chiang Kai-shek's monuments, however, points to another passage of transmission of trauma. Nearly forty years after his death, the statues of Chiang Kai-shek have been increasingly targeted while the island confronts its contested past. As one of the most divisive historical figure in contemporary China, Chiang was seen as a hero by some for resisting communist China on the one hand, and was regarded by some as an autocrat on the other. However, the long silenced public generally inclined to avoid the highly controversial memory even after the lifting of martial law. As a result, his stone figures are still ubiquitous around the country. Yet the indifference turned into hostile in recent years particularly in youths demanding the remove of effigies. The generations of postmemory fulfill and enrich their terror memory by removing and eliminating the statues in the public space. While hardly any of the young actors are the offspring of the purged as in most postmemory literatures, the driving force and meaning of their actions need other explanations. By illustrating the process of the construction, evolving and transmission

of the traumatic memory among the young protesters, I suggest the more theoretical discussion of postmemory are needed.

Counter-Monuments in/and the Urban Space: New Dynamics in the Social Construction of Memory

Natalia Krzyzanowska
Orebro University, Sweden
natalia.krzyzanowska(at)oru.se

In my presentation, I analyze strategies of material commemoration in contemporary urban spaces. My main attention is drawn to the distinction between traditional ways of commemoration – connected with traditional, figurative, neoclassical and ornamental monuments – and a new form of commemorating embodied by so called counter-monuments as new tools of stimulating supra-individual social identities as well as identity of the urban space as a social and cultural milieu. I depart from the look at memory as a profoundly social activity and an expression and active binding force of group action (Halbwachs 1992, Till 2001) and foreground the necessity of seeing memory as context-dependent and deeply localized in social and physical space (Hoelscher & Alderman 2004). I then turn to the analysis of counter-monuments as new tools of production of social space and its identity as well as a vehicle of social and cultural memory. In my presentation, I focus especially on contested 'living' counter-monuments – such as e.g. the Holocaust-commemorating Monument Against War and Fascism (Vienna 1988) – and point to their evolution and change over time as a way of on-going opening of new possibilities of commemoration offered to the public. On the basis of such and other examples analysed with critical-analytic tools, I argue that counter-monuments often transgress the traditional frontiers of public and private commemoration. They allow affordances necessary in the often over-individualised societies of late modernity where commemoration cannot be collectivised and ought be open to individual(ised) interpretations & experience.

RS08 | Session 07a Literature, Music and Memory

Literature And Testimony: A Study About Zabel Yesayan

Gizem Ekin ÇELİK
Ankara University / Faculty of Communication, Turkey
gizemekin(at)gmail.com

This study aims at rethinking the subject of literature and testimony of Zabel Yesayan, one of the leading representatives of Armenian literature, in particular. Zabel Yesayan is the first feminist of both the Armenian community and Ottoman society, who has been active in first feminist organizations, witnessed the 1909 massacre in Adana, and has changed her literature and life in line with the violence she witnessed, and she has been one of the 234 Armenian intellectuals to be deported in 1915, which has managed to survive that black list.

In addition to these features, her book "Among the

Ruins" () published in 1911 was effective in choosing her as the focus of this study. This book was described by Marc Nichanian as "the only Armenian work that can transform testimony into a literary work". In the study, it is essential to clarify the concepts first. In this context, the concepts of testimony, genocide and disaster will be analyzed. This analysis gains more depth regarding the historical and extraordinary testimonies of Ricouer, and Nichanian's argument about the impossibility of testimony. Literature is important in terms of the opportunity it provides as a breakpoint of the impossibility of testimony.

Talking about social remembrance or forgetting also necessitates taking all the dynamics of that social structure into consideration. Assmann has emphasized that remembering was an emotional and conscious relationship with the past. In this context, the traces of this relationship will be investigated by analyzing Yesayan's books.

Antinomies of Historical Memory

Jiri Subrt
Charles University, Faculty of Humanities, Czech Republic
jiri.subrt(at)ff.cuni.cz

Theoretical thinking in the humanities and social sciences is formed by opinions often based on very different starting points. As a result, there are certain recurrent theoretical problems, which appear to us as antinomies, dilemmas and paradoxes. The study of historical memory shows that even in these areas there are many conflicting opinions. This contribution outlines ten antinomies characterized by the following terms: individual memory and collective memory, spirit and matter, saving and deleting, irrevocable and revocable history, spontaneous and purposeful memory, myth and science, rationality and irrationality, liberating and traumatic memory, connecting and dividing memory, enlightenment and incorrigibility.

Aural Borders and Archival Silence: Field Recording and the Politics of Sonic Memory

Tom Western
Independent scholar, Athens, Greece, Greece
thomwestern(at)gmail.com

Nationalism is back at the top of the political agenda across Europe. Borders are closing, and various voices are calling for the protection of national cultures. Music is enrolled in these developments, and the resurgence of nationalism has run in parallel with an explosion of interest in historical field recordings of traditional musics. Heard as truthful transmissions of national pasts, these field recordings are understood as existing outside of mass culture, feeding into desires for national purity.

This paper listens to the production of field recordings in Europe after World War II, hearing how folklorists, anthropologists and archivists worked within transnational media infrastructures to produce national musics. Drawing on recent work on borders—wherein nations are understood as the products of processes

of bordering—the paper posits field recordings as political objects that were created to salvage nations and secure aural borders in postwar Europe. As a result, minorities, migrants and placeless people have been denied representational space in sonic histories of nationness.

The paper thus also explores the consequences of these histories in the present. As recordings return to the aural public sphere, online sound archives at once open a space for negotiating ideas of national memory, but also provide fixed representations of national cultures, limiting inclusivity and feeding into current political problems. Histories of colonialism and displacement remain silent. The paper concludes with examples of how current artistic practices utilise these recordings: either by celebrating these signs of the nation, or by drawing attention to archival silence.

Songs of resistance: Counter-narratives to globalisation

Padmaja Shaw
Osmania University, India
padmajashaw(at)gmail.com

India has had a rough historical brush with colonialism as a former colony of European powers (British, Portugal, Dutch, French). When India became Independent in 1947, some of its states were under the Portuguese and French control, which were integrated into the Indian union in early 1960s.

There were also 565 princely states ruled by independent maharajas, which were integrated into the Indian union. For the people who were living under the indirect rule of princely states, the struggle for liberation was two-fold, anti-imperial and anti-feudal.

The princely state of Hyderabad in South-Central India was home to a left-wing, armed peasant insurgency that succeeded temporarily in redistributing land in 3000 villages and installing progressive decentralised local government in 1946-48. However, the Indian army was sent in to this area to crush the nascent rebellion and to restore the status quo.

The resonance of this rebellion continues to inspire progressive movements and there is a rich heritage of folk music and literature that is still used to reclaim people's history all over the country. The people's music attempts to reframe and produce alternative perspective to the policies of globalisation that form the dominant discourse on mainstream media. More importantly, the music attempts to correct the attempts to co-opt historical figures and events by producing a counter-narrative.

This paper will attempt to present case studies of people's poets who have created revolutionary music that forms the cultural fulcrum in the mobilisation of popular movements.

RS08 | Session 08a Politics of Memory and Forgetting

The Memory Work on the Second World War in Poland

Marta Magdalena Karkowska
The Polish Academy of Sciences, Poland
mkarkowska(at)ifispan.waw.pl

In times of communist in Poland the memory of events and people involved in anticommunist resistance movement during the Second World War was contested, neglected or disregarded by the authorities. After 1989 and the collapse communist system everything changed and many of these issues became not only the symbols of national heroism and martyrdom during the Second World War but also symbols of resistance communist authorities oblivion and an attempt to distort the vision of the past.

One of the examples is Warsaw Uprising 1944 I would like to focus on. Nowadays in the public sphere in Poland we could see how the events, stories of people but also the signs connected with Warsaw Uprising 1944 are being reread and reinterpreted and the past is reconstructed and presented in new contexts and in new ways. These activities are manifested in many forms : not only new monuments or museums, new films or songs but also the bottom-up memory expressions like mural paintings, activities of historical reenactment groups, new body practices (like "patriotic tattoos"; popular in some groups) or the creations of new watchword commemorating the past and people who commemorated it (like in watchword "we remember 1944"). I would like to present some examples of public memory transformation and new forms of commemoration. In the end I would also like to ask questions about the Warsaw Uprising 1944 as an example of "winning" counter-memory or discuss issues like the limits of transforming the past.

The Possibility of Forgiveness without Forgetting: Dersim 38 Tertelesi (Massacre)

Bedriye Poyraz
Ankara University Communication Faculty, Turkey
poyraz(at)media.ankara.edu.tr

This study aims to discuss the possibility of forgiveness without forgetting in terms of Dersim 38 Tertelesi (Massacre) that was planned and implemented by the state. The Dersim 38 Tertelesi is the biggest and dirtiest page of the Turkish Republic. According to official documents made open by the Prime Minister of the time while the operation was being debated in the public, 13,806 persons were killed and 11,683 persons were forced into exile as a result of the operation (Radikal, Zaman, Cumhuriyet, 24.11. 2011). Unfortunately, such weapons of mass destruction as gas was used during the massacre of this scale as well (Hür, 2008, Taraf).

Although Dersim 38 start to take place on the agenda of media and politics to the certain degree, it is clear that the State does not intend to apologize or any reconciliation policy. In this context is it possible to

forgive? According to Ricoeur two difficulties must be avoided. The first would be that of confusing forgiveness and forgetting. On the contrary, we can forgive only where there is no forgetting, where the humble have been released from a promise.

“I think it is the mother who keeps the things going”: The Gendered Division of Labour of Transmitting the Memory of the Genocide Among young Armenians

Öndercan Muti, Öykü Gürpınar
Humboldt University, Germany; Ecole des hautes études en sciences sociales, France
ondercanmuti(at)gmail.com, aeyque(at)gmail.com

Marking the hundred years since the Armenian Genocide, in 2015 had a research group from Turkey started a research on the memory of the Genocide among the young Armenians in Turkey, Armenia, Lebanon, Germany and France. Consisting of 4 research assistants and a project coordinator, the research team has interviewed with 100 Armenians between the ages of 19-35. Throughout the interviews, the participants have answered various questions about how they remember the past, how the familial memory has been transmitted, how the knowledge of the genocide affects their daily life and political attitude as well as their emotional state, and what kind of practices of commemoration they prefer. In this paper, the fundamental outcomes of the research will be publicized within a comparative perspective. The gender differences on the patterns of remembrance, memorial transmission between generations, constitution of identity and selfknowledge in the shadow of genocide, and the effects of the genocide on the determination of political engagements of the young Armenians in Turkey, Armenia, Lebanon, Germany and France signify the main outline of the analysis. In this context, the analysis indicates an interpretation of how the gender plays a role in the postmemory of the Armenian Genocide. Also the analysis contributes to a comparative comprehension of the differing narrations of 1915. Accordingly, a variety of memorizing and dealing with a traumatic collective past among Armenian youth in different countries will be presented and analysed in a comparative historical and gender perspective. After revealing this variety of attitudes and strategies, diverse memory demands of Armenian youth in relation to Genocide we will be presented and discussed.

RS11 - Sociology of Celebration

RS11 | Session 06a Celebrating Identity: Community-Building, Rituals of Belonging, and Diasporic Experiences

Strengthening social ties: the role of the 'Gathering' in connecting the Irish diaspora

Bernadette Mary Quinn, Ziene Mottiar, Theresa Ryan
Dublin Institute of Technology, Ireland; Dublin Institute of Technology, Ireland; Dublin Institute of Technology, Ireland
Bernadette.quinn(at)dit.ie, ziene.mottiar(at)dit.ie, theresa.ryan(at)dit.ie

Festivals and events are important social practices which have collective, participatory celebration as their central core. Drawing on social capital literature, the study reported here investigates the role that planned social gatherings play in shaping social ties within family units, specifically within families whose relationships are stretched by diasporic ties across varying geographical distances. Empirically, it draws on a study of the Gathering, a 2013 tourism initiative that encouraged people in Ireland to organise 'gatherings' aimed at attracting 'home' friends and families scattered across the globe. The initiative produced some 600 communal celebrations that ranged from the miniscule to the enormous. A significant proportion of the gatherings were family celebrations and it is a sample of these that are investigated here.

Drawing on survey, interview and focus group data gathered from both the Irish based family members who organised the gatherings, and the diasporic family members who travelled 'home' from abroad to participate, the findings demonstrate the profound meanings that the gatherings had for all concerned. They served to create and recreate social ties, strengthening connections across families members separated by geographic distance (predominantly the USA, Canada, the UK and Australia) and by chronological time (returning family members' connections were sometimes generations apart from their current Irish relatives). They further served to renew and revitalise connections with the 'home' place and to build a sense of pride in that place not just for returning emigrants but for those family members living in Ireland. Finally, the findings show that a profoundly important role played by the 'Gathering' was to strengthen both national and family identity for both Irish-based and diasporic family members.

Disentangling the ins and outs of supremacy of appearing over being: the role of social networks interactions around consumer experiences building identity in the risk society

Laura Aso Miranda
Department of Sociological Theory, University of Barcelona, Spain
lauraasom(at)gmail.com

In the current scenario, the values guiding the behaviour of social actors are extensively subjected to the logic of the market. One of the greatest consequences of this trend drawing attention among sociologists is the growing importance of consumption both in the social and the personal spheres of life. In a previous paper, the concept of continuous consumption of new experiences was introduced along with its influence on identity construction in the risk society. The reason behind to highlight the relationship between this kind of consumption and identity is because the former is grounded on individualism, variety, change or novelty and this set of values allow individuals to become appreciated and reaffirmed.

This work aims to broaden the existing knowledge on the invisible forces driving consumer acts in the mentioned particular process of identity construction. Accordingly, a new element is introduced here with the support of the paradigm of symbolic interactionism of Mead and the externally conducted social character of Riesman: the role of communication of consumer acts in identity determination. Building on communicative methodology, which paves the way to collect quotidian insights of social actors from an intersubjective perspective while generating new sociological theory, this paper examine the extent to which 1) identity not only depends on what individuals live but on what they broadcast regarding the experiences they live, thereby developing certain types of celebration rituals; 2) social networks not only enable communication of consumer acts but strengthen these acts. As a result, interactions in social networks around consumption of experiences might be a significant driver for the dynamic of identity creation.

Young people at a revivalist movement's summer gathering: celebrating the community, or just celebrating?

Paula Karoliina Nissilä
University of Tampere, Finland
nissila.paula.k(at)student.uta.fi

This paper asks how religiosity is constructed in temporary celebratory settings through examining youths' experiences of rituals and activities. While the religious affiliation and public participation are declining, some collective religious activities have continued popular. In Finland, the open-air revivalist mass gatherings are still build on traditional, formal rituals, and yet they attract masses of people every summer. Furthermore, it is argued that especially the appeal to young people is essential for religious

communities. This paper explores the meanings that young, firmly involved participants attach to the summer event of the moderate Awakening movement, one of the two largest traditional revivalist movements under the protestant Evangelical Lutheran Church of Finland.

This paper perceives the gathering as a festival context though the gatherings are often separated from the secular ways of spending leisure time. Drawing on interviews, narratives and observation the results show that the religiosity of young people at the gathering is strongly based on the peer solidarity created through social activities in the context separated from everyday life. The gathering also signifies a liminal transition phase for the youths. In previous studies among Finnish revival gatherings, the spiritual content has generally stood out as the main motivator to attend. The preliminary results of ongoing analysis on how the community and its rituals construct a religious space for the youths show that the liberal communality of the movement is especially valued.

RS11 | Session 07a Celebrating Togetherness: Music, Dance, and Sport Festivals

1. Stakeholder relationships in the most important Danish sport festival planning process

Annette Michelsen la Cour
University of Southern Denmark, Denmark
amlacour(at)sam.sdu.dk

In 2013 the most important sport-for-all-festival in Denmark, the Landsstævne dating back to 1863 successfully took place in the city of Esbjerg. The relationship of the stakeholders managing the festival was the subject of a study of the difference in aims, strategies and power in the last four months before the festival. The stakeholders organized in the festival secretariat consisted of the DGI, who's the festival owner, the regional DGI stakeholder the DGI South West, one representative from the municipality of Esbjerg and a number of local associations. Differences in expectations, interests and aims as to the instrumental outcome of the festival were analyzed from an organizational power perspective. The study was a qualitative study consisting of nine qualitative interviews with stakeholders, a document study as well as participant observation during the festival. Whereas the DGI redesigned their festival call in order to rebranded the festival as a young festival, the city of Esbjerg used the festival to rebrand the city as a family-friendly workplace while simultaneously strengthening the networks between the civic society and the city. Some of the local sports associations took advantage of the festival's need for volunteers to recruit and strengthen the ties with potential, "sleeping" volunteers before and during the festival. In doing so, they came out of the festival with strengthened networks, while others saw the festival as an opportunity to train their collaborative skills of managing an event. The outcome of the collaboration during the planning process was a successful

rebranding of the festival and the city strengthening both the civic stakeholders and the municipal stakeholders and leaving the community of Esbjerg with improved event management skills.

Lithuanian national Song and Dance festivals: celebration to reproduce lost trauma

Nerija Putinaite
Vilnius University, Lithuania
nerija.putinaite(at)tspmi.vu.lt

Based on the case of tradition of Lithuanian National Song and Dance festival the presentation seeks to reveal, that politically inspired national celebrations built upon traumatic experience generate structure of meaning, which survives the political transformation and casts traumatic expectations upon the new reality. The tradition of massive National Song festivals was invented by the Lithuanian Soviet authorities in 1946. The political motivation to organize the Song festival was to create space for massive festivity, to restructure national symbols and national identity, and to mask the trauma of the loss of sovereignty. The festivals played a double role. Soviet political leaders used them to discipline national feelings and national expectations; and the society interpreted the festivals a conspiring celebration of the lost sovereign nationhood, and even as an act of "resistance" against Soviet politics of internationalization and russification. After Lithuania regained its independence after 1990, it continued to celebrate the massive Song and Dances festivals. The meaning structure of festivals persisted. Generated by the trauma of Soviet occupation nowadays it hunts for a new traumatising political actor. The meaning structure seats the "European regime" in the place of the former Soviet regime as a source of (lost) source of trauma. The festivals display the traumatic meaning structure in the new political and social reality and celebrates it as traumatizing.

"Classic sociological vs. historiographic approaches to celebration in relation to social organizing. A comparison of Emil Durkheim (Division du travail; Formes elementaires) and Fustel Coulanges (La cite antique)

Ismo Juhani Kantola
University of Turku, Finland
ikantola(at)utu.fi

A larger frame for this presentation resides in an attempt to understand the historical alteration of celebration: from early antiquity to modern times and beyond, as well as how to study it. A comparison of Durkheim's and Fustel Coulanges' research methods as well as their overall potentials for understanding the nature and place of celebration in different societies will be presented. For the elaboration of analysis the paper asks, should we also know something about the presence and role of art and technology (or skills and knowledge, know how, taste) in any kind of celebration? According to Adorno, in modern societies art is a substitution for religion; for Heidegger it is

technology. Now, are there celebratory rituals attached to art, to technology? It seems that there are. Art is a passionate form of celebration while technology's celebration is more of hype (or effervescence). The role of religion, art, and technology in the material practices celebration is discussed. The paper ends in concluding comments on the direction of explanation in Durkheim and Fustel de Coulanges: the first one derives religious collective feelings from social order while the latter one explains social order from the exigencies of religion. The paper discusses summarily the role and nature of celebratory practices, and their study, in early antiquity, early Christianity, and modern secular/multicultural World.

RS11 | Session 08a Celebrating the Sacred: Politics, Holidays, and Family Rituals

The manifestation of the holiday spirit across cultures. A comparative analysis of winter holidays diaries, in the UK and Romania.

Ozana Cucu-Oancea

Institute of Sociology, Romanian Academy, Romania
ocucuoancea(at)yahoo.com

Socio-cultural constructs, being the result of one's need for self-identification and legitimization as a member of social groups, and also the result of the necessity to structure and organize one's social and spiritual life, celebrations represent a valuable research tool that allows you to find out more about social values shared by a particular community, in a particular time at a particular place. The core concept of my research is the well-known syntagm „holiday spirit”, defined as a multidimensional value pattern, internalized through socialization, and emerged from the constant overlapping of the representations, existing at individual/community/society level, on how a holiday is supposed to be.

