Bimetallic Iron–Rhodium Anionic Carbonyl Clusters \([\text{Fe}_x\text{Rh}(\text{CO})_y]^\mp\) (\(x = 10\) or 11), \([\text{Fe}_x\text{Rh}_2(\text{CO})_y]^\mp\), \([\text{Fe}_x\text{Rh}_3(\text{CO})_y]^\mp\), and \([\text{Fe}_x\text{Rh}_4(\text{CO})_y]^\mp\).

Alessandro Ceriotti, Giuliano Longoni, Mario Manassero, Mirella Sansoni, Roberto Della Pergola, Brian T. Heaton, and David O. Smith

The syntheses and interconversions of mixed iron–rhodium carbonyl clusters are described; a combination of X-ray analysis and multinuclear n.m.r. measurements allowed the structural characterisation of \([\text{Fe}_x\text{Rh}_y(\text{CO})_z]^\mp\), \([\text{Fe}_x\text{Rh}_y(\text{CO})_z]^\mp\), and \([\text{Fe}_x\text{Rh}_y(\text{CO})_z]^\mp\), which can all be obtained from the unstable cluster, \([\text{Fe}_x\text{Rh}_y(\text{CO})_z]^\mp\) (\(x = 10\) or 11).

Bimetallic carbonyl clusters containing iron are now known with many transition metals. However, whereas \([\text{Fe}_x\text{Co}_y(\text{CO})_z]^\mp\) was the first anionic mixed metal cluster to be isolated and characterized, there have been no reports of the corresponding iron-rhodium carbonyl clusters, although some neutral iron-rhodium carbonyl clusters containing other ligands (e.g. C\(_5\)H\(_5\), PPh\(_3\)) are known. We now report preparative routes for \([\text{Fe}_x\text{Rh}_y(\text{CO})_z]^\mp\) (\(x = 10\) or 11), \([\text{Fe}_x\text{Rh}_y(\text{CO})_z]^\mp\), and \([\text{Fe}_x\text{Rh}_y(\text{CO})_z]^\mp\) (Scheme 1).

It has not yet proved possible to obtain (1) as a pure crystalline solid but the stoichiometry of the reactants and spectroscopic measurements are consistent with the formulation \([\text{Fe}_x\text{Rh}_y(\text{CO})_z]^\mp\) (\(x = 10\) or 11). The i.r. spectrum of (1) shows only terminal carbonyl bands; n.m.r. measurements at -85°C show only one rhodium resonance at +0.1 p.p.m. and the \(1^{13}\)C n.m.r. spectrum consists of a singlet at 217.4 p.p.m. due to the iron carbonyls and a doublet at 186.1 p.p.m. due to the rhodium carbonyls. Unfortunately, \(1^{13}\)C n.m.r. spectra of iron–rhodium carbonyl clusters do not give reliable integrations for carbonyls on different metals and the exact value of \(x\) for (1) remains undetermined.

Complex (2) has been shown by multinuclear n.m.r. measurements to be isostructural with \([\text{Ru}_x\text{Rh}_y(\text{CO})_z]^\mp\) but different from both the solution and solid-state structure of \([\text{Rh}_x(\text{CO})_z]^\mp\). Direct \(^{13}\)C n.m.r. spectra of (2) at -70°C show three resonances in the ratio 2:1:1 at +59.4, -241.9, and -1170.9 p.p.m. due to Rh\(_a\), Rh\(_b\), and Rh\(_c\) (Figure 1), respectively and \(^{13}\)C–\(^{103}\)Rh n.m.r. spectra at -86°C are entirely consistent with the carbonyl distribution shown in Figure 1. The i.r. spectrum and cell constants of (PPN)\(_2\)[FeRh(CO)\(_{16}\)] [triclinic, \(a = 11.447(6), b = 14.096(8), c = 3986(4)\) Å] are also very similar to those found for (PPN)\(_2\)[FeRh(CO)\(_{16}\)]. All the carbonyls, except CO\(_a\) and CO\(_b\), migrate around the Fe\(_2\)-Rh skeleton at +65°C.