Being only a part of a longitudinal project, that aims at deepening the sociological knowledge of the dynamics of the holiday spirit, at three levels - intergenerational, along the individual life course, intercultural -, this paper examines the manifestation of the holiday spirit both in British and Romanian cultures, bringing into focus how individuals from different countries relate to the Christmas and New Year's celebrations.

Guided by Grounded Theory methodology, the comparative analysis is based on two qualitative data sets: one consisting of 30 British solicited diaries, held by Mass Observation Archive from Brighton, U.K. (13 `Christmas Day` diaries from 1986, and 17 `Millenium` diaries from 1999, kept for 2 weeks - Dec. 22/Jan 4), and one consisting of 32 Romanian solicited diaries (16 diaries from 2004 and 16 from 2010/2011), kept for 2 weeks, by the same sample, around Christmas time (Dec. 20/Jan. 4).

Reinventing the Sacred: Revival of the family Slava in Serbia

Mikko Lagerspetz, Sabina Hadzibulic

Åbo Akademi University, Finland; Uppsala University, Sweden

mlagersp(at)abo.fi, sabina.hadzibulic(at)abo.fi

The end of Real Socialism and the disintegration of the Yugoslav federal state profoundly changed the role of religion in Serbian society. The Serbian Orthodox Church experienced an upsurge not only because it was filling a perceived ideological vacuum, but also as a corner stone of nation building efforts. A unique celebration within the Serbian Orthodox tradition, the Slava, is one of the most visible ways in which religious and ethnic identities became intertwined with family life. The Slava is a celebration of an individual patron saint by a religious family and its closest friends; from the 2000s, however, it has also started to be celebrated by organizations such as schools, government institutions and private companies. The customs has also been adopted by families previously indifferent to religion.

The focus of this paper is on families in the process of discovering and reviving the Slava. How does a formerly neglected tradition again gain credibility, “objectivity” of the kind that is necessary for an institution to survive? How is the concept of the sacred re-established in a modern society otherwise characterized by rationality? How are the traditional practices molded and re-interpreted by families adopting them? The paper uses empirical material from open-ended interviews and an online questionnaire.

Celebrating Death in the Romanian Iron Guard's Ideology of Thanatic Nationalism

Mihai Stelian Rusu

Lucian Blaga University of Sibiu, Romania

mihai.rusu(at)ulbsibiu.ro

Under ordinary circumstances, death is cross-culturally a reason of loss and mourning. Human cultures have everywhere elaborated intricate and sober funeral rituals to cope with the pain of loss brought about by death. In stark contrast, celebration stands at the very opposite end of the ritual spectrum, forming a rather antithetical relationship with mourning. The interwar Romanian fascist Iron Guard conspicuously departs from these cultural expectations. This paper explores the movement's political culture by paying particularly close attention to its funeral practices. In the face of continuous state harassment and political persecution, the Iron Guard had drawn on the Christian rhetoric of martyrdom which allowed it to cast its fallen as martyrs. Through a wide range of funeral practices, the movement had sacralized death as martyrdom and saw it as endowed with vicariously redemptive power. By delving into the Iron Guard's necropolitics – i.e., its politics of death – as expressed in its funeral practices of burying, unearthing, re-burying and commemorating its fallen, the paper attempts to unravel the movement's thanatic

culture founded upon the cult of martyrdom and celebration of death. This will allow us to shed light on the “existential transvaluation” performed by the Iron Guard, in which life was defined as (spiritual) death while death was transfigured into (after-) life. The paper concludes by arguing that this transvaluation of reality with its celebration of death lies at the core of the Iron Guard’s hallmark ideology of thanatic ultranationalism.

RS12 - Sociology of Knowledge

RS12 | Session 01a Theoretical Perspectives in the Sociology of Knowledge 1: Communicative Constructivism

What is Communicative Constructivism?

Hubert Knoblauch
 Technical University Berlin, Germany
 Hubert.Knoblauch(at)tu-berlin.de

In the last decades, a new approach has been emerging which came to be called communicative constructivism. It is mainly based on empirical studies in sociology, communication, and other social sciences studies. Although they are inspired by the "Social Construction of Reality", they avoid the presumed "cognitivism", "subjectivism" and "relativism" as ascribed to Social Constructivism" by postconstructivists. In this presentation I will sketch the basic theoretical frame of the emerging theory of the communicative construction of reality. Correcting some of the problems of the Social Constructivism raised by its critiques, it is based on a notion of communicative action. After sketching some of the most basic categories, such as reciprocity, performativity and relationality, in the paper turns to the question how the approach can address the notion of knowledge. In the conclusion it indicates the relevance of these social theoretical notions in order to understand the move from what has been called the "Knowledge Society" to the "Communication Society".

Variety of Communicative Constructivism

Tilo Grenz, Michaela Irene Pfadenhauer
 University of Vienna, Austria; University of Vienna, Austria
 tilo.grenz(at)univie.ac.at,
 michaela.pfadenhauer(at)univie.ac.at

In Sociology, Social Constructivism is a common frame of reference. Especially in the German speaking Sociology of Knowledge "The Social Construction of Reality" by Peter L. Berger and Thomas Luckmann serves as a mile stone in theory. However, even here Social Constructivism has become the notion of an old-fashioned approach that is to be seen as deficient in regard to certain topics which today are a matter of course (e.g. body, materiality, performance, discourse).

Lately there have been various attempts towards a fundamental shift from Social to Communicative Constructivism including the "Mediated Construction

of Reality", the "Discursive Construction of Reality", the "Communicative Construction of Reality", and the "Communicative Power". With each attempt different conceptual priorities are related.

Since their common point of reference is the "Social Construction of Reality", the question to ask is how close the variants actually are to the reference. Hence, we focus on the variant's relation to the "dialectic" as the book's core-idea. This allows to discuss which variant can be located either as a further development of Social Constructivism or as a new development. Subsequently, the focus lies on the variants' closeness to each other. At least two questions come easily to mind: Is there only old wine in new skins or evidence of a paradigm shift? Since none of the above mentioned approaches intends to ignore the reference to Berger and Luckmann and all of them take empirical evidence as a rationale for its renewal: shouldn't they finally end up in a significant similarity?

The communicative construction of powerful, normative social fictions - The sustainability of love and the love of sustainability

Regine Herbrich
 Leuphana University Lüneburg, Germany
 regine.herbrich(at)conjunktiv.de

The presentation suggests to read "sustainability" and "love" as mostly normative, social fictions. It argues that it is useful to transfer Wolfgang Iser's triad of the real, the imaginary and the fictitious to the field of sociology of knowledge. With that, we will try to see how the real and the imaginary are intertwined in everyday life, and how their interplay manifests itself from time to time in figurations that can be called 'fictions', in the non-pejorative sense of the term.

Empirically, it will be shown, how the communicative construction of 'love' and 'sustainability' is accomplished by actors and in the framework of discourses. By doing so, several dimensions of the interrelations between love and sustainability will become visible. We will, on the one hand, discuss the question, how certain aspects of sustainability, as for example durability or 'mindfulness', are part of current concepts of love. On the other hand, we will ask and try to find first answers to the question, which emotions are linked to sustainability, which emotional styles are socially desired thereby and what love, especially caring and parental love as well as the love of god, has to do with sustainability.

It will be argued that the communicative construction, as a methodological framework, allows us to understand the complex interplay between the normativity and the emotionality of social fictions, such as "love" and "sustainability". It also helps us to grasp how both of them are communicatively related to each other.

RS12 | Session 02a Theoretical Perspectives in Sociology of Knowledge 2: Theoretical Positions

Phenomenology, sociology of knowledge and interpretive social research

Thomas S. Eberle
University of St Gallen, Switzerland
thomas.eberle(at)unisg.ch

Sociology of knowledge in the tradition of Berger & Luckmann (1966) has three pillars: a phenomenological analysis of the formal structure of the lifeworld; a sociological perspective on society as a constellation of objectivations, institutions and the symbolic worlds of their legitimation; and the actor's subjective view on society, its formation by internalization as well as the processes of handling meaning crises and of accounting for identities in interaction. Following Luckmann, it has become a common wisdom to make a distinction between phenomenological, egological analysis and cosmological sociological investigation, and to consider the structures of the lifeworld a protosociology that has been successfully described. Such a position has been seminal in many respects. Phenomenology is basically an epistemology that founds sociological analysis, and Alfred Schutz has greatly contributed to clarify the methodology of the social sciences. However, present-day sociologists are more engaged in exegesis of Schutz's texts than doing phenomenological analyses themselves, and they are hardly acquainted with the state of the art of phenomenological philosophy. Phenomenology has become a broad movement (Spiegelberg) and has diversified in many different strands. Even based on Schutz, different kinds of phenomenological sociologies have developed. In my presentation, I will demonstrate that phenomenological analysis is not only crucial to found the methodology of sociology, but also to achieve certain reflective achievements in empirical social research. Different types of research substantiate this, like ethnophenomenology, lifeworld-analytical ethnography and phenomenological hermeneutics. I will focus on the latter and present a brief analysis of a concrete empirical case.

Practice and Action. Opposed or complimentary?

René Tuma
TU Berlin, Germany
rene.tuma(at)tu-berlin.de

Social Constructivism is maybe "the" core concept in SoK. With its grounding within Alfred Schutz phenomenological sociology it is general considered to be connected to theory of action, as has also been provided by Schutz (and Luckmann). The concept of action consists in the transformation of experience of finished actions ("Handlungen") into (modified) projects "modo future exacti". Those guide the action ("Handeln") that takes place in the here and now of the subject.

Nowadays Theories of Practice are established. They do not only highlight of bodily practices and tacit

knowledge, a new focus on processes and sequences, but also a theoretical shift that decenters or even removes the subjective standpoint. For Schatzki for example, not the subject, but the practice itself is the "nexus of all doings and sayings".

I am going to argue that some of its arguments are important, but in radical reading leads to new structuralist thinking. Many of their claims have already been addressed in the discussion, especially looking at newer developments such as communicative constructivism.

Also here the universal subject is slightly decentered and replaced by cultural specific identities that emerge as a consequence of communicative processes of communicative action (Knoblauch uses a processual concept of interrelated subjectivity and objectivations). Based upon this rethinking of the concepts of action is necessary: Do we need to thread action and practice not as essential categories, but rather as culture specific? How do practice and action work in complement to each other rather than as opposed concepts?

RS12 | Session 03a Theoretical Concepts in the Sociology of Knowledge: Shared Worlds

Companionship and its Varieties of meaning – A sociology of knowledge informed action-theoretical approach

Christoph Dukat
Catholic University Eichstätt-Ingolstadt, Germany
christoph.dukat(at)ku.de

The term 'Companionship' (companionship is used here as a translation of the German term 'Begleitung') is common in many (informal and institutionalized) contexts. Currently, 'unaccompanied refugee minors' (unbegleitete minderjährige Flüchtlinge) might be one of the - at least assumedly - most prominent examples - in Germany prevailed by authorities as well as public media. By problematizing 'unaccompanied refugee minors' simultaneously a need for 'companionship' is articulated. The overall spectrum of the societal usage and relevance of companionship is widespread. It comprises everyday encounters e.g. when someone asks a fellow-man or woman for a local shop he or she can't find by him- or herself and the fellow-men or woman offers to accompany the asking guy or woman to the shop. This intuitively reminds oneself of simple "going along with someone" respectively "bringing someone from place a to place b". Institutionalized contexts in which the term is used are reaching from activity specifications like 'Everyday companion' (Alltagsbegleiter), 'Spiritual guidance' (Geistliche Begleiter) and 'carer of dying' (Sterbebegleiter) to overall professional and also organizational conceptualizations like 'Everyday companionship' (Alltagsbegleitung) in elderly care homes. The follow-up question, the paper at hand is going to deal with is, in which way 'different' meanings of 'Companionships' are transported within these contexts. Therefore, sociology of knowledge informed action-theoretical concepts are consulted, based on

"The Structures of the Life World by Schütz/Luckmann (especially "The Social Arrangement of the Life-World of Everyday-Existence").

Everyday Reality of a Virtual World: Common Sense Knowledge in World of Warcraft

Ceyda Yolgörmez
Concordia University, Canada
ceyda.yol(at)gmail.com

"Under what circumstances do we think things real?" (James, 1950). Berger and Luckmann's 1966 book 'The Social Construction of Reality' dealt with this question and provided a systematized framework that takes common sense knowledge as the basis of everyday reality. In line with this particular conceptualization, this study aims to capture how everyday reality is constructed by exploring the processes that go into constitution of common sense knowledge in the virtual world of a Massively Multiplayer Online Role Playing Game (MMORPG), the World of Warcraft (WoW) (Blizzard, 2004). WoW players spend on average 20-25 hours per week in the virtual world (Statista, 2013); however, these spaces are rarely taken as objects for analysis in studies of everyday life. This may be due to the common assumption that everyday reality takes place in the 'real' world. This work, by challenging this assumption, argues that everyday realities are produced in virtual worlds as well; and looks at the habits and routines of the participants of the most played MMORPG worldwide (Activision Blizzard, 2016). In order to discern the mechanisms of everyday life, the researcher has conducted participant observation for 13 months in European servers of the game; and collected game-specific information from the official website, wikis and forums. The ethnographic data was then analyzed through three notions that organize the everyday reality (Berger and Luckmann, 1966): 'here and now' zone, intersubjectivity, and taken-for-grantedness. By showing the processes that go into construction of common sense knowledge, it is concluded that virtual worlds produce their own particular notions and experiences of everyday life, and that they make significant objects of analysis for sociological inquiry.

RS12 | Session 04a Key Topics in the Sociology of Knowledge I: Historical Perspectives on Sociology

Ludwik Fleck – European and World Pioneer in the Sociology of Scientific Knowledge

Mariusz Zemlo
Catholic University of Lublin, Poland
mzemlo(at)gmail.com

During my presentation I would like to take the opportunity to present the main ideas associated with the works of Ludwik Fleck thanks to which we can acknowledge him as a European and world pioneer in the Sociology of Knowledge.

Ludwik Fleck (1896-1961) - a physician and

microbiologist; carried out research into venereal diseases. Aside from conducting empirical studies he also gave a lot of meta-theoretical consideration to the development of medical science, as a result of which he inspired an intriguing discussion in the field of science studies and sociology of knowledge in general, and moreover a discussion concerning the conditions of scientific knowledge in particular.

The core of Fleck's deliberations that are connected with the sociology of knowledge concentrate around three guiding themes: diachronic terms of knowledge, synchronous conditions of knowledge and paradigm. Understanding the process requires taking into consideration the historical perspective. It decides about elements such as: a) terminology, b) ideas, c) ways of looking at problems, d) the methods and means of research, e) solutions, explanations, generalisations, classifications, theories, etc.

Synchronous conditions of cognition are contained in the statement that scientific knowledge is not an act of individual consciousness, but the result of social action. Every attempt at intellectually tackling the problem is connected with reaching out to what is social and done in an aura of social tension.

Another crucial feature of Fleck's scientific legacy is the paradigm. It is characterised as a specific thought style that - says the scientist - by means of "harmony of illusions" keeps solid, impenetrable structures.

During this presentation, these three key elements will be discussed in detail.

Sociology of Knowledge in the Lvov-Warsaw School (Szkoła Lwowsko-Warszawska)

Arkadiusz Jablonski
Catholic University of Lublin, Poland
jarski(at)kul.lublin.pl

The main aim of this paper is to analyze the findings of Lvov-Warsaw School relevant to the issues of the sociology of knowledge. I will try to show that even though this school is philosophical one, however, many issues are important for the sociology of knowledge. Collective achievement of the Lvov-Warsaw Schools representatives was the conviction metaphysical on how science should be cultivated. Formulated thesis in these investigations not found greater use in twentieth-century sociological research, but they are important from the point of view of contemporary of science and technology studies within the framework of the so-called non-classical sociology of knowledge. However, empirical studies undertaken on the work of the scientific too easily lead to relativism and subjectivism (collectivism). Relativism is associated with a too simplistic understanding of truth and rejection of the classical concept of truth for a pragmatic and deflationary conception of truth. Subjectivism (collectivism) is due to the treatment of products of knowledge and a lack of distinguishing between content of knowledge and object of knowledge, as well as, the lack of distinguishing between unstable mental products and durable psychophysical products. I will try to show the relationships between ways of interpreting these

concepts in the Lvov-Warsaw School, and as a result of these analyzes are presented differences in contemporary sociology of knowledge between constructivism and critical realism.

'Post Marx': the reception of Hannah Arendt in Italy and in Germany after 1989

Barbara Grüning
University of Bologna, Italy
barbara.gruning2(at)unibo.it

Hannah Arendt was a German-born Jewish political theorist, emigrated in the USA in 1940 because of the Jewish persecution in the Nazi Germany. Although in the fifties and sixties some of her works were strongly criticized and despite in the seventies and eighties her notoriety declined as a consequence of the hegemony of marxist theories, after 1989 she became an intellectual icon at international level. However, her consecration process in the transnational public space does not account for how her works and theories have been appropriated within specific national contexts.

The work moves then from the tension between the global circulation of Arendt's ideas and their uses in two countries, Germany and Italy, that shared similar historical experiences, pivotal in Arendt's political and philosophical reflection. Object of the comparison are the genesis and (social and symbolic) structures of the disciplinary fields where Arendt has been received, paying particular attention to their epistemological and institutional boundaries. The conceptual framework of the analysis is the Bourdieu's field theory and his studies on the consecration of (public) intellectuals. The analysis is based on quantitative (works on Arendt and quotations of Arendt in handbooks) and qualitative (semi-structured interviews with Arendt's expert) data, collected for the period from 1945 to 2015. Aim of the paper is to distinguish analytically between the 'public success' Arendt reached in the German and in Italian public spheres and her canonization in some disciplinary fields. I will finally argue that the different reception of Arendt depends chiefly on the prestige of her main mediators and on the different legitimization's criteria of public intellectuals which rule the different German and Italian fields of knowledge.

Is it possible to read history of sociology as history of receptions?

Mehmet Ali Akyurt
Istanbul University, Turkey
akyurt82(at)gmail.com

There has been an increasing interest in new ways of grasping history of sociology since the 1960s, as seen in collections of Tiryakian, Lepenies, Dayé and Moebius. As a result of the general orientation from an abstract, pure scientific, isolating and intellectual approach toward a concrete, institutional, contextual, relational and sociological one, history of sociology seems more like sum of scientific networks rather than an aggregate of abstract theories or a simple "history of thoughts". Even if there are certain continuities in

the historiography of sociology, such as focusing on sociologists/classics, theories/schools of thought, and national traditions, it is obvious that these "old" focuses are no longer handled from old points of view. Parallel to this transition, memories, biographies, book reviews, dairies, memoirs of and correspondence between sociologists become new research objects. This also widens the scope of history of sociology, and new units of analysis come forward such as membership to schools and circles, institutional and generational identities, socio-cultural and political background. The attempt to read history of sociology as a history of receptions (Rezeptionsgeschichte) is a great example for this shift. According to this relational and sociological approach, a generic and universal reading regarding a specific sociologist, school of sociology or national tradition has to be replaced by a multitude of viewpoints stemming from diverse locations in time and space. Instances for this research program would be Max Weber's reception in France, Chicago School's reception in Germany or German sociology's reception in America in certain periods. Moving from previous attempts, this paper aims to question possibility of reading history of sociology based on diverging or converging receptions stemming from various contexts.

RS12 | Session 05a Key Topics in the Sociology of Knowledge II: Power and Discourse

Critical Meta-theory Analysis of Szelényi's Work on the Relationship between Knowledge and Power

Karmo Kroos
Tallinn University, Estonia
karmo(at)tlu.ee

This paper discusses how critical meta-theory analysis relates to sociology of knowledge. Based on critical meta-theory analysis of Ivan Szelényi's work on the relationship between knowledge and power, I hope to provide the metatheoretical context that enables one to understand better his entire reflexive sociology of intellectuals. It will be demonstrated that one can do it systematically if a comprehensive frame of meta-theory analysis is adopted. While the general approach of it builds, among others, on Kuhn, Sorokin, Lakatos as well as Gouldner, it has been brought together by Ritzer (1988 & 1991) in his MU type of metatheorizing. More specifically, it will be shown how vital it is to analyze and understand: (i) the major underlying cognitive paradigms that underlie scholar's scholarship, (ii) key concepts and silent assumptions, (iii) the historical evolution of one's ideas, and (iv) how the sociocultural, political, disciplinary and methodological context influence the development of one's works. By reflecting how this multidimensional frame of metatheorizing was undertaken to study Szelényi's sociology of intellectuals from these four dimensions, methodological similarities and contrast to sociology of knowledge will be discussed.

To vax or not to vax: different answers, same discourse

Ioana-Alexandra Rusu

University of Bucharest, Romania
alexandra.rusu(at)sas.unibuc.ro

In the European Union, six out of ten people seek health-related information online, according to a Eurobarometer released in 2014. More than half trust such information and more than three quarters of Europeans believe they can distinguish between low-quality and high-quality information they find online. One special health topic researched and discussed on the internet is that of vaccination, as there is a heated debate between parents and “experts” on the utility, safety, and risks of vaccines. There are web pages, Facebook pages and groups, blogs, and forums dedicated to the topic of vaccination or, more generally, to health issues including vaccination, on both sides of the discussion.

This paper analyzes the discourses produced by each party – “vaxxers” and “anti-vaxxers” -, in order to figure out the way information is presented and what kinds of arguments are employed. The research focuses on selected blogs and their public Facebook pages produced by “vaxxers” and “anti-vaxxers”. The main findings are that, although there are major differences between the content promoted, both parties employ similar discourses and, to some degree, identical arguments. It is interesting to note that, although there is an abundance of scientific information on the topic, most arguments are emotional, even when discussing scientific findings.

Science and democracy within knowledge-society

Andrea Cerroni

University of Milan-Bicocca, Italy
andrea.cerroni(at)unimib.it

As we have been living in a quickly developing knowledge-society at least since WW2, scientific knowledge, either from natural and social sciences, is today the basis of almost every public policies. However, citizens' movements often vigorously contest science-based decisions, taking advantage from, and feeding as well, debates more or less grounded within scientific community. If knowledge is thought to be a (peculiar) public good, presently we are confronting dramatic challenges about current relationship between science and democracy and knowledge citizenship. Will be confronted documents such as Ventotene Manifesto (1941-1944), Vannevar Bush's Science the endless frontier (1945), Charles P. Snow The two cultures (1959/1963), Trilateral's The Crisis of democracy (1975) and from Horizon 2020, too. The urgent task for social science between socio-economic dire straits and sociological imagination deficiencies will be argued.

Construction of Consent in Neoliberalism: A Perspective from the Sociology of Knowledge

Dušan Ristić, Dušan Marinković

University of Novi Sad, Serbia; University of Novi Sad,

Serbia

dusanrist(at)gmail.com, ladumza(at)gmail.com

In this paper, we discuss the problem of the construction of consent in neoliberalism from a perspective of the sociology of knowledge. Despite the fact that it is impossible to find a consistent theoretical determination of neoliberalism and that there is no unique strategy of neoliberal practices, the authors claim that every day practices are a field in which neoliberalism is manifested most clearly. We consider the theoretical approaches from human geography and digital humanities to sociology of knowledge. Our assumption is that what is called neoliberal ideology can be identified through the hegemonic, discursive practices that in daily life are imposed as something “natural” – as a “normalizing” discourse, or in other words – as hegemonic common sense. We claim that this form of knowledge brings the changes in the context of the capability of people to ‘go on’ through the flow of largely routinized social life. Furthermore, neoliberal ideology in daily life is reflected through the processes of deritualization – disappearance of old connections among discourses and practices, among social fields. Neoliberal ideology brings the “illusion of unity” without the sense of the whole, solidarity, society. On the one side, older and stable hierarchies of society are fragmented and liquid, losing the signification as an ultimate source of meaning; on the other, there is a rise and growing importance of the digital platforms for social networking. We question the neoliberal ideology through the practices of deritualization in daily life that undermines the “old” matrix of society and with examples from the sphere of digital communication we are trying to demonstrate how the autopoiesis of neoliberal ideology works.

RS12 | Session 06a Key Topics in the Sociology of Knowledge III: Discourses, Affectivity & Subjectivities**An interpretive perspective on the affective underpinning of downward mobility, precarity and ethnicity**

Florian Elliker

University of St. Gallen, Switzerland
florian.elliker(at)unisg.ch

This paper attempts at further developing parts of a conceptually integrated framework for the study of three domains that are conventionally discussed in conjunction: firstly, the rise of socioeconomic inequality and the corresponding growth of ‘classes’ or ‘milieus’ that have been labelled the ‘new minority’ (Gest 2016), the ‘precariat’ (Standing 2011), or ‘strangers in their own land’ (Hochschild 2016); secondly, the rise of right-wing populist and conservative movements in the USA and Western Europe, advocating conservative and nationalist political ideologies; and thirdly, the intersection of the aforementioned domains with racial and ethnic categories and self-understandings.

The paper draws on a case study that focuses on the

formerly dominant but relatively small white Afrikaans-speaking population segment in South Africa. The process of becoming a minority after the end of Apartheid has been contradictory and ambivalent: While for some, social downward mobility has become a reality, the majority remains privileged when compared to the rest of the South African population in terms of wealth and income. However, an increasingly uncertain socioeconomic outlook as well as symbolic and political marginalization have created an overall sense of decline and precarity. The paper focuses on the hypothesis that dealing with socioeconomic and ethnocultural precarity does not seem to entail only 'rational' strategies, but also emotions. It considers how such an affective underpinning of processes of negotiating (politicized) ethnic self-understandings in the context of perceived precarity and downward mobility can be conceptualized.

Angry White Men and the Jihadist Subject - Global Subjectivation Processes from a Sociology of Knowledge Perspective

Sasa Bosancic

University of Augsburg, Germany

sasa.bosancic(at)phil.uni-augsburg.de

Regarding the emergence of a globalized 'society of spectacle' (Guy Debord), and considering the global distribution of knowledge through the new media and people 'floating' in and around cities all over the world, it becomes clear, that human subjectivities are no longer only bound to local ecologies. In this respect one has to take into account that "we and the people and things we choose to study are all routinely both producing and awash in seas of discourses" (Adele Clarke 2005, p.145). This paper proposes a methodological grounding for the empirical research on the discursive situatedness of the human subjectivities. For this I have developed a concept of subjectivation that is located in a Sociology of Knowledge Approach to Discourse and which considers the poststructuralist assumptions of the 'decentered subject' as well as Mead's, Goffman's and other's theories of identities. In this paper I will argue that an understanding of subjectivation as a 'sensitizing concept' (Blumer) establishes a broader perspective on the discursive situatedness of human subjectivities. In this respect I will discuss the uprising of two dominant global subject positions: the Angry White Men and the Jihadist Subject.

"Welcome to paradise [sic]" Discourse ethnography in the refugees' world/s in Europe.

Rixta Wundrak

University of Bremen, Germany

wundrak(at)uni-bremen.de

A shelter for refugees in Berlin, my experiences as a volunteer, and my participant observations as a researcher are the empirical setting which I will refer to in order to analyse the relationship between everyday knowledge, meanings of solidarity and

discourses around institutional help and asylum in Europe. Working at the shelter as a volunteer in October 2015, keeping by auto-ethnographic log-books with descriptions of experiences, feelings and visual associations related to discourses in the world of flight and asylum in European society today, led to a small live-world analysis. Based on this data, I will present a set of methodological propositions for the "The Sociology of Knowledge Approach in Discourse Ethnography". Auto-ethnography and live world analyses will be combined with Foucault's concept of heterotopia. Heterotopias are counter-sites, "the other place" of society, that can be found within the culture and that are simultaneously represented, contested, and inverted with the space in which they are embedded. I consider the shelters in particular and the migrant's world in general as such heterotopias. The questions will be answered, as to how "welcoming" as well as "deportation" are becoming patterns of meaning in this live-world and how they effect thinking and speaking. I will show how discourses structure tacit knowledge and practices, and conversely, how these patterns of meaning are constructed socially and communicatively in every-day interaction in the shelter and in society as a whole.

RS12 | Session 07a Key Topics in the Sociology of Knowledge IV: The Study of Sociological Knowledge

Translations of Sociological Knowledge: A Theoretical Model and Empirical Evidence of Practical Application of Sociology

Seweryn Rudnicki

AGH University of Science and Technology, Poland

sew.rudnicki(at)gmail.com

This presentation takes on the case of sociological knowledge and the process of its application in practice. It starts with a reconstruction of the key theoretical arguments indicating main barriers to the use of sociological knowledge: 1) the complex, emergent and reflective nature of social reality; 2) insufficient academic standards of the discipline and its backwardness in relation to the natural sciences; 3) orientation at purely scientific issues, not towards the needs of potential recipients of this knowledge; 4) organizational and institutional shortcomings of the discipline. Although all these arguments function within sociology almost as clichés, they are rarely validated with empirical data on the application of sociological knowledge.

The aim of this presentation is to review them in the light of the empirical evidence coming from the examination of 10 cases of technologies (research, consultancy and training methods) based upon sociological knowledge. The results suggest that neither reducing complexity and the reflexive nature of social reality, nor the usage of knowledge that meets highest scientific standards are the necessary conditions for the effective application of sociology. Instead, the findings suggest that: 1) the use of sociological knowledge to solve practical problems

can be more adequately described in terms of 'translation' of knowledge into a different type of object (e.g. technologies, recommendations, policies) involving displacements and inconsistencies; 2) to be successful results of such translation must offer value recognizable by its receivers. The resulting theoretical model of translation-transaction combines inspirations from actor-network theory and Luhmann's system theory.

Sociological Practices – A Gateway to Academic Sociological Knowledge?

Josef Ginnerskov Dahlberg
Uppsala University, Sweden
josef.dahlberg(at)gmail.com

What is academic sociological knowledge? Contemporary sociology is a dynamic and pluralistic academic discipline of numerous established subdivisions, each with its own state of the art knowledge. While some "theoretical heroes" are shared by the majority of the discipline, most are not. Few sociologists can give a general definition of sociological knowledge, even though most can distinguish their own "breed" from others and point out sociology's contributions within and outside academia. Previous studies have sought to map the philosophical foundations of sociology and the structural circumstances of key social theoreticians. These offer a solid historical basis for the foundation of contemporary academic sociological knowledge, but not a deeper understanding of what it is. With this presentation, I want to open up for a conversation on how to empirically investigate sociological knowledge in situ by sketching the outline of my PhD-project. In my study, I approach the problem by focusing on the meaning sociologists assign to this knowledge in the academic practices where it is embedded. Initially, a division is made between teaching and researching in academic sociology since the two strive towards dissimilar overarching goals. Each goal affect how knowledge can be (re)produced. Teaching and research are further on constituted by diverse sets of practices (lecturing, debating, writing etc.), which character and temporary context of implementation also determine what shape the situated knowledge will take. With these considerations in mind, I compare how meaning of traditional sociological themes (e.g. structure-agency, quantitative-qualitative and micro-macro) alter in different practices of teaching and research.

"Commensuration" as an analytic framework for studying the expanding measuring culture in social work

Teres Hjärpe, Elizabeth Martinell Barfoed
Lund University, Sweden; Lund University, Sweden
teres.hjarpe(at)soch.lu.se,
elizabeth.martinell_barfoed(at)soch.lu.se

This presentation is based on a PhD-project in social work dealing with measurements and statistics as knowledge base and source for governance of social

work activities. Social workers are currently experiencing the measuring and ranking of the quality of their work according to quantitative indicators, to serve the request, typical for our time, for better knowledge about the actual effects of the services delivered by the social workers.

Participant observations of a child- and welfare management team were made during a year when they, encouraged by the participation in a state-sponsored management course, were involved in the adaptation of national indicators. The ethnographic data identified a paradox with the status of the numbers as objective "truth speakers" on the one hand, and reluctance and confusions when applied to practice on the other, along with different kinds of implications for social work. Situations played out where misunderstandings of numbers lead to conflicts, where statistics were being manipulated, where problem areas were given lower priority because of immeasurableness and where the need to show satisfying statistics changed the content of the work. Situations when figures became important ammunition for more resources and influence were also identified. The presentation explores how sociologists Espeland & Stevens' conceptualization of "numbers that commensurate" can be used to analyze the foundation and construction of modern governance tools in order to illuminate the socially transformative potential of quantification. We wish to discuss how the framework suggested of five dimensions; work, reactivity, discipline, authority and aesthetics, can guide further exploration of the identified paradox.

Dissecting Social Groups with Imitation Game Experiments

Ilkka AT Arminen, Mika Simonen, Otto Segersven
University of Helsinki, Finland; University of Helsinki, Finland; University of Helsinki, Finland
ilkka.arminen(at)helsinki.fi, mika.simonen(at)helsinki.fi,
otto(at)segersven.fi

In Imitation Game experiments participants from two different social groups, via computers, type their own questions and answers in attempting to imitate one another's social group and recognize imitators from genuine group members. The method – based on Alan Turing's idea – was developed by Harry Collins and his team to empirically test the notion of interactional expertise, a knowledge referring to the capability to grasp the conceptual structure of another's social world. Collins's idea was to develop imitation games into a methodology to inspect the distribution of interactional expertise, hence illuminating how inclusive or exclusive social groups are and provide an analytical insight on what is the social group composition of societies. Our empirical work, however, has shown that different groups use different types of questioning strategies – questions and their assessments – making straightforward comparisons between groups or societal group compositions obsolete. Instead, we propose that imitation game experiments make visible interpretative practices of meaning making of group formation,

revealing people's methodical practices of building alignments between members of (different) groups, and in that way constructing social groups. Initially, in imitation games as in many forms of sociology, social groups were taken for granted basis for social identities. In fact, the experiments enable an analysis of the methodic practices through which participants form an epistemologically and empathically relevant relationship with the recipients thereby constituting the "groupness" of a social group. We open up the constitution of social group by exploring how "we"/"them" distinction is built as a social practice.

RS12 | Session 08a Key Topics in the Sociology of Knowledge V: Expertise & Politics

Policy learning as/and translation: the making of the Chilean policy makers in the UK

Barbara Foster
University of Bristol, United Kingdom
barbara.foster.2014(at)bristol.ac.uk

Drawing on 12 semi-structured interviews to Chilean Public Policy Masters' students in the UK, this paper aims to explore the ideas, values and beliefs that students have learned on the policy process in a different context than their country of origin (Anglo Saxon context). Scholarship programmes to study abroad Masters in Public Policy have fostered policy networks and policy mobility –or policy learning– processes that not only include the movements of policies across borders but also entail policy as a translation process. Adopting a policy post-colonial translation approach and using the Foucauldian idea of governmentality, this paper takes the Chilean case as an instance of translation and specific knowledge production process. Through an examination of students' narratives about their experience as master students in public policy and their expectations as future policy-makers the paper will show: 1) the extent to which these experiences of policy learning can be understood as an 'act of oppression' (Clarke et al., 2015) by which dominant ideas are translated from an Anglo Saxon to a Latin-American context, following a technical, objectivist and economic perspective, and reproducing a framing of policy only in terms of rational choice; and 2) the extent to which Chilean students' learning experiences are transformed into collective ones when they are considered products of a policy for advanced human capital formation and identify themselves as human capital, integrating an economic logic in their personal lives and in their relationship with other individuals and institutions. An evaluation on the limits and possibilities that a Foucauldian power-knowledge approach opens up for the study of translation policy process will be also included.

Think-tank researchers and the construction of intellectual credibility: a case study in the sociology of expertise

Jordan Soukias Tchilingirian
University of Bath, United Kingdom

j.s.tchilingirian(at)bath.ac.uk

Traditionally sociologists of knowledge have focused on experts and intellectuals found within established fields or professions. However, contemporary knowledge production often takes place beyond these bounded and relatively autonomous spheres (Stampnitzky, 2013). Think-tanks are an important example of this form of intellectual engagement.

Think-tanks and their researchers are located within an interstitial and ill-defined 'space between fields' (Eyal, 2011). This space is symbolically constituted, and also divided, by the worlds of science/academia, politics, bureaucracy, journalism and business (Medvetz, 2015). This is problematic for a think-tank researcher's intellectual credibility, as they lack the recognised cultural and symbolic capital derived from being located within an established field. Despite this, think-tanks are seen as valuable and relevant intellectual contributors to public life – and sometimes more so than traditional academic social scientists (Miształ, 2012). The question arises, how do think-tanks gain intellectual credibility?

In this paper I present the findings of a mixed-method social network analysis of the intellectual life within British think-tanks, and explore how think-tank researchers construct 'intellectual credibility'. I suggest that think-tank credibility is not a property or attribute of any profession, but emerges from a complex web of relationships across the established fields/professions they are located between. Think-tank researchers must engage in a complex 'dance' of positioning the symbols, capitals, and interests of a number of professions. Researchers must carefully stay in step with competing interests from different professions; at times aligning them, at other times blocking or obscuring them from one another, or risk losing their integrity.

The presentation of self in political life. On think tanks in Poland

Katarzyna Jezierska
University of Gothenburg, Sweden
katarzyna.jezierska(at)gu.se

In spite of claims of the advance of post-factual democracy, contemporary governance still requires expert advice. Different kinds of "political experts" exercise significant political influence without any democratic mandate or control in the form of being elected or responsible to the people (Garsten, Rothstein & Svallfors 2015). Among these actors, the sociological category of think tanks is especially interesting. They have no formal function in the institutional design of the democratic system and often operate in the clandestine. At the same time they need to gain some visibility and create an account of credibility in order to influence policy-making.

Think tank scholarship is heavily biased toward the Anglo-American context (Weaver & McGann 2000; Stone & Garnett 1998; Medvetz 2012; Kelstrup 2016). To remedy this bias, this paper will analyze think tanks in a Central European country, Poland. I contrast the

external and internal image of Polish think tanks, in order to understand the position these organizations are ascribed and aspire to. How do think tanks present themselves? How are they represented in the mainstream printed media? What role and position in the decision-making system are they ascribed/do they ascribe themselves? The analysis is based on a series of semi-structured interviews with Polish think tank leaders and qualitative content analysis of two major Polish newspapers.

The Influence of Macroeconomics in Central Banks: Knowledge Production and Distribution in the Federal Reserve

Jan Sparsam

Ludwig-Maximilians-University, Germany

jan.sparsam(at)lmu.de

The global financial crisis 2007-08 did not only induce a broad skepticism towards economic policy-making but also propelled the sociological inquiry of the causes of the crisis. In this context the guiding role of knowledge stemming from the academic discipline of economics has gained center stage. The involved research is currently forming under the label of 'sociology of economics'. The sociology of economics is primarily concerned with issues of economic sociology but processing them with instruments of the sociology of knowledge. One of the most prominent approaches in this research area is concerned with the performativity of economics: the production of economic reality according to economic models. Building on the sociology of economics, the presentation gives account of an ongoing research project that is based on a discourse analysis of documents issued by the Federal Reserve. The leading research questions are which kinds of macroeconomic knowledge are at issue at the Fed and how the transformation of academic knowledge into policy-relevant knowledge is conducted. The presentation will show the process of knowledge circulation in the Fed and identify the instances at which economic knowledge is applied. Furthermore, the main paradigms of central banking are tackled: central bank independence, inflation targeting, and monetary policy transparency. It will be shown that these paradigms are not simply performative effects of academic knowledge produced by macroeconomics, but pragmatically translated concepts according to a political regime of problem solving.

RS12 | Session 09a Key Topics in the Sociology of Knowledge VI: World Views & Politics

De/legitimation from the fringes: UK and Serbia, two worlds apart?

Vladimir Cvetković

n/a, Serbia

cvet(at)zaplanje.rs

In 2016 UK citizens voted to leave the EU. At the same time support for joining the EU is solidifying in Serbia, and administratively at least, it seems that

similarly to UK there is a steady progress towards the future status. Though these two events may appear to be at the opposite ends when it comes to what Europe means to the citizens of the two countries, they still have one significant thing in common: they are driven by the dominant opinions that social and national aspirations cannot be fulfilled inside/outside of the common Europe. Juxtaposed positions of the two societies provides a unique situation where making and unmaking Europe, (re)defining common idea and understanding of, happens at the same time.

This paper presents an insight into how cases for and against EU membership, in Serbia and UK respectively, are publicly articulated and promoted – specifically, what legitimation machineries are used and what legitimation patterns are being created. Based on the analysis of national press, particularly readers' opinions and letters concerning the EU discussion, and identified legitimation patterns, the paper further discusses how these legitimation patterns fit into the wider social and institutional context relevant for the issue, and what core social values are at play. Finally, similarities and differences between identified legitimation patterns are analysed in order to assess what distinct legitimation possibilities on one hand, and obstacles on the other hand characterise the two societies. The paper also presents a methodology for legitimation analysis inspired by Berger's and Luckmann's work in sociology of knowledge.