Scheme 1. i, Rh\(_2(\text{CO})_8\)Cl\(_2\), THF; ii, Pr\(_3\)OH; iii, H\(_2\)PO\(_4\), MeCN.

\(\nu(\text{CO})/\text{cm}^{-1}\) for the iron-rhodium carbonyl clusters (1)–(4) in tetrahydrofuran (THF): (1) 2040w, 2000ms, 1980m, 1940m, and 1890w; (2) 2030w, 2005s, 1970s, 1810s, 1790m, and 1740s; (3) 2040w, 2005s, 1985ms, 1960m, 1950m, 1900w, 1725ms, and 1710s; (4) 2080w, 2040s, 2005m, 1990m, 1950w, 1765ms.

\(\delta(\text{p.p.m.}) = 11.376\) MHz at such a magnetic field that the protons in Me\(_3\)Si resonate at exactly 360 MHz.

Figure 1. Schematic representation of the structure adopted by \([\text{Fe}_x\text{Rh}_y(\text{CO})_z]^\mp\).
but, unlike the PtRh-group in [PtRh(CO)$_{16}$]$^{2-}$ ($x = 12.14$) which can be obtained with the platinum atom in either the equatorial or apical positions,* there is no evidence for rearrangement of the FeRh$_2$-skeleton.

The structures of (3) and (4) have been established by a combination of X-ray† and multinuclear n.m.r. measurements because of metal disorder in the solid state; they are both isostructural with the isoelectronic cluster [Rh$_6$(CO)$_{16}$]$^6$ and n.m.r. measurements show that (3) contains both cis- and trans-Fe$_2$Rh$_4$ groups (ca. 1:3, respectively).

Consistent with the increasing iron content, the average metal–metal bond length decreases on going from [Rh$_6$(CO)$_{16}$] (2.78 Å) to (4) (2.750 Å) to (3) (2.727 Å). In both (3) and (4), however, the metal disorder does not significantly affect the carbonyl groups, which show normal thermal parameters and interatomic bond lengths $d(M$–$C_{C}$) 1.860, 1.799, $d(M$–$C_{O}$) 1.132, 1.159, and $d(C$–$O_{C}$) 1.168, 1.194 Å for (4) and (3), respectively, and the variation of M–C and C–O bond lengths in the series [Rh$_6$(CO)$_{16}$], (4), (3) is in keeping with increasing metal-to-carbonyl back-bonding.

At $-70^\circ$ C the rhodium n.m.r. spectrum of (4) consists of two resonances at $-400.6$ and $-501.7$ p.p.m. in the ratio 4:1 and $^{103}$Rh. (4) measurements are entirely in accord with the carbonyl distribution around the FeRh$_2$-octahedron, being identical to that found in [Rh$_6$(CO)$_{18}$]. An identical carbonyl distribution is found for (3) but in this case the $^{103}$Rh n.m.r. spectrum at $-70^\circ$ C shows three peaks due to cis- ($-408.7$ and $-452.7$ p.p.m.) and trans-isomers ($-408.9$ p.p.m.); these assignments were confirmed by $^{103}$C. ($^{103}$Rh) n.m.r. measurements and, although the carbonyls are fluxional at room temperature, there is no evidence for rearrangement of the metallic skeleton.

Thus, the structures of [Fe$_2$Rh$_4$(CO)$_{16}$]$^{2-}$, [FeRh$_6$(CO)$_{16}$]$^6$, and [Rh$_6$(CO)$_{18}$] are very similar whereas the structures of [Fe$_2$Rh$_4$(CO)$_{16}$]$^{2-}$ and [Rh$_6$(CO)$_{18}$] are different and this illustrates the present difficulties encountered in predicting arrangements of carbonyls and metals even in closely related transition metal carbonyl clusters.

We thank C.N.R. and the S.E.R.C. for financial support and for a research fellowship (to R. D. P.) We thank the S.E.R.C. for providing high-field n.m.r. facilities and Dr. I. H. Sadler for recording the $^{103}$Rh n.m.r. spectra.