Changing role of public opinion polls in the Czech Republic – 1946 to 2001

Martin Vávra, Tomáš Čížek

Institute of Sociology of the Czech Academy of Sciences, Czech Republic; Institute of Sociology of the Czech Academy of Sciences, Czech Republic

martin.vavra(at)soc.cas.cz, tomas.cizek(at)soc.cas.cz

Public opinion polling was established in 1946 in Czechoslovakia under Ministry of information (Czechoslovak Institute of Public Opinion) but after only four years it was stopped. During first period of communist rule (1950') opinion polls were not carried out at all. In mid-sixties empirical surveys on public opinion were revived (with personal continuity to 40' polls). In sixties Institute was part academic field, actively communicating with media and producing data on politically sensitive topics. After invasion of Soviet troops in 1968, during period of so called "normalization" rapid changes occurred. Institute was moved from academy to Statistical office, personnel policy was changed and strict control of research activities was established. After 1989 Institute was looking for new meaning of its existence in (neo) liberal society.

We try to reconstruct framework in our paper in which all the transformations (and some continuities) mentioned can be interpreted as consequence of institutional, ideological and social changes and conflicts.

To complete the reconstruction, we try to answer following questions:

How topics of polls were selected?
 What was role of institutional background of Institute?
 How results of public opinion polls were used?
 We will also present how are these data from the polls archived and how can polls be used for new sociological and historical inquiry.
 The paper is based on analysis of documents and interviews with people working in Institute of Public Opinion during (some part of) period 1946 – 2001.

The Making of a New World View: capitalism, solidarity and subjectivity and the current political turmoil

Manfred Prisching
 University of Graz, Austria
 manfred.prisching(at)uni-graz.at

The triad of terms included in the subtitle of the conference offers an appropriate initial point for analyzing the present political change in world views. The American case is the most important and the most dangerous, but it will be partly the template for the process of “unmaking Europe”.

First, three wide-spread anxieties. “Capitalism”: until now the experience of wealth and security and the vision of further progress; replaced by economic crisis, job insecurity, income polarization, stagnation, and job drift to less developed countries. “Solidarity”: until now feelings of community and resonance; replaced by disembedding, foreignness, and estrangement in the own country. “Subjectivity”: until now reputation and respect; replaced by the experience of disrespect, contempt, and identity confusion.

Second: It can be demonstrated by the ongoing discourse about current politics (vocabulary, arguments, images) that neo-authoritarian messages (Trumpism as well as European groups) address just these elements, and thereby they are working to create a new world approach.

Third: There are three additional conditions for converting knowledge about the world successfully. First, the leader (in the most prominent case characterized by the “dark triad”: narcissism, Machiavellism and psychopathy). Second, enemies (preferably “above” and “below” the main electorate). Third, a vision (an understandable narrative in a complex world).

Therefore we have three sources of anxiety; three promises; and three additional catalysts. A “map” can be drawn showing the relations between these items. It is a topical case study about the mechanisms of how knowledge about society can be re-arranged and re-constructed, how a new paradigm of the world is moulded, and how the entrance into the “age of neo-authoritarianism” can be implemented. And Europe might be “unmade”.

RS13 - Sociology of Law

RS13 | Session 04a ADR & Cultural Mediation as Crisis-Management Tools

Court or Compromise as a Way Out of the Personal Conflict

Jacek Maria Kurczewski, Malgorzata Fuszara
University of Warsaw, Poland; University of Warsaw,
Poland
j.kurczewski(at)uw.edu.pl, mfuscara(at)op.pl

The four local surveys made three times in Poland in 1970s, early 2000s and mid-2010s are the base for presentation of the different ways used and advocated out of the personal conflict situation. The private criminal procedure, available in Poland in case of slander and abuse of physical integrity is compared with civil compensation procedure as both are initiated by the wronged individual and the fate of the case remains under the private control. The incidence (rare) of mediation in these cases is discussed. The transformation of the type of conflict related to change in the technology of communication is revealed. The court records are then compared with the ideal patterns of the dispute as declared in the interviews by the general local opinion. Finally, the research is put in the general cultural context and the cultural meaning of compromise or court authoritative decision analysed through decoding the contemporary value of honour (reputation) as against the practical utility of privately negotiated compromise settlement.

Cultural Mediation in Italy. A case of Lay Cultural Expertise in-progress

Franca Bimbi
University of Padua, Italy
franca.bimbi(at)unipd.it

In Italy, the term 'cultural-linguistic mediation' indicates an area of expertise relating to various practices: socio-linguistic, socio-legal and social assistance, all mainly aiming at representing new migrants, asylum-seekers, refugees, and partially those of foreign origin. Cultural mediation may be considered as example of hybrid expertise, in which we find a mix between certified competence and lay expertise, which have developed in various ways over time.

In the first part of the paper I introduce a preliminary reflection on the definitions and methods of cultural mediation involving a proposal for a contextual knowledge with an intersectional approach. The second part considers cultural mediation as hybrid

and lay cultural expertise in the relationship between endogenous and exogenous cultural conflicts in Europe. The mainstream line of thought of the Europe of universal rights and individual liberties tends to be represented as a culturally homogeneous universe of non-negotiable Euro-Western values, faced with the cultural differences of groups of migrants, considered in their turn as bearers of non-negotiable values. This representation tends to marginalise the cultural expertise on social studies. However, in countries with Civil law like Italy, juridical pluralism expands and cultural expertise is involved, practically to negotiate some conflicts defined as non-negotiable in principle. We can find some examples in the judgements of Italian courts when they recognise specific effects of polygamous marriages concerning foreign mothers and their children. The third part of my paper considers research lines on the Ngo organization and on the occupational profiles of Italian cultural mediators considering their biographies, diverse forms of training, and their professional or lay expertise and competences.

Kurdish cultural mediation and expertise : a gendered perspective

Orkide Izci
University of Padua, Italy
izciorkide(at)gmail.com

Cultural mediation and expertise -- which has always been important, constitute, more and more, an outstanding issue with "the refugee crisis" and the arrival of new migrants and asylum-seekers to the Western countries. People who come to the West belong to many different nations. However, this paper will report only the study on the Kurdish case which is important because of a fact which I will call "being guest at one's own home". This is because Kurds -- as a stateless nation-- even before becoming refugees, migrants, asylum-seekers and need cultural mediation in a hosting country, they have already had similar experiences in their own country such as cultural or linguistic mediation in Turkey.

This paper aims to explore the different types of relationship between Kurdish women refugees and men/women cultural mediators from viewpoint of national identity (Kurds as stateless nation) and gender. This paper will show using empirical methods from the field, how Kurdish women refugees and cultural mediators deal with issues regarding women, solidarity, identification, xenophobia from a gendered perspective. It is important to underline that this paper will take into consideration the personal experience of the cultural mediators in case he or she has been a refugee/asylum-seeker before. This will show us the role and --if exist-- different approaches used by cultural mediators towards women refugees and vice versa, with the particularity of the Kurdish case.

A critical approach to the language of human rights in spaces of confinement based on an empirical research on youth imprisonment

Nilay Kavur
Utrecht University, Netherlands, The

nilaykavur(at)hotmail.com

This paper aims to bring the prevalence and authority of the human rights discourse in its ability to secure justice in the criminal and youth justice systems into question. More specifically, based on the findings of a research on the roles of remand imprisonment (pre-trial detention) in the Turkish youth justice system, this paper aims to disclose how the prevalent discourse of human rights perplexes and misleads to comprehend the complexity of the roles attributed to remand imprisonment in penal politics to control the society. Building on the literature of sociology of human rights, I approach human rights as a socially constructed language embedded in the liberalism movement of Enlightenment, and demonstrate its compatibility with the quest for security through spatial control, at times when social security remains weak. The findings of the research indicate to an intrinsic relation between security-oriented, neoliberalizing managerialist governmentality and the language of human rights. Consequently, the social constructivist study of the language of human rights in the Turkish youth/criminal justice system shows that, the language of human rights is totally compatible with the managerialist governance of the criminal justice system in the neoliberal political economy. I argue and demonstrate that the compatibility stems from the common characteristic of the rights language and managerialism, which is, mystification of the structural patterns of getting in conflict with the law and individualization of crime in the liberal individualist governmentality.

RS13 | Session 05a Social and Economic Rights at Risk: The Response of the Legal System

Social rights in peril – Right to housing in Greece

Elisavet Panagiotidou
Aristotle University, Greece
elisavetpanag(at)gmail.com

Social rights derive from the social contract which gives to every state the freedom to use its authority in order to secure a minimum protection of these rights. References to social rights can be found in many international texts, such as the Universal Declaration of Human Rights (UDHR) and the International Covenant on Economic, Social and Cultural rights. During these hard times of economic crisis, it is necessary to redefine the scope of certain social rights. According to the article 25 of UDHR, the right to housing approaches the right to a real shelter, where someone can satisfy all his physical and emotional needs. This exact right in Greece seems to be irreversibly affected by the economic crisis. Since 2010, as an answer to prevent the total recession of this right, there is a special law in Greece (law 3869/2010), which aims to the protection of the principal residence in case that a debtor cannot pay his debts to banks or state agencies. However, which sacrifices should be made in order to be satisfied the economic-or even worse – the cash interest of the

state? Because, despite the existence of this law, there are too many people who have lost not only their jobs, but also their houses during the past six years, without having any protection, as even the best legislation may not be correctly applied. This essay attempts to present that preservation of social rights is a matter of policy and continuity for every state.

Legal institutions and household indebtedness in Greece: Judicial application of the concept of debt forgiveness under Law 3869/2010.

Charilaos Peitsinis
AUTH, Greece
xpeits(at)yahoo.gr

Consumer insolvency is a topic that has gained much prominence in the context of the greek debt crisis. Consumer bankruptcy proceedings have been recently introduced in the Greek legal order, through Law 3869/2010. The final stage of the procedure, which the debtor enters in the event creditors object to his debt restructuring proposal, purports to judicially regulate the debtor's obligations. In practice this means that in cases where the debtor's assets do not suffice, then the court taking into account the debtor's income, determines an amount that the debtor will be obliged to pay to its creditors, and relieves him or her from the remaining part of the debt.

The purpose of this study is to research the judicial application of the Law, and especially of the concept of debt forgiveness, as a counter-measure, aimed at alleviating the excessive debt burden carried by consumer debtors. Based on the biggest and most inclusive court jurisprudential data base (NOMOS), we will research the demographic profile of debtors (age, sex, occupation etc) and the main reasons for their indebtedness, to gain a truly sociological understanding of consumer bankruptcy. Furthermore, we will analyze the judgements justification with regards to the issue of debt relief, the criteria taken into consideration by the Judge, and the possible moral evaluations contained or lack thereof.

Challenges of participatory budget adoption in Polish cities

Ewa Jolanta Kryglon
Jagiellonian University, Poland
ewa.kryglon(at)doctoral.uj.edu.pl

In theory, participatory budgeting is thought to be an effective way to empower citizens and promote local democracy. However, in practice introduction of participatory budget in Poland met a number of unique challenges – moderate public interests, scepticism of lower-level city administration officials and media. In many cities those challenges brought questions about the necessity of participatory budget programme altogether.

This paper presents results of a research project that was aimed at examining causes of a low voter turnout in a participatory budget in Cracow. Opinions of various stakeholders were taken into account in explaining the phenomenon - city activists, voters, city

administration, city council, district council, and media. Results indicate that the design of the current participatory budgeting system promotes individualist rather than collectivist goals, causes conflicts between groups of citizens and district councils (instead of promoting cooperation and definition of common good) and fails to induce an attachment of the city or the district and a feeling of responsibility for the community. Moreover, analysis of individual stakeholder perspectives showed that the design of the entire programme was questionable, and that city activists, voters, city administration, city council, district council, and media; all presented different views on what the goal of participatory budgeting actually was.

The paper proposes a number of reforms to the current design of the participatory budget programme which has a potential to resolve value clashes in relation to a number of Polish cultural, organisational, and juridical practices.

ICT, learning and the absorption of democratic innovations in local government

Anna Przybylska

University of Warsaw, Poland

a.przybylska(at)uw.edu.pl

The aim of this paper is to reflect on formal regulations and institutional practice that hinder the absorption of democratic innovations in the Polish local government. In the context of local politics, an innovation can be understood as new procedures, tools and practices that are proposed to amend or replace old procedures, tools and practices not only to deliver community services of higher standards, but also to make the decision-making process socially inclusive, transparent and reflexive. This relates us to the model of deliberative democracy that is used in this study while we operationalize the quality of public consultations.

Three hypotheses are proposed. H1: The reflection on the methodology is hardly observable during public consultations. H2: There is a low level of knowledge and competences among public officials concerning the methodology of public consultations in general, and the role of deliberation in particular. H3: The ignorance of methodology during public consultations can also be explained by the ambiguities in the law and the pursuit of political gains.

Two empirical studies will provide data enabling the verification of hypotheses. The first comprises the results of a survey, in-depth interviews and the analysis of documents (2011-2014). In the second the In Dialogue software, which we have developed, is used to support learning of the methodology of public consultations among the representatives of local government in the real-life situations. We have gathered information on the results of this intervention through participatory observations and interviews in two cities in 2016 and eight municipalities in 2017.

RS13 | Session 06a Citizenship, Migration & Justice Systems in Transition

Judicial reforms “under pressure”: the new map/organisation of the Portuguese judicial system

João Paulo Dias, Conceição Gomes

Centre for Social Studies of the University of Coimbra, Portugal; Centre for Social Studies of the University of Coimbra, Portugal

jpgdias(at)ces.uc.pt, cgomes(at)ces.uc.pt

The implementation of the new map/organisation of the judicial system in Portugal, approved in 2013, became an example of an externally induced reform. The biggest reform process ever seen within the justice system took place under the rule of the Troika in Portugal, in tandem with budget cuts to the justice system as a result of the Portuguese financial crisis (since external financial support required strict austerity measures). The key word was therefore concentration: concentration of courts, litigation and resources. The reform of the organization/map of the judicial system reduced 232 lower courts to 23 district courts (the concentration process), each with jurisdiction over a larger territory and greater specialization. Most of the former smaller courts were transformed into local sections or branches of the now streamlined judicial system in an attempt to retain some proximity to citizens. However, a significant number of cases are heard in central courts rather than in these local courts. This reorganisation, including a totally new management model, led to profound organisational changes and altered the relationship between citizens and the justice administration.

The aim of this presentation is to discuss the context, actors and politics involved in this judicial reform process as an example of a top-down strategy designed under pressure in response to an external “order” and influenced by internal actors. Within this reform, citizenship and democracy remained outside the courts.

Drug addiction and the justice system in Italy: from criminalization to Public Health Model

Maria Letizia Zanier, Alessia Bertolazzi

University of Macerata, Italy, Italy; University of Macerata, Italy, Italy

marialetizia.zanier(at)unimc.it,

alessia.bertolazzi(at)unimc.it

Introduction: in Italy, during the past two decades, relevant normative changes have occurred regarding drug addiction and the justice system. In the 2006 a national law imposed a criminalization of drug use and possession, but it has been declared unconstitutional in 2014. From 2008 the management of the health services in prison has been transferred from Ministry of Justice to Ministry of Health.

Methods: the study is based on a mixed-methods design. A secondary data analysis has been carried out by using dataset from Ministry of Justice

(Penitentiary Administration Department) and local health authorities. Semi-structured interviews has been conducted with 25 healthcare professionals involved in the drug treatment of inmates.

Results: on the one hand, the criminalization of drug possession and use have dramatically increased the rates of incarceration, in particular for immigrants, frequently implied in drug-related crimes, exacerbating the problem of the prison overcrowding. On the other hand, the application of the public health model to addicted inmates doesn't appear fully achieved. Respondents, with regional disparities, underlined some organizational difficulties to promote drug treatments inside the prison and structural discrimination of migrant inmates in the access to alternative measures.

Discussion: the study introduces important indications on the implementation of the Public Health Model regarding the treatment of drugs addicts inmates. In particular, it emerges that the recovery function of the prisoners, that is proper of the continental legal culture, in many cases is not complete neither effective.

Greek Migration Policy between E.U.'s governance and citizenship participation

Helen Rethymiotaki, Ioannis Flytzanis
University of Athens, Greece; University of Athens, Greece
erethemn(at)law.uoa.gr, iflytzanis(at)gmail.com

The paper will first sketch the guidelines of E.U.'s multilevel governance model of migration policy. Its embedment problems became acute after the mass influx of displaced by Syrian war. E.U.'s aporia to face the problem deepened both its regulative and legitimation deficit. Borders closed and xenophobic reactions have been fueled by extreme right rhetoric. The management of refugee's crisis has revitalized the public discussion in Greece about how citizens can actively address its challenges.

The focal point of the discussion is the meaning of citizenship. Austerity had already thrown greek citizenship status, with its dual dimensions social and political, into severe crisis. Effective democratic participation in nation-state level is eroded and welfare policies are dismantled. The refugee's crisis opened a new dimension of what citizenship means in the present context and who is to be included and excluded in Polity. Managing the refugee's crisis has given the chance to challenge the top down way to tackle the problem and to actively create an alternative bottom up approach.

E.U. besides the hotspots also finances programs of temporary housing which are realized by local governments and NGOs such as the program R.E.A.C.T (Refugee Assistance Collaboration in Thessaloniki). At the same time grassroots solidarity movements occupied empty buildings to host refugees in order to empower their self-organization abilities, such as three closed public schools in the center of Athens. Their efforts have been either received or rejected by local governments and public opinion.

Sex, Migration and the Law. Patterns of judgement in human trafficking trials

Mathilde Aurélie Darley, Gwénaëlle Mainsant
CNRS, France, CESDIP; CNRS, France, IRISSO
mathilde.darley(at)gmail.com,
gwenaelle.mainsant(at)gmail.com

In a context where a particular attention has been paid to trafficking in women for sexual purposes at the international, European and national level but few trafficking cases are actually recorded in most European countries, the research project ProCrim (Institutionalizing Trafficking – A French/German comparison, ANR-13-FRAL-0014-01) led by Mathilde Darley (CNRS – CESDIP) and Rebecca Pates (University of Leipzig) aims at understanding the ways state institutions deal with migrant prostitution and qualify it (or not) as trafficking (involving exploitation without consent). As the ultimate place where trafficking as an offence has to be proved and the relationship between a (migrant) prostitute and her pimp has therefore to be qualified, trafficking and pimping trials appear to be a crucial arena of analysis. Drawing on ethnographic observations of 28 trials in French courts and about 30 interviews with different legal actors (attorneys, defense and civil party lawyers, judges), we propose to analyze the role played by cognitive frameworks that are socially situated, gendered and racialized when legal professions interpret the seriousness of the offence (especially the importance of violence), the role of the different parties in the case and in fine the legal categories. In particular, we want to question how the stereotypes commonly expressed by judges and lawyers during interviews impact their daily judging practices and the designation of victims and perpetrators, questioning the racialized and gendered dimensions of a sex and migration policy.

RS13 | Session 07a Subjectivities in Law under Crisis: Theory and Method

Research Integrity in Europe: from definitions to methodology

Stamatia Garani, Vasiliki Petousi
National School of Public Health, Greece; University of Crete, Greece
sgarani(at)esdy.edu.gr, petousiv(at)uoc.gr

This paper has been produced within the context of the DEFORM project (Defining the Global and Financial Impact of Research Misconduct) in order to provide a robust theoretical building block for the specific objectives of the project. This review of integrity revolves around two main issues: firstly what is integrity? And secondly, how can it be determined and when does a researcher comply with this principle? These questions are approached with the help of a pathway starting from the definition of integrity as the shaping of a certain concept, moving to the criteria, namely the measurable conditions which fulfill the definition and lastly focusing on the methods facilitating the measurement of research

misconduct as the behaviours violating the principle. The study elucidates the importance of principles, values and ethical norms pertaining to scientific research integrity, by investigating its long history, the nature of the regulatory efforts, the dominant typology of RM (Fabrication, Falsification and Plagiarism), the legalization of the issue and adopts the position that only after the theoretical issues are addressed in a way which has gained public acceptance and broad consensus, measurement tools and indicators can be developed. This approach is followed in order to meaningfully support the attempt of this project to proceed to quantitative methods as part of policies for preventing, monitoring and regulating research misconduct. It also introduces the importance of a systemic approach of the RM phenomenon through a human rights normative perspective linked with the critical reflective character of Bioethics.

Reconstructing “Missing Links” between Education Law and Practice: The case of “Creative Project” in Greek Secondary Education

Evangelia Koutidou

Institute of Educational Policy, Greece
koutidouevagelia(at)yahoo.gr

Education policy implementation poses major challenges for the Greek society, currently still experiencing recession circumstances. If “making” national economy work presupposes “re-making” education and utilizing its dynamic forces to the benefit of people, then a key question is how education policies are translated from law into practice.

The present paper aims to propose a socio-legal lens, through which school education policy can be perceived and implemented in daily practice. A much less explored terrain lying between the development of policies and the impact of those policies is put forward, concerning the development of guidelines in which legislative intent is translated into administrative prescription for action. Legal data sources examined concern a case study on the “Creative Project” in lower and upper secondary education, as recently re-initiated in schools by two presidential decrees.

Firstly, it is discussed how non normative data affect, directly or indirectly, the implementation of an education policy institution, enacted but remaining inactive in the Greek education policy-practice continuum. Additionally, key questioning includes three successive classifications: first, distinguishing between law/presidential decrees and guidelines; next, as regards guidelines, distinguishing between requirements and recommendations; and finally, in relation to both data sources, law and guidelines, distinguishing between explicit and implicit requirements and recommendations. More theoretical legal issues, namely the twin evils of excessive statutory specificity and excessive bureaucratic discretion are also mentioned.

In conclusion, a socio-legal perspective offers the methodological framework, within which education policy-makers can develop effective ways of tracing

and reconstructing “missing links” between education law and practice.

„Anti-capitalist, anti-Fascist and feminist state- and law-critical Thought in Germany – an explorative approach

Philipp Lorig

University of Leipzig, Germany
PhilippLorig(at)gmail.com

In the sociology of law not much attention has been devoted in recent years to the state- and law-critical thought linked to a more general critical perspective on society. As far as research on Germany is concerned a huge research gap exists. This presentation aims to address both these gaps. It will show continuities and discontinuities in the state- and law-critical thinking in the German legal thought starting with the time of Weimar Republic and ending today by taking up such concepts as the Injustice State (Unrechtsstaat), Class Justice (Klassenjustiz), Patriarchal Men`s State (patriarchaler Männerstaat), among others. The aim is to throw light on how critical thinking changed its objects, actors and uses, paying special attention to the moments when concepts abandoned legal and wandered into the public sphere. The presentation will draw on the older and newer texts written by lawyers. It will connect these to the state- and law-critical views formulated in (expert) interviews conducted in 2016 with academic lawyers, attorneys and judges. Most of the interviewees define themselves as „critical“. The main idea is to analyze the original definitions of specific state- and law-critical concepts, tracing the semantic shifts, ups and downs in their careers, and the shifts in their legal and public uses.

Personal data in social science research: legal framework, ethics and integrity

Evgenia Smyrnaki, Vasiliki Petousi

University of Crete, Greece; University of Crete, Greece

jenny_smyrnak(at)yahoo.gr, petousiv(at)uoc.gr

The purpose of this paper is to identify and critically analyze the interrelations between aspects of sociological research and legal provisions pertaining to personal data protection issues. Collection and handling of personal data is largely inherent in social science research methods. Nevertheless, technological advances have increased both the ease and the volume of personal data collected and processed. High level technological and digital tools facilitate the fast, automated collection and processing of personal data. Taping devices, online questionnaires, technically obtained consent, digital processing of data, automated generation of results, and storage of simple or sensitive data for indefinite time are only some of the research methods of increasing appeal; methods however which create significant ethical challenges. This paper addresses the legal and ethical issues related to personal data processed for research purposes. Furthermore, the

paper addresses research ethics challenges researchers face when dealing with data sources and tools easily accessible and available online. The analysis will consider the legal framework and case law at the EU and Greek level with special reference to the General Data Protection Regulation (679/2016). Special attention will be given to practical guidance in identifying and complying with personal data regulation. The above will be considered in light of the principle of freedom of research, the need to protect research participants' rights as well as the mandate for research integrity.

This research is part of the HORIZON2020 funded program DEFORM: Determine the global and financial impact of research misconduct. Project ID: 710246

Equal Litigants, Unequal Litigations? Access to Justice after Austerity in the Southern European Democracies

Luca Verzelloni, Daniela Piana

CES Coimbra, Portugal; University of Bologna, Italy
luca.verzelloni(at)unibo.it, d.piana(at)unibo.it

The link between the two sides of the coins, rule of law and equality, has been observed from different normative and methodological perspectives. Even recently, an interesting work has pointed to the correlation between the rule of law and the individual wellbeing, this latter being assessed against standards of life expectancy, child mortality rate, and health. This quantitative analysis follows up along the same line traced already by previous studies, which aimed showing that a fair and transparent legal environment is strongly correlated to the economic development and, by than means, to better living standards. Far from being uncontested, these works reveal a wide spread attention for the relationship that exists between rule of law and equality. Yet, very little empirical investigation has been unfolded on the access to justice-equality interconnection.

This work disentangles the matrix rule of law – equality – equal access to justice by taking an empirical avenue. It starts by focusing on the Southern European countries – Greece, Italy, Portugal and Spain –, then it develops a comparison of the policies adopted in the justice sector at the aftermath of the economic crisis that hit the Euro zone in 2007-08. It finally investigates in depth the outcomes these policies ended up with in terms of 1) capacity to respond to the demand for justice; 2) “output legitimacy of the court system”; 3) differential implementation of the policy instruments adopted, taking into consideration the interplay between the austerity-driven reforms and the on going policies of judicial governance.

RS14 - Sociology of Morality

RS14 | Session 02a Sociology of Morality III

Morality in the state of doom. Sexual abuse against women as an element of collective violence

Urszula Anna Szczepankowska, Izabela Sakson-Szafrańska
University of Warsaw, Poland; University of Warsaw, Poland
u.szczepankowska(at)op.pl, sara2000(at)hoga.pl

Sexuality is one of the most important aspects of human life, especially for female existence. Conversely, sexual activity doesn't play a significant role in scientific research and rarely been examined in research on collective violence. It didn't fit so easily into the postwar image of the concentration camps as monuments to suffering. Sexual activity is anchored in everyday society. It seems that during collective violence there is no different.

In mass conflict, survivors of sexualized violence and their family members often experience shame and keep their stories with them to the grave.

Focusing mainly on two totalitarian regimes in 20th century in Europe, the paper will start by discussing how sexualized violence is presented based on existing source, including women's history from WWII. Brothels were in concentration camps spread across German occupied Europe. While there are many suppositions as to why this was initiated, Himmler himself to clarify the complexity thought it would be an effective incentive to promote a hard work ethic.

The Soviet Union introduced their own system of prisons and forced-labor camps - Gulag. Rape and prostitution, both heterosexual and homosexual, were part of camp life. We aim at identifying and mapping practices of sexualized violence and investigate their tendency to disappear.

Our paper addresses the tension between real experience of sexualized violence and the maintenance of heroic identity. Focused on Lagerbordell, Überlebensprostitution, sex for survival and forced prostitution.

In conclusion, the paper will highlight: how sexualized violence is used as a weapon of mass violence; the relations between the moral recognition of different kinds of sexualized violence; the concept of patterns of sexual violence to clarify the complexity of this subject.

Meat, masculinity and morality

Stefan Wahlen
Wageningen University and Research, Netherlands,
The
stefan.wahlen(at)wur.nl

Moralities of eating meat in everyday life are constantly evolving with associated food practices. This contribution aims at scrutinizing dynamics and linkages in practices of eating, gender performances and representations as well as moralities. The practices of eating meat evolve with associated elements of social practices: understandings, procedures and engagements. Of particular relevance for moralities is the understanding of such practices in terms of meaning and representations in performed practices. The performativity of doing food would not be possible with particular material, i.e. food, being handled that is understood as good or bad. Moral aspects of social practices become particularly apparent when considering gender roles: eating and preparing meat is broadly considered a male social practice. Barbequeing is an empirically very interesting example, as its role in many European societies has changed during recent decades. The moralities of eating meat are under constant contestation with 'lay normativity', i.e. moral orientations associated with meat, being influenced by media. Through an analysis of gender representations in the monthly magazine "beef", a journal that is targeted towards male barbequers, the dynamics and linkages of meat, masculinity and morality can be emphasized. Further, this contribution attempts to disentangle and problematize moralities being associated with masculinities and eating meat, thereby advancing theories of social practices highlighting representations of manliness without propelling meat as a symbol of masculinity. As such, this contribution avoids a reification of androcentrism but rather advances a problematization of gender roles and moralities in social practices of eating.

Solidarity or charity? On the moral orientations of the refugee helpers in Europe. A report from the sociological field research at the refugee camps in Iraq and Greece.

Iwo Tomasz Los
The University of Warsaw, Poland
iwo.t.los(at)gmail.com

The so called refugee crisis inspired the specific – both institutionalized and spontaneous – reactions of the people in Europe. In my presentation I will analyze different discourses and moral orientations characteristic for the social actors engaged in various forms of helping the refugees. One of the main discursive distinction defining the movements is built on the alternative: solidarity vs charity, or optionally: solidarity not charity. What does solidarity mean as opposed to the charity in the relevant axiological contexts of the refugee crisis?

In 2014 I visited the official UNHCR-run refugee camp Kawergosk, Iraq. In 2016 I was in the unofficial

Idomeni refugee camp, Greece. As part of my research I engaged in the informal volunteers group providing clothes and food for the refugees and organizing the painting stations for children leaving in the Idomeni camp. I will analyze the relevance of the “solidarity not charity” discourse and will verify if in fact the different discourses and moral orientations translate into different forms of alliances and help. Focusing on the unexpected alliance of the informal groups with the UNHCR office I will show what happens in practice when they cross each other. A will analyze the conditions for such an alliance and its sustainability. Among other social theories, I will ask my research questions in a relation to the findings of the anthropological research by James C. Scott described in his *Weapons of the Weak* and to the in-depth analysis of the late development of the Solidarity movement by David Ost.

The Moralisation of Society and the Rise of ‘Conscripted Volunteering’

Itamar Shachar

University of Amsterdam, Netherlands, The
itajab(at)gmail.com

Militaries increasingly engage their soldiers in activities beyond their regular military duties and defence-related tasks that are framed as ‘community engagement’ or ‘volunteering’, ranging from facilitating activities for children to delivering food to the needy. The paper conceptualizes this phenomenon as ‘conscripted volunteering’, and analyses its proliferation is part of broader ‘moralization’ of contemporary society that glorifies ‘volunteering’ as a prominent route for ethical conduct, constituting it as an object of intensified political interest and promotion. The paper explores the growing spread of ‘conscripted volunteering’ in various armies, while focusing on its intensive implementation in the Israeli military, a military which is considered a paradigmatic case in studies of armed forces. While ‘volunteering’ that is facilitated by militaries can be considered as a means to enhance their public legitimacy, inspired by corporate techniques of reputation management, the paper proposes to analyse it also as a governmentality technique that reinforces the ideological loyalty and ethical coherence of soldiers in relation to their routine duties, through cognitive and affective means. This analysis enables to re-think ethics not as a ‘civic’ product that limits military conduct but as a constitutive force in the formation of militarized subjects. In the case of the Israeli military, which is embedded in an ongoing settler-colonial project, conscripted volunteering appears as a particularly useful mechanism that contributes to the regulation of soldiers’ subjecthood and ethical conduct. Through engaging soldiers in activities that are accepted uncritically as ‘good’, their self-perception as ethical subjects is restored.

RS14 | Session 04a Sociology of Morality - General Session

(Re)Moralizing the Law: Conservative Utopists as Legal Moralists. The Case of Poland

Marta Bucholc

University of Bonn, Germany
mbucholc(at)uni-bonn.de

Law and morality have long been interwoven in both legal and moral philosophy, while their relations were envisaged in a variety of manners, from the law being a source and guarantor of morality through morality being a source of legitimation and validity for the law. Nevertheless, the distinction between the two cannot be taken for granted and the connection of morality and law is currently repositioned as a practical issue by the political forces which I argue qualify as conservative utopists in the meaning of Karl Mannheim. In my talk, I will examine the constitutional practice in Poland after 2005 and, in particular, after 2015, in order to address the basic tenets of legal philosophy advocated by conservative utopists, the crucial point of which is (re)moralizing the law.

Crisis of Morality: Value-Fundamentalism as a Contemporary Challenge to Sittlichkeit

Spyros Gangas

Deree -the American College of Greece, Greece
sgangas(at)acg.edu

Sociology’s entanglement with the Enlightenment and with the European project of integration had always been sensitive to the role of values. Durkheim’s moral sociology, Parsons’ value-generalization as a code of integration in the social system as well as modernization theory’s shift to self-expression values constitute different but at points converging research programmes of moral sociology. At the other end, Weber’s and Luhmann’s skepticism with regards to value-integration has cautioned sociologists from placing excessive faith in morality’s integrative role in society. If we assume, as this paper will argue, that the project of a just/good ordering of the polis (configured as *Sittlichkeit* by Hegel and as ‘organic solidarity’ by Durkheim) is still worth pursuing as a normative ideal, then salvaging it requires confronting the maladjustment of value-standpoints, so typical of 21st century social and system disintegration. Apposite to this goal is Parsons’ category of ‘value-fundamentalism’. As I shall argue this concept not only aligns diagnostically with various contemporary fundamentalisms (market-driven, religious, political) that claim to monopolize the prospect of ‘value-integration’, but also operationalizes sociologically the theme of the ‘tyranny of values’ advocated by Nicolai Hartmann and Carl Schmitt. Given the rapid deterioration of consensus-based self-moderation of values in a global environment of populism, extremism, market crises and growing inequality, taking up the sociological toolkit of ‘value-fundamentalism’ can enable us to locate the institutional junctures where values (e.g. economic,

political, moral) tend to claim 'absolute' status, to 'devalue' other values and, hence, to de-differentiate society.

Searching for the moral space: An analysis of the homology between moral thought styles and social class

Kobe De Keere

University of Amsterdam, Netherlands, The
k.dekeere(at)uva.nl

According to Lamont (1992), class sociologists such as Bourdieu, often overstated the power of cultural and economic boundaries while neglecting the importance of moral ones. People obtain access to class-specific and privileged resources not only because they value the same cultural style or have a similar economic profile, but also because they share the same moral dispositions. The objective of this paper is now to explore to what extent the configuration of the contemporary moral space is determined by the class structure. First, this means clarifying the role of morality within a larger process of creating class boundaries and the possible variations exist therein by relying on Mary Douglas categorization of four thought styles (1978). Based on survey data from Flanders (Belgium) (N: 1.600) and using multiple correspondence analysis, I empirically construct the moral field by analyzing the way people respond to eight different scenarios on private and public dilemma's. Second, it will be, by relying on Bourdieu's notion of the social space, explored whether there exists a structural similarity between the space of social classes and the moral space. This will be done by executing a visualized regression technique as has already been applied by Rosenlund and others (e.g. Rosenlund, 2009, Harrits, 2013). In this way it will be investigated whether the variations in the amount and composition of capitals are structuring principles for both the space of social classes in general, as well as for the moral space in particular.

Ugly surveillance versus privacy, trust and solidarity: Spying between neighbors, citizens and allies in the age of insecurity

Minas Samatas

University of Crete, Greece
samatasm(at)uoc.gr

This study analyzes the new ethics and morality of the emerging 'glocal' surveillance society vis a vis privacy, trust and solidarity.

Any kind of surveillance violating privacy and freedom can be considered as a negative practice; however, the real 'ugly surveillance' is spying between neighbors, fellow citizens and allies, nullifying friendship, trust and solidarity. Although citizens watching citizens (CWC) and spying between allies are not unusual and both are going on for centuries, they have been lately expanded and normalized due to the growing insecurity in local and global scale. Locally, in many democratic societies following

neoliberal, antiterrorist and xenophobic policies, CWC is encouraged by the authorities and adapted by citizens and communities. In the global level, as the Snowden revelations have confirmed, the USA have practiced bugging of its European allies, which are also mutually spying. Yet, in our digital era, internet and Facebook surveillance, stalking and self exposure abolish privacy and sensitive data protection.

Our analysis will use pertinent 'co-veillance' data from post - 9/11 USA, UK, other European societies and especially from Greece under the current austerity crisis; we aim to elucidate the socio-economic, cultural and geopolitical reasons of the growth, success and failure of this 'ugly surveillance,' and its overall implications on morality and solidarity.

RS14 | Session 05a Sociology of Morality II

Legalizing marijuana : a moral case

Anne Philibert

University of Geneva, Switzerland
anne.philibert(at)unige.ch

For a long time, drug policies have been primarily constructed through a moral and emotional framework. Recent efforts to end marijuana prohibition are rooted instead in frameworks that focus around areas such as health, criminality or economics. While drug use engenders some risk for the consumer's health, its prohibition reveals ambiguity in our values: we try to control risks, but on the other hand our highly individualistic society encourages individual risk-taking and sometimes values it (for example, in extreme sports). Individual risk-taking is not necessarily unusual, but it is valued in the context of athletic performance, at the same time that it is viewed with concern within the context of the modification of consciousness through drugs. Therefore, we seek to identify perspectives that allow us to see drug use not in the traditional way as a morally unacceptable risk, but instead as an acceptable risk.

Through an analysis of the various ongoing debates about marijuana legalization in several European countries (the Netherlands, Spain, Italy, the United Kingdom) but also in the United States and Uruguay, we wish to identify the values and rules that lead to change or continuation of the status-quo. Up until now, the debate around marijuana has been anchored in the discourse of moral prohibition. As these debates shift into the registers of compassion, individual rights, and social good, new arguments emerge that propose the legitimization of marijuana.

Morality and ethics in the world of theatre

Wojciech Jacek Sobolewski

University of Warsaw, Poland
wojciech.j.sobolewski(at)gmail.com

Production process of a theatre play is very unique. It gathers and distributes certain type of people in a set institutional structure for a period of time. In Polish artistic theatre, production process takes usually 2-4 months, six days a week from 9 a.m. till 11 p.m.. It

thrives on creativity, individuality and team work. Every person involved in the process is walking a thin line between “sacrum” and “profanum”. Being an established artist allows one to cross certain social and moral boundaries. Artists are allowed to drink and do drugs - all for “the greater good of art”. Creating a “real” and “emotional” scene sometimes requires real emotions in the rehearsal stage - fights, shouting, mobbing...

This paper tackles the morality of an artist. What is moral and immoral in the world of Theatre? What are the boundaries that cannot be crossed? What do such words as good and evil mean?

Based on participant observation and informal interviews I will try to describe the theoretical and practical aspects of the process of production of theatre play. With such authors in mind like Howard Becker or Maria Ossowska and others.

500th Anniversary of Reformation: ethics and morality in Luther’s writings and documents of the Lutheran World Federation

Helena Anna Jedrzejczak
University of Warsaw, Poland
helena.jedrzejczak(at)gmail.com

The 500th Anniversary of Reformation which we celebrate in 2017 is an opportunity for making a reflection of the social aspect of the Lutheran theology. Issues of ethics and morality based on this ethics are one of the most important matters in the XVI Century as well as nowadays.

During my paper I will show 3 ethical problems described in Luther’s ethical writings and present in modern document of the Lutheran World Federation (LWF):

1. Relationship between Churches, state and a Christian
2. Woman issues / relationship between man and woman
3. Presence of Christians in the world and society

For understanding the ethical writings it’s necessary to know the socio-cultural context in which they’re written. Relationships in the society, it’s history and the status of a single person whose activities or opinions are analysed in the field of morality decide which opinions or activities are described as ‘morally correct’ in the society or political community.

The contexts of creation of Luther’s ethical writings (written by 16th Century former Saxon monk) and, on the other hand, of the LWF documents which are effects of many years’ discussions and debates of the Lutherans from all over the World, seems to be different in all possible dimensions. During my paper I’ll show their common characteristics (i.e. basis of the Holy Scripture) as well as fundamental changes that have occurred within Lutheranism in the field of ethics and morality presented on their social background.

Moral values and ideological motivations in residential child- and youthcare

Sylvia M Meichsner
University of Sheffield, United Kingdom
s.meichsner(at)sheffield.ac.uk

This paper seeks to shed light on the tension between what supporters of child-focused charitable activity believe they do following their intentions and the unintended, inadvertent consequences of their actions. It will draw on extensive desk research into institutionalised child- and youthcare examining the situation in different countries with a different socio-cultural, economic and historical context each. Starting point for this research is the observation that there are worldwide an estimated 8 million children known to grow up in residential care facilities to which adds an unknown number of children living in institutional care arrangements unmonitored by the corresponding authorities. Although most of these children are not actual orphans, but do have a living parent or other relative who would be able to take care of them, are these facilities commonly termed ‘orphanage’. The associations such wording generates ignite and contribute to maintain a variety of support mechanisms who have in some locations become an end in itself and part of what Cheney and Rotabi (2014) call the ‘global orphanage industrial complex’. The paper will analyse what the broader circumstances are that allow for this phenomenon to emerge and flourish, considering the specific circumstances that make residential care for children and young people in each location necessary and possible. Since the moral values and ideological motivations of those involved play a major part in that, particular attention shall be paid to the ethical principles guiding the establishment and maintenance of care facilities as well as the attraction of children to and their inclusion into them.

RS14 | Session 07a Sociology of Morality IV

Homosexuality through the Eyes of Russian Students

Zhanna Puzanova, Tatiana Larina
Peoples` Friendship University of Russia, Russian Federation; Peoples` Friendship University of Russia, Russian Federation
puzanova_zhv(at)pfur.ru, larina_ti(at)pfur.ru

The understanding of individual freedom and its realization in modern Russia based on the Constitution, but is not limited to it. Public opinion, social norms effect on people’s perceptions of what is allowed and what is not allowed

Unwritten norms depend on concrete society, so for this reason in the modern world there are distinctions between understanding of freedom in Russia and in Europe. The fact that socially approved framework of self-realization of the person in the context of the European culture is much wider, than in Russia.

Youth is the most proactive part of society, and student’s youth is the most progressive part of this

proactive force, therefore within the empirical research conducted by us this social group is chosen as a research object. The research was conducted in September, 2016, based on the RUDN University (Moscow) for examination of opinion towards questions related to personal freedom within the context of the nonconventional gender relations. Legislatively in Russia same-sex marriages are not allowed, however these kind of relationships which are not legally fixed do exist, as well as in many other countries around the world. They traditionally meet a negative response from the Russian public. The youth is most susceptible to changes and it is logical to believe, that their attitude towards the considered aspects can be other.

Following the results of a research of 34% of students don't see anything reprehensible in the homosexual unions, every fifth – categorically against this kind of relations, 46% are not against the similar unions if it doesn't concern personally their or their acquaintances.

Is human nature good or evil? The case of violence

Anne Nassauer
Freie Universität Berlin, Germany
anne.nassauer(at)fu-berlin.de

Are humans inherently good or evil? Is it part of human nature to hurt and kill others, or do humans act against their innate instincts when violence erupts? This presentation discusses these questions with regard to a human inhibition towards violence. I argue that the idea of an immanent 'cruel nature' lacks empirical basis, contrary to common belief.

The presentation connects a wide array of novel findings across research fields. Recent sociological findings indicate that all humans need to overcome an inhibition threshold to use violence. Studies on hooligans, street gangs, crowd violence, and atrocities show that being violent is difficult, not easy. Historical studies support these claims, showing that although every person at each point can use violence, violence is empirically rare across history. Anthropological research indicates that such an inhibition might exist as a product of human's necessity to live within a group or larger society in order to be well supplied and protected. Neurological studies show that if people experience trust and solidarity by other human beings, they directly experience an increase of positive neurotransmitters, whereas the use of violence does generally not lead to such an increase. Lastly, primate studies indicate that serious fights are also rare among our direct ancestors, the great apes. Cooperative and affiliate behaviors are considerably more common across all primate species.

The presentation brings together these recent research results to argue for a non-violent human nature. Findings imply that humans could invest less effort in protecting themselves from each other and instead rely more on humans' innate solidarity with each other.

The morality of homonegativity: revisiting the operationalization of modern homonegativity

Dieter Dekeyser, Koen Abts
Ghent University, Belgium; Tilburg University, The Netherlands
dieter.dekeyser(at)ugent.be,
k.abts(at)tilburguniversity.edu

Background: Previous research has separated negative attitudes towards LGBT's into two dimensions: modern and traditional homonegativity. While traditional homonegativity is grounded in a moral (religious) traditionalist outlook on sexuality; modern homonegativity includes frustrations with public attention to LGBT's which are grounded in a lack of solidarity and empathy. Both modern and traditional homonegativity are essential parts of the multilayered way in which LGBT's are perceived in society.

Research problem: However, past results show that modern homonegativity is strongly associated with both traditional homonegativity and moral traditionalism. This questions the validity of modern homonegativity as a non-traditional type of homonegativity and makes it difficult to estimate the prevalence and social causes of modern homonegativity.

Aim: This study argues that modern homonegativity should be operationalized as a type of homonegativity that is not associated with traditional homonegativity. This takes account of the tendencies of moral traditionalists to be both modern and traditional homonegative and is based on our expectation that moral non-traditionalists will not be traditional homonegative, but are able to be modern homonegative. Using structural equation modeling, we statistically control modern for traditional homonegativity and relate both constructs to moral traditionalism and solidarism.

Results: Solidarism is related to modern homonegativity, but not to traditional homonegativity. Higher levels of moral traditionalism are related to higher levels of traditional homonegativity and, contrary to past results, to lower levels of modern homonegativity. These results reaffirm modern homonegativity as a subdimension of homonegativity with specific moral foundations and social explanations.

Moralities of provisioning amidst recession and austerity

Andreas Streinzer
University of Vienna, Austria
andreas.streinzer(at)univie.ac.at

The Greek economic crisis has challenged notions of European solidarity and of solidarity among people living through austerity and recession. The severe decline in available incomes from state and private sectors has created serious difficulties for the social reproduction of most Greek households.

In my paper, I will present ethnographic data from my 11 months of doctoral fieldwork in Volos, Greece, to

discuss how people moralize these changes in their everyday economic lives and justify their actions in ambiguous contexts of contemporary capitalism.

In arguing so, I will focus on three themes:

First, doing one's taxes right. While longing for a redistributive state yet observing social groups with easy access to the means of evading taxes, my interlocutors were ambivalent about how to deal with taxes in their own everyday economic lives.

Second, putting one's money into the right pockets. While facing the imperative for austerity in their own households, purchasing became a means of investment - by investing into the future of one's children but also by supporting the right producers and retailers. But who are they?

Third, doing economic relations better. By founding alternative economic networks for mutual solidarity, my interlocutors created new forms of inequalities that they struggled to accommodate in their quest for the good life.

The paper concludes with a discussion of the contribution that an analysis of these moralities in turmoil can be for the sociology of moralities as well as for economic anthropology.

RS15 - Visual and Filmic Sociology

S15 | Session 04a Media Impact on General Opinion

The Spectacle of Terror

Yvonne Alexia Kosma

American College of Thessaloniki, Greece

yvoko(at)act.edu

The notion that the medium is the message is hardwired into acts of terrorism. Terrorism becomes a cultural act, a public performance in which death makes the statement, becoming a morbid work of art. Yet, the idea that terrorism is a theatre, a live-action spectacular, or a form of performance art is not particularly new. However, it is striking that there seems to be an effort to stage the enactment of violence in a way that it becomes ever more elaborate. In this context, the graphic violence of individual operations cannot be seen in isolation, but as an act within a larger trajectory of violence. However, instead of addressing each incident as an isolated occurrence, I will consider staged terrorist violence as a slow-motion, ever-evolving process, in which each new participant's action makes sense in reaction to and in combination with those who came before. This way each act becomes a new link in a chain of meaning. Another important element to consider in this process is the amplification of its effects through the representation of the message by the mass media, that becomes the message in itself. In this procedure the terrorist act ceases to be just a news story related to current affairs, and becomes a sensory experience more akin to performance art that operates in multiple modalities—not only by way of the eye and ear. The task of the 'performer' is to 'show' sensory experiences that are invisible, or more accurately, to provide visual cues that evoke haptic and olfactory sensations, provoked by the horrid spectacle of the dying body. To understand this process I will draw from Granovetter's threshold model.

Marginality and counter-culture through Europe as a criticism of capitalism. The case of the techno movement. A socio-filmic reflection.

Alexandra Tilman

university of evry, France, IPSA Uco of Angers

alextilman1(at)gmail.com

Rave parties, squats and marginal techno movements

have spread over Europe since the 1990's. This phenomenon can be seen as a global form of resistance to the classic labour and leisure life style. Studying the city of Le Havre in France, this industrial port where culture and merchandise circulate since its creation in the 16th century, has lead me to think of the way counter-cultures spread and circulate in Europe, revealing a common form of criticism of capitalism as a way of living and showing how people gather around a will of "something else" being either English, French, Spanish, Italian or Czech. I will then show some images of the film I made in Le havre for my Phd research in 2014 and I will open my speech to a european gaze on how counter-cultures reflect this global form of resistance to capitalism. I will also talk about how, in the case of that specific research the cinematographic language can open the reflection to an international audience in a more effective way than with a simple speech. To this end, I propose to show 10mn of the film *Cadences* during my presentation. <https://vimeo.com/132032366>

The perception of Visual Infotainment in the political news: A cultural approach through New Media

Lambrini Papadopoulou, Irene Photiou, Theodora Maniou

Panteion University, Greece; Frederick University, Cyprus; Frederick University, Cyprus

lpapadopoulou83(at)gmail.com,

photiou.irene(at)gmail.com, manioud(at)yahoo.gr

Traditionally, Infotainment has been introduced to refer to television programs and/or tabloid news which exhibit the trend of integrating in a single reportage two seemingly contrasting concepts in mainstream journalism: information and entertainment (e.g., Bonner & McKay, 2003, p. 119; see also, Berrocal-Gonzalo, Redondo-García, Martín-Jiménez & Campos-Domínguez, 2014). With its origins in the late 1980s, infotainment is not a fairly modern trend, however the discussion around it has never ceased while in the last decade seems to be widely re-framed (see, for example, Harrington, 2008). Especially with the introduction of the New Media in the post-truth era, Infotainment seems to be evolving in a characteristic trend affecting all areas of news reporting. The proposed paper aims to introduce the phenomenon of Visual Infotainment, regarding aspects of Infotainment in visual artefacts, deployed in the news. Specifically, the research focusses on visual elements (photographs, graphics, etc.) used in the New Media, when posting and citing political news. The case study of this paper is the Cyprus talks between Greek-Cypriots and Turkish-Cypriots, held in Mont Pelerin and Geneva in 2016 and 2017 respectively, aiming to resolve the Cyprus conflict. The study is based on a qualitative approach, using Visual Framing Analysis, on an effort to identify a consistent set of frames in order to determine the perception of Visual Infotainment in the political news and the specific ways in which hard news can be transformed into soft news.

The Cinematic Representation of Cultural Identity: The Case of Turkish Migrants in Germany

Deniz Günes Yardimci

Royal Holloway, University of London, Germany
denizyardimci(at)web.de

There is already a substantial scholarly work on Turkish German diasporic cinema produced by second and third generation Turkish German filmmakers since the late 1990s. Authors like Göktürk (1999), Berghahn (2012), Hake and Mennel (2012), and Burns (2006) agree on a shift in the filmic representation of the Turkish immigrants in Germany from a rather pessimistic and problem-based perspective focussing on early Turkish guestworkers' difficult lives shaped by the experience of loneliness, speechlessness, and victimization, to a cinema made by Turkish German hyphenated identity directors such as Fatih Akin and Thomas Arslan, who go beyond depicting difficulties of the migration experience and feature cultural hybridity as normality in a multicultural environment.

I argue that whilst earlier migration movies by German directors emphasised a cultural identity conflict of characters with a migration background, Turkish German filmmakers display diasporic characters and their culturally hybrid identities as an enriching and productive resource. Moreover, I particularly focus on the so far scholarly widely neglected perspective of Turkish cinema about Turkish migration to Germany and suggest that like early German cinema Turkish directors likewise represents a cultural essentialist perspective when depicting cultural identity and stress the incompatibility of diverse cultures. I argue that this filmic perspective on cultural identity is related to the fact that Turkish emigration cinema from the 1960s until the 1990s were strongly influenced by the Turkish Yesilcam cinema convention of constructing binary oppositions of good, rural, East versus bad, urban, Western (European) to establish a melodramatic overtone.

RS15 | Session 05a Democracy and Everyday Life

Democracy and Multiculturalism: A Documentary View

Jean-Pierre Durand, Joyce Sebag

University of Evry, France; University of Evry, France
jpd.duran(at)gmail.com, joyce.sebag(at)gmail.com

The movement of people between countries and between nations is a phenomenon that goes through the whole history of men. But new questions have emerged over several decades which have generated a plurality of responses. Democracies that think themselves universalist are confronted with attitudes of refusal of this universalism and for some actors a withdrawal on themselves. Which can go as far as the will to maintain their own history and cultures with a public recognition of data considered as belonging to the private domain (religion, moral and cultural values). This is contrary to the spirit of the French law

of 1905 on secularism (separation of the Church and the State), which is shared by American researchers such as M. Walzer who insist on the private nature of religion. These demands remain rather minority among the people "of immigrant origin", but occupy a disproportionate place in the imaginations of the nations of the North countries. This is probably due to the fact that the relations between cultures have been largely associated with the inclusion of these populations among the working classes. These populations of immigrant origin and having French nationality for the majority of them - including those living in France in so-called sensitive districts - in their great majority do not share these maximalist visions. A large part of the intellectuals, by abandoning all reference to economic questions and social class issues, bear the multiculturalist claim which is only very partially shared by the populations concerned. Excerpts of the sociological documentary that we have realized shows the difficulty of living with the other according to the individual histories of each one: these emerge and are exacerbated.

« The passing of the baton » Learning in the "between-us": From situation of disability to comic side of situation.

Anne Marcellini

Universite de Lausanne, Switzerland
anne.marcellini(at)unil.ch

This communication is based on film of a learning session of "the passing of the baton" in relay races. The film has been taken by ourselves in a specialized sport association for athletes with intellectual disability*. Research was conceived in a filmic sociology perspective to put in light changes in representations of people with intellectual disabilities. It aims to show how bodies in motion can better reveal what it means to be labelled as mild or moderate intellectual deficient today, than a written paper could do. During interviews, athletes talk about their experiences of scorn and humiliation in daily life and especially at school. But during training sessions in peer group, images show athletes running, joking, laughing together and helping each other, performing various learning together, under the direction of the coach. The follow-up of a training session is an inside view that make feel pleasure and quality in relationships inside the group. Film shows how a benevolent humour about their own disability is developed by athletes. Repetitions and burlesque scenes showing the very difficult learning process of "the passing of the baton" in relay races allows to understand how athletes construct together a comic side of the situation of disability.

*The fieldwork of this research was conducted in the framework of a scientific collaboration between the Santesih Laboratory of the University of Montpellier (EA 4614) and the 'Study and Research' section of the French Federation of Adapted Sport (FFSA), with financial aid from the latter. The analyses presented in this paper do not necessarily reflect the viewpoint of the FFSA.

Migrants' deaths : visual reflections

Ottavia Salvador
University of Genova, Italy
ottavia.s(at)gmail.com

How to capture death's recounts and mournings in photos and films? And why? Since the beginning, this question crossed my research about migrants' deaths, started in 2015 within the Italian context and still ongoing. The study adopts qualitative research methods with a strong narrative dimension, intended as the most appropriate to answer its main questions by providing materialist and empirical based coherence. The research explores in depth the social and political treatments of these deaths, following immigrants' life traces (after death), investigating social significations of their burial 'choice' and class conditions' impact on them. The research activities, including visual and audio devices, are: several interviews (audio and video-recorded, when possible) with relatives 'left-behind' or people who were close to the dead; ethnographic research in Muslim funerals and corpses' repatriations; the lifestory of a maroccan migrant who died in a migrant detention center in Italy (included in a documentary project); various narrative and visual materials on immigrants' unidentified-anonymous deaths (media, public discourse and policy papers). Taking pictures and filming has sometimes expanded, in different ways, the stories' expressivity becoming a medium between respondents and the world. This contribution represents the ongoing reflection on visual and filmic sociology starting from the collected materials.

Dogs of Democracy - documentary reflections on the Greek Crisis

Mary Zournazi
University of New South Wales, Australia, Australia
m.zournazi(at)unsw.edu.au

In this paper, I will discuss the making of my essay-style documentary, *Dogs of Democracy*, which is a visual ethnography of the Greek crisis. The film is about the stray dogs of Athens and the people who take care of them. It explores life on the streets through the eyes of the dogs and peoples' everyday experience of austerity. Shot in location in Athens, the film is about how Greece have become the 'stray dogs of Europe', and how the dogs have become a symbol of hope for the people and for the anti- austerity movement. A universal story about love and loyalty and what we might learn from animals and peoples' timeless quest for democracy.

RS15 | Session 06a Urban Transformation**Visualizing the urban life of transnational families**

Anca Raluca Astilean, Calin Ilea
Center for the Study of the Population; Center for the Study of the Population
anca.astilean(at)gmail.com, calin.ilea(at)gmail.com

Using the video composite method, in this paper we

shall comparatively present some key elements of the life of transnational families having at least one Romanian member. We shall use photo/video materials from our multi-site research from several urban areas, from Romania (Drobeta Turnu Severin, Cluj-Napoca) and from abroad (Londra, UK; Mons, Belgium; Chi inău, the Republic of Moldova).

We shall try to compare the following focal topics (in two or more towns): children of transnational families; bi-national/mixed couples; discrimination of transnational family

members. Through these visual materials, we hope to provide a face to transnational families living in urban areas, in Romania and abroad.

Another aspect of the presentation will be a comparative analysis of two photo albums, one focusing on photographs taken in the rural milieu (already released by team members, where we primarily find pictures of elderly remaining at home) and another one, in the urban milieu, created specifically for this scholarly session.

The photo albums (together with the videos) are the visual documentation of our research, and will illustrate the main topics of our research as a whole.

Everyday Mobility & Practical Cosmopolitanism: A Spatial Semiotic Approach

Timothy Shortell, Jerome Krase
Brooklyn College, City University of New York, United States of America; Brooklyn College, City University of New York, United States of America
shortell(at)brooklyn.cuny.edu,
jkrase(at)brooklyn.cuny.edu

A majority of the world's population lives in cities, and the proportion is growing rapidly. As a result, cities are places of strangers. Urban dwellers are socialized in the norms of interaction with others whom they do not know, including those whose cultural practices are seen as "strange." Urban neighborhoods are sometimes sites of social conflict. But perhaps more remarkably, everyday urban life in vernacular neighborhoods is marked mainly by "cultural strangers" getting along. In the everyday rhythms of urban life, particularly in public places such as public transit, people know that they must get along to go along. Quotidian mobilities are the dominant rhythms of vernacular urban neighborhoods. The pace of the city is strongly tied to forms of urban living, and as a result, of the impressions urban dwellers form of themselves, of others, and of urban space. This makes mobility an important part of urban life and culture. It is, in a fundamental way, the dynamic quality of place. As such, it is important for urban researchers to investigate ordinary mobilities in urban public places. We believe this is best accomplished by visual methods and visual data, including photographs, video, and observation. We bring examples from our research on urban neighborhoods in some of the global cities of Europe to illustrate a method for seeing contested identities and practical cosmopolitanism in the rhythms of everyday

mobilities—not only is everyday mobility a significant form of social activity, but it is also a key research method in the study of urban communities.

RS15 | Session 07a Creativity and Criticism

Everyday life as reflected in the Polish artistic photo-projects

Urszula Jarecka

Institute of Philosophy and Sociology Polish Academy of Sciences, Poland

ujarecka(at)ifispan.waw.pl

The paper is devoted to analyze some aspects of everyday life as discovered in the long life photo-projects conducted during the Polish People's Republic era. Rural and urban life of ordinary people, documented and artistically transformed can give us new understanding of the past. The aesthetics categories rooted in everyday photography will be also employed to uncover main trends in visualizing the lifestyle of the epoch. What can we read from photographed scenes and objects now? How meanings of everyday rituals and objects had been changed in the series of photographs?

The main research material for this paper comes from the project Sociological Record conducted by Zofia Rydet. The author was a prominent Polish photographer of the PPR times, who tried to find the sociological view of the everyday life in Poland under the communist regime. The main body of photographs were taken during 1977 and 1993, and it is digitalized. Nowadays, artistic photography is challenged by technology and the newest trends in visual culture, but the majestic and heroic vision of everyday life of common people offered by Zofia Rydet is still fresh and inspiring.

Academic frame of reference to interpret the visualization of changes in meanings of lifestyle is rhetoric of everyday in Erving Goffman concept, and Odo Marquard's philosophical defense of accidental as well. Artistic frame of reference here is the analysis of similar projects of the same epoch in Poland.

Street Art and the European Dream: Athens, İstanbul and Lisbon

Ebru Thwaites Diken

Istinye University, Department of Sociology, Turkey

ecthwaites(at)gmail.com

Social protest in general builds upon visual communication as much as the powers it targets, often articulating its slogans, messages and proposals in visual contexts, deliberately seeking to create, develop and regulate its icons. The images in social protests circulate and create meaning to provide a base for social movements. The photographs taken in social protest locations sometimes obtain an iconic character, to which the artists respond by politicizing them. Significantly in this context, street art in European cities has flourished as a reaction to social, economic and political crisis. Street artists displace the imageries in social protests and politicise them.

Inspired by the works of Botero who shows how art work produced from digital photography helps to sustain cultural memory in contemporary societies, this talk focuses on examples of street art in some European cities (Athens, İstanbul, and Lisbon) - particularly those works of street art which developed from digital photography. On the basis of these examples, it argues that despite the increasing East-West divide (i.e. on issues of immigration) and the North-South divide (i.e. on issues of austerity and financial crisis) in Europe, street art intervenes to provide a base for re-creating the European dream in Bauman's terms. Overall this talk reflects on issues related to the relationship between art and politics in the making of contemporary Europe.

RS15 | Session 08a Images and Word

La Revue Française des Méthodes Visuelles : défis et avancement pour la création d'une revue francophone sur les méthodes visuelles

Michaël Meyer, Fabien Reix

University of Lausanne, Switzerland; University of Bordeaux, France

michael.meyer(at)unil.ch, freix(at)free.fr

La Revue Française des Méthodes Visuelles est une revue interdisciplinaire et internationale en cours de création (n°1 à paraître en 2017). Elle est conçue comme un lieu de discussion et de recherche entre les disciplines sur les méthodes visuelles et, au-delà, sur l'ensemble des méthodes qui ne se limitent pas à l'écrit. L'ambition de la revue est d'offrir un espace de dialogue aux sciences humaines et sociales et, ainsi, de construire progressivement une vision d'ensemble de ces méthodes. Les chercheurs sont de plus en plus nombreux à mobiliser l'image (fixe ou animée), ou d'autres méthodes alternatives à l'écrit, dans leurs pratiques professionnelles. Il s'agit désormais de se tourner vers ces pratiques pour tenter d'en comprendre les apports réels et d'enrichir la recherche et l'enseignement universitaires.

La RFMV souhaite publier des textes en français. Les articles abordent les aspects théoriques, méthodologiques, épistémologiques ou éthiques de thèmes liés aux pratiques de l'image dans les techniques d'enquêtes ; sans exclure toutefois d'autres méthodes alternatives à l'écrit. La revue se propose d'explorer, plus largement, le champ des pratiques audio-visuelles et sensorielles pour la recherche à l'heure du numérique et des réseaux.

Lieu de dialogue et de confrontation, la revue traduit la volonté de construire progressivement une vision d'ensemble d'un domaine éclaté, et parfois isolé, par le cloisonnement des disciplines. L'expression en un même lieu des différentes expériences pourra, nous l'espérons, permettre de dessiner et d'apprécier peu à peu les cadres généraux de ces pratiques.

Notre communication fera un bilan de cette expérience francophone de création d'une revue autour des « méthodes visuelles ». Nous montrerons les défis pratiques, mais aussi définitionnels que pose la constitution d'un tel projet éditorial.

Multimedia collages of memory. Investigating functions of collective memory through photo-elicitation

Ludmila Władyniak
Charles University, Czech Republic
ludka.wladyniak(at)gmail.com

The presented study is a part of the research project 'Memory on borderland. A study of collective memory in the former East Prussia region in Poland and the Sudetes in the Czech Republic', which main aim is to study the functions of collective memory and its practice in the region of borderland. The project focuses on collective memory in the two borderland regions of Central Europe: the former East Prussia in Poland and the Sudetes in the Czech Republic. Those two regions are undergoing regional revival after many years of silence over their past and identity. This finds its representation in the dynamic development of different websites and social media pages devoted to the regional history, mainly with visual texts of memory as their primary content.

The paper presents the partial, very first results of quality content analysis of the images reproduced online and of confronting them in photo-elicitation interviews, conducted with the inhabitants of borderland. The main assumption of the study is that the communicative memory in the region of borderland is the process that involves not only the members of a borderland group. It also includes texts of memory (in this case – visual internet-based texts of memory). This process undergoes within a hermeneutical triangle that includes the communication / interaction between memory users, memory makers and visual objects of representation. It results in a situation when collective memories are multimedia collages consisting of various elements. Two Goffmanian concepts of face (facework) and frame are used here, as analytical categories, defining the interactional approach to the problem under study.

“To be or not to be” a visual anthropologist in Romania - The story of a documentary short film

Iulia-Elena Hossu
Centre for Population Studies - UBB Cluj, Romania;
Romanian Institute for Research on National Minorities, Romania
iulia_hossu(at)yahoo.com

Until 2002, when the Faculty of Sociology and Social Work (UBB) in Cluj-Napoca (Romania) created its undergraduate program in anthropology, the only universities offering such programs were those in Bucharest and Sibiu. The history of documentary film is therefore tied to a great extent to the slow and shy beginnings of anthropology as an academic discipline in Romania. Besides being short, the history of documentary film was not a particular happy one either. Seen as a marginalized field, there were very few substantial, sustained and successful projects centered on documentary film that could help create the context for the emergence and development of a fully fledged generation of filmmakers.

With the project *Confronting difference through the practices of transnational families* a team of social researchers are trying to study transnational families based on a qualitative field research methodology and visual recording. This video material exhibits and queries the main challenges involved in the research methodology on the subject of transnational families. The main objective of the research consists in analyzing the strategies through which the transnational families manage their specific way of life. This paper will show the story of the production and post-production of the documentary short film produced within this project. In the background, the analyse will talk about the problem of the visual anthropologists' position in the process of making a documentary film in Romania.

Industrialisation de la campagne lorraine Retour sur une enquête sociologique classique et filmique.

Christine Louveau
Université d'Evry Val d'Essonne, France
ch.louveau(at)gmail.com

Au début des années 70, dans le cadre du Groupe de Sociologie Rurale du CNRS dirigé par Henri Mendras, une vaste étude a été menée dans un village lorrain.

Cette étude visait à questionner la mutation d'un village agricole en village ouvrier, les enjeux de pouvoirs, la différence d'ancrages politiques entre syndicalisme, élections villageoises et liens de parenté en fonction des situations.

Cette recherche a mêlé le film aux méthodes classiques des sciences sociales. Il en est ainsi résulté un livre et un film .

Au moment où le bassin lorrain est sinistré en termes de désindustrialisation, cette présentation visera à questionner ce qu'apporte d'un point de vue socio-historique la mise en perspective de texte et d'images d'une enquête sociologique.

Cette approche comparative concernera également d'autres régions européennes marquées alternativement par une industrialisation d'environnements ruraux et par la désindustrialisation.

RS16 - What turns the European labour market into a fortress?

RS16 | Session 04a Migrants' Agency at Work and Upward Mobility

Emerging Patterns of Socio-Spatial Mobility within the EU: The Case of Young Italians in Berlin

Stefania Animento

Humboldt-Universität zu Berlin, Germany
s.animento(at)campus.unimib.it

In this paper I investigate practices of spatial mobility developed by young South European migrants as a response to precarization, which has further expanded into their lives since the crisis. Many of these young people, who are mainly middle class and well-educated, have moved to North European metropolises. Such mobility is more liquid and flexible than Fordist forms of work-driven migration. It also takes place within a favourable migration regime such as the inner-European one. However, it does not necessarily result in lower precarity. While literature shows that human capital and high skills are the keys to the access to labour markets abroad, my research on young Italian migrants in Berlin sheds light on contradictory dynamics. While some migrants experience upward social mobility, many of them end up working precariously in low-wage sectors and dwelling under uncertain conditions. According to literature, their paths of incorporation should diverge depending on the resources to which they have access. However, given their similar backgrounds, there is a lack of knowledge about what resources are more specifically relevant to them. What elements mostly affect young middle class migrants' abilities to anticipate future paths and thus face precarity? I tackle this question through a mixed-methods analysis based on a set of 50 interviews, an online survey and participant observation. The analysis challenges conventional understandings of class, gender and ethnicity. I claim that we need to seriously consider the restructuring of labour markets that is currently taking place in the Global North as well as the effects of the European „free mobility regime“ on migration patterns.

Methodological nationalism and the role of research in the closure of migrants' labour market participation

Hans Siebers

Tilburg University, Netherlands, The
h.g.siebers(at)tilburguniversity.edu

Ethno-migrant inequality remains a persistent trait of the labour market in Europe (Heath and Cheung, 2007; Van Tubergen, Maas and Flap, 2004). Scholars have put forward several explanations. First, migrants may have less access to human capital formation (education, on-the-job learning, language proficiency, skills acquirement) (Duvander, 2001; Rafferty, 2012). Second, they may have less access to resources embedded in social capital and network ties (Lin, 2000), drawing on Bourdieu (1986), Granovetter (1983) and Putnam (2000). Third, there is the impact of government legislation and formal institutions regarding guest labourers (Van Tubergen et al., 2004) contributing to the precarity of labour conditions many migrants confront (Anderson, 2010; Lewis et al., 2015; Siebers, 2015; Houwerzijl, 2013) and there is the discursive impact of government policies fuelling ethno-nationalist conflicts (Siebers, 2010; 2015; Siebers and Dennissen, 2015). Fourth, migrants may have to face discrimination (Andriessen et al., 2010, 2012 and 2014; Blommaert et al., 2012).

Little attention has been paid so far to the possibility that scholars themselves may be contributing to the production of such inequality. Drawing on Andreas Wimmer's and Nina Glick Schiller's (2002;2003) critique on methodological nationalism, I will first demonstrate how some branches of literature are indeed marked by looking at ethno-migrant inequality in the labour market from an (ethno-)nationalist lens. Thus, their research designs and interpretations of findings produce serious biases. Second, these biases feed ethno-nationalist approaches of migrants in politics, policies and interactions in work setting that contribute to the widening of the ethno-migrant gap in the labour market.

The intersections of state policy, individual agency and the labour market experiences of undocumented migrants

Alice Bloch

University of Manchester, United Kingdom
alice.bloch(at)manchester.ac.uk

Drawing on interviews with 55 undocumented migrants from Bangladesh, China and Turkey who were living in London at the time of their interview this paper will examine the complex ways in which undocumented migrants experience the labour market within the punitive and exclusionary state practices that target and penalize undocumented migrants and their employers. It is clear that incrementally punitive policies including raids on businesses, fines on employers found to be employing workers without the correct documentation and the constant threat of deportation can and do exacerbate the potential exploitation of undocumented migrants, in relation to working conditions, workplace relations, labour market mobility, workplace rights and wages. However, what is less examined are the complex and variable ways in which undocumented migrants are active agents who can, on occasions, improve their working conditions, their skills and their wages even within the constraints

of their status and state policies. The focus of this paper is on the multiple ways in which state policy, individual agency and the labour market experiences and strategies among undocumented migrants interact.

RS16 | Session 06a Mechanisms of Ethno-Migrant Inequality Production at Work

Legalising exploitation? New forms of gangmastering in Italian agriculture, tourism and logistics

Federico Oliveri

University of Pisa, Italy

federico.oliveri(at)cisp.unipi.it

Since 2010, after migrant farmworkers rioted and went on strike in many Italian districts, gangmastering in agriculture gained new media attention and started being addressed by criminal law. Nevertheless, living and working conditions of migrants did not improve; instead they worsened, under the pressure of economic crisis and restructuring among other reasons.

This paper discusses four theses on the persistent exploitation of migrant workers as one of the most evident sign of structural racial inequality affecting Italian labour market.

1. Moralising discourses and repressive policies focused on (ethnic) gangmasters avoid addressing the causes of exploitation and illegal/informal subcontracting of labour in agriculture. These causes include social and legal vulnerability of migrants (regular and irregular as well), and the unfair organisation of food supply chains.

2. As an effect of the ongoing penal turn, exploitative gangmastering takes new forms, more difficult to detect and repress. Exploitation becomes de facto legalised, as new gangmasters use formally legal labour agencies, subcontracts and social cooperatives in order to supply companies with disposable and cheap labour.

3. Unlike the traditional ones, new forms of gangmastering are not limited to the agriculture of Southern Italy, but spread out through the whole country, affecting sectors such as tourism and logistics too.

4. Struggles of migrants and their supporters against new forms of gangmastering provide a significant standpoint for addressing systemic causes of exploitation and developing adequate strategies of action, including class solidarity and coalitions between migrant and non-migrant workers.

Migrant divisions and management practices in the hotel sector in Venice

Gabriella Alberti, Francesco Iannuzzi

University of Leeds, United Kingdom; University of

Leeds, United Kingdom

g.alberti(at)leeds.ac.uk,

francescoiannuzzi1(at)yahoo.it

Migrant workers, from a wide range of countries,

comprise an important part of the workforce in Venice hotels, whose size varies according to seasonal fluctuations (Istat, 2016). Similarly to previous studies conducted in London (McDowell 2008; Alberti 2014), workers appear differentiated along multiple lines of divisions including race, gender, nationality and migration status.

One overlooked aspect of research on migrant labour in the low-paid end of the tourism sector is how the particular forms of segregation experienced by migrants in relation to their specific occupation dovetail with forms of discrimination related to contractual status. This intersection appears particularly relevant in the wider context of precarisation of employment relations and growing inequality experienced by non-citizens.

Drawing from fieldwork conducted in 2016-17 in Venice the paper shows how migrant hotel workers tend to experience discrimination along three main overlapping dimensions. The first concerns their position in back of house jobs mostly invisible to “the tourist gaze”, where gender and racial stereotypes more than precarious migratory status permeate management discriminatory practices. The second level is connected to the relationship between migrant labour and job insecurity where migrants are overrepresented in the contingent workforce (e.g. seasonal and temporary agency work). The third is related to migrant employment in departments that are often outsourced to contractors called “cooperative firms”, which appear to be important devices in reproducing migrants’ precarity. Bringing these dimensions together the authors develop an argument about the specific forms of divisions that underpins and reproduce the precarisation of labour in Venetian hotels.

Understanding ethno-migrant disadvantage in UK public sector employment in semi-rural areas: persistent barriers, inadequate solutions

Philomena de Lima, Maria Helen Hudson, Gina Netto, Mike Noon, Filip Sosenko, Nicolina Kamenou-aigbekaen

University of the Highlands and Islands, United

Kingdom; University of Essex, United Kingdom;

Heriot-Watt University, United Kingdom; Queen Mary,

University of London, United Kingdom; Heriot-Watt

University, United Kingdom; Zayed University, United

Arab Emirates

Philomena.deLima.ic(at)uhi.ac.uk,

mhudson(at)essex.ac.uk, G.Netto(at)hw.ac.uk,

m.a.noon(at)qmul.ac.uk, F.Sosenko(at)hw.ac.uk,

nkamenou(at)aol.com

The UK public sector has long drawn on migrant labour, in part reflecting national labour shortages, the socio-economic aspirations of economic migrants and obstacles to private sector opportunities. A growth in race-related equal opportunities policies occurred in parallel with the casting of the state as ‘good’ employer. However, this belied the historically persistent under-evaluation of, and unequal outcomes for, migrant/ethnic minority women and men, over-

represented in low paid work. With the economic crisis, austerity measures adopted and the continued exposure of the public sector to market forces, the opportunity structures of migrant/ ethnic minority workers have been eroded through job loss, outsourcing and an erosion of progression opportunities.

Local economic contexts are under explored in critical diversity/inequality studies. This paper explores the social (re)production of ethno-migrant disadvantage and its changing contours using the lens of intersectionality. It focuses on public sector employment in semi-rural localities to explore the contingent nature of 'configurations of inequalities' reflected in intersections of ethnicity, migrant status, gender and class shaping social/human capital constraints on social mobility in local economies. It will consider the role of the public sector equality duty and employer positive action measures in countering these constraints and their limitations in fostering progressive change in racial hierarchies.

The exploration draws on local authority and NHS Trust case studies in two semi-rural areas in Scotland/England, undertaken in 2012/13, including interviews with HR and line managers, minority ethnic individuals who are long-term residents/British/EU Citizens and recent EU/non-EU migrants.

Migration, Gender and Progressing to Better Paid Work: New Opportunities to break through Glass Ceilings or Sticky Floors?

Gina Netto, Maria Hudson, Mike Noon, Filip Sosenko, Philomena de Lima, Nicolina Kamenou-Aigbekaen
Heriot Watt University; University of Essex; Queen Mary University of London; Heriot Watt University; University of the Highlands and Islands; Zahid University
g.netto(at)hw.ac.uk, mhudson(at)essex.ac.uk, m.a.noon(at)qmul.ac.uk, f.sosenko(at)hw.ac.uk, Philomena.deLima.ic(at)uhi.ac.uk, n.kamenou(at)aol.com

Migration is influenced by multiple factors acting at the macro, meso and micro levels in which gender plays a key role. At the macro level, changing labour shortages in advanced Western industrialised countries may shift traditional gendered patterns of migration at the meso-level of households within which men typically lead the process, and intersect with the micro level agency of women and men. Migration represents a significant change in the life course and career trajectories of individuals requiring them to shape their career trajectories within new labour markets, opportunity structures and cultural norms in destination countries. A key focus of research is the transferability of human capital or the knowledge and skills that migrants bring with them. However, the aspirations of migrants and how they seek to advance their careers within the workplace, and the ways in which gender influences this process is under-researched.

Drawing on research funded by the Joseph Rowntree Foundation and carried out in five organisations in

England and Scotland, this study draws on analysis of narratives generated by interviews with thirty migrants and individual case studies to explore the aspirations of women and men in low-paid work and their attempts to progress their careers within their workplaces. It reveals the complex ways in which gender intersects with other aspects of migrant identity to influence how women and men make sense of discontinuities/continuities in their career pathways and the challenges they face in navigating routes to career development within their new contexts.

RS16 | Session 07a Discursive Framing and Migrants' Exclusion at Work

Citizenship, ethnicity and right to work: access to labour market for non-citizens in Croatia

Vedrana Baricevic
University of Zagreb, Faculty of Political Science, Croatia
vedrana.baricevic(at)fpzg.hr

The paper departs from the understanding that work is far more than just an economic activity. Instead, (right to) work is a central tenet in integration and citizenship, directly conditioned and conditioning one's citizenship status and rights (Anderson, Shutes and Walker 2014; Zatz and Boris 2014). Building on these premises, the paper shall explore the nexus between laws and discourses on immigration, citizenship and work, seeking to understand how the underlying normative conceptions that shape citizenship and immigration discourses and policies have affected access to labour market and working rights of ethnomigrants in Croatia. In doing so, the author argues that access to labour market is legally and socially construed as a resource of the dominant ethnonational group (ethnic Croat population), symbolically and practically delineating between those who belong and those who do not belong. More specifically, while right to work is formally provided to citizens and several groups of non-citizens (e.g. EU nationals and refugees) on equal grounds, closer reading of legislation on immigration and citizenship reveals that it is the ethnicity - often rather than the human capital and certainly rather than the legal citizenship/residency status - that imbues one with the moral right to have access to the labour market.

To explore these assumptions, the paper shall analyse policies and discourses on immigration and citizenship and how they map one's right to work/access to labour market. In addition, the paper shall contrast discourses and laws on different groups of non-citizens who have diverse formal rights to access the labour market: i.e. the refugees and EU citizens (formally full access to labour market), and TCNs and ethnic Croats without Croatian citizenship (controlled but facilitated access to labour market).

**Contemporary regimes of super exploitation:
Exploring the mutually constitutive relation
between discursive constructions of minorities'
skills and the labor process**

Hannah Vermaut, Patrizia Zaroni
Unia, Hasselt University (Belgium); Hasselt University
(Belgium)
hannah.vermaut(at)unia.be,
patrizia.zaroni(at)uhasselt.be

This study analyses the role of skills in the super exploitation of workers belonging to historically subordinated socio-demographic groups in the workplace. Taking a double perspective to skill as both an aspect of the material labor process (the skills required to carry out specific jobs) and a social construction (the specific skills associated with specific socio-demographic groups), it investigates exploitation in three companies employing a large share of women and ethnic minorities in low-rank jobs. The analysis shows the mutually constitutive relation between the material labour process and the discursive representations of historically subordinated groups' skills. It contributes to the extant post-structuralist literature on diversity by pointing to the importance of the material organization of work in theorizing minorities' super exploitation. It further rejoins the contingency perspective in the labour process literature by pointing to the heterogeneity of regimes of super exploitation of a diverse workforce in contemporary organizations, despite general pressures towards low wages and high flexibility.

**Neoliberal Governing through economization and
ethnicization of the 'ideal' migrant subject:
Subjectivation processes of migrant
entrepreneurs from Turkey in Austria**

Alev Cakir
University of Vienna, Austria
alev.cakir(at)univie.ac.at

This paper analyzes how subject formations promoted in policies and discourses on migration, in particular on migrant entrepreneurship, are negotiated by migrant entrepreneurs from Turkey. Thereby, it examines which continuities, overlaps but also breaks and resistances or disconnections occur in these subjectivation processes. This paper also explores which categories (i.e. gender and ethnicity) and their intersectionality structure these subjectivation processes. Migrant entrepreneurship has been increasingly emphasized in the political agenda of the EU, OECD, in Austria and policies and societal discourses. Migrants have been framed as having a particular 'migrant entrepreneurial spirit'. With respect to Austria, entrepreneurs from Turkey are a crucial group targeted within the respective policies and discourses. Their positioning has to be understood in a post-guest worker context which is characterized by discrimination experiences and exclusions and is linked with post-Fordist employment conditions which presuppose precarious working conditions. The respective policies, discourses but also migrant

entrepreneurs themselves reproduce 'migrants' as ethnicized and economicized 'Others' or 'Selves' and link entrepreneurship with social mobility, integration, economic development and the figure of the 'ideal migrant'. Hence, this analysis also demonstrates how ethnicity is also strategically used as a resource i.e. in form of social capital by the migrant entrepreneurs. The analysis is based on frame analysis of policies and interviews with representatives of institutions promoting migrant entrepreneurship and migrant entrepreneurs from Turkey in Austria. A systematic and intersectional analysis of the relationship between subject formation and subjectivation of migrant entrepreneurs from Turkey offers contributions to the debate on forms of inequality and precarization in the context of migration and capitalist labour markets, ethnicization processes and the role of policies in subjectivation processes of migrants.

**RS16 | Session 08a Government Policies' Impact
on Migrants' Labour Market Positions**

**(Re)working refugees? Integration policies or the
race for employability in Germany**

Mouna Maaroufi
Free University Berlin, Germany
mouna.maa(at)gmail.com

Employability has become the mantra for most education and labour market policies in emerging welfare states in Europe. In Germany, labour market reforms since the 2000s have increased pressure on job-seekers by holding them accountable for failing to be employable. This discourse has allowed for disciplining and sanctioning measures to become a widespread tool of labour market policies. Against this backdrop, it is not surprising that similar practices are applied on refugees seeking to integrate the labour market. It can be argued that the inclusion of refugees into the formal labour market is a progressive step in light of previous exclusion. However, unequal power relations risk to remain unchallenged in this approach. In the context of refugees seeking employment and being shaped according to the requirements of the labour market, yet more symbolical and material means of coercion can be employed to determine refugees' position on the labour market. Thus, the "perspective of stay" has become an official category to allow refugees from certain countries privileged access to the labour market as well as to provide incentives for desirable refugees to find employment. Moreover, the multiplication of measures designed to make refugees employable reinforces the representation and self-perception of refugees as less qualified. Based on qualitative research exploring the perspective of refugees and power relations vis-à-vis institutional actors, I research the way racist and postcolonial representations and unequal relations are reproduced by institutions, employers and workers. This way, the research questions if the material and symbolical pressure exerted on refugees serves not only for their activation and employability but also for weakening their position on the labour market leading

to precarious and exploitative labour relations.

Entrepreneurship among immigrants in Germany: the 2004 reform of the German Trade and Crafts Code as a natural experiment

Jeremy Jesse Kuhnle

Mannheim Centre for European Social Research (MZES); University of Mannheim, Germany
jeremy.kuhnle(at)mzes.uni-mannheim.de

Labor market integration is an important step in the overall integration of immigrants into their receiving country's society. Previous research has shown that self-employment is a viable route in this regard. In this paper I investigate how institutional barriers affect the labor market entry of immigrants. Specifically, using the 2004 reform of the German Trade and Crafts Code (HwO) as a natural experiment, I examine what effect occupational deregulation has on labor market entry via self-employment, specifically among first generation immigrants. Prior to 2004, craftspeople that wanted to open their own business in Germany were required to hold a Master Craftsmen degree (Meister) in order to do so. This restriction was partially lifted by the 2004 reform, which decreased the number of occupations in which this was a prerequisite from 94 to 41. Accordingly, using repeated cross-sections of the German micro-census data (1997-2012) and applying (triple) difference-in-differences estimators to determine causality, I analyze what effect the 2004 reform has had on the probability of self-employment among first generation immigrant craftspeople in the 53 deregulated crafts (treatment group). The main findings indicate that the probability of being self-employed, relative to German men, has significantly increased for East European men (EU-12) active in one of the deregulated trades. Furthermore, the same result holds for East European women (EU-12), relative to German women, since the reform. Conclusively, implications for future policy efforts regarding occupational deregulation and its effectiveness on (successfully) integrating immigrants into the labor market can be drawn from the results.

Excluded and failed worker-citizens: unemployment, migration and labour in Finland

Daria Krivonos

University of Helsinki, Finland
daria.krivonos(at)helsinki.fi

The paper examines overlapping exclusions from social citizenship and decent work, which are created by the border regime, on the one hand, and transformations in the welfare state such as "activating labour market policies" or "workfare", on the other. Contrary to the arguments about migrants' lacking of right human capital and skills, my research shows how young highly-educated Russian-speakers in Finland end up in precarious low-paid work due to various institutional factors. As in case of other non-EU citizens, regular residence in Finland and access to welfare rights are tied to the inflexible system of immigration controls and obtainment of residence

permits based on work. This requirement forces migrants with an insecure migrant status to do work in a low-skilled sector, even if it does not match their qualifications. At the same time, social rights such as unemployment benefits are also becoming conditional upon participation in labour activation measures such as unpaid work trials mainly in a service sector – already for those with a regular citizenship status. My data shows that work becomes an imperative, a requirement and a duty both for "excluded" (migrants) and "failed" (unemployed) citizens, to borrow Anderson's (2013) terms. I suggest that the growing exclusion from welfare rights within regular citizenship overlaps with exclusions created by migration. Such focus on work and unemployment may also help to evade the reproduction of methodological nationalism in research on labour.

Anderson, B. (2013) *Us and Them? The Dangerous Politics of Immigration Control*. Oxford University Press

Return of the Guestworkers? Temporary Labour Migration Programmes in Europe

Amparo González-Ferrer, Erica Consterdine, James Hampshire

Centre for Human and Social Sciences (CCHS), Spain; University of Sussex, United Kingdom; University of Sussex, United Kingdom
amparo.gonzalez(at)cchs.csic.es,
e.consterdine(at)sussex.ac.uk,
J.A.Hampshire(at)sussex.ac.uk

Less than ten years ago, policymakers and civil society alike were heralding temporary migration programmes (TMPs) as a panacea for managed migration in Europe. Faced with political opposition to immigration on the one hand, and labour market gaps on the other, TMPs were presented as the solution to Europe's migration conundrum. The European Commission emerged as a leading advocate for the expansion of circular and temporary programmes, which it claimed could meet three objectives: addressing labour market shortages in receiving countries without permanent settlement; mitigating the 'brain drain' and promoting development in sending countries; and minimizing irregular migration (COM (2007) 248). Critics of TMPs in academic and policymaking communities, however, argue that they are unworkable and undesirable as they do not benefit migrants or sending countries. Drawing on results from a new immigration policy index (ImPol), we show that TMPs have not come to fruition in Europe. Instead, states have outsourced temporary labour recruitment to employers, whilst tinkering with their existing regimes in a broader move towards "temporariness". We argue that the development of temporariness is neither efficient as a system of migration management, nor rights-based. Temporariness within migration regimes has curtailed migrants' rights, impeded mechanisms that facilitate circularity, and exacerbated the stratification of rights based on 'economic worth' (Anderson 2013).

RS17 - 100 Years Charles Wright Mills: Sociological Imagination Today

RS17 | Session 01a 100 Years Charles Wright Mills: Sociological Imagination Today - Theoretical Questions / Commitment

Mills : a sociologist with commitment and capacities of indignation

Roland Pfefferkorn

Strasbourg University, France

roland.pfefferkorn(at)unistra.fr

Mills's book *The Power Elite* has triggered many comments from liberals or conservatives mainly to discredit the author - "this solitary horseman, who is in part a prophet, in part a teacher, in part a rough-tongued brawler" – but also the research – "original research with sour grapes". The work has been described as journalistic and ideological. The author was considered as a moralist at a time when leading American sociology was celebrating axiological neutrality in social sciences. The work was also criticized by Marxists because it did not start with a class-struggle perspective.

In my contribution I want first give a short overview of the academic reception, mostly very negative, of Mills's book who became sixty years later a classic in sociology. I will also go back over his comment on Criticism and insist on his interest in sociology of knowledge. Mills maintained a capacity for indignation, tried to build concepts and skills to expose and respond to social injustice and finally did not forget that the sociologist also is "a creature of value in a word of evaluations".

People's courses of action, a truly Millsian concept if used in its plural form

Daniel Bertaux

Université de Strasbourg et CNRS, France

daniel.beraux(at)misha.fr

Wright Mills' recommendation to sociologists - to focus on the very point where history, social structure and biography meet and mix together - sounds as relevant to-day as when he formulated it. As for the inclusion of "biography" in the trilogy, we believe it stands for what philosophers used to refer to as "Man", a shorthand reminder that social research cannot be equated to natural sciences.

A thorough examination of the idea of course of action

– the time-ordered series of actions of some individual (or resp. collective) actor trying to reach a given goal - has convinced us not only of the Millsian nature of this idea, but also of the urgent necessity for sociology to transform this idea into a fully developed sociological concept. The expression course of action is part of English language ("the actions to be taken", Webster), but is apparently seldom used; and equivalent expressions do not even exist in French or German. By referring to action through time ("action dans la durée"), thus to action pursued and pushed through the maze of social-structural constraints and opportunities to realize a given project, it combines the three components of Mills's core recommendation. But it also opens a door to discovering a whole universe of unsuspected properties of courses of action, including some that actually reshape and transform social "structures", thus contributing to make human history. Three of such major properties will be mentioned. The whole view lead to a remarkable conclusion: constructivism should not be located, as one would believe, somewhere between structuralism and actionalism, but beyond actionalism, and pointing to a yet unexplored fourth perspective.

Social movement strategy and the politics of the possible

Luke Yates

University of Manchester, United Kingdom

luke.s.yates(at)manchester.ac.uk

This paper aims to map out a research agenda on the politics of the possible: the processes by which contentious action shapes, is shaped by, and concerns, visions of the future. It reviews relevant extant research on the ideational and imaginative work of social movements. It argues that the politics of the possible depends on a broader context of competing visions of the future. This means the cognitive dimension of social movements is located in broader societal modes of futurology – professionalised, highly technical, and orientated mainly around risk; and the particular conditions of (thinking about future in) societies of very high personal debt, precarious work and housing, and near-unanimity about impending environmental apocalypse and economic stagnation. The paper hypothesises some ways in which these conditions and processes relate to movement activity, thinking about movements of different sorts and their relationships with other entities (businesses, governments, cultural producers) that depict alternative societies. The paper finally raises some questions around the future-oriented question of strategy, considering how to consciously plan and struggle in an era of foreclosed future, how to negotiate the lack of consensus over political goals on the Left, and how to act together or coordinate in movements lacking formal organisation.

The Critical Theory of the (Power) Elite? Mills' Conception of Power and Theory of Recognition.

Ondřej Lánský

The Institute of Philosophy of the Academy of Sciences of the Czech Republic, Czech Republic
ondrejlanisky(at)gmail.com

In my contribution, I would like to elaborate on critical theory of power based on the critical comparison of Charles Wright Mills' concept of power and Axel Honneth's theory of recognition. I will emphasize Mills' book *The Power Elite* as a part of a broader project: an attempt to understand the modern (American) society or the advanced-industrial society in its totality. It is important to read *The Power Elite* in the context of two preceding works by Mills: *The Puerto Rican Journey* (1950) and *The White Collar* (1951). Mills proceeds systematically. The first book is an analysis of the situation of the poor as well as of the most disadvantaged: immigrants and their families. In the second book Mills studies the middle class. Finally, he analyzes what he calls the power elite. Consequently, we may regard the question of power as the significant topic. In this context, I would like to reconstruct the concept of power (political, social and economic) and power relations. That will allow me to interpret Mills' works as a part of, or as a form of, Critical Theory. In that framework, I will consider Axel Honneth's theory of recognition, one of the main contemporary concepts within the frame of Critical Theory. The main goal of my contribution is therefore to analyze Mills' concept of power and its implications for Honneth's theory of recognition, which I would thereby like to show as deficient regarding the issue of power. That is why, I believe, it needs to be informed by theory of social relations based on a profound conception of power. Mills' theory and empirical work would prove beneficial for contemporary critical-theoretical thought.

RS17 | Session 02a 100 Years Charles Wright Mills: Sociological Imagination Today - Elite / Middle Class / Vulnerable Groups

C. Wright Mills and the question of the global power elite

Markus Ojala

University of Helsinki, Finland
markus.ojala(at)helsinki.fi

Owners and managers of giant transnational corporations and banks, government leaders of major economic and military powers, and directors of key international organizations have unprecedented institutional capacity to affect the lives of millions of people around the world. At the same time, everyday political discourse tends to present a pluralistic account of world society, characterized by elite division into competing camps, mostly along national and sectoral lines. In order to critically appreciate the potential for transnational elite integration, and to counter any simplistic notions of a multipolar and pluralistic world society, this paper explores two

interrelated questions: What grounds do we have to speak about a global power elite today, and what does it mean to argue about the existence of a global power elite in contemporary world society? Following C. Wright Mills' insights into the formation of the power elite in the mid-twentieth-century United States, the paper stresses the importance of a context-specific analysis of world society in terms of (a) long-term structural developments, (b) hierarchy of power, (c) elite socialisation and interlocks, and (d) ideological work towards the establishment of unifying interests. Discussing each of the dimensions in relation to post-war developments in the global political economy, the paper argues that Mills' critical notion of the power elite provides valuable insights into the concentration of power in contemporary world society.

Leader communities: The making of elites

Mikael Holmqvist

Stockholm University, Sweden
mikael.holmqvist(at)sbs.su.se

Based on ethnographic methods I study a Swedish elite community named Djursholm as a "leader community" i.e., a place where leaders choose to live and exert their dominion, socialize with other leaders, and, most importantly, form families and raise their children into future leaders (see Holmqvist, 2017). In C. W. Mills's (1956) sense, leaders are often considered a power elite not on the basis of superior intellectual abilities or superlative formal merits; but rather on an idea to be morally elevated (see also Jackall, 1988). An important concept in my interpretation and understanding of the sociology of Djursholm is consecration, i.e., the "initiation of someone", or, "making someone sacred." In all essential respects it is about elevating a human being, imbuing him or her with certain higher moral or spiritual qualities. This takes place by means of the culture, history, traditions, ceremonies, rituals, and institutions of the place, which are possessed of a certain aura continually recreated through the actions of the population. Indeed, this society accumulates such a concentration of what Bourdieu (1984) would call "symbolic capital" that it becomes sacred, and the people that live and act there are transformed from merely living an "ordinary", profane life, into the realm of the sacred. The prerequisite of consecration is social separation and differentiation on a physical, mental, and cultural level. I often a number of critical remarks on these kinds of environments, focusing on their downplaying of traditional meritocratic ideals and virtues for social advancement and influence.

The Middle Class, Old and New

Jacek Tittenbrun

Adam Mickiewicz University, Poland
jacek(at)amu.edu.pl

A key contribution of Mills to the theory of social differentiation consists in his distinction between two groupings he called "old middle class" and "new middle class." There are some serious problems with

Mills' definitions.

First and foremost, the underlying term 'middle class' is a misnomer, or more exactly, an oxymoron. This is the case because the adjective 'middle' is inherently hierarchical in nature, which means that it fits in the framework of social stratification rather than class-it is the former that is necessarily hierarchical in character, whereas inter-class relations are, as a rule, more complex, and only in rare cases could be boiled down to a ladder-like scheme. Thus, Mills' 'new middle class' is in fact a collection of a variety of employee and managerial classes, including even social estates, e.g. civil servants.

However, Mills' 'old middle class' refers indeed to a social class-which by Marxists is usually termed the petty bourgeoisie, and which the present author proposes to frame as the autocephalous class, borrowing Weber's term. This term highlights what for Mills is a key feature of the class in question, i.e. independence-they are independent owners of the means of economic activity (production, exchange, etc.) In addition, they rely only on their own work, not employing other people's labour power.

It is striking that this 'conceptual death' is paralleled by the real-world decline of what passes as 'the middleclass', though the process is being obfuscated by its false conceptualisation.

Who rules Greece? Greek prime ministers (1974 – 2016): Paths to leadership and/or leading to crisis

Despoina Valassi, Gerasimos Karoulas

University of Crete, Greece; National and Kapodistrian University of Athens, Greece

dvalassi(at)gmail.com, gerasimoskaroulas(at)yahoo.gr

Following the sociological tradition of C. W. Mills and especially his writings on power elite we conducted a research study of the Greek prime ministers as the highest political leaders in the country. The intention of the authors, entering C. W. Mills theory into the Greek political field, is to highlight that Greek prime ministers, after 1974 and the restoration of Greek democracy, regardless their political traditions and ideological origins and differences, entered the Greek political field having, at least the majority of them, similarities in their social background, educational trajectories and recruitment patterns. Trying to describe their "paths to leadership", we studied a number of factor/variables related to the political tradition of the Greek prime ministers, their inclusion in different elite groups, e.g. economic, bureaucratic, their families socio-economic status, their occupational trajectories and cosmopolitan cultural capital. C.W.Mills was one of the first sociologists highlighted the importance of "elite schools" and their clubs like the "old boys network". In Greece the graduation from elite schools seems to be one of the most privileged and secured paths to high status strata and to the power elite. Also, we strongly believe that studying the Greek political elite and its linkages with other forms of power elite (economic, bureaucratic) it is possible to highlight reasons that "led to the socio-economic crisis". The data collected through a mixed - qualitatively and quantitatively -

methodological approach through the method of "prosopography" as the most adequate for an in-depth analysis, promoting us with the proper biographical details. The analysis encompass the prime ministers of Greece from 1974 until the last parliamentary term started in September of 2015.

Societal and Political Transition in Balkan Countries: Solidarity, In-group Bonds and Attitudes towards Vulnerable Groups

Antoanela Petkovska, Mihajlo Popovski, Marija Dimitrovska

Ss. Cyril and Methodius University of Skopje, Faculty of Philosophy - Skopje, Macedonia, Former Yugoslav Republic of; Ss. Cyril and Methodius University of Skopje, Faculty of Philosophy - Skopje, Macedonia, Former Yugoslav Republic of; Ss. antoanela(at)zf.ukim.edu.mk,
mihajlo(at)zf.ukim.edu.mk,
dimitrovska.marija(at)outlook.com

The societal and political transformation of the Republic of Macedonia after gaining its independence from the former Yugoslavia generated different kind of challenges for the Macedonian citizens as well as for the citizens of the former socialist states. The changes were manifested through economic and political crises, crisis of value systems and caused disruption of social security, trust in other people and institutions and the quality of life. These had an impact on the citizens' attitudes towards certain vulnerable groups: the elderly, the unemployed, ill people and people with disabilities, children of poor families and immigrants. The main assumption is that these processes had influence on the empathy and solidarity of the citizens towards vulnerable groups, as well as their in-groups: the family, their neighborhood, the region they belong to, and through their civic engagement. This paper is based on the analysis of data obtained from the last wave of European Value Study. The data will be subjected to comparative analysis of EVS data obtained from other Balkan countries.
